What’s New in PL/SQL Packages and Types Reference? ............................................................... xxxiii
  Oracle Database 10g Release 1 (10.1) New Features ................................................................. xxxiv
  Oracle9i Release 2 (9.2) New Features ......................................................................................... xl
  Oracle9i Release 1 (9.0.1) New Features ..................................................................................... xlii
  Oracle8i Release 2 (8.1.6) New Features ..................................................................................... xliii
  Oracle8i Release 1 (8.1.5) New Features ..................................................................................... xliii
  This book was new for release 8.1.5. ......................................................................................... xliii

1 Introduction
  Package Overview .......................................................................................................................... 1-2
  Abbreviations for Datetime and Interval Datatypes ................................................................. 1-7
  Summary of Oracle Supplied PL/SQL Packages ..................................................................... 1-7

12 DBMS_ADVISOR
Using DBMS_ADVISOR.................................................................................................................. 12-2
Summary of DBMS_ADVISOR Subprograms.............................................................................. 12-20

13 DBMS_ALERT
Using DBMS_ALERT....................................................................................................................... 13-2
Summary of DBMS_ALERT Subprograms.................................................................................... 13-6

14 DBMS_APPLICATION_INFO
Using DBMS_APPLICATION_INFO.................................................................................................. 14-2
Summary of DBMS_APPLICATION_INFO Subprograms................................................................. 14-4

15 DBMS_APPLY_ADM
Summary of DBMS_APPLY_ADM Subprograms.......................................................................... 15-2

16 DBMS_AQ
Using DBMS_AQ............................................................................................................................ 16-2
Summary of DBMS_AQ Subprograms.......................................................................................... 16-6

17 DBMS_AQADM
Using DBMS_AQADM.................................................................................................................... 17-2
Summary of DBMS_AQADM Subprograms................................................................................. 17-5

18 DBMS_AQELM
Summary of DBMS_AQELM Subprograms................................................................................... 18-2

19 DBMS_CAPTURE_ADM
Summary of DBMS_CAPTURE_ADM Subprograms....................................................................... 19-2

20 DBMS_CDC_PUBLISH
Using DBMS_CDC_PUBLISH.......................................................................................................... 20-3
Summary of DBMS_CDC_PUBLISH Subprograms..................................................................... 20-5
21  DBMS_CDC_SUBSCRIBE
Using DBMS_CDC_SUBSCRIBE ............................................................... 21-2
Summary of DBMS_CDC_SUBSCRIBE Subprograms ......................... 21-5

22  DBMS_CRYPTO
Using the DBMS_CRYPTO Subprograms ........................................... 22-2
Summary of DBMS_CRYPTO Subprograms ....................................... 22-10

23  DBMS_DATA_MINING
Using DBMS_DATA_MINING .............................................................. 23-2
Summary of DBMS_DATA_MINING Subprograms ............................. 23-19

24  DBMS_DATA_MINING_TRANSFORM
Using DBMS_DATA_MINING_TRANSFORM ........................................ 24-2
Summary of DBMS_DATA_MINING_TRANSFORM Subprograms .......... 24-8

25  DBMS_DATAPUMP
Using DBMS_DATAPUMP ................................................................. 25-2
Summary of DBMS_DATAPUMP Subprograms ................................ 25-9

26  DBMS_DDL
Using DBMS_DDL ........................................................................... 26-2
Summary of DBMS_DDL Subprograms ......................................... 26-3

27  DBMS_DEBUG
Using DBMS_DEBUG ...................................................................... 27-2
Summary of DBMS_DEBUG Subprograms ....................................... 27-16

28  DBMS_DEFER
Documentation of DBMS_DEFER ................................................. 28-2
29 DBMS_DEFER_QUERY
Documentation of DBMS_DEFER_QUERY ............................................................ 29-2

30 DBMS_DEFER_SYS
Documentation of DBMS_DEFER_SYS .............................................................. 30-2

31 DBMS_DESCRIBE
Using DBMS_DESCRIBE .................................................................................. 31-2
Summary of DBMS_DESCRIBE Subprograms .................................................... 31-8

32 DBMS_DIMENSION
Using DBMS_DIMENSION ............................................................................... 32-2
Summary of DBMS_DIMENSION Subprograms ................................................. 32-3

33 DBMS_DISTRIBUTED_TRUST_ADMIN
Using DBMS_DISTRIBUTED_TRUST_ADMIN .................................................... 33-2
Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms ...................... 33-5

34 DBMS_FGA
Using DBMS_FGA ............................................................................................ 34-2
Summary of DBMS_FGA Subprograms .............................................................. 34-3

35 DBMS_FILE_TRANSFER
Summary of DBMS_FILE_TRANSFER Subprograms ............................................ 35-2

36 DBMS_FLASHBACK
Using DBMS_FLASHBACK .................................................................................. 36-2
Summary of DBMS_FLASHBACK Subprograms .................................................. 36-8

37 DBMS_FREQUENT_ITEMSET
Summary of DBMS_FREQUENT_ITEMSET Subprograms .................................... 37-2
38  DBMS_HS_PASSTHROUGH
Summary of DBMS_HS_PASSTHROUGH Subprograms .......................................................... 38-2

39  DBMS_IOT
Summary of DBMS_IOT Subprograms ........................................................................... 39-2

40  DBMS_JAVA
Documentation of DBMS_JAVA .................................................................................... 40-2

41  DBMS_JOB
Using DBMS_JOB ........................................................................................................ 41-2
Summary of DBMS_JOB Subprograms ........................................................................ 41-5

42  DBMS_LDAP
Documentation of DBMS_LDAP .................................................................................... 42-2

43  DBMS_LDAP_UTL
Documentation of DBMS_LDAP_UTL ............................................................................ 43-2

44  DBMS_LIBCACHE
Using DBMS_LIBCACHE ............................................................................................... 44-2
Summary of DBMS_LIBCACHE Subprograms ................................................................. 44-3

45  DBMS_LOB
Using DBMS_LOB ........................................................................................................ 45-2
Summary of DBMS_LOB Subprograms ........................................................................ 45-15

46  DBMS_LOCK
Using DBMS_LOCK ........................................................................................................ 46-2
Summary of DBMS_LOCK Subprograms ........................................................................ 46-5
47  DBMS_LOGMNR
Using DBMS_LOGMNR................................................................. 47-2
Summary of DBMS_LOGMNR Subprograms ................................ 47-6

48  DBMS_LOGMNR_D
Using DBMS_LOGMNR_D ......................................................... 48-2
Summary of DBMS_LOGMNR_D Subprograms ......................... 48-3

49  DBMS_LOGSTDBY
Using DBMS_LOGSTDBY ....................................................... 49-2
Summary of DBMS_LOGSTDBY Subprograms ......................... 49-3

50  DBMS_METADATA
Using DBMS_METADATA .......................................................... 50-2
Summary of DBMS_METADATA Subprograms ......................... 50-8

51  DBMS_MGWADM
Using DBMS_MGWADM ......................................................... 51-2
Summary of DBMS_MGWADM Subprograms ......................... 51-29

52  DBMS_MGWMSG
Using DBMS_MGWMSG ........................................................ 52-2
Summary of DBMS_MGWMSG Subprograms ......................... 52-24

53  DBMS_MONITOR
Summary of DBMS_MONITOR Subprograms ............................. 53-2

54  DBMS_MVIEW
Using DBMS_MVIEW .......................................................... 54-2
Summary of DBMS_MVIEW Subprograms ......................... 54-3
55  DBMS_OBFUSCATION_TOOLKIT
   Using DBMS_OBFUSCATION_TOOLKIT.......................................................... 55-2
   Summary of DBMS_OBFUSCATION Subprograms......................................... 55-6

56  DBMS_ODCI
   Summary of DBMS_ODCI Subprograms..................................................... 56-2

57  DBMS_OFFLINE_OG
   Documentation of DBMS_OFFLINE_OG.................................................... 57-2

58  DBMS OLAP
   Using DBMS OLAP.................................................................................. 58-3
   Summary of DBMS OLAP Subprograms................................................... 58-10

59  DBMS_OUTLN
   Using DBMS_OUTLN................................................................................ 59-2
   Summary of DBMS_OUTLN Subprograms.................................................. 59-3

60  DBMS_OUTLN_EDIT
   Summary of DBMS_OUTLN_EDIT Subprograms......................................... 60-2

61  DBMS_OUTPUT
   Using DBMS_OUTPUT............................................................................... 61-2
   Summary of DBMS_OUTPUT Subprograms............................................... 61-7

62  DBMS_PCLXUTIL
   Using DBMS_PCLXUTIL.......................................................................... 62-2
   Summary of DBMS_PCLXUTIL Subprograms.............................................. 62-5

63  DBMS_PIPE
   Using DBMS_PIPE................................................................................... 63-2
   Summary of DBMS_PIPE Subprograms.................................................... 63-18
64 DBMS_PROFILER
Using DBMS_PROFILER ................................................................. 64-2
Summary of DBMS_PROFILER Subprograms ............................... 64-8

65 DBMS_PROPAGATION_ADM
Summary of DBMS_PROPAGATION_ADM Subprograms .............. 65-2

66 DBMS_RANDOM
Using DBMS_RANDOM ................................................................. 66-2
Summary of DBMS_RANDOM Subprograms .................................. 66-3

67 DBMS_RECTIFIER_DIFF
Documentation of DBMS_RECTIFIER_DIFF ............................... 67-2

68 DBMS_REDEFINITION
Using DBMS_REDEFINITION ........................................................ 68-2
Summary of DBMS_REDEFINITION Subprograms ....................... 68-4

69 DBMS_REFRESH
Documentation of DBMS_REFRESH ............................................. 69-2

70 DBMS_REPAIR
Using DBMS_REPAIR ................................................................. 70-2
Summary of DBMS_REPAIR Subprograms ................................. 70-5

71 DBMS_REPCAT
Documentation of DBMS_REPCAT ............................................. 71-2

72 DBMS_REPCAT_ADMIN
Documentation of DBMS_REPCAT_ADMIN .................................. 72-2
73  DBMS_REPCAT_INSTANTIATE
    Documentation of DBMS_REPCAT_INSTANTIATE ................................................. 73-2

74  DBMS_REPCAT_RGT
    Documentation of DBMS_REPCAT_RGT ................................................................. 74-2

75  DBMS_REPUTIL
    Documentation of DBMS_REPUTIL ......................................................................... 75-2

76  DBMS_RESOURCE_MANAGER
    Using DBMS_RESOURCE_MANAGER ........................................................................ 76-2
    Summary of DBMS_RESOURCE_MANAGER Subprograms ............................................. 76-8

77  DBMS_RESOURCE_MANAGER_PRIVS
    Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms .................................... 77-2

78  DBMS_RESUMABLE
    Using DBMS_RESUMABLE ..................................................................................... 78-2
    Summary of DBMS_RESUMABLE Subprograms ....................................................... 78-3

79  DBMS_RLS
    Using DBMS_RLS ................................................................................................. 79-2
    Summary of DBMS_RLS Subprograms ..................................................................... 79-4

80  DBMS_ROWID
    Using DBMS_ROWID .............................................................................................. 80-2
    Summary of DBMS_ROWID Subprograms .................................................................. 80-6

81  DBMS_RULE
    Using DBMS_RULE ............................................................................................... 81-2
    Summary of DBMS_RULE Subprograms .................................................................. 81-3

99  DBMS_STREAMS_TABLESPACE_ADM
Using DBMS_STREAMS_TABLESPACE_ADM................................................................. 99-2
Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms......................... 99-5

100  DBMS_TRACE
Using DBMS_TRACE................................................................................................. 100-2
Summary of DBMS_TRACE Subprograms................................................................. 100-7

101  DBMS_TRANSACTION
Using DBMS_TRANSACTION.......................................................................................... 101-2
Summary of DBMS_TRANSACTION Subprograms...................................................... 101-3

102  DBMS_TRANSFORM
Summary of DBMS_TRANSFORM Subprograms......................................................... 102-2

103  DBMS_TYPES
Using DBMS_TYPES.................................................................................................. 103-2

104  DBMSUTILITY
Using DBMSUTILITY.................................................................................................. 104-2
Summary of DBMSUTILITY Subprograms............................................................... 104-4

105  DBMS_WARNING
Using DBMS_WARNING.............................................................................................. 105-2
Summary of DBMS_WARNING Subprograms.......................................................... 105-3

106  DBMS_WORKLOAD_REPOSITORY
Summary of DBMS_WORKLOAD_REPOSITORY Subprograms................................. 106-2

107  DBMS_WM
Documentation of DBMS_WM.................................................................................... 107-2
117  DBMS_XMLSAVE
Using DBMS_XMLSAVE ................................................................. 117-2
Summary of DBMS_XMLSAVE Subprograms ..................................... 117-3

118  DBMS_XMLSCHEMA
Constants of DBMS_XMLSCHEMA................................................. 118-2
Summary of DBMS_XMLSCHEMA Subprograms ................................. 118-3
Catalog Views of the DBMS_XMLSCHEMA .................................... 118-18

119  DBMS_XMLSTORE
Using DBMS_XMLSTORE .............................................................. 119-2
Summary of DBMS_XMLSTORE Subprograms .................................... 119-3

120  DBMS_XPLAN
Using DBMS_XPLAN ................................................................. 120-2
Summary of DBMS_XPLAN Subprograms ....................................... 120-8

121  DBMS_XSLPROCESSOR
Summary of DBMS_XSLPROCESSOR Subprograms ......................... 121-2

122  DEBUG_EXTPROC
Using DEBUG_EXTPROC ............................................................ 122-2
Summary of DEBUG_EXTPROC Subprograms ................................... 122-4

Using OWA_CACHE ....................................................................................................... 129-2
Summary of OWA_CACHE Subprograms ..................................................................... 129-3

130 OWA_COOKIE
Using OWA_COOKIE ...................................................................................................... 130-2
Summary of OWA_COOKIE Subprograms .................................................................... 130-3

131 OWA_CUSTOM
Using OWA_CUSTOM ...................................................................................................... 131-2
Summary of OWA_CUSTOM Subprograms .................................................................. 131-3

132 OWA_IMAGE
Using OWA_IMAGE ....................................................................................................... 132-2
Summary of OWA_IMAGE Subprograms ..................................................................... 132-3

133 OWA_OPT_LOCK
Using OWA_OPT_LOCK .................................................................................................. 133-2
Summary of OWA_OPT_LOCK Subprograms

134 OWA_PATTERN
Using OWA_PATTERN
Summary of OWA_PATTERN Subprograms

135 OWA_SEC
Using OWA_SEC
Summary of OWA_SEC Subprograms

136 OWA_TEXT
Using OWA_TEXT
Summary of OWA_TEXT Subprograms

137 OWA_UTIL
Using OWA_UTIL
Summary of OWA_UTIL Subprograms

138 SDO_CS
Documentation of SDO_CS

139 SDO_GCDR
Documentation of SDO_GCDR

140 SDO_GEOM
Documentation of SDO_GEOM

141 SDO_GEOR
Documentation of SDO_GEOR

142 SDO_GEOR_UTL
Documentation of SDO_GEOR_UTL
143  SDO_LRS
   Documentation of SDO_LRS ................................................................. 143-2

144  SDO_MIGRATE
   Documentation of SDO_MIGRATE .......................................................... 144-2

145  SDO_NET
   Documentation of SDO_NET .................................................................... 145-2

146  SDO_SAM
   Documentation of SDO_SAM .................................................................... 146-2

147  SDO_TOPO
   Documentation of SDO_TOPO .................................................................. 147-2

148  SDO_TOPO_MAP
   Documentation of SDO_TOPO_MAP ......................................................... 148-2

149  SDO_TUNE
   Documentation of SDO_TUNE .................................................................. 149-2

150  SDO_UTIL
   Documentation of SDO_UTIL .................................................................. 150-2

151  UTL_COLL
   Summary of UTL_COLL Subprograms ..................................................... 151-2

152  UTL_COMPRESS
   Using UTL_COMPRESS .......................................................................... 152-2
   Summary of UTL_COMPRESS Subprograms ............................................. 152-4
153  UTL_DBWS
Using UTL_DBWS ................................................................. 153-2
Summary of UTL_DBWS Subprograms ............................... 153-3

154  UTL_ENCODE
Summary of UTL_ENCODE Subprograms .............................. 154-2

155  UTL_FILE
Using UTL_FILE ................................................................. 155-2
Summary of UTL_FILE Subprograms ................................. 155-8

156  UTL_HTTP
Using UTL_HTTP ................................................................. 156-2
Subprogram Groups ......................................................... 156-21
Summary of UTL_HTTP Subprograms ............................... 156-30

157  UTL_I18N
Using UTL_I18n ................................................................. 157-2
Summary of UTL_I18N Subprograms ................................. 157-3

158  UTL_INADDR
Using UTL_INADDR ............................................................ 158-2
Summary of UTL_INADDR Subprograms ............................ 158-3

159  UTL_LMS
Using UTL_LMS ................................................................. 159-2
Summary of UTL_LMS Subprograms ................................. 159-3

160  UTL_MAIL
Using UTL_MAIL ................................................................. 160-2
Summary of UTL_MAIL Subprograms ............................... 160-3
169  ANYDATASET TYPE
Construction........................................................................................................................................ 169-2
Summary of ANYDATASET TYPE Subprograms.................................................................................. 169-3

170  ANYTYPE TYPE
Summary of ANYTYPE Subprograms.................................................................................................. 170-2

171  Oracle Streams AQ TYPEs
Summary of Types.................................................................................................................................. 171-2

172  Database URI TYPEs
Summary of URITYPE Supertype Subprograms .............................................................................. 172-2
Summary of HTTPURITYPE Subtype Subprograms ......................................................................... 172-9
Summary of DBURITYPE Subtype Subprograms ............................................................................. 172-18
Summary of XDBURITYPE Subtype Subprograms ............................................................................ 172-27
Summary of URIFACTORY Package Subprograms .......................................................................... 172-36

173  JMS Types
Using JMS Types.................................................................................................................................. 173-2
Summary of JMS Types...................................................................................................................... 173-14

174  Logical Change Record TYPEs
Summary of Logical Change Record Types....................................................................................... 174-2
Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD .................................. 174-33

175  interMedia ORDAudio TYPE
Documentation of ORDAudio............................................................................................................ 175-2

176  interMedia ORDDoc TYPE
Documentation of ORDDoc .............................................................................................................. 176-2
177  *inter*Media ORDImage TYPE
    Documentation of ORDImage ................................................................. 177-2

178  *inter*Media ORDImageSignature TYPE
    Documentation of ORDImageSignature ..................................................... 178-2

179  *inter*Media SQL/MM Still Image TYPE
    Documentation of SQL/MM Still Image ................................................... 179-2

180  *inter*Media ORDVideo TYPE
    Documentation of ORDVideo ................................................................. 180-2

181  Rule TYPEs
    Summary of Rule Types ............................................................................ 181-2

182  XMLTYPE
    Summary of XMLType Subprograms ......................................................... 182-2

Send Us Your Comments

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this document. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most?

If you find any errors or have any other suggestions for improvement, please indicate the document title and part number, and the chapter, section, and page number (if available). You can send comments to us in the following ways:

- Electronic mail: infodev_us@oracle.com
- FAX: (650) 506-7227 Attn: Server Technologies Documentation Manager
- Postal service:

  USA

If you would like a reply, please give your name, address, telephone number, and (optionally) electronic mail address.

If you have problems with the software, please contact your local Oracle Support Services.
This reference manual describes the Oracle PL/SQL packages shipped with the Oracle database server. This information applies to versions of the Oracle database server that run on all platforms unless otherwise specified.

This preface contains these topics:

- Audience
- Organization
- Related Documentation
- Conventions
- Documentation Accessibility
Audience

*PL/SQL Packages and Types Reference* is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Organization

See Table 1–1, "Summary of Oracle Supplied PL/SQL Packages" on page 1-8 for information about the organization of this reference.

Related Documentation

For more information, see these Oracle resources:

- *Oracle Database Application Developer’s Guide - Fundamentals*
- *PL/SQL User’s Guide and Reference*

Many books in the documentation set use the sample schemas of the seed database, which is installed by default when you install Oracle. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

http://oraclestore.oracle.com/

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

http://otn.oracle.com/admin/account/membership.html

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

http://otn.oracle.com/docs/index.htm
Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.</td>
<td>When you specify this clause, you create an index-organized table.</td>
</tr>
<tr>
<td><em>Italics</em></td>
<td>Italic typeface indicates book titles, emphasis, syntax clauses, or placeholders.</td>
<td>Oracle Database Concepts</td>
</tr>
<tr>
<td>UPPERCASE monospace</td>
<td>Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, user names, and roles.</td>
<td>You can specify this clause only for a NUMBER column.</td>
</tr>
<tr>
<td>(fixed-width font)</td>
<td></td>
<td>You can back up the database by using the BACKUP command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Query the TABLE_NAME column in the USER_ TABLES data dictionary view.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Use the DBMS_STATS.GENERATE_STATS procedure.</td>
</tr>
<tr>
<td>lowercase monospace</td>
<td>Lowercase monospace typeface indicates executables and sample user-supplied elements. Such elements include computer and database names, net service names, and connect identifiers, as well as user-supplied database objects and structures, column names, packages and classes, user names and roles, program units, and parameter values.</td>
<td>Enter sqlplus to open SQL*Plus.</td>
</tr>
<tr>
<td>(fixed-width font)</td>
<td></td>
<td>The password is specified in the orapwd file.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Back up the datafiles and control files in the /disk1/oracle/dbs directory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The department_id, department_name, and location_id columns are in the hr.departments table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The JRepUtil class implements these methods.</td>
</tr>
</tbody>
</table>
### Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```sql
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Brackets enclose one or more optional items. Do not enter the brackets.</td>
<td>DECIMAL (digits [ , precision ])</td>
</tr>
<tr>
<td>{ }</td>
<td>Braces enclose two or more items, one of which is required. Do not enter the braces.</td>
<td>(ENABLE</td>
</tr>
<tr>
<td></td>
<td>A vertical bar represents a choice of two or more options within brackets or braces. Enter one of the options. Do not enter the vertical bar.</td>
<td>(ENABLE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[COMPRESS</td>
</tr>
<tr>
<td>...</td>
<td>Horizontal ellipsis points indicate either:</td>
<td>CREATE TABLE ... AS subquery;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>SELECT col1, col2, ... , coln FROM employees;</td>
</tr>
<tr>
<td>.</td>
<td>Vertical ellipsis points indicate that we have omitted several lines of code not directly related to the example.</td>
<td>SQL&gt; SELECT NAME FROM V$DATAFILE;</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>NAME</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>------------------------------------</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>/fsl/dbs/tbs_01.dbf</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>/fsl/dbs/tbs_02.dbf</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>.</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>.</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>/fsl/dbs/tbs_09.dbf</td>
</tr>
<tr>
<td>.</td>
<td></td>
<td>9 rows selected.</td>
</tr>
<tr>
<td>Other notation</td>
<td>You must enter symbols other than brackets, braces, vertical bars, and ellipsis points as shown.</td>
<td>acctbal NUMBER(11,2);</td>
</tr>
<tr>
<td></td>
<td></td>
<td>acct CONSTANT NUMBER(4) := 3;</td>
</tr>
</tbody>
</table>
Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For additional information, visit the Oracle Accessibility Program Web site at

http://www.oracle.com/accessibility/

Accessibility of Code Examples in Documentation  JAWS, a Windows screen reader, may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, JAWS may not always read a line of text that consists solely of a bracket or brace.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
</table>
| Italics    | Italicized text indicates placeholders or variables for which you must supply particular values. | CONNECT SYSTEM/system_password  
DB_NAME = database_name |
| UPPERCASE  | Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. However, because these terms are not case sensitive, you can enter them in lowercase. | SELECT last_name, employee_id FROM employees;  
SELECT * FROM USER_TABLES;  
DROP TABLE hr.employees; |
| lowercase  | Lowercase typeface indicates programmatic elements that you supply. For example, lowercase indicates names of tables, columns, or files. | SELECT last_name, employee_id FROM employees;  
sqlplus hr/hr  
CREATE USER mjones IDENTIFIED BY ty3MJ9; |

Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.
Accessibility of Links to External Web Sites in Documentation  This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.
The following sections describe the new features in Oracle PL/SQL Packages and Types Reference:

- Oracle Database 10g Release 1 (10.1) New Features
  - New Packages
  - New Types
  - Updated Packages
  - Updated Types
- Oracle9i Release 2 (9.2) New Features
- Oracle9i Release 1 (9.0.1) New Features
- Oracle8i Release 2 (8.1.6) New Features
- Oracle8i Release 1 (8.1.5) New Features
Oracle Database 10g Release 1 (10.1) New Features

New Packages

- DBMS_ADVANCED_REWRITE
- DBMS_ADVISOR
- DBMS_CRYPTO
- DBMS_DATAPUMP
- DBMS_DATA_MINING
- DBMS_DATA_MINING_TRANSFORM
- DBMS_DIMENSION
- DBMS_FILE_TRANSFER
- DBMS_FREQUNET_ITEMSET
- DBMS_JAVA
- DBMS_MONITOR
- DBMS_SCHEDULER
- DBMS_SERVER_ALERT
- DBMS_SERVICE
- DBMS_SQLTUNE
- DBMS_STAT_FUNCS

Updated Types

- ANYDATA TYPE
- ANYDATASET TYPE
- Oracle Streams AQ TYPEs
- Logical Change Record TYPEs
- Rule TYPEs
Oracle9i Release 2 (9.2) New Features

This release includes the following new chapters:

- Advanced Queuing Types
- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_LOGSTDBY
- DBMS_MGWADM
- DBMS_MGWMG
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STORAGE_MAP
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_XDB
- DBMS_XDBT
- DBMS_XDB_VERSION
- DBMS_XMLDOM
- DBMS_XMLPARSER
- DBMS_XPLAN
- DBMS_XSLPROCESSOR
- JMS Types
- Logical Change Record Types
- Rule Types

This release includes changes to the following chapters:
- DBMS_DDL
- DBMS_FLASHBACK
- DBMS_LOB
- DBMS_LOGMNR
- DBMS_LOGMNR_CDC_PUBLISH
- DBMS_LOGMNR_CDC_SUBSCRIBE
- DBMS_LOGMNR_D
- DBMS_METADATA
- DBMS_REDEFINITION
- DBMS_RLS
- DBMS_SPACE_ADMIN
- DBMS_STATS
- DBMS_TRANSFORM
- DBMS_WM
- DBMS_XMLGEN
- DBMS_XMLQUERY
- DBMS_XMLSAVE
- DBMS_XMLSchema
- UTL_FILE
- UTL_HTTP
Oracle9i Release 1 (9.0.1) New Features

This release includes the following new packages:

- DBMS_AQELM
- DBMS_ENCODE
- DBMS_FGA
- DBMS_FLASHBACK
- DBMS_LDAP
- DBMS_LibCache
- DBMS_LOGMNR_CDC_PUBLISH
- DBMS_LOGMNR_CDC_SUBSCRIBE
- DBMS_METADATA
- DBMS_ODCI
- DBMS_OUTLN_EDIT
- DBMS_REDEFINITION
- DBMS_TRANSFORM
- DBMS_URL
- DBMS_WM
- DBMS_XMLGEN
- DBMS_XMLEnQuery
- DMBS_XMILSave
- UTL_ENCODE

This release includes new information about types:

- DBMS_TYPES
- ANYDATA_TYPE
- ANYDATASET_TYPE
- ANYTYPE_TYPE

This release includes enhancements to the following packages:
Oracle8i Release 2 (8.1.6) New Features

This release included the following new packages:

- DBMS_BACKUP_RESTORE
- DBMS_OBFUSCATION_TOOLKIT
- UTL_INADDR
- UTL_SMTP
- UTL_TCP

This release included enhancements to the following packages:

- DBMS_DEBUG
- DBMS_DISTRIBUTED_TRUST_ADMIN
- DBMS_LOGMINER
- DBMS_LOGMINER_D
- DBMS_PCLXUTIL
- DMBS_PROFILER
- DBMS_REPAIR
- DBMS_RESOURCE_MANAGER
- DBMS_ROWID
- DBMS_SQL
- DBMS.Utility
- UTL_HTTP

Oracle8i Release 1 (8.1.5) New Features

This book was new for release 8.1.5.
Introduction

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

**Note:** This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

This chapter contains the following topics:

- **Package Overview**
- **Abbreviations for Datetime and Interval Datatypes**
- **Summary of Oracle Supplied PL/SQL Packages**

**See Also:** *Oracle Database Application Developer’s Guide - Fundamentals* for information on how to create your own packages
Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Packages have many advantages over standalone procedures and functions. For example, they:

- Let you organize your application development more efficiently.
- Let you grant privileges more efficiently.
- Let you modify package objects without recompiling dependent schema objects.
- Enable Oracle to read multiple package objects into memory at once.
- Let you *overload* procedures or functions. Overloading means creating multiple procedures with the same name in the same package, each taking arguments of different number or datatype.
- Can contain global variables and cursors that are available to all procedures and functions in the package.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```sql
CREATE PACKAGE name AS  -- specification (visible part)
  -- public type and item declarations
  -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
  -- private type and item declarations
  -- subprogram bodies
[BEGIN
  -- initialization statements]
```
The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

### Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created and the `CATPROC.SQL` script is run. For example, to create the `DBMS_ALERT` package, the `DBMSALRT.SQL` and `PRVTALRT.PLB` scripts must be run when connected as the user `SYS`. These scripts are run automatically by the `CATPROC.SQL` script.

Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have `EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

### Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

   You can declare program objects in the package specification. Such objects are called `public` objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   **Note:** It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement.
2. Create the package body with the `CREATE PACKAGE BODY` statement.
   You can declare and define program objects in the package body.
   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called `private` objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

See Also:
- PL/SQL User’s Guide and Reference
- Oracle Database Application Developer’s Guide - Fundamentals
  for more information on creating new packages
- Oracle Database Concepts
  for more information on storing and executing packages

Separating the Specification and Body
The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example
The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```sql
CREATE PACKAGE employee_management AS
    FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
        mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
        deptno NUMBER) RETURN NUMBER;
    PROCEDURE fire_emp (emp_id NUMBER);
```
PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;

The body for this package defines the function and the procedures:

CREATE PACKAGE BODY employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                     mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                     deptno NUMBER) RETURN NUMBER IS

The function accepts all arguments for the fields in the employee table except for
the employee number. A value for this field is supplied by a sequence. The function
returns the sequence number generated by the call to this function.

  new_empno    NUMBER(10);

BEGIN
  SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
  INSERT INTO emp VALUES (new_empno, name, job, mgr,
                           hiredate, sal, comm, deptno);
  RETURN (new_empno);
END hire_emp;

PROCEDURE fire_emp(emp_id IN NUMBER) AS

The procedure deletes the employee with an employee number that corresponds to
the argument emp_id. If no employee is found, then an exception is raised.

BEGIN
  DELETE FROM emp WHERE empno = emp_id;
  IF SQL%NOTFOUND THEN
    raise_application_error(-20011, 'Invalid Employee
           Number: ' || TO_CHAR(emp_id));
  END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS

The procedure accepts two arguments. Emp_id is a number that corresponds to an
employee number. Sal_incr is the amount by which to increase the employee's
salary.

BEGIN

  -- If employee exists, then update salary with increase.
UPDATE emp
    SET sal = sal + sal_incr
    WHERE empno = emp_id;
IF SQL%NOTFOUND THEN
    raise_application_error(-20011, 'Invalid Employee Number: ' || TO_CHAR(emp_id));
END IF;
END sal_raise;
END employee_management;

---

**Note:** If you want to try this example, then first create the sequence number emp_sequence. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
    > START WITH 8000 INCREMENT BY 10;
```

---

**Referencing Package Contents**

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```
Abbreviations for Datetime and Interval Datatypes

Many of the datetime and interval datatypes have names that are too long to be used with the procedures and functions in the replication management API. Therefore, you must use abbreviations for these datatypes instead of the full names. The following table lists each datatype and its abbreviation. No abbreviation is necessary for the DATE and TIMESTAMP datatypes.

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>TSTZ</td>
</tr>
<tr>
<td>TIMESTAMP LOCAL TIME ZONE</td>
<td>TSLTZ</td>
</tr>
<tr>
<td>INTERVAL YEAR TO MONTH</td>
<td>IYM</td>
</tr>
<tr>
<td>INTERVAL DAY TO SECOND</td>
<td>IDS</td>
</tr>
</tbody>
</table>

For example, if you want to use the `DBMS_DEFER_QUERY.GET_datatype_ARG` function to determine the value of a `TIMESTAMP LOCAL TIME ZONE` argument in a deferred call, then you substitute `TSLTZ` for `datatype`. Therefore, you run the `DBMS_DEFER_QUERY.GET_TSLTZ_ARG` function.

Summary of Oracle Supplied PL/SQL Packages

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:
- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.
Table 1–1  Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTX_ADM</td>
<td>Lets you administer servers and the data dictionary.</td>
</tr>
<tr>
<td>CTX_CLS</td>
<td>Lets you generate CTXRULE rules for a set of documents.</td>
</tr>
<tr>
<td>CTX_DDL</td>
<td>Lets you create and manage the preferences, section lists and stopgroups required for Text indexes.</td>
</tr>
<tr>
<td>CTX_DOC</td>
<td>Lets you request document services.</td>
</tr>
<tr>
<td>CTX_OUTPUT</td>
<td>Lets you manage the index log.</td>
</tr>
<tr>
<td>CTX_QUERY</td>
<td>Lets you generate query feedback, count hits, and create stored query expressions.</td>
</tr>
<tr>
<td>CTX_REPORT</td>
<td>Lets you create various index reports.</td>
</tr>
<tr>
<td>CTX_THES</td>
<td>Lets you to manage and browse thesauri.</td>
</tr>
<tr>
<td>CTX_ULEXER</td>
<td>For use with the user-lexer.</td>
</tr>
<tr>
<td>DBMS_ADVANCED_REWRITE</td>
<td>Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite.</td>
</tr>
<tr>
<td>DBMS_ADVISOR</td>
<td>Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements.</td>
</tr>
<tr>
<td>DBMS_ALERT</td>
<td>Provides support for the asynchronous notification of database events.</td>
</tr>
<tr>
<td>DBMS_APPLICATION_INFO</td>
<td>Lets you register an application name with the database for auditing or performance tracking purposes.</td>
</tr>
<tr>
<td>DBMS_APPLY_ADM</td>
<td>Provides administrative procedures to start, stop, and configure an apply process.</td>
</tr>
<tr>
<td>DBMS_AQ</td>
<td>Lets you add a message (of a predefined object type) onto a queue or to dequeue a message.</td>
</tr>
<tr>
<td>DBMS_AQADM</td>
<td>Lets you perform administrative functions on a queue or queue table for messages of a predefined object type.</td>
</tr>
<tr>
<td>DBMS_AQELM</td>
<td>Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP.</td>
</tr>
<tr>
<td>DBMS_CAPTURE_ADM</td>
<td>Describes administrative procedures to start, stop, and configure a capture process; used in Streams.</td>
</tr>
</tbody>
</table>
### Table 1–1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_CDC_PUBLISH</td>
<td>Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application.</td>
</tr>
<tr>
<td>DBMS_CDC_SUBSCRIBE</td>
<td>Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package.</td>
</tr>
<tr>
<td>DBMS_CRYPTO</td>
<td>Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms.</td>
</tr>
<tr>
<td>DBMS_DATA_MINING</td>
<td>Lets you use data mining to discover hidden patterns and use that knowledge to make predictions.</td>
</tr>
<tr>
<td>DBMS_DATA_MINING_TRANSFORM</td>
<td>Provides set of data transformation utilities available for use with the DBMS_DATA_MINING package for preparing mining data.</td>
</tr>
<tr>
<td>DBMS_DATAPUMP</td>
<td>Lets you move all, or part of, a database between databases, including both data and metadata.</td>
</tr>
<tr>
<td>DBMS_DDL</td>
<td>Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs.</td>
</tr>
<tr>
<td>DBMS_DEBUG</td>
<td>Implements server-side debuggers and provides a way to debug server-side PL/SQL program units.</td>
</tr>
<tr>
<td>DBMS_DEFER</td>
<td>Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DEFER_QUERY</td>
<td>Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DEFER_SYS</td>
<td>Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_DESCRIBE</td>
<td>Describes the arguments of a stored procedure with full name translation and security checking.</td>
</tr>
<tr>
<td>DBMS_DIMENSION</td>
<td>Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.</td>
</tr>
</tbody>
</table>
### Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_DISTRIBUTED_TRUST_ADMIN</td>
<td>Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted.</td>
</tr>
<tr>
<td>DBMS_FGA</td>
<td>Provides fine-grained security functions.</td>
</tr>
<tr>
<td>DMBS_FILE_TRANSFER</td>
<td>Lets you copy a binary file within a database or to transfer a binary file between databases.</td>
</tr>
<tr>
<td>DMBS_FLASHBACK</td>
<td>Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).</td>
</tr>
<tr>
<td>DBMS_FREQUENT_ITEMSET</td>
<td>Enables frequent itemset counting.</td>
</tr>
<tr>
<td>DBMS_HS_PASSTHROUGH</td>
<td>Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems.</td>
</tr>
<tr>
<td>DBMS_IOT</td>
<td>Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command.</td>
</tr>
<tr>
<td>DBMS_JAVA</td>
<td>Provides a PL/SQL interface for accessing database functionality from Java.</td>
</tr>
<tr>
<td>DBMS_JOB</td>
<td>Lets you schedule administrative procedures that you want performed at periodic intervals; it is also the interface for the job queue.</td>
</tr>
<tr>
<td>DBMS_LDAP</td>
<td>Provides functions and procedures to access data from LDAP servers.</td>
</tr>
<tr>
<td>DBMS_LDAP_UTL</td>
<td>Provides the Oracle Extension utility functions for LDAP.</td>
</tr>
<tr>
<td>DBMS_LIBCACHE</td>
<td>Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution.</td>
</tr>
<tr>
<td>DBMS_LOB</td>
<td>Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only).</td>
</tr>
<tr>
<td>DBMS_LOCK</td>
<td>Lets you request, convert and release locks through Oracle Lock Management services.</td>
</tr>
<tr>
<td>DBMS_LOGMNR</td>
<td>Provides functions to initialize and run the log reader.</td>
</tr>
<tr>
<td>DBMS_LOGMNR_D</td>
<td>Queries the dictionary tables of the current database, and creates a text based file containing their contents.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_LOGSTDBY</td>
<td>Describes procedures for configuring and managing the logical standby database environment.</td>
</tr>
<tr>
<td>DBMS_METADATA</td>
<td>Lets callers easily retrieve complete database object definitions (metadata) from the dictionary.</td>
</tr>
<tr>
<td>DBMS_MGWADM</td>
<td>Describes the Messaging Gateway administrative interface; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MGWMSG</td>
<td>Describes object types—used by the canonical message types to convert message bodies—and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MONITOR</td>
<td>Let you use PL/SQL for controlling additional tracing and statistics gathering.</td>
</tr>
<tr>
<td>DBMS_MVIEW</td>
<td>Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.</td>
</tr>
<tr>
<td>DBMS_OBFUSCATION_TOOLKIT</td>
<td>Provides procedures for Data Encryption Standards.</td>
</tr>
<tr>
<td>DBMS_ODCI</td>
<td>Returns the CPU cost of a user function based on the elapsed time of the function.</td>
</tr>
<tr>
<td>DBMS_OFFLINE_OG</td>
<td>Provides public APIs for offline instantiation of master groups.</td>
</tr>
<tr>
<td>DBMS_OLAP</td>
<td>Provides procedures for summaries, dimensions, and query rewrites.</td>
</tr>
<tr>
<td>DBMS_OUTLN</td>
<td>Provides the interface for procedures and functions associated with management of stored outlines. Synonymous with OUTLN_PKG</td>
</tr>
<tr>
<td>DBMS_OUTLN_EDIT</td>
<td>Lets you edit an invoker’s rights package.</td>
</tr>
<tr>
<td>DBMS_OUTPUT</td>
<td>Accumulates information in a buffer so that it can be retrieved later.</td>
</tr>
<tr>
<td>DBMS_PCLXUTIL</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes.</td>
</tr>
<tr>
<td>DBMS_PIPE</td>
<td>Provides a DBMS pipe service which enables messages to be sent between sessions.</td>
</tr>
<tr>
<td>DBMS_PROFILER</td>
<td>Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks.</td>
</tr>
</tbody>
</table>
### Table 1–1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_PROPAGATION_ADM</td>
<td>Provides administrative procedures for configuring propagation from a source queue to a destination queue.</td>
</tr>
<tr>
<td>DBMS_RANDOM</td>
<td>Provides a built-in random number generator.</td>
</tr>
<tr>
<td>DBMS_RECTIFIER_DIFF</td>
<td>Provides APIs used to detect and resolve data inconsistencies between two replicated sites.</td>
</tr>
<tr>
<td>DBMS_REDEFINITION</td>
<td>Lets you perform an online reorganization of tables.</td>
</tr>
<tr>
<td>DBMS_REFRESH</td>
<td>Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_REPAIR</td>
<td>Provides data corruption repair procedures.</td>
</tr>
<tr>
<td>DBMS_REPCAT</td>
<td>Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_ADMIN</td>
<td>Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_INSTANTIATE</td>
<td>Instantiates deployment templates. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPCAT_RGT</td>
<td>Controls the maintenance and definition of refresh group templates. Requires the Replication Option.</td>
</tr>
<tr>
<td>DBMS_REPUTIL</td>
<td>Provides routines to generate shadow tables, triggers, and packages for table replication.</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER</td>
<td>Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema.</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER_PRIVS</td>
<td>Maintains privileges associated with resource consumer groups.</td>
</tr>
<tr>
<td>DBMS_RESUMABLE</td>
<td>Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution.</td>
</tr>
<tr>
<td>DBMS_RLS</td>
<td>Provides row level security administrative interface.</td>
</tr>
<tr>
<td>DBMS_ROWID</td>
<td>Provides procedures to create rowids and to interpret their contents.</td>
</tr>
<tr>
<td>DBMS_RULE</td>
<td>Describes the EVALUATE procedure used in Streams.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_RULE_ADM</td>
<td>Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams.</td>
</tr>
<tr>
<td>DBMS_SCHEDULER</td>
<td>Provides a collection of scheduling functions that are callable from any PL/SQL program.</td>
</tr>
<tr>
<td>DBMS_SERVER_ALERT</td>
<td>Lets you issue alerts when some threshold has been violated.</td>
</tr>
<tr>
<td>DBMS_SERVICE</td>
<td>Lets you create, delete, activate and deactivate services for a single instance.</td>
</tr>
<tr>
<td>DBMS_SESSION</td>
<td>Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures.</td>
</tr>
<tr>
<td>DBMS_SHARED_POOL</td>
<td>Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism.</td>
</tr>
<tr>
<td>DBMS_SPACE</td>
<td>Provides segment space information not available through standard SQL.</td>
</tr>
<tr>
<td>DBMS_SPACE_ADMIN</td>
<td>Provides tablespace and segment space administration not available through the standard SQL.</td>
</tr>
<tr>
<td>DBMS_SQL</td>
<td>Lets you use dynamic SQL to access the database.</td>
</tr>
<tr>
<td>DBMS_SQLTUNE</td>
<td>Provides the interface to tune SQL statements.</td>
</tr>
<tr>
<td>DBMS_STAT_FUNCS</td>
<td>Provides statistical functions.</td>
</tr>
<tr>
<td>DBMS_STATS</td>
<td>Provides a mechanism for users to view and modify optimizer statistics gathered for database objects.</td>
</tr>
<tr>
<td>DBMS_STORAGE_MAP</td>
<td>Communicates with FMON to invoke mapping operations.</td>
</tr>
<tr>
<td>DBMS_STREAMS</td>
<td>Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADMIN</td>
<td>Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level.</td>
</tr>
<tr>
<td>DBMS_STREAMS_AUTH</td>
<td>Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_STREAMS_MESSAGING</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue.</td>
</tr>
<tr>
<td>DBMS_STREAMS_TABLESPACE_ADM</td>
<td>Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another.</td>
</tr>
<tr>
<td>DBMS_TRACE</td>
<td>Provides routines to start and stop PL/SQL tracing.</td>
</tr>
<tr>
<td>DBMS_TRANSACTION</td>
<td>Provides access to SQL transaction statements from stored procedures and monitors transaction activities.</td>
</tr>
<tr>
<td>DBMS_TRANSFORM</td>
<td>Provides an interface to the message format transformation features of Oracle Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_TTS</td>
<td>Checks if the transportable set is self-contained.</td>
</tr>
<tr>
<td>DBMS_TYPES</td>
<td>Consists of constants, which represent the built-in and user-defined types.</td>
</tr>
<tr>
<td>DBMSUTILITY</td>
<td>Provides various utility routines.</td>
</tr>
<tr>
<td>DBMS_WARNING</td>
<td>Provides the interface to query, modify and delete current system or session settings.</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPOSITORY</td>
<td>Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.</td>
</tr>
<tr>
<td>DBMS_WM</td>
<td>Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions.</td>
</tr>
<tr>
<td>DBMS_XDB</td>
<td>Describes Resource Management and Access Control APIs for PL/SQL.</td>
</tr>
<tr>
<td>DBMS_XDB_VERSION</td>
<td>Describes versioning APIs</td>
</tr>
<tr>
<td>DBMS_XDBT</td>
<td>Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance</td>
</tr>
<tr>
<td>DBMS_XDBZ</td>
<td>Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).</td>
</tr>
<tr>
<td>DBMS_XMLGEN</td>
<td>Converts the results of a SQL query to a canonical XML format.</td>
</tr>
<tr>
<td>DBMS_XMLOM</td>
<td>Explains access to XMLType objects</td>
</tr>
<tr>
<td>DBMS_XMLPARSER</td>
<td>Explains access to the contents and structure of XML documents.</td>
</tr>
</tbody>
</table>
### Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DMBS_XMLQUERY</td>
<td>Provides database-to-XMLType functionality.</td>
</tr>
<tr>
<td>DBMS_XMLSAVE</td>
<td>Provides XML-to-database-type functionality.</td>
</tr>
<tr>
<td>DBMS_XMLSCHEMA</td>
<td>Explains procedures to register and delete XML schemas.</td>
</tr>
<tr>
<td>DBMS_XMLSTORE</td>
<td>Provides the ability to store XML data in relational tables.</td>
</tr>
<tr>
<td>DBMS_XPLAN</td>
<td>Describes how to format the output of the EXPLAIN PLAN command.</td>
</tr>
<tr>
<td>DBMS_XSLPROCESSOR</td>
<td>Explains access to the contents and structure of XML documents.</td>
</tr>
<tr>
<td>DEBUG_EXTPROC</td>
<td>Lets you debug external procedures on platforms with debuggers that attach to a running process.</td>
</tr>
<tr>
<td>HTF</td>
<td>Hypertext functions generate HTML tags.</td>
</tr>
<tr>
<td>HTMLDB_APPLICATION</td>
<td>Enables users to take advantage of global variables</td>
</tr>
<tr>
<td>HTMLDB_CUSTOM_AUTH</td>
<td>Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.</td>
</tr>
<tr>
<td>HTMLDB_ITEM</td>
<td>Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.</td>
</tr>
<tr>
<td>HTMLDB_UTIL</td>
<td>Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.</td>
</tr>
<tr>
<td>HTP</td>
<td>Hypertext procedures generate HTML tags.</td>
</tr>
<tr>
<td>OWA_CACHE</td>
<td>Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications.</td>
</tr>
<tr>
<td>OWA_COOKIE</td>
<td>Provides an interface for sending and retrieving HTTP cookies from the client’s browser.</td>
</tr>
<tr>
<td>OWA_CUSTOM</td>
<td>Provides a Global PLSQL Agent Authorization callback function</td>
</tr>
<tr>
<td>OWA_IMAGE</td>
<td>Provides an interface to access the coordinates where a user clicked on an image.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OWA_OPT_LOCK</td>
<td>Contains subprograms that impose optimistic locking strategies so as to prevent lost updates.</td>
</tr>
<tr>
<td>OWA_PATTERN</td>
<td>Provides an interface to locate text patterns within strings and replace the matched string with another string.</td>
</tr>
<tr>
<td>OWA_SEC</td>
<td>Provides an interface for custom authentication.</td>
</tr>
<tr>
<td>OWA_TEXT</td>
<td>Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.</td>
</tr>
<tr>
<td>OWA_UTIL</td>
<td>Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.</td>
</tr>
<tr>
<td>SDO_CS</td>
<td>Provides functions for coordinate system transformation.</td>
</tr>
<tr>
<td>SDO_GCDR</td>
<td>Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.</td>
</tr>
<tr>
<td>SDO_GEOM</td>
<td>Provides functions implementing geometric operations on spatial objects.</td>
</tr>
<tr>
<td>SDO_GEOG</td>
<td>Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata.</td>
</tr>
<tr>
<td>SDO_GEOG_UTL</td>
<td>Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.</td>
</tr>
<tr>
<td>SDO_LRS</td>
<td>Provides functions for linear referencing system support.</td>
</tr>
<tr>
<td>SDO_MIGRATE</td>
<td>Provides functions for migrating spatial data from previous releases.</td>
</tr>
<tr>
<td>SDO_NET</td>
<td>Provides functions and procedures for working with data modeled as nodes and links in a network.</td>
</tr>
<tr>
<td>SDO_SAM</td>
<td>Contains functions and procedures for spatial analysis and data mining.</td>
</tr>
<tr>
<td>SDO_TOPO</td>
<td>Provides procedures for creating and managing Spatial topologies.</td>
</tr>
</tbody>
</table>
### Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDO_TOPO_MAP</td>
<td>Contains subprograms for editing Spatial topologies using a cache (TopoMap object).</td>
</tr>
<tr>
<td>SDO_TUNE</td>
<td>Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial.</td>
</tr>
<tr>
<td>SDO_UTIL</td>
<td>Provides utility functions and procedures for Oracle Spatial.</td>
</tr>
<tr>
<td>UTL_COLL</td>
<td>Enables PL/SQL programs to use collection locators to query and update.</td>
</tr>
<tr>
<td>UTL_COMPRESS</td>
<td>Provides a set of data compression utilities.</td>
</tr>
<tr>
<td>UTL_DBWS</td>
<td>Provides database web services.</td>
</tr>
<tr>
<td>UTL_ENCODE</td>
<td>Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts.</td>
</tr>
<tr>
<td>UTL_FILE</td>
<td>Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O.</td>
</tr>
<tr>
<td>UTL_HTTP</td>
<td>Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges.</td>
</tr>
<tr>
<td>UTL_I18N</td>
<td>Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications.</td>
</tr>
<tr>
<td>UTL_INADDR</td>
<td>Provides a procedure to support internet addressing.</td>
</tr>
<tr>
<td>UTL_LMS</td>
<td>Retrieves and formats error messages in different languages.</td>
</tr>
<tr>
<td>UTL_MAIL</td>
<td>A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt.</td>
</tr>
<tr>
<td>UTL_RAW</td>
<td>Provides SQL functions for RAW datatypes that concat, substr to and from RAWs.</td>
</tr>
<tr>
<td>UTL_RECOMP</td>
<td>Recompiles invalid PL/SQL modules, Java classes, indextypes and operators in a database, either sequentially or in parallel.</td>
</tr>
<tr>
<td>UTL_REF</td>
<td>Enables a PL/SQL program to access an object by providing a reference to the object.</td>
</tr>
</tbody>
</table>
### Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>

<tbody>
<tr>
<td>UTL_SMTP</td>
<td>Provides PL/SQL functionality to send emails.</td>
</tr>
<tr>
<td>UTL_TCP</td>
<td>Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world.</td>
</tr>
<tr>
<td>UTL_URL</td>
<td>Provides escape and unescape mechanisms for URL characters.</td>
</tr>
<tr>
<td>WPG_DOCLOAD</td>
<td>Provides an interface to download files, BLOBs and BFILEs.</td>
</tr>
<tr>
<td>ANYDATA TYPE</td>
<td>A self-describing data instance type containing an instance of the type plus a description.</td>
</tr>
<tr>
<td>ANYDATASET TYPE</td>
<td>Contains a description of a given type plus a set of data instances of that type.</td>
</tr>
<tr>
<td>ANYTYPE TYPE</td>
<td>Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions</td>
</tr>
<tr>
<td>Oracle Streams AQ Types</td>
<td>Describes the types used in Advanced Queuing</td>
</tr>
<tr>
<td>Database URI Type</td>
<td>Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package</td>
</tr>
<tr>
<td>JMS TYPES</td>
<td>Describes JMS types so that a PL/SQL application can use JMS queues of JMS types.</td>
</tr>
<tr>
<td>LOGICAL CHANGE RECORD</td>
<td>Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams</td>
</tr>
<tr>
<td>JMS TYPES</td>
<td></td>
</tr>
<tr>
<td>interMedia ORDAudio Type</td>
<td>Supports the storage and management of audio data.</td>

This Oracle Text package lets you administer servers and the data dictionary. Note that you must install this package in order to use it.

- Documentation of CTX_ADM
For a complete description of this package within the context of Oracle Text, see CTX_ADM in the Oracle Text Reference.
This Oracle Text package enables generation of CTXRULE rules for a set of documents.

- Documentation of CTX_CLS
Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see CTX_CLS in the Oracle Text Reference.
This Oracle Text package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- Documentation of CTX_DDL
Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see CTX_DDL in the Oracle Text Reference.
This Oracle Text package lets you request document services. Note that you must install this package in order to use it.

- Documentation of CTX_DOC
For a complete description of this package within the context of Oracle Text, see CTX_DOC in the Oracle Text Reference.
This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- Documentation of CTX_OUTPUT
For a complete description of this package within the context of Oracle Text, see CTX_OUTPUT in the Oracle Text Reference.
This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- Documentation of CTX_QUERY
Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the Oracle Text Reference.
This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- Documentation of CTX_REPORT
For a complete description of this package within the context of Oracle Text, see CTX_REPORT in the Oracle Text Reference.
This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- Documentation of CTX_THES
For a complete description of this package within the context of Oracle Text, see CTX.THES in the Oracle Text Reference.
This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- Documentation of CTX_ULEXER
Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX_ULEXER in the Oracle Text Reference.
DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also: Oracle Data Warehousing Guide for more information about query rewrite

This chapter contains the following topics:

- Using DBMS_ADVANCED_REWRITE
- Security Model
- Summary of DBMS_ADVANCED_REWRITE Subprograms
Using DBMS_ADVANCED_REWRITE

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```sql
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.
### Summary of DBMS_ADVANCED_REWRITE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_REWRITE_EQUIVALENCE</td>
<td>Changes the mode of the rewrite equivalence declaration to the mode you specify</td>
</tr>
<tr>
<td>DROP_REWRITE_EQUIVALENCE</td>
<td>Drops the specified rewrite equivalence declaration</td>
</tr>
<tr>
<td>DECLARE_REWRITE_EQUIVALENCE</td>
<td>Creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance</td>
</tr>
<tr>
<td>VALIDATE_REWRITE_EQUIVALENCE</td>
<td>Validates the specified rewrite equivalence declaration using the same validation method as described with the validate parameter</td>
</tr>
</tbody>
</table>
ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```plsql
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (  
    name    VARCHAR2,  
    mode    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to alter. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that compiles with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.</td>
</tr>
<tr>
<td>mode</td>
<td>The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</td>
</tr>
</tbody>
</table>
DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY=trusted and stale_tolerated modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (  
     name                 VARCHAR2,  
     source_stmt          VARCHAR2,  
     destination_stmt     VARCHAR2,  
     validate             BOOLEAN    := TRUE,  
     mode                 VARCHAR2   := 'TEXT_MATCH');
```

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (  
     name                 VARCHAR2,  
     source_stmt          CLOB,  
     destination_stmt     CLOB,  
     validate             BOOLEAN   := TRUE,  
     mode                 VARCHAR2  := 'TEXT_MATCH');
```

Parameters

**Table 11-3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.</td>
</tr>
<tr>
<td>source_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.</td>
</tr>
<tr>
<td>destination_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format.</td>
</tr>
</tbody>
</table>
Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration’s source_stmt or the materialized

---

Table 11–3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validate</td>
<td>A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.</td>
</tr>
<tr>
<td>mode</td>
<td>The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</td>
</tr>
</tbody>
</table>

Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.
view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.
DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```sql
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (name VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to drop. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the VALIDATE parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 11-9.

Syntax

DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (name VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that compiles with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the source_stmt and destination_stmt of the specified equivalence declaration.</td>
</tr>
</tbody>
</table>
DBMS_ADVISOR is part of the Server Manageability suite of Advisors, a set of expert systems that identifies and helps resolve performance problems relating to the various database server components.

  - Subprograms Used in SQLAccess Advisor
  - Parameters
  - Summary of DBMS_ADVISOR Subprograms
Using DBMS_ADVISOR

- Security Model
- Subprograms Used in All Advisors
- Subprograms Used in SQLAccess Advisor
- Parameters

Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package. In addition, there is an ADVISOR privilege, which is required by DBMS_ADVISOR procedures.

Subprograms Used in All Advisors

Table 12–1 lists DBMS_ADVISOR procedures that are used in all Advisors.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANCEL_TASK Procedure on page 12-27</td>
<td>Cancels a currently executing task operation</td>
</tr>
<tr>
<td>CREATE_FILE Procedure on page 12-28</td>
<td>Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports</td>
</tr>
<tr>
<td>CREATE_OBJECT Procedure on page 12-30</td>
<td>Creates a new task object</td>
</tr>
<tr>
<td>CREATE_TASK Procedures on page 12-34</td>
<td>Creates a new Advisor task in the repository</td>

</tbody>
</table>
Parameters

The Oracle Database includes a number of advisors for different subsystems in the database to automatically determine how the operation of the corresponding subcomponents could be further optimized. The SQL Tuning and SQLAccess Advisor, for example, provide recommendations for running SQL statements faster. Memory advisors help size the various memory components without resorting to trial-and-error techniques. The Segment Advisor handles all space-related issues, such as recommending wasted-space reclamation, predicting the sizes of new tables and indexes, and analyzing growth trends, and the Undo Advisor lets you size the undo tablespace. You should see the specific documentation for each Advisor for details regarding how parameters are used.

This section includes:
- Generic Advisor Parameters
- SQLAccess Advisor Task Parameters
- SQL Workload Object Parameters
- Segment Advisor Parameters

Generic Advisor Parameters

The generic Advisor parameters are the following:
- DAYS_TO_EXPIRE
- END_SNAPSHOT
- END_TIME
- INSTANCE
- JOURNALING
- JOURNALING
- MODE
- START_SNAPSHOT
- START_TIME
- TARGET_OBJECTS
- TIME_LIMIT

See your Advisor-specific documentation for further information.
### SQLAccess Advisor Task Parameters

Table 12–3 lists SQLAccess Advisor task parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTION_LIST</td>
<td>STRINGLIST</td>
<td>Contains a fully qualified list of actions that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement’s action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. Possible values are: Single action Comma-delimited action list ADVISOR_UNUSED (default)</td>
</tr>
<tr>
<td>COMMENTED_FILTER_LIST</td>
<td>NUMBER</td>
<td>Comma-delimited list of strings. When set, SQLAccess Advisor will filter out any SQL statement that contain any of the specified strings in the first 20 characters of its text.</td>
</tr>
<tr>
<td>CREATION_COST</td>
<td>STRING</td>
<td>When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored.</td>
</tr>
<tr>
<td>DAYS_TO_EXPIRE</td>
<td>NUMBER</td>
<td>Specifies the expiration time in days for the current SQLAccess Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Possible values are: An integer in the range of 0 to 2147483647 ADVISOR_UNLIMITED ADVISOR_UNUSED The default value is 30.</td>
</tr>
</tbody>
</table>
### Table 12-3  SQLAccess Advisor Task Parameters (Cont.)

<td>STRING</td>
<td>Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views. The default value is ADVISOR_UNUSED.</td>
</tr>
<tr>
<td>DEF_MVLOG_TABLESPACE</td>
<td>STRING</td>
<td>Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED.</td>
</tr>
</tbody>
</table>
When set to `TRUE`, the SQLAccess advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, it may favor a Btree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application.

See the related parameter `refresh_mode`.

Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.

Each date must be in the standard Oracle form of MM-DD-YY HH24:MI:SS, where:

- DD is the numeric date
- MM is the numeric month
- YYYY is the numeric year
- HH is the hour in 24 hour format
- MI is the minute
- SS is the second

If set to `TRUE`, causes SQLAccess Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated.

Possible values are:

- FALSE (default) and `TRUE`

The type of recommendations that is desired. Possible values:

- FULL: All supported recommendation types will be considered.
- INDEX_ONLY: The SQLAccess Advisor will only consider index solutions as recommendations.
- MVIEW_ONLY: The SQLAccess Advisor will consider materialized view and materialized view log solutions as recommendations.
- MVIEW_LOG_ONLY: The SQLAccess Advisor will only consider materialized view log solutions as recommendations.

The default value is `FULL`.

MVIEW_LOG_ONLY: The SQLAccess Advisor will only consider materialized view log solutions as recommendations. The default value is <code>FULL</code>.</td>
</tr>
</tbody>
</table>
INDEX_NAME_TEMPLATE

Specifies the method by which new index names are formed.

If the TASK_ID is omitted from the template, names generated by two concurrently executing SQLAccess Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. Once formatted, the maximum size of a name is 30 characters.

Valid keywords are:

Any literal value up to 22 characters.

TABLE

Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit.

TASK_ID

Causes the current task identifier number to be inserted in hexadecimal form.

SEQ

Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.

The default template is:

TABLE_IDX$$_TASK_IDSEQ

JOURNALING

Controls the logging of messages to the journal (USER_ADVISOR_JOURNAL view). The higher the setting, the more information is logged to the journal.

Valid settings are:

0: no journal messages
1: informational messages only
2: warning messages
3: explanation of errors
4: explanation of fatal errors (default)
5-9: debug messages

Abbreviations and Acronyms

- ORDER_LIST: Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys.
- Buffer Gets: Sets the order using the SQL statement's buffer-get count value.
- CPU Time: Sets the order using the SQL statement's CPU time value.
- Disk Reads: Sets the order using the SQL statement's disk-read count value.
- Elapsed Time: Sets the order using the SQL statement's elapsed time value.
- Executions: Sets the order using the SQL statement's execution frequency value.
- Optimizer Cost: Sets the order using the SQL statement's optimizer cost value.
- I/O: Sets the order using the SQL statement's I/O count value.
- Priority: Sets the order using the user-supplied business priority value.
- All values are accessed in descending order, where a high value is considered more interesting than a low value.
- The default value is PRIORITY, OPTIMIZER_COST.
- Refresh Mode: Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE.
- Possible values are:
  - ON_DEMAND (default) and ON_COMMIT
  - ON_DEMAND
  - ON_COMMIT
- Date Format: This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI.
Table 12–3 SQLAccess Advisor Task Parameters(Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL_LIMIT</td>
<td>NUMBER</td>
<td>Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQLAccess Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. Possible values: An integer in the range of 1 to 2147483647 ADVISOR_UNLIMITED ADVISOR_UNUSED (default)</td>
</tr>
<tr>
<td>START_TIME</td>
<td>STRING</td>
<td>Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: DD is the numeric date MM is the numeric month YYYY is the numeric year HH is the hour in 24 hour format MI is the minute SS is the second</td>
</tr>
<tr>
<td>STORAGE_CHANGE</td>
<td>NUMBER</td>
<td>Contains the amount of space adjustment that can be consumed by SQLAccess Advisor recommendations. Zero or negative values are only permitted if the workload type is marked as FULL. When the SQLAccess Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQLAccess Advisor to remove existing structures in order to shrink space demand. Possible values: Any valid integer including negative values, zero and positive values. The default value is ADVISOR_UNLIMITED.</td>
</tr>
</tbody>
</table>
Using DBMS_ADVISOR

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USERNAME_ LIST</td>
<td>STRINGLIST</td>
<td>Contains a fully qualified list of usernames that are eligible for processing in a workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement’s username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. Possible values: Single username comma-delimited username list ADVISOR_UNUSED The default value is ADVISOR_UNUSED.</td>
</tr>
<tr>
<td>VALID_TABLE_ LIST</td>
<td>TABLELIST</td>
<td>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user’s scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. Valid syntax for a table reference is: <code>schema.table</code> <code>schema</code> <code>schema.%</code> (equivalent to <code>schema</code>) Possible values: Single table reference comma-delimited table reference list ADVISOR_UNUSED The default value is ADVISOR_UNUSED.</td>
</tr>
<tr>
<td>WORKLOAD_ SCOPE</td>
<td>STRING</td>
<td>Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.</td>

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
</table>
| ACTION_LIST        | STRINGLIST  | Contains a fully qualified list of actions that are eligible for saving in a workload.  
An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.  
During a workload import operation, if a SQL statements action does not match a name in the action list, it will not be stored in the workload object.  
An action name is case sensitive.  
Possible values:  
Single action  
comma-delimited action list  
ADVISOR_UNUSED  
The default value is ADVISOR_UNUSED. |
| COMMENTED_FILTER_LIST | NUMBER     | Comma-delimited list of strings. When set, SQLAccess Advisor will filter out any SQL statement that contain any of the specified strings in the first 20 characters of its text. |
| DAYS_TO_EXPIRE    | NUMBER      | Specifies the expiration time in days for the current SQL Workload object.  
The value is relative to the last modification date.  
Once the data expires, it will become a candidate for removal by an automatic purge operation.  
Possible values:  
An integer in the range of 0 to 2147483647  
ADVISOR_UNLIMITED  
ADVISOR_UNUSED  
The default value is 30. |

### Table 12-4  SQL Workload Object Parameters (Cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
</table>
| JOURNALING   | NUMBER     | Controls the logging of messages to the journal (USER_ADVISOR_JOURNAL view). The higher the setting, the more information is logged to the journal.       
|              |            | Valid settings are:                                                                                                                                 |
|              |            | 0: no journal messages                                                                                                                                 |
|              |            | 1: informational messages only                                                                                                                                 |
|              |            | 2: warning messages                                                                                                                                 |
|              |            | 3: explanation of errors                                                                                                                                 |
|              |            | 4: explanation of fatal errors (default)                                                                                                                                 |
|              |            | 5-9: debug messages                                                                                                                                 |
| MODULE_LIST  | STRINGLIST | Contains a fully qualified list of application modules that are eligible for saving in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. |
|              |            | A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. |
|              |            | During a workload import operation, if a SQL statements application module does not match a name in the module list, it will not be stored in the workload object/task. |
|              |            | Possible values:                                                                                                                                 |
|              |            | Single module                                                                                                                                 |
|              |            | comma-delimited module list                                                                                                                                 |
|              |            | ADVISOR_UNUSED                                                                                                                                 |
|              |            | The default value is ADVISOR_UNUSED.                                                                                                                                 |
| ORDER_LIST   | STRING     | Contains the primary natural order in which the SQLAccess Advisor processes workload elements during the import operation. | 
|              |            | Possible values are: BUFFER_GETS, OPTIMIZER_COST, CPU_TIME, DISK_READS, ELAPSED_TIME, EXECUTIONS, and PRIORITY. |
| REPORT_DATE_FORMAT | STRING   | This parameter is not used. |

12-16  PL/SQL Packages and Types Reference
Using DBMS_ADVISOR

Table 12–4  SQL Workload Object Parameters(Cont.)

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
</table>
| SQL_LIMIT   | NUMBER     | Specifies the maximum number of SQL statements to be saved during a workload import operation. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, Access Advisor will process and save the most interesting SQL statements by ordering the statements according to the specified sort keys. Possible values: An integer in the range of 1 to 2147483647
|             |            | ADVISOR_UNLIMITED                                                                                                                           |
|             |            | ADVISOR_UNUSED                                                                                                                              |
|             |            | The default value is ADVISOR_UNLIMITED.                                                                                                       |
| START_TIME  | STRING     | Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: DD is the numeric date MM is the numeric month YYYY is the numeric year HH is the hour in 24 hour format MI is the minute SS is the second |
| USERNAME_LIST| STRINGLIST | Contains a fully qualified list of usernames that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. During a workload import operation, if a SQL statements username does not match a name in the username list, it will not be stored in the workload object. A Username is not case sensitive unless it is quoted. Possible values: Single username comma-delimited username list ADVISOR_UNUSED The default value is ADVISOR_UNUSED. |
Segment Advisor Parameters

Table 12–5 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

</tbody>
</table>
ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQLAccess Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQLAccess Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (  
  task_name              IN VARCHAR2,
  workload_name          IN VARCHAR2);
```

Parameters

Table 12–7  ADD_SQLWKLD_REF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQLAccess task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE  
  task_id NUMBER;  
  task_name VARCHAR2(30);  
  workload_name VARCHAR2(30);  
BEGIN  
  task_name := 'My Task';  
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
END;  
/  
```
ADD_SQLWKLD_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

Syntax

```sql
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (  
  workload_name  IN VARCHAR2,  
  module         IN VARCHAR2,  
  action         IN VARCHAR2,  
  cpu_time       IN NUMBER := 0,  
  elapsed_time   IN NUMBER := 0,  
  disk_reads     IN NUMBER := 0,  
  buffer_gets    IN NUMBER := 0,  
  rows_processed IN NUMBER := 0,  
  optimizer_cost IN NUMBER := 0,  
  executions     IN NUMBER := 1,  
  priority       IN NUMBER := 2,  
  last_execution_date IN DATE := 'SYSDATE',  
  stat_period    IN NUMBER := 0,  
  username       IN VARCHAR2,  
  sql_text       IN CLOB);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>module</td>
<td>An optional business application module that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>action</td>
<td>An optional application action that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>cpu_time</td>
<td>The total CPU time in seconds that is consumed by SQL statement over the population time window.</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>The total elapsed time in seconds that is consumed by SQL statement over the population time window.</td>
</tr>
<tr>
<td>disk_reads</td>
<td>The total disk-read operations that are consumed by SQL statement over the population time window.</td>
</tr>
</tbody>
</table>
Summary of DBMS_ADVISOR Subprograms

**Usage Notes**

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-63 for directions on setting a task to its initial state.

**Examples**

```sql
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
```

---

**Table 12-8 ADD_SQLWKLD_STATEMENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer_gets</td>
<td>The total buffer-get operations that are consumed by SQL statement over the population time window.</td>
</tr>
<tr>
<td>rows_processed</td>
<td>The average number of rows processed by the statement over the population time window.</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>The optimizer's calculated cost value.</td>
</tr>
<tr>
<td>executions</td>
<td>The total execution count by the SQL statement over the population time window.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>last_execution_date</td>
<td>The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.</td>
</tr>
<tr>
<td>stat_period</td>
<td>Time interval in seconds from which statement statistics were calculated.</td>
</tr>
<tr>
<td>username</td>
<td>The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.</td>
</tr>
<tr>
<td>sql_text</td>
<td>The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.</td>
</tr>
</tbody>
</table>
ADD_SQLWKLD_STATEMENT Procedure

DECLARE
  v_avg NUMBER;
  v_desc TEXT;
BEGIN
  v_desc := 'SH';
  v_avg := 0;
  FOR v_row IN (SELECT avg(amount_sold)
                 FROM sh.sales)
  LOOP
    v_avg := v_avg + v_row; END LOOP;

  SELECT v_avg INTO v_avg;
END;
CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQLAccess Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```sql
DBMS_ADVISOR.CANCEL_TASK (
    task_name      IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Usage Notes

A cancel command effective restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed. Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/```
CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```sql
DBMS_ADVISOR.CREATE_FILE (
    buffer       IN  CLOB,
    location     IN  VARCHAR2,
    filename     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>A CLOB buffer containing report or script information.</td>
</tr>
<tr>
<td>location</td>
<td>Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.</td>
</tr>
<tr>
<td>filename</td>
<td>Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form <code>filename.filetype</code>.</td>
</tr>
</tbody>
</table>

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```sql
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
```
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
    100,400,5041,103,640445,680000,2,
    1,SYSDATE,1,'SH','SELECT avg(amount_sold)
    FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
    'MY_DIR','script.sql');

END;
/
CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```sql
DBMS_ADVISOR.CREATE_TASK (  
    task_name         IN VARCHAR2,
    object_type       IN VARCHAR2,
    attr1             IN VARCHAR2 :=  NULL,
    attr2             IN VARCHAR2 :=  NULL,
    attr3             IN VARCHAR2 :=  NULL,
    attr4             IN CLOB := NULL,
    attr5             IN VARCHAR2 := NULL,
    object_id         OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_type</td>
<td>Specifies the external object type.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator’s Guide for details regarding these parameters and object types.

Return Values

Returns the new object identifier.
Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator's Guide for further information regarding the Segment Advisor.

Examples

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);

END;
/
CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQLAccess Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```sql
DBMS_ADVISOR.CREATE_SQLWKLD (  
  workload_name            IN VARCHAR2,  
  description              IN VARCHAR2 := NULL,  
  template                 IN VARCHAR2 := NULL,  
  is_template              IN VARCHAR2 := 'FALSE');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>Specifies an optional workload description. Descriptions can be up to 256 characters.</td>
</tr>
<tr>
<td>template</td>
<td>An optional SQL Workload name of an existing workload data object or data object template.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.</td>
</tr>
</tbody>
</table>

Return Values

The SQLAccess Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.
Once a SQL Workload object is present, it can then be referenced by one or more SQLAccess Advisor tasks using the `ADD_SQLWKLD_REF` procedure.

**Examples**

```sql
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/```
CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```plsql
DBMS_ADVISOR.CREATE_TASK (
    advisor_name           IN VARCHAR2 NOT NULL,
    task_name              IN VARCHAR2,
    task_desc              IN VARCHAR2 := NULL,
    task_or_template       IN VARCHAR2 := NULL,
    is_template            IN VARCHAR2 := 'FALSE');

DBMS_ADVISOR.CREATE_TASK (
    advisor_name            IN VARCHAR2 NOT NULL,
    task_id                 OUT NUMBER,
    task_name               IN OUT VARCHAR2,
    task_desc               IN VARCHAR2 := NULL,
    task_or_template        IN VARCHAR2 := NULL,
    is_template             IN VARCHAR2 := 'FALSE');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR.DEFINITIONS.</td>
</tr>
<tr>
<td>task_id</td>
<td>A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.</td>
</tr>
<tr>
<td>task_name</td>
<td>Specifies a new task name. Names must be unique among all tasks for the user. For version 2 of CREATE_TASK, the system can generate a unique name. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>task_desc</td>
<td>Specifies an optional task description. Descriptions can be up to 256 characters in length.</td>
</tr>
<tr>
<td>task_or_template</td>
<td>An optional task name of an existing task or task template. To specify built-in SQLAccess Advisor templates, use the template name as described earlier.</td>
</tr>
</tbody>
</table>
Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQLAccess Advisor, use the identifier DBMS_ADVISOR.SQLACCESS_ADVISOR as the advisor_name.

The SQLAccess Advisor provides three built-in task templates, using the following constants:

- DBMS_ADVISOR.SQLACCESS_OLTP
  Parameters are preset to favor an OLTP application environment.

- DBMS_ADVISOR.SQLACCESS_WAREHOUSE
  Parameters are preset to favor a data warehouse application environment.

- DBMS_ADVISOR.SQLACCESS_GENERAL
  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQLAccess Advisor, this is the default template.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```
DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```
DELETE_SQLWKLD_REF Procedure

This procedure removes a link between the current SQLAccess task and a SQL Workload data object.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
    task_name              IN VARCHAR2,
    workload_name          IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQLAccess task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100, 400, 5041, 103, 640445, 680000, 2,
        1, SYSDATE, 1, 'SH', 'SELECT avg(amount_sold)
        FROM sh.sales');
    DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/```
DELETE_SQLWKLD_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name        IN VARCHAR2,
    sql_id               IN VARCHAR2);
```

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
    workload_name        IN VARCHAR2,
    search               IN VARCHAR2,
    deleted              OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement.</td>
</tr>
<tr>
<td>search</td>
<td>An optional SQL predicate that allows the user to refine the workload entries that will be deleted. The <code>WHERE</code> keyword should not be included in the text.</td>
</tr>
<tr>
<td>deleted</td>
<td>Returns the number of statements deleted by the searched deleted operation.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    deleted NUMBER;
    id NUMBER;
```
BEGIN

  workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');

DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
  100, 400, 5041, 103, 640445, 680000, 2,
  1, SYSDATE, 1, 'SH', 'SELECT avg(amount_sold)
FROM sh.sales');

DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
  100, 400, 5041, 103, 640445, 680000, 2,
  1, SYSDATE, 1, 'SH', 'SELECT avg(amount_sold)
FROM sh.sales');

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, 'module =
  'MONTHLY'', deleted);

SELECT min(sql_id) INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/

DBMS_ADVISOR 12-39
DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (  
    task_name       IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```
EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task.

Syntax

```sql
DBMS_ADVISOR.EXECUTE_TASK (  
    task_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```sql
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',  
    100,400,5041,103,640445,680000,2,  
    1,SYSDATE,1,'SH','SELECT avg(amount_sold)  
FROM sh.sales');  
DBMS_ADVISOR.EXECUTE_TASK(task_name);  
END;  
/
```
This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

**Syntax**

```sql
DBMS_ADVISOR.GET_REC_ATTRIBUTES (  
    workload_name         IN VARCHAR2,  
    rec_id                IN NUMBER,  
    action_id             IN NUMBER,  
    attribute_name        IN VARCHAR2,  
    value                 OUT VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute to change.</td>
</tr>
<tr>
<td>value</td>
<td>The buffer to receive the requested attribute value.</td>
</tr>
</tbody>
</table>

**Return Values**

The requested attribute value is returned in the `VALUE` argument.

**Usage Notes**

This will name and assign ownership to new objects such as indexes and materialized views during the analysis operation. However, it will not necessarily choose appropriate names, so you can manually set the owner, name and tablespace values for new objects.
Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT avg(amount_sold)
                                         FROM sh.sales WHERE promo_id = 10');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
GET_TASK_REPORT Procedure

This procedure creates and returns an XML report for the specified task.

Syntax

```plsql
DBMS_ADVISOR.GET_TASK_REPORT (  
  task_name  IN VARCHAR2,  
  type       IN VARCHAR2 := 'TEXT',  
  level      IN VARCHAR2 := 'TYPICAL',  
  section    IN VARCHAR2 := 'ALL',  
  owner_name IN VARCHAR2 := NULL)  
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task from which the script will be created.</td>
</tr>
<tr>
<td>type</td>
<td>The possible values are: TEXT, HTML, and XML.</td>
</tr>
<tr>
<td>level</td>
<td>The possible values are BASIC, TYPICAL, and ALL.</td>
</tr>
<tr>
<td>section</td>
<td>Advisor-specific report sections.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.</td>
</tr>
</tbody>
</table>

Return Values

Returns the buffer receiving the script.
GET_TASK_SCRIPT Procedure

This procedure creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT ( 
    task_name          IN VARCHAR2, 
    type               IN VARCHAR2 := 'IMPLEMENTATION', 
    rec_id             IN NUMBER := NULL, 
    action_id          IN NUMBER := NULL) 
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of script to generate. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>IMPLEMENTATION and UNDO</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation identifier number that can be used to extract a</td>
</tr>
<tr>
<td></td>
<td>subset of the implementation script.</td>
</tr>
<tr>
<td></td>
<td>A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted</td>
</tr>
<tr>
<td></td>
<td>recommendations would be included. The default is to include all accepted</td>
</tr>
<tr>
<td></td>
<td>recommendations for the task.</td>
</tr>
<tr>
<td>action_id</td>
<td>Optional action identifier number that can be used to extract a single</td>
</tr>
<tr>
<td></td>
<td>action as a DDL command.</td>
</tr>
<tr>
<td></td>
<td>A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the</td>
</tr>
<tr>
<td></td>
<td>recommendation would be included. The default is to include all actions for</td>
</tr>
<tr>
<td></td>
<td>a recommendation.</td>
</tr>
</tbody>
</table>

Return Values

Returns the script as a CLOB buffer.
Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    buf CLOB;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT avg(amount_sold)
                                         FROM sh.sales');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/```
IMPORT_SQLWKLD_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (  
    workload_name         IN VARCHAR2,  
    import_mode           IN VARCHAR2,  
    priority              NUMBER := 2,  
    saved_rows            OUT NUMBER,  
    failed_rows           OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>total_rows</td>
<td>Returns the number of rows processed.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>
Return Values

This call returns the number of rows processed and the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimension or primary/foreign key information.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved, failed);
END;/

IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
    workload_name         IN VARCHAR2,
    import_mode           IN VARCHAR2,
    priority              IN NUMBER := 2,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns number of rows processed and the number of rows saved as output parameters.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>
Return Values

This call returns the number of rows processed and the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved, failed);
END;
/
```
IMPORT_SQLWKLD_STS Procedure

This procedure loads a SQL workload from an existing SQL Tuning Set. A SQL Tuning Set is typically created from the server workload repository using various time and data filters.

Syntax

```sql
DBMS_ADVISOR.IMPORT.SqlWKLD_STS (
workload_name IN VARCHAR2,
sqlset_name IN VARCHAR2,
import_mode IN VARCHAR2,
priority IN NUMBER := 2,
saved_rows OUT NUMBER,
failed_rows OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>The name of an existing SQL Tuning Set workload from which the data will be imported.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>
IMPORT_SQLWKLD_STS Procedure

Return Values

This call returns the number of rows processed and the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
    saved, failed);
END;
/  
```

Table 12–24 IMPORT_SQLWKLD_STS Procedure Parameters(Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>
IMPORT_SQLWKLD_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist 9i Summary Advisor users in the migration to SQLAccess Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (  
    workload_name    IN VARCHAR2,  
    import_mode      IN VARCHAR2,  
    priority         IN NUMBER := 2,  
    sumadv_id        IN NUMBER,  
    saved_rows       OUT NUMBER,  
    failed_rows      OUT NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQLAccess Advisor priority. The value must be one of the following:</td>
</tr>
<tr>
<td></td>
<td>1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>sumadv_id</td>
<td>Specifies the Summary Advisor workload identifier number.</td>
</tr>
</tbody>
</table>
Return Values

This call returns the number of rows processed and the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
    sumadv_id NUMBER;
BEGIN
    workload_name := 'My Workload';
    sumadv_id := 394;
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id, saved, failed);
END;
/```
IMPORT_SQLWKLD_USER Procedure

This procedure collects a SQL workload from a specified user table.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
    workload_name         IN VARCHAR2,
    import_mode           IN VARCHAR2,
    owner                 IN VARCHAR2,
    table                 IN VARCHAR2,
    saved_rows            OUT NUMBER,
    failed_rows           OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>APPEND</td>
</tr>
<tr>
<td></td>
<td>Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>NEW</td>
</tr>
<tr>
<td></td>
<td>Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>REPLACE</td>
</tr>
<tr>
<td></td>
<td>Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.</td>
</tr>
<tr>
<td>owner</td>
<td>Specifies the owner name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>table</td>
<td>Specifies the name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the workload object.</td>
</tr>
</tbody>
</table>
Return Values

This call returns the number of rows processed and the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
        'USER_WORKLOAD',
        saved, failed);
END;
/

failed_rows

Returns the number of rows that were not saved due to syntax or validation errors.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>
INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be interrupted.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/  
```
MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (  
    task_name IN VARCHAR2  
    id IN NUMBER,  
    action IN VARCHAR2);
```

Parameters

Table 12–28  MARK_RECOMMENDATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>id</td>
<td>The recommendation identifier number assigned by the Advisor.</td>
</tr>
<tr>
<td>action</td>
<td>The recommendation action setting. The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>ACCEPT: Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</td>
</tr>
<tr>
<td></td>
<td>IGNORE: Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</td>
</tr>
<tr>
<td></td>
<td>IMPLEMENTED: Marks the recommendation as implemented. With this setting, a user can manage which recommendations have been successfully implemented. The implementation script can also set this value.</td>
</tr>
<tr>
<td></td>
<td>REJECT: Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</td>
</tr>
</tbody>
</table>

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30); 
```
attribute VARCHAR2(100);
rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
    100, 400, 5041, 103, 640445, 680000, 2,
    1, SYSDATE, 'SH', 'SELECT avg(amount_sold)
    FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;

  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```sql
DBMS_ADVISOR.QUICK_TUNE (  
  advisor_name           IN VARCHAR2,  
  task_name              IN VARCHAR2,  
  attr1                  IN CLOB,  
  attr2                  IN VARCHAR2 := NULL,  
  attr3                  IN NUMBER := NULL,  
  task_or_template       IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Name of the Advisor that will perform the analysis.</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific attribute in the form of a CLOB variable.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific attribute in the form of a VARCHAR2 variable.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific attribute in the form of a NUMBER.</td>
</tr>
<tr>
<td>task_or_template</td>
<td>An optional task name of an existing task or task template.</td>
</tr>
</tbody>
</table>

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQLAccess task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.
attr1 must be the single SQL statement to tune.

Examples

DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
        'SELECT avg(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/

RESET_SQLWKLD Procedure

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```sql
DBMS_ADVISOR.RESET_SQLWKLD (    workload_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```sql
DECLARE    workload_name VARCHAR2(30); BEGIN    workload_name := 'My Workload';    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP', 100,400,5041,103,640445,680000,2, 1,SYSDATE,1,'SH','SELECT avg(amount_sold) FROM sh.sales WHERE promo_id = 10');    DBMS_ADVISOR.RESET_SQLWKLD(workload_name); END; /
```

12-62 PL/SQL Packages and Types Reference
RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to INITIAL.

Syntax

```
DBMS_ADVISOR.RESET_TASK ( 
    task_name          IN VARCHAR2);
```

Parameters

Table 12–31  RESET_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT avg(amount_sold)
                                         FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```
SET_DEFAULT_SQLWKLD_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter            IN VARCHAR2,
  value                IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter            IN VARCHAR2,
  value                IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
```
END;
/

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

**Syntax**

```sql
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (advisor_name  IN VARCHAR2,
                                           parameter     IN VARCHAR2,
                                           value         IN VARCHAR2);
```

```sql
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (advisor_name  IN VARCHAR2,
                                           parameter     IN VARCHAR2,
                                           value         IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
                                          'VALID_TABLE_LIST', 'SH.%');
END;
/
```
SET_SQLWKLD_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```sql
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (    
  workload_name IN VARCHAR2,    
  parameter IN VARCHAR2,    
  value IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (    
  workload_name IN VARCHAR2,    
  parameter IN VARCHAR2,    
  value IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```sql
DECLARE
  workload_name VARCHAR2(30);
```
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/*
**SET_TASK_PARAMETER Procedures**

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

**Syntax**

```sql
DBMS_ADVISOR.SET_TASK_PARAMETER (task_name IN VARCHAR2, parameter IN VARCHAR2, value IN VARCHAR2);
```

```sql
DBMS_ADVISOR.SET_TASK_PARAMETER (task_name IN VARCHAR2, parameter IN VARCHAR2, value IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A task cannot be modified unless it is in its initial state. See "RESET_TASK Procedure" on page 12-63 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

**Examples**

```sql
DECLARE
    task_id NUMBER;
```
task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
                                    'SH.%,SCOTT.EMP');
END;
/
TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```sql
DBMS_ADVISOR.TUNE_MVIEW (  
    task_name IN OUT VARCHAR2,  
    mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.</td>
</tr>
<tr>
<td>mv_create_stmt</td>
<td>The original materialized view creation statement.</td>
</tr>
</tbody>
</table>

See Also: Oracle Data Warehousing Guide for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.
TUNE_MVIEW Procedure

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7 GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS '/myscript_dir';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_task'), -
```

---

### Table 12-37  USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>The materialized view owner's name</td>
</tr>
<tr>
<td>TASK_NAME</td>
<td>The task name as a key to access the set of recommendations</td>
</tr>
<tr>
<td>SCRIPT_TYPE</td>
<td>Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.</td>
</tr>
<tr>
<td>ACTION_ID</td>
<td>Action ID used as the command order number</td>
</tr>
<tr>
<td>STATEMENT</td>
<td>For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: CREATE MATERIALIZED VIEW LOG ALTER MATERIALIZED VIEW LOG FORCE [CREATE</td>
</tr>
</tbody>
</table>

---

**Examples**

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7 GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS '/myscript_dir';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_task'), -
```
The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.
UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```sql
DBMS_ADVISOR.UPDATE_OBJECT (  
    task_name       IN VARCHAR2  
    object_id       IN NUMBER,  
    attr1           IN VARCHAR2 := NULL,  
    attr2           IN VARCHAR2 := NULL,  
    attr3           IN VARCHAR2 := NULL,  
    attr4           IN CLOB := NULL,  
    attr5           IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr1, attr2, attr3, attr4, attr5</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator’s Guide for details regarding these parameters and object types.
### Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

### Examples

```sql
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
    'SELECT * FROM SH.SALES',obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
    'SELECT count(*) FROM SH.SALES');
END;
/
```
UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```sql
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
    task_name            IN VARCHAR2,
    rec_id               IN NUMBER,
    action_id            IN NUMBER,
    attribute_name       IN VARCHAR2,
    value                IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be changed. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>owner The new owner of the object.</td>
</tr>
<tr>
<td></td>
<td>name The new name of the object.</td>
</tr>
<tr>
<td></td>
<td>tablespace The new tablespace for the object.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies the new value for the recommendation attribute.</td>
</tr>
</tbody>
</table>

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
```
attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT avg(amount_sold)'
                                         FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    attribute := 'SH';

    DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```plsql
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (  
    workload_name        IN VARCHAR2,
    new_name             IN VARCHAR2 := NULL,
    description          IN VARCHAR2 := NULL,
    read_only            IN VARCHAR2 := NULL,
    is_template          IN VARCHAR2 := NULL,
    source               IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Set to TRUE so it cannot be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>TRUE if workload is to be used as a template.</td>
</tr>
<tr>
<td>source</td>
<td>Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.</td>
</tr>
</tbody>
</table>

Examples

```plsql
DECLARE  
    workload_name VARCHAR2(30);
BEGIN  
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
  100,400,5041,103,640445,680000,2,
  1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales WHERE promo_id = 10');
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/

UPDATE_SQLWKLD_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (  
    workload_name     IN VARCHAR2,  
    updated           OUT NUMBER,  
    action            IN VARCHAR2,  
    priority          IN NUMBER,  
    username          IN VARCHAR2,  
    search            IN VARCHAR2);
```

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (  
    workload_name     IN VARCHAR2,  
    sql_id            IN NUMBER,  
    module            IN VARCHAR2,  
    action            IN VARCHAR2,  
    priority          IN NUMBER,  
    username          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.</td>
</tr>
<tr>
<td>updated</td>
<td>Returns the number of statements changed by a searched update.</td>
</tr>
<tr>
<td>module</td>
<td>Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>action</td>
<td>Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
</tbody>
</table>
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-63 to set a task to its initial state.

Examples

DECLARE
    workload_name VARCHAR2(30);
    updated NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                         FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, 'module = ' 'MONTHLY''',
                                             updated, 'YEARLY', NULL, NULL, NULL);
END;
/

Table 12-41  UPDATE_SQLWKLD_STATEMENT Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| priority  | The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW
If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. |
| username  | The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT. |
| search    | An optional SQL predicate that allows the user to refine the workload entries that will be updated. The WHERE keyword should not be included in the text. |
UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```sql
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (  
task_name    IN VARCHAR2,  
new_name     IN VARCHAR2 := NULL,  
description  IN VARCHAR2 := NULL,  
read_only    IN VARCHAR2 := NULL,  
is_template  IN VARCHAR2 := NULL,  
source       IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new Advisor task name. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the task will not be renamed. A task name can be up to</td>
</tr>
<tr>
<td></td>
<td>30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new task description. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the description will not be changed. Names can be up to</td>
</tr>
<tr>
<td></td>
<td>256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Sets the task to read-only. Possible values are: TRUE and FALSE</td>
</tr>
<tr>
<td></td>
<td>If the value is NULL or contains the value ADVISOR_UNUSED, the setting</td>
</tr>
<tr>
<td></td>
<td>will not be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>Marks the task as a template. Physically, there is no difference between a</td>
</tr>
<tr>
<td></td>
<td>task and a template; however, a template cannot be executed. Possible</td>
</tr>
<tr>
<td></td>
<td>values are: TRUE and FALSE. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the setting will not be changed.</td>
</tr>
<tr>
<td>source</td>
<td>Indicates a source application name that initiated the task creation. If</td>
</tr>
<tr>
<td></td>
<td>the value is NULL or contains the value ADVISOR_UNUSED, the source will not</td>
</tr>
<tr>
<td></td>
<td>be changed.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
   task_id NUMBER;
```

12-82   PL/SQL Packages and Types Reference
task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
    DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Using DBMS_ALERT
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Exceptions
  - Restrictions
  - Examples
- Summary of DBMS_ALERT Subprograms
Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (WAITONE) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (SIGNAL) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package.

Constants

maxwait constant integer := 86400000; -- 1000 days

The maximum time to wait for an alert (this is essentially forever).
Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 13-1 shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.

- A waiting application is blocked in the database and cannot do any other work.

- An application can register for multiple events and can then wait for any of them to occur using the WAITANY procedure.

- An application can also supply an optional timeout parameter to the WAITONE or WAITANY procedures. A timeout of 0 returns immediately if there is no pending alert.

- The signalling session can optionally pass a message that is received by the waiting session.

- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).

- If the application does not require transaction-based alerts, the DBMS_PIPE package may provide a useful alternative.

See Also: Chapter 63, "DBMS_PIPE"

- If the transaction is rolled back after the call to SIGNAL, no alert occurs.
It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the prior alert, but before the data was read for that prior alert.

Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:

- Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
- `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

### Table 13–1  DBMS_ALERT Error Messages

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10001 lock request error, status: N</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10015 error: N waiting for pipe status</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10016 error: N sending on pipe 'X'</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10017 error: N receiving on pipe 'X'</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10019 error: N on lock request</td>
<td>WAIT</td>
</tr>
<tr>
<td>ORU-10020 error: N on lock request</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10021 lock request error; status: N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10022 lock request error, status: N</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10023 lock request error; status N</td>
<td>WAITONE</td>
</tr>
<tr>
<td>ORU-10024 there are no alerts registered</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10025 lock request error; status N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10037 attempting to wait on uncommitted signal from same session</td>
<td>WAITONE</td>
</tr>
</tbody>
</table>
Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```sql
DBMS_ALERT.REGISTER('emp_table_alert');
<<readagain>>:
  /* ... read the emp table and graph it */
  DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
  if status = 0 then goto <<readagain>>; else /* ... error condition */

The EMP table would have a trigger similar to this:

```sql
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
BEGIN
  DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
END;
```

When the application is no longer interested in the alert, it makes this request:

```sql
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.
## Summary of DBMS_ALERT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGISTER Procedure on page 13-7</td>
<td>Receives messages from an alert</td>
</tr>
<tr>
<td>REMOVE Procedure on page 13-8</td>
<td>Disables notification from an alert</td>
</tr>
<tr>
<td>REMOVEALL Procedure on page 13-9</td>
<td>Removes all alerts for this session from the registration list</td>
</tr>
<tr>
<td>SET_DEFAULTS Procedure on page 13-10</td>
<td>Sets the polling interval</td>
</tr>
<tr>
<td>SIGNAL Procedure on page 13-11</td>
<td>Signals an alert (send message to registered sessions)</td>
</tr>
<tr>
<td>WAITANY Procedure on page 13-12</td>
<td>Waits ( \text{timeout} ) seconds to receive alert message from an alert registered for session</td>
</tr>
<tr>
<td>WAITONE Procedure on page 13-13</td>
<td>Waits ( \text{timeout} ) seconds to receive message from named alert</td>
</tr>
</tbody>
</table>
REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```sql
DBMS_ALERT.REGISTER (  
    name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert in which this session is interested.</td>
</tr>
</tbody>
</table>

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.
REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

DBMS_ALERT.REMOVE (  
    name  IN  VARCHAR2);  

Parameters

Table 13–4 REMOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert (case-insensitive) to be removed from registration list.</td>
</tr>
</tbody>
</table>

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.
REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

DBMS_ALERT.REMOVEALL;
SET_DEFAULTS Procedure

In case a polling loop is required, use the `SET_DEFAULTS` procedure to set the polling interval.

Syntax

```sql
DBMS_ALERT.SET_DEFAULTS ( sensitivity  IN  NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitivity</td>
<td>Polling interval, in seconds, to sleep between polls. The default interval is five seconds.</td>
</tr>
</tbody>
</table>
**SIGNAL Procedure**

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

**Syntax**

```sql
DBMS_ALERT.SIGNAL {
    name    IN  VARCHAR2,
    message IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to signal.</td>
</tr>
<tr>
<td>message</td>
<td>Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.</td>
</tr>
</tbody>
</table>
**WAITANY Procedure**

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

**Syntax**

```sql
DBMS_ALERT.WAITANY (
    name     OUT  VARCHAR2,
    message  OUT  VARCHAR2,
    status   OUT  INTEGER,
    timeout  IN   NUMBER DEFAULT MAXWAIT);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Returns the name of the alert that occurred.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert.</td>
</tr>
<tr>
<td></td>
<td>This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
<tr>
<td>status</td>
<td>Values returned:</td>
</tr>
<tr>
<td></td>
<td>0 - alert occurred</td>
</tr>
<tr>
<td></td>
<td>1 - timeout occurred</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum time to wait for an alert.</td>
</tr>
<tr>
<td></td>
<td>If no alert occurs before timeout seconds, this returns a status of 1.</td>
</tr>
</tbody>
</table>

**Usage Notes**

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

**Exceptions**

-20000, ORU-10024: there are no alerts registered.
WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (  
    name        IN   VARCHAR2,  
    message     OUT  VARCHAR2,  
    status      OUT  INTEGER,  
    timeout     IN   NUMBER DEFAULT MAXWAIT);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to wait for.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
</tbody>
</table>
| status | Values returned:  
  0 - alert occurred  
  1 - timeout occurred |
| timeout | Maximum time to wait for an alert. If the named alert does not occurs before timeout seconds, this returns a status of 1. |
WAITONE Procedure
Application developers can use the DBMS_APPLICATION_INFO package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- **Using DBMS_APPLICATION_INFO**
  - Overview
  - Security Model
  - Operational Notes
- **Summary of DBMS_APPLICATION_INFO Subprograms**
Using DBMS_APPLICATION_INFO

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V$SESSION and V$SQLAREA views.

Security Model

**Note:** The public synonym for DBMS_APPLICATION_INFO is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The DBMSAPIN.SQL script is already run by catproc.

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the SYS version of the package.
The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA’s version of the package.
### Summary of DBMS_APPLICATION_INFO Subprograms

**Table 14–1  DBMS_APPLICATION_INFO Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
</table>
| **READ_CLIENT_INFO**
Procedure on page 14-5       | Reads the value of the `client_info` field of the current session             |
| **READ_MODULE**
Procedure on page 14-6       | Reads the values of the module and action fields of the current session       |
| **SET_ACTION**
Procedure on page 14-8       | Sets the name of the current action within the current module                 |
| **SET_CLIENT_INFO**
Procedure on page 14-10      | Sets the `client_info` field of the session                                  |
| **SET_MODULE**
Procedure on page 14-11      | Sets the name of the module that is currently running to a new module         |
| **SET_SESSION_LONGOPS**
Procedure on page 14-13       | Sets a row in the `V$SESSION_LONGOPS` table                                  |

---

14-4  PL/SQL Packages and Types Reference
**READ_CLIENT_INFO Procedure**

This procedure reads the value of the `client_info` field of the current session.

**Syntax**

```sql
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (  
    client_info OUT VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>client_info</code></td>
<td>Last client information value supplied to the <code>SET_CLIENT_INFO</code> procedure.</td>
</tr>
</tbody>
</table>
READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (  
    module_name OUT VARCHAR2,  
    action_name OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Last value that the module name was set to by calling SET_MODULE.</td>
</tr>
<tr>
<td>action_name</td>
<td>Last value that the action name was set to by calling SET_ACTION or SET_MODULE.</td>
</tr>
</tbody>
</table>

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action  
FROM v$sqlarea  
WHERE module = 'add_employee';
```

```
SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ------------- ------------------ 
INSERT INTO emp 1 add_employee insert into emp  
(ename, empno, sal, mgr, job, hiredate, comm, deptno)  
VALUES  
(name, next.emp_seq, manager, title, SYSDATE, commission, department)
```
Summary of DBMS_APPLICATION_INFO Subprograms

1 row selected.
SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
    action_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_name</td>
<td>The name of the current action within the current module. When the current</td>
</tr>
<tr>
<td></td>
<td>action terminates, call this procedure with the name of the next action if</td>
</tr>
<tr>
<td></td>
<td>there is one, or NULL if there is not. Names longer than 32 bytes are</td>
</tr>
<tr>
<td></td>
<td>truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN
    -- balance transfer transaction
    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
    WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
    WHERE acct# = :acct;

    -- balance transfer transaction
```

14-8 PL/SQL Packages and Types Reference
COMMIT;
DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

DBMS_APPLICATION_INFO.SET_CLIENT_INFO (  
   client_info IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Supplies any additional information about the client application. This information is stored in the V$SESSION view. Information exceeding 64 bytes is truncated.</td>
</tr>
</tbody>
</table>

Note: CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.
SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE {
  module_name IN VARCHAR2,
  action_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee{
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE{
    module_name => 'add_employee',
    action_name => 'insert into emp'};
  INSERT INTO emp
  (ename, empno, sal, mgr, job, hiredate, comm, deptno)
  VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
          commission, department);
```
DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
**SET_SESSION_LONGOPS Procedure**

This procedure sets a row in the `V$SESSION_LONGOPS` view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

**Syntax**

```sql
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (  
  rindex      IN OUT BINARY_INTEGER,  
  slno        IN OUT BINARY_INTEGER,  
  op_name     IN     VARCHAR2       DEFAULT NULL,  
  target      IN     BINARY_INTEGER DEFAULT 0,  
  context     IN     BINARY_INTEGER DEFAULT 0,  
 sofar       IN     NUMBER         DEFAULT 0,  
  totalwork   IN     NUMBER         DEFAULT 0,  
  target_desc IN     VARCHAR2       DEFAULT 'unknown target',  
  units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rindex</td>
<td>A token which represents the <code>V$SESSION_LONGOPS</code> row to update. Set this to <code>set_session_longops_nohint</code> to start a new row. Use the returned value from the prior call to reuse a row.</td>
</tr>
<tr>
<td>slno</td>
<td>Saves information across calls to <code>set_session_longops</code>: It is for internal use and should not be modified by the caller.</td>
</tr>
<tr>
<td>op_name</td>
<td>Specifies the name of the long running task. It appears as the OPNAME column of <code>V$SESSION_LONGOPS</code>. The maximum length is 64 bytes.</td>
</tr>
</tbody>
</table>
**Table 14-7 SET_SESSION_LONGOPS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target</td>
<td>Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v$session_longops.</td>
</tr>
<tr>
<td>context</td>
<td>Any number the client wants to store. It appears in the CONTEXT column of v$session_longops.</td>
</tr>
<tr>
<td>sofar</td>
<td>Any number the client wants to store. It appears in the SOFAR column of v$session_longops. This is typically the amount of work which has been done so far.</td>
</tr>
<tr>
<td>totalwork</td>
<td>Any number the client wants to store. It appears in the TOTALWORK column of v$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.</td>
</tr>
<tr>
<td>target_desc</td>
<td>Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v$session_longops. The maximum length is 32 bytes.</td>
</tr>
<tr>
<td>units</td>
<td>Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>

**Example**

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```plsql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
```

**Example**

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```plsql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
```

**Example**

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```plsql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
```

**Example**

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```plsql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
```

**Example**

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```plsql
DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;
BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
```
-- perform task on object target

sofar :=sofar + 1;
dbms_application_info.set_session_longops(rindex, slno, 
  "Operation X", obj, 0, sofar, totalwork, "table", "tables");
END LOOP;
END;
SET_SESSION_LONGOPS Procedure
The DBMS_APPLY_ADM package, one of a set of Streams packages, provides administrative interfaces to start, stop, and configure an apply process. This package includes subprograms for configuring apply handlers, setting enqueue destinations for events, and specifying execution directives for events. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

**See Also:** Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and apply processes

ALTER_APPLY Procedure

This procedure alters an apply process.

Syntax

```sql
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name                IN  VARCHAR2,
    rule_set_name             IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set           IN  BOOLEAN   DEFAULT false,
    message_handler           IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler    IN  BOOLEAN   DEFAULT false,
    ddl_handler               IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler        IN  BOOLEAN   DEFAULT false,
    apply_user                IN  VARCHAR2  DEFAULT NULL,
    apply_tag                 IN  RAW       DEFAULT NULL,
    remove_apply_tag          IN  BOOLEAN   DEFAULT false,
    precommit_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_precommit_handler  IN  BOOLEAN   DEFAULT false,
    negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set  IN  BOOLEAN   DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process being altered. You must specify an existing apply process name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
### Table 15–2 ALTER_APPLY Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply events. If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to false, then retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to true, then removes any existing positive rule set.</td>
</tr>
<tr>
<td>remove_rule_set</td>
<td>If true, then removes the positive rule set for the specified apply process. If you remove the positive rule set for an apply process, and the apply process does not have a negative rule set, then the apply process dequeues all events in its queue. If you remove the positive rule set for an apply process, and a negative rule set exists for the apply process, then the apply process dequeues all events in its queue that are not discarded by the negative rule set. If false, then retains the positive rule set for the specified apply process. If the rule_set_name parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Table 15–2 ALTER_APPLY Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_ddl_handler</td>
<td>If true, then removes the DDL handler for the specified apply process. If false, then retains any DDL handler for the specified apply process. If the ddl_handler parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
| apply_user      | The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the apply user is not changed. To change the apply user, the user who invokes the ALTER_APPLY procedure must be granted DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition, make sure the apply user has the following privileges:  
  * Execute privilege on the rule sets used by the apply process  
  * Execute privilege on all rule-based transformation functions used in the rule set  
  * Execute privilege on all apply handler procedures  
  * Execute privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process  
These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply process by running either the CREATE_APPLY procedure in this package or one of the following procedures in the DBMS_STREAMS_ADM package with the streams_type parameter set to apply: ADD_GLOBAL_RULES, ADD_SCHEMA_RULES, ADD_TABLE_RULES, and ADD_SUBSET_RULES. Note: If the specified user is dropped using DROP USER ... CASCADE, then the apply_user for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run. |

---

Summary of DBMS_APPL Y_ADM Subprograms
The tag is a binary value that can be used to track LCRs.

The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter.

If NULL, the default, then the apply tag for the apply process is not changed.

The following is an example of a tag with a hexadecimal value of 17:

```
HEXTORAW('17')
```

See Also: Oracle Streams Replication Administrator’s Guide for more information about tags

If true, then sets the apply tag for the specified apply process to NULL, and the apply process generates redo entries with NULL tags.

If false, then retains any apply tag for the specified apply process.

If the apply_tag parameter is non-NULL, then this parameter should be set to false.
precommit_handler

A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process.

An internal commit directive is enqueued into a queue when a capture process captures the commit directive for a transaction that contains row LCRs that were captured, and when a user or application enqueues messages into a queue and then issues a COMMIT statement. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database, but for a user-enqueued event, the commit SCN is generated by the apply process.

You must specify an existing procedure in the form [schema_name.]procedure_name. For example, to specify a procedure in the hr schema named process_commits, enter hr.process_commits. An error is returned if the specified procedure does not exist.

The user who invokes the ALTER_APPLY procedure must have EXECUTE privilege on a specified precommit handler. Also, if the schema_name is not specified, then the user who invokes the ALTER_APPLY procedure is the default.

The precommit handler procedure must conform to the following restrictions:

- Any work that commits must be an autonomous transaction.
- Any rollback must be to a named savepoint created in the procedure.

If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the events in the transaction are moved to the error queue.

remove_precommit_handler

If true, then removes the precommit handler for the specified apply process.

If false, then retains any precommit handler for the specified apply process.

If the precommit_handler parameter is non-NULL, then this parameter should be set to false.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>precommit_handler</td>
<td>A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. </tr>
<tr>
<td>remove_precommit_handler</td>
<td>If true, then removes the precommit handler for the specified apply process. If false, then retains any precommit handler for the specified apply process. If the precommit_handler parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
An apply process is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- **negative_rule_set_name**: The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard events.

  If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form `[schema_name.]rule_set_name`. For example, to specify a negative rule set in the `hr` schema named `neg_apply_rules`, enter `hr.neg_apply_rules`. If the schema is not specified, then the current user is the default.

  An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

  If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `false`, then retains any existing negative rule set. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `true`, then removes any existing negative rule set.

  If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.

- **remove_negative_rule_set**: If `true`, then removes the negative rule set for the specified apply process. If you remove the negative rule set for an apply process, and the apply process does not have a positive rule set, then the apply process dequeues all events in its queue.

  If you remove the negative rule set for an apply process, and a positive rule set exists for the apply process, then the apply process dequeues all events in its queue that are not discarded by the positive rule set.

  If `false`, then retains the negative rule set for the specified apply process.

  If the `negative_rule_set_name` parameter is non-NULL, then this parameter should be set to `false`.

Usage Notes

An apply process is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:
Summary of DBMS_APPLY_ADM Subprograms

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler
COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old value of one or more columns in a row LCR with the current value of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

See Also: Oracle Streams Replication Administrator’s Guide for more information about conflict detection and resolution in a Streams environment

Syntax

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name         IN VARCHAR2,
    { column_list       IN VARCHAR2,
    | column_table      IN DBMS_UTILITY.LNAME_ARRAY,}
    operation           IN VARCHAR2 DEFAULT 'UPDATE',
    compare             IN BOOLEAN  DEFAULT true,
    apply_database_link IN VARCHAR2 DEFAULT NULL);

Note: This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

Parameters

Table 15–3 COMPAR E_OLD_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of the columns in the table. There must be no spaces between entries. Specify * to include all nonkey columns.</td>
</tr>
</tbody>
</table>
Usage Notes

By default, an apply process uses the old column values in a row LCR to detect conflicts. You may choose not to compare old column values to avoid conflict detection for specific tables. For example, if you use a time column for conflict detection, then an apply process does not need to check old values for nonkey and non time columns.

**Note:** An apply process always compares old values for key columns when they are present in a row LCR. This procedure raises an error if a key column is specified and the compare parameter is set to false.
CREATE_APPLY Procedure

This procedure creates an apply process.

Syntax

```sql
DBMS_APPLY_ADM.CREATE_APPLY(
  queue_name  IN  VARCHAR2,
  apply_name  IN  VARCHAR2,
  rule_set_name  IN  VARCHAR2  DEFAULT NULL,
  message_handler  IN  VARCHAR2  DEFAULT NULL,
  ddl_handler  IN  VARCHAR2  DEFAULT NULL,
  apply_user  IN  VARCHAR2  DEFAULT NULL,
  apply_database_link  IN  VARCHAR2  DEFAULT NULL,
  apply_tag  IN  RAW       DEFAULT '00',
  apply_captured  IN  BOOLEAN   DEFAULT false,
  precommit_handler  IN  VARCHAR2  DEFAULT NULL,
  negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
  source_database  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue from which the apply process dequeues LCRs and user messages. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply process being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply process or messaging client.</td>
</tr>
</tbody>
</table>

Note: The apply_name setting cannot be altered after the apply process is created.
### Table 15–4  CREATE_APPLY Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply events.</td>
</tr>
<tr>
<td></td>
<td>If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL, and no negative rule set is specified, then the apply process applies either all captured events or all user-enqueued events in the queue, depending on the setting of the apply_captured parameter.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
<tr>
<td>message_handler</td>
<td>A user-defined procedure that processes non-LCR messages in the queue for the apply process. You must specify an existing procedure in one of the following forms:</td>
</tr>
<tr>
<td></td>
<td>[schema_name.]procedure_name</td>
</tr>
<tr>
<td></td>
<td>[schema_name.]package_name.procedure_name</td>
</tr>
<tr>
<td></td>
<td>If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_msgs, enter hr.apply_pkg.process_msgs. An error is returned if the specified procedure does not exist.</td>
</tr>
<tr>
<td></td>
<td>The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified message handler. Also, if the schema_name is not specified, then the user who invokes the CREATE_APPLY procedure is the default.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Usage Notes&quot; on page 15-20 for more information about a message handler procedure.</td>
</tr>
</tbody>
</table>
CREATE_APPLY Procedure

A user-defined procedure that processes DDL LCRs in the queue for the apply process. You must specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified DDL handler. Also, if the `schema_name` is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.

See "Usage Notes" on page 15-20 for more information about a DDL handler procedure.

The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.

Only a user who is granted DBA role can set an apply user. Only the SYS user can set the apply_user to SYS.

Note: If the specified user is dropped using DROP USER... CASCADE, then the apply_user setting for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.

The database at which the apply process applies messages. This parameter is used by an apply process when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply process applies messages at the local database.

Note: The apply_database_link setting cannot be altered after the apply process is created.
**Table 15–4  CREATE_APPLY Procedure Parameters (Cont.)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| apply_tag       | A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. By default, the tag for an apply process is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17:

```
HEXTORAW('17')
```

If NULL, then the apply process generates redo entries with NULL tags.  
**See Also:** Oracle Streams Replication Administrator’s Guide for more information about tags |
| apply_captured  | Either true or false. If true, then the apply process applies only the events in a queue that were captured by a Streams capture process. If false, then the apply process applies only the user-enqueued events in a queue. These events are user messages that were not captured by a Streams capture process. These messages may or may not contain a user-created LCR. To apply both captured and user-enqueued events in a queue, you must create at least two apply processes.  
**Note:** The apply_captured setting cannot be altered after the apply process is created.  
**See Also:** Oracle Streams Concepts and Administration for more information about processing captured or user-enqueued events with an apply process |
precommit_handler

A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process.

An internal commit directive is enqueued into a queue when a capture process captures the commit directive for a transaction that contains row LCRs that were captured, and when a user or application enqueues messages into a queue and then issues a COMMIT statement. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database, but for a user-enqueued event, the commit SCN is generated by the apply process.

You must specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_commits`, enter `hr.apply_pkg.process_commits`. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified precommit handler. Also, if the `schema_name` is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the events in the transaction are moved to the error queue.

The precommit handler procedure must conform to the following restrictions:

- Any work that commits must be an autonomous transaction.
- Any rollback must be to a named savepoint created in the procedure.

See "Usage Notes" on page 15-20 for more information about a precommit handler procedure.
negative_rule_set_name
The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard events.

If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default.

If you specify NULL, and no positive rule set is specified, then the apply process applies either all captured events or all user-enqueued events in the queue, depending on the setting of the apply_captured parameter.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.

source_database
The global name of the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured events, then the apply process can apply events from only one capture process at one source database.

If NULL, then the source database name of the first LCR received by the apply process is used for the source database.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.

The rules in the apply process rule sets determine which events are dequeued by the apply process. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.
**Usage Notes**

The user who invokes this procedure must be granted **DBA** role.

The **apply_user** parameter specifies the user who applies changes that satisfy the apply process rule sets and who runs user-defined apply handlers. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

In addition, make sure the apply user has the following privileges:

- The necessary privileges to perform DML and DDL changes on the apply objects
- Execute privilege on the rule sets used by the apply process
- Execute privilege on all rule-based transformation functions used in the rule set
- Execute privilege on all apply handler procedures
- Execute privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process

These privileges must be granted directly to the apply user. They cannot be granted through roles.

The following sections describe the PL/SQL procedures that are specified as message handlers, DDL handlers, and precommit handlers.

**Message Handler and DDL Handler Procedure**

The procedure specified in both the **message_handler** parameter and the **ddl_handler** parameter must have the following signature:

```plsql
PROCEDURE handler_procedure (
    parameter_name   IN  SYS.AnyData);
```

Here, **handler_procedure** stands for the name of the procedure and **parameter_name** stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a **SYS.AnyData** encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a **SYS.AnyData** encapsulation of a DDL LCR.

**See Also:** Chapter 174, "Logical Change Record TYPEs" for information about DDL LCRs
Precommit Handler Procedure
The procedure specified in the `precommit_handler` parameter must have the following signature:

```sql
PROCEDURE handler_procedure (  
    parameter_name   IN  NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.
DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply process.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
    apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are deleted.</td>
</tr>
</tbody>
</table>
DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```sql
DBMS_APPLY_ADM.DELETE_ERROR(
    local_transaction_id   IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
</tbody>
</table>
DROP_APPLY Procedure

This procedure drops an apply process.

Syntax

```sql
DBMS_APPLY_ADM.DROP_APPLY(    apply_name IN VARCHAR2,    drop_unused_rule_sets IN BOOLEAN DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process being dropped. You must specify an existing apply process name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If true, then drops any rule sets, positive and negative, used by the specified apply process if these rule sets are not used by any other Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If false, then does not drop the rule sets used by the specified apply process, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

When you use this procedure to drop an apply process, information about rules created for the apply process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the apply process. The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
■ ALL_STREAMS_SCHEMA_RULES
■ DBA_STREAMS_SCHEMA_RULES
■ ALL_STREAMS_TABLE_RULES
■ DBA_STREAMS_TABLE_RULES

See Also: Oracle Streams Concepts and Administration for more information about Streams data dictionary views
EXECUTE_ALL_ERRORS Procedure

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions for the specified apply process.
The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

Syntax

DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
    apply_name       IN  VARCHAR2  DEFAULT NULL,
    execute_as_user  IN  BOOLEAN   DEFAULT false);

Parameters

Table 15–8 EXECUTE_ALL_ERRORS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process that raised the errors while processing the transactions. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then all error transactions for all apply processes are reexecuted.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If true, then reexecutes the transactions in the security context of the current user.</td>
</tr>
<tr>
<td></td>
<td>If false, then reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction.</td>
</tr>
<tr>
<td></td>
<td>The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.</td>
</tr>
</tbody>
</table>
EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction.

Syntax

```sql
DBMS_APPLY_ADM.EXECUTE_ERROR(
    local_transaction_id    IN  VARCHAR2,
    execute_as_user         IN  BOOLEAN   DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If true, then reexecutes the transaction in the security context of the current user. If false, then reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.</td>
</tr>
</tbody>
</table>
GET_ERROR_MESSAGE Functions

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message is an event, which may be a logical change record (LCR) or a non-LCR event.

One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the event should be enqueued, if one exists, and whether or not the event should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

See Also:
- "SET_ENQUEUE_DESTINATION Procedure" on page 15-36
- "SET_EXECUTE Procedure" on page 15-38

Syntax

```sql
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number IN NUMBER,
    local_transaction_id IN VARCHAR2,
    destination_queue_name OUT VARCHAR2,
    execute OUT BOOLEAN)
RETURN SYS.AnyData;
```

Note: This function is overloaded. One version of this function contains two OUT parameters, and the other does not.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_number</td>
<td>The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.</td>
</tr>
<tr>
<td>local_transaction_id</td>
<td>Identifier of the error transaction for which to return a message</td>

SET_DML_HANDLER Procedure

This procedure sets a user procedure as a DML handler for a specified operation on a specified object. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```sql
DBMS_APPLY_ADM.SET_DML_HANDLER(
    object_name       IN  VARCHAR2,
    object_type       IN  VARCHAR2,
    operation_name    IN  VARCHAR2,
    error_handler     IN  BOOLEAN  DEFAULT false,
    user_procedure    IN  VARCHAR2,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL,
    apply_name         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as <code>[{schema_name}].object_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default. The specified object does not need to exist in the local destination database when you run this procedure.</td>
</tr>
<tr>
<td>object_type</td>
<td>The type of the source object. Currently, <code>TABLE</code> is the only possible source object type.</td>
</tr>
</tbody>
</table>
**Table 15–11  SET_DML_HANDLER Procedure Parameters (Cont.)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>- INSERT</td>
</tr>
<tr>
<td></td>
<td>- UPDATE</td>
</tr>
<tr>
<td></td>
<td>- DELETE</td>
</tr>
<tr>
<td></td>
<td>- LOB_UPDATE</td>
</tr>
</tbody>
</table>
|                  | For example, suppose you run this procedure twice for the hr.employees table. In one call, you set operation_name to UPDATE and user_procedure to employees_update. In another call, you set operation_name to INSERT and user_procedure to employees_insert. Both times, you set error_handler to false. 
|                  | In this case, the employees_update procedure is run for UPDATE operations on the hr.employees table, and the employees_insert procedure is run for INSERT operations on the hr.employees table. |
| error_handler    | If true, then the specified user procedure is run when a row LCR involving the specified operation on the specified object raises an apply process error. The user procedure may try to resolve possible error conditions, or it may simply notify administrators of the error or log the error. 
|                  | If false, then the handler being set is run for all row LCRs involving the specified operation on the specified object. |
|                  | **Note:** Currently, error handlers are not supported when applying changes to a non-Oracle database. |
| user_procedure   | A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when the apply process encounters an error. 
|                  | Specify NULL to unset a DML handler that is set for the specified operation on the specified object. |
| apply_database_link | The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. |
Usage Notes

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

If the error_handler parameter is set to true, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply process error. Such an error may result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to false, then the user procedure is a DML handler, not an error handler, and a DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a DML handler or an error handler for a particular operation on an object. It cannot set both a DML handler and an error handler for the same object and operation.

If the apply_name parameter is non-NULL, then the DML handler or error handler is set for the specified apply process. In this case, this handler is not invoked for other apply processes at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply processes at the destination database. When a handler is set for a specific apply process, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A DML handler named handler_hr is specified for an apply process named apply_hr for UPDATE operations on the hr.employees table.
- A general DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.
In this case, the apply_hr apply process uses the handler_hr DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

---

**Attention:** Do not modify LONG, LONG RAW or LOB column data in an LCR. This includes DML handlers, error handlers, and rule-based transformation functions.

---

**Note:** Currently, setting an error handler for an apply process that is applying changes to a non-Oracle database is not supported.

The SET_DML_HANDLER procedure can be used to set either a DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The following sections describe the signature of a DML handler procedure and the signature of an error handler procedure.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the package_name must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the schema_name is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the procedure_name has the following properties:

- `hr` is the schema_name.
- `apply_pkg` is the package_name.
- `employees_default` is the procedure_name.

In this case, specify the following:

`hr.apply_pkg.employees_default`

The following restrictions apply to the user procedure:
SET_DML_HANDLER Procedure

- Do not execute COMMIT or ROLLBACK statements. Doing so may endanger the consistency of the transaction that contains the LCR.

- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.

- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

See Also: Oracle Streams Replication Administrator's Guide for information about and restrictions regarding DML handlers and LOB, LONG, and LONG RAW datatypes

Signature of a DML Handler Procedure
The procedure specified in the user_procedure parameter must have the following signature:

```
PROCEDURE user_procedure ( 
    parameter_name IN SYS.AnyData);
```

Here, user_procedure stands for the name of the procedure and parameter_name stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a SYS.AnyData encapsulation of a row LCR.

See Also: Chapter 174, "Logical Change Record TYPEs" for more information about LCRs

Signature of an Error Handler Procedure
The procedure you create for error handling must have the following signature:
PROCEDURE user_procedure (  
  message IN SYS.AnyData,  
  error_stack_depth IN NUMBER,  
  error_numbers IN DBMS_UTILITY.NUMBER_ARRAY,  
  error_messages IN emsg_array);  

If you want to retry the DML operation within the error handler, then have the error  
handler procedure run the EXECUTE member procedure for the LCR. The last error  
raised is on top of the error stack. To specify the error message at the top of the error  
stack, use error_numbers(1) and error_messages(1).  

---  

**Note:**  
- Each parameter is required and must have the specified  
datatype. However, you can change the names of the  
parameters.  
- The emsg_array value must be a user-defined array that is a  
table of type VARCHAR2 with at least 76 characters.  

---  

Running an error handler results in one of the following outcomes:  
- The error handler successfully resolves the error and returns control to the  
  apply process.  
- The error handler fails to resolve the error, and the error is raised. The raised  
  error causes the transaction to be rolled back and placed in the error queue.
SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where an event that satisfies the specified rule is enqueued automatically by an apply process.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for an event. In this case, the client of the rules engine is a Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is a SYS.AnyData instance containing the queue name specified as a VARCHAR2.

Syntax

```sql
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Summary of DBMS_APPLY_ADM Subprograms

Usage Notes

If an apply handler, such as a DML handler, DDL handler, or message handler, processes an event that is also enqueued into a destination queue, then the apply handler processes the event before it is enqueued.

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply process tries to enqueue an event into it.
- Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply processes using the specified rule must have the necessary privileges to enqueue events into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply process. If the rule is in the negative rule set for an apply process, then the apply process does not enqueue the event into the destination queue.
- If the commit SCN for an event is less than or equal to the relevant instantiation SCN for the event, then the event is not enqueued into the destination queue, even if the event satisfies the apply process rule sets.

Table 15–12  SET_ENQUEUE_DESTINATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_queue_name</td>
<td>The name of the queue into which the apply process should enqueue the event. Specify the queue in the form [schema_name.]queue_name. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair already exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.</td>
</tr>
</tbody>
</table>

Usage Notes
SET_EXECUTE Procedure

This procedure specifies whether an event that satisfies the specified rule is executed by an apply process.

This procedure modifies the specified rule’s action context to specify event execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for an event. In this case, the client of the rules engine is a Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

An event execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_EXECUTE.
- The value is a SYS.AnyData instance that contains NO as a VARCHAR2. When the value is NO, then an apply process does not execute the event and does not send the event to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
    rule_name  IN  VARCHAR2,
    execute    IN  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Usage Notes

If the event is a logical change record (LCR) and the event is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the event is not executed, then it is not sent to any apply handler.

Note:

- Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply process to follow the execution directive. If the rule is in the negative rule set for an apply process, then the apply process ignores the execution directive for the rule.
SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL LCRs from a source database are ignored and which DDL LCRs are applied by an apply process.

Syntax

```sql
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the local domain is appended to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then DBS1.NET is specified automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.</td>
</tr>
</tbody>
</table>
Summary of DBMS_APPLY_ADM Subprograms

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have object_owner, base_table_owner, and base_table_name specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a command_type of CREATE USER.

If the recursive parameter is set to true, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the SET_SCHEMA_INSTANTIATION_SCN procedure to set the instantiation SCN for each schema, and it uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to false, then this procedure does not set the instantiation SCN for any schemas or tables.

Table 15-14  SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recursive</td>
<td>If true, then sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If false, then sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables. Note: If recursive is set to true, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
</tbody>
</table>

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have object_owner, base_table_owner, and base_table_name specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a command_type of CREATE USER.

If the recursive parameter is set to true, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the SET_SCHEMA_INSTANTIATION_SCN procedure to set the instantiation SCN for each schema, and it uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to false, then this procedure does not set the instantiation SCN for any schemas or tables.
SET_GLOBAL_INSTANTIATION_SCN Procedure

---

**Note:**

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the SYS or SYSTEM schemas.

---

- *Oracle Streams Replication Administrator's Guide*
**SET_KEY_COLUMNS Procedures**

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist. Unlike true primary keys, these columns may contain NULLs.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
  object_name IN VARCHAR2,
  { column_list        IN  VARCHAR2, |
    column_table       IN  DBMS_UTILITY.NAME_ARRAY, }|
  apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

**Table 15–15 SET_KEY_COLUMNS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. If the apply process is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of the columns in the table that you want to use as the substitute primary key, with no spaces between the column names. If the column_list parameter is empty or NULL, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL index-by table of type DBMS_UTILITY.NAME_ARRAY of the columns in the table that you want to use as the substitute primary key. The index for column_table must be 1-based, increasing, dense, and terminated by a NULL. If the column_table parameter is empty or NULL, then the current set of key columns is removed.</td>
</tr>
</tbody>
</table>
SET_KEY_COLUMNS Procedures

Table 15–15  SET_KEY_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

When not empty, this set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object already has primary key columns and you want to use those primary key columns as the key.

Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

Note:

- Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You should also create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.

- You should not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.

- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```sql
DBMS_APPLY_ADM.SET_PARAMETER (  
    apply_name  IN  VARCHAR2,  
    parameter IN  VARCHAR2,  
    value IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply process name. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting. See &quot;Apply Process Parameters&quot; on page 15-45 for a list of these parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set</td>
</tr>
</tbody>
</table>

Apply Process Parameters

The following table lists the parameters for the apply process.
### Table 15–17 Apply Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>commit_serialization</td>
<td>full or none</td>
<td>full</td>
<td>The order in which applied transactions are committed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If full, then the apply process commits applied transactions in the order in which they were committed at the source database.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If none, then the apply process may commit transactions in any order. Performance is best if you specify none.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Regardless of the specification, applied transactions may execute in parallel subject to data dependencies and constraint dependencies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Logical standby environments typically specify full.</td>
</tr>
<tr>
<td>disable_on_error</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the apply process is disabled on the first unresolved error, even if the error is not fatal.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the apply process continues regardless of unresolved errors.</td>
</tr>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the apply process is disabled if the apply process terminates because it reached a value specified by the time_limit parameter or</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>transaction_limit parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the apply process is restarted immediately after stopping because it reached a limit.</td>
</tr>
<tr>
<td>maximum_scn</td>
<td>A valid SCN or</td>
<td>infinite</td>
<td>The apply process is disabled before applying a transaction with a commit SCN greater than or equal to the value specified.</td>
</tr>
<tr>
<td></td>
<td>infinite</td>
<td></td>
<td>If infinite, then the apply process runs regardless of the SCN value.</td>
</tr>
</tbody>
</table>
### Table 15–17  Apply Process Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| parallelism    | A positive integer | 1       | The number of transactions that may be concurrently applied. Note:  
- When you change the value of this parameter, the apply process is stopped and restarted automatically. This may take some time depending on the size of the transactions currently being applied.  
- Setting the parallelism parameter to a number higher than the number of available parallel execution servers may disable the apply process. Make sure the PROCESSES and PARALLEL_MAX_SERVERS initialization parameters are set appropriately when you set the parallelism apply process parameter. |
| startup_seconds | 0, a positive integer, or infinite | 0       | The maximum number of seconds to wait for another instantiation of the same apply process to finish. If the other instantiation of the same apply process does not finish within this time, then the apply process does not start. If infinite, then an apply process does not start until another instantiation of the same apply process finishes. |
| time_limit     | A positive integer or infinite | infinite | The apply process stops as soon as possible after the specified number of seconds since it started. If infinite, then the apply process continues to run until it is stopped explicitly. |
### Table 15–17  Apply Process Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_level</td>
<td>0 or a positive integer</td>
<td>0</td>
<td>Set this parameter only under the guidance of Oracle Support Services.</td>
</tr>
<tr>
<td>transaction_limit</td>
<td>A positive integer or infinite</td>
<td>infinite</td>
<td>The apply process stops after applying the specified number of transactions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If infinite, then the apply process continues to run regardless of the number of transactions applied.</td>
</tr>
<tr>
<td>write_alert_log</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the apply process writes a message to the alert log on exit.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If N, then the apply process does not write a message to the alert log on exit.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The message specifies the reason why the apply process stopped.</td>
</tr>
</tbody>
</table>

### Usage Notes

When you alter a parameter value, a short amount of time may pass before the new value for the parameter takes effect.

---

**Note:**

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `infinite` for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.
SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL LCRs for a schema are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
    source_schema_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_schema_name</td>
<td>The name of the source schema. For example, hr.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the local is appended to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then DBS1.NET is specified automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.</td>
</tr>
</tbody>
</table>
SET_SCHEMA_INSTANTIATION_SCN Procedure

### Table 15–18 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recursive</td>
<td>If true, then sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If false, then sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables. <strong>Note:</strong> If recursive is set to true, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
</tbody>
</table>

### Usage Notes

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-NULL `object_owner` specified and no `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the
instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to false, then this procedure does not set the instantiation SCN for any tables.

---

**Note:** Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

- *Oracle Streams Replication Administrator’s Guide*
SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which LCRs for a table are ignored and which LCRs are applied by an apply process.

Syntax

```sql
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the local domain name is appended to the database name automatically. For example, if you specify DBS1 and the global domain is .NET, then DBS1.NET is specified automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.</td>
</tr>
</tbody>
</table>
Usage Notes

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply process at the destination database disregards the LCR. Otherwise, the apply process applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

---

**Note:** The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes an update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name          IN  VARCHAR2,
    method_name          IN  VARCHAR2,
    resolution_column    IN  VARCHAR2,
    column_list          IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The schema and name of the table, specified as <code>{schema_name}.{object_name}</code>, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
You can specify one of the built-in handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:

- **MAXIMUM**: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.
- **MINIMUM**: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.
- **OVERWRITE**: Applies the column list from the source database, overwriting the column values at the destination database.
- **DISCARD**: Retains the column list from the destination database, discarding the column list from the source database.

If **NULL**, then removes any existing update conflict handler with the same `object_name`, `resolution_column`, and `column_list`. If non-**NULL**, then replaces any existing update conflict handler with the same `object_name` and `resolution_column`.

### resolution_column

Name of the column used to uniquely identify an update conflict handler. For the **MAXIMUM** and **MINIMUM** prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the `column_list` parameter.

**NULL** is not allowed for this parameter. For the **OVERWRITE** and **DISCARD** prebuilt methods, you can any column in the column list.
### Usage Notes

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an existing update conflict handler. You can modify the prebuilt method or the column list.

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply process, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

**Note:** Currently, setting an update conflict handler for an apply process that is applying to a non-Oracle database is not supported.
Examples

The following is an example for setting an update conflict handler for the employees table in the hr schema:

```
DECLARE
    cols    DBMS_UTILITY.NAME_ARRAY;
BEGIN
    cols(1) := 'salary';
    cols(2) := 'commission_pct';
    DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
        object_name           =>  'hr.employees',
        method_name           =>  'MAXIMUM',
        resolution_column     =>  'salary',
        column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the salary or commission_pct column in the hr.employees table. If such a conflict occurs, then the salary column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the job_id column, then this conflict handler is not called.
START_APPLY Procedure

This procedure directs the apply process to start applying events.

Syntax

```sql
DBMS_APPLY_ADM.START_APPLY(
    apply_name  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply process name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>

Usage Notes

The start status is persistently recorded. Hence, if the status is START, then the apply process is started upon database instance startup. Each apply process is an Oracle background process and is prefixed by AP.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply process.

You can create the apply process using the following procedures:

- `DBMS_APPLY_ADM.CREATE_APPLY`
- `DBMS_STREAMS_ADM.ADD_GLOBAL_RULES`
- `DBMS_STREAMS_ADM.ADD_SCHEMA_RULES`
- `DBMS_STREAMS_ADM.ADD_TABLE_RULES`
- `DBMS_STREAMS_ADM.ADD_SUBSET_RULES`

See Also: Chapter 96, "DBMS_STREAMS_ADM"
STOP_APPLY Procedure

This procedure stops the apply process from applying events and rolls back any unfinished transactions being applied.

Syntax

DBMS_APPLY_ADM.STOP_APPLY(
   apply_name  IN  VARCHAR2,
   force IN  BOOLEAN   DEFAULT false);

Parameters

Table 15–22  STOP_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply process name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If true, then stops the apply process as soon as possible. If false, then stops the apply process after ensuring that there are no gaps in the set of applied transactions.</td>
</tr>
</tbody>
</table>

The behavior of the apply process depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply process parameter. See "Usage Notes" for more information.

Usage Notes

The stop status is persistently recorded. Hence, if the status is STOP, then the apply process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply process.

The following table describes apply process behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply process parameter. In all cases, the apply process rolls back any unfinished transactions when it stops.
For example, assume that the `commit_serialization` apply process parameter is set to `none` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply process has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `true`, then transaction 2 is not applied, and the apply process stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `false`, then transaction 2 is applied before the apply process stops.

A different scenario would result if the `commit_serialization` apply process parameter is set to `full`. For example, assume that the `commit_serialization` apply process parameter is set to `full` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply process has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `true`, then transactions B and C are not applied, and the apply process stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `false`, then transaction B is applied before the apply process stops, and transaction C is rolled back.

**See Also:** "SET_PARAMETER Procedure" on page 15-45 for more information about the `commit_serialization` apply process parameter
The `DBMS_AQ` package provides an interface to Oracle Streams Advanced Queuing (AQ).

**See Also:**

Using DBMS_AQ

- Constants
- Data Structures
- Operational Notes

Constants

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE. Table 16–1 lists the PL/SQL enumerated constants that require the prefix, DBMS_AQ.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>visibility</td>
<td>IMMEDIATE, ON_COMMIT</td>
</tr>
<tr>
<td>dequeue mode</td>
<td>BROWSE, LOCKED, REMOVE, REMOVE_NODATA</td>
</tr>
<tr>
<td>navigation</td>
<td>FIRST_MESSAGE, NEXT_MESSAGE, NEXT_TRANSACTION</td>
</tr>
<tr>
<td>state</td>
<td>WAITING, READY, PROCESSED, EXPIRED</td>
</tr>
<tr>
<td>sequence_deviation</td>
<td>BEFORE, TOP</td>
</tr>
<tr>
<td>wait</td>
<td>FOREVER, NO_WAIT</td>
</tr>
<tr>
<td>delay</td>
<td>NO_DELAY</td>
</tr>
<tr>
<td>expiration</td>
<td>NEVER</td>
</tr>
<tr>
<td>namespace</td>
<td>NAMESPACE_AQ, NAMESPACE_ANONYMOUS</td>
</tr>
</tbody>
</table>

Data Structures

Table 16–2  DBMS_AQ Data Structures

<table>
<thead>
<tr>
<th>Data Structures</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Name on page 16-3</td>
<td>Names database objects</td>
</tr>
</tbody>
</table>
Object Name

The object_name data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

object_name := VARCHAR2;
object_name := [schema_name.]name;

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in Oracle Database SQL Reference with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The type_name data structure defines queue types.

Syntax

type_name := VARCHAR2;
type_name := object_type | "RAW";

Attributes

Table 16–3  Type Name Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Maximum number of attributes in the object type is limited to 900.</td>
</tr>
</tbody>
</table>
The `plsqlcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

**Syntax**

If a notification message is expected for a `RAW` payload enqueue, then the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
  context  IN  RAW,
  reginfo  IN  SYS.AQ$$_REG_INFO,
  descr    IN  SYS.AQ$$_DESCRIPTOR,
  payload  IN  RAW,
  payloadl IN  NUMBER);
```

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>Specifies the context for the callback function that was passed by <code>dbms_aq.register</code>. See <code>AQ$$_REG_INFO Type</code> on page 171-10.</td>
</tr>
</tbody>
</table>
If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
    context  IN RAW,
    reginfo  IN SYS.AQ$$_REG_INFO,
    descr    IN SYS.AQ$$_DESCRIPTOR,
    payload  IN VARCHAR2,
    payloadl IN NUMBER);
```

If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.

`payload` specifies the length of `payload`. If `payload` is null, `payloadl = 0`.

### Operational Notes

- **DBMS_AQ and DBMS_AQADM Java Classes**

#### DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for DBMS_AQ and DBMS_AQADM. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have `EXECUTE` privileges on the DBMS_AQIN package to use these interfaces.
Summary of DBMS_AQ Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_AGENT Procedure</td>
<td>Creates an entry for an Oracle Streams AQ agent in the LDAP directory</td>
</tr>
<tr>
<td>DEQUEUE Procedure</td>
<td>Dequeues a message from the specified queue</td>
</tr>
<tr>
<td>DEQUEUE_ARRAY Function</td>
<td>Dequeues an array of messages from the specified queue</td>
</tr>
<tr>
<td>ENQUEUE Procedure</td>
<td>Adds a message to the specified queue</td>
</tr>
<tr>
<td>ENQUEUE_ARRAY Function</td>
<td>Adds an array of messages to the specified queue</td>
</tr>
<tr>
<td>LISTEN Procedure</td>
<td>Listen to one or more queues on behalf of a list of agents</td>
</tr>
<tr>
<td>POST Procedure</td>
<td>Posts to an anonymous subscription which allows all clients who are registered for the subscription to get notifications</td>
</tr>
<tr>
<td>REGISTER Procedure</td>
<td>Registers for message notifications</td>
</tr>
<tr>
<td>UNBIND_AGENT Procedure</td>
<td>Removes an entry for an Oracle Streams AQ agent from the LDAP directory</td>
</tr>
<tr>
<td>UNREGISTER Procedure</td>
<td>Unregisters a subscription which turns off notification</td>
</tr>
</tbody>
</table>

Note: DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.
BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```sql
DBMS_AQ.BIND_AGENT(
    agent    IN SYS.AQ$_AGENT,
    certificate  IN VARCHAR2 default NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be registered in LDAP server.</td>
</tr>
<tr>
<td>certificate</td>
<td>Location (LDAP distinguished name) of the &quot;organizationalperson&quot; entry in LDAP whose digital certificate (attribute <code>usercertificate</code>) is to be used for this agent. Example: &quot;cn=OE, cn=ACME, cn=com&quot; is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.</td>
</tr>
</tbody>
</table>

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the OrganizationalPerson entity. The distinguished name for this OrganizationalPerson must be specified when binding the agent.
DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (  
    queue_name     IN      VARCHAR2,  
    dequeue_options IN      dequeue_options_t,  
    message_properties OUT     message_properties_t,  
    payload        OUT     type_name,  
    msgid          OUT     RAW);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue.</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>See DEQUEUE_OPTIONS_T Type on page 171-14.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See &quot;MESSAGE_PROPERTIES_T Type&quot; on page 171-18.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of type_name refer to Type Name on page 16-3.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message.</td>
</tr>
</tbody>
</table>

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in dequeue_options:

- consumer_name
- msgid

Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless msgid is specified.

- correlation

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.
Deque_condition

Deque_condition is an expression based on the message properties, the message data properties and PL/SQL functions. A deque_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include priority, corrid and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: tab.user_data.orderstatus='EXPRESS'

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the msgid and correlation ID in dequeue_options.

The database-consistent read mechanism is applicable for queue operations. For example, a BROWSE call may not see a message that is enqueued after the beginning of the browsing transaction.

The default NAVIGATION parameter during dequeue is NEXT_MESSAGE. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the FIRST_MESSAGE navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.
DEQUEUE Procedure

**Note:** It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

**Using Secure Queues**

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See `DEQUEUE_OPTIONS_T Type` on page 171-14 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See `CREATE_AQ_AGENT Procedure` on page 17-18.

- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See `ENABLE_DB_ACCESS Procedure` on page 17-35.

**See Also:** *Oracle Streams Concepts and Administration* for information about secure queues.
DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (queue_name                IN   VARCHAR2,
dehueque_options           IN   dequeue_options_t,
array_size                IN   pls_integer,
message_properties_array  OUT  message_properties_array_t,
payload_array             OUT  "<COLLECTION_1>",
msgid_array               OUT  msgid_array_t)
RETURN pls_integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name from which messages are dequeued (same as single-row dequeue).</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>The set of options which will be applied to all messages in the array (same as single-row dequeue).</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to dequeue.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 171-22.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of dequeued payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, varray or nested table in its PL/SQL representation.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 171-23.</td>
</tr>
</tbody>
</table>

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible
for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 16-8 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also: DEQUEUE_OPTIONS_T Type on page 171-14

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.
ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```sql
DBMS_AQ.ENQUEUE (
    queue_name          IN      VARCHAR2,
    enqueue_options     IN      enqueue_options_t,
    message_properties  IN      message_properties_t,
    payload             IN      "type_name",
    msgid               OUT     RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type on page 171-17.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type on page 171-18.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of type_name refer to Type Name on page 16-3.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.</td>
</tr>
</tbody>
</table>

Usage Notes

The sequence_deviation parameter in enqueue_options can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the enqueue_options parameter relative_msgid. The relationship is identified by the sequence_deviation parameter.

Specifying sequence_deviation for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which
this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error ORA_24033 is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

**Using Secure Queues**

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See `MESSAGE_PROPERTIES_T Type` on page 171-18 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See `CREATE_AQ_AGENT Procedure` on page 17-18.

- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See `ENABLE_DB_ACCESS Procedure` on page 17-35.

  **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues
ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```sql
DBMS_AQ.ENQUEUE_ARRAY (
    queue_name                IN   VARCHAR2,
    enqueue_options           IN   enqueue_options_t,
    array_size                IN   pls_integer,
    message_properties_array  IN   message_properties_array_t,
    payload_array             IN   "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t)
RETURN pls_integer;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name in which messages are enqueued (same as single-row enqueue).</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type on page 171-17.</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to enqueue.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 171-22.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, VARRAY, or nested table in its PL/SQL representation.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 171-23.</td>
</tr>
</tbody>
</table>
LISTEN Procedure

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (  
    agent_list IN    aq$_agent_list_t,  
    wait       IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,  
    agent      OUT   sys.aq$_agent);  
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_list</td>
<td>List of agents to listen for.</td>
</tr>
<tr>
<td>wait</td>
<td>Time out for the listen call in seconds. By default, the call will block forever.</td>
</tr>
<tr>
<td>agent</td>
<td>Agent with a message available for consumption.</td>
</tr>
</tbody>
</table>

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.
A successful return from the listen call is only an indication that there is a message for one of the listed agents in one of the specified queues. The interested agent must still dequeue the relevant message.

**Note:** You cannot call listen on nonpersistent queues.
POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (  
    post_list   IN  SYS.AQ$_POST_INFO_LIST,  
    count       IN  NUMBER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>post_list</td>
<td>Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO Type.</td>
</tr>
<tr>
<td>count</td>
<td>Specifies the number of entries in the post_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.
**REGISTER Procedure**

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

**Syntax**

```sql
DBMS_AQ.REGISTER (
    reg_list IN SYS.AQ$_REG_INFO_LIST,
    count    IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.

If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

**See Also:** Chapter 18, "DBMS_AQELM" for more information on e-mail and HTTP notifications
UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```sql
DBMS_AQ.UNBIND_AGENT(
    agent    IN SYS.AQ$_AGENT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be removed from the LDAP server</td>
</tr>
</tbody>
</table>
UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```sql
DBMS_AQ.UNREGISTER (
    reg_list IN SYS.AQ$_REG_INFO_LIST,
    count    IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.
UNREGISTER Procedure
The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

See Also:
- Oracle Streams Advanced Queuing User's Guide and Reference
- Chapter 171, "Oracle Streams AQ TYPES" for information about the TYPES to use with DBMS_AQADM

This chapter contains the following topics:
- Using DBMS_AQADM
  - Constants
  - Queue Table Subprograms
  - Privilege Subprograms
  - Queue Subprograms
  - Subscriber Subprograms
  - Notification Subprograms
  - Propagation Subprograms
  - Oracle Streams AQ Agent Subprograms
  - Alias Subprograms
  - Using DBMS_AQADM
Using DBMS_AQADM

- Constants
- Queue Table Subprograms
- CREATE_QUEUE Procedure
- GRANT_SYSTEM_PRIVILEGE Procedure
- ADD_SUBSCRIBER Procedure
- SCHEDULE_PROPAGATION Procedure
- CREATE_AQ_AGENT Procedure
- Alias Subprograms

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>0, 1, 2...INFINITE</td>
</tr>
<tr>
<td>message_grouping</td>
<td>TRANSACTIONAL, NONE</td>
</tr>
<tr>
<td>queue_type</td>
<td>NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE</td>
</tr>
</tbody>
</table>

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

Queue Table Subprograms

- CREATE_QUEUE_TABLE Procedure
- ALTER_QUEUE_TABLE Procedure
Using DBMS_AQADM

- DROP_QUEUE_TABLE Procedure
- PURGE_QUEUE_TABLE Procedure
- MIGRATE_QUEUE_TABLE Procedure
- ENABLE_JMS_TYPES Procedure

Privilege Subprograms
- GRANT_SYSTEM_PRIVILEGE Procedure
- REVOKE_SYSTEM_PRIVILEGE Procedure
- GRANT_QUEUE_PRIVILEGE Procedure
- REVOKE_QUEUE_PRIVILEGE Procedure

Queue Subprograms
- CREATE_QUEUE Procedure
- CREATE_NP_QUEUE Procedure
- ALTER_QUEUE Procedure
- DROP_QUEUE Procedure
- START_QUEUE Procedure
- STOP_QUEUE Procedure
- QUEUE_SUBSCRIBERS Function

Subscriber Subprograms
- ADD_SUBSCRIBER Procedure
- ALTER_SUBSCRIBER Procedure
- REMOVE_SUBSCRIBER Procedure

Notification Subprograms
- GET_WATERMARK Procedure
Propagation Subprograms

- SET_WATERMARK Procedure

Propagation Subprograms

- SCHEDULE_PROPAGATION Procedure
- UNSCHEDULE_PROPAGATION Procedure
- VERIFY_QUEUE_TYPES Procedure
- ALTER_PROPAGATION_SCHEDULE Procedure
- ENABLE_PROPAGATION_SCHEDULE Procedure
- DISABLE_PROPAGATION_SCHEDULE Procedure

Oracle Streams AQ Agent Subprograms

- CREATE_AQ_AGENT Procedure
- ALTER_AQ_AGENT Procedure
- DROP_AQ_AGENT Procedure
- ENABLE_DB_ACCESS Procedure
- DISABLE_DB_ACCESS Procedure

Alias Subprograms

- ADD_ALIAS_TO_LDAP Procedure
- DEL_ALIAS_FROM_LDAP Procedure
### Summary of DBMS_AQADM Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_ALIAS_TO_LDAP Procedure</strong> on page 17-8</td>
<td>Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP</td>
</tr>
<tr>
<td><strong>ADD_SUBSCRIBER Procedure</strong> on page 17-9</td>
<td>Adds a default subscriber to a queue</td>
</tr>
<tr>
<td><strong>ALTER_AQ_AGENT Procedure</strong> on page 17-11</td>
<td>Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues</td>
</tr>
<tr>
<td><strong>ALTER_PROPAGATION_SCHEDULE Procedure</strong> on page 17-12</td>
<td>Alters parameters for a propagation schedule</td>
</tr>
<tr>
<td><strong>ALTER_QUEUE Procedure</strong> on page 17-14</td>
<td>Alters existing properties of a queue</td>
</tr>
<tr>
<td><strong>ALTER_QUEUE_TABLE Procedure</strong> on page 17-16</td>
<td>Alters the existing properties of a queue table</td>
</tr>
<tr>
<td><strong>ALTER_SUBSCRIBER Procedure</strong> on page 17-17</td>
<td>Alters existing properties of a subscriber to a specified queue</td>
</tr>
<tr>
<td><strong>CREATE_AQ_AGENT Procedure</strong> on page 17-18</td>
<td>Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues</td>
</tr>
<tr>
<td><strong>CREATE_NP_QUEUE Procedure</strong> on page 17-20</td>
<td>Creates a nonpersistence RAW queue</td>
</tr>
<tr>
<td><strong>CREATE_QUEUE Procedure</strong> on page 17-22</td>
<td>Creates a queue in the specified queue table</td>
</tr>
<tr>
<td><strong>CREATE_QUEUE_TABLE Procedure</strong> on page 17-25</td>
<td>Creates a queue table for messages of a predefined type</td>
</tr>
<tr>
<td><strong>DEL_ALIAS_FROM_LDAP Procedure</strong> on page 17-29</td>
<td>Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP</td>
</tr>
<tr>
<td><strong>DISABLE_DB_ACCESS Procedure</strong> on page 17-30</td>
<td>Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent</td>
</tr>
</tbody>
</table>
## Table 17–2  (Cont.) DBMS_AQADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_PROPAGATION_ SCHEDULE Procedure on page 17-31</td>
<td>Disables a propagation schedule</td>
</tr>
<tr>
<td>DROP_AQ_AGENT Procedure on page 17-32</td>
<td>Drops an agent that was previously registered for Oracle Streams AQ Internet access</td>
</tr>
<tr>
<td>DROP_QUEUE Procedure on page 17-33</td>
<td>Drops an existing queue</td>
</tr>
<tr>
<td>DROP_QUEUE_TABLE Procedure on page 17-34</td>
<td>Drops an existing queue table</td>
</tr>
<tr>
<td>ENABLE_DB_ACCESS Procedure on page 17-35</td>
<td>Grants an Oracle Streams AQ Internet agent the privileges of a specific database user</td>
</tr>
<tr>
<td>ENABLE_JMS_TYPES Procedure on page 17-36</td>
<td>A precondition for the enqueue of JMS types and XML types</td>
</tr>
<tr>
<td>ENABLE_PROPAGATION_ SCHEDULE Procedure on page 17-37</td>
<td>Enables a previously disabled propagation schedule</td>
</tr>
<tr>
<td>GET_WATERMARK Procedure on page 17-38</td>
<td>Retrieves the value of watermark set by the SET_WATERMARK Procedure</td>
</tr>
<tr>
<td>GRANT_QUEUE_PRIVILEGE Procedure on page 17-39</td>
<td>Grants privileges on a queue to users and roles</td>
</tr>
<tr>
<td>GRANT_SYSTEM_PRIVILEGE Procedure on page 17-40</td>
<td>Grants Oracle Streams AQ system privileges to users and roles</td>
</tr>
<tr>
<td>MIGRATE_QUEUE_TABLE Procedure on page 17-41</td>
<td>Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table</td>
</tr>
<tr>
<td>PURGE_QUEUE_TABLE Procedure on page 17-42</td>
<td>Purges messages from queue tables</td>
</tr>
<tr>
<td>QUEUE_SUBSCRIBERS Function on page 17-44</td>
<td>Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type DBMS_AQADM.AQ$subscriber_list_t</td>
</tr>
<tr>
<td>REMOVE_SUBSCRIBER Procedure on page 17-45</td>
<td>Removes a default subscriber from a queue</td>
</tr>
</tbody>
</table>
### Table 17-2  (Cont.) DBMS_AQADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REVOKE_QUEUE_PRIVILEGE Procedure on page 17-46</td>
<td>Revokes privileges on a queue from users and roles</td>
</tr>
<tr>
<td>REVOKE_SYSTEM_PRIVILEGE Procedure on page 17-47</td>
<td>Revokes Oracle Streams AQ system privileges from users and roles</td>
</tr>
<tr>
<td>SCHEDULE_PROPAGATION Procedure on page 17-48</td>
<td>Schedules propagation of messages from a queue to a destination identified by a specific database link</td>
</tr>
<tr>
<td>SET_WATERMARK Procedure on page 17-50</td>
<td>Used for Oracle Streams AQ notification to specify and limit memory use</td>
</tr>
<tr>
<td>START_QUEUE Procedure on page 17-51</td>
<td>Enables the specified queue for enqueuing or dequeuing</td>
</tr>
<tr>
<td>STOP_QUEUE Procedure on page 17-52</td>
<td>Disables enqueuing or dequeuing on the specified queue</td>
</tr>
<tr>
<td>UNSCHEDULE_PROPAGATION Procedure on page 17-53</td>
<td>Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link</td>
</tr>
<tr>
<td>VERIFY_QUEUE_TYPES Procedure on page 17-54</td>
<td>Verifies that the source and destination queues have identical types</td>
</tr>
</tbody>
</table>
ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
    alias IN VARCHAR2,
    obj_location IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Name of the alias. Example: west_shipping.</td>
</tr>
<tr>
<td>obj_location</td>
<td>The distinguished name of the object (queue, agent or connection factory) to which alias refers.</td>
</tr>
</tbody>
</table>

Usage Notes

This method can be used to create aliases for Queues, Agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.
**ADD_SUBSCRIBER Procedure**

This procedure adds a default subscriber to a queue.

**Syntax**

```sql
DBMS_AQADM.ADD_SUBSCRIBER (
    queue_name     IN    VARCHAR2,
    subscriber     IN    sys.aq$_agent,
    rule           IN    VARCHAR2 DEFAULT NULL,
    transformation IN    VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being defined.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data</td>
</tr>
<tr>
<td></td>
<td>properties and PL/SQL functions. A rule is specified as a Boolean expression</td>
</tr>
<tr>
<td></td>
<td>using syntax similar to the WHERE clause of a SQL query. This Boolean</td>
</tr>
<tr>
<td></td>
<td>expression can include conditions on message properties, user data</td>
</tr>
<tr>
<td></td>
<td>properties (object payloads only), and PL/SQL or SQL functions (as</td>
</tr>
<tr>
<td></td>
<td>specified in the where clause of a SQL query). Currently supported</td>
</tr>
<tr>
<td></td>
<td>message properties are priority and corrid. To specify rules on a message</td>
</tr>
<tr>
<td></td>
<td>payload (object payload), use attributes of the object type in clauses.</td>
</tr>
<tr>
<td></td>
<td>You must prefix each attribute with tab.user_data as a qualifier to</td>
</tr>
<tr>
<td></td>
<td>indicate the specific column of the queue table that stores the payload.</td>
</tr>
<tr>
<td></td>
<td>The rule parameter cannot exceed 4000 characters.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber</td>
</tr>
<tr>
<td></td>
<td>dequeues the message. The source type of the transformation must match the</td>
</tr>
<tr>
<td></td>
<td>type of the queue. If the subscriber is remote, then the transformation</td>
</tr>
<tr>
<td></td>
<td>is applied before propagation to the remote queue.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction
is committed. Enqueue requests that are executed after the completion of this call
will reflect the new behavior.

Any string within the rule must be quoted:

rule  => 'PRIORITY <= 3 AND CORRID = ''FROM JAPAN'''

Note that these are all single quotation marks.
ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

See Also: Oracle Streams Concepts and Administration for information about secure queues

Syntax

DBMS_AQADM.ALTER_AQ_AGENT (  
    agent_name  IN VARCHAR2,  
    certificate_location  IN VARCHAR2 DEFAULT NULL,  
    enable_http  IN BOOLEAN DEFAULT FALSE,  
    enable_smtp  IN BOOLEAN DEFAULT FALSE,  
    enable_anyp  IN BOOLEAN DEFAULT FALSE )

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>
ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```sql
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
    queue_name      IN     VARCHAR2,
    destination     IN     VARCHAR2 DEFAULT NULL,
    duration        IN     NUMBER   DEFAULT NULL,
    next_time       IN     VARCHAR2 DEFAULT NULL,
    latency         IN     NUMBER   DEFAULT 60);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
</tbody>
</table>
Summary of DBMS_AQADM Subprograms

next_time  
Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as `SYSDATE + 1 - duration/86400`.

latency  
Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value.

For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.

---

Table 17–6  (Cont.) ALTER_PROPAGATION_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| next_time | Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as `SYSDATE + 1 - duration/86400`.
| latency   | Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters max_retries, retention_time, and retry_delay are not supported for nonpersistent queues.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE (  
queue_name        IN    VARCHAR2,  
max_retries       IN    NUMBER   DEFAULT NULL,  
retry_delay       IN    NUMBER   DEFAULT NULL,  
retention_time    IN    NUMBER   DEFAULT NULL,  
auto_commit       IN    BOOLEAN  DEFAULT TRUE,  
comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be altered</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is $2^{31}-1$. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
</tbody>
</table>

Table 17–7 (Cont.) ALTER_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention_time</td>
<td>Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.</td>
</tr>
</tbody>
</table>
ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE_TABLE (
    queue_table      IN   VARCHAR2,
    comment          IN   VARCHAR2       DEFAULT NULL,
    primary_instance IN   BINARY_INTEGER DEFAULT NULL,
    secondary_instance IN  BINARY_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created.</td>
</tr>
<tr>
<td>comment</td>
<td>Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
</tbody>
</table>
### ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

#### Syntax

```sql
DBMS_AQADM.ALTER_SUBSCRIBER (
    queue_name     IN    VARCHAR2,
    subscriber     IN    sys.aq$_agent,
    rule           IN    VARCHAR2
    transformation IN    VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being altered. See &quot;AQ$_AGENT Type&quot; on page 171-3.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
</tbody>
</table>

#### Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the `schema.AQ$_queue_table_R` and `schema.AQ$_queue_table_S` views.
CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

See Also: Oracle Streams Concepts and Administration for information about secure queues

Syntax

```sql
DBMS_AQADM.CREATE_AQ_AGENT ( 
    agent_name                IN VARCHAR2,
    certificate_location      IN VARCHAR2 DEFAULT NULL,
    enable_http               IN BOOLEAN DEFAULT FALSE,
    enable_smtp               IN BOOLEAN DEFAULT FALSE,
    enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>certificate_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>
Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents.
CREATE_NP_QUEUE Procedure

This procedure creates a nonpersistent RAW queue.

Syntax

```sql
DBMS_AQADM.CREATE_NP_QUEUE (  
    queue_name              IN        VARCHAR2,  
    multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,  
    comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Reference.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
</tbody>
</table>

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (`AQ$_MEM_SC` or `AQ$_MEM_MC`) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.
You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the listen call on a nonpersistent queue.
CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```sql
DBMS_AQADM.CREATE_QUEUE (  
    queue_name    IN       VARCHAR2,  
    queue_table   IN       VARCHAR2,  
    queue_type    IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,  
    max_retries   IN       NUMBER         DEFAULT NULL,  
    retry_delay   IN       NUMBER         DEFAULT 0,  
    retention_time IN       NUMBER         DEFAULT 0,  
    dependency_tracking IN       BOOLEAN        DEFAULT FALSE,  
    comment       IN       VARCHAR2       DEFAULT NULL,  
    auto_commit   IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>queue_table</td>
<td>Name of the queue table that will contain the queue.</td>
</tr>
<tr>
<td>queue_type</td>
<td>Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.</td>
</tr>
</tbody>
</table>
Summary of DBMS_AQADM Subprograms

max_retries

Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is $2^{31} - 1$.

A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.

Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.

retry_delay

Delay time, in seconds, before this message is scheduled for processing again after an application rollback.

The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.

retention_time

Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.

dependency_tracking

Reserved for future use. FALSE is the default. TRUE is not permitted in this release.

comment

User-specified description of the queue. This user comment is added to the queue catalog.

auto_commit

TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.

Caution: This parameter has been deprecated.

### Table 17–12 (Cont.) CREATE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with the REMOVE mode can be attempted</td>
</tr>
<tr>
<td></td>
<td>on a message. The maximum value of max_retries is $2^{31} - 1$.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time, in seconds, before this message is scheduled for processing</td>
</tr>
<tr>
<td></td>
<td>again after an application rollback.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>retention_time</td>
<td>Number of seconds for which a message is retained in the queue table after</td>
</tr>
<tr>
<td></td>
<td>being dequeued from the queue.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>dependency_tracking</td>
<td>Reserved for future use. FALSE is the default. TRUE is not permitted in</td>

<td>TRUE causes the current transaction, if any, to commit before the CREATE_</td>
</tr>
<tr>
<td></td>
<td>QUEUE operation is carried out. The CREATE_QUEUE operation becomes</td>
</tr>
<tr>
<td></td>
<td>persistent when the call returns. This is the default. FALSE means the</td>
</tr>
<tr>
<td></td>
<td>operation is part of the current transaction and becomes persistent only</td>
</tr>
<tr>
<td></td>
<td>when the caller enters a commit.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>
Usage Notes

All queue names must be unique within a schema. After a queue is created with `CREATE_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.
CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```sql
DBMS_AQADM.CREATE_QUEUE_TABLE (
    queue_table          IN      VARCHAR2,
    queue_payload_type   IN      VARCHAR2,
    [storage_clause      IN      VARCHAR2        DEFAULT NULL,]
    sort_list            IN      VARCHAR2        DEFAULT NULL,
    multiple_consumers   IN      BOOLEAN         DEFAULT FALSE,
    message_grouping     IN      BINARY_INTEGER  DEFAULT NONE,
    comment              IN      VARCHAR2        DEFAULT NULL,
    auto_commit          IN      BOOLEAN         DEFAULT TRUE,
    primary_instance     IN      BINARY_INTEGER  DEFAULT 0,
    secondary_instance   IN      BINARY_INTEGER  DEFAULT 0,
    compatible           IN      VARCHAR2        DEFAULT NULL,
    secure               IN      BOOLEAN         DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created</td>
</tr>
<tr>
<td>queue_payload_type</td>
<td>Type of the user data stored. See Type Name on page 16-3 for valid values for this parameter.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablesapce is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablesapce is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Reference for the usage of these parameters.</td>
</tr>
</tbody>
</table>
**Table 17–13 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sort_list</td>
<td>The columns to be used as the sort key in ascending order. This parameter has the following format:</td>
</tr>
<tr>
<td></td>
<td>'sort_column_1, sort_column_2'</td>
</tr>
<tr>
<td></td>
<td>The allowed column names are priority and enq_time. If both columns are specified, then sort_column_1 defines the most significant order.</td>
</tr>
<tr>
<td></td>
<td>After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.</td>
</tr>
<tr>
<td></td>
<td>If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.</td>
</tr>
<tr>
<td></td>
<td>Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>message_grouping</td>
<td>Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.</td>
</tr>
</tbody>
</table>

Note: This parameter has been deprecated.
Table 17–13 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary_instance</td>
<td>The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.</td>
</tr>
<tr>
<td>compatible</td>
<td>The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.</td>
</tr>
<tr>
<td>secure</td>
<td>This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.</td>
</tr>
</tbody>
</table>

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$queue_table_name`, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- `aq$_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations
For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$_queue_table_name_s`, a table for storing information about the subscribers
- `aq$_queue_table_name_r`, a table for storing information about rules on subscriptions
- `aq$_queue_table_name_h`, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8i release 8.1.5 or later. See the Oracle Streams Advanced Queuing User’s Guide and Reference for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.
DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

DBMS_AQ.DEL_ALIAS_FROM_LDAP (alias IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>The alias to be removed.</td>
</tr>
</tbody>
</table>
The DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```sql
DBMS_AQADM.DISABLE_DB_ACCESS (  
    agent_name    IN VARCHAR2,  
    db_username   IN VARCHAR2)  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specifies the database user whose privileges are to be revoked from the</td>
</tr>
<tr>
<td></td>
<td>Oracle Streams AQ Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.
DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```sql
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (    queue_name IN VARCHAR2,    destination IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
</tbody>
</table>
DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (  
    agent_name IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent</td>
</tr>
</tbody>
</table>
**DROP_QUEUE Procedure**

This procedure drops an existing queue.

**Syntax**

```sql
DBMS_AQADM.DROP_QUEUE (  
    queue_name        IN    VARCHAR2,  
    auto_commit       IN    BOOLEAN DEFAULT TRUE);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be dropped.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

**Usage Notes**

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.
This procedure drops an existing queue table.

**Syntax**

```plsql
DBMS_AQADM.DROP_QUEUE_TABLE (
    queue_table       IN    VARCHAR2,
    force             IN    BOOLEAN DEFAULT FALSE,
    auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be dropped.</td>
</tr>
<tr>
<td>force</td>
<td>FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

**Usage Notes**

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.
ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (  
    agent_name   IN VARCHAR2,  
    db_username  IN VARCHAR2)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Streams AQ Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

See Also: Oracle Streams Concepts and Administration for information about secure queues

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.
ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams Sys.Anydata queues unless you call this procedure after DBMS_STREAMS_ADM.SET_UP_QUEUE. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```sql
DBMS_AQADM.ENABLE_JMS_TYPES (  
    queue_table IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be enabled for JMS and XML types.</td>
</tr>
</tbody>
</table>
ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```sql
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (queue_name IN VARCHAR2,
                                           destination IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
</tbody>
</table>
GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

Syntax

```
DBMS_AQADM.GET_WATERMARK (  
    wmvalue    OUT    NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE ( privilege        IN    VARCHAR2,
                                      queue_name       IN    VARCHAR2,
                                      grantee          IN    VARCHAR2,
                                      grant_option     IN    BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>grant_option</td>
<td>Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.</td>
</tr>
</tbody>
</table>
GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (  
  privilege     IN    VARCHAR2,  
  grantee       IN    VARCHAR2,  
  admin_option  IN    BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>admin_option</td>
<td>Specifies if the system privilege is granted with the ADMIN option or not.</td>
</tr>
<tr>
<td></td>
<td>If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.</td>
</tr>
</tbody>
</table>
MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
    queue_table   IN   VARCHAR2,  
    compatible    IN   VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be migrated.</td>
</tr>
<tr>
<td>compatible</td>
<td>Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.</td>
</tr>
</tbody>
</table>
PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent queues.

Syntax

```sql
DBMS_AQADM.PURGE_QUEUE_TABLE(
    queue_table        IN   VARCHAR2,
    purge_condition    IN   VARCHAR2,
    purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 171, "Oracle Streams AQ TYPES".

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table (IN VARCHAR2)</td>
<td>Specifies the name of the queue table to be purged.</td>
</tr>
<tr>
<td>purge_condition (IN VARCHAR2)</td>
<td>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table view. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).</td>
</tr>
<tr>
<td>purge_options IN aq$_purge_options_t</td>
<td>Type aq$_purge_options_t contains a block parameter. If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.</td>
</tr>
</tbody>
</table>
Usage Notes

You can purge selected messages from the queue table by specifying additional parameters in the API call. Table 17–27 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.

A trace file is generated in the udump destination when you run this procedure. It details what the procedure is doing. The procedure commits after it has processed all the messages.
**QUEUE_SUBSCRIBERS Function**

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type DBMS_AQADM.AQ$._subscriber_list_t. Each element of the collection is of type sys.aq$._agent. This functionality is provided for 8.1-compatible queues by the AQ$queue_table_name_S view.

**Syntax**

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (queue_name IN VARCHAR2);
```

**Parameters**

Table 17–28  QUEUE_SUBSCRIBERS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the queue whose subscribers are to be printed.</td>
</tr>
</tbody>
</table>
REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```sql
DBMS_AQADM.REMOVE_SUBSCRIBER (    queue_name IN VARCHAR2,    subscriber IN sys.aq$_agent);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent who is being removed. See &quot;AQ$_AGENT Type&quot; on page 171-3.</td>
</tr>
</tbody>
</table>
REVOKE QUEUE PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
    privilege     IN      VARCHAR2,
    queue_name    IN      VARCHAR2,
    grantee       IN      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.</td>
</tr>
</tbody>
</table>

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor’s privileges are revoked.
REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (privilege IN VARCHAR2, grantee IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
</tbody>
</table>
This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

**Syntax**

```sql
DBMS_AQADM.SCHEDULE_PROPAGATION (
    queue_name      IN    VARCHAR2,
    destination     IN    VARCHAR2 DEFAULT NULL,
    start_time      IN    DATE     DEFAULT SYSDATE,
    duration        IN    NUMBER   DEFAULT NULL,
    next_time       IN    VARCHAR2 DEFAULT NULL,
    latency         IN    NUMBER   DEFAULT 60);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td><code>destination</code></td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td><code>start_time</code></td>
<td>Initial start time for the propagation window for messages from the source queue to the destination.</td>
</tr>
<tr>
<td><code>duration</code></td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
</tbody>
</table>
Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in either the same or different queues, then the message is propagated to all of them at the same time.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.</td>
</tr>
</tbody>
</table>
This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

**Syntax**

```
DBMS_AQADM.SET_WATERMARK (  
    wmvalue    IN    NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>
START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (  
    queue_name   IN     VARCHAR2,  
    enqueue      IN     BOOLEAN DEFAULT TRUE,  
    dequeue      IN     BOOLEAN DEFAULT TRUE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be enabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
</tbody>
</table>

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.
STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```plsql
DBMS_AQADM.STOP_QUEUE (
    queue_name      IN   VARCHAR2,
    enqueue         IN   BOOLEAN DEFAULT TRUE,
    dequeue         IN   BOOLEAN DEFAULT TRUE,
    wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be disabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.</td>
</tr>
</tbody>
</table>

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.
UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```sql
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
    queue_name     IN   VARCHAR2,
    destination    IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
</tbody>
</table>
VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```sql
DBMS_AQADM.VERIFY_QUEUE_TYPES (  
  src_queue_name    IN    VARCHAR2,  
  dest_queue_name   IN    VARCHAR2,  
  destination       IN    VARCHAR2 DEFAULT NULL,  
  rc                OUT   BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>dest_queue_name</td>
<td>Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>rc</td>
<td>Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in rc.</td>
</tr>
</tbody>
</table>
The DBMS_AQELM package provides procedures to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

**See Also:** Oracle Streams Advanced Queuing User's Guide and Reference for detailed information about DBMS_AQELM

This chapter contains the following topic:

- Summary of DBMS_AQELM Subprograms
### Summary of DBMS_AQELM Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_MAILHOST Procedure</td>
<td>Gets the host name set by DBMS_AQELM.SET_MAILHOST for the SMTP server</td>
</tr>
<tr>
<td>GET_MAILPORT Procedure</td>
<td>Gets the port number for the SMTP server set by the DBMS_AQELM.SET_MAILPORT procedure or the default value, which is 25</td>
</tr>
<tr>
<td>GET_PROXY Procedure</td>
<td>Gets the proxy server name and no_proxy_domains set by DBMS_AQELM.SET_PROXY for HTTP notifications</td>
</tr>
<tr>
<td>GET_SENDFROM Procedure</td>
<td>Gets the sent-from e-mail address set by DBMS_AQELM.SET_SENDFROM procedure</td>
</tr>
<tr>
<td>SET_MAILHOST Procedure</td>
<td>Sets the host name for the SMTP server that the database will uses send out e-mail notifications</td>
</tr>
<tr>
<td>SET_MAILPORT Procedure</td>
<td>Sets the port number for the SMTP server</td>
</tr>
<tr>
<td>GET_MAILHOST Procedure</td>
<td>Gets the host name set by DBMS_AQELM.SET_MAILHOST for the SMTP server</td>
</tr>
<tr>
<td>SET_PROXY Procedure</td>
<td>Sets the proxy server name to be used for requests of HTTP protocol, excluding requests for hosts that belong to the domain specified in no_proxy_domains</td>
</tr>
<tr>
<td>SET_SENDFROM Procedure</td>
<td>Sets the sent-from e-mail address</td>
</tr>
</tbody>
</table>
GET_MAILHOST Procedure

This procedure gets the host name set by DBMS_AQELM.SET_MAILHOST for the SMTP server.

Syntax

```sql
DBMS_AQELM.GET_MAILHOST (
    mailhost  OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailhost</td>
<td>SMTP server host name.</td>
</tr>
</tbody>
</table>
GET_MAILPORT Procedure

This procedure gets the port number for the SMTP server set by the DBMS_AQELM.
SET_MAILPORT procedure or the default value, which is 25.

Syntax

DBMS_AQELM.GET_MAILPORT (  
  mailport  OUT NUMBER);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailport</td>
<td>SMTP server port number.</td>
</tr>
</tbody>
</table>
GET_PROXY Procedure

This procedure gets the proxy server name and no_proxy_domains set by DBMS_AQELM.SET_PROXY for HTTP notifications.

Syntax

DBMS_AQELM.GET_PROXY (  
proxy OUT VARCHAR2,  
no_proxy_domains OUT VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>Proxy server host and port number.</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>List of no-proxy domains or hosts.</td>
</tr>
</tbody>
</table>
GET_SENDFROM Procedure

GET_SENDFROM Procedure

This procedure gets the sent-from e-mail address set by DBMS_AQELM.SET_SENDFROM procedure.

Syntax

DBMS_AQELM.GET_SENDFROM (  
    sendfrom OUT VARCHAR2);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendfrom</td>
<td>The sent-from e-mail address.</td>
</tr>
</tbody>
</table>
**SET_MAILHOST Procedure**

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

**Syntax**

```sql
DBMS_AQELM.SET_MAILHOST (
    mailhost  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailhost</td>
<td>SMTP server host name.</td>
</tr>
</tbody>
</table>

**Usage Notes**

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.
SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```sql
DBMS_AQELM.SET_MAILPORT (  
  mailport IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailport</td>
<td>SMTP server port number.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25.
SET_PROXY Procedure

This procedure sets the proxy server name to be used for requests of HTTP protocol, excluding requests for hosts that belong to the domain specified in `no_proxy_domains`.

Syntax

```sql
DBMS_AQELM.SET_PROXY (
    proxy           IN VARCHAR2,
    no_proxy_domains IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>Proxy server host and port number. The syntax is &quot;[http://]host[:port][/]&quot;. For example, &quot;www-proxy.my-company.com:80&quot;.</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>List of no-proxy domains or hosts. The syntax is a list of host or domains, with optional port numbers separated by a comma, a semi-colon, or a space. For example, &quot;corp.my-company.com, eng.my-company.com:80&quot;.</td>
</tr>
</tbody>
</table>

Usage Notes

The proxy server name can include an optional TCP/IP port number at which the proxy server listens. If the port is not specified for the proxy server, port 80 is assumed.

`no_proxy_domains` is a list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server. Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at that port of the particular domain or host. When `no_proxy_domains` is NULL and the proxy server is set, all requests go through the proxy server. When the proxy server is not set, `http_send` sends the requests to the target Web servers directly.

As part of the configuration for HTTP notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package can choose to set the proxy server name and a list of `no_proxy_domains`. 
if required, before registering for HTTP notifications. The database will use this information to post HTTP notifications.
SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (
    sendfrom IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendfrom</td>
<td>The sent-from e-mail address.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications.
The DBMS_CAPTURE_ADM package, one of a set of Streams packages, provides administrative interfaces for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue (created using the DBMS_STEAMS_ADM.SET_UP_QUEUE procedure or the DBMS_AQADM package).

See Also: Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and capture processes

</table>

Note: All procedures commit unless specified otherwise.
ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION procedure. Specifically, running this procedure removes data dictionary information related to the database instantiation.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION();
```
ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. Specifically, running this procedure removes data dictionary information related to the schema instantiation.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
    schema_name  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema for which to abort the effects of preparing instantiation.</td>
</tr>
</tbody>
</table>
ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure. Specifically, running this procedure removes data dictionary information related to the table instantiation.

Syntax

DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name  IN  VARCHAR2);

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table for which to abort the effects of preparing instantiation, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
ALTER_CAPTURE Procedure

This procedure alters a capture process.

See Also: Oracle Streams Concepts and Administration for more information about altering a capture process

Syntax

```sql
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
    capture_name IN VARCHAR2,
    rule_set_name IN VARCHAR2 DEFAULT NULL,
    remove_rule_set IN BOOLEAN DEFAULT false,
    start_scn IN NUMBER DEFAULT NULL,
    use_database_link IN BOOLEAN DEFAULT NULL,
    first_scn IN NUMBER DEFAULT NULL,
    negative_rule_set_name IN VARCHAR2 DEFAULT NULL,
    remove_negative_rule_set IN BOOLEAN DEFAULT false,
    capture_user IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
rule_set_name

The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.

If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the HR schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify NULL and the remove_rule_set parameter is set to false, then retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to true, then removes any existing positive rule set.

See Also: Oracle Streams Concepts and Administration for more information about the changes that can be captured by a capture process

remove_rule_set

If true, then removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.

If false, then retains the positive rule set for the specified capture process.

If the rule_set_name parameter is non-NULL, then this parameter should be set to false.
### Table 19–4 (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start scn</td>
<td>A valid SCN for the database from which the capture process should start capturing changes. The SCN value specified must be greater than or equal to the first SCN for the capture process. An error is returned if an invalid SCN is specified.</td>
</tr>
</tbody>
</table>
| use_database_link  | If true, then specifies that the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify true. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.  

If false, then specifies either that the capture process is running on the source database or that the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify false. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.  

If NULL, then the current value of this parameter for the capture process is not changed. |
Specifications for the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:

- It must be greater than the current first SCN for the capture process.
- It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.
- It must be less than or equal to the required checkpoint SCN for the capture process.

An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 19-13 for information about determining an SCN value that meets all of these conditions.

When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN.

Also, if the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>Specifies the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:</td>
</tr>
<tr>
<td></td>
<td>- It must be greater than the current first SCN for the capture process.</td>
</tr>
<tr>
<td></td>
<td>- It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.</td>
</tr>
<tr>
<td></td>
<td>- It must be less than or equal to the required checkpoint SCN for the capture process.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified SCN does not meet the first three requirements. See &quot;Usage Notes&quot; on page 19-13 for information about determining an SCN value that meets all of these conditions.</td>
</tr>
<tr>
<td></td>
<td>When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN.</td>
</tr>
<tr>
<td></td>
<td>Also, if the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.</td>
</tr>
</tbody>
</table>
negative_rule_set_name

The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.

If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify NULL and the remove_negative_rule_set parameter is set to false, then retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to true, then removes any existing negative rule set.

If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

remove_negative_rule_set

If true, then removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.

If false, then retains the negative rule set for the specified capture process.

If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to false.

Table 19–4 (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</td>
</tr>
<tr>
<td>remove_negative_rule_set</td>
<td>If true, then removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.</td>
</tr>
<tr>
<td></td>
<td>If false, then retains the negative rule set for the specified capture process.</td>
</tr>
<tr>
<td></td>
<td>If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
ALTER_CAPTURE Procedure

Table 19–4  (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| capture_user   | The user who captures DML and DDL changes that satisfy the capture process rule sets. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, make sure the capture user has the following privileges:  
  - Execute privilege on the rule sets used by the capture process  
  - Execute privilege on all rule-based transformation functions used in the rule set  
  - Execute privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process  
These privileges must be granted directly to the capture user. They cannot be granted through roles. By default, this parameter is set to the user who created the capture process by running either the CREATE_CAPTURE procedure in this package or one of the following procedures in the DBMS_STREAMS_ADM package with the streams_type parameter set to capture:  
  - ADD_GLOBAL_RULES  
  - ADD_SCHEMA_RULES  
  - ADD_TABLE_RULES  
  - ADD_SUBSET_RULES  
**Note:** If the specified user is dropped using DROP USER...CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run. |
Usage Notes

If you want to alter the first SCN for a capture process, then value specified must meet the conditions in the description for the first_scn parameter. The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```sql
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```

Also, a capture process is stopped and restarted automatically when you change the value of one or more of the following ALTER_CAPTURE procedure parameters:

- start_scn
- capture_user
BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
    first_scn  OUT  NUMBER);
```

**Note:** This procedure is overloaded. One version of this procedure contains the OUT parameter `first_scn`, and the other does not.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>first_scn</code></td>
<td>Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process</td>
</tr>
</tbody>
</table>

Usage Notes

You can run this procedure multiple times at a source database.

If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.

After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the...
CREATE_CAPTURE or ALTER_CAPTURE procedure in the DBMS_CAPTURE_ADM package.
CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:
- Oracle Streams Concepts and Administration for more information about creating a capture process
- Chapter 82, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```sql
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
  queue_name              IN  VARCHAR2,
  capture_name            IN  VARCHAR2,
  rule_set_name           IN  VARCHAR2  DEFAULT NULL,
  start_scn               IN  NUMBER    DEFAULT NULL,
  source_database         IN  VARCHAR2  DEFAULT NULL,
  use_database_link       IN  BOOLEAN   DEFAULT false,
  first_scn               IN  NUMBER    DEFAULT NULL,
  logfile_assignment      IN  VARCHAR2  DEFAULT 'implicit',
  negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
  capture_user            IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>Note: The queue_name setting cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>Note: The capture_name setting cannot be altered after the capture process is created.</td>
</tr>
</tbody>
</table>
Table 19–6 (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</td>
</tr>
</tbody>
</table>

If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default.

An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.

If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.

See Also: Oracle Streams Concepts and Administration for more information about the changes that can be captured by a capture process.

start_scn       | A valid SCN for the database from which the capture process should start capturing changes. If the specified value is lower than the current SCN of the source database, then either the first_scn should be specified, or the SCN value specified for start_scn must be greater than or equal to the first SCN of an existing capture process which has taken at least one checkpoint. |

If start_scn is NULL and no value is specified for the first_scn parameter, then the database's current SCN is used as start SCN. If start_scn is NULL and a non-NULL value is specified for the first_scn parameter, then the first_scn value is used.

If a value is specified for both start_scn and first_scn, then the start_scn value must be greater than or equal to the first_scn value.

An error is returned if an invalid SCN is specified.
The global name of the source database. The source database is where the changes to be captured originated.

If you do not include the domain name, then it is appended to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then DBS1.NET is specified automatically.

If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.

If true, then specifies that the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary.

If false, then specifies either that the capture process is running on the source database or that the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:

- Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created
- Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.
- Prepare source database objects for instantiation
Summary of DBMS_CAPTURE_ADM Subprograms

Table 19-6 (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>Specifies the lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available.</td>
</tr>
<tr>
<td>logfile_assignment</td>
<td>If implicit, the default, then the capture process at a downstream database scans all redo log files added by log transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR logminer_session_name clause when the redo log file is added manually to the downstream database. If explicit, then log transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. See Also: &quot;Usage Notes&quot; on page 19-20 for information about adding redo log files manually</td>
</tr>
</tbody>
</table>
CREATE_CAPTURE Procedure

Table 19–6 (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</td>
</tr>
<tr>
<td>capture_user</td>
<td>The user who captures DML and DDL changes that satisfy the capture process rule sets. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. Note: If the specified user is dropped using DROP USER...CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who invokes this procedure must be granted DBA role.

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the
queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, make sure the capture user has the following privileges:

- Execute privilege on the rule sets used by the capture process
- Execute privilege on all rule-based transformation functions used in the rule set
- Execute privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process

These privileges must be granted directly to the capture user. They cannot be granted through roles.

---

**Note:**

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process may pass these changes to a rule-based transformation function. Therefore, make sure you consider security implications when you configure a capture process.
- Creation of the first capture process in a database may take some time because the data dictionary is duplicated during this creation.

---

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
    file_name FOR capture_process;
```

Here, `file_name` is the name of the redo log file being added and `capture_process` is the name of the capture process that will use the redo log file at the downstream database. The `capture_process` is equivalent to the `logminer_session_name` and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the `DBMS_FILE_TRANSFER` package, FTP, or some other transfer method.
CREATE_CAPTURE Procedure

See Also: Oracle Database SQL Reference for more information about the ALTER DATABASE statement and Oracle Data Guard Concepts and Administration for more information registering redo log files
DROP_CAPTURE Procedure

This procedure drops a capture process.

See Also:
- "STOP_CAPTURE Procedure" on page 19-34
- Oracle Streams Concepts and Administration for more information about Streams data dictionary views

Syntax

```sql
DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name           IN  VARCHAR2,
    drop_unused_rule_sets  IN  BOOLEAN  DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If true, then drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If false, then does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

When you use this procedure to drop a capture process, information about rules created for the capture process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Streams rules:
- ALL_STREAMS_GLOBAL_RULES
DROP_CAPTURE Procedure

- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

**Note:** A capture process must be stopped before it can be dropped.
INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process.

Syntax

DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
  capture_name    IN  VARCHAR2,
  attribute_name  IN  VARCHAR2,
  include         IN  BOOLEAN   DEFAULT true);

Parameters

Table 19–8  INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Specify an existing capture process name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
The redo log contains information about each change made to a database, and some of this information is not captured by a capture process unless you use this procedure to instruct a capture process to capture it. This procedure enables you to specify extra information in the redo log that a capture process should capture. If you want to exclude an extra attribute that is being captured by a capture process, then specify the attribute and specify false for the include parameter.
**PREPARE_GLOBAL_INSTANTIATION Procedure**

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

**Syntax**

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION;
```

**Usage Notes**

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.
This procedure performs the synchronization necessary for instantiating all tables in the schema at another database.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

**Syntax**

```sql
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
    schema_name  IN  VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Run this procedure at the source database. If you use a capture process to capture all of the changes to schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.
**PREPARE_TABLE_INSTANTIATION Procedure**

This procedure performs the synchronization necessary for instantiating the table at another database.

This procedure records the lowest SCN of the table for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

**Syntax**

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Run this procedure at the source database. If you use a capture process to capture all of the changes to schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.
SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
    capture_name  IN  VARCHAR2,
    parameter     IN  VARCHAR2,
    value         IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes from the redo logs.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting. See &quot;Capture Process Parameters&quot; on page 19-30 for a list of these parameters.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set</td>
</tr>
</tbody>
</table>

Usage Notes

When you alter a parameter value, a short amount of time may pass before the new value for the parameter takes effect.

Capture Process Parameters

The following table lists the parameters for the capture process.
### Table 19–12  Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process is disabled if the capture process terminates because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit.</td>
</tr>
<tr>
<td>maximum_scn</td>
<td>A valid SCN or infinite</td>
<td>infinite</td>
<td>The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If infinite, then the capture process runs regardless of the SCN value.</td>
</tr>
<tr>
<td>message_limit</td>
<td>A positive integer or infinite</td>
<td>infinite</td>
<td>The capture process stops after capturing the specified number of messages. If infinite, then the capture process continues to run regardless of the number of messages captured.</td>
</tr>
</tbody>
</table>
| parallelism        | A positive integer | 1       | The number of parallel execution servers that may concurrently mine the redo log. Note:  
  * When you change the value of this parameter, the capture process is stopped and restarted automatically.  
  * Setting the parallelism parameter to a number higher than the number of available parallel execution servers may disable the capture process. Make sure the PROCESSES and PARALLEL_MAX_SERVERS initialization parameters are set appropriately when you set the parallelism capture process parameter. |
SET_PARAMETER Procedure

Table 19–12 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startup_seconds</td>
<td>0, a positive integer, or infinite</td>
<td>0</td>
<td>The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If infinite, then a capture process does not start until another instantiation of the same capture process finishes.</td>
</tr>
<tr>
<td>time_limit</td>
<td>A positive integer or infinite</td>
<td>infinite</td>
<td>The capture process stops as soon as possible after the specified number of seconds since it started. If infinite, then the capture process continues to run until it is stopped explicitly.</td>
</tr>
<tr>
<td>trace_level</td>
<td>0 or a positive integer</td>
<td>0</td>
<td>Set this parameter only under the guidance of Oracle Support Services.</td>
</tr>
<tr>
<td>write_alert_log</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.</td>
</tr>
</tbody>
</table>

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify infinite for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.
**START_CAPTURE Procedure**

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by `c`.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of a capture process.

*See Also:* Chapter 96, "DBMS_STREAMS_ADM"

**Syntax**

```sql
DBMS_CAPTURE_ADM.START_CAPTURE(
    capture_name  IN  VARCHAR2);
```

**Parameters**

*Table 19–13  START_CAPTURE Procedure Parameter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You can create the capture process using the following procedures:

- `DBMS_CAPTURE_ADM.CREATE_CAPTURE`
- `DBMS_STREAMS_ADM.ADD_GLOBAL_RULES`
- `DBMS_STREAMS_ADM.ADD_SCHEMA_RULES`
- `DBMS_STREAMS_ADM.ADD_TABLE_RULES`
This procedure stops the capture process from mining redo logs. The stop status is persistently recorded. Hence, if the status is DISABLED, then the capture process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.

Syntax

```sql
DBMS_CAPTURE_ADM.STOP_CAPTURE(
    capture_name  IN  VARCHAR2,
    force         IN  BOOLEAN  DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>This parameter is reserved for future use. In the current release, valid BOOLEAN settings are ignored.</td>
</tr>
</tbody>
</table>
The DBMS_CDC_PUBLISH package is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one publisher who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data.

Note: In previous releases, this package was named DBMS_LOGMNR_CDC_PUBLISH. Beginning with release 10g, the LOGMNR string has been removed from the name, resulting in the name DBMS_CDC_PUBLISH. Although both variants of the name are still supported, the variant with the LOGMNR string has been deprecated and may not be supported in a future release.

See Also: Oracle Data Warehousing Guide for more information about Oracle Change Data Capture and DBMS_CDC_SUBSCRIBE for information on the package used to subscribe to published change data.
This chapter contains the following topics:

- **Using DBMS_CDC_PUBLISH**
  - Overview
  - Security Model
  - Deprecated Subprograms
- **Summary of DBMS_CDC_PUBLISH Subprograms**
Using DBMS_CDC_PUBLISH

Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the procedures in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

Security Model

To use the DBMS_CDC_PUBLISH package, the publisher must have the EXECUTE_CATALOG_ROLE privilege.
Deprecated Subprograms

The following subprograms have been deprecated beginning with release 10g:

- **DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW**
  Dropping a subscriber view is now performed automatically by Change Data Capture.

- **DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION with a subscription handle**
  When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.
Summary of DBMS_CDC_PUBLISH Subprograms

Table 20–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of *All* in Mode column of Table 20–1 indicates that the subprogram can be used with synchronous and both modes of asynchronous Change Data Capture.

</tbody>
</table>
**ALTER.AUTOLOG.CHANGE_SOURCE Procedure**

This procedure changes the properties of an existing AutoLog change source.

**Syntax**

```sql
DBMS_CDC_PUBLISH.ALTER.AUTOLOG.CHANGE_SOURCE(
    change_source_name  IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description  IN VARCHAR2 DEFAULT 'N',
    first_scn           IN NUMBER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of an existing change source. Change source names follow Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>New description of the change source. The description must be specified using 255 or fewer characters.</td>
</tr>
<tr>
<td>remove_description</td>
<td>A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.</td>

<td>The description and remove_description parameters cannot both be specified</td>
</tr>
</tbody>
</table>
Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in determining which redo logs are no longer needed for an asynchronous AutoLog change set.

**See Also:** The section on asynchronous Change Data Capture and redo log files in *Oracle Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in determining which redo log files are no longer needed for an asynchronous AutoLog change set.

<td>Cannot alter or drop predefined change set</td>
</tr>
</tbody>
</table>
Summary of DBMS_CDC_PUBLISH Subprograms

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, SYNC_SET, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: enable_capture, recover_after_error, remove_ddl, and stop_on_ddl.

- Properties supplied to this procedure with a NULL value are unchanged.

- This procedure can alter more than one parameter at a time.

- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

  Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the stop_on_ddl parameter is set to 'Y' and any of the following statements is encountered:

  - `ANALYZE TABLE`
  - `LOCK TABLE`
  - `GRANT privileges to access a table`
  - `REVOKE privileges to access a table`
  - `COMMENT on a table`
  - `COMMENT on a column`

  These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value longer than maximum length</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>
When the stop_on_ddl parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. (There are also system conditions that can cause capture errors, such as being out of disk space.)

**See Also:** The Change Data Capture chapter in *Oracle Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

The publisher can attempt to recover an asynchronous change set after a capture error by specifying 'Y' for the recover_after_error parameter. Capture errors can occur when any of the following is true:

- The stop_on_ddl parameter is set to 'Y' and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify 'Y' for the remove_ddl parameter.
- The stop_on_ddl parameter is set to 'N' and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
- A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table string partition string by string in tablespace string).

**See Also:** The Change Data Capture chapter in *Oracle Data Warehousing Guide* for more information on how to recover from a capture error.
ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE(
    owner                   IN VARCHAR2,
    change_table_name       IN VARCHAR2,
    operation               IN VARCHAR2,
    column_list             IN VARCHAR2,
    rs_id                   IN CHAR,
    row_id                  IN CHAR,
    user_id                 IN CHAR,
    timestamp               IN CHAR,
    object_id               IN CHAR,
    source_colmap           IN CHAR,
    target_colmap           IN CHAR);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>The schema that owns the change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>The change table that is being altered. Change table names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>operation</td>
<td>Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.</td>
</tr>
<tr>
<td>column_list</td>
<td>User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.</td>
</tr>
</tbody>
</table>
ALTER_CHANGE_TABLE Procedure

Table 20–6 (Cont.) ALTER_CHANGE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rs_id</td>
<td>Each listed parameter specifies a particular control column, as follows:</td>
</tr>
<tr>
<td>row_id</td>
<td>The rs_id parameter specifies the RSID$ control column.</td>
</tr>
<tr>
<td>user_id</td>
<td>The row_id parameter specifies the ROW_ID$ control column.</td>
</tr>
<tr>
<td>timestamp</td>
<td>The user_id parameter specifies the USERNAME$ control column.</td>
</tr>
<tr>
<td>object_id</td>
<td>The timestamp parameter specifies the TIMESTAMP$ control column.</td>
</tr>
<tr>
<td>source_colmap</td>
<td>The object_id parameter specifies the SYS_NC_OID$ control column.</td>

<td>The source_colmap parameter specifies the SOURCE_COLMAP$ control column.</td>
</tr>
</tbody>
</table>
|             | The target_colmap parameter specifies the TARGET_COLMAP$ control column.

Each parameter must have a value of either 'Y' or 'N', where:
- 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter.
- 'N': Neither adds the specified control column, nor drops it from the change table.

See Also: The Change Data Capture chapter in Oracle Data Warehousing Guide for a complete description of control columns

<tr>
<td>ORA-31416</td>
<td>Invalid SOURCE_COLMAP value</td>
</tr>
<tr>
<td>ORA-31417</td>
<td>Column list contains control column control-column-name</td>
</tr>
</tbody>
</table>
Summary of DBMS_CDC_PUBLISH Subprograms

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the `ALTER_CHANGE_TABLE` procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the `column_list` parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the `source_colmap` and `object_id` parameters.

**See Also:** Oracle Data Warehousing Guide for information about the impact on subscriptions when a publisher adds a column to a change table.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31421</td>
<td>Change table does not exist</td>
</tr>
<tr>
<td>ORA-31422</td>
<td>Specified owner schema does not exist</td>
</tr>

<td>Invalid <code>OBJECT_ID</code> value</td>
</tr>
</tbody>
</table>

**Table 20–7 (Cont.) ALTER_CHANGE_TABLE Procedure Exceptions**
CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on a set of redo log files automatically copied by log transport services to the system on which the staging database resides.

Syntax

```sql
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE(
    change_source_name  IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    source_database     IN VARCHAR2,
    first_scn           IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of the change source. Change source names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the change source. Specify using 255 or fewer characters.</td>
</tr>
<tr>
<td>source_database</td>
<td>Global name of the change source's source database instance.</td>
</tr>
<tr>
<td>first_scn</td>
<td>The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31436</td>
<td>Duplicate change source specified</td>
</tr>
<tr>
<td>ORA-31497</td>
<td>Invalid value specified for first_scn</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value is longer than the maximum length</td>
</tr>
<tr>
<td>ORA-31508</td>
<td>Invalid parameter value for synchronous change set</td>
</tr>
</tbody>
</table>
Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the source_database parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the GLOBAL_NAME column in the GLOBAL_NAME view at the source database for the source_database parameter value.

- The publisher must configure log transport services to automatically copy the log files to the system on which the staging database resides.

  **See Also:** The section on performing asynchronous AutoLog publishing in Oracle Data Warehousing Guide for information on configuring log transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The CREATE_AUTOLOG_CHANGE_SOURCE first scn parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the first scn parameter using either of the following methods:

  - Direct DBMS_CAPTURE_ADM.BUILD to return the value when the dictionary is built:

    ```sql
    SET SERVEROUTPUT ON
    VARIABLE FSCN NUMBER;
    BEGIN
    :FSCN := 0;
    DBMS_CAPTURE_ADM.BUILD(:FSCN);
    DBMS_OUTPUT.PUT_LINE('The first scn value is ' || :FSCN);
    END;
    /
    The first scn value is 207722
    ```

  - Make the following query on the source database. If this query returns multiple distinct values for first_change#, then the data dictionary has been extracted more than once and the publisher should choose the first_change# value that is the most appropriate to the change source.

    ```sql
    SELECT DISTINCT FIRST_CHANGE#, NAME
    ```
CREATE_AUTOLOG_CHANGE_SOURCE Procedure

FROM V$ARCHIVED_LOG
WHERE DICTIONARY_BEGIN = 'YES';

**See Also:** The section on performing asynchronous AutoLog publishing in *Oracle Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

**See Also:** The Change Data Capture chapter in *Oracle Data Warehousing Guide* for information about supplemental logging
**CREATE_CHANGE_SET Procedure**

This procedure allows the publisher to create a change set. For asynchronous Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

**Syntax**

```sql
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
    change_set_name        IN VARCHAR2,
    description            IN VARCHAR2 DEFAULT NULL,
    change_source_name     IN VARCHAR2,
    stop_on_ddl            IN CHAR DEFAULT 'N',
    begin_date             IN DATE DEFAULT NULL,
    end_date               IN DATE DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>Name of the change set. Change set names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the change set. Specify using 255 or fewer characters.</td>
</tr>
<tr>
<td>change_source_name</td>
<td>Name of the existing change source to contain this change set.</td>
</tr>
<tr>
<td>stop_on_ddl</td>
<td>A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.</td>
</tr>
<tr>
<td>begin_date</td>
<td>Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous mode of Change Data Capture only.</td>
</tr>
<tr>
<td>end_date</td>
<td>Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous mode of Change Data Capture only.</td>
</tr>

<tr>
<td>ORA-31507</td>
<td>Specified parameter value longer than maximum length</td>
</tr>
<tr>
<td>ORA-31508</td>
<td>Invalid parameter value for synchronous change set</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: begin_date, end_date, and stop_on_ddl.

- The begin_date and end_date parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
  - When a begin_date is specified, changes from transactions that begin on or after that date are captured.
  - When a begin_date is not specified, capture starts with the earliest available change data.
  - When an end_date is specified, changes from transactions that are committed on or before that date are captured.
  - When an end_date is not specified, Change Data Capture continues indefinitely.

- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to ‘Y’, asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops
a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the stop_on_ddl parameter is set to 'Y' and any of the following statements is encountered:

* ANALYZE TABLE
* LOCK TABLE
* GRANT privileges to access a table
* REVOKE privileges to access a table
* COMMENT on a table
* COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

When the stop_on_ddl parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

**See Also:** The Change Data Capture chapter in Oracle Data Warehousing Guide for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.
CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

Note: Oracle recommends that the publisher be certain that the source table that will be referenced in a CREATE_CHANGE_TABLE procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the stop_on_ddl parameter set to 'Y'.

Syntax

```sql
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
  owner                  IN VARCHAR2,
  change_table_name      IN VARCHAR2,
  change_set_name        IN VARCHAR2,
  source_schema          IN VARCHAR2,
  source_table           IN VARCHAR2,
  column_type_list       IN VARCHAR2,
  capture_values         IN VARCHAR2,
  rs_id                  IN CHAR,
  row_id                 IN CHAR,
  user_id                IN CHAR,
  timestamp              IN CHAR,
  object_id              IN CHAR,
  source_colmap          IN CHAR,
  target_colmap          IN CHAR,
  options_string         IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>

<td>Invalid OBJECT_ID value</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
A change table is a database table that contains the change data in these two types of columns:

- User columns, which are copies of actual columns of source tables that reside in the change table.
- Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.

The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.

When creating a change table for asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters.

When the publisher specifies the rs_id parameter, the RSID$ column is added to the change table. The RSID$ column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the RSID$ column value by itself to order committed operations across transactions; it must be used in conjunction with the CSCN$ column value.

The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the options_string parameter. With the options_string parameter, the publisher can set any option that is valid for the CREATE TABLE DDL statement (except for partitioning properties).

---

**Note:** How the publisher defines the options_string parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses NOT NULL constraints and a particular column is not changed in an incoming change row, then the constraint can cause the INSERT operation to fail and the transaction that contains the INSERT operation to be rolled back.

---

Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system...
CREATE_CHANGE_TABLE Procedure

tablespace or if the publisher specifies a tablespace in the `options_string` parameter. If a tablespace is not specified by the publisher, and the publisher’s default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

See Also: The Change Data Capture chapter in *Oracle Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.
DROP CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.DROP_CHANGE_SET(
    change_set_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31410</td>
<td>Specified change set is not an existing change set</td>
</tr>
<tr>
<td>ORA-31411</td>
<td>Specified change set is referenced by a change table</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31505</td>
<td>Cannot alter or drop predefined change set</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value is longer than maximum length</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.
DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE(
    change_source_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_source_name</td>
<td>Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31401</td>
<td>Specified change source is not an existing change source</td>
</tr>
<tr>
<td>ORA-31406</td>
<td>Specified change source is referenced by a change set</td>
</tr>
<tr>
<td>ORA-31499</td>
<td>Null value specified for required parameter</td>
</tr>
<tr>
<td>ORA-31504</td>
<td>Cannot alter or drop predefined change source</td>
</tr>
<tr>
<td>ORA-31507</td>
<td>Specified parameter value longer than maximum length</td>
</tr>
</tbody>
</table>

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.
DROP_CHANGE_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE(
    owner              IN VARCHAR2,
    change_table_name  IN VARCHAR2,
    force_flag         IN CHAR);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Name of the schema that owns the change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>force_flag</td>
<td>Drops the change table, depending on whether or not there are subscriptions to it, as follows:</td>
</tr>
<tr>
<td></td>
<td>- Y: Drops the change table even if there are subscriptions to it.</td>
</tr>
<tr>
<td></td>
<td>- N: Drops the change table only if there are no subscriptions to it.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31421</td>
<td>Change table does not exist</td>
</tr>
<tr>
<td>ORA-31422</td>
<td>Specified owner schema does not exist</td>
</tr>
<tr>
<td>ORA-31424</td>
<td>Change table has active subscriptions</td>
</tr>
<tr>
<td>ORA-31441</td>
<td>Table is not a change table</td>
</tr>
</tbody>
</table>
DROP_CHANGE_TABLE Procedure

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.

- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP_CHANGE_TABLE procedure using the force_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.
DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
    subscription_name  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>Name of the subscription that was specified by a previous call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31432</td>
<td>Invalid source table</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table.
indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. (Ideally, subscribers drop subscriptions that are no longer needed using the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure and the publisher need not use the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.)
**PURGE Procedure**

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

**Syntax**

```sql
DBMS_CDC_PUBLISH.PURGE;
```

**Exceptions**

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

**Usage Notes**

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
  - The publisher can run this procedure manually from the command line to purge data from change tables.
  - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.
PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```sql
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET(
    change_set_name in VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>Name of an existing change set. Change set names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31410</td>
<td>Change set is not an existing change set</td>
</tr>
</tbody>
</table>

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.
**PURGE_CHANGE_TABLE Procedure**

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

**Syntax**

```sql
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE(
    owner               in VARCHAR2,
    change_table_name   in VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the named change table.</td>
</tr>
<tr>
<td>change_table_name</td>
<td>Name of an existing change table. Change table names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31421</td>
<td>Change table does not exist</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the `DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE` procedure (used by the publisher) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE` procedure physically removes unneeded rows from the specified change table. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW`
procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.
The DBMS_CDC_SUBSCRIBE package lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The subscribers (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

Be aware that Change Data Capture grants EXECUTE privileges to PUBLIC on the DBMS_CDC_SUBSCRIBE procedure.

---

**Note:** In previous releases, this package was named DBMS_LOGMNR_CDC_SUBSCRIBE. Beginning with release 10g, the LOGMNR string has been removed from the name, resulting in the name DBMS_CDC_SUBSCRIBE. Although both variants of the name are still supported, the variant with the LOGMNR string has been deprecated and may not be supported in a future release.

---

**See Also:** Oracle Data Warehousing Guide for more information about Oracle Change Data Capture and DBMS_CDC_PUBLISH for information on the package for publishing change data.

This chapter contains the following topics:

- Using DBMS_CDC_SUBSCRIBE
  - Overview
  - Deprecated Subprograms
- Summary of DBMS_CDC_SUBSCRIBE Subprograms
Using DBMS_CDC_SUBSCRIBE

Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in a set of source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the procedures in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL SELECT statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 21–1 provides a graphical flowchart of the information provided in Table 21–1. The flowchart shows the order in which subscribers most typically use the procedures in the DBMS_CDC_SUBSCRIBE package. A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.
Using DBMS_CDC_SUBSCRIBE

Note: If a subscriber uses the PURGE_WINDOW procedure immediately after using an EXTEND_WINDOW procedure, then change data may be lost without ever being processed.

Figure 21–1 Subscription Flow

Deprecated Subprograms

The following DBMS_CDC_SUBSCRIBE procedures have been deprecated beginning with release 10g:

- GET_SUBSCRIPTION_HANDLE
Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.

- **PREPARE_SUBSCRIBER_VIEW**
  Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

- **DROP_SUBSCRIBER_VIEW**
  Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

If an existing application uses these deprecated `DBMS_CDC_SUBSCRIBE` procedures with release 10g, note the following changes in behavior:

- Subscriber views are persistent for the life of the subscription.
- Some error conditions, particularly with regard to subscriber view management, no longer occur.
- If a publisher alters a publication such that it contains different control columns, the subscriber must call `DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW` to see the new column structure.

**Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

In addition, the use of the `subscription_handle` parameter with the following `DBMS_CDC_SUBSCRIBE` procedures has been deprecated beginning with release 10g:

- **SUBSCRIBE**
- **ACTIVATE_SUBSCRIPTION**
- **EXTEND_WINDOW**
- **PURGE_WINDOW**
- **DROP_SUBSCRIPTION**
Summary of DBMS_CDC_SUBSCRIBE Subprograms

<table>
<thead>
<tr>
<th>Procedures</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVATE_SUBSCRIPTION Procedure on page 21-6</td>
<td>Indicates that a subscription is ready to start accessing change data</td>
</tr>

<td>Drops a subscription that was created with a prior call to the CREATE_SUBSCRIPTION procedure</td>
</tr>
<tr>
<td>EXTEND_WINDOW Procedure on page 21-11</td>
<td>Sets a subscription window high boundary so that new change data can be seen</td>
</tr>
<tr>
<td>PURGE_WINDOW Procedure on page 21-13</td>
<td>Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data</td>
</tr>
<tr>
<td>SUBSCRIBE Procedure on page 21-15</td>
<td>Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table</td>
</tr>
</tbody>
</table>
ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```sql
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION(
   subscription_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31426</td>
<td>Cannot modify active subscriptions</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.

- Once the subscriber activates the subscription:
  - No additional source tables can be added to the subscription.
  - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
– The subscriber must use the `EXTEND_WINDOW` procedure to see the initial set of change data.
– The subscription cannot be activated again.

■ A subscription cannot be activated if the underlying change set has reached its `end_date` parameter value.
CREATE_SUBSCRIPTION Procedure

CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated GET_SUBSCRIPTION_HANDLE procedure.

Syntax

DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION(
    change_set_name  IN  VARCHAR2,
    description      IN  VARCHAR2,
    subscription_name IN  VARCHAR2);

Parameters

Table 21–4 CREATE_SUBSCRIPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_set_name</td>
<td>The name of an existing change set to which the subscriber subscribes.</td>
</tr>
<tr>
<td>description</td>
<td>A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.</td>
</tr>
<tr>
<td>subscription_name</td>
<td>A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of CDC$. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

Table 21–5 CREATE_SUBSCRIPTION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31415</td>
<td>Specified change set does not exist</td>
</tr>
<tr>
<td>ORA-31449</td>
<td>Invalid value for change_set_name</td>
</tr>
<tr>
<td>ORA-31457</td>
<td>Maximum length of description field exceeded</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
</tbody>
</table>
Summary of DBMS_CDC_SUBSCRIBE Subprograms

Usage Notes

- The CREATE_SUBSCRIPTION procedure allows a subscriber to register interest in a change set associated with source tables of interest.

- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.

- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber’s login ID.

- Subscriptions cannot be created if the underlying change set has reached its end_date parameter value.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31506</td>
<td>Duplicate subscription name specified</td>
</tr>
<tr>
<td>ORA-31510</td>
<td>Name uses reserved prefix CDC$</td>
</tr>
<tr>
<td>ORA-31511</td>
<td>Name exceeds maximum length of 30 characters</td>
</tr>
</tbody>
</table>
DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION(
    subscription_name  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.
EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```sql
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW(
    subscription_name  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31429</td>
<td>Subscription has not been activated</td>
</tr>
<tr>
<td>ORA-31432</td>
<td>Invalid source table</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31509</td>
<td>Publication does not exist</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
EXTEND_WINDOW Procedure

- The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
- Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.

Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.

When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the EXTEND_WINDOW procedure will not raise the high boundary.
Summary of DBMS_CDC_SUBSCRIBE Subprograms

**PURGE_WINDOW Procedure**

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

**Syntax**

```sql
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW(
    subscription_name   IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
</tbody>
</table>

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-31409</td>
<td>One or more values for input parameters are incorrect</td>
</tr>
<tr>
<td>ORA-31425</td>
<td>Subscription does not exist</td>
</tr>
<tr>
<td>ORA-31429</td>
<td>Subscription has not been activated</td>
</tr>
<tr>
<td>ORA-31432</td>
<td>Invalid source table</td>
</tr>
<tr>
<td>ORA-31469</td>
<td>Cannot enable Change Data Capture for change set</td>
</tr>
<tr>
<td>ORA-31514</td>
<td>Change set disabled due to capture error</td>
</tr>
</tbody>
</table>

**Usage Notes**

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
- Informs Change Data Capture that the subscriber is finished with the current set of change data.
- Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.

- When the underlying change set for a subscription has reached its `end_date` parameter value, subsequent calls to the `PURGE_WINDOW` procedure will not move the low boundary.
SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table
  
  When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified source_table and column_list. If such a publication cannot be found, then Change Data Capture returns an error.

  ```sql
  DBMS_CDC_SUBSCRIBE.SUBSCRIBE(
      subscription_name    IN VARCHAR2,
      source_schema        IN VARCHAR2,
      source_table         IN VARCHAR2,
      column_list          IN VARCHAR2,
      subscriber_view      IN VARCHAR2);
  ```

- Using publication IDs
  
  When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the column_list parameter are not in the identified change table, then Change Data Capture returns an error.

  ```sql
  DBMS_CDC_SUBSCRIBE.SUBSCRIBE(
      subscription_name    IN VARCHAR2,
      publication_id       IN NUMBER,
      column_list          IN VARCHAR2,
      subscriber_view      IN VARCHAR2);
  ```
Parameters

Table 21–12 SUBSCRIBE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscription_name</td>
<td>The name of a subscription that was specified for, or returned by, a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>source_schema</td>
<td>The name of the schema where the source table resides.</td>
</tr>
<tr>
<td>source_table</td>
<td>The name of a published source table.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of columns from the published source table or publication.</td>
</tr>
<tr>
<td>subscriber_view</td>
<td>Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of CDC$. Subscriber view names follow the Oracle schema object naming rules.</td>
</tr>
<tr>
<td>publication_id</td>
<td>A valid publication_id, which the subscriber can obtain from the ALL_PUBLISHED_COLUMNS view.</td>
</tr>
</tbody>
</table>

Exceptions

<tr>
<td>ORA-31510</td>
<td>Name uses reserved prefix CDC$</td>
</tr>
<tr>
<td>ORA-31511</td>
<td>Name exceeds maximum length of 30 characters</td>
</tr>
</tbody>
</table>
Usage Notes

- The `SUBSCRIBE` procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the `SUBSCRIBE` procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the `SUBSCRIBE` procedure to include multiple source tables or publications IDs in a subscription.

- If the columns of interest are all in a single publication, the subscriber can call the `SUBSCRIBE` procedure using the `source_schema` and `source_table` parameters or using the `publication_id` parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the `SUBSCRIBE` procedure using the `publication_id` parameter.

- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the `ALL_PUBLISHED_COLUMNS` view.

- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source table columns accessible to the subscriber.

- Subscriptions must be created before a subscriber calls the `SUBSCRIBE` procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.

- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the `SUBSCRIBE` procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.

- All specified source tables or publications must be in the change set that is associated with the named subscription.

- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
A subscriber cannot subscribe to a publication within a change set that has reached its end_date parameter value.
DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also: Oracle Database Security Guide for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

  - Types
  - Algorithms
  - Restrictions
  - Exceptions
  - Operational Notes
- Summary of DBMS_CRYPTO Subprograms
Using the DBMS_CRYPTO Subprograms

Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound.
Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 22-1 lists the DBMS_CRYPTO package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLS.
DBMS_CRYPTO is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

Security Model

Oracle Database installs this package in the SYS schema. You can then grant package access to existing users and roles as needed.

Types

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

<table>
<thead>
<tr>
<th>Table 22–2 DBMS_CRYPTO Datatypes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>BLOB</td>
</tr>
<tr>
<td>CLOB</td>
</tr>
<tr>
<td>PLS_INTEGER</td>
</tr>
<tr>
<td>RAW</td>
</tr>
</tbody>
</table>
The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

**Table 22–3  DBMS_CRYPTO Cryptographic Hash Functions**

<tr>
<td>ENCRYPT 3DES_2KEY</td>
<td>Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.</td>
</tr>
<tr>
<td>ENCRYPT 3DES</td>
<td>Data Encryption Standard. Block cipher. Operates on a block 3 times.</td>
</tr>
<tr>
<td>ENCRYPT_RC4</td>
<td>Stream cipher. Uses a secret, randomly generated key unique to each session.</td>
</tr>
</tbody>
</table>
Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to
After performing these conversions, you can then encrypt it with the `DBMS_CRYPTO` package.

**See Also:** "Conversion Rules" on page 22-8 for information about converting datatypes.

---

### Exceptions

Table 22–9 lists exceptions that have been defined for `DBMS_CRYPTO`.

### Operational Notes

- **When to Use Encrypt and Decrypt Procedures or Functions**
- **When to Use Hash or Message Authentication Code (MAC) Functions**
- **About Generating and Storing Encryption Keys**
- **Conversion Rules**

### When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to
encrypt and decrypt RAW datatypes. Data of type VARCHAR2 must be converted to RAW before you can use DBMS_CRYPTO functions to encrypt it.

**When to Use Hash or Message Authentication Code (MAC) Functions**

This package includes two different types of one-way hash functions: the HASH function and the MAC function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs DBMS_CRYPTO.HASH against the stored data to create a hash value. When she retrieves the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The HASH function included with DBMS_CRYPTO, is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The MAC function is also a one-way hash function, but with the addition of a secret key. It works the same way as the DBMS_CRYPTO.HASH function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

**About Generating and Storing Encryption Keys**

The DBMS_CRYPTO package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by DBMS_CRYPTO occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.
Although `DBMS_CRYPTO` cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the `RANDOMBYTES` function to generate random material for keys. (Calls to the `RANDOMBYTES` function behave like calls to the `DESGETKEY` and `DES3GETKEY` functions of the `DBMS_OBFUSCATION_TOOLKIT` package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

**See Also:**
- *Oracle Advanced Security Administrator’s Guide* for information about configuring network encryption and SSL.
- "Key Management" on page 55-3 for a full discussion about securely storing encryption keys.
- "RANDOMBYTES Function" on page 22-21

**Conversion Rules**

- To convert `VARCHAR2` to `RAW`, use the `UTL_I18N.STRING_TO_RAW` function to perform the following steps:
  1. Convert `VARCHAR2` in the current database character set to `VARCHAR2` in the AL32UTF8 database character.
  2. Convert `VARCHAR2` in the AL32UTF8 database character set to `RAW`.

  Syntax example:

  ```sql
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert `RAW` to `VARCHAR2`, use the `UTL_I18N.RAW_TO_CHAR` function to perform the following steps:
  1. Convert `RAW` to `VARCHAR2` in the AL32UTF8 database character set.
  2. Convert `VARCHAR2` in the AL32UTF8 database character set to `VARCHAR2` in the database character set you wish to use.

  Syntax example:

  ```sql
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```
If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

See Also: Chapter 157, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.
Summary of DBMS_CRYPTO Subprograms

Table 22–10  DBMS_CRYPTO Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECRYPT Function on page 22-11</td>
<td>Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)</td>
</tr>
<tr>
<td>DECRYPT Procedures on page 22-13</td>
<td>Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Function on page 22-14</td>
<td>Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Procedures on page 22-16</td>
<td>Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>HASH Function on page 22-17</td>
<td>Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data</td>
</tr>
<tr>
<td>MAC Function on page 22-19</td>
<td>Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection</td>
</tr>
<tr>
<td>RANDOMBYTES Function on page 22-21</td>
<td>Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys</td>
</tr>
<tr>
<td>RANDOMINTEGER Function on page 22-22</td>
<td>Returns a random BINARY_INTEGER</td>
</tr>
<tr>
<td>RANDOMNUMBER Function on page 22-23</td>
<td>Returns a random 128-bit integer of the NUMBER datatype</td>
</tr>
</tbody>
</table>
DECYPRT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv  IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragma

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

```
Table 22–11  DECRYPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be decrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>
```

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  **See Also:** "Usage Notes" for the ENCRYPT function on page 22-14 for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.
See Also: "Conversion Rules" on page 22-8 for a discussion of the VARCHAR2 to RAW conversion process.
DECrypt Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

```
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is all zeroes.</td>
</tr>
</tbody>
</table>
```
ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv  IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be encrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 22–7 and Table 22–8 on page 22-5 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:
DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES + DBMS_CRYPTO.CHAIN_CBC + DBMS_CRYPTO.PAD_NONE;

See Table 22–6 on page 22-5 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

  **See Also:** "Conversion Rules" on page 22-8 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.
ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

```
DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            CLOB         CHARACTER SET ANY_CS,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Conversion Rules" on page 22-8 for usage notes about using the ENCRYPT procedure.
HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a hash value. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to “When to Use Hash or Message Authentication Code (MAC) Functions” on page 22-7 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 22–3 on page 22-4.

Syntax

```
DBMS_CRYPTO.Hash (  
    src IN RAW,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

```
DBMS_CRYPTO.Hash (  
    src IN BLOB,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

```
DBMS_CRYPTO.Hash (  
    src IN CLOB CHARACTER SET ANY_CS,  
    typ IN PLS_INTEGER)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```
Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The source data to be hashed.</td>
</tr>
<tr>
<td>typ</td>
<td>The hash algorithm to be used.</td>
</tr>
</tbody>
</table>

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, HASH_SH1, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.
MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 22-17, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 22-7 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 22–4 on page 22-4 for a list of MAC algorithms that have been defined for this package.

Syntax

DBMS_CRYPTO.MAC (  
  src IN RAW,  
  typ IN PLS_INTEGER,  
  key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
  src IN BLOB,  
  typ IN PLS_INTEGER  
  key IN RAW)  
RETURN RAW;

DBMS_CRYPTO.MAC (  
  src IN CLOB CHARACTER SET ANY_CS,  
  typ IN PLS_INTEGER  
  key IN RAW)  
RETURN RAW;

Pragmas

pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Source data to which MAC algorithms are to be applied.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>typ</td>
<td>MAC algorithm to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for MAC algorithm.</td>
</tr>
</tbody>
</table>

*Table 22–16  MAC Function Parameters*
RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator), and it draws its entropy (seed) from the sqlnet.ora file parameter SQLNET.CRYPTO_SEED.

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
   number_bytes IN POSITIVE)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_bytes</td>
<td>The number of pseudo-random bytes to be generated.</td>
</tr>
</tbody>
</table>

Usage Note

- The number_bytes value should not exceed the maximum length of a RAW variable.
- The SQLNET.CRYPTO_SEED parameter can be set by entering 10 to 70 random characters with the following syntax in the sqlnet.ora file:

  SQLNET.CRYPTO_SEED = <10 to 70 random characters>

  **See Also:** Oracle Advanced Security Administrator’s Guide for more information about the SQLNET.CRYPTO_SEED parameter and its use.
RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle
BINARY_INTEGER datatype.

Syntax

DBMS_CRYPTO.RANDOMINTEGER
    RETURN BINARY_INTEGER;

Pragmas

pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of [0..2**128-1].

Syntax

```sql
DBMS_CRYPTO.RandomNumber
RETURN NUMBER;
```

Pragmas

```sql
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```
RANDOMNUMBER Function
Oracle Data Mining (ODM) is designed for programmers, systems analysts, project managers, and others interested in developing database applications that use data mining to discover hidden patterns and use that knowledge to make predictions.

This chapter contains the following topics:

- Using DBMS_DATA_MINING
  - Overview
  - Constants
  - Data Types
  - Exceptions
  - User Views
  - Constants
- Summary of DBMS_DATA_MINING Subprograms
Overview

Oracle Data Mining (ODM) embeds data mining in the Oracle database. The data never leaves the database — the data, its preparation, model building, and model scoring activities all remain in the database. This enables Oracle to provide an infrastructure for data analysts and application developers to integrate data mining seamlessly with database applications.

ODM provides two interfaces that support in-database data mining: a Java interface and a PL/SQL interface. The Java interface is described in Oracle Data Mining Application Developer's Guide.

You can use the package to build a mining model, test the model, and apply this model to your data to obtain predictive and descriptive information. For detailed examples of how to perform these tasks, see the sample programs in Oracle Data Mining Application Developer’s Guide. The sample code is in the demo directory.

General information about both the Java and the PL/SQL interface is contained in Oracle Data Mining Application Developer’s Guide. See Oracle Data Mining Concepts for a discussion of data mining concepts.

This chapter contains an overview of the development methodology, followed by information on data types, settings, and constants, as well as detailed descriptions of the PL/SQL subprograms. The DBMS_DATA_MINING_TRANSFORM package supports data pre-processing for data mining.
Constants

Table 23–1 through Table 23–8 list the constants to be used for various settings in the settings table.

**Table 23–1  DBMS_DATA_MINING Constants Summary: Mining Function**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>association</td>
<td>Parameter value for mining function in CREATE_MODEL, representing association mining function.</td>
</tr>
<tr>
<td>attribute_importance</td>
<td>Parameter value for mining function in CREATE_MODEL, representing attribute importance mining function.</td>
</tr>
<tr>
<td>classification</td>
<td>Parameter value for mining function in CREATE_MODEL, representing classification mining function.</td>
</tr>
<tr>
<td>regression</td>
<td>Parameter value for mining function in CREATE_MODEL, representing regression mining function.</td>
</tr>
<tr>
<td>clustering</td>
<td>Parameter value for mining function in CREATE_MODEL, representing clustering mining function.</td>
</tr>
<tr>
<td>feature_extraction</td>
<td>Parameter value for mining function in CREATE_MODEL, representing feature extraction mining function.</td>
</tr>
</tbody>
</table>

**Table 23–2  DBMS_DATA_MINING Constants Summary: Function Settings**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clas_priors_table_name</td>
<td>Setting name representing prior probability table name for classification function.</td>
</tr>
<tr>
<td>clus_num_clusters</td>
<td>Setting name representing number of clusters for clustering function.</td>
</tr>
<tr>
<td>feat_num_features</td>
<td>Setting name representing number of features for feature selection function.</td>
</tr>
<tr>
<td>asso_max_rule_length</td>
<td>Setting name representing maximum rule length.</td>
</tr>
<tr>
<td>asso_min_confidence</td>
<td>Setting name representing minimum confidence.</td>
</tr>
<tr>
<td>asso_min_support</td>
<td>Setting name representing minimum support.</td>
</tr>
</tbody>
</table>
## Constants

| Table 23–3  DBMS_DATA_MINING Constants Summary: Algorithm Settings |
|---------------------------------|---------------------------------|
| **Constant**                     | **Purpose**                     |
| algo_name                        | Setting name representing the mining algorithm. |
| algo_apriori_association_rules   | Setting value for Apriori algorithm for association rules. |
| algo_naive_bayes                 | Setting value for Naive Bayes (NB) algorithm for classification. |
| algo_support_vector_machines     | Setting value for Support Vector Machines (SVM) algorithm for classification or regression. |
| algo_nonnegative_matrix_factor   | Setting value for Non-Negative Matrix Factorization (NMF) for feature selection. |
| algo_kmeans                      | Setting value for $k$-Means (KM) for clustering. |
| algo_ai_mdl                      | Setting value for Minimum Description Length based algorithm for Attribute Importance. |

| Table 23–4  DBMS_DATA_MINING Constants Summary: Adaptive Bayes Network |
|---------------------------------|---------------------------------|
| **Constant**                     | **Purpose**                     |
| abns_model_type                  | Setting name representing ABN model type. |
| abns_single_feature              | Setting value representing single feature ABN model. |
| abns_multi_feature               | Setting value representing multi feature ABN model. |
| abns_naive_bayes                 | Setting value representing Naive Bayes ABN model. |
| abns_max_build_minutes           | Setting name representing maximum time threshold to complete an ABN model build. |
| abns_max_nb_predictors           | Setting name representing the maximum number of Naive Bayes predictors to be considered for building an ABN model of type abns_naive_bayes. |

| Table 23–5  DBMS_DATA_MINING Constants Summary: Naive Bayes |
|---------------------------------|---------------------------------|
| **Constant**                     | **Purpose**                     |
| nabs_singleton_threshold         | Setting value for singleton threshold for Naive Bayes. |
| nabs_pairwise_threshold          | Setting value for pair-wise threshold for Naive Bayes. |
### Table 23–6  DBMS_DATA_MINING Constants Summary: Support Vector Machines

<table>
<thead>
<tr>
<th>Constant</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>svms_kernel_function</td>
<td>Setting name representing the kernel function for SVM.</td>
</tr>
<tr>
<td>svms_linear</td>
<td>Setting value for Linear Kernel for SVM.</td>

<tr>
<td>kmns_cosine</td>
<td>Setting value representing cosine distance function.</td>
</tr>
<tr>
<td>kmns_fast_cosine</td>
<td>Setting value representing fast cosine distance function.</td>
</tr>
<tr>
<td>kmns_iterations</td>
<td>Setting name representing number of iterations.</td>
</tr>
<tr>
<td>kmns_conv_tolerance</td>
<td>Setting name representing convergence tolerance.</td>
</tr>
<tr>
<td>kmns_split_criterion</td>
<td>Setting name representing split criterion.</td>
</tr>
<tr>
<td>kmns_variance</td>
<td>Setting value representing variance as the split criterion.</td>
</tr>
</tbody>
</table>
The `DBMS_DATA_MINING` and the `DBMS_DATA_MINING_TRANSFORM` packages use the data types shown in Table 23–9.

### Table 23–9  `DBMS_DATA_MINING` Summary of Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ABN_Detail</td>
<td>This type represents each row of the model detail output generated by <code>GET_MODEL_DETAILS_ABN</code>.</td>
</tr>
<tr>
<td>DM_ABN_Details</td>
<td>This type represents the ABN model details generated by <code>GET_MODEL_DETAILS_ABN</code>.</td>
</tr>
<tr>
<td>DM_Centroid</td>
<td>This type represents the centroid of a cluster. It is used when retrieving cluster details using <code>GET_MODEL_DETAILS_KM</code>.</td>
</tr>
<tr>
<td>DM_Child</td>
<td>This type represents each child node of a cluster.</td>
</tr>
<tr>
<td>DM_Children</td>
<td>This type represents a set of children nodes for a given cluster identifier.</td>
</tr>
<tr>
<td>DM_Cluster</td>
<td>This type represents a cluster retrieved using <code>GET_MODEL_DETAILS_KM</code>.</td>
</tr>
<tr>
<td>DM_Clusters</td>
<td>This type represents a set of clusters.</td>
</tr>
<tr>
<td>DM_Conditional</td>
<td>This type represents each conditional probability from a set of conditional probabilities associated with each mining attribute used in a Naive Bayes or Adaptive Bayes Network model.</td>
</tr>
<tr>
<td>DM_Conditionals</td>
<td>This type represents conditional probabilities associated with a given mining attribute used in a Naive Bayes or Adaptive Bayes Network model. It is used when retrieving model details using <code>GET_MODEL_DETAILS_NB</code> or <code>GET_MODEL_DETAILS_ABN</code> respectively.</td>
</tr>
</tbody>
</table>
### Table 23–9  DBMS_DATA_MINING Summary of Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_Histogram_Bin</td>
<td>This type represents a histogram associated with a cluster identifier. It is used when retrieving cluster details using GET_MODELDETAILS_KM.</td>
</tr>
<tr>
<td>DM_Histograms</td>
<td>This type represents a set of histograms.</td>
</tr>
<tr>
<td>DM_Item</td>
<td>This type represents an item in a set of items.</td>
</tr>
<tr>
<td>DM_Items</td>
<td>This type represents the set of items in an ItemSet.</td>
</tr>
<tr>
<td>DM_ItemSet</td>
<td>This type represents an ItemSet.</td>
</tr>
<tr>
<td>DM_ItemSets</td>
<td>This type represents frequent itemsets in Association models.</td>
</tr>
<tr>
<td>DM_Model_Settings</td>
<td>This type represents the algorithm settings retrieved using the GET_MODEL_SETTINGS function.</td>
</tr>
<tr>
<td>DM_Model_Signature</td>
<td>This type represents a list of model signature attributes generated by GET_MODEL_SIGNATURE.</td>
</tr>
<tr>
<td>DM_Modelname_List</td>
<td>This type represents a list of model names provided as input for the parameter model_names in EXPORT_MODEL and IMPORT_MODEL procedures.</td>
</tr>
<tr>
<td>DM_NB_Detail</td>
<td>This type represents the each row of the model detail output generated by GET_MODELDETAILS_NB.</td>
</tr>
<tr>
<td>DM_NB_Details</td>
<td>This type represents the NB model details generated by GET_MODELDETAILS_NB.</td>
</tr>
<tr>
<td>DM_Nested_Categoricals</td>
<td>This type represents a nested table of categorical attributes, used for representing wide data.</td>
</tr>
<tr>
<td>DM_Nested_Numericals</td>
<td>This type represents a nested table of numerical attributes, used for representing wide data.</td>
</tr>
<tr>
<td>DM_NMF_Attribute</td>
<td>This type represents each attribute in an attribute set for NMF model details.</td>
</tr>
<tr>
<td>DM_NMF_Attribute_Set</td>
<td>This type represents a set of attributes that correspond to a feature identifier, returned by GET_MODELDETAILS_NMF.</td>
</tr>
<tr>
<td>DM_NMF_Feature</td>
<td>This type represents a feature in a NMF model.</td>
</tr>
<tr>
<td>DM_NMF_Feature_Set</td>
<td>This type represents a set of features returned by GET_MODELDETAILS_NMF.</td>
</tr>
<tr>
<td>DM_Predicate</td>
<td>This type represents each predicate in the set of predicates in a rule.</td>
</tr>
</tbody>
</table>
### Data Types

</tr>
</tbody>
</table>

Operational Notes

The development methodology for data mining using the DBMS_DATA_MINING interface is divided into two phases.

The first phase includes your application data analysis and design, where you perform the following two steps:

1. Analyze your problem, and choose the mining function and algorithm.
2. Analyze the data to be used for building mining models (build data), testing predictive models (test data), and the new data on which the model will be applied (scoring data).

The second phase involves developing a mining application using DBMS_DATA_MINING and DBMS_DATA_MINING_TRANSFORM packages.

3. Prepare the build, test, and scoring data using the DBMS_DATA_MINING_TRANSFORM package or other third-party tool or direct SQL or PL/SQL utility scripts in a manner suitable for the chosen mining function and algorithm. An important caveat is that the three datasets referred to earlier have to be prepared in an identical manner for mining results to be meaningful. This is an optional step, required only if your data is not prepared for mining.
4. Prepare a settings table that overrides the default mining algorithm for a given mining function, and the default algorithm settings. This is also an optional step.

5. Build a mining model for the given training dataset.

6. For predictive models (classification and regression), test the model for its accuracy and measures of performance. This amounts to applying the model on the test data (that is, scoring the test data), and computing various metrics on the apply results.

7. Retrieve the model signature to determine the mining attributes that will be used by a given model for scoring. This information will help ascertain that the scoring data is suitable for a given model. This is an optional step.

8. Apply a classification, regression, clustering, or feature extraction model to new data to generate predictions and/or descriptive summaries and patterns about the data.

9. Retrieve the model details to understand why a model scored the data in a particular manner. This is an optional step.

10. Repeat steps 3 through 9 until you obtain satisfactory results.

See Oracle Data Mining Application Developer’s Guide for more general discussion of the PL/SQL interface to Oracle Data Mining.

**Settings Table**

The settings table is a simple relational table with a fixed schema. You can choose the name of the settings table, but the column names and their types must be defined as specified:

```sql
(setting_name VARCHAR2(30),
setting_value VARCHAR2(128))
```

The values provided in the settings table override the default values assumed by the system. The values inserted into the setting_name column are one or more of several constants defined in the DBMS_DATA_MINING package. Depending on what the setting name denotes, the value for the setting_value column can be a predefined constant or the actual numerical or string value corresponding to the setting itself. The setting_value column is defined to be VARCHAR2, so you must cast numerical inputs to string using the TO_CHAR function before input into the settings table.
Table 23-12 through Table 23-17 list the various setting names and the valid setting values, with a brief explanation of each setting.

</tr>
<tr>
<td></td>
<td>Default value is kmns_variance.</td>
</tr>
</tbody>
</table>
You can create a settings table as shown in the example that follows for an SVM classification model, and edit the individual values using SQL DML.

```
CREATE TABLE drugstore_settings (
    setting_name VARCHAR2(30),
    setting_value VARCHAR2(128)
)
BEGIN
    -- override the default for convergence tolerance for SVM Classification
    INSERT INTO drugstore_model_settings (setting_name, setting_value) VALUES (dbms_data_mining.svms_conv_tolerance, TO_CHAR(0.081));
    COMMIT;
END;
```

### kmns_num_bins

- **Number of histogram bins.** Specifies the number of bins in the attribute histogram produced by k-Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin.

  - Range: > 0.
  - Default value: 10.

### kmns_block_growth

- **Growth factor for memory allocated to hold cluster data.**
- **TO_CHAR(1 < numeric_expr <= 5)**

### kmns_min_pct_attr_support

- **Minimum percentage support required for attributes in rules.** Specifies the minimum percentage of values for an attribute in a given cluster required to include this attribute in the rule description of the cluster.

  - That is, if the required support level is not met, the attribute would be omitted from the rule. This would allow retaining in the rule only the well-represented attributes. Setting the parameter value too high in data with missing values can result in very short or even empty rules.

  - Range: >= 0 and <= 1.
  - Default: 0.1.
The table function `GET_DEFAULT_SETTINGS` provides you all the default settings for mining functions and algorithms. If you intend to override all the default settings, you can create a seed settings table and edit them using SQL DML.

```sql
BEGIN
    CREATE TABLE drug_store_settings AS
    SELECT setting_name, setting_value
    FROM TABLE (DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
                WHERE setting_name LIKE 'SVMS_%');
    -- update the values using appropriate DML
END;
```

You can also create a settings table based on another model's settings using `GET_MODEL_SETTINGS`, as shown in the following example:

```sql
BEGIN
    CREATE TABLE my_new_model_settings AS
    SELECT setting_name, setting_value
    FROM TABLE (DBMS_DATA_MINING.GET_MODEL_SETTINGS('my_other_model'));
END;
```

### Prior Probabilities Table

Consult *Oracle Data Mining Concepts* for an explanation of the prior probabilities table. You can specify a prior probabilities table as an optional function setting when building classification models.

You must create the prior probabilities table using the fixed schema shown in the following code samples. For numerical targets, use the following schema:

```
target_value      NUMBER
prior_probability  NUMBER
```

For categorical targets, use the following schema:

```
target_value      VARCHAR2
prior_probability  NUMBER
```

Next, provide the name of the prior probabilities table as input to the `setting_value` column in the settings table, with the corresponding value for the `setting_name` column to be `DBMS_DATA_MINING.clas_priors_table_name`, as shown:

```sql
BEGIN
    INSERT INTO drugstore_settings (setting_name, setting_value)
    VALUES (DBMS_DATA_MINING.class_priors_table_name, 'census_priors');
END;
```
COMMIT;
END;

Cost Matrix Table

Consult Oracle Data Mining Concepts for an explanation of the cost matrix. You must create a cost matrix table with the fixed schema shown in the following code samples. For numerical targets, use the following schema:

```
actual_target_value    NUMBER
predicted_target_value NUMBER
cost                   NUMBER
```

For categorical targets, use the following schema:

```
actual_target_value    VARCHAR2
predicted_target_value VARCHAR2
cost                   NUMBER
```

The DBMS_DATA_MINING package enables you to evaluate the cost of predictions from classification models in an iterative manner during the experimental phase of mining, and to eventually apply the optimal cost matrix to predictions on the actual scoring data in a production environment.

The data input to each COMPUTE procedure in the package is the result generated from applying the model on test data. In addition, if you also provide a cost matrix as an input, the COMPUTE procedure generates test results taking the cost matrix into account. This enables you to experiment with various costs for a given prediction against the same APPLY results, without rebuilding the model and applying it against the same test data for every iteration.

Once you arrive at an optimal cost matrix, you can then input this cost matrix to the RANK_APPLY procedure along with the results of APPLY on your scoring data. RANK_APPLY will provide your new data ranked by cost.
### Summary of DBMS_DATA_MINING Subprograms

</tbody>
</table>
**APPLY Procedure**

This procedure applies a mining model to the data to be scored, and generates the APPLY results in a table. This operation is applicable for predictive models (classification, regression) and also for descriptive models (clustering, feature extraction).

**Syntax**

```sql
DBMS_DATA_MINING.APPLY (  
    model_name           IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of table or view representing data to be scored.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column.</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table to store apply results.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema containing the data to be scored.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The data provided for APPLY should match the data provided to CREATE_MODEL in terms of the schema definition and relevant content. The GET_MODEL_SIGNATURE function provides this information. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing. The case identifier is not considered to be a mining attribute during APPLY.

You must provide the name of the table in which the results of the apply operation are to be stored. APPLY creates a table with an algorithm-specific fixed schema in the user schema that owns the model.
The behavior of an APPLY operation is analogous to a SQL query operation, even though it is packaged as a procedure. It does not update the model contents and does not have any contention with CREATE_MODEL, DROP_MODEL, or RENAME_MODEL operations. The corollary is that if you potentially drop or rename a model while a model is being applied to scoring data, the APPLY operation may discontinue with partial or unpredictable results.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will match the case identifier column name provided by you. The type of incoming case-id column is preserved in Apply output.

**Classification Algorithms**
The table containing the APPLY results for all classification models has the same schema. For numerical targets, the results table will have the schema as shown:

```
case_id VARCHAR2/NUMBER
prediction NUMBER
probability NUMBER
```

For categorical targets, the results table will have the following schema:

```
case_id VARCHAR2/NUMBER
prediction VARCHAR2
probability NUMBER
```

**Regression using Support Vector Machines**
The results table will have the following schema:

```
case_id VARCHAR2/NUMBER
prediction NUMBER
```

**Clustering using k-Means**
Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table will have the schema as shown:

```
case_id VARCHAR2/NUMBER
cluster_id NUMBER
probability NUMBER
```

**Feature Extraction using NMF**
Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier
corresponding to a case, and the associated match quality. The results table will have the schema as shown:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>case_id</td>
<td>VARCHAR2/NUMBER</td>
</tr>
<tr>
<td>feature_id</td>
<td>NUMBER</td>
</tr>
<tr>
<td>match_quality</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

**Examples**

BEGIN

/* build a model with name census_model. */
(See example under CREATE_MODEL)
*/

/* if build data was pre-processed in any manner, 
* perform the same pre-processing steps on the 
* scoring data also. */
(See examples in the section on DBMS_DATA_MINING_TRANSFORM)
*/

/* apply the model to data to be scored */
dbms_data_mining.apply(
    model_name => 'census_model',
    data_table_name => 'census_2d_apply',
    case_id_column_name => 'person_id',
    result_table_name => 'census_apply_result');
END;
/

-- View Apply Results
SELECT case_id, prediction, probability
FROM census_apply_result;
CREATE_MODEL Procedure

This procedure creates a mining model for a given mining function using a specified mining algorithm.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
    model_name            IN VARCHAR2,
    mining_function       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    case_id_column_name   IN VARCHAR2,
    target_column_name    IN VARCHAR2 DEFAULT NULL,
    settings_table_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    settings_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
<tr>
<td>mining_function</td>
<td>Constant representing the mining function.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table or view containing the training data.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of the target column — NULL for descriptive models.</td>
</tr>
<tr>
<td>settings_table_name</td>
<td>Name of the table or view containing algorithm settings.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the training data.</td>
</tr>
<tr>
<td>settings_schema_name</td>
<td>Name of the schema hosting the settings table/view.</td>
</tr>
</tbody>
</table>

Usage Notes

The data provided to all subsequent operations such as APPLY must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to subsequent operations such as APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing. The case identifier column is not considered to be a mining attribute during CREATE_MODEL.
You can view the default settings for each algorithm through `GET_DEFAULT_SETTINGS`. You can override the defaults by providing a settings table specifying your choice of mining algorithm and relevant overriding algorithm settings.

Once a model has been built, information about the attributes used for model build can be obtained from `GET_MODEL_SIGNATURE`. To inspect or review model contents, you can use any of the algorithm-specific `GET_MODEL_DETAILS` functions.

The behavior of the `CREATE_MODEL` is analogous to a SQL DDL `CREATE` operation. It contends with `RENAME_MODEL` and `DROP_MODEL` operations.

**Note:** The `CREATE_MODEL` operation creates a set of system tables in the owner’s schema to store the patterns and information that constitutes a mining model for a particular algorithm. The names of these tables have the prefix `DM$.` The number, schema, and content of these tables is Oracle proprietary and may change from release to release. You must not direct any queries or updates against these system tables.

### Examples

Assume that you need to build a classification model using Support Vector Machines algorithm.

```sql
/* prepare a settings table to override default */
/* settings (Naïve Bayes is the default classifier) */
CREATE TABLE census_settings (  
  setting_name VARCHAR2(30),  
  setting_value VARCHAR2(128));

BEGIN  
  /* indicate that SVM is the chosen classifier */  
  INSERT INTO census_settings VALUES (  
    dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);  
  /* override the default value for complexity factor */  
  INSERT INTO census_settings (setting_name, setting_value) VALUES (dbms_data_mining.svms_complexity_factor, TO_CHAR(0.081));

  COMMIT;

  /* build a model with name census_model */
  dbms_data_mining.create_model(  
    model_name => 'census_model',  
    mining_function => DBMS_DATA_MINING.CLASSIFICATION,  
    data_table_name => 'census_2d_build',
```
CREATE_MODEL Procedure

    case_id_column_name => 'person_id',
    target_column_name => 'class',
    settings_table_name => 'census_settings');
END;
/
**COMPUTE_CONFUSION_MATRIX Procedure**

This procedure computes the confusion matrix for a classification model and also provides the accuracy of the model. See Oracle Data Mining Concepts for a description of confusion matrix.

The inputs are a table containing the results of applying the model on the test data, and a table that contains only the target and case identifier columns from the test data.

**Syntax**

```sql
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (  
    accuracy                     OUT NUMBER,  
    apply_result_table_name      IN  VARCHAR2,  
    target_table_name            IN  VARCHAR2,  
    case_id_column_name          IN  VARCHAR2,  
    target_column_name           IN  VARCHAR2,  
    confusion_matrix_table_name  IN  VARCHAR2,  
    score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',  
    score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',  
    cost_matrix_table_name       IN  VARCHAR2 DEFAULT NULL,  
    apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,  
    target_schema_name           IN  VARCHAR2 DEFAULT NULL,  
    cost_matrix_schema_name      IN  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accuracy</td>
<td>Accuracy of the model.</td>
</tr>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes).</td>
</tr>
<tr>
<td>target_table_name</td>
<td>Name of the table or view containing only the case identifier column and target column values (see Usage Notes for required schema specification).</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of the target column.</td>
</tr>
</tbody>
</table>
Usage Notes

You can also provide a cost matrix as an optional input in order to have the cost of predictions reflected in the results.

It is important to note that the data inputs to COMPUTE_CONFUSION_MATRIX do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the confusion matrix and accuracy as outputs. The quality of the results is dependent on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

Before you use the COMPUTE_CONFUSION_MATRIX procedure, you must prepare two data input streams from your test data.

---

<tr>
<td>cost_matrix_table_name</td>
<td>Name of the fixed-schema cost matrix table.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Name of the schema hosting the targets table.</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table.</td>
</tr>
</tbody>
</table>
First, you must APPLY the model on your test data. The parameter `apply_result_table_name` in the `COMPUTE_CONFUSION_MATRIX` procedure represents the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. The parameter `target_table_name` reflects this input. The schema for this view or table name for a numerical target attribute is:

```
(case_identifier_column_name VARCHAR2/NUMBER,
 target_column_name NUMBER)
```

The schema for this view or table name for a categorical target attribute is:

```
(case_identifier_column_name VARCHAR2/NUMBER,
 target_column_name NUMBER)
```

You must provide the name of the table in which the confusion matrix is to be generated. The resulting fixed schema table will always be created in the schema owning the model.

For numerical target attributes, the confusion matrix table will have the schema:

```
(actual_target_value NUMBER,
predicted_target_value NUMBER,
value NUMBER)
```

For categorical target attributes, the confusion matrix table will have the schema:

```
(actual_target_value VARCHAR2,
predicted_target_value VARCHAR2,
value NUMBER)
```

**Examples**

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```sql
DECLARE
    v_sql_stmt VARCHAR2(4000);
    v_accuracy NUMBER;
BEGIN

    /* apply the model census_model on test data */
    dbms_data_mining.apply(
        model_name => 'census_model',
```
data_table_name => 'census_2d_test',
case_id_column_name => 'person_id',
result_table_name => 'census_test_result');
CREATE VIEW census_2d_test_view as select person_id, class from census_2d_test;

/* now compute the confusion matrix from the two
 * data streams, also providing a cost matrix as input.
 */
dbms_data_mining.compute_confusion_matrix (  
  accuracy => v_accuracy,
  apply_result_table_name => 'census_test_result',
  target_table_name => 'census_2d_test_view',
  case_id_column_name => 'person_id',
  target_column_name => 'class',
  confusion_matrix_table_name => 'census_confusion_matrix',
  cost_matrix_table_name => 'census_cost_matrix');

dbms_output.put_line('Accuracy of the model: ' || v_accuracy);
END;
/

-- View the confusion matrix using Oracle SQL
SELECT actual_target_value, predicted_target_value, value  
FROM census_confusion_matrix;
COMPUTE_LIFT Procedure

This procedure computes a lift table for a given positive target for a classification model. See Oracle Data Mining Concepts for a description of lift.

The inputs are a table containing the results of applying the model on the test data, and a table that contains only the target and case identifier columns from the test data.

Syntax

```
DBMS_DATA_MINING.COMPUTE_LIFT (
    apply_result_table_name      IN VARCHAR2,
    target_table_name            IN VARCHAR2,
    case_id_column_name          IN VARCHAR2,
    target_column_name           IN VARCHAR2,
    lift_table_name              IN VARCHAR2,
    positive_target_value        IN VARCHAR2,
    score_column_name            IN VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name  IN VARCHAR2 DEFAULT 'PROBABILITY',
    num_quantiles                IN NUMBER DEFAULT 10,
    cost_matrix_table_name       IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name     IN VARCHAR2 DEFAULT NULL,
    target_schema_name           IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes).</td>
</tr>
<tr>
<td>target_table_name</td>
<td>Name of the table or view containing only the case identifier column and target column values (see Usage Notes for required schema specification).</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of the target column.</td>
</tr>
</tbody>
</table>

You can also provide a cost matrix as an optional input to have the cost of predictions reflected in the results.

It is important to note that the data inputs to COMPUTE_LIFT do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the lift table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

### Usage Notes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lift_table_name</td>
<td>Name of the table into which the lift table is to be generated.</td>
</tr>
<tr>
<td>positive_target_value</td>
<td>Value of the positive target. If the target column is of NUMBER type, use TO_CHAR() operator to provide the value as a string.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.</td>
</tr>
<tr>
<td>num_quantiles</td>
<td>Number of quantiles required in the lift table.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Name of the schema hosting the targets table.</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table.</td>
</tr>
</tbody>
</table>
Before you use the `COMPUTE_LIFT` procedure, you must prepare two data input streams from your test data.

First, you must `APPLY` the model on your test data. The parameter `apply_result_table_name` in the `COMPUTE_LIFT` procedure represents the table that will be generated in your schema as a result of the `APPLY` operation.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. The parameter `target_table_name` reflects this input. The schema for this view or table name for a numerical target attribute is:

\[
\begin{align*}
\text{case_identifier_column_name} & \quad \text{VARCHAR2/NUMBER}, \\
\text{target_column_name} & \quad \text{NUMBER}
\end{align*}
\]

The schema for this view or table name for a categorical target attribute is:

\[
\begin{align*}
\text{case_identifier_column_name} & \quad \text{VARCHAR2/NUMBER}, \\
\text{target_column_name} & \quad \text{NUMBER}
\end{align*}
\]

You must provide the name of the table in which the lift table is to be generated. The resulting fixed schema table is always created in the schema that owns the model.

The resulting lift table will have the following schema:

\[
\begin{align*}
\text{quantile_number} & \quad \text{NUMBER}, \\
\text{quantile_total_count} & \quad \text{NUMBER}, \\
\text{quantile_target_count} & \quad \text{NUMBER}, \\
\text{percent_records_cumulative} & \quad \text{NUMBER}, \\
\text{lift_cumulative} & \quad \text{NUMBER}, \\
\text{target_density_cumulative} & \quad \text{NUMBER}, \\
\text{targets_cumulative} & \quad \text{NUMBER}, \\
\text{non_targets_cumulative} & \quad \text{NUMBER}, \\
\text{lift_quantile} & \quad \text{NUMBER}, \\
\text{target_density} & \quad \text{NUMBER}
\end{align*}
\]

The output columns are explained in *Oracle Data Mining Concepts*.

**Examples**

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
```

BEGIN

/* apply the model census_model on test data */
dbms_data_mining.apply(
    model_name => 'census_model',
    data_table_name => 'census_2d_test,
    case_id_column_name => 'person_id',
    result_table_name => 'census_test_result');

/* next create a view from test data that projects */
/* only the case identifier and target column */

/* now compute lift with the default 10 quantiles */
/* from the two data streams */
dbms_data_mining.compute_lift (
    apply_result_table_name => 'census_test_result',
    target_table_name => 'census_2d_test_view',
    case_id_column_name => 'person_id',
    target_column_name => 'class',
    lift_table_name => 'census_lift',
    positive_target_value => '1',
    cost_matrix_table_name => 'census_cost_matrix');
END;
/

-- View the lift table contents using SQL
SELECT *
FROM census_lift;
**COMPUTE_ROC Procedure**

This procedure computes the receiver operating characteristic (ROC) for a binary classification model. See *Oracle Data Mining Concepts* for a description of receiver operating characteristic.

The inputs are a table containing the results of applying the model on the test data, and a table that contains only the target and case identifier columns from the test data.

**Syntax**

```sql
DBMS_DATA_MINING.COMPUTE_ROC (  
  roc_area_under_curve         OUT NUMBER,  
  apply_result_table_name      IN  VARCHAR2,  
  target_table_name            IN  VARCHAR2,  
  case_id_column_name          IN  VARCHAR2,  
  target_column_name           IN  VARCHAR2,  
  roc_table_name               IN  VARCHAR2,  
  positive_target_value        IN  VARCHAR2,  
  score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',  
  score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',  
  apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,  
  target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roc_area_under_the_curve</td>
<td>A measure of model accuracy, specifically, the probability that the model will correctly rank a randomly chosen pair of rows of opposite classes.</td>
</tr>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes).</td>
</tr>
<tr>
<td>target_table_name</td>
<td>Name of the table or view containing only the case identifier column and target column values (see Usage Notes for required schema specification).</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column in the test data set.</td>
</tr>
</tbody>
</table>
Usage Notes

It is important to note that the data inputs to `COMPUTE_ROC` do not always have to be generated using `APPLY`. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the ROC table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to `CREATE_MODEL` in schema and relevant content. If the data provided as input to `CREATE_MODEL` has been pre-processed, then the data input to `APPLY` must also be pre-processed using the statistics from the `CREATE_MODEL` data pre-processing.

Before you use the `COMPUTE_ROC` procedure, you must prepare two data input streams from your test data.

First, you must `APPLY` the model on your test data. The parameter `apply_result_table_name` in the `COMPUTE_ROC` procedure represents the table that will be generated in your schema as a result of the `APPLY` operation.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. The parameter `target_table_name` reflects this input. The schema for this view or table name for a numerical target attribute is:

```plaintext
case_identifier_column_name VARCHAR2/NUMBER,
```

---

**Table 23–23 (Cont.) COMPUTE_ROC Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roc_table_name</td>
<td>Name of the table into which ROC results are to be generated.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Name of the column representing the score in the apply results table. In the fixed schema table generated by <code>APPLY</code>, this column has the name <code>PREDICTION</code>, which is the default.</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by <code>APPLY</code> for classification models, this column has the name <code>PROBABILITY</code>, which is the default. Values in this column must be represented numerically.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the <code>APPLY</code> results table.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Name of the schema hosting the targets table.</td>
</tr>
</tbody>
</table>
The schema for this view or table name for a categorical target attribute is:

\[
\begin{align*}
target\_column\_name & \quad \text{NUMBER} \\
\text{case\_identifier\_column\_name} & \quad \text{VARCHAR2/NUMBER}, \\
target\_column\_name & \quad \text{VARCHAR2}
\end{align*}
\]

You must provide the name of the table in which the ROC table is to be generated. The resulting fixed schema table will always be created in the schema that owns the model. The resulting ROC table will have the following schema:

\[
\begin{align*}
\text{probability} & \quad \text{NUMBER}, \\
\text{true\_positives} & \quad \text{NUMBER}, \\
\text{false\_negatives} & \quad \text{NUMBER}, \\
\text{false\_positives} & \quad \text{NUMBER}, \\
\text{true\_negatives} & \quad \text{NUMBER}, \\
\text{true\_positive\_fraction} & \quad \text{NUMBER}, \\
\text{false\_positive\_fraction} & \quad \text{NUMBER}
\end{align*}
\]

The output columns are explained in Table 23–24.

**Table 23–24  COMPUTE_ROC Output**

<table>
<thead>
<tr>
<th>Output Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>probability</td>
<td>Minimum predicted positive class probability resulting in a positive class prediction. Thus, different threshold values result in different hit rates and false_alarm_rates.</td>
</tr>
<tr>
<td>true_negatives</td>
<td>Negative cases in the test data with predicted probabilities below the probability_threshold (correctly predicted).</td>
</tr>
<tr>
<td>true_positives</td>
<td>Positive cases in the test data with predicted probabilities above the probability_threshold (correctly predicted).</td>
</tr>
<tr>
<td>false_negatives</td>
<td>Positive cases in the test data with predicted probabilities below the probability_threshold (incorrectly predicted).</td>
</tr>
<tr>
<td>false_positives</td>
<td>Negative cases in the test data with predicted probabilities above the probability_threshold (incorrectly predicted).</td>
</tr>
<tr>
<td>true_positive_fraction</td>
<td>( \text{true_positives}/(\text{true_positives} + \text{false_negatives}) )</td>
</tr>
<tr>
<td>false_positive_fraction</td>
<td>( \text{false_positives}/(\text{false_positives} + \text{true_negatives}) )</td>
</tr>
</tbody>
</table>
The typical use scenario is to examine the true_positive_fraction and false_positive_fraction to determine the most desirable probability_threshold. This threshold is then used to predict class values in subsequent apply operations. For example, to identify positively predicted cases in probability rank order from an apply result table, given a probability_threshold:

```
select case_id_column_name from apply_result_table_name where probability > probability_threshold order by probability DESC;
```

There are two procedures one might use to identify the most desirable probability_threshold. One procedure applies when the relative cost of positive class versus negative class prediction errors are known to the user. The other applies when such costs are not well known to the user. In the first instance, one can apply the relative costs to the ROC table to compute the minimum cost probability_threshold. Suppose the relative cost ratio, Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like:

```
WITH cost AS (  
  SELECT probability_threshold, 20 * false_negatives + false_positives cost  
  FROM ROC_table  
  GROUP BY probability_threshold),  
  minCost AS (  
    SELECT min(cost) minCost  
    FROM cost)  
  SELECT max(probability_threshold) probability_threshold  
  FROM cost, minCost  
  WHERE cost = minCost;
```

If relative costs are not well known, the user simply scans the values in the table (in sorted order) and makes a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable:

```
select * from ROC_table order by probability_threshold
```

**Examples**

Assume that you have built a classification model `census_model` using the SVM algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```sql
DECLARE  
  v_sql_stmt VARCHAR2(4000);  
  v_accuracy NUMBER;
BEGIN
```
/* apply the model census_model on test data */
DBMS_DATA_MINING.apply(
    model_name => 'census_model',
    data_table_name => 'census_2d_test',
    case_id_column_name => 'person_id',
    result_table_name => 'census_test_result');

/* next create a view from test data that projects *
* only the case identifier and target column *
*/
v_sql_stmt :=
'CREATE VIEW census_2d_test_view AS ' ||
'SELECT person_id, class FROM census_2d_test';
EXECUTE IMMEDIATE v_sql_stmt;

/* now compute the receiver operating characteristics from *
* the two data streams, also providing a cost matrix *
* as input. */
DBMS_DATA_MINING.compute_roc(
    accuracy => v_accuracy,
    apply_result_table_name => 'census_test_result',
    target_table_name => 'census_2d_test_view',
    case_id_column_name => 'person_id',
    target_column_name => 'class',
    roc_table_name => 'census_roc',
    cost_matrix_table_name => 'census_cost_matrix');
END;
/

-- View the ROC results using Oracle SQL
SELECT *
FROM census_roc;
This procedure drops an existing mining model from the user's schema.

**Syntax**

```sql
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

**Usage Notes**

You can use `DROP_MODEL` to drop an existing mining model.

The behavior of the `DROP_MODEL` is similar to a SQL DDL DROP operation. It blocks `RENAME_MODEL` and `CREATE_MODEL` operations. It does not block or block on `APPLY`, which is a SQL query-like operation that does not update any model data.

If an `APPLY` operation is using a model, and you attempt to drop the model during that time, the `DROP` will succeed and `APPLY` will return indeterminate results. This is in line with the conventional behavior in the RDBMS, where DDL operations do not block on Query operations.

**Examples**

Assume the existence of a model `census_model`. The following example shows how to drop this model.

```sql
BEGIN
    DBMS_DATA_MINING.drop_model(model_name => 'census_model');
END;
/
**EXPORT_MODEL Procedure**

This procedure exports specified data mining models into a dump file set.

**Syntax**

```sql
DBMS_DATA_MINING.EXPORT_MODEL (
    filename IN VARCHAR2,
    directory IN VARCHAR2,
    model_filter IN VARCHAR2 DEFAULT NULL,
    filesize IN VARCHAR2 DEFAULT NULL,
    operation IN VARCHAR2 DEFAULT NULL,
    remote_link IN VARCHAR2 DEFAULT NULL,
    jobname IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the dump file set must be unique in the directory. A dump file set may contain one or more files. The number of files in a file set is determined by the size of the exporting data and the specified file size (see filesize). If only one file is created, it is named <code>filename&gt;01.dmp</code>. If multiple files are created, they are named sequentially as <code>filename01.dmp</code>, <code>filename02.dmp</code>, and so forth.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of the directory object where the dump file set is to be located. The directory object must be created before export. You must have WRITE privileges on the directory object and the corresponding file system directory.</td>
</tr>
<tr>
<td>model_filter</td>
<td>Filter that specifies models to be exported. See Usage Notes for details.</td>
</tr>
<tr>
<td>filesize</td>
<td>Size of the dump file; may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). Defaults to 50 MB.</td>
</tr>
<tr>
<td>operation</td>
<td>Use one of the literals 'EXPORT'/'ESTIMATE'; defaults to 'EXPORT'.</td>
</tr>
<tr>
<td>remote_link</td>
<td>A valid DB link or NULL. When a DB link is provided, exporting DM models from a remote database is allowed. Defaults to NULL for local operations, namely, exporting models in the current database.</td>
</tr>
</tbody>
</table>
Use `EXPORT_MODEL` to export all or specific data mining models from the source. This procedure creates a dump file set that includes one or more files. The location of the dump files is specified by parameter `directory`, which is the name of a directory object created before this procedure is called. The user must have `WRITE` privileges on this directory object. The dump file name must be unique. When the export operation completes successfully, the dump file name is automatically expanded to `filename01.dmp` even if there is only one file in the dump set.

A log file is created for every successful export operation in the directory mapped by `directory`. If `jobname` is specified, the log is named `jobname.log`. If `jobname` is set to `NULL` (the default), the log is named as `USERNAME_exp_<nnnn>.log`, where `nnnn` is a number. If `jobname` is provided, it must be unique.

Parameter `model_filter` is used to specify models to be exported; its use is indicated in the following table:

**Table 23–27  Table MODEL_FILTER for Export**

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>Default. Export all models from the user schema.</td>
<td>none</td>
</tr>
<tr>
<td>ALL</td>
<td>Export all models from the user schema.</td>
<td>Same as NULL; useful to improve code readability.</td>
</tr>
<tr>
<td>A valid WHERE clause, such as:</td>
<td>Specify which models are to be exported.</td>
<td>Any string that can be appended to 'select name from dm_user_models where' and make it a valid SQL query.</td>
</tr>
</tbody>
</table>

Usage Notes

Use `EXPORT_MODEL` to export all or specific data mining models from the source. This procedure creates a dump file set that includes one or more files. The location of the dump files is specified by parameter `directory`, which is the name of a directory object created before this procedure is called. The user must have `WRITE` privileges on this directory object. The dump file name must be unique. When the export operation completes successfully, the dump file name is automatically expanded to `filename01.dmp` even if there is only one file in the dump set.

A log file is created for every successful export operation in the directory mapped by `directory`. If `jobname` is specified, the log is named `jobname.log`. If `jobname` is set to `NULL` (the default), the log is named as `USERNAME_exp_<nnnn>.log`, where `nnnn` is a number. If `jobname` is provided, it must be unique.

Parameter `model_filter` is used to specify models to be exported; its use is indicated in the following table:
EXPORT_MODEL is not mutually exclusive with the DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. In other words, if an export operation is currently underway and the model is dropped at that time, then the results in the exported dump file are unpredictable.

**Examples**

The following example shows exporting one model from the current user schema into a dump file. The dump file will be located in operating system directory /home/models, which is mapped to a directory object DM_DUMP. The directory object DM_DUMP must be created before executing the sample, and the user must be granted WRITE privileges on it.

```sql
DECLARE
    job_name VARCHAR2(32) := 'model_exp_001';
    filename VARCHAR2(32);
BEGIN
    filename := job_name;
    DBMS_DATA_MINING.export_model(
        filename => filename,
        directory => 'DM_DUMP',
        metadata_filter => 'name=\"NB_MODEL_01\"',
        remote_link => NULL,
        filesize => '30M',
        operation => 'EXPORT',
        job_name => job_name);
    dbms_output.put_line(
        'Export_model '||job_name||' completed sucessfully!');
```

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>'name= &quot;super_model&quot;'</td>
<td>Export the named model.</td>
<td>none</td>
</tr>
<tr>
<td>'name IN (&quot;modell&quot;,&quot;model2&quot;,&quot;model3&quot;)'</td>
<td>Export 3 named models.</td>
<td>none</td>
</tr>
<tr>
<td>'ALGORITHM_NAME= &quot;NAIVE_BAYES&quot;'</td>
<td>Export all NB models.</td>
<td>none</td>
</tr>
<tr>
<td>'FUNCTION_NAME=CLASSIFICATION'</td>
<td>Export all classification models.</td>
<td>none</td>
</tr>
<tr>
<td>'name LIKE &quot;NB_MODEL&quot;ESCAPE&quot;&quot;'</td>
<td>Export all models whose names start with &quot;NB_MODEL&quot;.</td>
<td>none</td>
</tr>
</tbody>
</table>
EXPORT_MODEL Procedure

END;
/

**GET_ASSOCIATION_RULES Function**

This table function returns the rules from an Association model. The rows are an enumeration of the rules generated during the creation of the model.

**Syntax**

```sql
DBMS_DATA_MINING.GET_ASSOCIATION RULES (model_name IN VARCHAR2)
RETURN DM_Rules pipelined;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_Rules</td>
<td>Represents a set of rows with schema:</td>
</tr>
<tr>
<td></td>
<td>(rule_id INTEGER,</td>
</tr>
<tr>
<td></td>
<td>antecedent DM_Predicates,</td>
</tr>
<tr>
<td></td>
<td>consequent DM_Predicates,</td>
</tr>
<tr>
<td></td>
<td>rule_support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>rule_confidence NUMBER)</td>
</tr>
<tr>
<td>DM_Predicates</td>
<td>Is a nested table with schema:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>conditional_oparator CHAR(2),</td>
</tr>
<tr>
<td></td>
<td>attribute_num_value NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_str_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_confidence NUMBER)</td>
</tr>
</tbody>
</table>
The table function pipes out rows with the schema:

```
rule_id           INTEGER,
antecedent        DM_Predicates,
consequent        DM_Predicates,
rule_support      NUMBER,
rule_confidence   NUMBER
```

`DM_Predicates` is a collection of `DM_Predicate` objects. When un-nested, each object maps to a row of the form:

```
attribute_name         INTEGER,
conditional_operator   CHAR(2),
attribute_num_value    NUMBER,
attribute_str_value    VARCHAR2,
attribute_support      NUMBER,
attribute_confidence   NUMBER
```

The significance of piped output is that each row is materialized by the table function as soon as it is read from model storage, without any latency or wait for the generation of the complete `DM_Rules` object. All GET operations use pipelining. For more information on pipelined, parallel table functions, consult the PL/SQL User’s Guide and Reference.

The examples shown in this section describe how to un-nest the values from each of the columns discussed earlier.

**Examples**

The following example demonstrates an Association model build followed by an invocation of `GET_ASSOCIATION_RULES` table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
  -- update the value of the minimum confidence
  UPDATE census_settings
```

23-46   PL/SQL Packages and Types Reference
SET setting_value = TO_CHAR(0.081)
WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build an AR model */
DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'market_model',
    function => DBMS_DATA_MINING.ASSOCIATION,
    data_table_name => 'market_build',
    case_id_column_name => 'item_id',
    target_column_name => NULL,
    settings_table_name => 'census_settings');
END;
/

-- View the (unformatted) rules from SQL/Plus
SELECT rule_id, antecedent, consequent, rule_support,
rule_confidence
FROM GET_ASSOCIATION_RULES('market_model'));

-- see ardemo.sql for retrieving formatted rules
/
GET_DEFAULT_SETTINGS Function

This table function returns all the default settings for all mining functions and algorithms supported in the DBMS_DATA_MINING package.

Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS;
```

Return Values

```
<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_Model_Settings</td>
<td>Represents a set of rows with schema:</td>
</tr>
<tr>
<td></td>
<td>(setting_name VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>setting_value VARCHAR2(128))</td>
</tr>
</tbody>
</table>
```

Pragmas

RNDS, WNDS, RNPS, WNPS

Usage Notes

The table function pipes out rows with the schema:

```
{setting_name VARCHAR2(30),
 setting_value VARCHAR2(128)}
```

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

Examples

For example, if you want to override some or all of k-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
    CREATE TABLE mysettings AS
    SELECT * FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
```

---

23-48 PL/SQL Packages and Types Reference
WHERE setting_name LIKE 'KMNS%';
-- now update individual settings as required
UPDATE mysettings
  SET setting_value = 0.02
  WHERE setting_name = dbms_data_mining.kmns_min_pct_attr_support;
END;
/

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. The rows are an enumeration of the frequent itemsets generated during the creation of the model. For a detailed description of frequent itemsets, consult Oracle Data Mining Concepts.

Syntax

```sql
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (  
    model_name IN VARCHAR2) 
RETURN DM_ItemSets pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ItemSets</td>
<td>Represents a set of rows with schema:</td>
</tr>
<tr>
<td></td>
<td>(itemsets_id NUMBER,</td>
</tr>
<tr>
<td></td>
<td>items DM_items,</td>
</tr>
<tr>
<td></td>
<td>support NUMBER,</td>
</tr>
<tr>
<td></td>
<td>number_of_items NUMBER)</td>
</tr>
</tbody>
</table>

Pragmas

RNDS, WNDS, RNPS, WNPS

Usage Notes

The table function pipes out rows with the schema:

```sql
     (itemsets_id NUMBER, 
     items DM_items, 
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
support NUMBER,
number_of_items NUMBER)

DM_Items is a nested table of VARCHAR2 strings representing individual item names.

The examples shown in this section describe how to un-nest the values from each of the columns discussed in the preceding sections.

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```sql
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
  -- update the value of the minimum confidence
  UPDATE census_settings
  SET setting_value = TO_CHAR(0.081)
  WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL/Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```
GET_MODELDETAILS_ABN Function

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

Syntax

DBMS_DATA_MINING.GET_MODELDETAILS_ABN (  
    model_name IN VARCHAR2)  
RETURN DM_ABN_Details

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_ABN_Details | Represents a set of rows with schema:  
  (attribute_name VARCHAR2(30),  
  attribute_num_value NUMBER,  
  attribute_str_val VARCHAR2(4000),  
  probability NUMBER,  
  conditionals DM_Conditionals) |

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_Conditionals| Represents a set of rows DM_Conditional with schema:  
  (attribute_name VARCHAR2(30),  
  attribute_num_value NUMBER,  
  attribute_str_val VARCHAR2(4000),  
  conditional_probability NUMBER) |

Pragmas

RNDS, WNDS, RNPS, WNPS.
Usage Notes

The table function *pipes* out rows with the schema:

The examples shown in this section describe how to un-nest the values from each of the columns discussed earlier.

This function returns details only for 'single feature' ABN model.

Examples

The following example demonstrates an ABN model build followed by an invocation of `GET_MODELDETAILS_ABN` table function from Oracle SQL.

```
BEGIN
    -- prepare a settings table to override default algorithm
    CREATE TABLE abn_settings (setting_name VARCHAR2(30),
                                setting_value VARCHAR2(128));
    INSERT INTO abn_settings VALUES (dbms_data_mining.algo_name, 
                                     dbms_data_mining.algo_adaptive_bayes_network);

    -- create a model
    DBMS_DATA_MINING.CREATE_MODEL (
        model_name => 'abn_model',
        function => DBMS_DATA_MINING.CLASSIFICATION,
        data_table_name => 'abn_build',
        case_id_column_name => 'id',
        target_column_name => NULL,
        settings_table_name => 'abn_settings');

END;
/

-- View the (unformatted) results from SQL/Plus
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_MODELDETAILS_ABN('abn_model'));
```
GET_MODELDETAILS_KM Function

This table function returns a set of rows that provide the details of a \( k \)-Means clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODELDETAILS_KM (    model_name IN VARCHAR2)    RETURN DM_Clusters pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_Clusters</td>
<td>Represents a set of rows of DM_Cluster with schema:</td>
</tr>
<tr>
<td></td>
<td>(id INTEGER, record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, child DM_Children) centroid DM_Centroids, histogram DM_Histogram, rule DM_Rule)</td>
</tr>
<tr>
<td>DM_Children</td>
<td>Is a nested table of DM_Child with schema:</td>
</tr>
<tr>
<td></td>
<td>(id NUMBER)</td>
</tr>
</tbody>
</table>
Pragmas

RNDS, WNDS, RNPS, WNPS

Usage Notes

The table function pipes out rows with the schema:

```sql
(id INTEGER, record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER)
```
GET_MODEL_DETAILS_KM Function

child       DM_Children,
centroid    DM_Centroids,
histogram   DM_Histograms,
rule        DM_Rule

Each DM_Children value is a nested table of id's.

Each DM_Centroid value is itself a nested table that, when un-nested, can return rows of the form:

(attribute_name VARCHAR2(30),
mean       NUMBER,
mode_value VARCHAR2(30),
variance   NUMBER);

Each DM_Histogram value is itself a nested table that, when un-nested, can return rows of the form:

(attribute_name VARCHAR2(30),
bin_id      NUMBER,
lower_bound NUMBER,
upper_bound NUMBER,
label       VARCHAR2(4000),
count       NUMBER)

Each DM_Rule value is an object with two nested DM_Predicate columns:

(rule_id      INTEGER,
antecedent    DM_Predicates,
consequent    DM_Predicates,
rule_support  NUMBER,
rule_confidence  NUMBER)

DM_Predicates is a collection of DM_Predicate objects. When un-nested, each object maps to a row of the form:

(attribute_name VARCHAR2(30),
conditional_operator CHAR(2),
attribute_num_value NUMBER,
attribute_str_value VARCHAR2(4000),
attribute_support NUMBER,
attribute_confidence NUMBER)

The examples shown in this section describe how to un-nest the values from each of the columns discussed earlier.
Examples

The following example demonstrates a $k$-Means clustering model build followed by an invocation of `GET_MODELDETAILS_KM` table function from Oracle SQL.

```sql
BEGIN
  -- create a settings table
  UPDATE cluster_settings
  SET setting_value = 3
  WHERE setting_name = DBMS_DATA_MINING.kmeans_block_growth;

  /* build a $k$-Means clustering model */
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'eight_clouds',
    function => DBMS_DATA_MINING.CLUSTERING,
    data_table_name => 'eight_clouds_build',
    case_id_column_name => 'id',
    target_column_name => NULL,
    settings_table_name => 'cluster_settings');
END;
/
```

```sql
-- View the (unformatted) rules from SQL/Plus
SELECT id, record_count, parent, tree_level, dispersion,
  child, centroid, histogram, rule
FROM TABLE(DBMS_DATA_MINING_GET_MODELDETAILS_KM('eight_clouds'));
```
GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model. The rows are an enumeration of the patterns generated during the creation of the model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (  
    model_name    IN    VARCHAR2)  
RETURN DM_NB_Details pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_NB_Details</td>
<td>Represents a set of rows DM_NB_Detail with schema:</td>
</tr>
<tr>
<td></td>
<td>(target_attr_name VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>target_attr_num_value NUMBER,</td>
</tr>
<tr>
<td></td>
<td>target_attr_str_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>prior_probability NUMBER,</td>
</tr>
<tr>
<td></td>
<td>conditionals</td>
</tr>
<tr>
<td>DM_Conditionals</td>
<td>Represents a set of rows DM_Conditional with schema:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>attribute_num_value NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_str_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>conditional_probability NUMBER)</td>
</tr>
</tbody>
</table>

Pragmas

RNDS, WNDS, RNPS, WNPS
Usage Notes

The table function \textit{pipes} out rows with the schema:

\begin{verbatim}
(target_attr_name VARCHAR2(30),
target_attr_num_value NUMBER,
target_attr_str_value VARCHAR2(4000),
prior_probability NUMBER,
conditionals DM_Conditionals)
\end{verbatim}

Each \textit{DM_Conditionals} value is itself as nested table that, when un-nested, can return rows of type \textit{DM_Conditional}, of the form:

\begin{verbatim}
(attribute_name VARCHAR2(30),
attribute_num_value NUMBER,
attribute_str_value VARCHAR2(4000),
conditional_probability NUMBER)
\end{verbatim}

The examples shown in this section describe how to un-nest the values from each of the columns discussed earlier.

Examples

Assume that you have built a classification model \texttt{census_model} using the Naive Bayes algorithm. You can retrieve the model details as shown in this example.

\begin{verbatim}
-- You can view the Naive Bayes model details in many ways
-- Consult the Oracle Application Developer's Guide -
-- Object-Relational Features for different ways of
-- accessing Oracle Objects.

-- View the (unformatted) details from SQL/Plus
SELECT attribute_name, attribute_num_value, attribute_str_value,
prior_probability, conditionals,
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('census_model'))
\end{verbatim}

See \texttt{nbdemo.sql} for generation of formatted rules.
GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
    model_name IN VARCHAR2
) RETURN DM_NMF_Details pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_NMF_Feature_set</td>
<td>Represents a set of rows of DM_NMF_Feature with schema:</td>
</tr>
<tr>
<td></td>
<td>(feature_id INTEGER,</td>
</tr>
<tr>
<td></td>
<td>attribute_set DM_NMF_Attribute_Set)</td>
</tr>
<tr>
<td>DM_NMF_Attribute_Set</td>
<td>Is a nested table of DM_NMF_Attribute with schema:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2,</td>
</tr>
<tr>
<td></td>
<td>attribute_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>coefficient NUMBER)</td>
</tr>
</tbody>
</table>

Pragmas

RNDS, WNDS, RNPS, WNPS
Usage Notes

The table function *pipes* out rows with the schema:

```sql
(feature_id INTEGER,
attribute_set DM_NMF_Attribute_Set)
```

Each DM_NMF_Feature_Set value is itself as nested table that, when un-nested, can return rows of the form:

```sql
(attribute_name) VARCHAR2,
attribute_value VARCHAR2(4000),
coefficient NUMBER)
```

The examples shown in this section describe how to un-nest the values from each of the columns discussed earlier.

Examples

Assume you have built an NMF model called *my_nmf_model*. You can retrieve model details as shown:

```sql
--View (unformatted) details from SQL/Plus
SELECT feature_id, attribute_set
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('my_nmf_model'));
```
GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a Support Vector Machines model. This is applicable only for classification or regression models built using a linear kernel. For any other kernel, the table function returns ORA-40215.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (model_name IN VARCHAR2) RETURN DM_SVM_Linear_Coeff pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVM_Linear_Coeff_Set</td>
<td>Represents a set of rows of DM_SVM_Linear_Coeff with schema:</td>
</tr>
<tr>
<td></td>
<td>(class VARCHAR2(4000), attribute_set DM_SVM_Attribute_Set)</td>
</tr>
<tr>
<td>DM_SVM_Attribute_Set</td>
<td>Is a nested table of DM_SVM_Attribute with schema:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(30), attribute_value VARCHAR2(4000), coefficient NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

The table function pipes out rows with the schema:

```sql
(class VARCHAR2(4000), attribute_set DM_SVM_Attribute_Set)
```
class represents classification target values. For regression targets, class is NULL. For each classification target value for classification models or once only for regression models, the DM_SVM_Attribute_Set value is itself a nested table that, when un-nested, can return rows of the form:

- attribute_name VARCHAR2(30),
- attribute_value VARCHAR2(4000),
- coefficient NUMBER)

The examples shown in this section describe how to un-nest the values from each of the columns discussed earlier.

Examples

The following example demonstrates an SVM model build followed by an invocation of GET_MODEL_DETAILS_SVM table function from Oracle SQL:

```
-- Create SVM model
BEGIN
  dbms_data_mining.create_model(
    model_name => 'SVM_Clas_sample',
    mining_function => dbms_data_mining.classification,
    data_table_name => 'svmc_sample_build_prepared',
    case_id_column_name => 'id',
    target_column_name => 'affinity_card',
    settings_table_name => 'svmc_sample_settings');
END;
/
-- Display model details
SELECT *
FROM TABLE(dbms_data_mining.get_model_details_svm('SVM_Clas_sample'))
ORDER BY class;
```
GET_MODEL_SETTINGS Function

This table function returns the list of settings that were used to build the model.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_SETTINGS(
    model_name    IN VARCHAR2)
RETURN DM_Model_Settings pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_Model_Settings</td>
<td>Represents a set of rows with schema:</td>
</tr>
<tr>
<td></td>
<td>(setting_name VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>setting_value VARCHAR2(128))</td>
</tr>
</tbody>
</table>

Pragmas

RNDS, WNDS, RNPS, WNPS

Usage Notes

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.
Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```sql
SELECT setting_name, setting_value
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```
GET_MODEL_SIGNATURE Function

This table function returns the model signature, which is a set of rows that provide the name and type of each attribute required as input to the APPLY operation.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

Syntax

```sql
DBMS_DATA_MINING.GET_MODEL_SIGNATURE(
    model_name IN VARCHAR2)
RETURN DM_Model_Signature pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_Model_Signature</td>
<td>Represents a set of rows with schema:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(30), attribute_type VARCHAR2(106))</td>
</tr>
</tbody>
</table>

Pragmas

RNDS, WNDS, RNPS, WNPS

Usage Notes

You can use this table function to get the list of attributes used for building the model. This is particularly helpful to describe a model when an APPLY operation on test or scoring data is done a significant time period after the model is built, or after it is imported into another schema.
Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```sql
SELECT attribute_name, attribute_type
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model'));
```
IMPORT_MODEL Procedure

This procedure imports specified data mining models from a dump file set or from a remote database.

Syntax

```sql
DBMS_DATA_MINING.IMPORT_MODEL (
    filename    IN  VARCHAR2,
    directory    IN  VARCHAR2,
    model_names IN  VARCHAR2 DEFAULT NULL,
    operation  IN  VARCHAR2 DEFAULT NULL,
    remote_link    IN  VARCHAR2 DEFAULT NULL,
    jobname    IN  VARCHAR2 DEFAULT NULL,
    schema_remap    IN  VARCHAR2 DEFAULT NULL
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the dump file set. If there are multiple files in the set, you may use &quot;%U&quot; to specify the file set. See Usage Notes for details.</td>
</tr>
<tr>
<td>directory</td>
<td>Name of the directory object where the dump file is located. The directory object must be created before the import operation and you must be granted both READ and WRITE privileges.</td>
</tr>
<tr>
<td>model_names</td>
<td>Specify the names of models to be imported. See Usage Notes for details.</td>
</tr>
<tr>
<td>operation</td>
<td>Use one of the literals 'IMPORT'/'SQL_FILE'; defaults to 'IMPORT'. When set to 'SQL_FILE', DDLs that create those database objects in the dump file set are generated in a text file in the dump directory. The DDL file is named job_name.sql.</td>
</tr>
<tr>
<td>remote_link</td>
<td>A valid DB link or NULL. When a DB link is provided, this allows moving DM models from the remote database to the local database. Default value is NULL for importing into the current database from a dump file set.</td>
</tr>
</tbody>
</table>
Usage Notes

Use `IMPORT_MODEL` to import all or specific data mining models from a dump or from a remote database by means of a DB link.

The dump file set must be created by `expdp` or `EXPORT_MODEL` procedure. The dump files must be located in the directory mapped by the `directory` object. The user must have `READ` and `WRITE` privileges on the `directory` object. In order to import models from a dump created by another user, you must have `IMP_FULL_DATABASE` privilege or have SYS role.

When import operation completes successfully, a log is created in the directory mapped by `directory` object. If `jobname` is provided, the log is named `jobname.log`. If `jobname` is NULL (the default) the log is named `username_imp_nnnn.log`, where `nnnn` is a number. If the dump file set contains multiple files, you can use "%U" in the filename. For example, if your dump file set contains 3 files, `archive01.dmp`, `archive02.dmp`, and `archive03.dmp`, you may specify `filename=>'archive%U'`.

Use the parameter `model_names` to specify which models to import. The use of `model_names` is dependent on the operation, whether the source is a dump file set or a remote database. When importing from dump files, model names are the sole useful reference. In this case, you can either assign `model_names` with comma-delimited model names or a `WHERE` clause with names explicitly specified. When importing from a remote database, `model_names` can be specified in the same fashion as in the `EXPORT_MODEL` procedure. Details are listed in Table 23–48.

---

**Table 23–47 (Cont.) IMPORT_MODEL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>job_name</code></td>
<td>Name of the import job, limited to 30 characters. It must be unique to that schema, that is, there is no active import job using the same name. If not supplied, a default name is provided in the form of <code>username_imp_nnnn</code>. For example, &quot;SCOTT_imp_76102&quot;.</td>
</tr>
<tr>
<td><code>schema_remap</code></td>
<td>Specify schema remapping. Must be specified when importing from a dump file set created by a different user. It must be specified in the form of 'FROM_NAME:TO_NAME'. For example, to remap schema from SCOTT to MARY, set <code>schema_remap=&gt;'SCOTT:MARY'</code>. You need <code>IMP_FULL_DATABASE</code> privileges to do schema remapping if you do not have a SYS role.</td>

<td>remote</td>
<td>Import all classification models.</td>
<td>---</td>
</tr>
<tr>
<td>'name LIKE &quot;NB_MODEL&quot;%&quot;ESCAPE&quot;'</td>
<td>remote</td>
<td>Import all models whose name start with 'NB_MODEL'.</td>
<td>---</td>
</tr>
</tbody>
</table>

IMPORT_MODEL is not mutually exclusive with the DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. In other words, if an import operation is underway, models with the same name are dropped at that time, and the results in the schema are unpredictable.
Examples

The following example shows user MARY imports all models from a dump file, model_exp_001.dmp, created by user SCOTT. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. Note that if user MARY does not have IMP_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

```sql
-- import all models
declare
  file_name VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.import_model(
    filename=>file_name,
    directory=>'DM_DUMP',
    schema_remap=>'SCOTT:MARY');
  dbms_output.put_line('DBMS_DATA_MINING.import_model of all models from SCOTT done!');
END;
/*
*/
RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```sql
DBMS_DATA_MINING.RANK_APPLY (  
  apply_result_table_name        IN VARCHAR2,  
  case_id_column_name            IN VARCHAR2,  
  ranked_apply_result_tab_name   IN VARCHAR2,  
  top_N                          IN INTEGER DEFAULT 1,  
  cost_matrix_table_name         IN VARCHAR2 DEFAULT NULL,  
  apply_result_schema_name       IN VARCHAR2 DEFAULT NULL,  
  cost_matrix_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes).</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column. This must be the same as the one used for generating APPLY results.</td>
</tr>
<tr>
<td>ranked_apply_result_tab_name</td>
<td>Name of the table containing the ranked apply results.</td>
</tr>
<tr>
<td>top_N</td>
<td>Top N predictions to be considered from the APPLY results for precision recall computation.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table.</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table.</td>
</tr>
</tbody>
</table>
Usage Notes

You can use `RANK_APPLY` to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if a cost matrix is provided.

The behavior of `RANK_APPLY` is similar to that of `APPLY` with respect to other DDL-like operations such as `CREATE_MODEL`, `DROP_MODEL`, and `RENAME_MODEL`. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from `APPLY`.

The main intended use of `RANK_APPLY` is for the generation of the final `APPLY` results against the scoring data in a production setting. You can apply the model against test data using `APPLY`, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for `RANK_APPLY`.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The `case_id` column will be the same case identifier column as that of the apply results.

**Classification Models — NB, ABN, SVM**

For numerical targets, the ranked results table will have the schema as shown:

```sql
    (case_id VARCHAR2/NUMBER,
        prediction NUMBER,
        probability NUMBER,
        cost NUMBER,
        rank INTEGER)
```

For categorical targets, the ranked results table will have the following schema:

```sql
    (case_id VARCHAR2/NUMBER,
        prediction VARCHAR2,
        probability NUMBER,
        cost NUMBER,
        rank INTEGER)
```

**Clustering using k-Means**

Clustering is an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the schema as shown, and contains the cluster ids ranked by top-N.

```sql
    (case_id VARCHAR2/NUMBER,
        cluster_id NUMBER,
        probability NUMBER,
        cost NUMBER,
        rank INTEGER)
```
RANK_APPLY Procedure

```sql
rank INTEGER)
```

**Feature Extraction using NMF**

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the schema as shown, and contains the feature ids ranked by top-N.

```sql
(case_id VARCHAR2/NUMBER,
feature_id NUMBER,
match_quality NUMBER,
rank INTEGER)
```

**Examples**

```sql
BEGIN
/* build a model with name census_model. */
/* (See example under CREATE_MODEL) */
/

/* if build data was pre-processed in any manner, */
/* perform the same pre-processing steps on apply */
/* data also. */
/* (See examples in the section on DBMS_DATA_MINING_TRANSFORM) */
/

/* apply the model to data to be scored */
DBMS_DATA_MINING.rank_apply(
  apply_result_table_name => 'census_apply',
  case_id_column_name => 'person_id',
  ranked_apply_result_tab_name => 'censusRanked_apply',
  top_N => 3,
  cost_matrix_table_name => 'census_cost_matrix');
END;
/

-- View Apply Results
SELECT *
  FROM census_ranked_apply;
```
RENAME_MODEL Procedure

This procedure renames a mining model to a specified new name.

Syntax

```sql
DBMS_DATA_MINING.RENAME_MODEL (  
    model_name            IN VARCHAR2,  
    new_model_name        IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Old name of the model (see Rules and Limitations).</td>
</tr>
<tr>
<td>new_model_name</td>
<td>New name of the model (see Rules and Limitations).</td>
</tr>
</tbody>
</table>

Usage Notes

You can use RENAME_MODEL to rename an existing mining model.

The behavior of the RENAME_MODEL is similar to a SQL DDL RENAME operation. It blocks DROP_MODEL and CREATE_MODEL operations. It does not block APPLY, which is a SQL query-like operation that does not update any model data.

If an APPLY operation is using a model, and you attempt to rename the model during that time, the RENAME will succeed and APPLY will return indeterminate results. This is in line with the conventional behavior in the RDBMS, where DDL operations do not block on query operations.

Examples

Assume the existence of a model census_model. The following example shows how to rename this model.

```sql
BEGIN
    DBMS_DATA_MINING.rename_model(  
        model_name => 'census_model',  
        new_model_name => 'census_new_model');
END;
/
```
RENAME_MODEL Procedure
The DBMS_DATA_MINING_TRANSFORM package is a set of data transformation utilities available for use with the DBMS_DATA_MINING package for preparing mining data.

This chapter contains the following topics:

- Using DBMS_DATA_MINING_TRANSFORM
  - Overview
  - Types
  - Supported Transformation Methods
  - Transformation Operations
  - Transformation Methodology
- Summary of DBMS_DATA_MINING_TRANSFORM Subprograms
Using DBMS_DATA_MINING_TRANSFORM

Overview

The DBMS_DATA_MINING_TRANSFORM package has two motivations:

- It is a basic utility package for preprocessing mining data before providing it as input to routines in the DBMS_DATA_MINING package.
- It is a learning tool that shows how to use SQL to perform common mining transforms. The inputs and outputs for this package are simple views and tables that are not Oracle proprietary. You can study these objects to help you create data transforms that are specific to your application data. The source code for this package is in dbmsdmxf.sql (for UNIX, the path is $ORACLE_HOME/dm/admin/dbmsdmxf.sql) and is available for inspection.

The main principle behind the design of this package is the fact that SQL has enough power to perform most of the common mining transforms efficiently. For example, binning can be done using CASE expression or DECODE function, and linear normalization is a simple algebraic expression of the form 
\((x - \text{shift})/\text{scale}\) where \(x\) is the data value that is being transformed.

However, the queries that perform the transforms can be rather lengthy. So it is desirable to have some convenience routines that will help in generating queries. Thus, the goal of this package is to provide query generation services for the most common mining transforms, as well as to provide a framework that can be easily extended for implementing other transforms.

Note: Use of this package for preprocessing data input to DBMS_DATA_MINING operations is not mandatory. You can use any third-party tool or any home-grown utilities that are customized for your application.

Types

Table 24–1   Summary of Data Types

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column_List</td>
<td>List of column names representing mining attributes, defined to be</td>
</tr>
<tr>
<td></td>
<td>VARRAY(1000) OF VARCHAR2(32);</td>
</tr>
</tbody>
</table>
Supported Transformation Methods

The DBMS_DATA_MINING_TRANSFORM package supports the following transformations for numerical and categorical attributes, which map to the NUMBER and VARCHAR2/CHAR Oracle data types respectively.

Binning

Binning involves mapping both continuous and discrete values to discrete values of reduced cardinality. For example, the age of persons can be binned into discrete numeric bins: 1-20 to 1, 21-40 to 2, and so on. Popular car manufacturers such as Ford, Chrysler, BMW, Volkswagen can be binned into discrete categorical bins: {Ford, Chrysler} to US_Car_Makers, and {BMW, Volkswagen} to European_Car_Makers. The package supports binning for both categorical and numerical attributes.

Note: This chapter uses standard interval notation for number sets: [a,b] is the set of all real numbers greater than or equal to a and less than or equal to b; [a,b) is the set of all real numbers greater than or equal to a and less than b. (b is in the set [a,b]; b is not in the set [a,b]).

Top-N Frequency Categorical Binning

The bin definition for each attribute is computed based on the occurrence frequency of values that are computed from the data. The user specifies a particular number of bins, say N. Each of the bins \( \text{bin}_1, \ldots, \text{bin}_N \) corresponds to the values with top frequencies. The bin \( \text{bin}_{N+1} \) corresponds to all remaining values.

Equi-Width Numerical Binning

The bin definition for each attribute is computed based on the \( \text{min} \) and \( \text{max} \) values that are computed from the data. The user specifies a particular number of bins, say N. Each of the bins \( \text{bin}_1, \ldots, \text{bin}_N \) span ranges of equal width of size \( \text{inc} = (\text{max} - \text{min})/N \), and \( \text{bin}_0 \) spans range \((-\text{inf}, \text{min})\) and \( \text{bin}_{N+1} \) range \((\text{max}, +\text{inf})\).

Quantile Numerical Binning

The definition for each relevant column is computed based on the \( \text{min} \) values for each quantile, where quantiles are computed from the data using NTILE function. Bins \( \text{bin}_1, \ldots, \text{bin}_{N-1} \) span ranges \([\text{min}_1, \text{min}_{1+1})\) and \( \text{bin}_N \) range \([\text{min}_N, \text{max}_0]\). Bins with equal left and right boundaries are collapsed.
Transformation Operations

Normalization
Normalization involves scaling continuous values down to specific range — as in -1.0 to 1.0 or 0.0 to 1.0 such that \( x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}} \). It applies only to numerical attributes.

Min-Max Normalization
The normalization definition for each attribute is computed based on the \( \text{min} \) and \( \text{max} \) values that are computed from the data. The values for \( \text{shift} \) and \( \text{scale} \) are computed to be \( \text{shift} = \text{min} \), and \( \text{scale} = (\text{max} - \text{min}) \) respectively.

Z-Score Normalization
The normalization definition for each attribute is computed based on the values for \( \text{mean} \) and \( \text{standard deviation} \) that are computed from the data. The values for \( \text{shift} \) and \( \text{scale} \) are computed to be \( \text{shift} = \text{mean} \), and \( \text{scale} = \text{standard deviation} \) respectively.

Winsorizing and Trimming (Clipping)
Some computations on attribute values can be significantly affected by extreme values. One approach to achieving a more robust computation is to winsorize or trim the data as a preprocessing step. Winsorizing involves setting the tail values of a particular attribute to some specified quantile of the data, while trimming removes the tails. In other words, trimmed values are ignored in further computations. This is achieved by setting the tails to \text{NULL}. For example, for a 90% winsorization, the bottom 5% are set equal to the minimum value in the 6th percentile, while the upper 5% are set equal to the value corresponding to the maximum value in the 95th percentile.

Transformation Operations
The package provides three classes of convenience routines. The first two classes of routines define the transformation, and the last class of routines generate the queries that provide the transformed data.

- Create the transform definition table using \text{CREATE} routines. The generated table is a transform-specific and has a pre-defined fixed schema. Each routine is equivalent to the SQL statement \text{CREATE TABLE table (...)}
- Define the transform — that is, populate the transform definition table — using \text{INSERT} routines. Each routine is equivalent to the SQL statement \text{INSERT INTO table SELECT...}
Using DBMS_DATA_MINING_TRANSFORM

- Generate the query for transformation using XFORM routines. Each routine is equivalent to the SQL statement CREATE VIEW view AS SELECT ...

Creating a Transform Definition Table

You must use CREATE_BIN_NUM or CREATE_BIN_CAT routines to create the bin definition tables. You must use CREATE_NORM_LIN to create the normalization definition table. You must use CREATE_CLIP to create the clipping definition table.

Usually, the consistency and integrity of transform definition tables is guaranteed by the creation process. Alternatively, it can be achieved by leveraging an integrity constraints mechanism. This can be done either by altering the tables created with CREATE routines, or by creating the tables manually with the necessary integrity constraints.

Defining the Transform

The most common way of defining the transform (populating the transform definition tables) for each attribute is based on data inspection using some predefined methods (also known as automatic transform definition). Some of the most popular methods have been captured by the INSERT routines in the package. For example, the z-score normalization method estimates mean and standard deviation from the data to be used as a shift and scale parameters of the linear normalization transform.

You can bin numerical attributes using INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE and categorical attributes using INSERT_BIN_CAT_FREQ. You can normalize numerical attributes using INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX. You can either winsorize numerical attributes using INSERT_CLIP_WINZOR_TAIL or trim them using INSERT_CLIP_TRIM_TAIL. You can invoke these routines several times to transform all relevant attributes from various data sources till the definition table fully represents all mining attributes for a given problem.

After performing automatic transform definition, some or all of the definitions can be adjusted by issuing SQL DML statements against the transform definition tables, thus providing virtually infinite flexibility in defining custom transforms.

The INSERT routines enable flexible transform definitions in several ways:

- The data provided to the INSERT routines do not necessarily have to be the data used for a particular model creation. It can be any data that contains adequate representation of the mining attributes.
Transformation Methodology

- The INSERT routines can be called any number of times against the same or different dataset until all the attributes have their transformations defined. You can selectively exclude one or more attributes for a particular iteration of the INSERT. In the most extreme case, each individual attribute can potentially have a unique transformation definition.

- You do not have to separately feed in numerical and categorical attributes, since categorical binning automatically skips over NUMBER columns in your table, and numerical binning and the normalization and clipping routines skip over VARCHAR2/CHAR columns in your input data.

Generating the Query for the Transform

Query generation is driven by the simple transform-specific definition tables with a predefined schema. Query generation routines should be viewed as macros, and transform definition tables as parameters used in macro expansions. Similar to using #define macros in the C language, the invoker is responsible for ensuring the correctness of the expanded macro, that is, that the result is a valid SQL query.

You can generate the views representing the transformation queries for binning using XFORM_BIN_CAT and XFORM_BIN_NUM, and for normalization using XFORM_NORM_LIN, and for clipping using XFORM_CLIP.

If your data contains a combination of numerical and categorical attributes, you must essentially feed the results of one transformation step to the next step. For example, the results of XFORM_BIN_CAT can be fed to XFORM_BIN_NUM or vice versa. The order is irrelevant since numerical and categorical transforms work on disjoint sets of attributes.

Transformation Methodology

Given a dataset for a particular mining problem, any preprocessing and transformations on the mining data must be uniform across all mining operations. In other words, if the build data is preprocessed according to a particular transform definition, then it follows that the test data and the scoring data must be preprocessed using the same definition.

The general usage of routines in this package can be explained using this example. Assume that your input table for model build contains both numerical and categorical data that require to be binned. A possible sequence of operations will be:

- Invoke CREATE_BIN_NUM to generate a numerical bin definition table.
Using DBMS_DATA_MINING_TRANSFORM

- Invoke INSERT_BIN_NUM_EQWIDTH to define the transforms for all numerical attributes in the build data input (For the sake of simplicity, let us assume that all numericals are to be binned into 10 bins.)

- Next invoke XFORM_BIN_NUM with the numerical bin table and the build data table as inputs. The resulting object is a view that represents a SQL query against the build data table that performs numerical binning. Assume that you have named this result object build_bin_num_view.

- Since you still have the categorical attributes to be binned, invoke CREATE_BIN_CAT to create a categorical bin definition table.

- Next, invoke INSERT_BIN_CAT_FREQ to define the transforms for all categorical attributes. (For the sake of simplicity, let us assume that all categorical attributes are to be binned into 10 bins.)

- As the final step, invoke XFORM_BIN_CAT with the categorical bin table and the view name provided by XFORM_BIN_NUM, namely build_bin_num_view, as the inputs. This essentially amounts to combining the transformations from both stages.

- The object resulting from this operation is a view that represents a SQL query against your build data table, influenced by the contents of the categorical bin boundary table also. Provide this view name as the data input to the CREATE_MODEL procedure in the DBMS_DATA_MINING package.

If this happens to be a classification model, and you want to APPLY this model to scoring data, you must prepare the scoring data similar to the build data. You can achieve this in two simple steps:

- First, call XFORM_BIN_NUM with the scoring data table and the numerical bin boundary table as inputs. The resulting object is a view that represents an SQL query against your scoring data table, influenced by the contents of the numerical bin boundary table. Assume that you have named this result object apply_bin_num_view.

- As the next and final step, invoke XFORM_BIN_CAT with the categorical bin table and the view name provided by XFORM_BIN_NUM, namely apply_bin_num_view, as the inputs.

- The object resulting from this operation is now a view that represents an SQL query against your scoring data table, influenced by the contents of the categorical bin boundary table also. Provide this view name as the data input to the APPLY procedure in the DBMS_DATA_MINING package.
## Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

<table>

<td>Creates the view representing the transformed output with normalized numerical data</td>
</tr>
</tbody>
</table>
CREATE_BIN_CAT Procedure

This procedure creates a categorical binning definition table. This table is used as input to INSERT_BIN_CAT_FREQ and XFORM_BIN_CAT procedures.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (  
  bin_table_name IN VARCHAR2,  
  bin_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bin_table_name</code></td>
<td>Name of the bin definition table.</td>
</tr>
<tr>
<td><code>bin_schema_name</code></td>
<td>Name of the schema hosting the bin definition table.</td>
</tr>
</tbody>
</table>

Usage Notes

The generated bin definition table will have the predefined schema:

```
col VARCHAR2(30)
val VARCHAR2(4000)
bin VARCHAR2(4000)
```

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('build_bin_cat_table');
END;
```
**CREATE_BIN_NUM Procedure**

This procedure creates a numerical binning definition table. This table is used as input to INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, and XFORM_BIN_NUM procedures.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (    bin_table_name      IN VARCHAR2,    bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the bin definition table.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Name of the schema hosting the bin definition table.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The generated bin definition table will have the predefined schema:

```sql
    col         VARCHAR2(30)    val  NUMBER    bin         VARCHAR2(4000)
```

**Examples**

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('build_bin_num_table');
END;
```
CREATE_CLIP Procedure

This procedure creates a clipping definition table. This table is used as input to INSERT_CLIP_WINSOR_TAIL, INSERT_CLIP_TRIM_TAIL, and XFORM_CLIP procedures.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (  
   clip_table_name    IN VARCHAR2,  
   clip_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the clipping definition table.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Name of the schema hosting the clipping definition table.</td>
</tr>
</tbody>
</table>

Usage Notes

The generated clipping definition table will have the predefined schema:

```sql
  col   VARCHAR2(30)  
  lcut  NUMBER  
  lval  NUMBER  
  rcut  NUMBER  
  rval  NUMBER
```

Examples

```sql
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('build_clip_table');
END;
```
CREATE_NORM_LIN Procedure

This procedure creates a linear normalization definition table. This table is used as input to INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_ZSCORE, XFORM_NORM_LIN procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
    norm_table_name       IN VARCHAR2,
    norm_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the normalization definition table.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Name of the schema hosting the normalization definition table.</td>
</tr>
</tbody>
</table>

Usage Notes

The generated normalization table will have the predefined schema:

```
col      VARCHAR2(30)
shift    NUMBER
scale    NUMBER
```

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('build_norm_table');
END;
```
INSERT_BIN_CAT_FREQ Procedure

This procedure finds the categorical binning definition for every VARCHAR2, CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the categorical binning definition table created using CREATE_BIN_CAT.

Definition for each relevant column is computed based on the occurrence frequency of column values that are computed from the data table. Each of the bin_num(N) bins bin_1, ..., bin_N corresponds to the values with top frequencies when N > 0 or bottom frequencies when N < 0, and bin_{N+1} to all remaining values, where \( bin_I = I \). Ordering ties among identical frequencies are broken by ordering on column values (ASC for \( N > 0 \) or DESC for \( N < 0 \)). When the number of distinct values \( C < N \) only \( C+1 \) bins will be created.

The parameter default_num(D) is used for pruning based on the number of values that fall into the default bin. When \( D > 0 \) only columns that have at least \( D \) defaults are kept while others are ignored. When \( D < 0 \) only columns that have at most \( D \) values are kept. No pruning is done when \( D = 0 \) or \( D = NULL \). Parameter bin_support (SUP) is used for restricting bins to frequent (\( SUP > 0 \)) values \( frq >= SUP*tot \), or infrequent (\( SUP < 0 \)) ones \( frq <= -SUP*tot \), where \( frq \) is a given value count and \( tot \) is a sum of all counts as computed from the data. No support filtering is done when \( SUP = NULL \) or when \( SUP = 0 \).

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (bin_table_name IN VARCHAR2,
data_table_name IN VARCHAR2,
bin_num IN PLS_INTEGER DEFAULT 9,
exclude_list IN Column_List DEFAULT NULL,
default_num IN PLS_INTEGER DEFAULT 2,
bin_support NUMBER DEFAULT NULL,
bin_schema_name IN VARCHAR2 DEFAULT NULL,
data_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 24–7  INSERT_BIN_CAT_FREQ Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the categorical bin table generated using CREATE_BIN_CAT procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the binning process.</td>
</tr>
<tr>
<td>default_num</td>
<td>Number of default values.</td>
</tr>
<tr>
<td>bin_support</td>
<td>Bin support as a fraction.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Name of the schema hosting the bin definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULLs are ignored. No bin definitions are populated when bin_num = 0, or bin_num, is NULL.

Examples

The simplest invocation of this routine populates bin definitions in the cat_bin_table for all the categorical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
        'cat_bin_table', 'build_table');
END;
/
```
This procedure finds the numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM.

Definition for each relevant column is computed based on the min and max values that are computed from the data table. Each of the $bin_{num}(N)$ bins $bin_1, \ldots, bin_N$ span ranges of equal width $inc = (max - min) / N$ where $bin_i = 1$ when $N > 0$ or $bin_i = N+1-i$ when $N < 0$, and $bin_N = bin_{N+1} = NULL$. The values of val column are rounded to $round_num$ significant digits prior to scoring them in the definition table.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
    bin_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    bin_num               IN PLS_INTEGER DEFAULT 10,
    exclude_list          IN Column_List DEFAULT NULL,
    round_num             IN PLS_INTEGER DEFAULT 6,
    bin_schema_name       IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the categorical bin table generated using CREATE_BIN_NUM procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the binning process.</td>
</tr>
<tr>
<td>round_num</td>
<td>Number of significant digits.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Name of the schema hosting the bin definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>
Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULLs or only one unique value are ignored. No bin definitions are populated when bin_num = 0, or bin_num is NULL.

For example, when N=2, col='mycol', min=10, and max = 21, the following three rows are inserted into the definition table (inc = 5.5):

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
<th>BIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycol</td>
<td>10</td>
<td>NULL</td>
</tr>
<tr>
<td>mycol</td>
<td>15.5</td>
<td>1</td>
</tr>
<tr>
<td>mycol</td>
<td>21</td>
<td>2</td>
</tr>
</tbody>
</table>

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM('num_bin_table', 'build_table');
END;
/
```
This procedure finds a numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the binning definition table that was created using CREATE_BIN_NUM.

The definition for each relevant column is computed based on the min values for each quantile, where quantiles are computed from the data using NTILE function. Bins $bin_1, \ldots, bin_{N-1}$ span ranges $[\text{min}_I, \text{min}_{I+1})$ and $bin_N$ range $[\text{min}_N, \text{max}_N]$ with $bin_I = I$ when $N > 0$ or $bin_I = N+1-I$ when $N < 0$, and $bin_0 = bin_{N+1} = \text{NULL}$. Bins with equal left and right boundaries are collapsed.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
  bin_table_name       IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  bin_num              IN PLS_INTEGER DEFAULT 10,
  exclude_list         IN Column_List DEFAULT NULL,
  bin_schema_name      IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the numerical binning definition table generated using the CREATE_BIN_NUM procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the binning process.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Name of the schema hosting the numerical binning definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>
Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for bin_num for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification. Columns with all NULLs are ignored.

Example 1. When \( N = 4 \), \( \text{col} = 'mycol' \), and data is \( \{1, 2, 2, 2, 2, 3, 4\} \), the following three rows are inserted into the definition table:

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
<th>BIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycol</td>
<td>1</td>
<td>NULL</td>
</tr>
<tr>
<td>mycol</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>mycol</td>
<td>4</td>
<td>2</td>
</tr>
</tbody>
</table>

Here quantities are \( \{1, 2\}, \{2, 2\}, \{2, 3\}, \{4\} \) and \( \min(1) = 1, \min(2) = 2, \min(3) = 2, \min(4) = 4, \max(4) = 4 \), and ranges are \( [1,2), [2,2), [2,4), [4,4] \). After collapsing \( [1,2), [2,4] \).

Examples

The simplest invocation of this routine populates numerical binning definitions in the num_bin_table for all the numerical attributes found in build_table.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE(
        'num_bin_table', 'build_table');
END;
```
INSERT_CLIP_TRIM_TAIL Procedure

This procedure finds the trimming definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

The definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that \( val(1) < val(2) < \ldots < val(N) \), where \( N \) is a total number of non-NULL values in a column:

\[
\begin{align*}
\text{lcut} &= \text{val}(1+\text{floor}(N\times q)) \\
\text{lval} &= \text{NULL} \\
\text{rcut} &= \text{val}(N-\text{floor}(N\times q)) \\
\text{rval} &= \text{NULL}
\end{align*}
\]

where \( q = \text{ABS}(\text{NVL}(\text{tail}\_\text{frac}, 0)) \). Nothing is done when \( q \geq 0.5 \).

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (  
    clip_table_name     IN VARCHAR2,  
    data_table_name     IN VARCHAR2,  
    tail_frac           IN NUMBER DEFAULT 0.025,  
    exclude_list        IN Column_List DEFAULT NULL,  
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,  
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the clipping definition table generated using the CREATE_CLIP procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>tail_frac</td>
<td>Tail fraction.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the clipping process.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Name of the schema hosting the clipping definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>
Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

<table>
<thead>
<tr>
<th>COL</th>
<th>LUCUT</th>
<th>LVAL</th>
<th>RCUT</th>
<th>RVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycol</td>
<td>2</td>
<td>NULL</td>
<td>4</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Here \(1 + \text{floor}(N \times q) = 1 + \text{floor}(7 \times 0.2) = 2\), \(lcut = \text{val}(2) = 2\).

\(N - \text{floor}(N \times q) = 7 - \text{floor}(7 \times 0.2) = 6\), \(r_cut = \text{val}(6) = 4\).

Examples

The simplest invocation of this routine populates clipping definitions in the clip_table for all the numerical attributes found in build_table.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL('clip_table', 'build_table');
END;
```
This procedure finds winsorizing definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

Definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that \( \text{val}(1) < \text{val}(2) < \ldots < \text{val}(N) \), where \( N \) is a total number of non-NULL values in a column:

\[
\begin{align*}
\text{lcut} &= \text{val}(1+\text{floor}(N\cdot q)) \\
\text{lval} &= \text{lcut} \\
\text{rcut} &= \text{val}(N-\text{floor}(N\cdot q)) \\
\text{rval} &= \text{rcut}
\end{align*}
\]

where \( q = \text{ABS}(\text{NVL(tail_frac,0)}) \). Nothing is done when \( q \geq 0.5 \).

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
   clip_table_name    IN VARCHAR2,
   data_table_name    IN VARCHAR2,
   tail_frac          IN NUMBER DEFAULT 0.025,
   exclude_list       IN Column_List DEFAULT NULL,
   clip_schema_name   IN VARCHAR2 DEFAULT NULL,
   data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the clipping definition table generated using CREATE_CLIP procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>tail_frac</td>
<td>Tail fraction.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the clipping process.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Name of the schema hosting the clipping definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>
Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attribute (that is, column names using the exclude_list parameter for a particular specification. Columns with all NULLs are ignored.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

<table>
<thead>
<tr>
<th>COL</th>
<th>LVAL</th>
<th>RCUT</th>
<th>RVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycol</td>
<td>2</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.
N - floor(N*q) = 7 - floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the clip_table for all the numerical attributes found in build_table.

BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL('clip_table', 'build_table');
END;
INSERT_NORM_LIN_ZSCORE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on z-score normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the min and max values that are computed from the data table, such that shift = min and scale = max – min. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN Column_List DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the normalization table generated using CREATE_NORM_LIN procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the normalization process.</td>
</tr>
<tr>
<td>round_num</td>
<td>Number of significant digits.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Name of the schema hosting the normalization definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular binning specification.
Columns with all NULLs or only one unique value are ignored.

**Examples**

The simplest invocation of this routine populates normalization definitions in the `norm_zscore_table` for all the numerical attributes found in `build_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE('norm_zscore_table', 'build_table');
END;
/
```
INSERT_NORM_LIN_MINMAX Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the mean and standard deviation that are computed from the data table, such that $shift = mean$ and $scale = stddev$. The values of $shift$ and $scale$ are rounded to $round_num$ significant digits prior to storing them in the definition table.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
  norm_table_name     IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  exclude_list        IN Column_List DEFAULT NULL,
  round_num           IN PLS_INTEGER DEFAULT 6,
  norm_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the normalization table generated using CREATE_NORM_LIN procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of columns (attributes) to be excluded from this iteration of the normalization process.</td>
</tr>
<tr>
<td>round_num</td>
<td>Number of significant digits.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Name of the schema hosting the normalization definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the table with data.</td>
</tr>
</tbody>
</table>
Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULLs or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX(
    'norm_minmax_table', 'build_table');
END;
```
**XFORM_BIN_CAT Procedure**

This procedure creates the view that performs categorical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (  
  bin_table_name       IN VARCHAR2,  
  data_table_name      IN VARCHAR2,  
  xform_view_name      IN VARCHAR2,  
  literal_flag         IN BOOLEAN DEFAULT FALSE,  
  bin_schema_name      IN VARCHAR2 DEFAULT NULL,  
  data_schema_name     IN VARCHAR2 DEFAULT NULL,  
  xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bin_table_name</code></td>
<td>Name of the categorized binning definition table generated using CREATE_BIN_CAT procedure.</td>
</tr>
<tr>
<td><code>data_table_name</code></td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td><code>xform_view_name</code></td>
<td>View representing the transformed output.</td>
</tr>
<tr>
<td><code>literal_flag</code></td>
<td>Literal flag.</td>
</tr>
<tr>
<td><code>bin_schema_name</code></td>
<td>Name of the schema hosting the bin definition table.</td>
</tr>
<tr>
<td><code>data_schema_name</code></td>
<td>Name of the schema hosting the data table.</td>
</tr>
<tr>
<td><code>xform_schema_name</code></td>
<td>Name of the schema hosting the view representing the transformed output.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The bin table created by CREATE_BIN_CAT and populated with bin definitions by INSERT_BIN_CAT_FREQ is used to guide the query generation process to construct categorical binning expressions of the following form:

```sql
DECODE("col", val, bin, 
...
```
This expression maps values \( val_1, \ldots, val_N \) into \( N \) bins \( bin_1, \ldots, bin_N \) and other values into \( bin_{N+1} \), while NULL values remain unchanged. \( bin_{N+1} \) is optional. If not specified, it defaults to NULL. To specify \( bin_{N+1} \) provide a row with \( val \) set to NULL.

The literal_flag parameter indicates whether the values in \( bin \) are valid SQL literals. When the flag is set to TRUE, the value of \( bin \) is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all \( bin \) are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that \( col \) is case-sensitive since it generates quoted identifiers. In cases when there are multiple entries with the same \( col, val \) combination with different \( bin \), the behavior is undefined — any one of the \( bin \) values might be used.

### Examples

**Example 1.** \( bin_{cat} \) contains four rows with \( col = 'mycol' \):

\[
\begin{align*}
\{ & col = 'mycol', \quad \text{val} = 'Waltham', \quad \text{bin} = 'MA' \\
\{ & col = 'mycol', \quad \text{val} = 'Burlington', \quad \text{bin} = 'MA' \\
\{ & col = 'mycol', \quad \text{val} = 'Redwood Shores', \quad \text{bin} = 'CA' \\
\{ & col = 'mycol', \quad \text{val} = NULL, \quad \text{bin} = 'OTHER'
\end{align*}
\]

the following expression is generated:

\[
\text{DECODE}('mycol', 'Waltham', 'MA', 'Burlington', 'MA', 'Redwood Shores', 'CA', NULL, NULL, 'OTHER')
\]

**Example 2.** \( bin_{cat} \) contains three rows with \( col = 'mycol' \):

\[
\begin{align*}
\{ & col = 'mycol', \quad \text{val} = 'Waltham', \quad \text{bin} = 'MA' \\
\{ & col = 'mycol', \quad \text{val} = 'Burlington', \quad \text{bin} = 'MA' \\
\{ & col = 'mycol', \quad \text{val} = 'Redwood Shores', \quad \text{bin} = 'CA'
\end{align*}
\]

the following expression is generated:

\[
\text{DECODE}('mycol', 'Waltham', 'MA',
\]
Example 3. For the definition:

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
<th>BIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycol</td>
<td>Waltham</td>
<td>1</td>
</tr>
<tr>
<td>mycol</td>
<td>Burlington</td>
<td>1</td>
</tr>
<tr>
<td>mycol</td>
<td>Redwood Shores</td>
<td>2</td>
</tr>
</tbody>
</table>

the following expression is generated when the literal flag is set to FALSE:

```
DECODE ("mycol", 'Waltham', 1,
       'Burlington', 1,
       'Redwood Shores', 2) "mycol"
```

and when the flag is set to TRUE:

```
DECODE("mycol", 'Waltham', 1,
       'Burlington', 1,
       'Redwood Shores', 2) "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on bin definitions in the `cat_bin_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT(
       'cat_bin_table', 'build_table', 'build_view');
END;
/
```
XFORM_BIN_NUM Procedure

This procedure creates the view that performs numerical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (  
    bin_table_name     IN VARCHAR2,  
    data_table_name    IN VARCHAR2,  
    xform_view_name    IN VARCHAR2,  
    literal_flag       IN BOOLEAN DEFAULT FALSE,  
    bin_schema_name    IN VARCHAR2 DEFAULT NULL,  
    data_schema_name   IN VARCHAR2 DEFAULT NULL,  
    xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the numerical binning definition table generated using CREATE_BIN_NUM procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>View representing the transformed output.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Literal flag.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Name of the schema hosting the bin definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the data table.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Name of the schema hosting the view representing the transformed output.</td>
</tr>
</tbody>
</table>

Usage Notes

The bin table created by CREATE_BIN_NUM and populated with bin definitions by INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE is used to guide the query generation process to construct numerical binning expressions of the following form:

```
    CASE WHEN "col" < val0 THEN 'bin0'
```
XFORM_BIN_NUM Procedure

```
WHEN "col" <= val1  THEN 'bin1'
...
WHEN "col" <= valN  THEN 'binN'
WHEN "col" IS NOT NULL THEN 'binN+1'
END "col"
```

This expression maps values in the range \([val_0; val_N]\) into \(N\) bins \(bin_1, \ldots, bin_N\) values outside of this range into \(bin_0\) or \(bin_{N+1}\), such that

\[
(-\infty; val_0) \rightarrow bin_0
\]

\[
[val_0; val_1) \rightarrow bin_1
\]

\[
\ldots
\]

\[
(val_N; +\infty) \rightarrow bin_{N+1}
\]

NULL values remain unchanged. \(bin_{N+1}\) is optional. If it is not specified, the values ("col" > val_N) are mapped to NULL. To specify \(bin_{N+1}\), provide a row with \(val\) set to NULL. The order of the WHEN ... THEN pairs is based on the ascending order of \(val\) for a given \(col\).

The literal_flag parameter indicates whether the values in \(bin\) are valid SQL literals. When the flag is set to TRUE, the value of \(bin\) is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all \(bin\) are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that \(col\) is case-sensitive since it generates quoted identifiers. In cases where there are multiple entries with the same \(col, val\) combination with different \(bin\), the behavior is undefined — any one of the \(bin\) values might be used.

Examples

Example 1. \(bin\_num\) contains four rows with \(col = 'mycol'\):

```
{col = 'mycol', val = 15.5, bin = 'small'}
{col = 'mycol', val = 10, bin = 'tiny'}
{col = 'mycol', val = 20, bin = 'large'}
{col = 'mycol', val = NULL, bin = 'huge'}
```

the following expression is generated:

```
CASE WHEN "mycol" < 10 THEN 'tiny'
WHEN "mycol" <= 15.5 THEN 'small'
WHEN "mycol" <= 20 THEN 'large'
```
 WHEN "mycol" IS NOT NULL THEN 'huge'
END "mycol"

Example 2. bin_num contains three rows with col = 'mycol':

(col = 'mycol', val = 15.5, bin = NULL)
(col = 'mycol', val = 10, bin = 'tiny')
(col = 'mycol', val = 20, bin = 'large')

the following expression is generated:

CASE WHEN "mycol" < 10 THEN NULL
WHEN "mycol" <= 15.5 THEN 'small'
WHEN "mycol" <= 20 THEN 'large'
END "mycol"

Example 3. For the definition:

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
<th>BIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycol</td>
<td>10</td>
<td>NULL</td>
</tr>
<tr>
<td>mycol</td>
<td>15.5</td>
<td>1</td>
</tr>
<tr>
<td>mycol</td>
<td>21</td>
<td>2</td>
</tr>
</tbody>
</table>

the following expression is generated when the literal flag is set to FALSE:

CASE WHEN "mycol" < 10 THEN NULL
WHEN "mycol" <= 15.5 THEN '1'
WHEN "mycol" <= 20 THEN '2'
END "mycol"

and when the flag is set to TRUE:

CASE WHEN "mycol" < 10 THEN NULL
WHEN "mycol" <= 15.5 THEN 1
WHEN "mycol" <= 20 THEN 2
END "mycol"

The simplest invocation of this routine generates a view build_view that
represents the transformation query on build_table based on transform
definitions in bin definitions in the num_bin_table.

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM(
    'num_bin_table', 'build_table', 'build_view');
END;
/

DBMS_DATA_MINING_TRANSFORM  24-33
XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
    clip_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    clip_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the clipping definition table generated using CREATE_CLIP.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>View representing the transformed output.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Name of the schema hosting the clipping definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the data table.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Name of the schema hosting the view representing the transformed output.</td>
</tr>
</tbody>
</table>

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```sql
CASE WHEN "col" < lcut THEN lval
  WHEN "col" > rcut THEN rval
  ELSE "col"
```

XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
    clip_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    clip_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the clipping definition table generated using CREATE_CLIP.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>View representing the transformed output.</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Name of the schema hosting the clipping definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the data table.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Name of the schema hosting the view representing the transformed output.</td>
</tr>
</tbody>
</table>

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```sql
CASE WHEN "col" < lcut THEN lval
  WHEN "col" > rcut THEN rval
  ELSE "col"
```
Note that `col` is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same `col`, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

Example 1 (Winsorizing). When `col = 'my_col'`, `lcut = -1.5`, `lval = -1.5`, and `rcut = 4.5` and `rval = 4.5`, the following expression is generated:

```sql
CASE WHEN "my_col" < -1.5 THEN NULL
    WHEN "my_col" >  4.5 THEN NULL
    ELSE "my_col"
END "my_col"
```

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in clipping definitions in the `clip_table`.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP(
        'clip_table', 'build_table', 'build_view');
END;
```
XFORM_NORM_LIN Procedure

This procedure creates the view that performs linear normalization. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (    norm_table_name IN VARCHAR2,
  data_table_name  IN VARCHAR2,
  xform_view_name  IN VARCHAR2,
  norm_schema_name IN VARCHAR2 DEFAULT NULL,
  data_schema_name IN VARCHAR2 DEFAULT NULL,
  xform_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the normalization definition table generated using CREATE_NORM_LIN procedure.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>View representing the transformed output.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Name of the schema hosting the normalization definition table.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema hosting the data table.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Name of the schema hosting the view representing the transformed output.</td>
</tr>
</tbody>
</table>

Usage Notes

The normalization table created by CREATE_NORM_LIN and populated with definitions by either INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX is used to guide the query generation process to construct normalization expressions of the following form:

```
("col" - shift)/scale "col"
```
Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

For example, when col = 'my_col', shift = -1.5, and scale = 20. The following expression is generated:

\[ \frac{\text{'my_col'} - (-1.5)}{20} \text{'my_col'} \]

**Examples**

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on normalization definitions in the norm_minmax_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN(
    'norm_minmax_table', 'build_table', 'build_view');
END;
```
XFORM_NORM_LIN Procedure
The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

See Also: Oracle Database Utilities for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- Using DBMS_DATAPUMP
  - Overview
  - Security Model
  - Constants
  - Types
- Summary of DBMS_DATAPUMP Subprograms
Using DBMS_DATAPUMP

Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and datatypes existing in Oracle Database 10g are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The existing EXP_FULL_DATABASE and IMP_FULL_DATABASE roles will be used to allow privileged users to take full advantage of the API. The Data Pump API will
use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

**EXP_FULL_DATABASE**

The `EXP_FULL_DATABASE` role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the `SYS` schema does not have the `EXP_FULL_DATABASE` role assigned to it, all security checks performed by Data Pump that require the `EXP_FULL_DATABASE` role will also grant access to the `SYS` schema.

**IMP_FULL_DATABASE**

The `IMP_FULL_DATABASE` role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the `SYS` schema does not have the `IMP_FULL_DATABASE` role assigned to it, all security checks performed by Data Pump that require the `IMP_FULL_DATABASE` role will also grant access to the `SYS` schema.

**Constants**

There are several public constants defined for use with the `DBMS_DATAPUMP.GET_STATUS` procedure. All such constants are defined as part of the `DBMS_DATAPUMP` package. Any references to these constants must be prefixed by `DBMS_DATAPUMP` and followed by the symbols in the following lists:

**Mask Bit Definitions**

The following mask bit definitions are used for controlling the return of data through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KUS$_STATUS_WIP`                `CONSTANT BINARY_INTEGER := 1;`
Types

- `KU.STATUS_JOB_DESC` CONSTANT BINARY_INTEGER := 2;
- `KU.STATUS_JOB_STATUS` CONSTANT BINARY_INTEGER := 4;
- `KU.STATUS_JOB_ERROR` CONSTANT BINARY_INTEGER := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU.DUMPFILE_TYPE_DISK` CONSTANT BINARY_INTEGER := 0;
- `KU.DUMPFILE_TYPE_TEMPLATE` CONSTANT BINARY_INTEGER := 3;

Types

The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10g, release 1 (10.1), there is a `sys.KU.STATUS1010` type, and in the next Oracle Database release, there could be a `sys.KU.STATUS1110` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `KU.STATUS1010` is defined for the `sys.KU.STATUS1010` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10g, release 1, the generic synonym `KU.STATUS` is defined as
ku$_Status1010. In a future release, there might be a ku$_Status1110 synonym for sys.ku$_Status1110. Because the ku$_Status generic synonym always points to the latest definition, it would now point to ku$_Status1110 rather than to ku$_Status1010.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

---

**Note:** Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

---

**See Also:** [GET_STATUS Procedure](#) on page 25-20 for additional information about how types are used

### Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```sql
CREATE TYPE sys.ku$_WorkerStatus1010 AS OBJECT {
worker_number NUMBER,
process_name VARCHAR2(30),
state VARCHAR2(30),
schema VARCHAR2(30),
name VARCHAR2(4000),
}
```
Types

object_type       VARCHAR2(200),
partition         VARCHAR2(30),
completed_objects NUMBER,
total_objects     NUMBER,
completed_rows    NUMBER,
completed_bytes   NUMBER,
percent_done      NUMBER )
/
CREATE PUBLIC SYNONYM ku$_WorkerStatus1010 FOR sys.ku$_WorkerStatus1010;
CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010
/
CREATE PUBLIC SYNONYM ku$_WorkerStatusList1010 FOR sys.ku$_WorkerStatusList1010;

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The ku$LogLine.errorNumber type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
logLineNumber   NUMBER,
errorNumber     NUMBER,
LogText         VARCHAR2(2000) )
/
CREATE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010
/
CREATE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (percent_done applies to data only):

CREATE TYPE sys.ku$_DumpFile1010 AS OBJECT (
file_name          VARCHAR2(4000),
file_type          NUMBER,
file_size          NUMBER,
file_size          NUMBER,
file_bytes_written NUMBER)

25-6  PL/SQL Packages and Types Reference
CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010;

CREATE TYPE sys.ku$_JobStatus1010 AS OBJECT {
    job_name VARCHAR2(30),
    operation VARCHAR2(30),
    job_mode VARCHAR2(30),
    bytes_processed NUMBER,
    total_bytes NUMBER,
    percent_done NUMBER,
    degree NUMBER,
    error_count NUMBER,
    state VARCHAR2(30),
    phase NUMBER,
    restart_count NUMBER,
    worker_status_list ku$_WorkerStatusList1010,
    files ku$_DumpFileSet1010
}

CREATE PUBLIC SYNONYM ku$_JobStatus1010
FOR sys.ku$_JobStatus1010;

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT {
    param_name VARCHAR2(30),
    param_op VARCHAR2(30),
    param_type VARCHAR2(30),
    param_length NUMBER,
    param_value_n NUMBER,
    param_value_t VARCHAR2(2000) );

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT {
    job_name VARCHAR2(30),
    guid RAW(16),
    operation VARCHAR2(30),
    job_mode VARCHAR2(30),
    remote_link VARCHAR2(4000),
    owner VARCHAR2(30),
    ...
Status Types

The status type is an aggregate of some of the previous types defined and is the return value for the GET_STATUS call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client’s shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the ku$_LogEntry that is returned has already had its log lines ordered for proper output. That is, the original ku$_LogEntry objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```sql
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
    mask               NUMBER,         /* Indicates which status types are present*/
    wip                ku$_LogEntry1010,  /* Work-In-Progress: std. exp/imp msgs */
    job_description    ku$_JobDesc1010,   /* Complete job description */
    job_status         ku$_JobStatus1010, /* Detailed job status + per-worker sts */
    error              ku$_LogEntry1010   /* Multi-level contextual errors */
)
```
## Summary of DBMS_DATAPUMP Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_FILE Procedure</strong> on page 25-10</td>
<td>Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure.</td>
</tr>
<tr>
<td><strong>ATTACH Function</strong> on page 25-14</td>
<td>Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state.</td>
</tr>
<tr>
<td><strong>DATA_FILTER Procedures</strong> on page 25-16</td>
<td>Specifies restrictions on the rows that are to be retrieved.</td>
</tr>
<tr>
<td><strong>DETACH Procedure</strong> on page 25-19</td>
<td>Specifies that the user has no further interest in using the handle.</td>
</tr>
<tr>
<td><strong>GET_STATUS Procedure</strong> on page 25-20</td>
<td>Monitors the status of a job or waits for the completion of a job or for more details on API errors.</td>
</tr>
<tr>
<td><strong>LOG_ENTRY Procedure</strong> on page 25-23</td>
<td>Inserts a message into the log file.</td>
</tr>
<tr>
<td><strong>METADATA_FILTER Procedure</strong> on page 25-25</td>
<td>Provides filters that allow you to restrict the items that are included in a job.</td>
</tr>
<tr>
<td><strong>METADATA_TRANSFORM Procedure</strong> on page 25-31</td>
<td>Specifies transformations to be applied to objects as they are processed in the specified job.</td>
</tr>
<tr>
<td><strong>METADATA_REMAP Procedure</strong> on page 25-28</td>
<td>Specifies a remapping to be applied to objects as they are processed in the specified job.</td>
</tr>
<tr>
<td><strong>OPEN Function</strong> on page 25-34</td>
<td>Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures except ATTACH.</td>
</tr>
<tr>
<td><strong>SET_PARALLEL Procedure</strong> on page 25-38</td>
<td>Adjusts the degree of parallelism within a job.</td>
</tr>
<tr>
<td><strong>SET_PARAMETER Procedures</strong> on page 25-40</td>
<td>Specifies job-processing options.</td>
</tr>
<tr>
<td><strong>START_JOB Procedure</strong> on page 25-45</td>
<td>Begins or resumes execution of a job.</td>
</tr>
<tr>
<td><strong>STOP_JOB Procedure</strong> on page 25-47</td>
<td>Terminates a job, but optionally, preserves the state of the job.</td>
</tr>
</tbody>
</table>
ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (  
  handle    IN NUMBER,  
  filename   IN VARCHAR2,  
  directory  IN VARCHAR2,  
  filesize   IN VARCHAR2 DEFAULT NULL,  
  filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, ... to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.</td>
</tr>
<tr>
<td>directory</td>
<td>The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in Oracle Database Utilities for information about the DIRECTORY command-line parameter.</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATAPUMP Subprograms

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- INVALID_STATE. The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- FILE_ERROR. Oracle does not have the requested operating system access to the specified file or the file has already been specified for the current operation.
- INVALID_OPERATION. A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE

### Table 25–2 (Cont.) ADD_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filesize</td>
<td>The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. filesize may only be specified for dump files.</td>
</tr>
<tr>
<td>filetype</td>
<td>The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP:</td>
</tr>
<tr>
<td></td>
<td>• KU$_FILE_TYPE_DUMP_FILE (dump file for a job)</td>
</tr>
<tr>
<td></td>
<td>• KU$_FILE_TYPE_LOG_FILE (log file for a job)</td>
</tr>
<tr>
<td></td>
<td>• KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)</td>
</tr>
</tbody>
</table>
ADD_FILE Procedure

operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.

- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation, an error will be returned.

- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the SET_PARALLEL procedure.

- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.

- If the substitution variable (%U) is included in a filename, multiple dump files may be specified through a single call to ADD_FILE. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current SET_PARALLEL value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple ADD_FILES with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were all specified for a job having a parallelism of 6, the initial dump files created would look like: expa01, expb01, expc01, expa02, expb02, and expc02.

- If presented with dump file specifications, expa%U, expb%U and expc%U, an Import or SQL_FILE operation will begin by attempting to open the dump files, expa01, expb01, and expc01. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, expa02, expb02, and expc02). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was
in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.
ATTACH Function

This function gains access to a previously-created job.

Syntax

```sql
DBMS_DATAPUMP.ATTACH(
    job_name    IN VARCHAR2 DEFAULT NULL,
    job_owner   IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).</td>
</tr>
<tr>
<td>job_owner</td>
<td>The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the EXP_FULL_DATABASE role (for export operations) or the IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.</td>
</tr>
</tbody>
</table>

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, STOP_JOB, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, and START_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.
- INVALID_OPERATION. The specified operation is not valid in this context.
Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.

- If you want to perform a second attach to a job, you must do so from a different session.

- If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.
DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```sql
DBMS_DATAPUMP.DATA_FILTER (  
    handle    IN NUMBER,  
    name      IN VARCHAR2,  
    value     IN NUMBER,  
    table_name IN VARCHAR2 DEFAULT NULL,  
    schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle that is returned from the OPEN procedure.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. There can be several reasons for this message:
  - A bad filter name is specified
Summary of DBMS_DATAPUMP Subprograms

- The mode is TRANSPORTABLE, which does not support data filters
- The specified table does not exist
- The filter has already been set for the specified values of schema_name and table_name

- INVALID_STATE. The user called DATA_FILTER when the job was not in the Defining state.
- INCONSISTENT_ARGS. The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- PRIVILEGE_ERROR. A schema name was supplied, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in Table 25–5.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Operations that Support Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_ROWS</td>
<td>number</td>
<td>EXPORT, IMPORT</td>
<td>If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.</td>
</tr>
</tbody>
</table>
For Export jobs, this filter specifies which partitions are unloaded from the database. For Import jobs, it specifies which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression. Double quotation marks around partition names are required only if the partition names contain special characters.

**PARTITION_EXPR** is not supported on jobs across a network link.

Default=All partitions are processed.

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Operations that Support Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARTITION_EXPR</td>
<td>text</td>
<td>EXPORT, IMPORT</td>
<td>For Export jobs, this filter specifies which partitions are unloaded from the database. For Import jobs, it specifies which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression. Double quotation marks around partition names are required only if the partition names contain special characters. <strong>PARTITION_EXPR</strong> is not supported on jobs across a network link. Default=All partitions are processed.</td>
</tr>
<tr>
<td>SUBQUERY</td>
<td>text</td>
<td>EXPORT, IMPORT</td>
<td>Specifies a subquery that is added to the end of the <strong>SELECT</strong> statement for the table. If you specify a <strong>WHERE</strong> clause in the subquery, you can restrict the rows that are selected. Specifying an <strong>ORDER BY</strong> clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.</td>
</tr>
</tbody>
</table>
DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

DBMS_DATAPUMP.DETACH{
    handle IN NUMBER};

Parameters

| Table 25–6  DETACH Procedure Parameters |
|-----------------|-----------------------------------|
| Parameter      | Description                                      |
| handle         | The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call. |

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user’s session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.
GET_STATUS Procedure

This procedure monitors the status of a job or wait for the completion of a job.

Syntax

```plsql
DBMS_DATAPUMP.GET_STATUS(
    handle    IN NUMBER,
    mask      IN BINARY_INTEGER,
    timeout   IN NUMBER DEFAULT NULL,
    job_state OUT VARCHAR2,
    status    OUT ku$_Status1010);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through an <code>OPEN</code> or <code>ATTACH</code> call. A null handle can be used to retrieve error information after <code>OPEN</code> and <code>ATTACH</code> failures.</td>
</tr>
<tr>
<td>mask</td>
<td>A bit mask that indicates which of four types of information to return:</td>
</tr>
<tr>
<td></td>
<td>- KU$_STATUS_WIP</td>
</tr>
<tr>
<td></td>
<td>- KU$_STATUS_JOB_DESC</td>
</tr>
<tr>
<td></td>
<td>- KU$_STATUS_JOB_STATUS</td>
</tr>
<tr>
<td></td>
<td>- KU$_STATUS_JOB_ERROR</td>
</tr>
<tr>
<td></td>
<td>Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See <code>Types</code> on page 25-4.</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.</td>
</tr>
<tr>
<td>job_state</td>
<td>Current state of the job. If only job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status1010 structure.</td>
</tr>
</tbody>
</table>
Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_VALUE.** The mask or timeout contains an illegal value.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

The **GET_STATUS** procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KU$_STATUS_JOB_DESC and KU$_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information only is requested, the timeout is ignored.
- If asynchronous information is requested, the interface will wait a maximum of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- The job state is always returned, as long as it can be determined.

Error Handling

There are two types of error scenarios that need to be handled using the **GET_STATUS** procedure:
GET_STATUS Procedure

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned ku$_Status.error will contain a ku$_LogEntry that describes the inconsistency in more detail.

- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The ku$_Status.error will contain a ku$_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client’s main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) “listening” for KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the ku$_Status is interpreted, the following guidelines should be used:

- ku$_Status.ku$_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  
  - EXPORT or network IMPORT-- \( \frac{\text{bytes_processed}}{\text{estimated_bytes}} \times 100 \)
  
  - IMPORT-- \( \frac{\text{bytes_processed}}{\text{total_expected_bytes}} \times 100 \)
  
  - SQL_FILE or estimate-only EXPORT-- 0.00 if not done or 100.00 if done

  The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.

  It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

  \( \left( \frac{\text{SYSDATE} - \text{start time}}{\text{ku$_Status.ku$_JobStatus.percent_done}} \right) \times 100 \)

- The caller should not use ku$_Status.ku$_JobStatus.percent_done for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in job_state.
LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY(
  handle IN NUMBER,
  message IN VARCHAR2
  log_file_only IN NUMBER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.</td>
</tr>
<tr>
<td>message</td>
<td>A text line to be added to the log file.</td>
</tr>
<tr>
<td>log_file_only</td>
<td>Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be
confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ";;;
"
**METADATA_FILTER Procedure**

This procedure provides filters that allow you to restrict the items that are included in a job.

**Syntax**

```sql
DBMS_DATAPUMP.METADATA_FILTER(
    handle       IN NUMBER,
    name         IN VARCHAR2,
    value        IN VARCHAR2,
    object_path  IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from the OPEN procedure.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter. See Table 25–10 for descriptions of the available filters.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter.</td>
</tr>
<tr>
<td>object_path</td>
<td>The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for <code>DATABASE_EXPORT_OBJECTS</code>, <code>SCHEMA_EXPORT_OBJECTS</code>, and <code>TABLE_EXPORT_OBJECTS</code>. (Note that the <code>TABLE_EXPORT_OBJECTS</code> view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.</td>
</tr>
</tbody>
</table>

Table 25–10 describes the name, object type, datatype, operations that support the filter, and the meaning of the filters available with the `METADATA_FILTER` procedure. The datatype for all the filters is a text expression. All operations support all filters.
### Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.

---

**Table 25–10 Filters Provided by METADATA_FILTER Procedure**

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_ NAME_EXPR</td>
<td>Named objects</td>
<td>Defines which object names are included in (INCLUDE_ NAME_EXPR), or excluded from (EXCLUDE_ NAME_EXPR), the job. You use the object_type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.</td>
</tr>
<tr>
<td>EXCLUDE_ NAME_EXPR</td>
<td>Named objects</td>
<td>For Table mode, identifies which tables are to be processed.</td>
</tr>
<tr>
<td>SCHEMA_EXPR</td>
<td>Schema objects</td>
<td>Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN ('SCOTT'')'). For Schema mode, identifies which users are to be processed.</td>
</tr>
<tr>
<td>TABLESPACE_ TABLE, CLUSTER, INDEX, ROLLBACK_ SEGMENT</td>
<td>TABLESPACE</td>
<td>Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.</td>
</tr>
<tr>
<td>INCLUDE_ PATH_EXPR and EXCLUDE_ PATH_EXPR</td>
<td>All</td>
<td>Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the operation. The object_path parameter is not supported for these filters.</td>
</tr>
</tbody>
</table>
Summary of DBMS_DATAPUMP Subprograms

- The specified object_path is not supported for the current mode.
- The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.

- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.

- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).

- The same filter name can be specified multiple times within a job. For example, specifying NAME_EXPR as '!=''EMP''' and NAME_EXPR as '!=''DEPT''' on a TABLE-mode export would produce a file set containing all of the tables except for EMP and DEPT.
METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_REMAP (  
    handle IN NUMBER,  
    name  IN VARCHAR2,  
    old_value IN VARCHAR2,  
    value IN VARCHAR2,  
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the remap. See Table 25–12 for descriptions of the available remaps.</td>
</tr>
<tr>
<td>old_value</td>
<td>Specifies which value in the dump file set should be reset to value.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the remap. This signifies the new value that old_value should be translated into.</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 25–12 describes the remaps provided by the METADATA_REMAP procedure.

Table 25–11 METADATA_REMAP Procedure Parameters
### Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.

- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The job's mode does not include the specified `object_type`.
  - The remap has already been specified for the specified `old_value` and `object_type`.

- **INVALID_OPERATION.** Remaps are only supported for SQL_FILE and Import operations. The job's operation was Export, which does not support the use of metadata remaps.

- **INVALID_STATE.** The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).

- **INCONSISTENT_ARGS.** There was no value supplied or it was of the wrong datatype for the remap.

- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.

- **NO_SUCH_JOB.** The specified job does not exist.

---

### Table 25-12 Remaps Provided by the `METADATA_REMAP` Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMAP_SCHEMA</td>
<td>Text</td>
<td>Schema objects</td>
<td>Any schema object in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> schema will be moved to the <code>value</code> schema.</td>
</tr>
<tr>
<td>REMAP_TABLESPACE</td>
<td>Text</td>
<td>TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED VIEW, MATERIALIZED VIEW LOG, TABLESPACE</td>
<td>Any storage segment in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> tablespace will be relocated to the <code>value</code> tablespace.</td>
</tr>
<tr>
<td>REMAP_DATAFILE</td>
<td>Text</td>
<td>LIBRARY, TABLESPACE, DIRECTORY</td>
<td>Any datafile reference in the job that matches the <code>object_type</code> parameter and referenced the <code>old_value</code> datafile will be redefined to use the <code>value</code> datafile.</td>
</tr>
</tbody>
</table>
Usage Notes

- The METADATA_REMAP procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.
METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
    handle   IN NUMBER,
    name     IN VARCHAR2,
    value    IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–13 METADATA_TRANSFORM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the transformation. See Table 25–14 for descriptions of the available transforms.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the transform.</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 25–14 describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 25–14 Transforms Provided by the METADATA_TRANSFORM Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENT_ATTRIBUTES</td>
<td>NUMBER</td>
<td>TABLE, INDEX</td>
<td>If nonzero (TRUE), emit storage segment parameters. Defaults to 1.</td>
</tr>
</tbody>
</table>
Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn’t support transforms.
  - The job’s mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job’s operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>STORAGE</td>
<td>NUMBER</td>
<td>TABLE</td>
<td>If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).</td>
</tr>
</tbody>
</table>
transforms can be defined for a single job. However, each transform defined must be unique according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.
OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures except ATTACH.

Syntax

```sql
DBMS_DATAPUMP.OPEN (  
    operation   IN VARCHAR2,  
    mode         IN VARCHAR2,  
    remote_link  IN VARCHAR2 DEFAULT NULL,  
    job_name     IN VARCHAR2 DEFAULT NULL,  
    version      IN VARCHAR2 DEFAULT 'COMPATIBLE')  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>The type of operation to be performed. Table 25–16 contains descriptions of valid operation types.</td>
</tr>
<tr>
<td>mode</td>
<td>The scope of the operation to be performed. Table 25–17 contains descriptions of valid modes. Specifying NULL generates an error.</td>
</tr>
<tr>
<td>remote_link</td>
<td>If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.</td>
</tr>
</tbody>
</table>
Table 25–15 (Cont.) OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN procedure and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: SYS_&lt;OPERATION&gt;_&lt;_MODE&gt;__%N&quot;. The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, &quot;SYS_IMPORT_FULL_03&quot;). The name supplied for the job will also be used to name the master table and other resources associated with the job.</td>
</tr>
<tr>
<td>version</td>
<td>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</td>
</tr>
<tr>
<td></td>
<td>• COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</td>
</tr>
<tr>
<td></td>
<td>• LATEST - the version of the metadata corresponds to the database version.</td>
</tr>
<tr>
<td></td>
<td>• A specific database version, for example, '10.0.0'. In Oracle Database10g, this value cannot be lower than 10.0.0.</td>
</tr>
</tbody>
</table>

Table 25–16 Valid Operation Types for the OPEN Procedure

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPORT</td>
<td>Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.</td>
</tr>
<tr>
<td>IMPORT</td>
<td>Restores data and metadata from a dump file set or across a database link.</td>
</tr>
</tbody>
</table>
Table 25–17 describes the valid modes for the OPEN procedure.

Table 25–17  Valid Modes for the OPEN Procedure

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FULL</td>
<td>Operates on the full database or full dump file set except for the SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, and LBACSYS schemas.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS schemas for this mode.</td>
</tr>
<tr>
<td>TABLE</td>
<td>Operates on a set of selected tables. Defaults to all of the tables in the current user’s schema. Only tables and their dependent objects are processed.</td>
</tr>
<tr>
<td>TABLESPACE</td>
<td>Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.</td>
</tr>
<tr>
<td>TRANSPORTABLE</td>
<td>Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.</td>
</tr>
</tbody>
</table>

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: SET_PARALLEL, ADD_FILE, DETACH, STOP_JOB, GET_STATUS, LOG_ENTRY, METADATA_FILTER, DATA_FILTER, METADATA_TRANSFORM, METADATA_REMAP, SET_PARAMETER, and START_JOB.

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **JOB_EXISTS.** A table already exists with the specified job name.
- **PRIVILEGE_ERROR.** The user does not have the necessary privileges or roles to use the specified mode.
- **INTERNAL_ERROR.** The job was created under the wrong schema or the master table was of the wrong format.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the `ATTACH` procedure.
- If the `OPEN` fails, call `GET_STATUS` with a null handle to retrieve additional information about the failure.
SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
    handle        IN NUMBER,
    degree        IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.</td>
</tr>
<tr>
<td>degree</td>
<td>The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before `SET_PARALLEL` can take effect.

Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.

Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.

The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the `PROCESSES` or `SESSIONS` initialization parameters in the `init.ora` file.

To parallelize an Export job to a degree of \( n \), the user should supply \( n \) files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

SQL.FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.
This procedure is used to specify job-processing options.

Syntax

```sql
DBMS_DATAPUMP.SET_PARAMETER(
    handle IN NUMBER,
    name   IN VARCHAR2,
    value  IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (  
    handle IN NUMBER,
    name   IN VARCHAR2,
    value  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through an OPEN call.</td>
</tr>
<tr>

<td></td>
<td>The ESTIMATE parameter cannot be used in Transportable Tablespace mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Default=BLOCKS.</td>
</tr>
<tr>
<td>ESTIMATE_ONLY</td>
<td>Number</td>
<td>Export</td>
<td>Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.</td>
</tr>
<tr>
<td>FLASHBACK_SCN</td>
<td>Number</td>
<td>Export and Import</td>
<td>System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.</td>
</tr>
<tr>
<td>FLASHBACK_TIME</td>
<td>Text</td>
<td>Export and Import</td>
<td>Either the date and time used to determine a consistent point for reading user data or a string of the form TO_TIMESTAMP (...).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.</td>
</tr>
</tbody>
</table>
Table 25–20 Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_METADATA</td>
<td>NUMBER</td>
<td>Export and Import</td>
<td>If nonzero, metadata for objects will be moved in addition to user table data. If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data. INCLUDE_METADATA is not supported in Transportable mode. Default=1.</td>
</tr>
<tr>
<td>REUSE_DATAFILES</td>
<td>NUMBER</td>
<td>Import</td>
<td>If nonzero, tablespace data files can be created using preexisting data files for tablespace creations. REUSE_DATAFILES is only supported in Full mode. Default=0</td>
</tr>
<tr>
<td>SKIP_UNUSABLE_INDEXES</td>
<td>NUMBER</td>
<td>Import</td>
<td>If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode. Default=1</td>
</tr>
<tr>
<td>TABLE_EXISTS_ACTION</td>
<td>Text</td>
<td>Import</td>
<td>Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP. If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported. If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import. Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE. If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped. If APPEND, new rows are added to the existing rows in the table. If SKIP, the preexisting table is left unchanged. TABLE_EXISTS_ACTION is not supported in Transportable mode. The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.</td>
</tr>
</tbody>
</table>
Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name
  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- **INVALID_OPERATION.** The operation specified is invalid in this context.

**Table 25–20 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLESPACE_DATAFILE</td>
<td>Text</td>
<td>Import</td>
<td>Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports. TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.</td>
</tr>
<tr>
<td>TTS_FULL_CHECK</td>
<td>NUMBER</td>
<td>Export</td>
<td>If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0.</td>
</tr>
<tr>
<td>USER_METADATA</td>
<td>NUMBER</td>
<td>Export and network import</td>
<td>For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter. The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has EXP_FULL_DATABASE role; 0 otherwise.</td>
</tr>
</tbody>
</table>
SET_PARAMETER Procedures

- **INVALID_STATE.** The specified job is not in the Defining state.
- **INCONSISTENT_ARGS.** Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- **PRIVILEGE_ERROR.** The user does not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role required for the specified parameter.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- The SET_PARAMETER procedure is used to specify optional features for the current job. See Table 25–20 for a list of supported options.
**START_JOB Procedure**

This procedure begins or resumes execution of a job.

**Syntax**

```sql
DBMS_DATAPUMP.START_JOB (  
    handle       IN NUMBER,  
    skip_current IN NUMBER DEFAULT 0);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through either the OPEN or ATTACH procedure.</td>
</tr>
<tr>
<td>skip_current</td>
<td>If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. skip_current is ignored for the initial START_JOB in a job. If zero, no data or metadata is lost upon a restart.</td>
</tr>
</tbody>
</table>

**Exceptions**

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_STATE.** The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
START_JOB Procedure

- A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
- The dump file set on an Import of SQL_FILE job was either incomplete or missing a master table specification

- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the SET_PARALLEL procedure was not called prior to the START_JOB procedure, the initial level of parallelism used in the job will be 1. If SET_PARALLEL was called prior to the job starting, the degree specified by the last SET_PARALLEL call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another SET_PARALLEL call.
- To restart a stopped job, an ATTACH must be performed prior to executing the START_JOB procedure.
STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```sql
DBMS_DATAPUMP.STOP_JOB (
    handle     IN NUMBER,
    immediate   IN NUMBER DEFAULT 0,
    keep_master IN NUMBER DEFAULT NULL,
    delay       IN NUMBER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.</td>
</tr>
<tr>
<td>immediate</td>
<td>If nonzero, the worker processes are aborted immediately. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. Performing an immediate shutdown halts the job more quickly, but parts of the job will have to be rerun if the job is ever restarted.</td>
</tr>
<tr>
<td>keep_master</td>
<td>If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.</td>
</tr>
<tr>
<td>delay</td>
<td>The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
**STOP_JOB Procedure**

- **INVALID STATE.** The job is already in the process of being stopped or completed.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the **GET_STATUS** procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the **DETACH** procedure.
- Once a job is stopped, it can be restarted using the **ATTACH** and **START_JOB** procedures, provided the master table and the dump file set are left intact.
- If the **KEEP_MASTER** parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.
This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as DDLs.

This chapter contains the following topics:

- Using DBMS_DDL
  - Security Model
  - Operational Notes
- Summary of DBMS_DDL Subprograms
Using DBMS_DDL

- Security Model
- Operational Notes

Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

Operational Notes

The ALTER_COMPILE procedure commits the current transaction, performs the operation, and then commits again.
### Summary of DBMS_DDL Subprograms

#### Table 26–1  DBMS_DDL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_COMPILE Procedure on page 26-4</td>
<td>Compiles the PL/SQL object</td>
</tr>
<tr>
<td>ALTER_TABLE_NOT_REFERENCEABLE Procedure on page 26-5</td>
<td>Reorganizes object tables and swizzles references</td>
</tr>
<tr>
<td>ALTER_TABLE_REFERENCEABLE Procedure on page 26-5</td>
<td>Reorganizes object tables and swizzles references</td>
</tr>
<tr>
<td>IS_TRIGGER_FIRE_ONCE Function on page 26-8</td>
<td>Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE</td>
</tr>
<tr>
<td>SET_TRIGGER_FIRING_PROPERTY Procedure on page 26-9</td>
<td>Sets the specified DML or DDL trigger’s firing property</td>
</tr>
</tbody>
</table>
ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

Syntax

```
DBMS_DDL.ALTER_COMPILE (
    type     VARCHAR2,
    schema   VARCHAR2,
    name     VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER.</td>
</tr>
<tr>
<td>schema</td>
<td>Schema name.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the object (case-sensitive).</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000:</td>
<td>Insufficient privileges or object does not exist.</td>
</tr>
<tr>
<td>ORA-20001:</td>
<td>Remote object, cannot compile.</td>
</tr>
<tr>
<td>ORA-20002:</td>
<td>Bad value for object type Should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER.</td>
</tr>
</tbody>
</table>
ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table table_schema.table_name so it becomes not the default referenceable table for the schema affected_schema. This is equivalent to SQL

ALTER TABLE [<table_schema>.]<table_name> NOT REFERENCEABLE FOR <affected_schema>

which is currently not supported or available as a DDL statement.

Syntax

```sql
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (  
    table_name        IN           VARCHAR2,  
    table_schema      IN  DEFAULT  NULL,  
    affected_schema   IN  DEFAULT  NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.</td>
</tr>
<tr>
<td>table_schema</td>
<td>The name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.</td>
</tr>
<tr>
<td>affected_schema</td>
<td>The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is, it simply undoes the previous ALTER_TABLE_REFERENCEABLE call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.
If the user executing this procedure has ALTER ANY TABLE and SELECT ANY TABLE and DROP ANY TABLE privileges, the user doesn't have to own the table and the affected schema can be any valid schema.
ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name>  REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
  table_name       IN  VARCHAR2,
  table_schema     IN  DEFAULT  NULL,
  affected_schema  IN  DEFAULT  NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>table_name</code></td>
<td>The name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.</td>
</tr>
<tr>
<td><code>table_schema</code></td>
<td>The name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.</td>
</tr>
<tr>
<td><code>affected_schema</code></td>
<td>The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same EOID; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it will make the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.
IS_TRIGGER_FIRE_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package

**Note:** Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: "SET_TRIGGER_FIRING_PROPERTY Procedure" on page 26-9

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
    trig_owner   IN  VARCHAR2,
    trig_name   IN  VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trig_owner</td>
<td>Schema of trigger</td>
</tr>
<tr>
<td>trig_name</td>
<td>Name of trigger</td>
</tr>
</tbody>
</table>
SET_TRIGGER_FIRING_PROPERTY Procedure

This procedure sets the specified DML or DDL trigger’s firing property. Use this procedure to control a DML or DDL trigger’s firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package.

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY
    trig_owner    IN  VARCHAR2,
    trig_name    IN  VARCHAR2,
    fire_once    IN  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trig_owner</td>
<td>Schema of the trigger to set</td>
</tr>
<tr>
<td>trig_name</td>
<td>Name of the trigger to set</td>
</tr>
<tr>
<td>fire_once</td>
<td>If TRUE, then the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers. If FALSE, then the trigger is set to always fire.</td>
</tr>
</tbody>
</table>

Usage Notes

You can specify one of the following settings for a trigger’s firing property:

- If the fire_once parameter is set to TRUE for a trigger, then the trigger does not fire for these types of changes.
- If the fire_once parameter is set to FALSE for a trigger, then the trigger fires for these types of changes.

Regardless of the firing property set by this procedure, a trigger continues to fire when changes are made by means other than the apply process or apply error execution. For example, if a user session or an application makes a change, then the trigger continues to fire, regardless of the firing property.
SET_TRIGGER_FIRING_PROPERTY Procedure

---

**Note:**

- If you dequeue an error transaction from the error queue and execute it without using the `DBMS_APPLY_ADM` package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.

- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

---

**See Also:** *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property.
DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

---

**Note:** The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

---

This chapter contains the following topics:

- Using DBMS_DEBUG
  - Overview
  - Constants
  - Variables
  - Types
  - Exceptions
  - Operational Notes
- Summary of DBMS_DEBUG Subprograms
Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with `DBMS_DEBUG`. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using `DBMS_DEBUG`: This tells it which target session to supervise. The debug session may then call entry points in `DBMS_DEBUG` to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- `SYNCHRONIZE Function`
- `DEBUG_ON Procedure`
- `DEBUG_OFF Procedure`

`DBMS_DEBUG` does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.
Using DBMS_DEBUG

### Constants

A breakpoint status may have the following value:
- **breakpoint_status_unused**—breakpoint is not in use

Otherwise, the status is a mask of the following values:
- **breakpoint_status_active**—a line breakpoint
- **breakpoint_status_disabled**—breakpoint is currently disabled
- **breakpoint_status_remote**—a shadow breakpoint (a local representation of a remote breakpoint)

### Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default_timeout</td>
<td>The timeout value (used by both sessions). The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.</td>
</tr>
</tbody>
</table>

### Types

- **BACKTRACE_TABLE Type**
- **BREAKPOINT_INFO Type**
- **BREAKPOINT_TABLE Type**
- **INDEX_TABLE Type**
- **PROGRAM_INFO Types**
- **RUNTIME_INFO Type**
- **VC2_TABLE Type**

#### BACKTRACE_TABLE Type

This type is used by PRINT_BACKTRACE.

```sql
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```
BREAKPOINT_INFO Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

```sql
TYPE breakpoint_info IS RECORD
(
    -- These fields are duplicates of 'program_info':
    Name VARCHAR2(30),
    Owner VARCHAR2(30),
    DbLink VARCHAR2(30),
    Line# BINARY_INTEGER,
    LibunitType BINARY_INTEGER,
    Status BINARY_INTEGER -- see breakpoint_status_* in following sections
);
```

BREAKPOINT_TABLE Type

This type is used by SHOW_BREAKPOINTS.

```sql
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Type

This type is used by GET_INDEXES to return the available indexes for an indexed table.

```sql
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

PROGRAM_INFO Types

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EntrypointName</td>
<td>Null, unless this is a nested procedure or function.</td>
</tr>
<tr>
<td>LibunitType</td>
<td>Disambiguate among objects that share the same namespace (for example, procedure and package specifications).</td>
</tr>
<tr>
<td></td>
<td>See the Libunit Types on page 27-13 for more information.</td>
</tr>
</tbody>
</table>
TYPE program_info IS RECORD
{
    -- The following fields are used when setting a breakpoint
    Namespace    BINARY_INTEGER,   -- See 'NAMESPACES' in following sections
    Name         VARCHAR2(30),    -- name of the program unit
    Owner        VARCHAR2(30),    -- owner of the program unit
    Dblink       VARCHAR2(30),    -- database link, if remote
    Line#        BINARY_INTEGER,
    -- Read-only fields (set by Probe when doing a stack backtrace)
    LibunitType  BINARY_INTEGER,
    EntrypointName  VARCHAR2(30)
};

RUNTIME_INFO Type
This type gives context information about the running program.

TYPE runtime_info IS RECORD
{
    Line#        BINARY_INTEGER,   -- (duplicate of program.line#)
    Terminated   BINARY_INTEGER,   -- has the program terminated?
    Breakpoint   BINARY_INTEGER,   -- breakpoint number
    StackDepth   BINARY_INTEGER,   -- number of frames on the stack
    InterpreterDepth  BINARY_INTEGER,  -- <reserved field>
    Reason       BINARY_INTEGER,   -- reason for suspension
    Program      program_info      -- source location
};

VC2_TABLE Type
This type is used by SHOW_SOURCE.

TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;

Exceptions
These values are returned by the various functions called in the debug session
(SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions
worked across client/server and server/server boundaries, then these would all be
exceptions rather than error codes.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Normal termination.</td>
</tr>
</tbody>
</table>
Exceptions

Statuses returned by GET_VALUE and SET_VALUE:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_bogus_frame</td>
<td>No such entrypoint on the stack.</td>
</tr>
<tr>
<td>error_no_debug_info</td>
<td>Program was compiled without debug symbols.</td>
</tr>
<tr>
<td>error_no_such_object</td>
<td>No such variable or parameter.</td>
</tr>
<tr>
<td>error_unknown_type</td>
<td>Debug information is unreadable.</td>
</tr>
<tr>
<td>error_indexed_table</td>
<td>Returned by GET_VALUE if the object is a table, but no index was provided.</td>
</tr>
<tr>
<td>error_illegal_index</td>
<td>No such element exists in the collection.</td>
</tr>
<tr>
<td>error_nullcollection</td>
<td>Table is atomically null.</td>
</tr>
<tr>
<td>error_nullvalue</td>
<td>Value is null.</td>
</tr>
</tbody>
</table>

Statuses returned by SET_VALUE:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_illegal_value</td>
<td>Constraint violation.</td>
</tr>
<tr>
<td>error_illegal_null</td>
<td>Constraint violation.</td>
</tr>
<tr>
<td>error_value_malformed</td>
<td>Unable to decipher the given value.</td>
</tr>
<tr>
<td>error_other</td>
<td>Some other error.</td>
</tr>
<tr>
<td>error_name_incomplete</td>
<td>Name did not resolve to a scalar.</td>
</tr>
</tbody>
</table>

Statuses returned by the breakpoint functions:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint.</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot enable or disable an unused breakpoint.</td>
</tr>
<tr>
<td>error_bad_handle</td>
<td>Unable to set breakpoint in given program (nonexistent or security violation).</td>
</tr>
</tbody>
</table>

General error codes (returned by many of the DBMS_DEBUG subprograms):
The following exceptions are raised by procedure SELF_CHECK:

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>illegal_init</td>
<td>DEBUG_ON was called prior to INITIALIZE.</td>
</tr>
</tbody>
</table>

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
```
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;

**Figure 27–1** and **Figure 27–2** illustrate the flow of operations in the session to be debugged and in the debugging session.

**Figure 27–1  Target Session**

- **Initialize session for debugging, and generate/specify unique debugID.**
  - DBMS_DEBUG.initialize()

- **Execute PL/SQL programs**

- **Start debugging**
  - DBMS_DEBUG.debug_on()

- **Stop debugging**
  - DBMS_DEBUG.debug_off()
Using DBMS_DEBUG

**Figure 27–2 Debug Session**

Input: debugID from target session

Initialize
DBMS_DEBUG.attach_session()

Manipulate breakpoints
DBMS_DEBUG.set_breakpoint()
DBMS_DEBUG.delete_breakpoint()
DBMS_DEBUG.disable_breakpoint()
DBMS_DEBUG.enable_breakpoint()
DBMS_DEBUG.show_breakpoints()

Read first event from target session
DBMS_DEBUG.synchronize()

Show stack
DBMS_DEBUG.print_backtrace()

Get/set values
DBMS_DEBUG.get_value()
DBMS_DEBUG.set_value()

Manipulate breakpoints

Show source
DBMS_DEBUG.show_source()
Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.

2. At any line containing an enabled breakpoint.

3. At any line where an interesting event occurs. The set of interesting events is specified by the flags passed to DBMS_DEBUG.CONTINUE in the breakflags parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to DBMS_DEBUG.SYNCHRONIZE after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:
- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

**Diagnostic Output**

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

**Common and Debug Session Sections**

**Common Section**
The following subprograms may be called in either the target or the debug session:

- `PROBE_VERSION Procedure`
- `SELF_CHECK Procedure`
- `SET_TIMEOUT Function`

**Target Session**
The following subprograms may be called only in the target session:

- `INITIALIZE Function`
- `DEBUG_ON Procedure`
- `DEBUG_OFF Procedure`
- `SET_TIMEOUT_BEHAVIOUR Procedure`
- `GET_TIMEOUT_BEHAVIOUR Function`

**Debug Session Section**
The following subprograms should be run in the debug session only:

- `ATTACH_SESSION Procedure`
- `SYNCHRONIZE Function`
- `SHOW_FRAME_SOURCE Procedure`
- `SHOW_SOURCE Procedures`
OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init`'d to the same OER, they are indistinguishable.
Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. Namespace_cursor contains cursors (anonymous blocks).
2. Namespace_pkgspec_or_toplevel contains:
   - Package specifications.
   - Procedures and functions that are not nested inside other packages, procedures, or functions.
   - Object types.
3. Namespace_pkg_body contains package bodies and type bodies.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in PROGRAM_INFO when Probe is giving a stack backtrace.

- LibunitType_cursor
- LibunitType_procedure
- LibunitType_function
- LibunitType_package
- LibunitType_package_body
- LibunitType_trigger
- LibunitType_Unknown

Breakflags

These are values to use for the breakflags parameter to CONTINUE, in order to tell Probe what events are of interest to the client. These flags may be combined.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>break_next_line</td>
<td>Break at next source line (step over calls).</td>
</tr>
<tr>
<td>break_any_call</td>
<td>Break at next source line (step into calls).</td>
</tr>
</tbody>
</table>
Information Flags

These are flags which may be passed as the `info_requested` parameter to `SYNCHRONIZE`, `CONTINUE`, and `GET_RUNTIME_INFO`.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_getStackDepth</td>
<td>Get the current depth of the stack.</td>
</tr>
<tr>
<td>info_getBreakpoint</td>
<td>Get the breakpoint number.</td>
</tr>
<tr>
<td>info_getLineinfo</td>
<td>Get program unit information.</td>
</tr>
</tbody>
</table>

Reasons for Suspension

After `CONTINUE` is run, the program either runs to completion or breaks on some line.

<table>
<thead>
<tr>
<th>Reason</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason_none</td>
<td>-</td>
</tr>
<tr>
<td>reason_interpreter_starting</td>
<td>Interpreter is starting.</td>
</tr>
<tr>
<td>reason_breakpoint</td>
<td>Hit a breakpoint.</td>
</tr>
<tr>
<td>reason_enter</td>
<td>Procedure entry.</td>
</tr>
<tr>
<td>reason_return</td>
<td>Procedure is about to return.</td>
</tr>
<tr>
<td>Reason</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>reason_finish</td>
<td>Procedure is finished.</td>
</tr>
<tr>
<td>reason_line</td>
<td>Reached a new line.</td>
</tr>
<tr>
<td>reason_interrupt</td>
<td>An interrupt occurred.</td>
</tr>
<tr>
<td>reason_exception</td>
<td>An exception was raised.</td>
</tr>
<tr>
<td>reason_exit</td>
<td>Interpreter is exiting (old form).</td>
</tr>
<tr>
<td>reason_knl_exit</td>
<td>Kernel is exiting.</td>
</tr>
<tr>
<td>reason_handler</td>
<td>Start exception-handler.</td>
</tr>
<tr>
<td>reason_timeout</td>
<td>A timeout occurred.</td>
</tr>
<tr>
<td>reason_instantiate</td>
<td>Instantiation block.</td>
</tr>
<tr>
<td>reason_abort</td>
<td>Interpreter is aborting.</td>
</tr>
</tbody>
</table>
## Summary of DBMS_DEBUG Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTACH_SESSION Procedure on page 27-19</td>
<td>Notifies the debug session about the target debugID</td>
</tr>
<tr>
<td>CONTINUE Function on page 27-20</td>
<td>Continues execution of the target program</td>
</tr>
<tr>
<td>DEBUG_OFF Procedure on page 27-22</td>
<td>Turns debug-mode off</td>
</tr>
<tr>
<td>DEBUG_ON Procedure on page 27-22</td>
<td>Turns debug-mode on</td>
</tr>
<tr>
<td>DELETE_BREAKPOINT Function on page 27-23</td>
<td>Deletes a breakpoint</td>
</tr>
<tr>
<td>DELETE_OER_BREAKPOINT Function on page 27-24</td>
<td>Deletes an OER breakpoint</td>
</tr>
<tr>
<td>DETACH_SESSION Procedure on page 27-25</td>
<td>Stops debugging the target program</td>
</tr>
<tr>
<td>DISABLE_BREAKPOINT Function on page 27-26</td>
<td>Disables a breakpoint</td>
</tr>
<tr>
<td>ENABLE_BREAKPOINT Function on page 27-27</td>
<td>Activates an existing breakpoint</td>
</tr>
<tr>
<td>EXECUTE Procedure on page 27-28</td>
<td>Executes SQL or PL/SQL in the target session</td>
</tr>
<tr>
<td>GET_INDEXES Function on page 27-31</td>
<td>Returns the set of indexes for an indexed table</td>
</tr>
<tr>
<td>GET_MORE_SOURCE Procedure on page 27-32</td>
<td>Provides additional source in the event of buffer overflow when using SHOW_SOURCE</td>
</tr>
<tr>
<td>GET_LINE_MAP Function on page 27-33</td>
<td>Returns information about line numbers in a program unit</td>
</tr>
<tr>
<td>GET_RUNTIME_INFO Function on page 27-34</td>
<td>Returns information about the current program</td>
</tr>
</tbody>
</table>
### Table 27–1  (Cont.) DBMS_DEBUG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_TIMEOUT_BEHAVIOUR Function on page 27-35</td>
<td>Returns the current timeout behavior</td>
</tr>
<tr>
<td>GET_VALUE Function on page 27-36</td>
<td>Gets a value from the currently-running program</td>
</tr>
<tr>
<td>INITIALIZE Function on page 27-39</td>
<td>Sets debugID in target session</td>
</tr>
<tr>
<td>PING Procedure on page 27-41</td>
<td>Pings the target session to prevent it from timing out</td>
</tr>
<tr>
<td>PRINT_BACKTRACE Procedure on page 27-42</td>
<td>Prints a stack backtrace</td>
</tr>
<tr>
<td>PRINT_INSTANTIATIONS Procedure on page 27-43</td>
<td>Prints a stack backtrace</td>
</tr>
<tr>
<td>PROBE_VERSION Procedure on page 27-44</td>
<td>Returns the version number of DBMS_DEBUG on the server</td>
</tr>
<tr>
<td>SELF_CHECK Procedure on page 27-45</td>
<td>Performs an internal consistency check</td>
</tr>
<tr>
<td>SET_BREAKPOINT Function on page 27-46</td>
<td>Sets a breakpoint in a program unit</td>
</tr>
<tr>
<td>SET_OER_BREAKPOINT Function on page 27-48</td>
<td>Sets an OER breakpoint</td>
</tr>
<tr>
<td>SET_TIMEOUT Function on page 27-49</td>
<td>Sets the timeout value</td>
</tr>
<tr>
<td>SET_TIMEOUT_BEHAVIOUR Procedure on page 27-50</td>
<td>Tells Probe what to do with the target session when a timeout occurs</td>
</tr>
<tr>
<td>SET_VALUE Function on page 27-51</td>
<td>Sets a value in the currently-running program</td>
</tr>
<tr>
<td>SHOW_BREAKPOINTS Procedures on page 27-53</td>
<td>Returns a listing of the current breakpoints</td>
</tr>
<tr>
<td>SHOW_FRAME_SOURCE Procedure on page 27-54</td>
<td>Fetches the frame source</td>
</tr>
<tr>
<td>SHOW_SOURCE Procedures on page 27-55</td>
<td>Fetches program source</td>
</tr>
</tbody>
</table>
### Table 27–1 (Cont.) DBMS_DEBUG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SYNCHRONIZE Function</strong>&lt;sup&gt;27-57&lt;/sup&gt;</td>
<td>Waits for program to start running</td>
</tr>
<tr>
<td><strong>TARGET_PROGRAM_RUNNING Procedure</strong>&lt;sup&gt;27-58&lt;/sup&gt;</td>
<td>Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not</td>
</tr>
</tbody>
</table>
ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```sql
DBMS_DEBUG.ATTACH_SESSION (
    debug_session_id  IN VARCHAR2,
    diagnostics       IN BINARY_INTEGER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug_session_id</td>
<td>Debug ID from a call to INITIALIZE in target session.</td>
</tr>
<tr>
<td>diagnostics</td>
<td>Generate diagnostic output if nonzero.</td>
</tr>
</tbody>
</table>
CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If info_requested is not NULL, then calls GET_RUNTIME_INFO.

Syntax

```sql
DBMS_DEBUG.CONTINUE (  
  run_info       IN OUT runtime_info,  
  breakflags     IN     BINARY_INTEGER,  
  info_requested IN     BINARY_INTEGER := NULL)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_info</td>
<td>Information about the state of the program.</td>
</tr>
<tr>
<td>breakflags</td>
<td>Mask of events that are of interest. See &quot;Breakflags&quot; on page 27-13.</td>
</tr>
<tr>
<td>info_requested</td>
<td>Which information should be returned in run_info when the program stops. See &quot;Information Flags&quot; on page 27-14.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td></td>
</tr>
<tr>
<td>error_timeout</td>
<td>Timed out before the program started running.</td>
</tr>
<tr>
<td>error_communication</td>
<td>Other communication error.</td>
</tr>
</tbody>
</table>
DEBUG_OFF Procedure

**Caution:** There must be a debug session waiting if immediate is TRUE.

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

**Syntax**

```
DBMS_DEBUG.DEBUG_OFF;
```

**Usage Notes**

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.
DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
    no_client_side_plsql_engine BOOLEAN := TRUE,
    immediate                   BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_client_side_plsql_engine</td>
<td>Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine.</td>
</tr>
<tr>
<td>immediate</td>
<td>If this is TRUE, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.</td>
</tr>
</tbody>
</table>
DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```plaintext
DBMS_DEBUG.DELETE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakpoint</td>
<td>Breakpoint number from a previous call to SET_BREAKPOINT.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td></td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint exists.</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot delete an unused breakpoint.</td>
</tr>
<tr>
<td>error_stale_breakpt</td>
<td>The program unit was redefined since the breakpoint was set.</td>
</tr>
</tbody>
</table>
DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```plsql
DBMS_DEBUG.DELETE_OER_BREAKPOINT (  
    oer IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oer</td>
<td>The OER (positive 4-byte number) to delete.</td>
</tr>
</tbody>
</table>
DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```
DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakpoint</td>
<td>Breakpoint number from a previous call to SET_BREAKPOINT.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td></td>
</tr>
<tr>
<td>error_no_such_break</td>
<td>No such breakpoint exists.</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot disable an unused breakpoint.</td>
</tr>
</tbody>
</table>
**ENABLE_BREAKPOINT Function**

This function is the reverse of disabling. This enables a previously disabled breakpoint.

**Syntax**

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

**Parameters**

*Table 27–11  ENABLE_BREAKPOINT Function Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakpoint</td>
<td>Breakpoint number from a previous call to SET_BREAKPOINT.</td>
</tr>
</tbody>
</table>

**Return Values**

*Table 27–12  ENABLE_BREAKPOINT Function Return Values*

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Success.</td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint exists.</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot enable an unused breakpoint.</td>
</tr>
</tbody>
</table>
EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

DBMS_DEBUG.EXECUTE (  
    what IN VARCHAR2,  
    frame# IN BINARY_INTEGER,  
    bind_results IN BINARY_INTEGER,  
    results IN OUT NOCOPY dbms_debug_vc2coll,  
    errm IN OUT NOCOPY VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>what</td>
<td>SQL or PL/SQL source to execute.</td>
</tr>
<tr>
<td>frame#</td>
<td>The context in which to execute the code. Only -1 (global context) is supported at this time.</td>
</tr>
</tbody>
</table>
| bind_results | Whether the source wants to bind to results in order to return values from the target session.  
0 = No  
1 = Yes |
| results   | Collection in which to place results, if bind_results is not 0. |
| errm      | Error message, if an error occurred; otherwise, NULL. |

Examples

Example 1

This example executes a SQL statement. It returns no results.

DECLARE  
coll sys.dbms_debug_vc2coll; -- results (unused)  
errm VARCHAR2(100);
BEGIN
dbms_debug.execute('insert into emp(ename, empno, deptno) ' ||
   'values('''LJE'', 1, 1), ' ||
   '-1, 0, coll, errm);
END;

**Example 2**
This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

DECLARE
coll sys.dbms_debug_vc2coll;
errm VARCHAR2(100);
BEGIN
dbms_debug.execute(''
   DECLARE PRAGMA autonomous_transaction; ' ||
   'BEGIN ' ||
   '   insert into emp(ename, empno, deptno) ' ||
   '   values('''LJE'', 1, 1); ' ||
   ' COMMIT; ' ||
   'END; '',
   -1, 0, coll, errm);
END;

**Example 3**
This example executes a PL/SQL block, and it returns some results.

DECLARE
coll sys.dbms_debug_vc2coll;
errm VARCHAR2(100);
BEGIN
dbms_debug.execute(''
   DECLARE ' ||
   '   pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
   '   x PLS_INTEGER; ' ||
   '   i PLS_INTEGER := 1; ' ||
   'BEGIN ' ||
   '   SELECT COUNT(*) INTO x FROM emp; ' ||
   '   pp.EXTEND(x * 6); ' ||
   '   FOR c IN (SELECT * FROM emp) LOOP ' ||
   '      pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
   '      pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
   '      pp(i) := ''Job:   '' || c.job; i := i+1; ' ||
'   pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
'   pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
'   pp(i) := null;                   i := i+1; ' ||
'   END LOOP; ' ||
'   :1 := pp;' ||
'END;,'

-1, 1, coll, errm);

each := coll.FIRST;
WHILE (each IS NOT NULL) LOOP
   dosomething(coll(each));
   each := coll.NEXT(each);
END LOOP;
END;
GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```sql
DBMS_DEBUG.GET_INDEXES (
    varname   IN  VARCHAR2,
    frame#    IN  BINARY_INTEGER,
    handle    IN  program_info,
    entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>varname</td>
<td>Name of the variable to get index information about.</td>
</tr>
<tr>
<td>frame#</td>
<td>Number of frame in which the variable or parameter resides; NULL for a package variable.</td>
</tr>
<tr>
<td>handle</td>
<td>Package description, if object is a package variable.</td>
</tr>
<tr>
<td>entries</td>
<td>1-based table of the indexes. If non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_no_such_object</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- The package does not exist.</td>
</tr>
<tr>
<td></td>
<td>- The package is not instantiated.</td>
</tr>
<tr>
<td></td>
<td>- The user does not have privileges to debug the package.</td>
</tr>
<tr>
<td></td>
<td>- The object does not exist in the package.</td>
</tr>
</tbody>
</table>
GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the SHOW_SOURCE Procedures which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (    buffer IN OUT VARCHAR2,
    buflen IN BINARY_INTEGER,
    piece# IN BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>The buffer.</td>
</tr>
<tr>
<td>buflen</td>
<td>The length of the buffer.</td>
</tr>
<tr>
<td>piece#</td>
<td>A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.
GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```sql
DBMS_DEBUG.GET_LINE_MAP (  
  program                IN   program_info,  
  maxline                OUT  BINARY_INTEGER,  
  number_of_entry_points OUT  BINARY_INTEGER,  
  linemap                OUT  RAW)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program</td>
<td>A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.</td>
</tr>
<tr>
<td>maxline</td>
<td>The largest source code line number in 'program'.</td>
</tr>
<tr>
<td>number_of_entry_points</td>
<td>The number of subprograms in 'program'</td>
</tr>
<tr>
<td>linemap</td>
<td>A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion.</td>
</tr>
<tr>
<td>error_no_debug_info</td>
<td>The program unit exists, but has no debug info.</td>
</tr>
<tr>
<td>error_bad_handle</td>
<td>No such program unit exists.</td>
</tr>
</tbody>
</table>

Summary of DBMS_DEBUG Subprograms
GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the info_requested parameter to SYNCHRONIZE or CONTINUE was set to 0.

**Note:** This is currently only used by client-side PL/SQL.

Syntax

```sql
DBMS_DEBUG.GET_RUNTIME_INFO (  
    info_requested  IN  BINARY_INTEGER,  
    run_info   OUT runtime_info)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_requested</td>
<td>Which information should be returned in run_info when the program stops. See “Information Flags” on page 27-14.</td>
</tr>
<tr>
<td>run_info</td>
<td>Information about the state of the program.</td>
</tr>
</tbody>
</table>
GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```plsql
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oer</td>
<td>The OER (a 4-byte positive number).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion.</td>
</tr>
</tbody>
</table>

Information Flags

```plsql
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`. 
GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
    variable_name  IN  VARCHAR2,
    frame#         IN  BINARY_INTEGER,
    scalar_value   OUT VARCHAR2,
    format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Name of the variable or parameter.</td>
</tr>
<tr>
<td>frame#</td>
<td>Frame in which it lives; 0 means the current procedure.</td>
</tr>
<tr>
<td>scalar_value</td>
<td>Value.</td>
</tr>
<tr>
<td>format</td>
<td>Optional date format to use, if meaningful.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion.</td>
</tr>
<tr>
<td>error_bogus_frame</td>
<td>Frame does not exist.</td>
</tr>
<tr>
<td>error_no_debug_info</td>
<td>Entrypoint has no debug information.</td>
</tr>
<tr>
<td>error_no_such_object</td>
<td>variable_name does not exist in frame#.</td>
</tr>
<tr>
<td>error_unknown_type</td>
<td>The type information in the debug information is illegible.</td>
</tr>
<tr>
<td>error_nullvalue</td>
<td>Value is NULL.</td>
</tr>
<tr>
<td>error_indexed_table</td>
<td>The object is a table, but no index was provided.</td>
</tr>
</tbody>
</table>
This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```sql
DBMS_DEBUG.GET_VALUE (  
    variable_name  IN  VARCHAR2,  
    handle         IN  program_info,  
    scalar_value   OUT  VARCHAR2,  
    format         IN  VARCHAR2 := NULL)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Name of the variable or parameter.</td>
</tr>
<tr>
<td>handle</td>
<td>Description of the package containing the variable.</td>
</tr>
<tr>
<td>scalar_value</td>
<td>Value.</td>
</tr>
<tr>
<td>format</td>
<td>Optional date format to use, if meaningful.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_no_such_object</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- Package does not exist.</td>
</tr>
<tr>
<td></td>
<td>- Package is not instantiated.</td>
</tr>
<tr>
<td></td>
<td>- User does not have privileges to debug the package.</td>
</tr>
<tr>
<td></td>
<td>- Object does not exist in the package.</td>
</tr>
<tr>
<td>error_indexed_table</td>
<td>The object is a table, but no index was provided.</td>
</tr>
</tbody>
</table>

Examples

This example illustrates how to get the value with a given package PACK in schema SCOTT, containing variable VAR:

```sql
DECLARE
```

GET_VALUE Function

handle   dbms_debug.program_info;
resultbuf VARCHAR2(500);
retval   BINARY_INTEGER;
BEGIN
  handle.Owner := 'SCOTT';
  handle.Name  := 'PACK';
  handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
  retval := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```sql
DBMS_DEBUG.INITIALIZE (
    debug_session_id   IN VARCHAR2 := NULL,
    diagnostics        IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug_session_id</td>
<td>Name of session ID. If NULL, then a unique ID is generated.</td>
</tr>
<tr>
<td>diagnostics</td>
<td>Indicates whether to dump diagnostic output to the tracefile.</td>
</tr>
</tbody>
</table>

0 = (default) no diagnostics

1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.
The **CREATE ANY PROCEDURE** privilege does not affect the visibility of routines through the debugger. A privilege **DEBUG** for each object has been introduced with a corresponding **DEBUG ANY PROCEDURE** variant. These are required in order to see routines owned by users other than the session’s login user.

Authentication of the debug role and the check for **DEBUG CONNECT SESSION** privilege will be done in the context of the caller to this routine. If the caller is a definer’s rights routine or has been called from one, only privileges granted to the defining user, the debug role, or **PUBLIC** will be used to check for **DEBUG CONNECT SESSION**. If this call is from within a definer’s rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the **DEBUG** privilege on individual procedures will be done in the context of the session’s login user, the roles that were enabled at session level at the moment this call was made (even if those roles were not available within a definer’s rights environment of the call), and the debug role.
PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the timeout_behaviour is set to retry_on_timeout then this procedure is not necessary.

Syntax

DBMS_DEBUG.PING;

Exceptions

Oracle will display the no_target_program exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling set_timeout_behaviour.

- retry_on_timeout - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- continue_on_timeout - Continue execution, using same event flags.
- nodebug_on_timeout - Turn debug-mode OFF (in other words, call debug_off) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.
- abort_on_timeout - Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.

retry_on_timeout CONSTANT BINARY_INTEGER:= 0;
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```sql
DBMS_DEBUG.PRINT_BACKTRACE (
    listing IN OUT VARCHAR2);

DBMS_DEBUG.PRINT_BACKTRACE (
    backtrace OUT backtrace_table);
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listing</td>
<td>A formatted character buffer with embedded newlines.</td>
</tr>
<tr>
<td>backtrace</td>
<td>1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.</td>
</tr>
</tbody>
</table>
PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```sql
DBMS_DEBUG.PRINT_INSTANTIATIONS (
    pkgs   IN OUT NOCOPY backtrace_table,
    flags  IN BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pkgs (OUT)</td>
<td>The instantiated packages</td>
</tr>
<tr>
<td>flags</td>
<td>Bitmask of options:</td>
</tr>
<tr>
<td></td>
<td>1 - show specs</td>
</tr>
<tr>
<td></td>
<td>2 - show bodies</td>
</tr>
<tr>
<td></td>
<td>4 - show local instantiations</td>
</tr>
<tr>
<td></td>
<td>8 - show remote instantiations (NYI)</td>
</tr>
<tr>
<td></td>
<td>16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.</td>
</tr>
</tbody>
</table>

Exceptions

- no_target_program - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: Namespace, Name, Owner, and LibunitType.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped
**PROBE_VERSION Procedure**

This procedure returns the version number of `DBMS_DEBUG` on the server.

**Syntax**

```sql
DBMS_DEBUG.PROBE_VERSION (major out BINARY_INTEGER,
                          minor out BINARY_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version number.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version number: increments as functionality is added.</td>
</tr>
</tbody>
</table>
SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pbload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
    timeout IN binary_integer := 60);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The timeout to use for the communication test. Default is 60 seconds.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OER-6516</td>
<td>Probe version is inconsistent.</td>
</tr>
<tr>
<td>pipe_creation_failure</td>
<td>Could not create a pipe.</td>
</tr>
<tr>
<td>pipe_send_failure</td>
<td>Could not write data to the pipe.</td>
</tr>
<tr>
<td>pipe_receive_failure</td>
<td>Could not read data from the pipe.</td>
</tr>
<tr>
<td>pipe_datatype_mismatch</td>
<td>Datatype in the pipe was wrong.</td>
</tr>
<tr>
<td>pipe_data_error</td>
<td>Data got garbled in the pipe.</td>
</tr>
</tbody>
</table>

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.
SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```sql
DBMS_DEBUG.SET_BREAKPOINT (
    program IN program_info,
    line# IN BINARY_INTEGER,
    breakpoint# OUT BINARY_INTEGER,
    fuzzy IN BINARY_INTEGER := 0,
    iterations IN BINARY_INTEGER := 0)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program</td>
<td>Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)</td>
</tr>
<tr>
<td>line#</td>
<td>Line at which the breakpoint is to be set.</td>
</tr>
<tr>
<td>breakpoint#</td>
<td>On successful completion, contains the unique breakpoint number by which to refer to the breakpoint.</td>
</tr>
<tr>
<td>fuzzy</td>
<td>Only applicable if there is no executable code at the specified line: 0 means return error_illegal_line. 1 means search forward for an adjacent line at which to place the breakpoint. -1 means search backward for an adjacent line at which to place the breakpoint.</td>
</tr>
<tr>
<td>iterations</td>
<td>Number of times to wait before signalling this breakpoint.</td>
</tr>
</tbody>
</table>
Return Values

Note: The fuzzy and iterations parameters are not yet implemented.

Table 27–33 SET_BREAKPOINT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion.</td>
</tr>
<tr>
<td>error_illegal_line</td>
<td>Cannot set a breakpoint at that line.</td>
</tr>
<tr>
<td>error_bad_handle</td>
<td>No such program unit exists.</td>
</tr>
</tbody>
</table>
SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```sql
DBMS_DEBUG.SET_OER_BREAKPOINT (
    oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oer</td>
<td>The OER (positive 4-byte number) to delete.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion.</td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such OER breakpoint exists.</td>
</tr>
</tbody>
</table>
Set with a timeout value and return the new timeout value.

Syntax

```sql
DBMS_DEBUG.SET_TIMEOUT (
    timeout BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The timeout to use for communication between the target and debug sessions.</td>
</tr>
</tbody>
</table>
SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
    behaviour IN PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>behaviour - One of the following:</td>
<td></td>
</tr>
<tr>
<td>retry_on_timeout</td>
<td>Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.</td>
</tr>
<tr>
<td>continue_on_timeout</td>
<td>Continue execution, using same event flags.</td>
</tr>
<tr>
<td>nodebug_on_timeout</td>
<td>Turn debug-mode OFF (in other words, call debug_off) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.</td>
</tr>
<tr>
<td>abort_on_timeout</td>
<td>Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.</td>
</tr>
</tbody>
</table>

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is continue_on_timeout, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.
SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```sql
DBMS_DEBUG.SET_VALUE (
    frame#               IN binary_integer,
    assignment_statement IN varchar2)
RETURN BINARY_INTEGER;

DBMS_DEBUG.SET_VALUE (
    handle               IN program_info,
    assignment_statement IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>frame#</td>
<td>Frame in which the value is to be set; 0 means the currently executing frame.</td>
</tr>
<tr>
<td>handle</td>
<td>Description of the package containing the variable.</td>
</tr>
<tr>
<td>assignment_statement</td>
<td>An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3';. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>-</td>
</tr>
<tr>
<td>error_illegal_value</td>
<td>Not possible to set it to that value.</td>
</tr>
<tr>
<td>error_illegal_null</td>
<td>Cannot set to NULL because object type specifies it as 'not null'.</td>
</tr>
</tbody>
</table>
**Usage Notes**

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that modification to a package variable using `SET_VALUE` might not take effect for a line or two.

**Examples**

To set the value of `SCOTT.PACK.var` to 6:

```plsql
DECLARE
    handle  dbms_debug.program_info;
    retval  BINARY_INTEGER;
BEGIN
    handle.Owner     := 'SCOTT';
    handle.Name      := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval           := dbms_debug.set_value(handle, 'var := 6;');
END;
```

---

<table>
<thead>
<tr>

<td></td>
<td>- User does not have privileges to debug the package.</td>
</tr>
<tr>
<td></td>
<td>- Object does not exist in the package.</td>
</tr>
</tbody>
</table>
SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (    
   listing    IN OUT VARCHAR2);  

DBMS_DEBUG.SHOW_BREAKPOINTS (    
   listing    OUT breakpoint_table);  

DBMS_DEBUG.SHOW_BREAKPOINTS (    
   code_breakpoints  OUT breakpoint_table,  
   oer_breakpoints   OUT oer_table);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listing</td>
<td>A formatted buffer (including newlines) of the breakpoints. Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.</td>
</tr>
<tr>
<td>code_breakpoints</td>
<td>The indexed table of breakpoint entries, indexed by breakpoint number.</td>
</tr>
<tr>
<td>oer_breakpoints</td>
<td>The indexed table of OER breakpoints, indexed by OER.</td>
</tr>
</tbody>
</table>
SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```sql
DBMS_DEBUG.SHOW_FRAME_SOURCE (
  first_line  IN            BINARY_INTEGER,
  last_line   IN            BINARY_INTEGER,
  source      IN OUT NOCOPY vc2_table,
  frame_num   IN            BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_line</td>
<td>Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)</td>
</tr>
<tr>
<td>last_line</td>
<td>Line number of last line to fetch. No lines are fetched past the end of the program.</td>
</tr>
<tr>
<td>source</td>
<td>The resulting table, which may be indexed by line#.</td>
</tr>
<tr>
<td>frame_num</td>
<td>1-based frame number.</td>
</tr>
</tbody>
</table>

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the Usage Notes to SHOW_SOURCE Procedures.
SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

DBMS_DEBUG.SHOW_SOURCE (  
  first_line  IN   BINARY_INTEGER,  
  last_line   IN   BINARY_INTEGER,  
  source      OUT  vc2_table);

DBMS_DEBUG.SHOW_SOURCE (  
  first_line   IN     BINARY_INTEGER,  
  last_line    IN     BINARY_INTEGER,  
  window       IN     BINARY_INTEGER,  
  print_arrow  IN     BINARY_INTEGER,  
  buffer       IN OUT VARCHAR2,  
  buflen       IN     BINARY_INTEGER,  
  pieces       OUT    BINARY_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_line</td>
<td>Line number of first line to fetch.  (PL/SQL programs always</td>
</tr>
<tr>
<td></td>
<td>start at line 1 and have no holes.)</td>
</tr>
<tr>
<td>last_line</td>
<td>Line number of last line to fetch. No lines are fetched past</td>
</tr>
<tr>
<td></td>
<td>the end of the program.</td>
</tr>
<tr>
<td>source</td>
<td>The resulting table, which may be indexed by line#.</td>
</tr>
<tr>
<td>window</td>
<td>'Window' of lines (the number of lines around the current</td>
</tr>
<tr>
<td></td>
<td>source line).</td>
</tr>
<tr>
<td>print_arrow</td>
<td>Nonzero means to print an arrow before the current line.</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer in which to place the source listing.</td>
</tr>
<tr>
<td>buflen</td>
<td>Length of buffer.</td>
</tr>
<tr>
<td>pieces</td>
<td>Set to nonzero if not all the source could be placed into the</td>
</tr>
<tr>
<td></td>
<td>given buffer.</td>
</tr>
</tbody>
</table>
SHOW_SOURCE Procedures

Return Values

An indexed table of source-lines. The source lines are stored starting at first_line. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```sql
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
    -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
    -- or GET_RUNTIME_INFO to fill in 'info'
    SELECT text INTO <buffer> FROM all_source
    WHERE owner = info.Program.Owner
    AND name = info.Program.Name
    AND line = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call SHOW_SOURCE. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of SHOW_SOURCE returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (buflen), then additional pieces can be retrieved using the GET_MORE_SOURCE procedure (pieces returns the number of additional pieces that need to be retrieved).
SYNCHRONIZE Function

This function waits until the target program signals an event. If info_requested is not NULL, then it calls GET_RUNTIME_INFO.

Syntax

```sql
DBMS_DEBUG.SYNCHRONIZE (
    run_info       OUT  runtime_info,
    info_requested IN   BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_info</td>
<td>Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.</td>
</tr>
<tr>
<td>info_requested</td>
<td>Optional bit-field in which to request information other than the default (which is info_getStackDepth + info_getLineInfo). 0 means that no information is requested at all. See &quot;Information Flags&quot; on page 27-14.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion.</td>
</tr>
<tr>
<td>error_timeout</td>
<td>Timed out before the program started execution.</td>
</tr>
<tr>
<td>error_communication</td>
<td>Other communication error.</td>
</tr>
</tbody>
</table>
TARGET_PROGRAM_RUNNING Procedure

This procedure returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not.

Syntax

DBMS_DEBUG.TARGET_PROGRAM_RUNNING
RETURN BOOLEAN;
DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

- Documentation of DBMS_DEFER
Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see
DBMS_DEFER in the Oracle Database Advanced Replication Management API Reference.
DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- Documentation of DBMS_DEFER_QUERY
For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the Oracle Database Advanced Replication Management API Reference.
DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

- Documentation of DBMS_DEFER_SYS
For a complete description of this package within the context of Replication, see `DBMS_DEFER_SYS` in the *Oracle Database Advanced Replication Management API Reference*. 
You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- Using `DBMS_DESCRIBE`
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- Summary of `DBMS_DESCRIBE` Subprograms
Overview

This package provides the same functionality as the Oracle Call Interface OCIDescribeAny call.

See Also: Oracle Call Interface Programmer’s Guide

Security Model

This package is available to PUBLIC and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBEPROCEDURE in its OUT parameters. The types are:

```plsql
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
  INDEX BY BINARY_INTEGER;

TYPE NUMBER_TABLE IS TABLE OF NUMBER
  INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.
Using DBMS_DESCRIBE

Operational Notes

From a third generation language, we cannot directly bind to an argument of record or boolean type. For a Boolean, the following workaround is available:

Assume function \( F \) returns a Boolean. \( G \) is a procedure with one \( \text{IN} \) Boolean argument, and \( H \) is a procedure with one \( \text{OUT} \) Boolean argument. You can execute these functions, binding in DTYINTs (native integer) as follows, where \( 0 \Rightarrow \text{FALSE} \) and \( 1 \Rightarrow \text{TRUE} \):

```
DECLARE b BOOLEAN;
BEGIN h(b);
IF b
THEN :dtyint_bind_var := 1;
ELSE :dtyint_bind_var := 0;
END IF;
END;
```

Access to procedures with arguments of the record type require writing a wrapper similar to that in the preceding example.

Examples

One use of the `DESCRIBE_PROCEDURE` procedure is as an external service interface.

For example, consider a client that provides an `OBJECT_NAME` of SCOTT.ACCOUNT_UPDATE, where `ACCOUNT_UPDATE` is an overloaded function with specification:

```
TABLE account  (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person   (person_id number(4), person_nm varchar2(10))
```

Table 31–1 DBMS_DESCRIBE Errors

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>

## Summary of DBMS_DESCRIBE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESCRIBE_PROCEDURE Procedure</td>
<td>Provides a brief description of a PL/SQL stored procedure</td>
</tr>
</tbody>
</table>
DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
    object_name IN VARCHAR2,
    reserved1 IN VARCHAR2,
    reserved2 IN VARCHAR2,
    overload OUT NUMBER_TABLE,
    position OUT NUMBER_TABLE,
    level OUT NUMBER_TABLE,
    argument_name OUT VARCHAR2_TABLE,
    datatype OUT NUMBER_TABLE,
    default_value OUT NUMBER_TABLE,
    in_out OUT NUMBER_TABLE,
    length OUT NUMBER_TABLE,
    precision OUT NUMBER_TABLE,
    scale OUT NUMBER_TABLE,
    radix OUT NUMBER_TABLE,
    spare OUT NUMBER_TABLE,
    include_string_constraints OUT BOOLEAN DEFAULT FALSE);
```
Parameters

</tr>
<tr>
<td>precision</td>
<td>If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.</td>
</tr>
</tbody>
</table>
Return Values

All values from DESCRIPTURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.
DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

See Also: Oracle Data Warehousing Guide for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- Using DBMS_DIMENSION
  - Security Model
- Summary of DBMS_DIMENSION Subprograms
Using DBMS_DIMENSION

Using DBMS_DIMENSION

- Security Model

Security Model

Security on this package can be controlled by granting EXECUTE to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: CREATE ANY DIMENSION, ALTER ANY DIMENSION, and DROP ANY DIMENSION.
Table 32–1  DBMS_DIMENSION Package Subprograms

<table>
<thead>

<td>Verifies that the relationships specified in a dimension are correct</td>
</tr>
</tbody>
</table>
DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```sql
DBMS_DIMENSION.DESCRIBE_DIMENSION (  
   dimension   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>The owner and name of the dimension in the format of owner.name.</td>
</tr>
</tbody>
</table>
VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION_EXCEPTIONS in the user's schema.

Syntax

```sql
DBMS_DIMENSION.VALIDATE_DIMENSION (  
dimension               IN VARCHAR2,  
incremental             IN BOOLEAN := TRUE,  
check_nulls             IN BOOLEAN := FALSE,  
statement_id            IN VARCHAR2 := NULL );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>The owner and name of the dimension in the format of owner.name.</td>
</tr>
<tr>
<td>incremental</td>
<td>If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.</td>
</tr>
<tr>
<td>check_nulls</td>
<td>If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-nullness is guaranteed by other means, such as NOT NULL constraints.</td>
</tr>
<tr>
<td>statement_id</td>
<td>A client-supplied unique identifier to associate output rows with specific invocations of the procedure.</td>
</tr>
</tbody>
</table>
DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- Using DBMS_DISTRIBUTED_TRUST_ADMIN
  - Overview
  - Security Model
  - Examples
- Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms
Using DBMS_DISTRIBUTED_TRUST_ADMIN

Using DBMS_DISTRIBUTED_TRUST_ADMIN

- Overview
- Security Model
- Examples

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly,
denying a particular server with the DENY_SERVER procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures DENY_ALL and ALLOW_ALL delete all entries (in other words, server names) that are explicitly allowed or denied using the ALLOW_SERVER procedure or DENY_SERVER procedure respectively.

**Examples**

If you have not yet used the package DBMS_DISTRIBUTED_TRUST_ADMIN to change the trust listing, by default you trust all databases in the same enterprise domain if that domain it listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST NAME
--------- ---------------------
Trusted All
```

Because all servers are currently trusted, you can execute the DENY_SERVER Procedure and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST NAME
--------- -----------------------------------------------
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the DENY_ALL Procedure, you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST NAME
--------- -----------------------------------------------
Untrusted All
```
The **ALLOW_SERVER Procedure** can be used to specify that one particular database is to be trusted:

```sql
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
    ('SALES.US.AMERICAS.ACME.AUTO.COM');
```

PL/SQL procedure successfully completed.

```sql
SELECT * FROM TRUSTED_SERVERS;
```

```
<table>
<thead>
<tr>
<th>TRUST</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusted</td>
<td>SALES.US.AMERICAS.ACME.AUTO.COM</td>
</tr>
</tbody>
</table>
```
### Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOW_ALL Procedure</td>
<td>Empties the list and inserts a row indicating that all servers should be trusted</td>
</tr>
<tr>
<td>ALLOW_SERVER Procedure</td>
<td>Enables a specific server to be allowed access even though deny all is indicated in the list</td>
</tr>
<tr>
<td>DENY_ALL Procedure</td>
<td>Empties the list and inserts a row indicating that all servers should be untrusted</td>
</tr>
<tr>
<td>DENY_SERVER Procedure</td>
<td>Enables a specific server to be denied access even though allow all is indicated in the list</td>
</tr>
</tbody>
</table>
ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.
ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

Syntax

```sql
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
    server IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>Unique, fully-qualified name of the server to be trusted.</td>
</tr>
</tbody>
</table>

Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.
DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are
denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no
servers are currently trusted.

Syntax

DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified allow all).

Syntax

```sql
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
    server IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>Unique, fully-qualified name of the server to be untrusted.</td>
</tr>
</tbody>
</table>

Usage Notes

If the Trusted Servers List contains the entry allow all, then this procedure adds an entry indicating that the specified database (for example, DBx) is not to be trusted.

If the Trusted Servers List contains the entry "deny all", and if there is no "allow DBx" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "deny all", and if there is an "allow DBx" entry, then this procedure causes that entry to be deleted.
The DBMS_FGA package provides fine-grained security functions.

**See Also:** Oracle Database Application Developer’s Guide - Fundamentals for a fuller discussion and more usage information on DBMS_FGA.

This chapter contains the following topics:

- **Using DBMS_FGA**
  - Security Model
  - Operational Notes
- **Summary of DBMS_FGA Subprograms**
Using DBMS_FGA

- Security Model
- Operational Notes

Security Model

Execute privilege on DBMS_FGA is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to DBA_FGA_AUDIT_TRAIL to analyze the SQL text and corresponding bind variables that are issued.
Table 34–1  DBMS_FGA Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_POLICY Procedure</td>
<td>Creates an audit policy using the supplied predicate as the audit condition</td>
</tr>
<tr>
<td>DISABLE_POLICY Procedure on page 34-8</td>
<td>Disables an audit policy</td>
</tr>
<tr>

<td>Drops an audit policy</td>
</tr>
<tr>
<td>ENABLE_POLICY Procedure on page 34-10</td>
<td>Enables an audit policy</td>
</tr>
</tbody>
</table>
ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

Syntax

```sql
DBMS_FGA.ADD_POLICY(
    object_schema   VARCHAR2,
    object_name     VARCHAR2,
    policy_name     VARCHAR2,
    audit_condition VARCHAR2,
    audit_column    VARCHAR2,
    handler_schema  VARCHAR2,
    handler_module  VARCHAR2,
    enable          BOOLEAN,
    statement_types VARCHAR2,
    audit_trail     BINARY_INTEGER IN DEFAULT,
    audit_column_opts BINARY_INTEGER IN DEFAULT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema of the object to be audited.</td>
</tr>
<tr>
<td>Default value: NULL. (If NULL, the current effective user schema is assumed.)</td>
<td></td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object to be audited.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The unique name of the policy.</td>
</tr>
<tr>
<td>audit_condition</td>
<td>A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.</td>
</tr>
<tr>
<td>Default value: NULL</td>
<td></td>
</tr>
<tr>
<td>audit_column</td>
<td>The columns to be checked for access. These can include hidden columns. The default, NULL, causes audit if any column is accessed or affected.</td>
</tr>
<tr>
<td>Default value: NULL</td>
<td></td>
</tr>
</tbody>
</table>
### Table 34–2  ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handler_schema</td>
<td>The schema that contains the event handler. The default, NULL, causes the current schema to be used. Default value: NULL</td>
</tr>
<tr>
<td>handler_module</td>
<td>The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition is processed in the query. If the procedure fails with exception, the user SQL statement will fail as well. Default value: NULL</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the policy if TRUE, which is the default. Default value: TRUE</td>
</tr>
<tr>
<td>statement_types</td>
<td>The SQL statement types to which this policy is applicable: insert, update, delete, or select only. Default value: SELECT</td>
</tr>
<tr>
<td>audit_trail</td>
<td>Whether to populate LSQLTEXT and LSQLBIND in fga_log$. Default value: DB_EXTENDED</td>
</tr>
<tr>
<td>audit_column_opts</td>
<td>Establishes whether a statement is audited when the query references any column specified in the audit_column parameter or only when all such columns are referenced. Default value: ANY_COLUMNS</td>
</tr>
</tbody>
</table>

### Usage Notes

- **Example:**
  ```sql
  DBMS_FGA.ADD_POLICY (object_schema => 'scott', object_name=>'emp', policy_name => 'mypolicy1', audit_condition => 'sal < 100', audit_column =>'comm, credit_card, expirn_date', handler_schema => NULL, handler_module => NULL, enable => TRUE, statement_types=> 'INSERT, UPDATE');
  ```

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- If object_schema is NULL, the current effective user schema is assumed.
- The audit function (handler_module) is an alerting mechanism for the administrator; it must have the following interface:
ADD_POLICY Procedure

PROCEDURE <fname> ( object_schema VARCHAR2, object_name VARCHAR2, policy_name VARCHAR2 )  AS ...

where <fname> is the name of the procedure, object_schema is the name of the schema of the table audited, object_name is the name of the table to be audited, and policy_name is the name of the policy being enforced.

- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's audit_condition. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.

- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)

- The audit_condition must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. This condition can be `NULL` (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:
  
  - Subqueries or sequences
  - Any direct use of SYSDATE, UID, USER or USERENV functions. However, a user-defined function and other SQL functions can use these functions to return the desired information.
  - Any use of the pseudocolumns LEVEL, PRIOR, or ROWNUM.

Specifying an audit condition of "1=1" to force auditing of all specified statements ("statement_types") affecting the specified column ("audit_column") is no longer needed to achieve this purpose. `NULL` will cause audit even if no rows were processed, so that all actions on a table with this policy are audited.

- The audit_trail parameter specifies whether to record the query's SQL Text and SQL Bind variable information in the FGA audit trail (fga_log$) columns named LSQLTEXT and LSQLBIND:
  
  - To populate, set to DBMS_FGA.DB_EXTENDED (the default);
  - To leave unpopulated, set to DBMS_FGA.DB.

The audit_trail parameter appears in the ALL_AUDIT_POLICIES view.

- The audit_column_opts parameter establishes whether a statement is audited...
when the query references any column specified in the audit_column parameter (audit_column_opts = DBMS_FGA.ANY_COLUMNS), or

- only when all such columns are referenced (audit_column_opts = DBMS_FGA.ALL_COLUMNS).

The default is DBMS_FGA.ANY_COLUMNS.

The ALL_AUDIT_POLICIES view also shows audit_column_opts.

Examples

```sql
DBMS_FGA.ADD_POLICY (object_schema => 'scott', object_name=>'emp', policy_name => 'mypolicy1', audit_condition => 'sal < 100', audit_column =>'comm, credit_card, expirn_date', handler_schema => NULL, handler_module => NULL, enable => TRUE, statement_types=> 'INSERT, UPDATE');
```
DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```sql
DBMS_FGA.DISABLE_POLICY(
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema of the object to be audited. (If NULL, the current effective user schema is assumed.)</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object to be audited.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The unique name of the policy.</td>
</tr>
</tbody>
</table>

The default value for object_schema is NULL. (If NULL, the current effective user schema is assumed.)
**DROP_POLICY Procedure**

This procedure drops an audit policy.

**Syntax**

```sql
DBMS_FGA.DROP_POLICY(
    object_schema VARCHAR2,
    object_name VARCHAR2,
    policy_name VARCHAR2 );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema of the object to be audited. (If NULL, the current effective user schema is assumed.)</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object to be audited.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The unique name of the policy.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The DBMS_FGA procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_FGA procedures are part of the DDL transaction. The default value for object_schema is NULL. (If NULL, the current effective user schema is assumed.)
ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY(
    object_schema VARCHAR2,
    object_name VARCHAR2,
    policy_name VARCHAR2,
    enable BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema of the object to be audited. (If NULL, the current effective user schema is assumed.)</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object to be audited.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The unique name of the policy.</td>
</tr>
<tr>
<td>enable</td>
<td>Defaults to TRUE to enable the policy.</td>
</tr>
</tbody>
</table>
The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- Oracle Database Concepts for conceptual information about file transfer
- Oracle Database Administrator’s Guide for instructions about using file transfer
- Oracle Streams Concepts and Administration for applications of file transfer.

This chapter contains the following topic:

- Summary of DBMS_FILE_TRANSFER Subprograms
## Summary of DBMS_FILE_TRANSFER Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPY_FILE Procedure</td>
<td>Reads a local file and creates a copy of it in the local file system</td>
</tr>
<tr>
<td>GET_FILE Procedure</td>
<td>Contacts a remote database to read a remote file and then creates a copy of the file in the local file system</td>
</tr>
<tr>
<td>PUT_FILE Procedure</td>
<td>Reads a local file and contacts a remote database to create a copy of the file in the remote file system</td>
</tr>
</tbody>
</table>
COPY_FILE Procedure

This procedure reads a local file and creates a copy of it in the local file system. The file that is copied is the source file, and new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

DBMS_FILE_TRANSFER.COPY_FILE(
    source_directory_object       IN  VARCHAR2,
    source_file_name              IN  VARCHAR2,
    destination_directory_object  IN  VARCHAR2,
    destination_file_name         IN  VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object from which the file is copied in the local file system. This directory object must exist.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The name of the file that is copied in the local file system. This file must exist in the local file system in the directory associated with the source directory object.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object into which the file is placed in the local file system. This directory object must exist in the local file system.</td>
</tr>
<tr>
<td>destination_file_name</td>
<td>The name of the file copied to the destination directory object in the local file system. A file with the same name must not exist in the destination directory in the local file system.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- Read privilege on the directory object specified in the source_directory_object parameter
COPY_FILE Procedure

- Write privilege on directory object specified in the destination_directory_object parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the V$SESSION_LONGOPS dynamic performance view.
GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
source_directory_object IN VARCHAR2,
source_file_name IN VARCHAR2,
source_database IN VARCHAR2,
destination_directory_object IN VARCHAR2,
destination_file_name IN VARCHAR2);
```

Parameters

**Table 35–3 GET_FILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object from which the file is copied at the source site. This directory object must exist at the source site.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.</td>
</tr>
<tr>
<td>source_database</td>
<td>The name of a database link to the remote database where the file is located.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.</td>
</tr>
<tr>
<td>destination_file_name</td>
<td>The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure successfully, the following users must have the following privileges:
The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.

The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the `V$SESSION_LONGOPS` dynamic performance view.
PUT_FILE Procedure

This procedure reads a local file and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
    source_directory_object       IN  VARCHAR2,
    source_file_name              IN  VARCHAR2,
    destination_directory_object  IN  VARCHAR2,
    destination_file_name         IN  VARCHAR2,
    destination_database          IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object from which the file is copied at the local source site.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The name of the file that is copied from the local file system.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object into which the file is placed at the destination site.</td>
</tr>
<tr>
<td>destination_file_name</td>
<td>The name of the file placed in the remote file system.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The name of a database link to the remote database to which the file is copied.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure successfully, the following users must have the following privileges:
The current user at the local database must have read privilege on the directory object specified in the `source_directory_object` parameter.

The connected user at the destination database must have write privilege to the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the `V$SESSION_LONGOPS` dynamic performance view.
Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).

See Also: Oracle Database Application Developer’s Guide - Fundamentals and Oracle Database SQL Reference for detailed information about DBMS_FLASHBACK.

This chapter contains the following topics:

- Using DBMS_FLASHBACK
  - Overview
  - Security Model
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_FLASHBACK Subprograms
Using DBMS_FLASHBACK

Using DBMS_FLASHBACK

- Overview
- Security Model
- Exceptions
- Operational Notes
- Examples

Overview

When DBMS_FLASHBACK is enabled, the user session uses the Flashback version of
the database, and applications can execute against the Flashback version of the
database.

You may want to use DBMS_FLASHBACK for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover
  the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to
  restore deleted e-mail by re-inserting the deleted message into the current
  message box.
- Decision support system (DSS) and online analytical processing (OLAP)
  applications: You can perform data analysis or data modeling to track seasonal
  demand.

Security Model

To use this package, a database administrator must grant EXECUTE privileges for
DBMS_FLASHBACK.
Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-08180</td>
<td>Time specified is too old.</td>
</tr>
<tr>
<td>ORA-08181</td>
<td>Invalid system change number specified.</td>
</tr>
<tr>
<td>ORA-08182</td>
<td>User cannot begin read-only or serializable transactions in Flashback mode.</td>
</tr>
<tr>
<td>ORA-08183</td>
<td>User cannot enable Flashback within an uncommitted transaction.</td>
</tr>
<tr>
<td>ORA-08184</td>
<td>User cannot enable Flashback within another Flashback session.</td>
</tr>
<tr>
<td>ORA-08185</td>
<td>SYS cannot enable Flashback mode.</td>
</tr>
</tbody>
</table>

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need. If you need to perform a Flashback over a 24-hour period, the DBA should set the undo_retention parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the RETENTION GUARANTEE clause for the undo tablespace to ensure that unexpired undo is not discarded. UNDO_RETENTION is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, RETENTION GUARANTEE prevents this. For more information, see the Oracle Database Administrator’s Guide.

In a Flashback-enabled session, SYSDATE will not be affected; it will continue to provide the current time.
DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM keep_scn is a temporary table to store scns that we are interested in

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

DBMS_FLASHBACK.DISABLE;

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```sql
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
    query_scn IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_scn</td>
<td>The system change number (SCN), a version number for the database that is incremented on every transaction commit.</td>
</tr>
</tbody>
</table>
### ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`. It enables Flashback for the entire session.

**Syntax**

```sql
DBMS_FLASHBACK.ENABLE_AT_TIME (
    query_time   IN TIMESTAMP);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>query_time</code></td>
<td>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Using the <code>TIMESTAMP</code> constructor: Example: execute dbms_flashback.enable_at_time(TIMESTAMP '2001-01-09 12:31:00'). Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</td>
</tr>
<tr>
<td></td>
<td>• Using the <code>TO_TIMESTAMP</code> function: Example: execute dbms_flashback.enable_at_time(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS')). You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</td>
</tr>
<tr>
<td></td>
<td>• If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M.</td>
</tr>
<tr>
<td></td>
<td>• Note that if the query time contains a time zone, the time zone information is truncated.</td>
</tr>
</tbody>
</table>
GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
RETURN NUMBER;
```
SCN_TO_TIMESTAMP Function

This function takes the SCN as an Oracle number datatype and returns the corresponding TIMESTAMP.

Syntax

```sql
DBMS_FLASHBACK.SCN_TO_TIMESTAMP
  query_scn  IN        NUMBER)
RETURN TIMESTAMP;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_scn</td>
<td>The system change number (SCN), a version number for the database that is incremented on every transaction commit.</td>
</tr>
</tbody>
</table>
TIMESTAMP_TO_SCN Function

This function takes a TIMESTAMP as input and returns the corresponding SCN as an Oracle number datatype.

Syntax

```sql
DBMS_FLASHBACK.TIMESTAMP_TO_SCN
    query_time    IN        TIMESTAMP
RETURN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_time</td>
<td>This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>- Using the TIMESTAMP constructor: Example: execute DBMS_FLASHBACK.ENABLE_AT_TIME (TIMESTAMP '2001-01-09 12:31:00'). Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</td>
</tr>
<tr>
<td></td>
<td>- Using the TO_TIMESTAMP function: Example: execute dbms_flashback.enable_at_time (TO_TIMESTAMP ('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS')). You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM.</td>
</tr>

</tr>
<tr>
<td></td>
<td>- Note that if the query time contains a time zone, the time zone information is truncated.</td>
</tr>
</tbody>
</table>
The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- Summary of DBMS_FREQUENT_ITEMSET Subprograms
Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 37–1  DBMS_FREQUENT_ITEMSET Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FI_TRANSACTIONAL Function</td>
<td>Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded</td>
</tr>
<tr>
<td>FI_HORIZONTAL Function</td>
<td>Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded</td>
</tr>
</tbody>
</table>
**FI_TRANSACTIONAL Function**

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

**Syntax**

```sql
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (    tranx_cursor         IN    SYSREFCURSOR,
    support_threshold    IN    NUMBER,
    itemset_length_min   IN    NUMBER,
    itemset_length_max   IN    NUMBER,
    including_items      IN    SYS_REFCURSOR DEFAULT NULL,
    excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (    itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
    support        NUMBER,
    length         NUMBER,
    total_tranx    NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tranx_cursor</td>
<td>The cursor parameter that the user will supply when calling the function.</td>
</tr>
<tr>
<td>support_threshold</td>
<td>A fraction number of total transaction count. An itemset is termed &quot;frequent&quot;</td>
</tr>
</tbody>
</table>

Applications must redefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table `tranx_table_in` looks as follows:

```
(1, 'apple')
```
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

itemset=('apple','banana'), support=2, length=2, total_tranx=3

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of VARCHAR2, you must create a nested table of VARCHAR2:

CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);

SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in),
    0.6,
    2,
    5,
    NULL,
    NULL));

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    CURSOR(SELECT tid, iid FROM tranx_table_in),
    0.6,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

SELECT
    bt.setid, nt.*
FROM (SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid 
FROM table(
    DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL))) bt,
    table(bt.itemset) nt;

If you want to use an insert statement to load frequent itemsets into a nested table, 
it is better to use the NESTED_TABLE_FAST_INSERT hint for performance:

CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS 
coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */  INTO fq_nt 
SELECT cast(itemset as FI_VARCHAR_NT) 
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));

Note that if you want to use the package inside a PL/SQL cursor, you must cast the 
return type of the table function:

CREATE TYPE fi_res AS OBJECT ( 
    itemset      FI_VARCHAR_NT, 
    support      NUMBER, 
    length       NUMBER, 
    total_tranx  NUMBER 
); 
/ 
CREATE TYPE fi_coll AS TABLE OF fi_res; 
/

DECLARE 
cursor freqC is
    SELECT Itemset 
    FROM table(
        CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
            cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
            NULL, NULL) AS fi_coll));
coll_nt  FI_VARCHAR_NT;
um_rows int;
um_itms int;
BEGIN 
um_rows := 0;
um_itms := 0;
OPEN freqC;
LOOP
    FETCH freqC INTO coll_nt;
    EXIT WHEN freqC%NOTFOUND;
    num_rows := num_rows + 1;
    num_itms := num_itms + coll_nt.count;
END LOOP;
CLOSE freqC;
DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || ' items were produced.');
END;
/

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```sql
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    tranx_cursor IN SYSREFCURSOR,
    support_threshold IN NUMBER,
    itemset_length_min IN NUMBER,
    itemset_length_max IN NUMBER,
    including_items IN SYS_REFCURSOR DEFAULT NULL,
    excluding_items IN SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
    itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
    support NUMBER,
    length NUMBER,
    total_tranx NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tranx_cursor</td>
<td>The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).</td>
</tr>
</tbody>
</table>
Return Values

Example

Suppose you have a table `horiz_table_in`.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4 VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in `horiz_table_in` looks as follows:
Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
        FROM horiz_table_in),
    0.3,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```
The pass-through SQL feature allows an application developer to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows for operations in statements for which there is no equivalent in Oracle.

You can run these statements directly at the non-Oracle system using the PL/SQL package DBMS_HS_PASSTHROUGH. Any statement executed with this package is run in the same transaction as regular "transparent" SQL statements.

This chapter discusses the following topic:

BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```sql
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (  
c      IN BINARY_INTEGER NOT NULL,  
p      IN BINARY_INTEGER NOT NULL,  
v      IN <dty>,  
n      IN VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

See Also: To bind RAW variables use BIND_VARIABLE_RAW Procedure on page 38-5.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Value that must be passed to the bind variable name.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports &quot;named binds&quot; instead of positional binds. Passing the position is still required.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>
Pragmas

Purity level defined: WNDS, RNDS
BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dty>,
  n      IN  VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

See Also: For binding OUT variables of datatype RAW, see BIND_OUT_VARIABLE_RAW Procedure on page 38-9.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>

BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of datatype RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (  
  c     IN  BINARY_INTEGER NOT NULL,  
  p     IN  BINARY_INTEGER NOT NULL,  
  v     OUT RAW,  
  n     IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Variable in which the OUT bind variable stores its value. The package remembers only the &quot;size&quot; of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.</td>
</tr>
<tr>
<td>n</td>

BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (  
c     IN     BINARY_INTEGER NOT NULL,  
p     IN     BINARY_INTEGER NOT NULL,  
v     IN OUT <dty>,  
n     IN     VARCHAR2);  
```

<dty> is either DATE, NUMBER, or VARCHAR2.

See Also: For binding IN OUT variables of datatype RAW see BIND_INOUT_VARIABLE_RAW Procedure on page 38-13.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
</tbody>
</table>
| v         | This value is used for two purposes:  
- To provide the IN value before the SQL statement is run.  
- To determine the size of the out value.  
| n         | (Optional) Name of the bind variable. For example, in `SELECT * FROM emp WHERE ename=:ename`, the position of the bind variable `ename` is 1, the name is `ename`. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN_CURSOR, PARSE, EXECUTE_NON_QUERY, CLOSE_CURSOR.

Syntax

DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE ( 
  s IN VARCHAR2 NOT NULL) 
RETURN BINARY_INTEGER;

Parameters

Table 38–16  EXECUTE_IMMEDIATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s</td>
<td>VARCHAR2 variable with the statement to be executed immediately.</td>
</tr>
</tbody>
</table>

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a SELECT statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (  
  c IN BINARY_INTEGER NOT NULL)  
RETURN BINARY_INTEGER;

Parameters

Table 38–18 EXECUTE_NON_QUERY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
</tbody>
</table>

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

<tr>
<td>ORA–28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
FETCH_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL SELECT statement. When there are no more rows to be fetched, the exception NO_DATA_FOUND is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```sql
DBMS_HS_PASSTHROUGH.FETCH_ROW (  
   c   IN BINARY_INTEGER NOT NULL,  
   f   IN BOOLEAN)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
</tbody>
</table>
| first     | (Optional) Reexecutes SELECT statement. Possible values:  
- TRUE: reexecute SELECT statement.  
- FALSE: fetch the next row, or if run for the first time, then execute and fetch rows (default). |

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28550</td>

GET_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of SELECT statements, after a row has been fetched.
- It retrieves the OUT bind values, after the SQL statement has been run.

Syntax

```sql
DBMS_HS_PASSTHROUGH.GET_VALUE (  
   c      IN  BINARY_INTEGER NOT NULL,  
   p    IN  BINARY_INTEGER NOT NULL,  
   v    OUT <dty>);  
```

`<dty>` is either DATE, NUMBER, or VARCHAR2.

**See Also:** For retrieving values of datatype RAW, see GET_VALUE_RAW Procedure on page 38-22.

Parameters

**Table 38–22  GET_VALUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>

OPEN_CURSOR Function

This function opens a cursor for running a pass-through SQL statement at the non-Oracle system. This function must be called for any type of SQL statement. The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure CLOSE_CURSOR.

Syntax

```sql
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
RETURN BINARY_INTEGER;
```

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>

The DBMS_IOT package creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command. DBMS_IOT can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the enable_constraint operation.

DBMS_IOT is not loaded during database installation. To install DBMS_IOT, run dbmsiotc.sql, available in the ADMIN directory.

This chapter contains the following topics:

- Summary of DBMS_IOT Subprograms

**Note:** With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.
Summary of DBMS_IOT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_CHAIN_ROWS_TABLE Procedure on page 39-3</td>
<td>Creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command</td>
</tr>
<tr>
<td>BUILD_EXCEPTIONS_TABLE Procedure on page 39-5</td>
<td>Creates an exception table into which rows of an index-organized table that violate a constraint can be placed</td>
</tr>
</tbody>
</table>
BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (  
    owner               IN VARCHAR2,  
    iot_name            IN VARCHAR2,  
    chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the index-organized table.</td>
</tr>
<tr>
<td>iot_name</td>
<td>Index-organized table name.</td>
</tr>
<tr>
<td>chainrow_table_name</td>
<td>Intended name for the chained-rows table.</td>
</tr>
</tbody>
</table>

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16), b char(16), c char(16), d char(240),  
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;  
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');
```

A chained-row table is created with the following columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>CLUSTER_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>PARTITION_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SUBPARTITION_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>HEAD_ROWID</td>
<td></td>
<td>ROWID</td>
</tr>
</tbody>
</table>
### BUILD_CHAIN_ROWS_TABLE Procedure

<table>
<thead>
<tr>
<th>TIMESTAMP</th>
<th>DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>CHAR(16)</td>
</tr>
<tr>
<td>B</td>
<td>CHAR(16)</td>
</tr>
<tr>
<td>C</td>
<td>CHAR(16)</td>
</tr>
</tbody>
</table>
**BUILD_EXCEPTIONS_TABLE Procedure**

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

**Syntax**

```sql
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (owner                  IN VARCHAR2,
                               iot_name              IN VARCHAR2,
                               exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the index-organized table.</td>
</tr>
<tr>
<td>iot_name</td>
<td>Index-organized table name.</td>
</tr>
<tr>
<td>exceptions_table_name</td>
<td>Intended name for exception-table.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You should create a separate exception table for each index-organized table to accommodate its primary key.

**Examples**

```sql
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE ('SYS', 'L', 'LE');
```

An exception table for the preceding index-organized table with the following columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROW_ID</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>OWNER</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
</tbody>
</table>
### BUILD_EXCEPTIONS_TABLE Procedure

<table>
<thead>
<tr>
<th>TABLE_NAME</th>
<th>VARCHAR2 (30)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONSTRAINT</td>
<td>VARCHAR2 (30)</td>
</tr>
<tr>
<td>A</td>
<td>CHAR (16)</td>
</tr>
<tr>
<td>B</td>
<td>CHAR (16)</td>
</tr>
<tr>
<td>C</td>
<td>CHAR (16)</td>
</tr>
</tbody>
</table>
The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- Documentation of DBMS_JAVA
For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer’s Guide*. 
The DBMS_JOB package schedules and manages jobs in the job queue.

---

**Note:** The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS_JOB by revoking the package execution privilege for users.

For more information, see "Moving from DBMS_JOB to DBMS_SCHEDULER" in *Oracle Database Administrator’s Guide.*

---

This chapter contains the following topics:

- Using DBMS_JOB
  - Security Model
  - Operational Notes
- Summary of DBMS_JOB Subprograms
Using DBMS_JOB

Security Model
No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

Operational Notes

Working with Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in 10i instance binding is not recommended. Service affinity is preferred. This concept is implemented in the DBMS_SCHEDULER package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

DBMS_JOB.SUBMIT
To submit a job to the job queue, use the following syntax:

DBMS_JOB.SUBMIT (}
Using DBMS_JOB

```sql
JOB OUT BINARY_INTEGER,
WHAT IN VARCHAR2, NEXT_DATE IN DATE DEFAULT SYSDATE,
INTERVAL IN VARCHAR2 DEFAULT 'NULL',
NO_PARSE IN BOOLEAN DEFAULT FALSE,
INSTANCE IN BINARY_INTEGER DEFAULT ANY_INSTANCE,
FORCE IN BOOLEAN DEFAULT FALSE);
```

Use the parameters INSTANCE and FORCE to control job and instance affinity. The default value of INSTANCE is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the INSTANCE value. Oracle displays error ORA-23319 if the INSTANCE value is a negative number or NULL.

The FORCE parameter defaults to FALSE. If force is TRUE, any positive integer is acceptable as the job instance. If FORCE is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

**DBMS_JOB.INSTANCE**

To assign a particular instance to execute a job, use the following syntax:

```sql
DBMS_JOB.INSTANCE( JOB IN BINARY_INTEGER,
INSTANCE IN BINARY_INTEGER,
FORCE IN BOOLEAN DEFAULT FALSE);
```

The FORCE parameter in this example defaults to FALSE. If the instance value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of force. If the INSTANCE value is positive and the FORCE parameter is FALSE, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the FORCE parameter is TRUE, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the INSTANCE value is negative or NULL.

**DBMS_JOB.CHANGE**

To alter user-definable parameters associated with a job, use the following syntax:

```sql
DBMS_JOB.CHANGE( JOB IN BINARY_INTEGER,
WHAT IN VARCHAR2 DEFAULT NULL,
NEXT_DATE IN DATE DEFAULT NULL,
INTERVAL IN VARCHAR2 DEFAULT NULL,
INSTANCE IN BINARY_INTEGER DEFAULT NULL,
FORCE IN BOOLEAN DEFAULT FALSE );
```

Two parameters, INSTANCE and FORCE, appear in this example. The default value of INSTANCE is NULL indicating that job affinity will not change.
The default value of `FORCE` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the `INSTANCE` number is negative.

**DBMS_JOB.RUN**
The `FORCE` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If force is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If force is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if force is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(
    JOB IN BINARY_INTEGER,
    FORCE IN BOOLEAN DEFAULT FALSE);
```

**Stopping a Job**
Note that, once a job is started and running, there is no easy way to stop the job.
Summary of DBMS_JOB Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BROKEN Procedure on page 41-6</td>
<td>Enables job execution</td>
</tr>
<tr>
<td>CHANGE Procedure on page 41-7</td>
<td>Alters any of the user-definable parameters associated with a job</td>
</tr>
<tr>
<td>INSTANCE Procedure on page 41-9</td>
<td>Assigns a job to be run by a instance</td>
</tr>
<tr>
<td>INTERVAL Procedure on page 41-10</td>
<td>Alters the interval between executions for a specified job</td>
</tr>
<tr>
<td>NEXT_DATE Procedure on page 41-11</td>
<td>Alters the next execution time for a specified job</td>
</tr>
<tr>
<td>REMOVE Procedure on page 41-12</td>
<td>Removes specified job from the job queue</td>
</tr>
<tr>
<td>RUN Procedure on page 41-13</td>
<td>Forces a specified job to run</td>
</tr>
<tr>
<td>SUBMIT Procedure on page 41-14</td>
<td>Submits a new job to the job queue</td>
</tr>
<tr>
<td>USER_EXPORT Procedures on page 41-16</td>
<td>Re-creates a given job for export, or re-creates a given job</td>
</tr>
<tr>
<td>WHAT Procedure on page 41-17</td>
<td>Alters the job description for a specified job</td>
</tr>
</tbody>
</table>
**BROKEN Procedure**

This procedure sets the broken flag. Broken jobs are never run.

**Syntax**

```sql
DBMS_JOB.BROKEN (
    job IN BINARY_INTEGER,
    broken IN BOOLEAN,
    next_date IN DATE DEFAULT SYSDATE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>broken</td>
<td>Job broken: IN value is FALSE.</td>
</tr>
<tr>
<td>next_date</td>
<td>Date of the next refresh.</td>
</tr>
</tbody>
</table>

**Note:** If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

**Usage Notes**

You must issue a COMMIT statement immediately after the statement.
CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```sql
DBMS_JOB.CHANGE (
    job       IN  BINARY_INTEGER,
    what      IN  VARCHAR2,
    next_date IN  DATE,
    interval  IN  VARCHAR2,
    instance  IN  BINARY_INTEGER DEFAULT NULL,
    force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>what</td>
<td>PL/SQL procedure to run.</td>
</tr>
<tr>
<td>next_date</td>
<td>Date of the next refresh.</td>
</tr>
<tr>
<td>interval</td>
<td>Date function; evaluated immediately before the job starts running.</td>
</tr>
<tr>
<td>instance</td>
<td>When a job is submitted, specifies which instance can run the job. This defaults to NULL, which indicates that instance affinity is not changed.</td>
</tr>
<tr>
<td>force</td>
<td>If this is FALSE, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is TRUE, then any positive integer is acceptable as the job instance.</td>
</tr>
</tbody>
</table>

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
If the parameters `what`, `next_date`, or `interval` are NULL, then leave that value as it is.

**Example**

```sql
BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;
```
INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```sql
DBMS_JOB.INSTANCE (
  job      IN BINARY_INTEGER,
  instance IN BINARY_INTEGER,
  force    IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>instance</td>
<td>When a job is submitted, a user can specify which instance can run the job.</td>
</tr>
<tr>
<td>force</td>
<td>If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

You must issue a COMMIT statement immediately after the statement.
INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

DBMS_JOB.INTERVAL (  
    job IN BINARY_INTEGER,  
    interval IN VARCHAR2);  

Parameters

**Table 41–5  INTERVAL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>interval</td>
<td>Date function, evaluated immediately before the job starts running.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the job completes successfully, then this new date is placed in next_date. interval is evaluated by plugging it into the statement select interval into next_date from dual;

- The interval parameter must evaluate to a time in the future. Legal intervals include:

<table>
<thead>
<tr>
<th>Interval</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'sysdate + 7'</td>
<td>Run once a week.</td>
</tr>
<tr>
<td>'next_day(sysdate,'TUESDAY')'</td>
<td>Run once every Tuesday.</td>
</tr>
<tr>
<td>'null'</td>
<td>Run only once.</td>
</tr>
</tbody>
</table>

- If interval evaluates to NULL and if a job completes successfully, then the job is automatically deleted from the queue.

- You must issue a COMMIT statement immediately after the statement.
**NEXT_DATE Procedure**

This procedure changes when an existing job next runs.

**Syntax**

```sql
DBMS_JOB.NEXT_DATE (
    job       IN  BINARY_INTEGER,
    next_date IN  DATE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>next_date</td>
<td>Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You must issue a `COMMIT` statement immediately after the statement.
REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```sql
DBMS_JOB.REMOVE (  
    job IN BINARY_INTEGER );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
</tbody>
</table>

Usage Notes

You must issue a COMMIT statement immediately after the statement.

Example

```sql
BEGIN
    DBMS_JOB.REMOVE(14144);
    COMMIT;
END;
```
**RUN Procedure**

This procedure runs job JOB now. It runs it even if it is broken.

Running the job recomputes `next_date`. See view `user_jobs`.

**Syntax**

```sql
DBMS_JOB.RUN (  
  job       IN  BINARY_INTEGER,  
  force     IN  BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>force</td>
<td>If this is TRUE, then instance affinity is irrelevant for running jobs in the foreground process. If this is FALSE, then the job can be run in the foreground only in the specified instance.</td>
</tr>
</tbody>
</table>

**Example**

```sql
EXECUTE DBMS_JOB.RUN(14144);
```

**Caution:** This re-initializes the current session's packages.

**Exceptions**

An exception is raised if `force` is FALSE, and if the connected instance is the wrong one.
SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence sys.jobseq.

Syntax

```
DBMS_JOB.SUBMIT (  
    job       OUT BINARY_INTEGER,  
    what      IN  VARCHAR2,  
    next_date IN  DATE DEFAULT sysdate,  
    interval  IN  VARCHAR2 DEFAULT 'null',  
    no_parse  IN  BOOLEAN DEFAULT FALSE,  
    instance  IN  BINARY_INTEGER DEFAULT any_instance,  
    force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 41–9 SUBMIT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>what</td>
<td>PL/SQL procedure to run.</td>
</tr>
<tr>
<td>next_date</td>
<td>Next date when the job will be run.</td>
</tr>
<tr>
<td>interval</td>
<td>Date function that calculates the next time to run the job. The default is NULL. This must evaluate to a either a future point in time or NULL.</td>
</tr>
<tr>
<td>no_parse</td>
<td>A flag. The default is FALSE. If this is set to FALSE, then Oracle parses the procedure associated with the job. If this is set to TRUE, then Oracle parses the procedure associated with the job the first time that the job is run.</td>
</tr>
<tr>
<td>force</td>
<td>If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.</td>
</tr>
<tr>
<td>instance</td>
<td>When a job is submitted, specifies which instance can run the job.</td>
</tr>
</tbody>
</table>
Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- The parameters instance and force are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure DBMS_DDL.ANALYZE_OBJECT to generate optimizer statistics for the table DQUON.ACCOUNTS. The statistics are based on a sample of half the rows of the ACCOUNTS table. The job is run every 24 hours:

```sql
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT(:jobno,
    'dbms_ddl.analyze_object(''TABLE'',
    'DQUON', 'ACCOUNTS',
    'ESTIMATE', NULL, 50);
  SYSDATE, 'SYSDATE + 1');
  COMMIT;
END;
/
Statement processed.
print jobno
JOBNO
----------
14144
```
USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8i and after) and preserves the compatibility.

Syntax

```sql
DBMS_JOB.USER_EXPORT (  
    job    IN    BINARY_INTEGER,  
    mycall IN OUT VARCHAR2);

DBMS_JOB.USER_EXPORT (  
    job    IN    BINARY_INTEGER,  
    mycall IN OUT VARCHAR2,  
    myinst IN OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>mycall</td>
<td>Text of a call to re-create the given job.</td>
</tr>
<tr>
<td>myinst</td>
<td>Text of a call to alter instance affinity.</td>
</tr>
</tbody>
</table>
WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```sql
DBMS_JOB.WHAT ( 
    job       IN  BINARY_INTEGER, 
    what      IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>Number of the job being run.</td>
</tr>
<tr>
<td>what</td>
<td>PL/SQL procedure to run.</td>
</tr>
</tbody>
</table>

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- Some legal values of `what` (assuming the routines exist) are:
  - `'myproc(''10-JAN-82'', next_date, broken);'`
  - `'scott.emppackage.give_raise(''JENKINS'', 30000.00);'`
  - `'dbms_job.remove(job);'`
WHAT Procedure
The DBMS_LDAP package lets you access data from LDAP servers.

- Documentation of DBMS_LDAP
For a complete description of this package within the context of Oracle Internet Directory, see DBMS_LDAP in the Oracle Internet Directory Application Developer’s Guide.
The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

- Documentation of DBMS_LDAP_UTL
Documentation of DBMS_LDAP_UTL

For a complete description of this package within the context of Oracle Internet Directory, see DBMS_LDAP_UTL in the Oracle Internet Directory Application Developer’s Guide.
The DBMS_LIBCACHE package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- Using DBMS_LIBCACHE
  - Overview
  - Security Model
- Summary of DBMS_LIBCACHE Subprograms
Using DBMS_LIBCACHE

Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package DBMS_LIBCACHE for SELECT statements. The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the MCODE.

Security Model

To execute DBMS_LIBCACHE you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, DBMS_LIBCACHE should be called for each. Alternatively, DBMS_LIBCACHE may be called with the generic user PARSER. However, this user cannot parse the SQL that uses objects with access granted though roles. This is a standard PL/SQL security limitation.
### Summary of DBMS_LIBCACHE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPILE_FROM_REMOTE Procedure on page 44-4</td>
<td>Extracts SQL in batch from the source instance and compiles the SQL at the target instance</td>
</tr>
</tbody>
</table>
COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```plsql
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
    p_db_link                 IN     dbms_libcache$def.db_link%type,
    p_username                IN     VARCHAR2 default null,
    p_threshold_executions    IN     NATURAL  default 3,
    p_threshold_sharable_mem  IN     NATURAL  default 1000,
    p_parallel_degree         IN     NATURAL  default 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_db_link</td>
<td>The database link to the source name (mandatory).</td>
</tr>
<tr>
<td>p_instance_name</td>
<td>The source instance name (reserved for future use).</td>
</tr>
<tr>
<td>p_username</td>
<td>The source username (default is all users).</td>
</tr>
<tr>
<td>p_threshold_executions</td>
<td>The lower bound on the number of executions.</td>
</tr>
<tr>
<td>p_threshold_sharable_mem</td>
<td>The lower bound on shared memory size.</td>
</tr>
<tr>
<td>p_parallel_degree</td>
<td>The number of parallel jobs</td>
</tr>
</tbody>
</table>

Usage Notes

- **P_DB_LINK**

  The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role SELECT_ON_CATALOG at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with `dbms_libcache$def.ACCESS_METHOD = DB_LINK_METHOD`
- **P_INSTANCE_NAME** (reserved for future use)
  The name of the instance that will be used for extracting the SQL statements.
  The instance name must be unique for all instances excluding the local instance.
  The name is not case sensitive.

- **P_USERNAME**
  The name of the username that will be used for extracting the SQL statements.
  The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single user_id, for example `APPS`, `APPS` is the parsing user_id that is recorded in the shared pool. To select only SQL statements parsed by `APPS`, enter the string ‘APPS’ in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example GL. If the username is supplied, it must be valid. The name is not case sensitive.

- **P_THRESHOLD_EXECUTIONS**
  The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

- **P_THRESHOLD_SHARABLE_MEM**
  The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.

- **P_PARALLEL_DEGREE**
  The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.
The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulation specific parts of a LOB or complete LOBs.

**See Also:** Oracle Database Application Developer’s Guide - Large Objects

This chapter contains the following topics:

- Using DBMS_LOB
  - Overview
  - Security Model
  - Constants
  - Types
  - Rules and Limits
  - Operational Notes
- Summary of DBMS_LOB Subprograms
Using DBMS_LOB

Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

Security Model

This package must be created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_LOB subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_LOB subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the AUTHID to indicate whether they want definer’s rights or invoker’s rights. For example:

CREATE PROCEDURE procl authid definer ...

or

CREATE PROCEDURE procl authid current_user ...

See Also: For more information on AUTHID and privileges, see PL/SQL User’s Guide and Reference
You can provide secure access to BFILEs using the DIRECTORY feature discussed in BFILENAME function in the Oracle Database Application Developer’s Guide - Large Objects and the Oracle Database SQL Reference.

For information about the security model pertaining to temporary LOBs, see Operational Notes.

### Constants

DBMS_LOB defines the following constants:

```sql
file_readonly CONSTANT BINARY_INTEGER := 0;
lob_readonly CONSTANT BINARY_INTEGER := 0;
lob_readwrite CONSTANT BINARY_INTEGER := 1;
lobmaxsize CONSTANT INTEGER := 18446744073709551615;
call CONSTANT PLS_INTEGER := 12;
session CONSTANT PLS_INTEGER := 10;
```

### Types

Parameters for the DBMS_LOB subprograms use these datatypes:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOB</td>
<td>A source or destination binary LOB.</td>
</tr>
<tr>
<td>RAW</td>
<td>A source or destination RAW buffer (used with BLOB).</td>
</tr>
<tr>
<td>CLOB</td>
<td>A source or destination character LOB (including NCLOB).</td>
</tr>
<tr>
<td>VARCHAR2</td>
<td>A source or destination character buffer (used with CLOB and NCLOB).</td>
</tr>
<tr>
<td>INTEGER</td>
<td>Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.</td>
</tr>
<tr>
<td>BFILE</td>
<td>A large, binary object stored outside the database.</td>
</tr>
</tbody>
</table>

The DBMS_LOB package defines no special types. An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets. The clause ANY_CS in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.
Rules and Limits

- General Rules and Limits
- Rules and Limits Specific to External Files (BFILEs)
- Maximum LOB Size
- Maximum Buffer Size

General Rules and Limits

- The following rules apply in the specification of subprograms in this package:
  - length, offset, and amount parameters for subprograms operating on BLOBs and BFILEs must be specified in terms of bytes.
  - length, offset, and amount parameters for subprograms operating on CLOBs must be specified in terms of characters.
- A subprogram raises an INVALID_ARGVAL exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as amount, offset, newlen, nth, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of offset, amount, newlen, nth must not exceed the value lobmaxsize (4GB-1) in any DBMS_LOB subprogram.
  4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed \( \frac{\text{lobmaxsize}}{\text{character\_width\_in\_bytes}} \) characters.

For example, if the CLOB consists of 2-byte characters, such as:

\( \text{JA16SJISFIXED} \)

Then, the maximum amount value should not exceed:

\( \frac{4294967295}{2} = 2147483647 \) characters.
PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for RAW and VARCHAR2 parameters used in DBMS_LOB subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for DBMS_LOB subprograms for CLOBs and NCLOBs.

The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

For example, in DBMS_LOB subprograms that take a VARCHAR2 buffer parameter, the form of the VARCHAR2 buffer must match the form of the CLOB parameter. If the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

If the value of `amount` plus the `offset` exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as READ, COMPARE, INSTR, and SUBSTR, read until End of Lob/File is reached. For example, for a READ operation on a BLOB or BFILE, if the user specifies offset value of 3 GB and an amount value of 2 GB, then READ reads only ((4GB-1)-3GB) bytes.

Functions with NULL or invalid input values for parameters return a NULL. Procedures with NULL values for destination LOB parameters raise exceptions.

Operations involving patterns as parameters, such as COMPARE, INSTR, and SUBSTR do not support regular expressions or special matching characters (such as % in the LIKE operator in SQL) in the pattern parameter or substrings.

The End Of LOB condition is indicated by the READ procedure using a NO_DATA_FOUND exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The READ buffer for the last read contains 0 bytes.
For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.

Unless otherwise stated, the default value for an offset parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the amount parameter — you must input the values explicitly.

You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as APPEND, COPY, ERASE, TRIM, or WRITE. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILEs)

The subprograms COMPARE, INSTR, READ, SUBSTR, FILECLOSE, FILECLOSEALL and LOADFROMFILE operate only on an opened BFILE locator; that is, a successful FILEOPEN call must precede a call to any of these subprograms.

For the functions FILEEXISTS, FILEGETNAME and GETLENGTH, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the DIRECTORY object and the file.

DBMS_LOB does not support any concurrency control mechanism for BFILE operations.

In the event of several open files in the session whose closure has not been handled properly, you can use the FILECLOSEALL subprogram to close all files opened in the session and resume file operations from the beginning.

If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.

If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after both normal and abnormal termination of operations on the BFILE.
In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION_MAX_OPEN_FILES.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open BFILEs are lost. The result is a larger open file count which may or may not exceed the SESSION_MAX_OPEN_FILES value.

For example, consider a READ operation past the end of the BFILE value, which generates a NO_DATA_FOUND exception:

```sql
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '|' ||
                        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;
```

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10

After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```sql
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
```
SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
dbms_lob.open(fil, dbms_lob.lob_readonly);
amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
dbms_lob.read(fil, amt, pos, buf);
dbms_output.put_line('Read F1 past EOF: '||
    utl_raw.cast_to_varchar2(buf));
dbms_lob.close(fil);
exception
WHEN no_data_found
THEN
    BEGIN
        dbms_output.put_line('End of File reached. Closing file');
        dbms_lob.fileclose(fil);
        -- or dbms_lob.filecloseall if appropriate
    END;
END;
/

Statement processed.
End of File reached. Closing file

In general, you should ensure that files opened in a PL/SQL block using DBMS_LOB are closed before normal or abnormal termination of the block.

**Maximum LOB Size**

The maximum size of a LOB supported by the database is equal to the value of the db_block_size initialization parameter times the value 4294967295. This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

**Maximum Buffer Size**

The maximum buffer size, 32767 bytes, is represented by maxbufsize.

**Operational Notes**

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system. See also Chapter 1 of Oracle Database Application Developer’s Guide - Large Objects.

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.
Using DBMS_LOB

- **Internal LOBs**
- **External LOBs**
- **Temporary LOBs**

**Internal LOBs**
To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

**External LOBs**
For an external LOB (BFILE) to be represented by a LOB locator, you must:
- Ensure that a DIRECTORY object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the DIRECTORY object and the filename of the external LOB you are adding to the BFILENAME function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the given LOB locator.

After the LOBs are defined and created, you can then SELECT from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to DBMS_LOB for access to the LOB value.

For details on the different ways to do this, you must refer to the section of the Oracle Database Application Developer’s Guide - Large Objects that describes Accessing External LOBs (BFILES).

**Temporary LOBs**
The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.
A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as CACHE/ NOCACHE. There is a default store for every session into which temporary LOBs are placed if you don’t specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL DBMS_LOB package, PRO*C, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.
Temporary LOBs do not support the EMPTY_BLOB or EMPTY_CLOB functions that are supported for permanent LOBs. The EMPTY_BLOB function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the DBMS_LOB package by using the appropriate FREETEMPORARY or OCIDurationEnd statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and DBMS_LOB statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or DBMS_LOB COPY command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user’s session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user’s own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else’s data.

The database keeps track of temporary LOBs for each session in a v$ view called V$TEMPORARY_LOBS, which contains information about how many temporary LOBs exist for each session. V$ views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using V$TEMPORARY_LOBS in conjunction with DBA_SEGMENTS, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in DBMS_LOB return NULL if any of the input parameters are NULL. All procedures in DBMS_LOB raise an exception if the LOB locator is input as NULL.

2. Operations based on CLOBs do not verify if the character set IDs of the parameters (CLOB parameters, VARCHAR2 buffers and patterns, and so on) match. It is the user’s responsibility to ensure this.

3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.
4. Temporary LOBs still adhere to value semantics in order to be consistent with permanent LOBs and to try to conform to the ANSI standard for LOBs. As a result, each time a user does an OCILobLocatatorAssign, or the equivalent assignment in PL/SQL, the database makes a copy of the temporary LOB.

Each locator points to its own LOB value. If one locator is used to create a temporary LOB, and then is assigned to another LOB locator using OCILobLocateAssign in OCI or through an assignment operation in PL/SQL, then the database copies the original temporary LOB and causes the second locator to point to the copy.

In order for users to modify the same LOB, they must go through the same locator. In OCI, this can be accomplished fairly easily by using pointers to locators and assigning the pointers to point to the same locator. In PL/SQL, the same LOB variable must be used to update the LOB to get this effect.

The following example shows a place where a user incurs a copy, or at least an extra round-trip to the server.

```plsql
DECLARE
  a blob;
  b blob;
BEGIN
  dbms_lob.createtemporary(b, TRUE);
  -- the following assignment results in a deep copy
  a := b;
END;
```

The PL/SQL compiler makes temporary copies of actual arguments bound to OUT or IN OUT parameters. If the actual parameter is a temporary LOB, then the temporary copy is a deep (value) copy.

The following PL/SQL block illustrates the case where the user incurs a deep copy by passing a temporary LOB as an IN OUT parameter.

```plsql
DECLARE
  a blob;
  procedure foo(parm IN OUT blob) is
  BEGIN
    ...
  END;
BEGIN
  dbms_lob.createtemporary(a, TRUE);
  -- the following call results in a deep copy of the blob a
  foo(a);
END;
```
To minimize deep copies on PL/SQL parameter passing, use the \texttt{NOCOPY} compiler hint where possible.

The duration parameter passed to \texttt{dbms_lob.createtemporary()} is a hint. The duration of the new temp \texttt{LOB} is the same as the duration of the locator variable in PL/SQL. For example, in the preceding program block, the program variable \texttt{a} has the duration of the residing frame. Therefore at the end of the block, memory of \texttt{a} will be freed at the end of the function.

If a PL/SQL package variable is used to create a temp \texttt{LOB}, it will have the duration of the package variable, which has a duration of \texttt{SESSION}.

\begin{verbatim}
BEGIN
    y clob;
END;
/
BEGIN
    dbms_lob.createtemporary(package.y, TRUE);
END;
\end{verbatim}

\textbf{See Also:} \textit{PL/SQL User's Guide and Reference} for more information on \texttt{NOCOPY} syntax

\section*{Exceptions}

\begin{table}[h]
\centering
\begin{tabular}{|c|c|p{10cm}|}
\hline
\textbf{Exception} & \textbf{Code} & \textbf{Description} \\
\hline
\texttt{INVALID_ARGVAL} & 21560 & The argument is expecting a non-\texttt{NULL}, valid value but the argument value passed in is \texttt{NULL}, invalid, or out of range. \\
\hline
\texttt{ACCESS_ERROR} & 22925 & You are trying to write too much data to the \texttt{LOB}: \texttt{LOB} size is limited to 4 gigabytes. \\
\hline
\texttt{NOEXIST_DIRECTORY} & 22285 & The directory leading to the file does not exist. \\
\hline
\texttt{NOPRIV_DIRECTORY} & 22286 & The user does not have the necessary access privileges on the directory or the file for the operation. \\
\hline
\texttt{INVALID_DIRECTORY} & 22287 & The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access. \\
\hline
\end{tabular}
\end{table}

<td>Writes a buffer to the end of a LOB</td>
</tr>
</tbody>
</table>
APPEND Procedure

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

There are two overloaded APPEND procedures.

Syntax

```sql
DBMS_LOB.APPEND (
    dest_lob IN OUT NOCOPY BLOB,
    src_lob  IN             BLOB);

DBMS_LOB.APPEND (
    dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    src_lob  IN             CLOB CHARACTER SET dest_lob%CHARSET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>Locator for the internal LOB to which the data is to be appended.</td>
</tr>
<tr>
<td>src_lob</td>
<td>Locator for the internal LOB from which the data is to be read.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either the source or the destination LOB is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

**See Also:** Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure.
CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

DBMS_LOB.CLOSE (lob_loc IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (file_loc IN OUT NOCOPY BFILE);

Parameters

Table 45-6  CLOSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILEs), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close APIs. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but
the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
COMPARE Function

This function compares two entire LOBs or parts of two LOBs.

Syntax

```sql
DBMS_LOB.COMPARE (
  lob_1            IN BLOB,
  lob_2            IN BLOB,
  amount           IN INTEGER := 4294967295,
  offset_1         IN INTEGER := 1,
  offset_2         IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.COMPARE (
  lob_1            IN CLOB  CHARACTER SET ANY_CS,
  lob_2            IN CLOB  CHARACTER SET lob_1%CHARSET,
  amount           IN INTEGER := 4294967295,
  offset_1         IN INTEGER := 1,
  offset_2         IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.COMPARE (
  lob_1            IN BFILE,
  lob_2            IN BFILE,
  amount           IN INTEGER,
  offset_1         IN INTEGER := 1,
  offset_2         IN INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_1</td>
<td>LOB locator of first target for comparison.</td>
</tr>
<tr>
<td>lob_2</td>
<td>LOB locator of second target for comparison.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to compare.</td>
</tr>
</tbody>
</table>
COMPARE Function

**Table 45–7  COMPARE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset_1</td>
<td>Offset in bytes or characters on the first LOB (origin: 1) for the comparison.</td>
</tr>
<tr>
<td>offset_2</td>
<td>Offset in bytes or characters on the first LOB (origin: 1) for the comparison.</td>
</tr>
</tbody>
</table>

**Return Values**

- INTEGER: Zero if the comparison succeeds, nonzero if not.
- NULL, if
  - amount < 1
  - amount > LOBMAXSIZE
  - offset_1 or offset_2 < 1
  - offset_1 or offset_2 > LOBMAXSIZE

**Usage Notes**

You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

COMPARE returns zero if the data exactly matches over the range specified by the offset and amount parameters. Otherwise, a nonzero INTEGER is returned.

For fixed-width n-byte CLOBs, if the input amount for COMPARE is specified to be greater than \((4294967295/n)\), then COMPARE matches characters in a range of size \((4294967295/n)\), or Max(length(clob1), length(clob2)), whichever is lesser.

**Exceptions**

**Table 45–8  COMPARE Function Exceptions for BFILE operations**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>

</tr>
</tbody>
</table>

**See Also:** *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure.
CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB(
    dest_lob IN OUT NOCOPY BLOB,
    src_clob IN CLOB CHARACTER SET ANY_CS,
    amount IN INTEGER,
    dest_offset IN OUT INTEGER,
    src_offset IN OUT INTEGER,
    blob_csid IN NUMBER,
    lang_context IN OUT INTEGER,
    warning OUT INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the destination LOB instance.</td>
</tr>
<tr>
<td>src_clob</td>
<td>LOB locator of the source LOB instance.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of characters to convert from the source LOB.</td>
</tr>
<tr>
<td></td>
<td>If you want to copy the entire LOB, pass the constant <code>DBMS_LOB.LOBMAXSIZE</code>.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in bytes in the destination LOB for the start of the write.</td>
</tr>
<tr>
<td></td>
<td>(OUT) The new offset in bytes after the end of the write.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in characters in the source LOB for the start of the read.</td>
</tr>
<tr>
<td></td>
<td>(OUT) Offset in characters in the source LOB right after the end of the read.</td>
</tr>
<tr>
<td>blob_csid</td>
<td>Desired character set ID of the converted data.</td>
</tr>
<tr>
<td>lang_context</td>
<td></td>
</tr>
<tr>
<td>warning</td>
<td></td>
</tr>
</tbody>
</table>
Summary of DBMS_LOB Subprograms

Usage Notes

Preconditions
Before calling the CONVERTTOBLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults
All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 45–10 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lang_context</td>
<td>(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.</td>
</tr>
<tr>
<td>warning</td>
<td>(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertable_char in the DBMS_LOB package.</td>
</tr>
</tbody>
</table>
You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the desired character set is the same as the source LOB character set, and performs a binary copy of the data—no character set conversion is performed.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source LOB. The amount and src_offset values are in characters and the dest_offset is in bytes. To convert the entire LOB, you can specify LOBMAXSIZE for the amount parameter.

### Exceptions

Table 45–11 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
</tbody>
</table>
INVALID_ARGVAL

One or more of the following:
- src_offset or dest_offset < 1.
- src_offset or dest_offset > LOBMAXSIZE.
- amount < 1.
- amount > LOBMAXSIZE.

See Also: Oracle Database Application Developer’s Guide - Large Objects for more information on using LOBs in application development.
CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB(
  dest_lob       IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
  src_blob       IN             BLOB,
  amount         IN             INTEGER,
  dest_offset    IN OUT         INTEGER,
  src_offset     IN OUT         INTEGER,
  blob_csid      IN             NUMBER,
  lang_context   IN OUT         INTEGER,
  warning        OUT            INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the destination LOB instance.</td>
</tr>
<tr>
<td>src_blob</td>
<td>LOB locator of the source LOB instance.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to convert from the source LOB.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in characters in the destination LOB for the start of the write.</td>
</tr>
<tr>
<td></td>
<td>(OUT) The new offset in characters after the end of the write.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in bytes in the source LOB for the start of the read.</td>
</tr>
<tr>
<td></td>
<td>(OUT) Offset in bytes in the source LOB right after the end of the read.</td>
</tr>
</tbody>
</table>
Usage Notes

Preconditions
Before calling the CONVERTTOCLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the CONVERTTOCLOB procedure. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults
All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 45–13 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.
CONVERTTOCLOB Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>lobmaxsize (IN)</td>
<td>convert the entire file</td>
</tr>
<tr>
<td>dest_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>src_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>csid</td>
<td>default_csid (IN)</td>
<td>default csid, use destination csid</td>
</tr>
<tr>
<td>lang_context</td>
<td>default_lang_ctx (IN)</td>
<td>default language context</td>
</tr>
<tr>
<td>warning</td>
<td>no_warning (OUT)</td>
<td>no warning message, success</td>
</tr>
<tr>
<td>warning</td>
<td>warn_inconvertible_char (OUT)</td>
<td>character in source cannot be properly converted</td>
</tr>
</tbody>
</table>

**General Notes**
You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the BLOB contains character data in the same character set as the destination CLOB, and performs a binary copy of the data to the destination LOB, no character set conversion being performed.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BLOB. The amount and src_offset values are in bytes and the dest_offset is in characters. To convert the entire BLOB, you can specify LOBMAXSIZE for the amount parameter.

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>One or more of the following:</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>
See Also: Oracle Database Application Developer’s Guide - Large Objects for more information on using LOBs in application development.
COPY Procedure

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```sql
DBMS_LOB.COPY (  
dest_lob    IN OUT NOCOPY BLOB,  
src_lob     IN            BLOB,  
amount      IN            INTEGER,  
dest_offset IN            INTEGER := 1,  
src_offset  IN            INTEGER := 1);
```

```sql
DBMS_LOB.COPY (  
dest_lob    IN OUT NOCOPY CLOB  CHARACTER SET ANY_CS,  
src_lob     IN            CLOB  CHARACTER SET dest_lob%CHARSET,  
amount      IN            INTEGER,  
dest_offset IN            INTEGER := 1,  
src_offset  IN            INTEGER := 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the copy target.</td>
</tr>
<tr>
<td>src_lob</td>
<td>LOB locator of source for the copy.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBS) or characters (for CLOBS) to copy.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.</td>
</tr>
<tr>
<td>src_offset</td>
<td>Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.</td>
</tr>
</tbody>
</table>
Exceptions

Table 45-16  COPY Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or invalid.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; LOBMAXSIZE</td>
</tr>
</tbody>
</table>

Usage Notes

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the src_offset to the end of the source LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also: Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
CREATETEMPORARY Procedure

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (  
  lob_loc IN OUT NOCOPY BLOB,  
  cache   IN            BOOLEAN,  
  dur     IN            PLS_INTEGER := 10);
```

```
DBMS_LOB.CREATETEMPORARY (  
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,  
  cache   IN            BOOLEAN,  
  dur     IN            PLS_INTEGER := 10);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>cache</td>
<td>Specifies if LOB should be read into buffer cache or not.</td>
</tr>
<tr>
<td>dur</td>
<td>1 of 2 predefined duration values (SESSION or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session or call. If dur is omitted, then the session duration is used.</td>
</tr>
</tbody>
</table>

See Also:
- *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure
- *PL/SQL User’s Guide and Reference* for more information about NOCOPY and passing temporarylobs as parameters
ERASE Procedure

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```
DBMS_LOB.ERASE ( lob_loc IN OUT NOCOPY BLOB,
                   amount IN OUT NOCOPY INTEGER,
                   offset IN INTEGER := 1);

DBMS_LOB.ERASE ( lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
                   amount IN OUT NOCOPY INTEGER,
                   offset IN INTEGER := 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be erased. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.</td>
</tr>
<tr>
<td>offset</td>
<td>Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).</td>
</tr>
</tbody>
</table>

Usage Notes

**Note:** The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "TRIM Procedure" on page 45-77.

When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.

The actual number of bytes or characters erased can differ from the number you specified in the `amount` parameter if the end of the LOB value is reached before
erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any input parameter is NULL.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1 or amount &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td></td>
<td>- offset &lt; 1 or offset &gt; LOBMAXSIZE</td>
</tr>
</tbody>
</table>

**Usage Notes**

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

**See Also:**
- "TRIM Procedure" on page 45-77

FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

---

**Note:** The database has only read-only access to BFILEs. This means that BFILEs cannot be written through the database.

---

Syntax

```
DBMS_LOB.FILECLOSE (    file_loc IN OUT NOCOPY BFILE);
```

Parameters

*Table 45–20 FILECLOSE Procedure Parameter*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE to be closed.</td>
</tr>
</tbody>
</table>

Exceptions

*Table 45–21 FILECLOSE Procedure Exceptions*

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>NULL input value for file_loc.</td>
</tr>
<tr>
<td>UNOPENED_FILE</td>
<td>File was not opened with the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
</tbody>
</table>
FILECLOSE Procedure

See Also:

- "FILEOPEN Procedure" on page 45-45
- "FILECLOSEALL Procedure" on page 45-39
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
FILECLOSEALL Procedure

This procedure closes all BFILES opened in the session.

Syntax

DBMS_LOB.FILECLOSEALL;

Exceptions

Table 45–22 FILECLOSEALL Procedure Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>No file has been opened in the session.</td>
</tr>
</tbody>
</table>

See Also:

- "FILEOPEN Procedure" on page 45-45
- "FILECLOSE Procedure" on page 45-37
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
FILEEXISTS Function

This function finds out if a given BFILE locator points to a file that actually exists on the server’s file system.

Syntax

```sql
DBMS_LOB.FILEEXISTS (    file_loc    IN    BFILE)    RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

| Table 45–23  FILEEXISTS Function Parameter |
|-----------------|------------------------------------------|
| Parameter       | Description                              |
| file_loc        | Locator for the BFILE.                   |

Return Values

| Table 45–24  FILEEXISTS Function Return Values |
|-----------------|-----------------------------------------------|
| Return          | Description                             |
| 0               | Physical file does not exist.            |
| 1               | Physical file exists.                    |

Exceptions

| Table 45–25  FILEEXISTS Function Exceptions |
|-----------------|---------------------------------------------|
| Exception       | Description                              |
| NOEXIST_DIRECTORY | Directory does not exist.                 |
| NOPRIV_DIRECTORY  | You do not have privileges for the directory. |
INVALID DIRECTORY
Directory has been invalidated after the file was opened.

See Also:

- "FILEISOPEN Function" on page 45-43.
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the dir_alias buffer is 30, and for the entire path name, it is 2000.

Syntax

```sql
DBMS_LOB.FILEGETNAME (  
  file_loc   IN    BFILE,  
  dir_alias  OUT   VARCHAR2,  
  filename   OUT   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE</td>
</tr>
<tr>
<td>dir_alias</td>
<td>Directory object name</td>
</tr>
<tr>
<td>filename</td>
<td>Name of the BFILE</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>dir_alias or filename are NULL.</td>
</tr>
</tbody>
</table>

See Also:  *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure
**FILEISOPEN Function**

This function finds out whether a BFILE was opened with the given FILE locator.

**Syntax**

```sql
DBMS_LOB.FILEISOPEN (  
    file_loc   IN    BFILE)  
RETURN INTEGER;
```

**Pragmas**

```sql
pragma restrict_references(FILEISOPEN, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE.</td>
</tr>
</tbody>
</table>

**Return Values**

INTEGER: 0 = file is not open, 1 = file is open

**Usage Notes**

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
</tbody>
</table>
FILEISOPEN Function

See Also:

- "FILEEXISTS Function" on page 45-40
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```sql
DBMS_LOB.FILEOPEN (  
    file_loc   IN OUT NOCOPY BFILE,  
    open_mode  IN             BINARY_INTEGER := file_readonly);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE.</td>
</tr>
<tr>
<td>open_mode</td>
<td>File access is read-only.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>file_loc or open_mode is NULL.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>open_mode is not equal to FILE_READONLY.</td>
</tr>
<tr>
<td>OPEN_TOOMANY</td>
<td>Number of open files in the session exceeds session_max_open_files.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory associated with file_loc does not exist.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
</tbody>
</table>
See Also:
- "FILECLOSE Procedure" on page 45-37
- "FILECLOSEALL Procedure" on page 45-39
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
FREETEMPORARY Procedure

This procedure frees the temporary BLOB or CLOB in your default temporary tablespace.

Syntax

DBMS_LOB.FREETEMPORARY (lob_loc  IN OUT  NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (lob_loc  IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Usage Notes

After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.

If an invalid LOB locator is assigned to another LOB locator using OCIlobLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

See Also: Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure.
GET_STORAGE_LIMIT

The DBMS_LOB.GET_STORAGE_LIMIT function returns the LOB storage limit for your database configuration. The DBMS_LOB package supports LOB instances up to this storage limit in size.

Syntax

```sql
DBMS_LOB.GET_STORAGE_LIMIT
RETURN INTEGER;
```

Return Value

The value returned from this function is the maximum allowable size for LOB instances for your database configuration. The return value depends on your DB_BLOCK_SIZE initialization parameter setting and is calculated as (4 gigabytes minus 1) times the value of the DB_BLOCK_SIZE initialization parameter.

Usage

Note that BLOB instances are sized in bytes while CLOB and NCLOB instances are sized in characters.

See Also: Oracle Database Application Developer's Guide - Large Objects for details on LOB storage limits
GETCHUNKSIZE Function

When creating the table, you can specify the chunking factor, which can be a multiple of database blocks. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

DBMS_LOB.GETCHUNKSIZE (  
    lob_loc IN BLOB)  
RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
RETURN INTEGER;

Pragmas

pragma restrict_references(GETCHUNKSIZE, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 45–33  GETCHUNKSIZE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Return Values

The value returned for BLOBs is in terms of bytes. The value returned for CLOBs is in terms of characters.

Usage Notes

Performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.
See Also: Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
GETLENGTH Function

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (    
   lob_loc   IN  BLOB)    
RETURN INTEGER;

DBMS_LOB.GETLENGTH (    
   lob_loc   IN  CLOB   CHARACTER SET ANY_CS) 
RETURN INTEGER;

DBMS_LOB.GETLENGTH (    
   file_loc   IN  BFILE) 
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>The file locator for the LOB whose length is to be returned.</td>
</tr>
</tbody>
</table>

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILES:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error
See Also:  Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
INSTR Function

This function returns the matching position of the \textit{nth} occurrence of the pattern in the \textit{LOB}, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (  
   lob_loc   IN   BLOB,  
   pattern   IN   RAW,  
   offset    IN   INTEGER := 1,  
   nth       IN   INTEGER := 1)  
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (  
   lob_loc   IN   CLOB      CHARACTER SET ANY_CS,  
   pattern   IN   VARCHAR2  CHARACTER SET lob_loc%CHARSET,  
   offset    IN   INTEGER := 1,  
   nth       IN   INTEGER := 1)  
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (  
   file_loc   IN   BFILE,  
   pattern   IN   RAW,  
   offset    IN   INTEGER := 1,  
   nth       IN   INTEGER := 1)  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

\begin{table}[h]
\centering
\begin{tabular}{|c|c|}
\hline
\textbf{Parameter} & \textbf{Description} \\
\hline
lob_loc & Locator for the \textit{LOB} to be examined. For more information, see \textit{Operational Notes}. \\
file_loc & The file locator for the \textit{LOB} to be examined. \\
\hline
\end{tabular}
\end{table}
INSTR Function

Table 45–35  INSTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern</td>
<td>Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes.</td>
</tr>
<tr>
<td>offset</td>
<td>Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)</td>
</tr>
<tr>
<td>nth</td>
<td>Occurrence number, starting at 1.</td>
</tr>
</tbody>
</table>

Return Values

Table 45–36  INSTR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.</td>
</tr>
<tr>
<td>NULL</td>
<td>Either: -any one or more of the IN parameters was NULL or INVALID. -offset &lt; 1 or offset &gt; LOBMAXSIZE. -nth &lt; 1. -nth &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

Usage Notes

The form of the VARCHAR2 buffer (the pattern parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILES, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.
Exceptions

Table 45–37  INSTR Function Exceptions for BFILES

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>File was not opened using the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>

ISOPEN Function

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
   lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISOPEN (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;

DBMS_LOB.ISOPEN (
   file_loc IN BFILE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(ISOPEN, WNDS, RNDS, WNPS, RNPS);
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>file_loc</td>
<td>File locator.</td>
</tr>
</tbody>
</table>
```

Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.
For external LOBs (BFILES), ISOPEN also requires a round-trip, because that's where the state is kept.

**See Also:** Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
ISTEMPORARY Function

This function determines whether a LOB instance is temporary.

Syntax

```sql
DBMS_LOB.ISTEMPORARY (  lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (  lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 45–39  ISTEMPORARY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see <a href="#">Operational Notes</a>.</td>
</tr>
</tbody>
</table>

Return Values

This function returns **TRUE** in temporary if the locator is pointing to a temporary LOB. It returns **FALSE** otherwise.

**See Also:** *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure
LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Syntax

```sql
DBMS_LOB.LOADFROMFILE (  
dest_lob    IN OUT NOCOPY BLOB,  
src_file    IN            BFILE,  
amount      IN            INTEGER,  
dest_offset IN            INTEGER := 1,  
src_offset  IN            INTEGER := 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the target for the load.</td>
</tr>
<tr>
<td>src_file</td>
<td>BFILE locator of the source for the load.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to load from the BFILE.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.</td>
</tr>
<tr>
<td>src_offset</td>
<td>Offset in bytes in the source BFILE (origin: 1) for the start of the load.</td>
</tr>
</tbody>
</table>

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is either in bytes or characters for BLOBs and CLOBs respectively.

**Note:** The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.
LOADFROMFILE Procedure

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

---

**Note:** If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using `DBMS_LOB.LOADFROMFILE`, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use `sql*loader` instead of `LOADFROMFILE` to load data into a CLOB or NCLOB because `sql*loader` will provide the necessary character set conversions.

---

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- <code>src_offset</code> or <code>dest_offset</code> &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- <code>amount</code> &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- <code>amount</code> &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>
See Also:  *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure
LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax

```sql
DBMS_LOB.LOADBLOBFROMFILE (    dest_lob    IN OUT NOCOPY BLOB,    src_bfile   IN            BFILE,    amount      IN            INTEGER,    dest_offset IN OUT        INTEGER,    src_offset  IN OUT        INTEGER);```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>BLOB locator of the target for the load.</td>
</tr>
<tr>
<td>src_bfile</td>
<td>BFILE locator of the source for the load.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.</td>
</tr>
</tbody>
</table>

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in bytes for BLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination.
BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

**Constants and Defaults**

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>DBMSLOB.LOBMAXSIZE (IN)</td>
<td>Load the entire file</td>
</tr>
<tr>
<td>dest_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>src_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
</tbody>
</table>

Constants defined in DBMSLOB.SQL

lobmaxsize CONSTANT INTEGER := 4294967295;
Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

See Also:  *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure
LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```sql
DBMS_LOB.LOADCLOBFROMFILE (  
dest_lob IN OUT NOCOPY BLOB,  
src_bfile IN BFILE,  
amount IN INTEGER,  
dest_offset IN OUT INTEGER,  
src_offset IN OUT INTEGER,  
src_csid IN NUMBER,  
lng_context IN OUT INTEGER,  
warning OUT INTEGER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>CLOB/NCLOB locator of the target for the load.</td>
</tr>
<tr>
<td>src_bfile</td>
<td>BFILE locator of the source for the load.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to load from the BFILE. Use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.</td>
</tr>
<tr>
<td>src_csid</td>
<td>Character set id of the source (BFILE) file.</td>
</tr>
</tbody>
</table>
LOADCLOBFROMFILE Procedure

### Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.

---

**Table 45-45  LOADCLOBFROMFILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lang_context</td>
<td>(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call</td>
</tr>
<tr>
<td>warning</td>
<td>(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined as warn_inconvertable_char in DBMSLOB.</td>
</tr>
</tbody>
</table>
- **csid=0** indicates the default behavior that uses database csid for CLOB and national csid for NCLOB in the place of source csid. Conversion is still necessary if it is of varying width.

- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

### Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for **IN/OUT** parameter or give a default value for the **IN** parameter. Here is a summary of the constants and the defaults that can be used.

</tbody>
</table>

See Also: *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure.
OPEN Procedure

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```sql
DBMS_LOB.OPEN (
    lob_loc   IN OUT NOCOPY BLOB,
    open_mode IN            BINARY_INTEGER);
```

```sql
DBMS_LOB.OPEN (
    lob_loc   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    open_mode IN            BINARY_INTEGER);
```

```sql
DBMS_LOB.OPEN (
    file_loc  IN OUT NOCOPY BFILE,
    open_mode IN            BINARY_INTEGER := file_readonly);
```

Parameters

**Table 45–48 OPEN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>open_mode</td>
<td>Mode in which to open. For BLOB and CLOB types, the mode can be either: lob_readonly or lob_readwrite. For BFILE types, the mode must be file_readonly.</td>
</tr>
</tbody>
</table>

Usage Notes

**Note:** If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external
LOBs (BFILES), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close APIs. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and nonLOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
**READ Procedure**

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input offset points past the End of LOB, then amount is set to 0, and a NO_DATA_FOUND exception is raised.

**Syntax**

```sql
DBMS_LOB.READ (  
    lob_loc   IN             BLOB,  
    amount    IN OUT  NOCOPY BINARY_INTEGER,  
    offset    IN             INTEGER,  
    buffer    OUT            RAW);  

DBMS_LOB.READ (  
    lob_loc   IN             CLOB CHARACTER SET ANY_CS,  
    amount    IN OUT  NOCOPY BINARY_INTEGER,  
    offset    IN             INTEGER,  
    buffer    OUT            VARCHAR2 CHARACTER SET lob_loc%CHARSET);  

DBMS_LOB.READ (  
    file_loc   IN              BFILE,  
    amount    IN OUT   NOCOPY BINARY_INTEGER,  
    offset    IN              INTEGER,  
    buffer    OUT             RAW);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be read. For more information, see Operational Notes.</td>
</tr>
<tr>

<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>File is not opened using the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
</tbody>
</table>
Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client’s character set. The database converts the LOB value from the server’s character set to the client’s character set before it returns the buffer to the user.

See Also: Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
**SUBSTR Function**

This function returns `amount` bytes or characters of a LOB, starting from an absolute `offset` from the beginning of the LOB.

For fixed-width `n`-byte CLOBs, if the input `amount` for `SUBSTR` is greater than `(32767/n)`, then `SUBSTR` returns a character buffer of length `(32767/n)`, or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, `n` is the maximum byte-width used for characters in the CLOB.

**Syntax**

```sql
DBMS_LOB.SUBSTR (lob_loc IN BLOB,
                 amount   IN INTEGER := 32767,
                 offset   IN INTEGER := 1)
RETURN RAW;
```

```sql
DBMS_LOB.SUBSTR (lob_loc IN CLOB CHARACTER SET ANY_CS,
                 amount   IN INTEGER := 32767,
                 offset   IN INTEGER := 1)
RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;
```

```sql
DBMS_LOB.SUBSTR (file_loc IN BFILE,
                 amount   IN INTEGER := 32767,
                 offset   IN INTEGER := 1)
RETURN RAW;
```

**Pragmas**

```sql
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
</tbody>
</table>
Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client’s character set. The database converts the LOB value from the server’s character set to the client’s character set before it returns the buffer to the user.

See Also:

- "INSTR Function" on page 45-53
- "READ Procedure" on page 45-71
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
TRIM Procedure

This procedure trims the value of the internal LOB to the length you specify in the newlen parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

---

**Note:** The TRIM procedure decreases the length of the LOB to the value specified in the newlen parameter.

---

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in newlen is greater than the size of the LOB, then an exception is raised.

**Syntax**

```sql
DBMS_LOB.TRIM (lob_loc        IN OUT  NOCOPY BLOB,
               newlen         IN             INTEGER);

DBMS_LOB.TRIM (lob_loc        IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS,
               newlen         IN             INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>newlen</td>
<td>New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.</td>
</tr>
</tbody>
</table>
Exceptions

Table 45–56  TRIM Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>lob_loc is NULL.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- new_len &lt; 0</td>
</tr>
<tr>
<td></td>
<td>- new_len &gt; LOBMAXSIZE</td>
</tr>
</tbody>
</table>

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "ERASE Procedure" on page 45-35
- "WRITEAPPEND Procedure" on page 45-82
- Oracle Database Application Developer's Guide - Large Objects for additional details on usage of this procedure
WRITE Procedure

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the buffer parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE {
    lob_loc  IN OUT NOCOPY  BLOB,
    amount   IN             BINARY_INTEGER,
    offset   IN             INTEGER,
    buffer   IN             RAW);

DBMS_LOB.WRITE {
    lob_loc  IN OUT NOCOPY CLOB   CHARACTER SET ANY_CS,
    amount   IN             BINARY_INTEGER,
    offset   IN             INTEGER,
    buffer   IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the internal LOB to be written to. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to write, or number that were written.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.</td>
</tr>
<tr>
<td>buffer</td>
<td>Input buffer for the write.</td>
</tr>
</tbody>
</table>
Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; MAXBUFSIZE</td>
</tr>
<tr>
<td></td>
<td>- offset &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- offset &gt; LOBMAXSIZE</td>
</tr>
</tbody>
</table>

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITE from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
See Also:
- "APPEND Procedure" on page 45-17
- "COPY Procedure" on page 45-32
- Oracle Database Application Developer’s Guide - Large Objects for additional details on usage of this procedure
WRITEAPPEND Procedure

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the buffer parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (  
  lob_loc IN OUT NOCOPY BLOB,  
  amount IN            BINARY_INTEGER,  
  buffer IN            RAW);
```

```
DBMS_LOB.WRITEAPPEND (  
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,  
  amount IN            BINARY_INTEGER,  
  buffer IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 45–59  WRITEAPPEND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the internal LOB to be written to. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to write, or number that were written.</td>
</tr>
<tr>
<td>buffer</td>
<td>Input buffer for the write.</td>
</tr>
</tbody>
</table>

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 45–60  WRITEAPPEND Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.</td>
</tr>
</tbody>
</table>
### Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITEAPPEND from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

The DBMS_LOCK package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

See Also: For more information, and an example of how to use the DBMS_LOCK package, see About User Locks in Oracle Database Application Developer’s Guide - Fundamentals

This chapter contains the following topics:

- Using DBMS_LOCK
  - Overview
  - Security Model
  - Constants
  - Rules and Limits
  - Operational Notes
- Summary of DBMS_LOCK Subprograms
Using DBMS_LOCK

- Overview
- Security Model
- Constants
- Rules and Limits
- Operational Notes

Overview

Some uses of user locks:
- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

Security Model

There might be operating system-specific limits on the maximum number of total locks available. This must be considered when using locks or making this package available to other users. Consider granting the EXECUTE privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant EXECUTE privilege to specific users. An example of a cover package is documented in the DBMS_LOCK.SQL package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.
Constants

Table 46–1  Constants - Names and Oracle Enterprise Manager Abbreviations

<table>
<thead>
<tr>
<th>Constant</th>
<th>Name</th>
<th>Alternate Name(s)</th>
<th>Oracle Enterprise Manager Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>nl_mode</td>
<td>NuLl</td>
<td></td>
<td>ULRS</td>
</tr>
<tr>
<td>ss_mode</td>
<td>Sub Shared</td>
<td></td>
<td>ULRS</td>
</tr>
<tr>
<td>sx_mode</td>
<td>Sub eXclusive</td>
<td>Row Exclusive Mode,</td>
<td>ULRX</td>
</tr>
<tr>
<td>s_mode</td>
<td>Sub eXclusive</td>
<td>Row Exclusive Mode, Intended Exclusive</td>
<td>ULRSX</td>
</tr>
<tr>
<td>ssx_mode</td>
<td>Shared</td>
<td>Share Row Exclusive Mode</td>
<td>ULX</td>
</tr>
<tr>
<td>x_mode</td>
<td>eXclusive</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

A sub-share lock can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object. Similarly, a sub-exclusive lock can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object. A share-sub-exclusive lock indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.

Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

Table 46–2  Lock Compatibility

<table>
<thead>
<tr>
<th>HELD MODE</th>
<th>GET NL</th>
<th>GET SS</th>
<th>GET SX</th>
<th>GET S</th>
<th>GET SSX</th>
<th>GET X</th>

</tr>
<tr>
<td>SS</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Fail</td>
</tr>
</tbody>
</table>
The constant `maxwait` waits forever.

### Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

### Table 46–2 Lock Compatibility

maxwait constant integer := 32767;

The constant `maxwait` waits forever.
## Summary of DBMS_LOCK Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ALLOCATE_UNIQUE Procedure</strong> on page 46-6</td>
<td>Allocates a unique lock ID to a named lock.</td>
</tr>
<tr>
<td><strong>CONVERT Function</strong> on page 46-8</td>
<td>Converts a lock from one mode to another.</td>
</tr>
<tr>
<td><strong>RELEASE Function</strong> on page 46-10</td>
<td>Releases a lock.</td>
</tr>
<tr>
<td><strong>REQUEST Function</strong> on page 46-11</td>
<td>Requests a lock of a specific mode.</td>
</tr>
<tr>
<td><strong>SLEEP Procedure</strong> on page 46-13</td>
<td>Puts a procedure to sleep for a specific time.</td>
</tr>
</tbody>
</table>
ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) given a lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (  
  lockname         IN  VARCHAR2,
  lockhandle       OUT VARCHAR2,
  expiration_secs  IN  INTEGER   DEFAULT 864000);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lockname</td>
<td>Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA$; these are reserved for products supplied by Oracle.</td>
</tr>
<tr>
<td>lockhandle</td>
<td>Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.</td>
</tr>
</tbody>
</table>
**Usage Notes**

If you choose to identify locks by name, you can use `ALLOCATE_UNIQUE` to generate a unique lock identification number for these named locks.

The first session to call `ALLOCATE_UNIQUE` with a new lock name causes a unique lock ID to be generated and stored in the `dbms_lock_allocated` table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least `expiration_secs` (defaults to 10 days) past the last call to `ALLOCATE_UNIQUE` with the given lock name. After this time, the row in the `dbms_lock_allocated` table for this lock name may be deleted in order to recover space. `ALLOCATE_UNIQUE` performs a commit.

---

**Note:** Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a given name.

---

**Exceptions**

ORA-20000, ORU-10003: Unable to find or insert lock `<lockname>` into catalog `dbms_lock_allocated`. 

### Table 46–4  `ALLOCATE_UNIQUE` Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expiration_secs</td>
<td>Number of seconds to wait after the last <code>ALLOCATE_UNIQUE</code> has been performed on a given lock, before permitting that lock to be deleted from the <code>dbms_lock_allocated</code> table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to <code>ALLOCATE_UNIQUE</code> may delete expired locks to recover space.</td>
</tr>
</tbody>
</table>
CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```sql
DBMS_LOCK.CONVERT(
    id         IN INTEGER ||
    lockhandle IN VARCHAR2,
    lockmode   IN INTEGER,
    timeout    IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id or lockhandle</td>
<td>User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.</td>
</tr>
<tr>
<td>lockmode</td>
<td>New mode that you want to assign to the given lock.</td>
</tr>
<tr>
<td>timeout</td>
<td>Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Timeout</td>
</tr>
<tr>
<td>2</td>
<td>Deadlock</td>
</tr>
</tbody>
</table>
### Table 46–6 CONVERT Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Parameter error</td>
</tr>
<tr>
<td>4</td>
<td>Don't own lock specified by id or lockhandle</td>
</tr>
<tr>
<td>5</td>
<td>Illegal lock handle</td>
</tr>
</tbody>
</table>
RELEASE Function

This function explicitly releases a lock previously acquired using the REQUEST function. Locks are automatically released at the end of a session. RELEASE is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.RELEASE (
    id         IN INTEGER)
RETURN INTEGER;

DBMS_LOCK.RELEASE (
    lockhandle IN VARCHAR2)
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id or lockhandle</td>
<td>User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>3</td>
<td>Parameter error</td>
</tr>
<tr>
<td>4</td>
<td>Do not own lock specified by id or lockhandle</td>
</tr>
<tr>
<td>5</td>
<td>Illegal lock handle</td>
</tr>
</tbody>
</table>
REQUEST Function

This function requests a lock with a given mode. REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```sql
DBMS_LOCK.REQUEST(
    id                 IN  INTEGER ||
    lockhandle         IN  VARCHAR2,
    lockmode           IN  INTEGER DEFAULT X_MODE,
    timeout            IN  INTEGER DEFAULT MAXWAIT,
    release_on_commit  IN  BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

The current default values, such as X_MODE and MAXWAIT, are defined in the DBMS_LOCK package specification.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id or lockhandle</td>
<td>User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.</td>
</tr>
<tr>
<td>lockmode</td>
<td>Mode that you are requesting for the lock.</td>
</tr>
<tr>
<td></td>
<td>For the available modes and their associated integer identifiers, see Constants on page 46-3.</td>
</tr>
<tr>
<td>timeout</td>
<td>Number of seconds to continue trying to grant the lock.</td>
</tr>
<tr>
<td></td>
<td>If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).</td>
</tr>
<tr>
<td>release_on_commit</td>
<td>Set this parameter to TRUE to release the lock on commit or roll-back.</td>
</tr>
<tr>
<td></td>
<td>Otherwise, the lock is held until it is explicitly released or until the end of the session.</td>
</tr>
</tbody>
</table>
### Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Timeout</td>
</tr>
<tr>
<td>2</td>
<td>Deadlock</td>
</tr>
<tr>
<td>3</td>
<td>Parameter error</td>
</tr>
<tr>
<td>4</td>
<td>Already own lock specified by id or lockhandle</td>
</tr>
<tr>
<td>5</td>
<td>Illegal lock handle</td>
</tr>
</tbody>
</table>
SLEEP Procedure

This procedure suspends the session for a given period of time.

Syntax

```sql
DBMS_LOCK.SLEEP (  
    seconds  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| seconds   | Amount of time, in seconds, to suspend the session.  
The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value. |
The **DBMS_LOGMNR** package contains procedures used to initialize the LogMiner tool and to begin and end a LogMiner session.

**See Also:** *Oracle Database Utilities* for information about using LogMiner and **DBMS_LOGMNR_D** for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

This chapter contains the following topics:

- **Using DBMS_LOGMNR**
  - Security Model
  - Constants
  - Operational Notes
- **Summary of DBMS_LOGMNR Subprograms**
Using DBMS_LOGMNR

Security Model

You must have the role, EXECUTE_CATALOG_ROLE to use the DBMS_LOGMNR package.

Constants

Table 47–1 describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 47–1 Constants for ADD_LOGFILE Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW</td>
<td>Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.</td>
</tr>
<tr>
<td>ADDFILE</td>
<td>Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.</td>
</tr>
</tbody>
</table>
Table 47–2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

**Table 47–2  Constants for START_LOGMNR Options Flag**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMITTED_DATA_ONLY</td>
<td>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on). If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</td>
</tr>
<tr>
<td>SKIP_CORRUPTION</td>
<td>Directs a select operation on the V$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.</td>
</tr>
<tr>
<td>DDL_DICT_TRACKING</td>
<td>If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open. This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.</td>
</tr>
</tbody>
</table>
Table 47–2 (Cont.) Constants for START_LOGMNR Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DICT_FROM_ONLINE_CATALOG</td>
<td>Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed. This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files. Expect to see a value of 2 in the STATUS column of the V$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.</td>
</tr>
<tr>
<td>DICT_FROM_REDO_LOGS</td>
<td>If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.</td>
</tr>
<tr>
<td>NO_SQL_DELIMITER</td>
<td>If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.</td>
</tr>
<tr>
<td>NO_ROWID_IN_STMT</td>
<td>If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled. When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.</td>
</tr>
<tr>
<td>PRINTPRETTY_SQL</td>
<td>If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.</td>
</tr>
<tr>
<td>CONTINUOUS_MINE</td>
<td>Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files.</td>
</tr>
</tbody>
</table>
Operational Notes

A LogMiner session begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue SQL `SELECT` statements against the `V$LOGMNR_CONTENTS` view to retrieve the data of interest.
## Summary of DBMS_LOGMNR Subprograms

### Table 47–3 DBMS_LOGMNR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_LOGFILE</strong> Procedure on page 47-7</td>
<td>Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session</td>
</tr>
<tr>
<td><strong>COLUMN_PRESENT</strong> Function on page 47-9</td>
<td>You can call this function for any row returned from the V$LOGMNR_CONTENTS view to determine if undo or redo column values exist for the column specified by the <code>column_name</code> input parameter to this function</td>
</tr>
<tr>
<td><strong>END_LOGMNR</strong> Procedure on page 47-11</td>
<td>Finishes a LogMiner session</td>
</tr>
<tr>
<td><strong>MINE_VALUE</strong> Function on page 47-12</td>
<td>You can call this function for any row returned from the V$LOGMNR_CONTENTS view to retrieve the undo or redo column value of the column specified by the <code>column_name</code> input parameter to this function</td>
</tr>
<tr>
<td><strong>REMOVE_LOGFILE</strong> Procedure on page 47-14</td>
<td>Removes a redo log file from the list of redo log files for LogMiner to process</td>
</tr>
<tr>
<td><strong>START_LOGMNR</strong> Procedure on page 47-16</td>
<td>Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to <code>DBMS_LOGMNR.ADD_LOGFILE</code>)</td>
</tr>
</tbody>
</table>
ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Syntax

```sql
DBMS_LOGMNR.ADD_LOGFILE(
    LogFileName     IN VARCHAR2,
    options         IN BINARY_INTEGER default ADDFILE );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogFileName</td>
<td>Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.</td>
</tr>
<tr>
<td>options</td>
<td>Does one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW)</td>
</tr>
<tr>
<td></td>
<td>- Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE)</td>
</tr>
</tbody>
</table>

See Table 47–1, " Constants for ADD_LOGFILE Options Flag".

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.
- Both archived and online redo log files can be mined.
ADD_LOGFILE Procedure

- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)

- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

Exceptions

- ORA-01284: file <filename> cannot be opened.
- ORA-01287: file <filename> is from a different database incarnation.
- ORA-01289: cannot add duplicate log file <filename>.
- ORA-01290: cannot remove unlisted log file <filename>.
- ORA-01324: cannot add file <filename> due to DB_ID mismatch.
COLUMN_PRESENT Function

This function is designed to be used in conjunction with the MINE_VALUE function. If the MINE_VALUE function returns a NULL value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a NULL value.

To distinguish between these two cases, use the COLUMN_PRESENT function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

DBMS_LOGMNR.COLUMN_PRESENT(
    sql_redo_undo IN RAW,
    column_name   IN VARCHAR2 default '') RETURN NUMBER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_redo_undo</td>
<td>Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.</td>
</tr>
</tbody>
</table>

Return Values

Table 47–6 describes the return values for the COLUMN_PRESENT function. The COLUMN_PRESENT function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of NULL values returned by the DBMS_LOGMNR.MINE_VALUE function.

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Specified column is not present in this row of V$LOGMNR_CONTENTS.</td>
</tr>
</tbody>
</table>
COLUMN_PRESENT Function

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V$LOGMNR_CONTENTS view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be null).

Exceptions

- ORA-01323: invalid state.
  Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
- ORA-00904: invalid identifier.
  The value specified for the column_name parameter was not a fully qualified column name.

Table 47–6 (Cont.) Return Values for COLUMN_PRESENT Function

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Column is present in this row of V$LOGMNR_CONTENTS.</td>
</tr>
</tbody>
</table>
END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the NEW option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

- ORA-01307: No LogMiner session is currently active.

  The END_LOGMNR procedure was called without adding any log files or before the START_LOGMNR procedure was called.
MINE_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```sql
DBMS_LOGMNR.MINE_VALUE(
    sql_redo_undo IN RAW,
    column_name IN VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_redo_undo</td>
<td>Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.</td>
</tr>
<tr>
<td>NON-NULL</td>
<td>The column is contained within the self-describing record; the value is returned in string format.</td>
</tr>
</tbody>
</table>

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
The MINE.VALUE function must be invoked in the context of a select operation from the V$LOGMNR_CONTENTS view.

The MINE.VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.

The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:

- If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
- If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
- If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be null).
- If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be null).

Exceptions

- ORA-01323: invalid state.
  
  Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.

- ORA-00904: invalid identifier.

  The value specified for the column_name parameter was not a fully qualified column name.
REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

---

**Note:** This procedure replaces the REMOVEFILE constant that was an option on the ADD_LOGFILE procedure prior to Oracle Database 10g.

---

Syntax

```plsql
DBMS_LOGMNR.REMOVE_LOGFILE(
  LogFileName IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogFileName</td>
<td>Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.</td>
</tr>
</tbody>
</table>

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo
log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

Exceptions

- ORA-01290: cannot remove unlisted log file <filename>. 
This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

Syntax

```sql
DBMS_LOGMNR.START_LOGMNR(
    startScn IN NUMBER default 0,
    endScn IN NUMBER default 0,
    startTime IN DATE default '01-jan-1988',
    endTime IN DATE default '31-dec-2110',
    DictFileName IN VARCHAR2 default '',
    Options IN BINARY_INTEGER default 0 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startScn</td>
<td>Directs LogMiner to return only redo records with an SCN greater than or equal to the startScn specified. This fails if there is no redo log file containing the specified startScn value. (You can query the FILENAME, LOW_SCN, and NEXT_SCN columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of SCN values contained in each redo log file.)</td>
</tr>
<tr>
<td>endScn</td>
<td>Directs LogMiner to return only redo records with an SCN less than or equal to the endScn specified. If you specify an endScn value that is beyond the value in any redo log file, then LogMiner will use the greatest endScn value in the redo log file that contains the most recent changes. (You can query the FILENAME, LOW_SCN, and NEXT_SCN columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of SCN values contained in each redo log file.)</td>
</tr>
<tr>
<td>startTime</td>
<td>Directs LogMiner to return only redo records with a timestamp greater than or equal to the startTime specified. This fails if there is no redo log file containing the specified startTime value. (You can query the FILENAME, LOW_TIME, and HIGH_TIME columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if startScn is specified. See the Usage Notes for additional information.</td>
</tr>
</tbody>
</table>
Usage Notes

LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See Oracle Database Utilities and Chapter 48 in this manual for more information about the LogMiner dictionary.

After executing the START_LOGMNR procedure, you can query the following views:

- `V$LOGMNR_CONTENTS` - contains history of information in redo log files
- `V$LOGMNR_DICTIONARY` - contains current information about the LogMiner dictionary file extracted to a flat file
- `V$LOGMNR_PARAMETERS` - contains information about the LogMiner session

(You can query the `V$LOGMNR_LOGS` view after a redo log file list has been added to the list of files that LogMiner is to mine.)
Parameters and options are not persistent across calls to `DBMS_LOGMNR.START_LOGMNR`. You must specify all desired parameters and options (including SCN and time ranges) each time you call `DBMS_LOGMNR.START_LOGMNR`.

Be aware that specifying redo log files using a timestamp is not precise.

The `CONTINUOUS_MINE` option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the `CONTINUOUS_MINE` option:

- The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the `V$ARCHIVED_LOGS` view to determine which redo log file entries will be found by LogMiner.

  Even if an entry is listed in the database control file (and the `V$ARCHIVED_LOGS` view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be not available.

- If you specify the `CONTINUOUS_MINE` option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the `V$LOGMNR_CONTENTS` view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.

- LogMiner can mine online redo logs. However, if the `CONTINUOUS_MINE` option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.

Keep the following in mind regarding starting and ending times or SCN ranges:
Summary of DBMS_LOGMNR Subprograms

If you specify neither a startTime nor a startScn parameter, LogMiner will set the startScn parameter to use the lowest SCN value from the redo log file that contains the oldest changes.

If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.

If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.

If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR without the CONTINUOUS_MINE option, and you specify:

* 0 for the startTime or startScn value, then the lowest SCN in the LogMiner redo log file list will be used as the startScn
* A nonzero number for the startTime or startScn value, then an error is returned
* 0 or a nonzero number for the endTime or endScn value, then the highest SCN in the LogMiner redo log file list will be used as the endScn

If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR with the CONTINUOUS_MINE option, and you specify:

* 0 for the startTime or startScn value, then an error is returned.
* A startTime or startScn value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the V$LOGMNR_CONTENTS view.
* An endTime or endScn parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
* 0 for the endTime or endScn parameter value, then LogMiner includes the online redo log files when it mines. When you query the
V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.

Exceptions

- **ORA-01280**: fatal LogMiner error.
  The procedure fails with this exception if LogMiner encounters an internal error.

- **ORA-01281**: SCN range specified is invalid.
  The startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.

- **ORA-01282**: date range specified is invalid.
  The value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.

- **ORA-01283**: options parameter specified is invalid.

- **ORA-01284**: file <filename> cannot be opened.
  The LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.

- **ORA-01285**: error reading file <filename>.

- **ORA-01291**: missing log file.
  Redo log files that are needed to satisfy the user’s requested SCN or time range are missing.

- **ORA-01292**: no log file has been specified for the current LogMiner session.

- **ORA-01293**: mounted database required for specified LogMiner options.

- **ORA-01294**: error occurred while processing information in dictionary file <filename>, possible corruption.

- **ORA-01295**: DB_ID mismatch between dictionary <filename> and log files.
  The specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.

- **ORA-01296**: character set mismatch between dictionary <filename> and log files.
- ORA-01297: redo version mismatch between dictionary <filename> and log files.
- ORA-01299: dictionary <filename> corresponds to a different database incarnation.
- ORA-01300: writable database required for specified LogMiner options.
The DBMS_LOGMNR_D package contains two procedures:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

**See Also:** Oracle Database Utilities for information about using LogMiner and DBMS_LOGMNR for information on the package subprograms used in running a LogMiner session.

This chapter contains the following topic:

- Using DBMS_LOGMNR_D
  - Overview
  - Security Model
  - Summary of DBMS_LOGMNR_D Subprograms
Using DBMS_LOGMNR_D

Overview

- Overview
- Security Model

Overview

Note: The LogMiner data dictionary consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the LogMiner dictionary throughout the LogMiner documentation.

Security Model

You must have the role, EXECUTE_CATALOG_ROLE to use the DBMS_LOGMNR_D package.
### Summary of DBMS_LOGMNR_D Subprograms

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BUILD Procedure</strong> on page 48-4</td>
<td>Extracts the LogMiner dictionary to either a flat file or one or more redo log files</td>
</tr>
<tr>
<td><strong>SET_TABLESPACE Procedure</strong> on page 48-8</td>
<td>Re-creates all LogMiner tables in an alternate tablespace</td>
</tr>
</tbody>
</table>
BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

Syntax

```
DBMS_LOGMNR_D.BUILD (  
dictionary_filename IN VARCHAR2,  
dictionary_location IN VARCHAR2,  
options IN NUMBER);
```

Parameters

Table 48–2 describes the parameters for the BUILD procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dictionary_filename</td>
<td>Specifies the name of the LogMiner dictionary file.</td>
</tr>
<tr>
<td>dictionary_location</td>
<td>Specifies the path to the LogMiner dictionary file directory.</td>
</tr>
<tr>
<td>options</td>
<td>Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).</td>
</tr>
</tbody>
</table>

To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the STORE_IN_REDO_LOGS option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the STORE_IN_FLAT_FILE option, the LogMiner dictionary is extracted to a flat file with the specified name.
If you do not specify a filename and location, but do specify the `STORE_IN_REDO_LOGS` option, the LogMiner dictionary is extracted to the redo log files.

If you specify a filename and location, as well as the `STORE_IN_REDO_LOGS` option, an error is returned.

If you do not specify a filename and location, but do specify the `STORE_IN_FLAT_FILE` option, an error is returned.

**Exceptions**

- **ORA-01302**: dictionary build options missing or incorrect.
  This error is returned under the following conditions:
  - If the value of the `OPTIONS` parameter is not one of the supported values (`STORE_IN_REDO_LOGS`, `STORE_IN_FLAT_FILE`) or is not specified
  - If the `STORE_IN_REDO_LOGS` option is not specified and neither the `dictionary_filename` nor the `dictionary_location` parameter is specified
  - If the `STORE_IN_REDO_LOGS` option is specified and either the `dictionary_filename` or the `dictionary_location` parameter is specified

- **ORA-01308**: initialization parameter UTL_FILE_DIR is not set.

- **ORA-01336**: specified dictionary file cannot be opened.
  This error is returned under the following conditions:
  - The specified value for the `dictionary_location` does not exist.
  - The `UTL_FILE_DIR` initialization parameter is not set to have access to the `dictionary_location`.
  - The dictionary file is read-only.

**Usage Notes**

- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9i release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
Do not run the `DBMS_LOGMNR_D.BUILD` procedure if there are any ongoing DDL operations.

The database must be open when you run the `DBMS_LOGMNR_D.BUILD` procedure.

When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:

- You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter `UTL_FILE_DIR` in the initialization parameter file. For example:
  
  ```
  UTL_FILE_DIR = /oracle/dictionary
  ```

  After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.

- You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

Be aware that the `DDL_DICT_TRACKING` option to the `DBMS_LOGMNR.START_LOGMNR` procedure is not supported for flat file dictionaries created prior to Oracle9i. If you attempt to use the `DDL_DICT_TRACKING` option with a LogMiner database extracted to a flat file prior to Oracle9i, the ORA-01330 error (problem loading a required build table) is returned.

To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The `DBMS_LOGMNR_D.BUILD` procedure must be run on a system that is running Oracle9i or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The `COMPATIBLE` parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner
offres. See Oracle Database Utilities for information about using supplemental logging with LogMiner.

Examples

Example 1: Extracting the LogMiner Dictionary to a Flat File
The following example extracts the LogMiner dictionary file to a flat file named dictionary.ora in a specified path (/oracle/database).

SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', - 'oracle/database/', - options => dbms_logmnr_d.store_in_flat_file);

Example 2: Extracting the LogMiner Dictionary to the Redo Log Files
The following example extracts the LogMiner dictionary to the redo log files.

SQL> EXECUTE dbms_logmnr_d.build( - options => dbms_logmnr_d.store_in_redo_logs);
SET_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYSAUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

Syntax

DBMS_LOGMNR_D.SET_TABLESPACE(
    new_tablespace    IN VARCHAR2);

Parameters

Table 48–3  SET_TABLESPACE Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tablespace</td>
<td>A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET_TABLESPACE procedure to move the tables to the SYSAUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

See Also:  Oracle Database Concepts and Oracle Database SQL Reference for information about tablespaces and how to create them

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS_LOGMNR_D.SET_TABLESPACE procedure.

SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f' SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
The DBMS_LOGSTDBY package provides procedures for configuring and managing the logical standby database environment.

Using DBMS_LOGSTBY

Using DBMS_LOGSTBY

- Overview
- Operational Notes

Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The procedures in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

- Allow controlled access to tables in the standby database that may require maintenance
- Control how transactions are applied to the logical standby database
- Provide a way to skip applying archived redo log files to selected tables or entire schemas in the standby database, and describe how exceptions should be handled
- Manage initialization parameters used by log apply services
- Ensure supplemental logging is enabled properly and build the LogMiner dictionary

Operational Notes

Ensure you use the correct case when supplying schema and table names to the DBMS_LOGSTDBY package. For example, the following statements show incorrect and correct syntax for a SKIP procedure that skips changes to OE.TEST.

Incorrect statement:

EXECUTE DBMS_LOGSTDBY.SKIP ('DML', 'oe', 'test', null);

Because the names are specified with lowercase characters, the transactions that update these columns will still be applied to the logical standby database.

Correct statement:

EXECUTE DBMS_LOGSTDBY.SKIP ('DML', 'OE', 'TEST', null);
### Summary of DBMS_LOGSTDBY Subprograms

**Table 49–1  DBMS_LOGSTDBY Package Subprograms**

<table>
<thead>

<td>Modifies the options set in the SKIP_TRANSACTION procedure</td>
</tr>
</tbody>
</table>
APPLY_SET Procedure

Use this procedure to set and modify the values of initialization parameters that configure and manage log apply services in a logical standby database environment. SQL apply cannot be running when you use this procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
    parameter           IN VARCHAR,
    value               IN VARCHAR);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX_SGA</td>
<td>Number of megabytes for the system global area (SGA) that SQL Apply will use to cache change records. The default value is 30 megabytes or less if the SHARED_POOL_SIZE initialization parameter is set to a small value. In most cases 30 megabytes is sufficient. Note: In Oracle9i, the parameter default was one quarter of the value set for the SHARED_POOL_SIZE initialization parameter.</td>
</tr>
<tr>
<td>MAX_SERVERS</td>
<td>Number of parallel query servers that SQL Apply uses to read and apply redo. It defaults to the value of the PARALLEL_MAX_SERVERS initialization parameter or 9, whichever is lower. Because the correct value for this parameter is really a function of the workload, it is best to explicitly set the parameter, using a reasonable value that will work in most cases. Note: In Oracle9i, the MAX_SERVERS parameter defaulted to the value of the PARALLEL_MAX_SERVERS initialization parameter.</td>
</tr>
<tr>
<td>MAX_EVENTS_RECORDERED</td>
<td>Number of events that will be stored in the DBA_LOGSTDBY_EVENTS table, which stores logical standby event information.</td>
</tr>
</tbody>
</table>
### TRANSACTION_CONSISTENCY
Level of transaction consistency maintained between the primary and standby databases. Specify one of the following values:

- **FULL**: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. (Transactions are applied in commit SCN order.) This is the default parameter setting.

- **READ_ONLY**: Transactions are committed out of order (which provides better performance), but SQL `SELECT` statements executed on the standby database always return consistent results based on the last consistent SCN known to SQL apply.

- **NONE**: Transactions are applied out of order from how they were committed on the primary database, and no attempt is made to provide read-consistent results.

Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened in the primary database. See the **Usage Notes** for details and recommendations.

### RECORD_SKIP_ERRORS
Controls whether skipped errors (as described by the `SKIP_ERROR` procedure) are recorded in the `DBA_LOGSTDBY_EVENTS` table. Specify one of the following values:

- **TRUE**: Skipped errors are recorded in the `DBA_LOGSTDBY_EVENTS` table. This is the default parameter setting.

- **FALSE**: Skipped errors are not recorded in the `DBA_LOGSTDBY_EVENTS` table.

### RECORD_SKIP_DDL
Controls whether skipped DDL statements are recorded in the `DBA_LOGSTDBY_EVENTS` table. Specify one of the following values:

- **TRUE**: Skipped DDL statements are recorded in the `DBA_LOGSTDBY_EVENTS` table. This is the default parameter setting.

- **FALSE**: Skipped DDL statements are not recorded in the `DBA_LOGSTDBY_EVENTS` table.

---

**Table 49–2 (Cont.) APPLY_SET Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSACTION_CONSISTENCY</td>
<td>Level of transaction consistency maintained between the primary and standby databases. Specify one of the following values:</td>
</tr>
<tr>
<td>RECORD_SKIP_ERRORS</td>
<td>Controls whether skipped errors (as described by the <code>SKIP_ERROR</code> procedure) are recorded in the <code>DBA_LOGSTDBY_EVENTS</code> table. Specify one of the following values:</td>
</tr>
<tr>
<td>RECORD_SKIP_DDL</td>
<td>Controls whether skipped DDL statements are recorded in the <code>DBA_LOGSTDBY_EVENTS</code> table. Specify one of the following values:</td>
</tr>
</tbody>
</table>
Usage Notes

- Although the default values provided by the system for initialization parameters are adequate for most applications, you might want to use the APPLY_SET procedure when you need to perform tuning and maintenance tasks. For example, use the APPLY_SET procedure when you want to override default initialization parameter values to tune log apply services.

- Log apply services must not be applying archived redo log data to the standby database when you modify initialization parameters with the APPLY_SET procedure. The initialization parameter values that you set using this procedure do not become active until you start log apply services.

- Use the APPLY_UNSET Procedure to reverse (undo) the actions of the APPLY_SET procedure.

- For the TRANSACTION_CONSISTENCY parameter:
  - The FULL option (the default) is recommended when the logical standby database is used for generic reporting applications. This option results in the lowest performance.
  - The READ_ONLY option is recommended when the logical standby database is used for read-only reporting.
SQL Apply periodically refreshes an SCN maintained in SGA that represents a consistent state. Queries executed on the standby database, automatically use Oracle Flashback to the maintained SCN. This is beneficial when the logical standby database is being used to generate reports. Any Oracle Flashback restrictions apply to this option.

- The **NONE** option works well as long as applications that are reading the logical standby database make no assumptions about transaction order. The **NONE** option is also useful when the logical standby database is in catch-up mode.

The **NONE** option results in the best performance of the three options for the `TRANSACTION_CONSISTENCY` parameter. However, this setting might give you inconsistent results on the standby database. If applications that are reading the logical standby database make no assumptions about transaction order, this option works well. For example:

* On the primary database, one transaction added a new customer and a second transaction added a new order for that customer.

* On the standby database, those transactions may be reversed. The order for the new customer might be added first. If you then run a reporting application on the standby database that expects to find a customer for the new order, the reporting application might fail because constraints are not checked and triggers are not fired.

### Examples

If parallel queries are routinely being performed by applications, a certain number of parallel query servers should be reserved for those queries. To allocate 30 parallel query servers for logical standby log apply services, enter the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('MAX_SERVERS', 30);
```

Thus, if the `PARALLEL_MAX_SERVERS` parameter is set to 50, 30 servers will be available for logical standby processing and 20 parallel query servers will be allocated for parallel query processing.

**Note:** If log apply services cannot allocate the parallel query server it requires because parallel queries are currently being processed, log apply services may stop. If this happens, start log apply services again.
APPLY_UNSET Procedure

Use the APPLY_UNSET procedure to reverse or undo the settings that you made with the APPLY_SET procedure. The APPLY_UNSET procedure resets the specified initialization parameter value to the system default value. The initialization parameter default value does not become active until log apply services are started.

Syntax

```sql
DBMS_LOGSTDBY.APPLY_UNSET (
    parameter   IN VARCHAR);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX_SGA</td>
<td>Number of megabytes for the system global area (SGA) allocation for log apply services cache. The default value is one quarter of the value set for the SHARED_POOL_SIZE initialization parameter.</td>
</tr>
<tr>
<td>MAX_SERVERS</td>
<td>Number of parallel query servers specifically reserved for log apply services. By default, log apply services use all available parallel query servers to read the log files and apply changes. See Oracle Database Reference for more information about parallel query servers.</td>
</tr>
<tr>
<td>MAX.Events_Recorded</td>
<td>Number of events that will be stored in the DBA_LOGSTDBY_EVENTS table, which stores logical standby event information.</td>
</tr>
</tbody>
</table>
Summary of DBMS_LOGSTDBY Subprograms

TRANSACTION_CONSISTENCY

Level of transaction consistency maintained between the primary and standby databases. Specify one of the following values:

FULL: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. (Transactions are applied in commit SCN order.) This is the default parameter setting.

READ_ONLY: Transactions are committed out of order (which provides better performance), but SQL SELECT statements executed on the standby database always return consistent results based on the last consistent SCN known to SQL apply.

NONE: Transactions are applied out of order from how they were committed on the primary database, and no attempt is made to provide read-consistent results.

Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened in the primary database. See the Usage Notes for details and recommendations.

RECORD_SKIP_ERRORS

Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the DBA_LOGSTDBY EVENTS table. Specify one of the following values:

TRUE: Skipped errors are recorded in the DBA_LOGSTDBY EVENTS table. This is the default parameter setting.

FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table.

RECORD_SKIP_DDL

Controls whether skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table. Specify one of the following values:

TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table. This is the default parameter setting.

FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table.

Table 49–3 (Cont.) APPLY_UNSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSACTION_CONSISTENCY</td>
<td>Level of transaction consistency maintained between the primary and standby databases. Specify one of the following values:</td>
</tr>
<tr>
<td>RECORD_SKIP_ERRORS</td>
<td>Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the DBA_LOGSTDBY_EVENTS table. Specify one of the following values:</td>
</tr>
<tr>
<td>RECORD_SKIP_DDL</td>
<td>Controls whether skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table. Specify one of the following values:</td>
</tr>
</tbody>
</table>
**Usage Notes**

- Log apply services must not be applying archived redo log data to the standby database when you modify initialization parameters with the `APPLY_UNSET` procedure.
- Use the `APPLY_SET` procedure to set the values of initialization parameters.

**Examples**

To unset the number of parallel query servers for log apply services, enter the following statement:

```sql
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('MAX_SERVERS');
```

Assuming that the `PARALLEL_MAX_SERVERS` initialization parameter is set to 50, this statement will result in 50 parallel query servers being available for parallel query processing. This is because, by default, log apply services use all available parallel query servers to read the log files and apply changes.

---

**Table 49–3 (Cont.) APPLY_UNSET Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECORD_APPLIED_DDL</td>
<td>Controls whether DDL statements that have been applied to the logical standby database are recorded in the <code>DBA_LOGSTDBY_EVENTS</code> table. Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the <code>DBA_LOGSTDBY_EVENTS</code> table. This is the default parameter setting.</td>
</tr>
<tr>
<td></td>
<td>FALSE: Indicates that applied DDL statements are not recorded.</td>
</tr>
<tr>
<td>APPLY_SERVERS</td>
<td>Controls the number of parallel execution servers used to apply changes. See Oracle Data Guard Concepts and Administration for an explanation of the logical standby processes.</td>
</tr>
<tr>
<td>PREPARE_SERVERS</td>
<td>Controls the number of parallel execution servers used to prepare changes. See Oracle Data Guard Concepts and Administration for an explanation of the logical standby processes.</td>
</tr>
</tbody>
</table>
**Note:** If log apply services cannot allocate the parallel query server it requires because parallel queries are currently being processed, log apply services may stop. If this happens, start log apply services again.
BUILD Procedure

Use this procedure on the primary database to preserve important metadata (LogMiner dictionary) information in the redo logs. If supplemental logging has not been set correctly, this procedure sets it up and enables it automatically.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the archived redo logs that helps log apply services to uniquely identify and correctly maintain tables in a logical standby database.
- LogMiner dictionary information allows log apply services to interpret data in the redo logs.
- The `ALTER DATABASE CREATE LOGICAL STANDBY CONTROLFILE` statement also performs this functionality.
INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (dblink) as an input parameter.

Use the INSTANTIATE_TABLE procedure to:
- Add a table to a standby database
- Re-create a table in a standby database

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (  
  schema_name   IN VARCHAR2,  
  table_name    IN VARCHAR2,  
  dblink        IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table to be created or re-created in the standby database.</td>
</tr>
<tr>
<td>dblink</td>
<td>Name of the database link account that has privileges to read and lock the table in the primary database.</td>
</tr>
</tbody>
</table>

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This procedure assumes that the metadata has been maintained correctly.
- This table is not safe until the redo log that was current on the primary database at the time of execution is applied to the standby database.

Examples

Enter this statement to create and populate a new table on the standby database.
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (  'myschema', 'mytable', 'mydblink');
**SKIP Procedure**

Use the SKIP procedure to define filters that prevent the application of SQL statements on the logical standby database.

By default, all SQL statements executed on a primary database are applied to a logical standby database. If only a subset of activity on a primary database is of interest for application to the standby database, you can use the SKIP procedure to define filters that prevent the application of SQL statements on the logical standby database. While skipping (ignoring) SQL statements is the primary goal of filters, it is also possible to associate a stored procedure with a DDL filter so that runtime determinations can be made whether to skip the statement, execute this statement, or execute a replacement statement.

**Syntax**

```sql
DBMS_LOGSTDBY.SKIP (  
    stmt                      IN VARCHAR2,  
    schema_name               IN VARCHAR2,  
    object_name               IN VARCHAR2,  
    proc_name                 IN VARCHAR2,  
    use_like                  IN BOOLEAN,  
    esc                       IN CHAR1);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt</td>
<td>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 49-6 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.</td>
</tr>
</tbody>
</table>
proc_name

Name of a stored procedure to call when log apply services
determines that a particular statement matches the filter defined
by the stmt, schema_name, and object_name parameters.
Specify the procedure in the following format:

'"schema"."package"."procedure"'

This procedure returns a value that directs log apply services to
perform one of the following: execute the statement, skip the
statement, or execute a replacement statement.

Log apply services calls the stored procedure with the following
call signature:

- IN STATEMENT VARCHAR2 -- The SQL statement that
  matches the filter
- IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter
- IN SCHEMA VARCHAR2 -- The schema_name of the filter, if
  applicable
- IN NAME VARCHAR2 -- The object_name of the filter, if
  applicable
- IN XIDUSN NUMBER -- Transaction ID part 1
- IN XIDSLT NUMBER -- Transaction ID part 2
- IN XIDSQN NUMBER -- Transaction ID part 3
- OUT SKIP_ACTION NUMBER -- Action to be taken by log
  apply services upon completion of this routine. Valid values
  are:
    SKIP_ACTION_APPLY -- Execute the statement
    SKIP_ACTION_SKIP -- Skip the statement
    SKIP_ACTION_REPLACE -- Execute the replacement
    statement supplied in the NEW_STATEMENT output parameter
- OUT NEW_STATEMENT VARCHAR2 -- The statement to
  execute in place of the original statement. Use of this option
  requires that SKIP_ACTION be set to SKIP_ACTION_'
  REPLACE. Otherwise, set this option to NULL.

Table 49–5 (Cont.) SKIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| proc_name    | Name of a stored procedure to call when log apply services determines that a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format:  

'"schema"."package"."procedure"'

This procedure returns a value that directs log apply services to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.

Log apply services calls the stored procedure with the following call signature:

- IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter
- IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter
- IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable
- IN NAME VARCHAR2 -- The object_name of the filter, if applicable
- IN XIDUSN NUMBER -- Transaction ID part 1
- IN XIDSLT NUMBER -- Transaction ID part 2
- IN XIDSQN NUMBER -- Transaction ID part 3
- OUT SKIP_ACTION NUMBER -- Action to be taken by log apply services upon completion of this routine. Valid values are:
  - SKIP_ACTION_APPLY -- Execute the statement
  - SKIP_ACTION_SKIP -- Skip the statement
  - SKIP_ACTION_REPLACE -- Execute the replacement statement supplied in the NEW_STATEMENT output parameter
- OUT NEW_STATEMENT VARCHAR2 -- The statement to execute in place of the original statement. Use of this option requires that SKIP_ACTION be set to SKIP_ACTION_ REPLACE. Otherwise, set this option to NULL. |
Usage Notes

**Caution:** Atomic execution cannot be guaranteed if hardware or software failures stop log apply services. In a failure situation, a statement may be executed more than once.

These stored procedures are not supported with `DBMS_LOGSTDBY.SKIP('DML'...)`. If multiple wildcards match a given database statement object defined by the `stmt` parameter, only one of the matching stored procedures will be called (alphabetically, by procedure).

- Use the `SKIP` procedure with caution, particularly when skipping DDL statements. If a `CREATE TABLE` statement is skipped, for example, you must also specify other DDL statements that refer to that table in the `SKIP` procedure. Otherwise, the statements will fail and cause an exception. When this happens, log apply services stop running.

- Before calling the `SKIP` procedure, log apply services must be halted. Do this by issuing an `ALTER DATABASE STOP LOGICAL STANDBY APPLY` statement. Once all desired filters have been specified, issue an `ALTER DATABASE START LOGICAL STANDBY APPLY` statement to start log apply services using the new filter settings.

---

**Table 49-5 (Cont.) SKIP Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>use_like</code></td>
<td>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <em>Oracle Database SQL Reference</em>.</td>
</tr>
<tr>
<td><code>esc</code></td>
<td>Identifies an escape character (such as the character “/”) that you can use for pattern matching. If the escape character appears in the pattern before the character “%” or “_” then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <em>Oracle Database SQL Reference</em> for more information about pattern matching.</td>
</tr>
</tbody>
</table>
See the **UNSKIP Procedure** for information about reversing (undoing) the settings of the **SKIP** procedure.

**Skip Statement Options**

Table 49–6 lists the supported values for the `stmt` parameter of the **SKIP** procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. Any of the SQL statements in the right column, however, are also valid values. Note that keywords are generally defined by database object.

The following example shows how to use the `SKIP` procedure to skip (ignore) a schema on the logical standby database.

### Exceptions

**Table 49–7**  
**DBMS_LOGSTDBY.SKIP Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16203</td>
<td>&quot;Unable to interpret skip procedure return values.&quot; Indicates that a <code>SKIP</code> procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the <code>DBA_LOGSTDBY_EVENTS</code> view.</td>
</tr>
</tbody>
</table>

### Examples

The following example shows how to use the `SKIP` procedure to skip (ignore) a schema on the logical standby database.
Example 1 Skip a Schema

To skip changes for a given schema, you must prevent log apply services from creating new objects in the schema and from modifying existing objects in the schema. In addition, the tablespace that supports the schema must not change. The following example demonstrates this using the SKIP procedure in a situation where schema smith has some number of tables defined in tablespace bones that we wish to ignore.

BEGIN
  DBMS_LOGSTDBY.SKIP('SCHEMA_DDL', 'SMITH', '%', null);
  DBMS_LOGSTDBY.SKIP('DML', 'SMITH', '%', null);
  DBMS_LOGSTDBY.SKIP('TABLESPACE', null, null, 'SMITH.PROTECT_BONES');
END;

In the previous example, wildcards were used for the object_name parameter to indicate that the filter applies to all objects. In the last call to the SKIP procedure, the PROTECT_BONES procedure was supplied so that TABLESPACE could prevent tablespace operations on BONES. The following example is the definition for the PROTECT_BONES procedure:

```
CREATE OR REPLACE PROCEDURE PROTECT_BONES (statement IN VARCHAR2,
  statement_type IN VARCHAR2,
  schema IN VARCHAR2,
  name IN VARCHAR2,
  xidusn IN NUMBER,
  xidslt IN NUMBER,
  xidsqn IN NUMBER,
  skip_action OUT NUMBER,
  new_statement OUT VARCHAR2) AS

  BEGIN
    -- Init
    new_statement := NULL;

    -- Guaranteed to be either CREATE, DROP, or TRUNCATE TABLESPACE
    IF statement LIKE '%TABLESPACE BONES%'
      THEN
        -- Skip the statement
        skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP;
      ELSE
        -- Apply the statement
        skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY;
      END IF;
  END protect_bones;
```

---

Summary of DBMS_LOGSTDBY Subprograms
Upon encountering an error, the logical standby feature uses the criteria contained in this procedure to determine if the error should cause log apply services to stop. All errors to be skipped are stored in system tables that describe how exceptions should be handled.

**Syntax**

```
DBMS_LOGSTDBY.SKIP_ERROR (  
    stmt                      IN VARCHAR2,  
    schema_name               IN VARCHAR2,  
    object_name               IN VARCHAR2,  
    proc_name                 IN VARCHAR2,  
    use_like                  IN BOOLEAN,  
    esc                       IN CHAR1);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt</td>
<td>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 49-6 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.</td>
</tr>
</tbody>
</table>
Summary of DBMS_LOGSTDBY Subprograms

**Table 49–8 (Cont.) SKIP_ERROR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| proc_name   | Name of a stored procedure to call when log apply services determines a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: \
|             | "schema"."package"."procedure" |
|             | This procedure returns a value that directs log apply services to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. |
|             | Log apply services call the stored procedure with the following call signature: |
|             | * IN STATEMENT VARCHAR(4000) -- The first 4K of the statement |
|             | * IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter |
|             | * IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable |
|             | * IN NAME VARCHAR2 -- The object_name of the filter, if applicable |
|             | * IN XIDUSN NUMBER -- Transaction ID part 1 |
|             | * IN XIDSLT NUMBER -- Transaction ID part 2 |
|             | * IN XIDSQN NUMBER -- Transaction ID part 3 |
|             | * IN ERROR VARCHAR(4000) -- Text of error to be recorded (optional) |
|             | * OUT NEW_ERROR VARCHAR(4000) -- Null or modified error text |
| use_like    | Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the Oracle Database SQL Reference. |
| esc         | Identifies an escape character (such as the characters "%" or "\") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "\" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See Oracle Database SQL Reference for more information about pattern matching. |
**SKIP_ERROR Procedure**

**Usage Notes**

- A stored procedure provided to the `SKIP_ERROR` procedure is called when log apply services encounter an error that could shut down the application of redo logs to the standby database.

Running this stored procedure affects the error being written in the `STATUS` column of the `DBA_LOGSTDBY_EVENTS` table. The `STATUS_CODE` column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the `NEW_ERROR` is written to the events table. To truly have no effect, set `NEW_ERROR` to `ERROR` in the procedure.

If the stored procedure requires that a shutdown be avoided, then you must set `NEW_ERROR` to `NULL`.

**Example**

```sql
DBMS_LOGSTDBY.SKIP_ERROR('DDL', 'joe', 'apptemp', null);
```
**SKIP_TRANSACTION Procedure**

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

You may want to use the `SKIP_TRANSACTION` procedure to:

- Skip a DDL transaction that has already failed and that might otherwise cause log apply services to stop.
- Skip a DDL transaction that may logically corrupt data.

**Syntax**

```sql
DBMS_LOGSTDBY.SKIP_TRANSACTION (  
  XIDUSN NUMBER,  
  XIDSLT NUMBER,  
  XIDSQN NUMBER);
```

**Parameters**

Table 49–9 describes the parameters for the `SKIP_TRANSACTION` procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XIDUSN</td>
<td>Transaction ID undo segment number of the transaction being skipped.</td>
</tr>
<tr>
<td>XIDSLT</td>
<td>Transaction ID slot number of the transaction being skipped.</td>
</tr>
<tr>
<td>XIDSQN</td>
<td>Transaction ID sequence number of the transaction being skipped.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If log apply services stop due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want log apply services to ignore.
CAUTION: To skip a DML failure, use a SKIP procedure, such as SKIP ('DML', 'MySchema', 'MyFailed Table'). Using the SKIP_TRANSACTION procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

Note: Do not let the primary and logical standby databases diverge when skipping transactions. If possible, you should manually execute a compensating transaction in place of the skipped transaction.

- View the last statement in DBA_LOGSTDBY_EVENTS to determine the reason that log apply services stopped processing transactions to the logical standby database. Examine the statement and error condition provided.
- Use the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by log apply services.
- Also, see the ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION statement in Oracle Database SQL Reference.
UNSKIP Procedure

This procedure reverses the actions of the SKIP procedure by finding the record, matching all the parameters, and removing the record from the system table. The match must be exact, and multiple skip actions can be undone only by a matching number of unskip actions. You cannot undo multiple skip actions using wildcard characters.

Syntax

```sql
DBMS_LOGSTDBY.UNSKIP (
    stmt                      IN VARCHAR2,
    schema_name               IN VARCHAR2,
    object_name               IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt</td>
<td>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 49-6 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.</td>
</tr>
</tbody>
</table>
UNSKIP Procedure

Table 49–10  (Cont.) UNSKIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| proc_name   | Name of a stored procedure to call when log apply services determines that a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: '"schema"."package"."procedure"'
|             | This procedure returns a value that directs log apply services to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. Log apply services calls the stored procedure with the following call signature:
|             |     IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter
|             |     IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter
|             |     IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable
|             |     IN NAME VARCHAR2 -- The object_name of the filter, if applicable
|             |     IN XIDUSN NUMBER -- Transaction ID part 1
|             |     IN XIDSLT NUMBER -- Transaction ID part 2
|             |     IN XIDSQN NUMBER -- Transaction ID part 3
|             |     OUT SKIP_ACTION NUMBER -- Action to be taken by log apply services upon completion of this routine. Valid values are:
|             |         SKIP_ACTION_APPLY -- Execute the statement
|             |         SKIP_ACTION_SKIP -- Skip the statement
|             |         SKIP_ACTION_REPLACE -- Execute the replacement statement supplied in the NEW_STATEMENT output parameter
|             |     OUT NEW_STATEMENT VARCHAR2 -- The statement to execute in place of the original statement. Use of this option requires that SKIP_ACTION be set to SKIP_ACTION_REPLACE. Otherwise, set this option to NULL.
Usage Notes

**CAUTION:** If DML changes for a table have been skipped, you must follow the call to the `UNSKIP` procedure with a call to a procedure that will import the affected table.

### Table 49–10 (Cont.) UNSKIP Procedure Parameters

<table>
<thead>
<tr>

See <em>Oracle Database SQL Reference</em> for more information about pattern matching.</td>
</tr>
</tbody>
</table>
UNSKIP_ERROR Procedure

This procedure reverses or undoes the actions of the SKIP_ERROR procedure by finding the record, matching all the parameters, and removing the record from the system table. The match must be exact, and multiple skip actions can be undone only by a matching number of unskip actions. You cannot undo multiple skip actions with just one unskip procedure call.

Syntax

`DBMS_LOGSTDBY.UNSKIP_ERROR (``
  stmt                      IN VARCHAR2,
  schema_name               IN VARCHAR2,
  object_name               IN VARCHAR2);`

Parameters

The parameter information for the UNSKIP_ERROR procedure is the same as that described for the SKIP_ERROR procedure. See Table 49–8 for complete parameter information.

Example

`DBMS_LOGSTDBY.UNSKIP_ERROR;`
**UNSKIP_TRANSACTION Procedure**

This procedure reverses the actions of the `SKIP_TRANSACTION` procedure. The match must be exact, and multiple `skip transaction` actions can be undone only by a matching number of `unskip transaction` actions. You cannot undo multiple `skip transaction` actions using wildcard characters.

**Syntax**

```sql
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
  XIDUSN NUMBER STRING,
  XIDSLT NUMBER STRING,
  XIDSQN NUMBER STRING);
```

**Parameters**

Table 49–11 describes the parameters for the `UNSKIP_TRANSACTION` procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XIDUSN NUMBER</td>
<td>Transaction ID undo segment number of the transaction being skipped.</td>
</tr>
<tr>
<td>XIDSLT NUMBER</td>
<td>Transaction ID slot number of the transaction being skipped.</td>
</tr>
<tr>
<td>XIDSQN NUMBER</td>
<td>Transaction ID sequence number of the transaction being skipped.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- Use the `DBA_LOGSTDBY_SKIP_TRANSACTION` view to list the transactions that are going to be skipped by log apply services.
UNSKIP_TRANSACTION Procedure
The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

**See Also:** Oracle Database Utilities for more information and for examples of using the Metadata API

This chapter contains the following topics:

- Using DBMS_METADATA
  - Overview
  - Security Model
  - Types
  - Rules and Limits
  - Organization of Subprograms
    - Subprograms for Retrieval of Multiple Objects from the Database
    - Subprograms for Submission of XML to the Database
  - Summary of DBMS_METADATA Subprograms
Using DBMS_METADATA

Using DBMS_METADATA

- Overview
- Security Model
- Types
- Rules and Limits
- Organization of Subprograms

Overview

You can use the DBMS_METADATA package to retrieve metadata and also to submit XML.

- Retrieving Metadata
- Submitting XML

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT (Extensible Stylesheet Language Transformation) stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and close retrieve multiple objects.
Using DBMS_METADATA

- For use in SQL queries and for browsing: `GET_XML` and `GET_DDL` return metadata for a single named object. The `GET_DEPENDENT_XML`, `GET_DEPENDENT_DDL`, `GET_GRANTED_XML`, and `GET_GRANTED_DDL` interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

**Submitting XML**

If you are submitting XML, you specify:
- The type of object
- Optional transform parameters to modify the object (for example, changing the object’s owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interfaces for submission of XML. It is comprised of the following procedures: `OPENW`, `ADD_TRANSFORM`, `SET_TRANSFORM_PARAM`, `SET_REMAP_PARAM`, `SET_PARSE_ITEM`, `CONVERT`, `PUT`, and `CLOSE`.

**Security Model**

The object views of the Oracle metadata model implement security as follows:
- Nonprivileged users can see the metadata of only their own objects.
- `SYS` and users with `SELECT_CATALOG_ROLE` can see all objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else’s schema, they will be able to retrieve the grant specification through the Metadata API, but not the object’s actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can
only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker’s possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.

**Types**

The following types, used by the DBMS_METADATA package, are defined in the SYS schema.

```sql
CREATE TYPE sys.ku$_parsed_item AS OBJECT ( item VARCHAR2(30),
value VARCHAR2(4000),
object_row NUMBER ) /

CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item /

CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT ( ddlText CLOB,
parsedItem sys.ku$_parsed_items ) /

CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl /

CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT ( object_row NUMBER,
    ddls sys.ku$_ddls ) /

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl; /
```
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (
    errorNumber NUMBER,
    errorText VARCHAR2(2000)
) /

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine /
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (
    ddl sys.ku$_ddl,
    errorLines sys.ku$_ErrorLines
);

CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult /
CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;

### Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS_METADATA package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX_SHARED_SERVERS initialization parameter.
Organization of Subprograms

The `DBMS_METADATA` subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- **Table 50–3** provides a summary of `DBMS_METADATA` subprograms used to retrieve multiple objects from a database.
- **Table 50–2** provides a summary of `DBMS_METADATA` subprograms used to submit XML metadata to a database.

**Subprograms for Retrieval of Multiple Objects from the Database**

---

**50-8**  PL/SQL Packages and Types Reference
ADD_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that `FETCH.xxx` applies to the XML representation of the retrieved objects.

- When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

**See Also:** For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database
- Subprograms for Submission of XML to the Database

**Syntax**

```
DBMS_METADATA.ADD_TRANSFORM (  
    handle IN NUMBER,  
    name IN VARCHAR2,  
    encoding IN VARCHAR2 DEFAULT NULL,  
    object_type IN VARCHAR2 DEFAULT NULL)  
RETURN NUMBER;
```

**Parameters**

<table>

<tbody>
<tr>
<td>handle</td>
<td>The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata.</td>
</tr>
</tbody>
</table>
ADD_TRANSFORM Function

**Table 50–4 (Cont.) ADD_TRANSFORM Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See <em>Oracle XML DB Developer’s Guide</em>. Otherwise, name designates a transform implemented by this project. The following transforms are defined:</td>
</tr>
<tr>
<td></td>
<td>- DDL - the document is transformed to DDL that creates the object. The output of this transform is <em>not</em> an XML document.</td>
</tr>
<tr>
<td></td>
<td>- MODIFY - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.</td>
</tr>
<tr>
<td>encoding</td>
<td>The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left NULL and the URL is external to the database, UTF-8 encoding is assumed. If left NULL and the URL is internal to the database (that is, it begins with /oradb/), then the encoding is assumed to be the database character set.</td>
</tr>
</tbody>
</table>
Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify an XSLT stylesheet to transform the returned documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were added.

Table 50–4 (Cont.) ADD_TRANSFORM Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</td>
</tr>
</tbody>
</table>

1. When you use ADD_TRANSFORM to retrieve objects, the following definition of object_type applies:

- Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.)
- By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur:
  - if object_type is omitted, the transform applies to all object types within the heterogeneous collection
  - if object_type is specified, the transform only applies to that specific object type within the collection
- If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.

2. When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, this caller should leave this parameter NULL.
ADD_TRANSFORM Function

The output of the first transform being used as input to the second, and so on.

- The output of the DDL transform is not an XML document. Therefore, no transform should be added after the DDL transform.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.

- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:
  - encoding is specified even though name is not a URL
  - object_type is not part of the collection designated by handle
CLOSE Procedure

This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

**See Also:** For more information about related subprograms:

- Subprograms for Retrieval of Multiple Objects from the Database
- Subprograms for Submission of XML to the Database

**Syntax**

```sql
DBMS_METADATA.CLOSE (
  handle  IN NUMBER);
```

**Parameters**

**Table 50–5  CLOSE Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN (or OPENW).</td>
</tr>
</tbody>
</table>

**Usage Notes**

**Note:** The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH_xxx returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH_xxx call to free resources held by the handle.

**Exceptions**

- INVALID_ARGVAL. The value for the handle parameter is NULL or invalid.
CONVERT Function

This function transforms an input XML document into creation DDL.

**See Also:** For more information about related subprograms:
- Subprograms for Submission of XML to the Database

**Syntax**

```
DBMS_METADATA.CONVERT (
  handle  IN NUMBER,
  document IN sys.XMLType)
RETURN sys.ku$_.multi_ddls;
```

```
DBMS_METADATA.CONVERT (
  handle  IN NUMBER,
  document IN CLOB)
RETURN sys.ku$_.multi_ddls;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPENW.</td>
</tr>
<tr>
<td>document</td>
<td>The XML document containing object metadata of the type of the OPENW handle.</td>
</tr>
</tbody>
</table>

**Return Values**

DDL to create the object(s).

**Usage Notes**

You can think of CONVERT as the second half of FETCH_xxx. The difference is that FETCH_xxx gets its XML document from the database, but CONVERT gets its XML document from the caller. The transforms specified with ADD_TRANSFORM are applied in turn, and the result is returned to the caller in a sys.ku$_.multi_ddls nested table. The DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column.

---

50-14  PL/SQL Packages and Types Reference
The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the current database compatibility level.

Exceptions

- **INVALID_ARGVAL**: A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INCONSISTENT_OPERATION**: The DDL transform was not specified.

- **INCOMPATIBLE_DOCUMENT**: The version of the XML document is not compatible with this version of the software.
FETCH_xxx Functions

These functions return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. See "Usage Notes" on page 50-17 for the variants.

See Also: For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database

Syntax

```sql
DBMS_METADATA.FETCH_XML (handle  IN NUMBER) RETURN sys.XMLType;
```

See Also: Oracle XML DB Developer’s Guide for a description of XMLType

```sql
DBMS_METADATA.FETCH_DDL (handle  IN NUMBER) RETURN sys.ku$_ddis;
```

```sql
DBMS_METADATA.FETCH_CLOB (handle  IN NUMBER) RETURN CLOB;
```

The FETCH procedures are as follows:

```sql
DBMS_METADATA.FETCH_CLOB (handle  IN NUMBER, doc IN OUT NOCOPY CLOB);
```

```sql
DBMS_METADATA.FETCH_XML_CLOB (handle  IN NUMBER, doc IN OUT NOCOPY CLOB, parsed_items OUT sys.ku$_parsed_items, object_type_path OUT VARCHAR2);
```
Summary of DBMS_METADATA Subprograms

Parameters

**Table 50–7  FETCH_xxx Function Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN.</td>
</tr>
<tr>
<td>doc</td>
<td>The metadata for the objects, or NULL if all objects have been returned.</td>
</tr>
<tr>
<td>parsed_items</td>
<td>A nested table containing the items specified by SET_PARSE_ITEM. If SET_PARSE_ITEM was not called, a NULL is returned.</td>
</tr>
<tr>
<td>object_type_path</td>
<td>For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to FETCH_xxx. If handle designates a homogeneous object type, a NULL is returned.</td>
</tr>
</tbody>
</table>

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to OPEN that returned the handle, and subsequent calls to SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. Each call to FETCH_xxx returns the number of objects specified by SET_COUNT (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to FETCH_xxx return NULL and cause the stream created by OPEN to be transparently closed.

There are several different FETCH_xxx functions and procedures:

- The FETCH_XML function returns the XML metadata for an object as an XMLType. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The FETCH_DDL function returns the DDL (to create the object) in a sys.ku$_ddls nested table. It assumes that the DDL transform has been specified. Each row of the sys.ku$_ddls nested table contains a single DDL statement in the ddlText column; if requested, parsed items for the DDL statement will be returned in the parsedItems column. Multiple DDL statements may be returned under the following circumstances:
- When you call `SET_COUNT` to specify a count greater than 1
- When an object is transformed into multiple DDL statements. For example, a `TYPE` object that has a DDL transform applied to it can be transformed into both `CREATE TYPE` and `CREATE TYPE BODY` statements. A `TABLE` object can be transformed into a `CREATE TABLE`, and one or more `ALTER TABLE` statements.

The `FETCH_CLOB` function simply returns the object, transformed or not, as a CLOB.

The `FETCH_CLOB` procedure returns the objects by reference in an `IN OUT NOCOPY` parameter. This is faster than the function variant, which returns LOBs by value.

The `FETCH_XML_CLOB` procedure returns the XML metadata for the objects as a CLOB in an `IN OUT NOCOPY` parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

All LOBs returned by `FETCH_xxx` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.

If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object's metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_ddls` nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:

- `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
- `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
- `object-row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_xxx`, (because `SET_COUNT` specified a count greater than 1) then `object_row`=1 for all items for the first object, 2 for the second, and so on.

The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.
In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be NULL.

If SET_PARSE_ITEM was not called, NULL is returned as the value of the parsed items nested table.

It is expected that the same variant of FETCH_xxx will be called for all objects selected by OPEN. That is, programs will not intermix calls to FETCH_XML, FETCH_DDL, FETCH_CLOB, and so on using the same OPEN handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.

Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the FETCH_xxx calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. Either FETCH_XML was called when the DDL transform had been specified, or FETCH_DDL was called when the DDL transform had not been specified.
The GET_xxx Functions

The following GET_xxx functions let you fetch metadata for objects with a single call:

- GET_XML
- GET_DDL
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also: For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database

Syntax

```
DBMS_METADATA.GET_XML (object_type IN VARCHAR2,
                         name      IN VARCHAR2 DEFAULT NULL,
                         schema    IN VARCHAR2 DEFAULT NULL,
                         version   IN VARCHAR2 DEFAULT 'COMPATIBLE',
                         model     IN VARCHAR2 DEFAULT 'ORACLE',
                         transform IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA.GET_DDL  (object_type IN VARCHAR2,
                         name      IN VARCHAR2 DEFAULT NULL,
                         schema    IN VARCHAR2 DEFAULT NULL,
                         version   IN VARCHAR2 DEFAULT 'COMPATIBLE',
                         model     IN VARCHAR2 DEFAULT 'ORACLE',
                         transform IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (object_type IN VARCHAR2,
                                  base_object_name IN VARCHAR2,
                                  base_object_schema IN VARCHAR2 DEFAULT NULL,
                                  base_object_version IN VARCHAR2 DEFAULT NULL,
                                  base_object_model    IN VARCHAR2 DEFAULT 'ORACLE',
                                  base_object_transform IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.</td>
</tr>
</tbody>
</table>
The GET_xxx Functions

Table 50–8 (Cont.) GET_xxx Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See Table 50–17 for a list of filters.</td>
</tr>
<tr>
<td>schema</td>
<td>The object schema. It is used internally in a SCHEMA filter. The default is the current user.</td>
</tr>
<tr>
<td>version</td>
<td>The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.</td>
</tr>
<tr>
<td>model</td>
<td>The object model to use. This parameter takes the same values as the OPEN model parameter.</td>
</tr>
<tr>
<td>transform</td>
<td>The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.</td>
</tr>
<tr>
<td>base_object_name</td>
<td>The base object name. It is used internally in a BASE_OBJECT_NAME filter.</td>
</tr>
<tr>
<td>base_object_schema</td>
<td>The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.</td>
</tr>
<tr>
<td>grantee</td>
<td>The grantee. It is used internally in a GRANTEE filter. The default is the current user.</td>
</tr>
<tr>
<td>object_count</td>
<td>The maximum number of objects to return. See SET_COUNT Procedure on page 50-39.</td>
</tr>
</tbody>
</table>

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML or DDL.
  - GET_xxx is used to fetch named objects, especially schema objects (tables, views). They can also be used with nameless objects, such as RESOURCE_COST.
  - GET_DEPENDENT_xxx is used to fetch dependent objects (audits, object grants).
– GET_GRANTED_xxx is used to fetch granted objects (system grants, role

For some object types you can use more than one function. For example, you
can use GET_xxx to fetch an index by name, or GET_DEPENDENT_xxx to fetch
the same index by specifying the table on which it is defined.

GET_xxx only returns a single named object.

For GET_DEPENDENT_xxx and GET_GRANTED_xxx, an arbitrary number of
dependent or granted objects can match the input criteria. You can specify an
object count when fetching these objects. (The default count of 10000 should be
adequate in most cases.)

If the DDL transform is specified, session-level transform parameters are
inherited.

If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0
and set LONG to some large number to get complete, uninterrupted output.

Exceptions

• INVALID_ARGVAL. A NULL or invalid value was supplied for an input
parameter. The error message text identifies the parameter.

• OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP
To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to
some large number, as shown, before executing your query.

SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE','EMP','SCOTT')
FROM DUAL;

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter
Out Nested Tables and Overflow Segments
This example fetches the DDL for all "complete" tables in the current schema,
filtering out nested tables and overflow segments. The example uses SET_
TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_
TRANSFORM meaning "for the current session") to specify that storage clauses are
The GET_xxx Functions

not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupt output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM,'STORAGE',false);
SELECT DBMS_METADATA.GETDDL('TABLE',u.table_name)
    FROM USER_ALL_TABLES u
    WHERE u.nested='NO'
    AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM,'DEFAULT');
```

**Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES**

```
SELECT DBMS_METADATA.GET_DEPENDENTDDL('OBJECT_GRANT','EMPLOYEES','HR') FROM DUAL;
```

**Example: Fetch the DDL For All System Grants Granted To SCOTT**

```
SELECT DBMS_METADATA.GET_GRANTEDDDL('SYSTEM_GRANT','SCOTT') FROM DUAL;
```
GET_QUERY Procedure

This procedure returns the text of the queries that are used by FETCH_xxx. This function assists in debugging.

**See Also:** For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database

**Syntax**

```sql
DBMS_METADATA.GET_QUERY (  
    handle IN NUMBER)
RETURN VARCHAR2;
```

**Parameters**

**Table 50–9 GET_QUERY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN. It cannot be the handle for a heterogeneous object type.</td>
</tr>
</tbody>
</table>

**Return Values**

The text of the queries that will be used by FETCH_xxx.

**Exceptions**

- *INVALID_ARGVAL*. A NULL or invalid value was supplied for the handle parameter.
OPEN Procedure

This procedure specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

**See Also:** For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database

**Syntax**

```sql
DBMS_METADATA.OPEN (  
  object_type  IN VARCHAR2,  
  version      IN VARCHAR2 DEFAULT 'COMPATIBLE',  
  model        IN VARCHAR2 DEFAULT 'ORACLE',  
  network_link IN VARCHAR2 DEFAULT NULL)  
RETURN NUMBER;
```
Parameters

Table 50–10  Open Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| object_type    | The type of object to be retrieved. Table 50–11 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see model in this table). The Attributes column in Table 50–11 specifies some object type attributes:  
  - Schema objects, such as tables, belong to schemas.  
  - Named objects have unique names (if they are schema objects, the name is unique to the schema).  
  - Dependent objects, such as indexes, are defined with reference to a base schema object.  
  - Granted objects are granted or assigned to a user or role and therefore have a named grantee.  
  - Heterogeneous object types denote a collection of related objects of different types. See Table 50–12 for a listing of object types returned for the heterogeneous object type. These attributes are relevant when choosing object selection criteria. See “SET_FILTER Procedure” on page 50-41 for more information. |
| version        | The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:  
  - COMPATIBLE (default)—the version of the metadata corresponds to the database compatibility level.  
  - LATEST—the version of the metadata corresponds to the database version.  
  - A specific database version, for example, 9.2.0. As of Oracle Database 10g, this value cannot be lower than 9.2.0. |
| model          | Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported as of Oracle Database 10g. |
| network_link   | Reserved.                                                                                                                                 |

Table 50–11 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema
object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

</tbody>
</table>
Return Values

An opaque handle to the class of objects. This handle is used as input to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, `GET_QUERY`, `SET_PARSE_ITEM`, `FETCH_xxx`, and `CLOSE`.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The version or model parameter was not valid for the object_type.

</table>
**OPENW Procedure**

This procedure specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

**See Also:** For more information about related subprograms:
- Subprograms for Submission of XML to the Database

**Syntax**

```sql
DBMS_METADATA.OPENW
(object_type  IN VARCHAR2,
version       IN VARCHAR2 DEFAULT 'COMPATIBLE',
model         IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The type of object to be submitted. Valid types names and their meanings are listed in Table 50–11. The type cannot be a heterogeneous object type.</td>
</tr>
<tr>
<td>version</td>
<td>The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows:</td>
</tr>
<tr>
<td></td>
<td>- COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>- LATEST - The version of the DDL corresponds to the database version.</td>
</tr>
<tr>
<td></td>
<td>- A specific database version. As of Oracle Database 10g, this value cannot be lower than 9.2.0.</td>
</tr>
<tr>
<td>model</td>
<td>Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.</td>
</tr>
</tbody>
</table>

**Return Values**

An opaque handle to write context. This handle is used as input to the ADD_TRANSFORM, CONVERT, PUT, and CLOSE procedures.
Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INVALID_OBJECT_PARAM.** The model parameter was not valid for the object_type.
PUT Function

This function submits an XML document containing object metadata to the database to create the objects.

See Also: For more information about related subprograms:
- Subprograms for Submission of XML to the Database

Syntax

DBMS_METADATA.PUT (  
  handle  IN NUMBER,  
  document IN sys.XMLType,  
  flags IN NUMBER,  
  results IN OUT NOCOPY sys.ku$SubmitResults)  
RETURN BOOLEAN;

DBMS_METADATA.PUT (  
  handle  IN NUMBER,  
  document IN CLOB,  
  flags IN NUMBER,  
  results IN OUT NOCOPY sys.ku$SubmitResults)  
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPENW.</td>
</tr>
<tr>
<td>document</td>
<td>The XML document containing object metadata for the type of the OPENW handle.</td>
</tr>
<tr>
<td>flags</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>results</td>
<td>Detailed results of the operation.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.
PUT Function

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the `sys.ku$_SubmitResults` nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the current database compatibility level.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. The DDL transform was not specified.
- INCOMPATIBLE_DOCUMENT. The version of the XML document is not compatible with this version of the software.
**SET_COUNT Procedure**

This procedure specifies the maximum number of objects to be retrieved in a single `FETCH_xxx` call. By default, each call to `FETCH_xxx` returns one object. You can use the `SET_COUNT` procedure to override this default. If `FETCH_xxx` is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single `FETCH_xxx` operation only returns objects of a single object type.

**See Also:** For more information about related subprograms:

- Subprograms for Retrieval of Multiple Objects from the Database

**Syntax**

```sql
DBMS_METADATA.SET_COUNT (  
  handle           IN NUMBER,  
  value            IN NUMBER,  
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN.</td>
</tr>
<tr>
<td>value</td>
<td>The maximum number of objects to retrieve.</td>
</tr>
<tr>
<td>object_type_path</td>
<td>A path name designating the object types to which the count value applies.</td>
</tr>
</tbody>
</table>

By default, the count value applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following:

- if `object_type_path` is omitted, the count applies to all object types within the heterogeneous collection
- if `object_type_path` is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection
Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INVALID_OPERATION.** SET_COUNT was called after the first call to FETCH_*** for the OPEN context. After the first call to FETCH_*** is made, no further calls to SET_COUNT for the current OPEN context are permitted.

- **INCONSISTENT_ARGS.** object_type parameter is not consistent with handle.
SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

**See Also:** For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database

Syntax

```sql
DBMS_METADATA.SET_FILTER (
  handle IN NUMBER,
  name IN VARCHAR2,
  value IN VARCHAR2,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_METADATA.SET_FILTER (
  handle IN NUMBER,
  name IN VARCHAR2,
  value IN BOOLEAN DEFAULT TRUE,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_METADATA.SET_FILTER (
  handle IN NUMBER,
  name IN VARCHAR2,
  value IN NUMBER,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN.</td>
</tr>
</tbody>
</table>
The name of the filter. For each filter, Table 50–17 lists the object_type it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any).

The Datatype column of Table 50–17 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (not a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXP filter in PL/SQL is as follows:

'IN (''DEPT'',''EMP'')'

The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The value of the filter. Text, Boolean, and Numeric filters are supported.</td>
</tr>
<tr>
<td>object_type_path</td>
<td>A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 50–18 for a listing of some of the values for this parameter.</td>
</tr>
</tbody>
</table>
Table 50–17 describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Datatype</th>

### Table 50–17  (Cont.) SET_FILTER: Filters

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Datatype</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_EXPORT</td>
<td>NAME_EXPR</td>
<td>text expression</td>
<td>The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>BEGIN_WITH</td>
<td>text</td>
<td>The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>BEGIN_AFTER</td>
<td>text</td>
<td>The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>END_BEFORE</td>
<td>text</td>
<td>The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>END_WITH</td>
<td>text</td>
<td>The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR</td>
<td>text expression</td>
<td>For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 50–18 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.</td>
</tr>
</tbody>
</table>
Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

  ```
  SET_FILTER(handle,'SCHEMA','SCOTT');
  SET_FILTER(handle,'NAME','EMP');
  ```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

  ```
  SET_FILTER(handle,'NAME_EXPR','>='"FELIX"');
  SET_FILTER(handle,'NAME_EXPR','<='"OSCAR"');
  ```

- With SET_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has SELECT_CATALOG_ROLE, then any object can be retrieved; otherwise, only the following can be retrieved:

  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA_EXPORT where the name is the current user
  - TABLE_EXPORT where SCHEMA is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as SELECT_CATALOG_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.
For heterogeneous object types, the `BEGIN_WITH` and `BEGIN_AFTER` filters allow restart on an object type boundary. Appropriate filter values are returned by the `FETCH_XML_CLOB` procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for `SCHEMA_EXPORT` the `NAME` filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a `NAME_EXPR` filter explicitly for the `TABLE` object type path. Table 50–18 lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (See Table 50–17 for filters defined for each path name.) These path names are valid in the `INCLUDE_PATH_EXPR` and `EXCLUDE_PATH_EXPR` filters. Path names marked with an asterisk (*) are only valid in those filters; they cannot be used as values of the `SET_FILTER object_type_path` parameter.

### Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INVALID_OPERATION.** SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.

- **INCONSISTENT_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
  - filter name not valid for the object type associated with the OPEN context
  - filter name not valid for the object_type_path
  - object_type_path not part of the collection designated by handle
  - filter value is the wrong datatype

---

SET_PARSE_ITEM Procedure

This procedure enables output parsing and specifies an object attribute to be parsed and returned.

**See Also:** For more information about related subprograms:
- Subprograms for Retrieval of Multiple Objects from the Database
- Subprograms for Submission of XML to the Database

**Syntax**

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```sql
DBMS_METADATA.SET_PARSE_ITEM (  
    handle      IN NUMBER,  
    name        IN VARCHAR2,  
    object_type IN VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```sql
DBMS_METADATA.SET_PARSE_ITEM (  
    handle     IN NUMBER,  
    name        IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN (or OPENW).</td>
</tr>
<tr>
<td>name</td>
<td>The name of the object attribute to be parsed and returned. See Table 50–20 for the attribute object type, name, and meaning.</td>
</tr>
</tbody>
</table>
Table 50–20 describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Table 50–20  SET_PARSE_ITEM: Parse Items

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>All objects</td>
<td>VERB</td>
<td>If FETCH_XML_CLOB is called, no value is returned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If FETCH_DDL is called, then for every row in the sys.ku$_ddls nested table returned by FETCH_DDL the verb in the corresponding ddlText is returned. If the ddlText is a SQL DDL statement, then the SQL verb (for example, CREATE, GRANT, AUDIT) is returned. If the ddlText is a procedure call (for example, DBMS_AQADM.CREATE_QUEUE_TABLE()) then the package.procedure-name is returned.</td>
</tr>
<tr>
<td>All objects</td>
<td>OBJECT_TYPE</td>
<td>If FETCH_XML_CLOB is called, an object type name from Table 50–11 is returned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If FETCH_DDL is called and the ddlText is a SQL DDL statement whose verb is CREATE or ALTER, the object type as used in the DDL statement is returned (for example, TABLE, PACKAGE_BODY, and so on). Otherwise, an object type name from Table 50–11 is returned.</td>
</tr>
<tr>
<td>Schema objects</td>
<td>SCHEMA</td>
<td>The object schema is returned. If the object is not a schema object, no value is returned.</td>
</tr>
<tr>
<td>Named objects</td>
<td>NAME</td>
<td>The object name is returned. If the object is not a named object, no value is returned.</td>
</tr>
</tbody>
</table>
Summary of DBMS_METADATA Subprograms

**Table 50–20 (Cont.) SET_PARSE_ITEM: Parse Items**

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE, TABLE_DATA, INDEX</td>
<td>TABLESPACE</td>
<td>The name of the object’s tablespace or, if the object is a partitioned table, the default tablespace is returned. For a TABLE_DATA object, this is always the tablespace where the rows are stored.</td>
</tr>
<tr>
<td>TRIGGER</td>
<td>ENABLE</td>
<td>If the trigger is enabled, ENABLE is returned. If the trigger is disabled, DISABLE is returned.</td>
</tr>
<tr>
<td>OBJECT_GRANT, TABLESPACE_QUOTA</td>
<td>GRANTOR</td>
<td>The grantor is returned.</td>
</tr>
<tr>
<td>Dependent objects (including domain index secondary tables)</td>
<td>BASE_OBJECT_NAME</td>
<td>The name of the base object is returned. If the object is not a dependent object, no value is returned.</td>
</tr>
<tr>
<td>Dependent objects (including domain index secondary tables)</td>
<td>BASE_OBJECT_SCHEMA</td>
<td>The schema of the base object is returned. If the object is not a dependent object, no value is returned.</td>
</tr>
<tr>
<td>Dependent objects (including domain index secondary tables)</td>
<td>BASE_OBJECT_TYPE</td>
<td>The object type of the base object is returned. If the object is not a dependent object, no value is returned.</td>
</tr>
<tr>
<td>Granted objects</td>
<td>GRANTEE</td>
<td>The grantee is returned. If the object is not a granted object, no value is returned.</td>
</tr>
</tbody>
</table>

**Usage Notes**

These notes apply when using SET_PARSE_ITEM to retrieve objects.

By default, the FETCH_xxx routines return an object’s metadata as XML or creation DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.
You can call `SET_PARSE_ITEM` multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For `TABLE_DATA` objects, the following parse item return values are of interest:

<table>
<thead>
<tr>
<th>If Object Is</th>
<th>NAME, SCHEMA</th>
<th>BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA</th>
</tr>
</thead>
<tbody>
<tr>
<td>nonpartitioned table</td>
<td>table name, schema</td>
<td>table name, schema</td>
</tr>
<tr>
<td>table partition</td>
<td>partition name, schema</td>
<td>table name, schema</td>
</tr>
<tr>
<td>nested table</td>
<td>storage table name, schema</td>
<td>name and schema of top-level table (not the parent nested table)</td>
</tr>
</tbody>
</table>

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the `BASE_OBJECT_NAME`, `BASE_OBJECT_SCHEMA` and `BASE_OBJECT_TYPE` parse items for secondary `TABLE` objects return the name, schema, and type of the domain index.

**See Also:**
- "FETCH_xxx Functions" on page 50-16
- Oracle Database Utilities for information about using the Metadata API

By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

**Exceptions**
- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION.** `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the OPEN context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- **INCONSISTENT_ARGS.** The attribute name is not valid for the object type associated with the OPEN context.
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

SET_TRANSFORM_PARAM and SET_REMAP_PARAM specify parameters to the XSLT stylesheet identified by transform_handle. Use them to modify or customize the output of the transform.

See Also: For more information about related subprograms:

- Subprograms for Retrieval of Multiple Objects from the Database
- Subprograms for Submission of XML to the Database

Syntax

```oracle
DBMS_METADATA.SET_TRANSFORM_PARAM (  
  transform_handle  IN NUMBER,  
  name              IN VARCHAR2,  
  value             IN VARCHAR2,  
  object_type       IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (  
  transform_handle  IN NUMBER,  
  name              IN VARCHAR2,  
  value             IN BOOLEAN DEFAULT TRUE),  
  object_type       IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (  
  transform_handle   IN NUMBER,  
  name               IN VARCHAR2,  
  value              IN NUMBER,  
  object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_REMAP_PARAM (  
  transform_handle   IN NUMBER,  
  name               IN VARCHAR2,  
  old_value          IN VARCHAR2,  
  new_value          IN VARCHAR2,  
  object_type        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 50–21 describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.
### Table 50–21  
**SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>transform_handle</td>
<td>Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session. Note that the handle returned by OPEN is not a valid transform handle. For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>The name of the parameter. Table 50–22 lists the transform parameters defined for the DDL transform, specifying the object_type it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive. Table 50–23 describes the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure. Table 50–24 describes the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>The value of the transform. This parameter is valid only for SET_TRANSFORM_PARAM.</td>
<td></td>
</tr>
<tr>
<td>old_value</td>
<td>The old value for the remapping. This parameter is valid only for SET_REMAP_PARAM.</td>
<td></td>
</tr>
<tr>
<td>new_value</td>
<td>The new value for the remapping. This parameter is valid only for SET_REMAP_PARAM.</td>
<td></td>
</tr>
</tbody>
</table>
| object_type    | Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply:  
  - If object_type is omitted, the parameter applies to all applicable object types within the heterogeneous collection.  
  - If object_type is specified, the parameter only applies to that object type.  
  This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection. |  |
Table 50–22 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the SET_TRANSFORM_PARAM procedure.

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Datatype</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>All objects</td>
<td>PRETTY</td>
<td>Boolean</td>
<td>If TRUE, format the output with indentation and line feeds. Defaults to TRUE.</td>
</tr>
<tr>
<td>All objects</td>
<td>SQLTERMINATOR</td>
<td>Boolean</td>
<td>If TRUE, append a SQL terminator ( ; or / ) to each DDL statement. Defaults to FALSE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>SEGMENT_ATTRIBUTES</td>
<td>Boolean</td>
<td>If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>STORAGE</td>
<td>Boolean</td>
<td>If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>TABLESPACE</td>
<td>Boolean</td>
<td>If TRUE, emit tablespace. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>CONSTRAINTS</td>
<td>Boolean</td>
<td>If TRUE, emit all non-referential table constraints. Defaults to TRUE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>REF_CONSTRAINTS</td>
<td>Boolean</td>
<td>If TRUE, emit all referential constraints (foreign keys). Defaults to TRUE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>CONSTRAINTS_AS_ALTER</td>
<td>Boolean</td>
<td>If TRUE, emit table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>OID</td>
<td>Boolean</td>
<td>If TRUE, emit the OID clause for object tables. Defaults to FALSE.</td>
</tr>
<tr>
<td>TABLE</td>
<td>SIZE_BYTE_KEYWORD</td>
<td>Boolean</td>
<td>If TRUE, emit the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.</td>
</tr>
<tr>
<td>INDEX</td>
<td>SEGMENT_ATTRIBUTES</td>
<td>Boolean</td>
<td>If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Table 50–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Datatype</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIBRARY, TABLESPACE, DIRECTORY</td>
<td>REMAP_DATAFILE</td>
<td>Text</td>
<td>Objects in the document will have their filespecs renamed as follows: any filespec matching old_value will be changed to new_value. Filespecs should not be enclosed in quotes. This parameter is additive. By default, filespecs are not renamed.</td>
</tr>
<tr>
<td>Schema Objects, Dependent Objects, Granted Objects, USER</td>
<td>REMAP_SCHEMA</td>
<td>Text</td>
<td>Any schema object in the document whose name matches old_value will have its schema name changed to new_value. Any dependent object whose base object schema name matches old_value will have its base object schema name changed to new_value. Any granted object whose grantee name matches old_value will have its grantee name changed to new_value. Any user whose name matches old_value will have its name changed to new_value. This parameter is additive. By default, schemas are not remapped.</td>
</tr>
<tr>
<td>TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK SEGMENT, MATERIALIZED VIEW, MATERIALIZED VIEW_LOG, TABLESPACE QUOTA</td>
<td>REMAP_TABLESPACE</td>
<td>Text</td>
<td>Objects in the document will have their tablespaces renamed as follows: any tablespace name matching old_value will be changed to new_value. This parameter is additive. By default, tablespaces are not remapped.</td>
</tr>
</tbody>
</table>
Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INVALID_OPERATION.** Either `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` was called after the first call to `FETCH_xxx` for the OPEN context. After the first call to `FETCH_xxx` is made, no further calls to `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` are permitted.

- **INCONSISTENT_ARGS.** The arguments are inconsistent. This can mean the following:
  - The transform parameter name is not valid for the object type associated with the OPEN context or for the transform associated with the transform handle.
  - The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',false);
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the MODIFY transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',5);
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces TBS1 and TBS3 are changed to TBS2 and TBS4, respectively.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS3','TBS4');
```
The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS2','TBS3');
```

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM` using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` inherit these parameters when they invoke the DDL transform.

**Note:** The enumerated constant must be prefixed with the package name `DBMS_METADATA.SESSION_TRANSFORM`. 
DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

---

**Note:** You must run the `catmgw.sql` script to load the Messaging Gateway packages and types into the database.

---

</tbody>
</table>
Types

- SYS.MGW_PROPERTY Type
- SYS.MGW_PROPERTIES Type
- SYS.MGW_MQSERIES_PROPERTIES Type
- SYS.MGW_TIBRV_PROPERTIES Type

SYS.MGW_PROPERTY Type

This type specifies a named property. SYS.MGW_PROPERTY is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

TYPE SYS.MGW_PROPERTY IS OBJECT(
   name VARCHAR2(100),
   value VARCHAR2(1000),

   -- Methods
   STATIC FUNCTION CONSTRUCT
   RETURN SYS.MGW_PROPERTY,

   STATIC FUNCTION CONSTRUCT(
      p_name IN VARCHAR2,
      p_value IN VARCHAR2)
   RETURN SYS.MGW_PROPERTY );

Attributes

Table 51–10  SYS.MGW_PROPERTY Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Property name</td>
</tr>
<tr>
<td>value</td>
<td>Property value</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new MGW_PROPERTY instance. All attributes are assigned a value of NULL.
CONSTRUCT Method, Initialized With Given Parameters

This method constructs a new MGWPROPERTY instance initialized using the given parameters.

Syntax

```
STATIC FUNCTION CONSTRUCT(  
    p_name   IN VARCHAR2,  
    p_value  IN VARCHAR2)  
RETURN SYS.MGW_PROPERTY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_name</td>
<td>Property name</td>
</tr>
<tr>
<td>p_value</td>
<td>Property value</td>
</tr>
</tbody>
</table>

SYS.MGW_PROPERTIES Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (100) OF SYS.MGW_PROPERTY;
```

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the MGWPROPS_prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- **Add or modify property**
  
  
  ```
  MGW_PROPERTY.NAME = property_name
  MGW_PROPERTY.VALUE = property_value
  ```

  If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- **Remove property**
  
  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
  MGW_PROPERTY.VALUE = name_of_property_to_remove
  ```

  No action is taken if the property name does not exist in the original list.

- **Remove all properties**
  
  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
  MGW_PROPERTY.VALUE = not used
  ```

The `DBMS_MGWADM` package defines constants to represent the reserved property names. See "WebSphere MQ System Properties" on page 51-12 for more information.

### SYS.MGW_MQSERIES_PROPERTIES Type

This type specifies basic properties for a WebSphere MQ messaging system link.

#### Syntax

```sql
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT {
  queue_manager VARCHAR2(64),
  hostname VARCHAR2(64),
  port INTEGER,
  channel VARCHAR2(64),
  interface_type INTEGER,
} 
```
max_connections     INTEGER,
username            VARCHAR2(64),
password            VARCHAR2(64),
inbound_log_queue   VARCHAR2(64),
outbound_log_queue  VARCHAR2(64),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_MQSERIES_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_MQSERIES_PROPERTIES );

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_manager</td>
<td>The name of the WebSphere MQ queue manager</td>
</tr>
<tr>
<td>hostname</td>
<td>The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.</td>
</tr>
<tr>
<td>port</td>
<td>The port number. This is used only for client connections; that is, when hostname is not NULL.</td>
</tr>
<tr>
<td>channel</td>
<td>The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.</td>
</tr>
<tr>
<td>interface_type</td>
<td>The type of messaging interface to use. Values:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used.</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.</td>
</tr>
<tr>
<td>max_connections</td>
<td>The maximum number of messaging connections to the WebSphere MQ messaging system</td>
</tr>
<tr>
<td>username</td>
<td>The username used for authentication to the WebSphere MQ messaging system</td>
</tr>
</tbody>
</table>
### CONSTRUCT Method

This method constructs a new `SYS.MGW_MQSERIES_PROPERTIES` instance. All attributes are assigned a value of `NULL`.

Table 51–12 (Cont.) `SYS.MGW_MQSERIES_PROPERTIES` Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>The password used for authentication to the WebSphere MQ messaging system</td>
</tr>
<tr>
<td>inbound_log_queue</td>
<td>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serves as a propagation source:</td>
</tr>
<tr>
<td></td>
<td>- For <code>MQSERIES_BASE_JAVA_INTERFACE</code>, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</td>
</tr>
<tr>
<td></td>
<td>- For <code>JMS_QUEUE_CONNECTION</code> interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</td>
</tr>
<tr>
<td></td>
<td>- For <code>JMS_TOPIC_CONNECTION</code> interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is <code>SYSTEM.JMS.D.SUBSCRIBER.QUEUE</code>.</td>
</tr>
<tr>
<td>outbound_log_queue</td>
<td>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:</td>
</tr>
<tr>
<td></td>
<td>- For <code>MQSERIES_BASE_JAVA_INTERFACE</code>, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</td>
</tr>
<tr>
<td></td>
<td>- For <code>JMS_QUEUE_CONNECTION</code> interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</td>
</tr>
<tr>
<td></td>
<td>- For <code>JMS_TOPIC_CONNECTION</code> interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is <code>SYSTEM.JMS.D.SUBSCRIBER.QUEUE</code>.</td>
</tr>
</tbody>
</table>
**Types**

**Syntax**
```sql
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_MQSERIES_PROPERTIES;
```

**ALTER_CONSTRUCT Method**
This method constructs a new `SYS.MGW_MQSERIES_PROPERTIES` instance for altering the properties of an existing messaging link. All attributes having a `VARCHAR2` data type are assigned a value of `DBMS_MGWADM.NO_CHANGE`. Attributes of other data types are assigned a value of `NULL`.

**Syntax**
```sql
STATIC FUNCTION ALTER_CONSTRUCT
RETURN SYS.MGW_MQSERIES_PROPERTIES;
```

**SYS.MGW_TIBRV_PROPERTIES Type**
A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

**Syntax**
```sql
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
    service   VARCHAR2(128),
    daemon    VARCHAR2(128),
    network   VARCHAR2(256),
    cm_name   VARCHAR2(256),
    cm_ledger VARCHAR2(256),

    -- Methods
    STATIC FUNCTION construct
    RETURN SYS.MGW_TIBRV_PROPERTIES,

    STATIC FUNCTION alter_construct
    RETURN SYS.MGW_TIBRV_PROPERTIES
);
```

CONSTRUCT Function

Constructs a new SYS.MGW_TIBRV_PROPERTIES instance. All attributes will be assigned a value of NULL.

Syntax

```sql
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_PROPERTIES;
```

ALTER_CONSTRUCT Function

Constructs a new SYS.MGW_TIBRV_PROPERTIES instance. This function is useful for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type will be assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types will be assigned a value of NULL.

Syntax

```sql
STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES;
```
Properties

- WebSphere MQ System Properties
- TIB/Rendezvous System Properties
- Optional Link Configuration Properties
- Optional Foreign Queue Configuration Properties
- Optional Subscriber Configuration Properties

WebSphere MQ System Properties

This section summarizes basic and optional properties of WebSphere MQ related to Messaging Gateway links, foreign queues, and subscribers.

See Also: Your WebSphere MQ (MQSeries) documentation for more information

Table 51–14 summarizes the basic configuration properties for a WebSphere MQ messaging link. The table indicates which properties of SYS.MGW_MQSERIES_PROPERTIES are optional (NULL allowed), which can be altered, and if alterable, which values can be dynamically changed.

See Also: "SYS.MGW_MQSERIES_PROPERTIES Type" on page 51-7

<table>
<thead>
<tr>
<th>Attribute</th>
<th>NULL Allowed?</th>
<th>Alter Value?</th>
<th>Dynamic?</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_manager</td>
<td>no</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>hostname</td>
<td>yes (1)</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>port</td>
<td>yes (1)</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>channel</td>
<td>yes (1)</td>
<td>no</td>
<td>no</td>
</tr>

<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>password</td>
<td>yes</td>
<td>yes</td>
<td>yes</td>
</tr>
</tbody>
</table>
Notes on Table 51–14

1. If hostname is NULL, then the port and channel must be NULL. If the hostname is not NULL, then the port and channel must be not NULL. If the hostname is NULL, then a WebSphere MQ bindings connection is used; otherwise a client connection is used.

2. If interface_type is NULL, then a default value of DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE is used.

3. If max_connections is NULL, then a default value of 1 is used.

4. Attribute inbound_log_queue can be NULL if the link is not used for inbound propagation. The log queue can be altered only when no inbound propagation subscriber references the link.

5. Attribute outbound_log_queue can be NULL if the link is not used for outbound propagation. The log queue can be altered only when no outbound propagation subscriber references the link.

Table 51–15 summarizes the optional configuration properties supported when a WebSphere MQ Base Java interface is used to access the WebSphere MQ messaging system. Table 51–16 summarizes the optional configuration properties supported when a WebSphere MQ JMS interface is used. Each table lists the property name, where that property applies, whether the property can be altered, and if alterable, whether the value can be dynamically changed. Only the properties listed in the tables are supported, and any extra properties will be ignored.

TIB/Rendezvous System Properties

This section summarizes basic and optional configuration properties of TIB/Rendezvous related to Messaging Gateway links, foreign queues and subscribers.

See Also: Your TIB/Rendezvous documentation for more information

Table 51–17 summarizes the basic configuration properties for a TIB/Rendezvous messaging link. It indicates which properties of SYS.MGW_TIBRV_PROPERTIES are optional (NULL allowed), which can be altered, and if alterable, which values can be dynamically changed.

See Also: "SYS.MGW_TIBRV_PROPERTIES Type" on page 51-10

<table>
<thead>
<tr>
<th>Attribute</th>
<th>NULL allowed?</th>
<th>Alter value?</th>
<th>Dynamic?</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>yes(1)</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>daemon</td>
<td>yes(1)</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>network</td>
<td>yes(1)</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>cm_name</td>
<td>yes(2)</td>
<td>no</td>
<td>no</td>
</tr>
<tr>
<td>cm_ledger</td>
<td>yes(2)</td>
<td>no</td>
<td>no</td>
</tr>
</tbody>
</table>

Notes on Table 51–17:
1. System default values will be used if service, daemon, or network are NULL.
2. The cm_name and cm_ledger attributes are reserved for future use when TIB/Rendezvous certified messages are supported. At present, a NULL must be specified for these parameters when a TIB/Rendezvous link is configured.

Table 51–18 summarizes the optional configuration properties supported when a TIB/Rendezvous messaging system is used. The table lists the property name, where that property applies, whether the property can be altered, and if alterable, whether the value can be dynamically changed. Only the properties listed in the table are supported, and any extra properties will be ignored.
Registering a TIB/Rendezvous subject
The `DBMS_MGWADM.register_foreign_queue` procedure is used to register a TIB/Rendezvous subject with the Messaging Gateway. The `provider_queue` parameter specifies a TIB/Rendezvous subject name. Wildcards are allowed in the subject name.

**Optional Link Configuration Properties**

This section describes optional link properties you can specify using the `options` parameter of `DBMS_MGWADM.create_msgsystem_link` and `DBMS_MGWADM.alter_msgsystem_link`. Each listing also indicates which messaging system might use that property.

<table>
<thead>
<tr>
<th>Property Name</th>

</tr>
</tbody>
</table>

**See Also:**
For more information on optional configuration properties:
- "Optional Link Configuration Properties" on page 51-16
- "Optional Foreign Queue Configuration Properties" on page 51-18
- "Optional Subscriber Configuration Properties" on page 51-19

**MQ_BrokerControlQueue**
Used by: WebSphere MQ JMS.

This property specifies the name of the broker control queue. It corresponds to WebSphere MQ JMS administration tool property `BROKERCONQ`. The default used by WebSphere MQ is `SYSTEM.BROKER.CONTROL.QUEUE`.

**MQ_BrokerPubQueue**
Used by: WebSphere MQ JMS
This property specifies the name of the broker publish queue. It corresponds to WebSphere MQ JMS administration tool property BROKER.PUBQ. The default used by WebSphere MQ is SYSTEM.BROKER.DEFAULT.STREAM.

**MQ_BrokerQueueManager**
Used by: WebSphere MQ JMS

This property specifies the name of the broker queue manager. It corresponds to WebSphere MQ administration tool property BROKER.QMGR. If not set, then no default will be used.

**MQ_BrokerVersion**
Used by: WebSphere MQ JMS

This property specifies the broker version number. It corresponds to WebSphere MQ JMS administration tool property BROKER.VER. The default used by WebSphere MQ is 0.

**MQ_ccsid**
Used by: WebSphere MQ Base Java and WebSphere MQ JMS

This property specifies the character set identifier to be used. This should be the integer value of the character set (for example, 819) rather than a descriptive string. If it is not set, then the WebSphere MQ default character set 819 is used.

**MQ_JmsDurSubQueue**
Used by: WebSphere MQ JMS

This property applies to WebSphere MQ JMS topic links only. The `SYS.MGW_MQSERIES_PROPERITES` attributes, `inbound_log_queue` and `outbound_log_queue`, specify the names of WebSphere MQ JMS topics used for propagation logging. This property specifies the name of the WebSphere MQ queue from which durable subscription messages are retrieved by the log topic subscribers. The default queue used by WebSphere MQ is `SYSTEM.JMS.D.SUBSCRIBER.QUEUE`.

**MQ_PubAckInterval**
Used by: WebSphere MQ JMS

This property specifies the interval, in number of messages, between publish requests that require acknowledgment from the broker. It corresponds to WebSphere MQ JMS administration tool property PUBACKINT. The default used by WebSphere MQ is 25.

**MQ_ReceiveExit**
Used by: WebSphere MQ Base Java and WebSphere MQ JMS
This property specifies the fully qualified Java classname of a class implementing the MQReceiveExit interface. This class must be in the CLASSPATH of the Messaging Gateway agent. There is no default.

**MQ_ReceiveExitInit**
Used by: WebSphere MQ JMS

Initialization string that is passed by WebSphere MQ JMS to the constructor of the class specified by MQ_ReceiveExit. Corresponds to WebSphere MQ JMS administration tool property REEXITINIT. There is no default.

**MQ_SecurityExit**
Used by: WebSphere MQ Base Java and WebSphere MQ JMS

This property specifies the fully qualified Java classname of a class implementing the MQSecurityExit interface. This class must be in the CLASSPATH of the Messaging Gateway agent. There is no default.

**MQ_SecurityExitInit**
Used by: WebSphere MQ JMS

Initialization string that is passed by WebSphere MQ JMS to the constructor of the class specified by MQ_SecurityExit. It corresponds to WebSphere MQ JMS administration tool property SEEXITINIT. There is no default.

**MQ_SendExit**
Used by: WebSphere MQ Base Java and WebSphere MQ JMS

This property specifies the fully qualified Java classname of a class implementing the MQSendExit interface. This class must be in the CLASSPATH of the Messaging Gateway agent. There is no default.

**MQ_SendExitInit**
Used by: WebSphere MQ JMS

Initialization string that is passed by WebSphere MQ JMS to the constructor of the class specified by MQ_SendExit. It corresponds to WebSphere MQ JMS administration tool property SSENDINIT. There is no default.

**Optional Foreign Queue Configuration Properties**
This section describes optional foreign queue properties that you can specify using the options parameter of DBMS_MGWADM.register_foreign_queue. Each listing also indicates which messaging system might use that property.
MQ_JmsDurSubQueue
Used by: WebSphere MQ JMS

A string representing the name of the WebSphere MQ queue from which durable subscription messages are retrieved by subscribers on this topic. It applies only to WebSphere MQ JMS topics. The default queue used by WebSphere MQ is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.

MQ_JmsTargetClient
Used by: WebSphere MQ JMS

Supported values are TRUE and FALSE. This property is only used for outbound propagation to a JMS queue or topic. TRUE indicates that WebSphere MQ should store the message as a JMS message. FALSE indicates that WebSphere MQ should store the message in non-JMS format so that non-JMS applications can access it. Default is TRUE.

MQ_openOptions
Used by: WebSphere MQ Base Java

This property specifies the value used for the openOptions argument of the WebSphere MQ Base Java MQQueueManager.accessQueue method. No value is required. But if one is given, then the Messaging Gateway agent adds MQOO_OUTPUT to the specified value for an enqueue (put) operation. MQOO_INPUT_SHARED is added for a dequeue (get) operation. The default is MQOO_OUTPUT for an enqueue/put operation; MQOO_INPUT_SHARED for a dequeue/get operation.

Optional Subscriber Configuration Properties

This section describes optional subscriber properties that you can specify using the options parameter of DBMS_MGWADM.add_subscriber and DBMS_MGWADM.alter_subscriber. Each listing also indicates which messaging system might use that property.

AQ_MsgProperties
Used by: TIB/Rendezvous

This property specifies how Oracle Streams AQ message properties will be used during message propagation. Supported values are TRUE and FALSE. The default value is FALSE.

For an outbound propagation subscriber, if the value is TRUE (case insensitive), then the Messaging Gateway agent will add a field for most Oracle Streams AQ message properties to the message propagated to the TIB/Rendezvous subject.
For an inbound propagation subscriber, if the value is TRUE (case insensitive), then the Messaging Gateway agent will search the source message for a field with a reserved name, and if it exists, use its value to set the corresponding Oracle Streams AQ message property. A default value will be used if the field does not exist or does not have an expected datatype.

**See Also:** *Oracle Streams Advanced Queuing User’s Guide and Reference* for the message conversion details

**JMS_DeliveryMode**
Used by: WebSphere MQ JMS and Oracle JMS.
You can use this property when the propagation destination is a JMS messaging system. It sets the delivery mode of messages enqueued to the propagation destination queue by a JMS MessageProducer. Supported values are PERSISTENT, NON_PERSISTENT and PRESERVE_MSG. The default is PRESERVE_MSG.

- If its value is PERSISTENT, then the delivery mode will be DeliveryMode.PERSISTENT.
- If its value is NON_PERSISTENT, then the delivery mode will be DeliveryMode.NON_PERSISTENT.
- If its value is PRESERVE_MSG, then the delivery mode of the source JMS message will be used when the message is propagated to the destination queue.

**JMS_NoLocal**
Used by: WebSphere MQ JMS and Oracle JMS.
You can use this property when the propagation source is a JMS messaging system. It sets the noLocal parameter of a JMS TopicSubscriber. Supported values are TRUE and FALSE. The default is FALSE.

- TRUE indicates that messages that have been published to this topic through the same Messaging Gateway link will not be propagated.
- FALSE indicates that such messages will be propagated from the topic.

**MsgBatchSize**
Used by: any
This property specifies the maximum number of messages, if available, to be propagated in one transaction. The default is 30.
**RV_discardAmount**
Used by: TIB/Rendezvous

This property specifies the discard amount of a queue. It is meaningful only for an inbound propagation subscriber. The default is 0.

**RV_limitPolicy**
Used by: TIB/Rendezvous

This property specifies the limit policy for resolving overflow of a queue limit. It is meaningful only for an inbound propagation subscriber. Supported values are DISCARD_NONE, DISCARD_FIRST, DISCARD_LAST and DISCARD_NEW. The default is DISCARD_NONE.

- If its value is DISCARD_NONE, then the limit policy is set to TibrvQueue.DISCARD_NONE.
- If its value is DISCARD_FIRST, then the limit policy is set to TibrvQueue.DISCARD_FIRST.
- If its value is DISCARD_LAST, then the limit policy is set to TibrvQueue.DISCARD_LAST.
- If its value is DISCARD_NEW, then the limit policy is set to TibrvQueue.DISCARD_NEW.

**RV_maxEvents**
Used by: TIB/Rendezvous

This property specifies the maximum event limit of a queue. It is meaningful only for an inbound propagation subscriber. The default is 0.
Database Views

The views listed in Table 51–19 provide Messaging Gateway configuration, status, and statistical information. Unless otherwise indicated, the SELECT privilege is granted to MGW_ADMINISTRATOR_ROLE so that only Messaging Gateway administrators have access to the views. All views are owned by SYS.

<table>

</tr>
</tbody>
</table>
ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```sql
DBMS_MGWADM.ADD_SUBSCRIBER(
    subscriber_id     IN VARCHAR2,
    propagation_type  IN BINARY_INTEGER,
    queue_name        IN VARCHAR2,
    destination       IN VARCHAR2,
    rule              IN VARCHAR2 DEFAULT NULL,
    transformation    IN VARCHAR2 DEFAULT NULL,
    exception_queue   IN VARCHAR2 DEFAULT NULL,
    options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Specifies a user-defined name that identifies this subscriber.</td>
</tr>
<tr>
<td>propagation_type</td>
<td>Specifies the type of message propagation. <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> is for Oracle Streams AQ to non-Oracle propagation. <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> is for non-Oracle to Oracle Streams AQ propagation</td>
</tr>
<tr>
<td>queue_name</td>
<td>Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>destination</td>
<td>Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>rule</td>
<td>Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
</tbody>
</table>
ADD_SUBSCRIBER Procedure

Usage Notes

See Also:  "Messaging Gateway Message Transformation", in Oracle Streams Advanced Queuing User’s Guide and Reference for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

See Also:  For additional information regarding subscriber options

Table 51–28  (Cont.) ADD_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transformation</td>
<td>Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If NULL, then the Oracle Streams AQ payload type must be supported by Messaging Gateway.</td>
</tr>
<tr>
<td>exception_queue</td>
<td>Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.</td>
</tr>
<tr>
<td>options</td>
<td>Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.</td>
</tr>
</tbody>
</table>

51-32  PL/SQL Packages and Types Reference
OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- `queue_name` specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.
- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an
Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

**INBOUND_PROPAGATION Subscribers**

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.
**ALTER_AGENT Procedure**

This procedure configures Messaging Gateway agent parameters.

**Syntax**

```sql
DBMS_MGWADM.ALTER_AGENT (  
    max_connections  IN BINARY_INTEGER DEFAULT NULL,  
    max_memory       IN BINARY_INTEGER DEFAULT NULL,  
    max_threads      IN BINARY_INTEGER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_connections</td>
<td>The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.</td>
</tr>
<tr>
<td>max_memory</td>
<td>The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.</td>
</tr>
<tr>
<td>max_threads</td>
<td>The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Default values for these configuration parameters are set when the Messaging Gateway agent is installed.

Changes to the `max_memory` and `max_threads` parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
**ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous**

Alters the properties of a TIB/Rendezvous messaging system link.

**Syntax**

```sql
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
    linkname      IN  VARCHAR2,
    properties    IN  SYS.MGW_TIBRV_PROPERTIES,
    options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

**Parameters**

| Parameters      | Description                                                                 |
|-----------------|                                                                            |
| linkname        | The messaging system link name                                             |
| properties      | Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed. |
| options         | Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options. |
| comment         | A user-specified description, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value will not be changed. |

**Usage Notes**

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

**See Also:**  "SYS.MGW_PROPERTIES Type" on page 51-6
Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

**See Also:** "TIB/Rendezvous System Properties" on page 51-15 for more information about the messaging system properties and options
### ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

**Syntax**

```sql
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (  
  linkname   IN  VARCHAR2,
  properties IN  SYS.MGW_MQSERIES_PROPERTIES,
  options    IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment    IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>The messaging system link name</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties for a WebSphere MQ messaging system link. If it is NULL, then no link properties are changed.</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

**See Also:** "SYS.MGW_PROPERTIES Type" on page 51-6
Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

**See Also:** "WebSphere MQ System Properties" on page 51-12 for more information about the messaging system properties and options
ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

Syntax

```sql
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (  
schedule_id IN VARCHAR2,  
duration IN NUMBER DEFAULT NULL,  
next_time IN VARCHAR2 DEFAULT NULL,  
latency IN NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be altered</td>
</tr>
<tr>
<td>duration</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>next_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>latency</td>
<td>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value &gt; 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.
ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

DBMS_MGWADM.ALTER_SUBSCRIBER ( 
    subscriber_id    IN VARCHAR2, 
    rule             IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE, 
    transformation   IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE, 
    exception_queue  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE 
    options          IN SYS.MGW_PROPERTIES DEFAULT NULL );

Parameters

Table 51–33 ALTER_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Identifies the subscriber to be altered</td>
</tr>
<tr>
<td>rule</td>
<td>Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.</td>
</tr>
</tbody>
</table>
**Usage Notes**

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

---

**Table 51–33 (Cont.) ALTER_SUBSCRIBER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exception_queue</code></td>
<td>Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no exception queue is used. If <code>DBMS_MGWADM.NO_CHANGE</code>, then the current value is unchanged. The source queue and exception queue cannot be the same queue.</td>
</tr>
<tr>
<td><code>options</code></td>
<td>Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.</td>
</tr>
</tbody>
</table>

- "INBOUND_PROPAGATION Subscribers" on page 51-34 for inbound propagation parameter interpretation
CLEANUP_GATEWAY Procedure

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The MGW_GATEWAY view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```sql
DBMS_MGWADM.CLEANUP_GATEWAY(
    action IN BINARY_INTEGER
    sarg IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>The cleanup action to be performed. Values:</td>
</tr>
<tr>
<td></td>
<td>• CLEAN_STARTUP_STATE for Messaging Gateway start up state recovery.</td>
</tr>
<tr>
<td></td>
<td>• CLEAN_LOG_QUEUES for log queue cleanup.</td>
</tr>
<tr>
<td></td>
<td>• RESET_SUB_MISSING_LOG_REC for subscriber recovery due to missing log record.</td>
</tr>
<tr>
<td></td>
<td>• RESET_SUB_MISSING_MESSAGE for subscriber recovery due to missing message.</td>
</tr>
<tr>
<td>sarg</td>
<td>Optional argument whose meaning depends on the value specified for action. This should be NULL if it is not used for the specified action.</td>
</tr>
</tbody>
</table>

Usage Notes

CLEAN_STARTUP_STATE

sarg is not used and must be NULL.

The CLEAN_STARTUP_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.
The CLEAN_STARTUP_STATE action may be needed when the MGW_GATEWAY view shows that the AGENT_STATUS value is something other than NOT_STARTED or START_SCHEDULED, and the AGENT_PING value is UNREACHABLE for an extended period of time.

If the AGENT_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN_STARTUP_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the queued job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT_STARTED.

Execution of this command fails if:

- The agent status is NOT_STARTED or START_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

CLEAN_LOG_QUEUES

sarg is not used and must be NULL.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.
CLEANUP_GATEWAY Procedure

Note: For Oracle Database 10g, the CLEAN_LOG_QUEUES action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC
sarg specifies a Messaging Gateway subscriber ID to be reset. It must be not NULL.

The Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

Caution: If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE
sarg specifies a Messaging Gateway subscriber ID to be reset. It must be not NULL.

The Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that subscriber. The procedure will fail if the Messaging Gateway agent is not running.
CREATE_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

Syntax

```sql
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK {
  linkname     IN  VARCHAR2,
  properties   IN  SYS.MGW_TIBRV_PROPERTIES,
  options      IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment      IN  VARCHAR2 DEFAULT NULL );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>A user-defined name to identify this messaging system link</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties of a TIB/Rendezvous messaging system link.</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description. NULL if one is not desired.</td>
</tr>
</tbody>
</table>

Usage Notes

See Also: "TIB/Rendezvous System Properties" on page 51-15 for more information about the messaging system properties and options
CREATE_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```sql
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname IN VARCHAR2,
  properties IN SYS.MGW_MQSERIES_PROPERTIES,
  options IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>A user-defined name to identify the messaging system link</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties of a WebSphere MQ messaging system link</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description. NULL if one is not desired</td>
</tr>
</tbody>
</table>

Usage Notes

See Also: "WebSphere MQ System Properties" on page 51-12 for more information about the messaging system properties and options
DB_CONNECT_INFO Procedure

This procedure configures connection information used by the Messaging Gateway agent for connections to Oracle Database.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
    username      IN VARCHAR2,
    password      IN VARCHAR2,
    database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The username used for connections to Oracle Database. NULL is not allowed</td>
</tr>
<tr>
<td>password</td>
<td>The password used for connections to Oracle Database. NULL is not allowed</td>
</tr>
<tr>
<td>database</td>
<td>The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from tnsnames.ora.</td>
</tr>
</tbody>
</table>

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role MGW_AGENT_ROLE, and then call this procedure to configure Messaging Gateway. Role MGW_AGENT_ROLE is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.
DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id  IN VARCHAR2 );

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be disabled</td>
</tr>
</tbody>
</table>
ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a propagation schedule.

Syntax

```sql
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (schedule_id IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be enabled</td>
</tr>
</tbody>
</table>
REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```plsql
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE(
    name           IN VARCHAR2,
    linkname       IN VARCHAR2,
    provider_queue IN VARCHAR2 DEFAULT NULL,
    domain         IN INTEGER DEFAULT NULL,
    options        IN SYS.MGW_PROPERTIES DEFAULT NULL,
    comment        IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.</td>
</tr>
<tr>
<td>linkname</td>
<td>The link name for the messaging system on which this queue exists.</td>
</tr>
<tr>
<td>provider_queue</td>
<td>The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.</td>
</tr>
<tr>
<td>domain</td>
<td>The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DOMAIN_QUEUE is for a queue (point-to-point model). DOMAIN_TOPIC is for a topic (publish-subscribe model)</td>
</tr>
<tr>
<td>options</td>
<td>Optional queue properties</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description. Can be NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.
See Also:

- "WebSphere MQ System Properties" on page 51-12 for more information when registering queues for the WebSphere MQ messaging system

- "TIB/Rendezvous System Properties" on page 51-15 for more information when registering queues for the TIB/Rendezvous messaging system
REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```sql
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(
    linkname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>The messaging system link name</td>
</tr>
</tbody>
</table>

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.
**REMOVE_SUBSCRIBER Procedure**

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

**Syntax**

```sql
DBMS_MGWADM.REMOVE_SUBSCRIBER ( 
    subscriber_id  IN VARCHAR2,
    force          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Identifies the subscriber to be removed</td>
</tr>
<tr>
<td>force</td>
<td>Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. NO_FORCE (0) means the subscriber is not removed if Messaging Gateway is unable to clean up successfully. FORCE (1) means the subscriber is removed, even though all cleanup actions may not be done.</td>
</tr>
</tbody>
</table>

The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.

**Usage Notes**

For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.
RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (  
    subscriber_id  IN VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Identifies the subscriber</td>
</tr>
</tbody>
</table>
**SET_LOG_LEVEL Procedure**

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

**Syntax**

```sql
DBMS_MGWADM.SET_LOG_LEVEL (
    log_level  IN BINARY_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_level</td>
<td>Level at which the Messaging Gateway agent logs information. BASIC_LOGGING generates the least information while TRACE_DEBUG_LOGGING generates the most information.</td>
</tr>
</tbody>
</table>

**See Also:** Table 51–6, "DBMS_MGWADM Constants—Logging Levels" on page 51-3 for details on the log_level parameter.
**SCHEDULE_PROPAGATION Procedure**

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

**Syntax**

```sql
DBMS_MGWADM.SCHEDULE_PROPAGATION (  
  schedule_id       IN VARCHAR2,  
  propagation_type  IN BINARY_INTEGER,  
  source            IN VARCHAR2,  
  destination       IN VARCHAR2,  
  start_time        IN DATE DEFAULT SYSDATE,  
  duration          IN NUMBER DEFAULT NULL,  
  next_time         IN VARCHAR2 DEFAULT NULL,  
  latency           IN NUMBER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Specifies a user-defined name that identifies the schedule</td>
</tr>
<tr>
<td>propagation_type</td>
<td>Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation.</td>
</tr>
<tr>
<td>source</td>
<td>Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>destination</td>
<td>Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>start_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>duration</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>next_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>latency</td>
<td>Reserved for future use</td>
</tr>
</tbody>
</table>
**Usage Notes**

For outbound propagation, parameters are interpreted as follows:

- **source** specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of `schema.queue`.
- **destination** specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- **source** specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- **destination** specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

---

**Table 51–45 (Cont.) SCHEDULE_PROPAGATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>next_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>latency</td>
<td>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value &gt; 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.</td>
</tr>
</tbody>
</table>
SHUTDOWN Procedure

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
    sdmode IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sdmode</td>
<td>The shutdown mode. The only value currently supported is <code>SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.</td>
</tr>
</tbody>
</table>
STARTUP Procedure

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP(
    instance  IN  BINARY_INTEGER DEFAULT 0,
    force     IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance</td>
<td>Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance.</td>
</tr>
<tr>
<td>force</td>
<td>If this is DBMS_MGWADM.FORCE, then any positive integer is acceptable as the job instance. If this is DBMS_MGWADM.NO_FORCE (the default), then the specified instance must be running; otherwise the routine raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

The Messaging Gateway agent cannot be started until an agent user has been configured using `DB_CONNECT_INFO`.

This procedure submits a job queue job, which starts the Messaging Gateway agent when it runs. The `instance` and `force` parameters are used for job queue affinity, which you use to indicate whether a particular instance or any instance can run a submitted job.
UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```sql
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
    name     IN VARCHAR2,
    linkname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The queue name</td>
</tr>
<tr>
<td>linkname</td>
<td>The link name for the messaging system on which the queue exists</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not remove the physical queue in the non-Oracle messaging system.

All subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a subscriber or propagation schedule references the non-Oracle queue.
UNSCHEDULE_PROPAGATION Procedure

This procedure removes a propagation schedule.

Syntax

```sql
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (
    schedule_id   IN VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be removed</td>
</tr>
</tbody>
</table>
DBMS_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

See Also: Chapter 51, "DBMS_MGWADM" which describes the Messaging Gateway administrative interface, DBMS_MGWADM

This chapter contains the following topics:

- Using DBMS_MGWMSG
  - Security Model
  - Constants
  - Types

- Summary of DBMS_MGWMSG Subprograms
Using DBMS_MGWMSG

- Security Model
- Constants
- Types

Security Model

The DBMS_MGWMSG packages and object types are owned by SYS.

**Note:** You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User’s Guide and Reference* for information on loading database objects and using DBMS_MGWMSG.

Constants

<table>
<thead>
<tr>
<th>Value</th>
<th>Constant</th>

</tr>
</tbody>
</table>
SYS.MGW_NAME_VALUE_T Type

This type specifies a named value. The name attribute, type attribute, and one of the <>_value attributes are typically not NULL.

Syntax

```sql
TYPE SYS_MGW_NAME_VALUE_T IS OBJECT(
    name VARCHAR2(250),
    type INTEGER,
    integer_value INTEGER,
    number_value NUMBER,
    text_value VARCHAR2(4000),
    raw_value RAW(2000),
    date_value DATE,

    -- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS_MGW_NAME_VALUE_T,
)
```

<tr>
<td>DBMS_MGWMSG.LONG_VALUE</td>
<td>number_value</td>
</tr>
</tbody>
</table>
CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```sql
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_TYPE Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in Table 52–6.

Syntax

```sql
STATIC FUNCTION CONSTRUCT_< (    name   IN VARCHAR2,    value  IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

```sql
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
   AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```
SYSD.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_ value attributes should be set.

Syntax

TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
   small_value VARCHAR2(4000),
   large_value CLOB,

   -- Methods
   STATIC FUNCTION CONSTRUCT
   RETURN SYS.MGW_TEXT_VALUE_T);

Attributes

**Table 52–7  SYS.MGW_TEXT_VALUE_T Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>small_value</td>
<td>Small TEXT value. Used for values &lt;= 4000.</td>
</tr>
<tr>
<td>large_value</td>
<td>Large TEXT value. Used when the value is too large for the small_value attribute.</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_TEXT_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;

SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_ value attributes.

Syntax

TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
small_value RAW(2000),
large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>small_value</td>
<td>Small RAW (bytes) value &lt;= 2000</td>
</tr>
<tr>
<td>large_value</td>
<td>Large RAW value. Used when the value is too large for</td>
</tr>
<tr>
<td></td>
<td>the small_value attribute.</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T;

SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

TYPE SYS.MGW_BASIC_MSG_T IS OBJECT{
    header     SYS.MGW_NAME_VALUE_ARRAY_T,
    text_body  SYS.MGW_TEXT_VALUE_T,
    raw_body   SYS.MGW_RAW_VALUE_T,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T);
Attributes

Table 52–9 SYS.MGW_BASIC_MSG_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header</td>
<td>Message header information as an array of name-value pairs</td>
</tr>
<tr>
<td>text_body</td>
<td>Message body for a TEXT message</td>
</tr>
<tr>
<td>raw_body</td>
<td>Message body for a RAW (bytes) message</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;

SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;

SYS.MGW_TIBRV_FIELD_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name          VARCHAR2(256),
  field_id            INTEGER,
  field_type          INTEGER,
  number_value        NUMBER,
  number_array_value  SYS.MGW_NUMBER_ARRAY_T,
  text_value          VARCHAR2(4000),
  raw_value           RAW(2000),
  date_value          DATE,
  clob_value          CLOB,        
)
blob_value  BLOB);

Attributes

**Table 52–10 SYS.MGW_TIBRV_FIELD_T Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field_name</td>
<td>Field name. This will be NULL if the field has no name.</td>
</tr>
<tr>
<td>field_id</td>
<td>Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.</td>
</tr>
<tr>
<td>field_type</td>
<td>Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_&lt;&gt; constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.</td>
</tr>
<tr>
<td>number_value</td>
<td>Used to store a numeric value</td>
</tr>
<tr>
<td>number_array_value</td>
<td>Used to store a numeric array value</td>
</tr>
<tr>
<td>text_value</td>
<td>Used to store a small text value</td>
</tr>
<tr>
<td>raw_value</td>
<td>Used to store a small raw value</td>
</tr>
<tr>
<td>date_value</td>
<td>Used to store a date value</td>
</tr>
<tr>
<td>clob_value</td>
<td>Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.</td>
</tr>
<tr>
<td>blob_value</td>
<td>Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.</td>
</tr>
</tbody>
</table>

**SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping**

*Table 52–11* describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

**Table 52–11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping**

<table>
<thead>
<tr>
<th>Field Type (DBMS_MGWMSG constant)</th>
<th>Value Stored in Attribute</th>
</tr>
</thead>

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

### Syntax

```sql
TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
  send_subject    VARCHAR2(256),
  reply_subject   VARCHAR2(256),
  cm_time_limit   NUMBER,
  cm_sender_name  VARCHAR2(256),
  cm_sequence_num NUMBER,
  fields          SYS.MGW_TIBRV_IFIELDS_T,
  clob_data1      CLOB,
  clob_data2      CLOB,
);
```
clob_data3 CLOB,
blob_data1 BLOB,
blob_data2 BLOB,
blob_data3 BLOB,

Construct Method

Constructs a new SYS.MGW_TIBRV_MSG_T instance. All attributes are set to NULL.

Syntax

```
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;
```

ADD_<> Procedures

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> ( {
  name IN VARCHAR2,
  id   IN INTEGER,
  value IN datatype );
```
Parameters

Table 52–13  SYS.MGW_TIBRV_MSG_T ADD_<-> Method Parameters

<table>

</tbody>
</table>
**SET_<> Methods**

Accessor methods to set an instance attribute to a specific value.

**Syntax**

MEMBER PROCEDURE SET_<> {
    value IN datatype ;
}

**Parameters**

**Table 52–15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value to be assigned</td>
</tr>
</tbody>
</table>

**GET_<> Methods**

Accessor methods to retrieve the value for an instance attribute.

**Syntax**

MEMBER PROCEDURE GET_<>
RETURN datatype;

**Parameters**
None

**Return Values**
Returns the attribute value.
GET_FIELD_COUNT Procedure

Gets the number of message fields.

Syntax

MEMBER PROCEDURE get_field_count
RETURN INTEGER;

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Procedure

Retrieves field information for the field having a given field collection index. This
method should only be called if get_field_count() returns a nonzero value and
idx must specify a valid collection index; that is, 1<=idx<=get_field_count().

Syntax

MEMBER PROCEDURE get_field ( 
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;

Parameters

Table 52–16 SYS.MGW_TIBRV_MSG_T GET_FIELD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>idx</td>
<td>Specifies the 1-based field collection index of the field to retrieve</td>
</tr>
</tbody>
</table>

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.
GET_FIELD_BY_NAME Procedure

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

MEMBER PROCEDURE get_field_by_name (  
  name IN VARCHAR2  
)  
RETURN SYS.MGW_TIBRV_FIELD_T;

Parameters

Table 52–17 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the field name to search for. This can be NULL to find the first field that does not have a field name.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field information, or NULL if no match was found.

GET_FIELD_BY_ID Procedure

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

MEMBER PROCEDURE get_field_by_id (  
  id IN INTEGER  
)  
RETURN SYS.MGW_TIBRV_FIELD_T;
Parameters

Table 52-18  SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Procedure

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

MEMBER PROCEDURE find_field_name (   
    name IN VARCHAR2,   
    start_idx IN INTEGER )   
RETURN INTEGER;

Parameters

Table 52-19  SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.</td>
</tr>
<tr>
<td>start_idx</td>
<td>Specifies the 1-based field collection index from which the search should start.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.
**FIND_FIELD_ID Procedure**

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

**Syntax**

```
MEMBER PROCEDURE find_field_id (  
id        IN  INTEGER,  
start_idx IN INTEGER )  
RETURN    INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>

| id         | Specifies the field identifier to search for. This can be zero (0) or NULL to find a field that does not have an identifier. |
| start_idx  | Specifies the 1-based field collection index from which the search should start. |

**Return Values**

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

</tbody>
</table>
NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (  
    p_array  IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_value  IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.</td>
</tr>
<tr>
<td>p_value</td>
<td>The value to add. If NULL, then p_array is not changed.</td>
</tr>
</tbody>
</table>
This function gets the name-value element of the name you specify in `p_name` from a name-value array.

**Syntax**

```sql
DBMS_MGWMSG.NVARRAY_GET (  
   p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,  
   p_name    IN VARCHAR2,  
   p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN SYS.MGW_NAME_VALUE_T;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_array</code></td>
<td>The name-value array</td>
</tr>
<tr>
<td><code>p_name</code></td>
<td>The value name</td>
</tr>
<tr>
<td><code>p_compare</code></td>
<td>Name comparison method. Values are <code>CASESENSITIVE</code> and <code>CASEINSENSITIVE</code>.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the matching element, or `NULL` if the specified name is not found.
NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in `p_name` and with the BOOLEAN_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in \texttt{p\_name} and with the \texttt{BYTE\_VALUE} value type.

Syntax

\begin{verbatim}
DBMS_MGWMSG.NVARRAY_GET_BYTE (    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,    p_name     IN VARCHAR2,    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
\end{verbatim}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{p_array}</td>
<td>The name-value array</td>
</tr>
<tr>
<td>\texttt{p_name}</td>
<td>The value name</td>
</tr>
<tr>
<td>\texttt{p_compare}</td>
<td>Name comparison method. Values are \texttt{CASE_SENSITIVE} and \texttt{CASE_INSENSITIVE}.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or \texttt{NULL} if either the specified name is not found or a type mismatch exists.
NVARRAY\_GET\_SHORT Function

This function gets the value of the name-value array element that you specify in p\_name and with the SHORT\_VALUE value type.

**Syntax**

```sql
DBMS_MGWMSG.NVARRAY\_GET\_SHORT ( p\_array IN SYS.MGW\_NAME\_VALUE\_ARRAY\_T, p\_name IN VARCHAR2, p\_compare IN BINARY\_INTEGER DEFAULT CASE\_SENSITIVE ) RETURN INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
**NVARRAY_GET_INTEGER Function**

This function gets the value of the name-value array element that you specify in `p_name` and with the `INTEGER_VALUE` value type.

**Syntax**

```sql
DBMS_MGWMSG.NVARRAY_GET_INTEGER (  
  p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,  
  p_name IN VARCHAR2,  
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_array</code></td>
<td>The name-value array</td>
</tr>
<tr>
<td><code>p_name</code></td>
<td>The value name</td>
</tr>
<tr>
<td><code>p_compare</code></td>
<td>Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code>.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_LONG (    p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,    p_name IN VARCHAR2,    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE ) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_FLOAT (  
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
   p_name     IN VARCHAR2,  
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE  
) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the DOUBLE_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_DOUBLE ( 
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_TEXT (
    p_array  IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name   IN VARCHAR2,
    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DATE_VALUE` value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_DATE (  
    p_array    IN SYS.MGW_NAMEVALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE  
) RETURN DATE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_array</code></td>
<td>The name-value array</td>
</tr>
<tr>
<td><code>p_name</code></td>
<td>The value name</td>
</tr>
<tr>
<td><code>p_compare</code></td>
<td>Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code>.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.
**NVARRAY_FIND_NAME Function**

This function searches a name-value array for the element with the name you specify in `p_name`.

**Syntax**

```sql
DBMS_MGWMSG.NVARRAY_FIND_NAME (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN BINARY_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_array</code></td>
<td>The name-value array to search</td>
</tr>
<tr>
<td><code>p_name</code></td>
<td>The name to find</td>
</tr>
<tr>
<td><code>p_compare</code></td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.
NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (  
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
   p_name     IN VARCHAR2,  
   p_type     IN BINARY_INTEGER  
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array to search</td>
</tr>
<tr>
<td>p_name</td>
<td>The name to find</td>
</tr>
<tr>
<td>p_type</td>
<td>The value type. Refer to the value type constants in Table 52-1 on page 52-2.</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.
The DBMS_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- Summary of DBMS_MONITOR Subprograms
### Summary of DBMS_MONITOR Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

<tr>
<td>SESSION_TRACE_ENABLE Procedure on page 53-15</td>
<td>Enables the trace for a given database session identifier (SID) on the local instance</td>
</tr>
</tbody>
</table>
**CLIENT_ID_STAT_DISABLE Procedure**

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

**Syntax**

```sql
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(
    client_id IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>The Client Identifier for which statistic aggregation is disabled.</td>
</tr>
</tbody>
</table>

**Examples**

To disable accumulation:

```sql
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```
CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V$CLIENT_STATS views.

Syntax

```sql
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(
    client_id IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>The Client Identifier for which statistic aggregation is enabled.</td>
</tr>
</tbody>
</table>

Examples

To enable statistic accumulation for a client with a given client ID:

```sql
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```
CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
    client_id      IN   VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>The Client Identifier for which SQL tracing is disabled.</td>
</tr>
</tbody>
</table>

Examples

EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```sql
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(
  client_id    IN  VARCHAR2,
  waits        IN  BOOLEAN DEFAULT TRUE,
  binds        IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Database Session Identifier for which SQL tracing is enabled.</td>
</tr>
<tr>
<td>waits</td>
<td>If TRUE, wait information is present in the trace.</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information is present in the trace.</td>
</tr>
</tbody>
</table>

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```sql
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE, FALSE);
```
SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V$SERV_MOD_ACT_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which statistic aggregation is disabled.</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the MODULE. An additional qualifier for the service. It is a required parameter.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.</td>
</tr>
</tbody>
</table>
SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, Module, and Action. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, Module name, and Action name on all instances for the same database. Statistics are accessible by means of the V$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which statistic aggregation is enabled.</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the Module. An additional qualifier for the service. It is a required parameter.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the Action. An additional qualifier for the Service and Module name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.</td>
</tr>
</tbody>
</table>

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```
Using ALL_ACTIONS for a module specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

**Examples**

To enable statistic accumulation for a given combination of Service name and MODULE:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1','PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1','GLEDGER','DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.
SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```sql
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS,
    instance_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which tracing is disabled.</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the MODULE. An additional qualifier for the service.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the ACTION. An additional qualifier for the Service and MODULE name.</td>
</tr>
<tr>
<td>instance_name</td>
<td>If set, this restricts tracing to the named instance_name.</td>
</tr>
</tbody>
</table>

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
    DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
    FALSE, NULL);
```

To disable tracing specified in the previous step:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
   DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);

To disable tracing specified in the previous step:
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1', 'PAYROLL');
SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
  service_name IN VARCHAR2,
  module_name IN VARCHAR2 DEFAULT ANY_MODULE,
  action_name IN VARCHAR2 DEFAULT ANY_ACTION,
  waits IN BOOLEAN DEFAULT TRUE,
  binds IN BOOLEAN DEFAULT FALSE,
  instance_name IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which tracing is enabled.</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the MODULE. An optional additional qualifier for the service.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the ACTION. An optional additional qualifier for the Service and MODULE name.</td>
</tr>
<tr>
<td>waits</td>
<td>If TRUE, wait information is present in the trace.</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information is present in the trace.</td>
</tr>
<tr>
<td>instance_name</td>
<td>If set, this restricts tracing to the named instance_name.</td>
</tr>
</tbody>
</table>

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.

- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.
- Specifying NULL for the module_name parameter means that statistics will be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
     DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
     FALSE, NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
     DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```
SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```sql
DBMS_MONITOR.SESSION_TRACE_DISABLE(
    session_id      IN     BINARY_INTEGER DEFAULT NULL,
    serial_num      IN     BINARY_INTEGER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>Name of the service for which SQL trace is disabled.</td>
</tr>
<tr>
<td>serial_num</td>
<td>Serial number for this session.</td>
</tr>
</tbody>
</table>

Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```
SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance.

Syntax

```sql
DBMS_MONITOR.SESSION_TRACE_ENABLE(
    session_id   IN  BINARY_INTEGER DEFAULT NULL,
    serial_num   IN  BINARY_INTEGER DEFAULT NULL,
    waits        IN  BOOLEAN DEFAULT TRUE,
    binds        IN  BOOLEAN DEFAULT FALSE)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>Database Session Identifier for which SQL tracing is enabled.</td>
</tr>
<tr>
<td>serial_num</td>
<td>Serial number for this session.</td>
</tr>
<tr>
<td>waits</td>
<td>If TRUE, wait information is present in the trace.</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information is present in the trace.</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7, 4634, TRUE, FALSE);
```
To disable tracing specified in the previous step:

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7, 4634);
```

Either

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

 traces the session with session ID of 5, while either

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

 traces the current user session. Also,

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, true, true);
```

 traces the current user session including waits and binds. The same can be also

 expressed using keyword syntax:

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>true);
```
DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

**Note:** DBMS_SNAPSHOT is a synonym for DBMS_MVIEW.

**See Also:**
- *Oracle Database Advanced Replication* for more information about using materialized views in a replication environment
- *Oracle Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:
- Using DBMS_MVIEW
  - Operational Notes
  - Rules and Limits
- Summary of DBMS_MVIEW Subprograms
Using DBMS_MVIEW

- Operational Notes
- Rules and Limits

Operational Notes

If a query is less than 256 characters long, you can invoke EXPLAIN_REWRITE using the EXECUTE command from SQL*PLUS. Otherwise, the recommended method is to use a PL/SQL BEGIN..END block, as shown in the examples in /rdbms/demo/smxrw.sql.

Rules and Limits

The EXPLAIN_REWRITE procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the EXPLAIN_MVIEW procedure.
# Summary of DBMS_MVIEW Subprograms

### Table 54–1 (Cont.) DBMS_MVIEW Package Subprograms (Cont.)

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGISTER_MVIEW Procedure on page 54-26</td>
<td>Enables the administration of individual materialized views</td>
</tr>
<tr>
<td>UNREGISTER_MVIEW Procedure on page 54-29</td>
<td>Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view</td>
</tr>
</tbody>
</table>
BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
    tabowner    IN   VARCHAR2,
    tabname     IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tabowner</td>
<td>Owner of the table being reorganized.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table being reorganized.</td>
</tr>
</tbody>
</table>
This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```sql
DBMS_MVIEW.END_TABLE_REORGANIZATION (  
    tabowner    IN   VARCHAR2,
    tabname     IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tabowner</td>
<td>Owner of the table being reorganized.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table being reorganized.</td>
</tr>
</tbody>
</table>
ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (
  stmt_id       IN  VARCHAR2,
  select_clause IN  VARCHAR2,
  num_rows      OUT NUMBER,
  num_bytes     OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt_id</td>
<td>NUMBER</td>
<td>Arbitrary string used to identify the statement in an EXPLAIN PLAN.</td>
</tr>
<tr>
<td>select_clause</td>
<td>STRING</td>
<td>The SELECT statement to be analyzed.</td>
</tr>
<tr>
<td>num_rows</td>
<td>NUMBER</td>
<td>Estimated cardinality.</td>
</tr>
<tr>
<td>num_bytes</td>
<td>NUMBER</td>
<td>Estimated number of bytes.</td>
</tr>
</tbody>
</table>
EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call DBMS_MVIEW.EXPLAIN_MVIEW, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the SELECT string or CREATE MATERIALIZED VIEW statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called MV_CAPABILITIES_TABLE, which is the default, or to an array called MSG_ARRAY.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to MV_CAPABILITIES_TABLE.
- The second version is for explaining an existing or potential materialized view with output to a VARRAY:

Syntax

```sql
DBMS_MVIEW.EXPLAIN_MVIEW ( 
    mv            IN VARCHAR2, 
    statement_id  IN VARCHAR2:= NULL); 

DBMS_MVIEW.EXPLAIN_MVIEW ( 
    mv            IN VARCHAR2, 
    msg_array   OUT SYS.ExplainMVArrayType); 
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mv</code></td>
<td>The name of an existing materialized view (optionally qualified with the owner name separated by &quot;.&quot;) or a SELECT statement or a CREATE MATERIALIZED VIEW statement for a potential materialized view.</td>
</tr>
</tbody>
</table>
You must run the utlxmv.sql script to create MV_CAPABILITIES_TABLE in the current schema prior to calling EXPLAIN_MVIEW except when you direct output to a VARRAY. The script is found in the admin directory.

**Usage Notes**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statement_id</td>
<td>A client-supplied unique identifier to associate output rows with specific invocations of EXPLAIN_MVIEW.</td>
</tr>
<tr>
<td>msg_array</td>
<td>The PL/SQL varray that receives the output. Use this parameter to direct EXPLAIN_MVIEW's output to a PL/SQL VARRAY rather than MV_CAPABILITIES_TABLE.</td>
</tr>
</tbody>
</table>
EXPLAIN_REWRITE Procedures

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

Syntax

You can obtain the output from EXPLAIN_REWRITE in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```sql
DBMS_MVIEW.EXPLAIN_REWRITE (query IN [VARCHAR2 | CLOB],
mv IN VARCHAR2,
statement_id IN VARCHAR2);
```

If you want to direct the output of EXPLAIN_REWRITE to a VARRAY, instead of a table, then the procedure should be called as follows:

```sql
DBMS_MVIEW.EXPLAIN_REWRITE (query IN [VARCHAR2 | CLOB],
mv IN VARCHAR2,
msg_array IN OUT SYS.RewriteArrayType);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>SQL SELECT statement to be explained.</td>
</tr>
<tr>
<td>mv</td>
<td>The fully qualified name of an existing materialized view in the form of SCHEMA.MV.</td>
</tr>
<tr>
<td>statement_id</td>
<td>A client-supplied unique identifier to distinguish output messages.</td>
</tr>
<tr>
<td>msg_array</td>
<td>The PL/SQL varray that receives the output. Use this parameter to direct EXPLAIN_REWRITE's output to a PL/SQL VARRAY.</td>
</tr>
</tbody>
</table>
Usage Notes

To obtain the output into a table, you must run the utlxrw.sql script before calling EXPLAIN_REWRITE. This script creates a table named REWRITE_TABLE in the current schema.
I_AM_A_REFRESH Function

This function returns the value of the I_AM_REFRESH package state.

Syntax

```sql
DBMS_MVIEW.I_AM_A_REFRESH
RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.
PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(
    rid IN ROWID)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>The rowid of a row entry in a master table.</td>
</tr>
</tbody>
</table>
This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

See Also: Oracle Data Warehousing Guide for more information

Syntax

DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
**PURGE_LOG Procedure**

This procedure purges rows from the materialized view log.

**Syntax**

```sql
DBMS_MVIEW.PURGE_LOG (
  master        IN   VARCHAR2,
  num           IN   BINARY_INTEGER := 1,
  flag          IN   VARCHAR2       := 'NOP');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>master</td>
<td>Name of the master table or master materialized view.</td>
</tr>
<tr>
<td>num</td>
<td>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</td>
</tr>
<tr>
<td></td>
<td>DBMS_MVIEW.PURGE_LOG('master_table', 2);</td>
</tr>
<tr>
<td></td>
<td>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</td>
</tr>
<tr>
<td></td>
<td>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</td>
</tr>
<tr>
<td></td>
<td>This statement completely purges the materialized view log that corresponds to master_table if fewer than 9999 materialized views are based on master_table. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</td>
</tr>
<tr>
<td>flag</td>
<td>Specify delete to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter num. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</td>
</tr>
<tr>
<td></td>
<td>DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');</td>
</tr>
</tbody>
</table>
PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its mview_id or the combination of the mviewowner, mviewname, and mviewsite. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```sql
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (  
mview_id IN BINARY_INTEGER |  
mviewowner IN VARCHAR2,  
mviewname IN VARCHAR2,  
mviewsite IN VARCHAR2);  
```

**Note:** This procedure is overloaded. The mview_id parameter is mutually exclusive with the three remaining parameters: mviewowner, mviewname, and mviewsite.
Parameters

Table 54–9  PURGE_MVIEW_FROM_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mview_id</td>
<td>If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the mview_id parameter. Query the DBA_BASE_TABLE_MVIEWS view at the materialized view log site for a listing of materialized view IDs. Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (DBA_REGISTERED_MVIEWS).</td>
</tr>
<tr>
<td>mviewowner</td>
<td>If you do not specify a mview_id, enter the owner of the target materialized view using the mviewowner parameter. Query the DBA_REGISTERED_MVIEWS view at the materialized view log site to view the materialized view owners.</td>
</tr>
<tr>
<td>mviewname</td>
<td>If you do not specify a mview_id, enter the name of the target materialized view using the mviewname parameter. Query the DBA_REGISTERED_MVIEWS view at the materialized view log site to view the materialized view names.</td>
</tr>
<tr>
<td>mviewsite</td>
<td>If you do not specify a mview_id, enter the site of the target materialized view using the mviewsite parameter. Query the DBA_REGISTERED_MVIEWS view at the materialized view log site to view the materialized view sites.</td>
</tr>
</tbody>
</table>

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.
REFRESH Procedure

This procedure refreshes a list of materialized views.

Syntax

```sql
DBMS_MVIEW.REFRESH (  
    { list                 IN     VARCHAR2,  
      tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}  
    method                 IN     VARCHAR2       := NULL,  
    rollback_seg           IN     VARCHAR2       := NULL,  
    push_deferred_rpc      IN     BOOLEAN        := true,  
    refresh_after_errors   IN     BOOLEAN        := false,  
    purge_option           IN     BINARY_INTEGER := 1,  
    parallelism            IN     BINARY_INTEGER := 0,  
    heap_size              IN     BINARY_INTEGER := 0,  
    atomic_refresh         IN     BOOLEAN        := true,  
    nested                 IN     BOOLEAN        := false);  
```

**Note:** This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</td>
</tr>
</tbody>
</table>
A string of refresh methods indicating how to refresh the listed materialized views. An f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.

If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following EXECUTE statement within SQL*Plus:

```sql
DBMS_MVIEW.REFRESH
('countries_mv,regions_mv,hr.employees_mv','cf');
```

This statement performs a complete refresh of the `countries_mv` materialized view, a fast refresh of the `regions_mv` materialized view, and a default refresh of the `hr.employees` materialized view.

**rollback_seg**

Name of the materialized view site rollback segment to use while refreshing materialized views.

**push_deferred_rpc**

Used by updatable materialized views only. Set this parameter to true if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.

**refresh_after_errors**

If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view’s master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.

**purge_option**

If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute PUS with this parameter set to 2 to reduce the queue.

---

**Table 54–10 (Cont.) REFRESH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>A string of refresh methods indicating how to refresh the listed materialized views. An f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td>rollback_seg</td>
<td>Name of the materialized view site rollback segment to use while refreshing materialized views.</td>
</tr>
<tr>

If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute PUS with this parameter set to 2 to reduce the queue.</td>
</tr>
</tbody>
</table>
parallelism

0 specifies serial propagation.

n > 1 specifies parallel propagation with n parallel processes.

1 specifies parallel propagation using only one parallel process.

heap_size

Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.

Note: Do not set this parameter unless directed to do so by Oracle Support Services.

atomic_refresh

If this parameter is set to true, then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.

If this parameter is set to false, then each of the materialized views is refreshed in a separate transaction.

nested

If true, then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.
REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```sql
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
    number_of_failures     OUT   BINARY_INTEGER,
    method                 IN    VARCHAR2         := NULL,
    rollback_seg           IN    VARCHAR2         := NULL,
    refresh_after_errors   IN    BOOLEAN          := false,
    atomic_refresh         IN    BOOLEAN          := true);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_of_failures</td>
<td>Returns the number of failures that occurred during processing.</td>
</tr>
<tr>
<td>method</td>
<td>A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. If no method is specified, a materialized view is refreshed according to its default refresh method. F or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td>rollback_seg</td>
<td>Name of the materialized view site rollback segment to use while refreshing materialized views.</td>
</tr>
</tbody>
</table>
REFRESH_ALL_MVIEWS Procedure

Table 54–11 (Cont.) REFRESH_ALL_MVIEWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</tbody>
</table>
| atomic_refresh         | If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.  
If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction. |
REFRESH_DEPENDENT Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```sql
DBMS_MVIEW.REFRESH_DEPENDENT (    number_of_failures OUT BINARY_INTEGER,    list IN VARCHAR2,    tab IN DBMS_UTILITY.UNCL_ARRAY,    method IN VARCHAR2 := NULL,    rollback_seg IN VARCHAR2 := NULL,    refresh_after_errors IN BOOLEAN := false,    atomic_refresh IN BOOLEAN := true,    nested IN BOOLEAN := false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_of_failures</td>
<td>Returns the number of failures that occurred during processing.</td>
</tr>
</tbody>
</table>
REFRESH_DEPENDENT Procedure

Table 54–12  (Cont.) REFRESH_DEPENDENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>tab</td>
</tr>
</tbody>
</table>

method | A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:

DBMS_MVIEW.REFRESH_DEPENDENT ('employees,deptartments,hr.regions','cf');

performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table. |

rollback_seg | Name of the materialized view site rollback segment to use while refreshing materialized views. |

refresh_after_errors | If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view’s master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view. |
atomic_refresh
If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.

If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.

nested
If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomic_refresh</td>
<td>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.</td>
</tr>
<tr>
<td>nested</td>
<td>If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.</td>
</tr>
</tbody>
</table>
This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (  
mviewowner IN VARCHAR2,  
mviewname IN VARCHAR2,  
mviewsite IN VARCHAR2,  
mview_id IN DATE | BINARY_INTEGER,  
flag IN BINARY_INTEGER,  
qry_txt IN VARCHAR2,  
rep_type IN BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

**Table 54–13 REGISTER_MVIEW Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mviewowner</td>
<td>Owner of the materialized view.</td>
</tr>
<tr>
<td>mviewname</td>
<td>Name of the materialized view.</td>
</tr>
<tr>
<td>mviewsite</td>
<td>Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.</td>
</tr>
<tr>
<td>mview_id</td>
<td>The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually,
the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.
UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (mviewowner IN VARCHAR2,
mviewname IN VARCHAR2,
mviewsite IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mviewowner</td>
<td>Owner of the materialized view.</td>
</tr>
<tr>
<td>mviewname</td>
<td>Name of the materialized view.</td>
</tr>
<tr>
<td>mviewsite</td>
<td>Name of the materialized view site.</td>
</tr>
</tbody>
</table>
DBMS_OBFUSCATION_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

This chapter contains the following topics:

- Using DBMS_OBFUSCATION_TOOLKIT
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_OBFUSCATION Subprograms
Using DBMS_OBFUSCATION_TOOLKIT

Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search: $2^{*}112$ or $2^{*}168$ attempts instead of $2^{*}56$ attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

Security Model

Oracle installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed. The package also grants access to the `PUBLIC` role so no explicit grant needs to be done.
Operational Notes

- Key Management
- Storing the Key in the Database
- Storing the Key in the Operating System
- User-Supplied Keys

Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The DBMS_OBFUSCATION_TOOLKIT package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package. Furthermore, the encryption and decryption done by the DBMS_OBFUSCATION_TOOLKIT takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See Oracle Advanced Security Administrator’s Guide for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.
The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

**Storing the Key in the Database**

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the `DBMS_OBFUSCATION_TOOLKIT` package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with SELECT access to EMP from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the EMP table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).
Storing the Key in the Operating System

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

User-Supplied Keys

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.
Summary of DBMS_OBFUSCATION Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>

</tbody>
</table>
DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "DES3ENCRYPT Procedures and Functions" on page 55-10.

Syntax

```sql
DBMS_OBFUSCATION_TOOLKIT.DES3Decrypt(
    input      IN   RAW,
    key        IN   RAW,
    decrypted_data  OUT  RAW,
    which      IN   PLS_INTEGER DEFAULT TwoKeyMode
    iv         IN   RAW DEFAULT NULL);
```

```sql
DBMS_OBFUSCATION_TOOLKIT.DES3Decrypt(
    input_string  IN   VARCHAR2,
    key_string    IN   VARCHAR2,
    decrypted_string  OUT  VARCHAR2,
    which      IN   PLS_INTEGER DEFAULT TwoKeyMode
    iv_string   IN   VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_OBFUSCATION_TOOLKIT.DES3Decrypt(
    input      IN  RAW,
    key        IN  RAW,
    which      IN  PLS_INTEGER DEFAULT TwoKeyMode
    iv         IN  RAW DEFAULT NULL)
RETURN RAW;
```

```sql
DBMS_OBFUSCATION_TOOLKIT.DES3Decrypt(
    input_string  IN  VARCHAR2,
    key_string    IN  VARCHAR2,
    which      IN  PLS_INTEGER DEFAULT TwoKeyMode
    iv_string   IN  VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Data to be decrypted</td>
</tr>
</tbody>
</table>
Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.
Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.
These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
    input           IN     RAW,
    key             IN     RAW,
    encrypted_data  OUT    RAW,
    which           IN     PLS_INTEGER  DEFAULT TwoKeyMode
    iv              IN     RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
    input_string      IN     VARCHAR2,
    key_string        IN     VARCHAR2,
    encrypted_string  OUT    VARCHAR2,
    which             IN     PLS_INTEGER  DEFAULT TwoKeyMode
    iv_string         IN     VARCHAR2     DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
    input        IN RAW,
    key          IN RAW,
    which        IN PLS_INTEGER DEFAULT TwoKeyMode
    iv           IN RAW         DEFAULT NULL)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
    input_string  IN VARCHAR2,
    key_string    IN VARCHAR2,
    which         IN PLS_INTEGER DEFAULT TwoKeyMode
    iv_string     IN VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

<td>encrypted_string</td>
<td>Encrypted string.</td>
</tr>
<tr>
<td>iv_string</td>
<td>Initialization vector.</td>
</tr>
</tbody>
</table>

Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the DES3ENCRYPT procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The DES3ENCRYPT procedure uses the 2-key implementation by default.

You also have the option of providing an initialization vector (IV) with the DES3ENCRYPT procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL DES3ENCRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."
If the input data given to the DES3ENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit."

If you try to double encrypt data using the DES3ENCRYPT procedure, then the procedure raises the error ORA-28233 "Double encryption not supported."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the which parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

The DES3ENCRYPT procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the DES3ENCRYPT function itself more than once to encrypt the same data using 3DES.)

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.
DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

Syntax

```sql
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
    which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
    seed         IN   RAW,
    key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
    which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
    seed_string  IN   VARCHAR2,
    key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
    which  IN  PLS_INTEGER DEFAULT TwoKeyMode,
    seed   IN  RAW)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
    which  IN  PLS_INTEGER DEFAULT TwoKeyMode,
    seed_string  IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>which</td>
<td>If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.</td>
</tr>
<tr>
<td>seed</td>
<td>A value at least 80 characters long.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key.</td>
</tr>
<tr>
<td>seed_string</td>
<td>A value at least 80 characters long.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key.</td>
</tr>
</tbody>
</table>
These subprograms generate the decrypted form of the input data.

**Syntax**

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
    input             IN   RAW,
    key               IN   RAW,
    decrypted_data    OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
    input_string      IN   VARCHAR2,
    key_string        IN   VARCHAR2,
    decrypted_string  OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
    input            IN  RAW,
    key              IN  RAW)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
    input_string     IN  VARCHAR2,
    key_string       IN  VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<td>Decrypted string.</td>
</tr>
</tbody>
</table>
Summary of DBMS_OBFUSCATION Subprograms

Usage Notes

If the input data or key given to the PL/SQL DESDECRYPT function is empty, then Oracle raises ORA error 28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DESDECRYPT function is not a multiple of 8 bytes, Oracle raises ORA error 28232 "Invalid input size for Obfuscation toolkit."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Note: ORA-28233 is not applicable to the DESDECRYPT function.

Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

Note: The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.
DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

Syntax

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
  input            IN    RAW,
  key              IN    RAW,
  encrypted_data   OUT   RAW);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
  input_string     IN    VARCHAR2,
  key_string       IN    VARCHAR2,
  encrypted_string OUT   VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
  input         IN  RAW,
  key           IN  RAW)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
  input_string  IN  VARCHAR2,
  key_string    IN  VARCHAR2)
RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Data to be encrypted.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key.</td>
</tr>
<tr>
<td>encrypted_data</td>
<td>Encrypted data.</td>
</tr>
<tr>
<td>input_string</td>
<td>String to be encrypted.</td>
</tr>
<tr>
<td>key_string</td>
<td>Encryption key string.</td>
</tr>
<tr>
<td>encrypted_string</td>
<td>Encrypted string.</td>
</tr>
</tbody>
</table>
Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the DESENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit."

If you try to double-encrypt data using the DESENCRYPT procedure, then the procedure raises the error ORA-28233 "Double encryption not supported."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Restrictions

The DESENCRYPT procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

**Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.
These subprograms take a random value and use it to generate an encryption key.

**Syntax**

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
    seed         IN   RAW,
    key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
    seed_string  IN   VARCHAR2,
    key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
    seed IN RAW)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
    seed_string IN VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>A value at least 80 characters long.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key.</td>
</tr>
<tr>
<td>seed_string</td>
<td>A value at least 80 characters long.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key.</td>
</tr>
</tbody>
</table>
MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

Syntax

DBMS_OBFUSCATION_TOOLKIT.MD5(
    input            IN   RAW,
    checksum         OUT  raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
    input_string     IN   VARCHAR2,
    checksum_string  OUT  varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
    input         IN  RAW)
RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5(
    input_string  IN  VARCHAR2)
RETURN varchar2_checksum;

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Data to be hashed</td>
</tr>
<tr>
<td>checksum</td>
<td>128-bit cryptographic message digest</td>
</tr>
<tr>
<td>input_string</td>
<td>Data to be hashed</td>
</tr>
<tr>
<td>checksum_string</td>
<td>128-bit cryptographic message digest</td>
</tr>
</tbody>

### Summary of DBMS_ODCI Subprograms

#### Table 56–1  DBMS_ODCI Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ESTIMATE_CPU_UNITS</code></td>
<td>Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)</td>
</tr>
</tbody>
</table>

Function on page 56-3
**ESTIMATE_CPU_UNITS Function**

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE_CPU_UNITS considers the speed of a single processor.

**Syntax**

```sql
DBMS_ODCI.ESTIMATE_CPU_UNITS(
    elapsed_time     NUMBER)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elapsed_time</td>
<td>The elapsed time in seconds that it takes to execute a function.</td>
</tr>
</tbody>
</table>

**Usage Notes**

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.
ESTIMATE_CPU_UNITS Function
The DBMS_OFFLINE_OG package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

- Documentation of DBMS_OFFLINE_OG
Documentation of DBMS_OFFLINE_OG

For a complete description of this package within the context of Replication, see DBMS_OFFLINE_OG in the Oracle Database Advanced Replication Management API Reference.
The DBMS_OLAP package, presented here for reasons of backward compatibility, provides a collection of materialized view analysis and advisory functions that are callable from any PL/SQL program. Some of the functions generate output tables.

**See Also:** Oracle Data Warehousing Guide for more information.
This chapter contains the following topics:

  - Views
  - Deprecated Subprograms
- Summary of DBMS_OLAP Subprograms
Using DBMS_OLAP

- Overview
- Views
- Deprecated Subprograms

Overview

DBMS_OLAP performs seven major functions, which include materialized view strategy recommendation, materialized view strategy evaluation, reporting and script generation, repository management, workload management, filter management, and dimension validation.

To perform materialized view strategy recommendation and evaluation functions, the workload information can either be provided by the user or synthesized by the Advisor engine. In the former case, cardinality information of all tables and materialized views referenced in the workload are required. In the latter case, dimension objects must be present and cardinality information for all dimension tables, fact tables, and materialized views are required. Cardinality information should be gathered with the `DBMS_STATS.GATHER_TABLE_STATS` procedure.

Once these functions are completed, the analysis results can be presented with the reporting and script generation function.

The workload management function handles three types of workload, which are user-specified workload, SQL cache workload, and Oracle Trace workload. To process the user-specified workload, a user-defined workload table must be present in the user's schema. To process Oracle Trace workload, the Oracle Trace formatter must be run to preprocess collected workload statistics into default V-tables in the user's schema.

Views

Several views are created when using DBMS_OLAP. All are in the SYSTEM schema. To access these views, you must have a DBA role.

Deprecated Subprograms

The DBMS_Olap subprograms have been replaced with improved technology: see Chapter 12, "DBMS_ADVISOR", Chapter 32, "DBMS_DIMENSION" and Chapter 54, "DBMS_MVIEW". All DBMS_Olap subprograms are obsolete with Oracle 10g Release 1 (10.1), and while Oracle will continue to support them, they are documented only for reasons of backward compatibility.

- ADD_FILTER_ITEM Procedure
- CREATE_ID Procedure
- ESTIMATE_MVIEW_SIZE Procedure
- EVALUATE_MVIEW_STRATEGY Procedure
- GENERATE_MVIEW_REPORT Procedure
- GENERATE_MVIEW_SCRIPT Procedure
- LOAD_WORKLOAD_CACHE Procedure
- LOAD_WORKLOAD_TRACE Procedure
- PURGE_FILTER Procedure
- PURGE_RESULTS Procedure
- PURGE_WORKLOAD Procedure
- RECOMMEND_MVIEW_STRATEGY Procedure
- SET_CANCELLED Procedure
- VALIDATE_DIMENSION Procedure
- VALIDATE_WORKLOAD_CACHE Procedure
- VALIDATE_WORKLOAD_TRACE Procedure
- VALIDATE_WORKLOAD_USER Procedure
Note: The DBMS_OLAP subprograms have been replaced with improved technology:

- If you are developing new or substantially modified applications and had previously used the Summary Advisor in DBMS_OLAP, you should now use the SQLAccess Advisor described in Chapter 12, "DBMS_ADVISOR".
- If you had previously used DBMS_OLAP.VALIDATE_DIMENSION, you should now use DBMS_DIMENSION.VALIDATE_DIMENSION described in Chapter 32, "DBMS_DIMENSION".
- If you had previously used DBMS_OLAP.ESTIMATE_MVIEW_SIZE, you should now use DBMS_MVIEW.ESTIMATE_MVIEW_SIZE described in Chapter 54, "DBMS_MVIEW".

| Table 58-8  DBMS_OLAP Package Subprograms |
|-----------------|---------------------------------------|
| Subprogram      | Description                           |
| ADD_FILTER_ITEM Procedure on page 58-12 | Filters the contents being used during the recommendation process [see Deprecated Subprograms on page 58-9] |
| CREATE_ID Procedure on page 58-14 | Generates an internal ID used by a new workload collection, a new filter, or a new advisor run [see Deprecated Subprograms on page 58-9] |
| ESTIMATE_MVIEW_SIZE Procedure on page 58-15 | Estimates the size of a materialized view that you might create, in bytes and rows [see Deprecated Subprograms on page 58-9] |
| EVALUATE_MVIEW_STRATEGY Procedure on page 58-16 | Measures the utilization of each existing materialized view [see Deprecated Subprograms on page 58-9] |
| GENERATE_MVIEW_REPORT Procedure on page 58-17 | Generates an HTML-based report on the given Advisor run [see Deprecated Subprograms on page 58-9] |
| GENERATE_MVIEW_SCRIPT Procedure on page 58-18 | Generates a simple script containing the SQL commands to implement Summary Advisor recommendations [see Deprecated Subprograms on page 58-9] |
| LOAD_WORKLOAD_CACHE Procedure on page 58-19 | Obtains a SQL cache workload [see Deprecated Subprograms on page 58-9] |
### Summary of DBMS_OLAP Subprograms

#### Table 58–8 (Cont.) DBMS_OLAP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOAD_WORKLOAD_TRACEProcedure on page 58-21</td>
<td>Loads a workload collected by Oracle Trace [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>LOAD_WORKLOAD_USERProcedure on page 58-23</td>
<td>Loads a user-defined workload [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>PURGE_FILTER Procedure on page 58-24</td>
<td>Deletes a specific filter or all filters [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>PURGE_RESULTS Procedure on page 58-25</td>
<td>Removes all results or those for a specific run [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>PURGE_WORKLOAD Procedure on page 58-26</td>
<td>Deletes all workloads or a specific collection [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>RECOMMEND_MVIEW_STRATEGYProcedure on page 58-27</td>
<td>Generates a set of recommendations about which materialized views should be created, retained, or dropped [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>SET_CANCELLED Procedure on page 58-29</td>
<td>Stops the Advisor if it takes too long returning results [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>VALIDATE_DIMENSION Procedure on page 58-30</td>
<td>Verifies that the relationships specified in a dimension are correct [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>VALIDATE_WORKLOAD_CACHE Procedure on page 58-32</td>
<td>Validates the SQL Cache workload before performing load operations [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>VALIDATE_WORKLOAD_TRACE Procedure on page 58-33</td>
<td>Validates the Oracle Trace workload before performing load operations [see Deprecated Subprograms on page 58-9]</td>
</tr>
<tr>
<td>VALIDATE_WORKLOAD_USER Procedure on page 58-34</td>
<td>Validates the user-supplied workload before performing load operations [see Deprecated Subprograms on page 58-9]</td>
</tr>
</tbody>
</table>
ADD_FILTER_ITEM Procedure

This procedure adds a new filter item to an existing filter to make it more restrictive. It also creates a filter to restrict what is analyzed for the workload.

Syntax

```sql
ADD_FILTER_ITEM (  
  filter_id  IN NUMBER,  
  filter_name IN VARCHAR2,  
  string_list IN VARCHAR2,  
  number_min  IN NUMBER,  
  number_max  IN NUMBER,  
  date_min    IN VARCHAR2,  
  date_max    IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_id</td>
<td>An ID that uniquely describes the filter. It is generated by the DBMS_OLAP.CREATE_ID procedure.</td>
</tr>
</tbody>
</table>
**Table 58–9 (Cont.) ADD_FILTER_ITEM Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| filter_name | APPLICATION: String-workload’s application column. An example of how to load a SQL Cache workload follows.  
  - BASETABLE: String-based tables referenced by workload queries. Name must be fully qualified including owner and table name (for example, SH.SALES).  
  - CARDINALITY: Numerical-sum of cardinality of the referenced base tables.  
  - FREQUENCY: Numerical-workload’s frequency column.  
  - LASTUSE: Date-workload’s lastuse column. Not used by SQL Cache workload.  
  - OWNER: String-workload’s owner column. Expected in uppercase unless owner defined explicitly to be not all in uppercase.  
  - PRIORITY: Numerical-workload’s priority column. Not used by SQL Cache workload.  
  - RESPONSETIME: Numerical-workload’s response time column. Not used by SQL Cache workload.  
  - SCHEMA: String-based schema referenced by workload filter.  
  - TRACENAME: String-list of oracle trace collection names. Only used by a Trace Workload. |
| string_list | A comma-delimited list of strings. This parameter is only used by the filter items of the string type. |
| number_min  | The lower bound of a numerical range. NULL represents the lowest possible value. This parameter is only used by the parameters of the numerical type. |
| number_max  | The upper bound of a numerical range. NULL for no upper bound. NULL represents the highest possible value. This parameter is only used by the parameters of the numerical type. |
| date_min    | The lower bound of a date range. NULL represents the lowest possible date value. This parameter is only used by the parameters of the date type. |
| date_max    | The upper bound of a date range. NULL represents the highest possible date value. This parameter is only used by the parameters of the date type. |
CREATE_ID Procedure

This procedure creates a unique identifier, which is used to identify a filter, a workload or results of an advisor or dimension validation run.

Syntax

```sql
CALL DBMS_OLAP.CREATE_ID (
  id       OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The unique identifier that can be used to identify a filter, a workload, or an Advisor run.</td>
</tr>
</tbody>
</table>
ESTIMATE_MVIEW_SIZE Procedure

**Note:** See Deprecated Subprograms on page 58-9.

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

**Syntax**

```sql
DBMS_OLAP.ESTIMATE_MVIEW_SIZE (   stmt_id       IN  VARCHAR2,   select_clause IN  VARCHAR2,   num_rows      OUT NUMBER,   num_bytes     OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt_id</td>
<td>Arbitrary string used to identify the statement in an EXPLAIN PLAN.</td>
</tr>
<tr>
<td>select_clause</td>
<td>The SELECT statement to be analyzed.</td>
</tr>
<tr>
<td>num_rows</td>
<td>Estimated cardinality.</td>
</tr>
<tr>
<td>num_bytes</td>
<td>Estimated number of bytes.</td>
</tr>
</tbody>
</table>
EVALUATE_MVIEW_STRATEGY Procedure

This procedure measures the utilization of each existing materialized view based on the materialized view usage statistics collected from the workload. The workload_id is optional. If not provided, EVALUATE_MVIEW_STRATEGY uses a hypothetical workload.

Syntax

DBMS_OLAP.EVALUATE_MVIEW_STRATEGY (run_id IN NUMBER, workload_id IN NUMBER, filter_id IN NUMBER);

Parameters

Table 58–12  EVALUATE_MVIEW_STRATEGY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_id</td>
<td>An ID generated by the DBMS_OLAP.CREATE_ID procedure to identify results of a run.</td>
</tr>
<tr>
<td>workload_id</td>
<td>An optional workload ID that maps to a workload in the current repository. Use the parameter DBMS_OLAP.WORKLOAD_ALL to choose all workloads.</td>
</tr>
<tr>
<td>filter_id</td>
<td>Specify filter for the workload to be used. The value DBMS_OLAP.FILTER_NONE indicates no filtering.</td>
</tr>
</tbody>
</table>

Usage Notes

Periodically, the unused results can be purged from the system by calling the DBMS_OLAP.PURGE_RESULTS procedure.
GENERATE_MVIEW_REPORT Procedure

**Note:** See [Deprecated Subprograms](#) on page 58-9.

This procedure generates an HTML-based report on the given Advisor run.

**Syntax**

```sql
DBMS_OLAP.GENERATE_MVIEW_REPORT (
    filename  IN VARCHAR2,
    id        IN NUMBER,
    flags     IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the &quot;Security and Performance&quot; section of the Java Developer's Guide for more information on file permissions.</td>
</tr>
<tr>
<td>id</td>
<td>An ID that identifies an advisor run. Or use the parameter <code>DBMS_OLAP.RUNID_ALL</code> to indicate all advisor runs should be reported.</td>
</tr>
<tr>
<td>flags</td>
<td>Bit masked flags indicating what sections should be reported</td>
</tr>
</tbody>
</table>

- `DBMS_OLAP.RPT_ACTIVITY` -- Overall activities
- `DBMS_OLAP.RPT_JOURNAL` -- Runtime journals
- `DBMS_OLAP.RPT_WORKLOAD_FILTER` -- Filters
- `DBMS_OLAP.RPT_WORKLOAD_DETAIL` -- Workload information
- `DBMS_OLAP.RPT_WORKLOAD_QUERY` -- Workload query information
- `DBMS_OLAP.RPT_RECOMMENDATION` -- Recommendations
- `DBMS_OLAP.RPT_USAGE` -- Materialized view usage
- `DBMS_OLAP.RPT_ALL` -- All sections
GENERATE_MVIEW_SCRIPT Procedure

This procedure generates a simple script containing the SQL commands to implement Summary Advisor recommendations.

Syntax

```sql
DBMS_OLAP.GENERATE_MVIEW_SCRIPT(
    filename    IN VARCHAR2,
    id          IN NUMBER,
    tspace      IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the &quot;Security and Performance&quot; section of the Java Developer's Guide for more information on file permissions.</td>
</tr>
<tr>
<td>id</td>
<td>An ID that identifies an advisor run. The parameter <code>DBMS_OLAP.RUNID_ALL</code> indicates all advisor runs should be reported.</td>
</tr>
<tr>
<td>tspace</td>
<td>Optional tablespace name to use when creating materialized views.</td>
</tr>
</tbody>
</table>
LOAD_WORKLOAD_CACHE Procedure

**Note:** See Deprecated Subprograms on page 58-9.

This procedure loads a SQL cache workload.

**Syntax**

```
DBMS_OLAP.LOAD_WORKLOAD_CACHE (  
    workload_id  IN NUMBER,   
    flags        IN NUMBER,   
    filter_id    IN NUMBER,   
    application  IN VARCHAR2, 
    priority     IN NUMBER);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_id</td>
<td>Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the “Security and Performance” section of the Java Developer’s Guide for more information on file permission.</td>
</tr>
</tbody>
</table>
| flags       | - DBMS_OLAP.WORKLOAD_OVERWRITE: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID.  
             - DBMS_OLAP.WORKLOAD_APPEND: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload.  
             - DBMS_OLAP.WORKLOAD_NEW: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error.  

Note: the flags have the same behavior irrespective of the LOAD_WORKLOAD operation. |
| filter_id   | Specify filter for the workload to be loaded.                                                                                              |
| application | The default business application name. This value will be used for a query if one is not found in the target workload.                      |
### Table 58–15 (Cont.) LOAD_WORKLOAD_CACHE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>The default business priority to be assigned to every query in the target workload.</td>
</tr>
</tbody>
</table>
LOAD_WORKLOAD_TRACE Procedure

Note: See Deprecated Subprograms on page 58-9.

This procedure loads an Oracle Trace workload.

Syntax

```sql
DBMS_OLAP.LOAD_WORKLOAD_TRACE (
    workload_id  IN NUMBER,
    flags        IN NUMBER,
    filter_id    IN NUMBER,
    application  IN VARCHAR2,
    priority     IN NUMBER,
    owner_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collectionid</td>
<td>Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the &quot;Security and Performance&quot; section of the Java Developer’s Guide for more information on file permission.</td>
</tr>
</tbody>
</table>
| flags        | • DBMS_OLAP.WORKLOAD_OVERWRITE: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID.  
  • DBMS_OLAP.WORKLOAD_APPEND: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload.  
  • DBMS_OLAP.WORKLOAD_NEW: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error.  
  Note: the flags have the same behavior irrespective of the LOAD_WORKLOAD operation. |
| filter_id    | Specify filter for the workload to be loaded.                                                                                                 |
| application  | The default business application name. This value will be used for a query if one is not found in the target workload.                          |
LOAD_WORKLOAD_TRACE Procedure

**Table 58–16 (Cont.) LOAD_WORKLOAD_TRACE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>The default business priority to be assigned to every query in the target workload.</td>
</tr>
<tr>
<td>owner_name</td>
<td>The schema that contains the Oracle Trace data. If omitted, the current user will be used.</td>
</tr>
</tbody>
</table>
LOAD_WORKLOAD_USER Procedure

This procedure loads a user-defined workload.

Syntax

```sql
DBMS_OLAP.LOAD_WORKLOAD_USER (
    workload_id IN NUMBER,
    flags IN NUMBER,
    filter_id IN NUMBER,
    owner_name IN VARCHAR2,
    table_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_id</td>
<td>The required id that was returned by the DBMS_OLAP.CREATE_ID call.</td>
</tr>
</tbody>
</table>
| flags        | - DBMS_OLAP.WORKLOAD_OVERWRITE: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID  
- DBMS_OLAP.WORKLOAD_APPEND: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload  
- DBMS_OLAP.WORKLOAD_NEW: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error  
Note: the flags have the same behavior irrespective of the LOAD_WORKLOAD operation. |
| filter_id    | Specify filter for the workload to be loaded.                               |
| owner_name   | The schema that contains the user supplied table or view.                   |
| table_name   | The table or view name containing valid workload data.                      |
This procedure removes a filter at any time. You can delete a specific filter or all filters.

**Syntax**

```plaintext
DBMS_OLAP.PURGE_FILTER (  
    filter_id    IN    NUMBER);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_id</td>
<td>The parameter DBMS_OLAP.FILTER_ALL indicates all filters should be removed.</td>
</tr>
</tbody>
</table>
Many procedures in the DBMS_OLAP package generate output in system tables, such as recommendation results for RECOMMEND_MVIEW_STRATEGY and evaluation results for EVALUATE_MVIEW_STRATEGY, and dimension validation results for VALIDATE_DIMENSION. When these outputs are no longer required, they should be removed using the procedure PURGE_RESULTS. You can remove all results or those for a specific run.

**Syntax**

```sql
DBMS_OLAP.PURGE_RESULTS (
    run_id    IN   NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_id</td>
<td>An ID generated with the DBMS_OLAP.CREATE_ID procedure. The ID should be associated with a RECOMMEND_MVIEW_STRATEGY or a EVALUATE_MVIEW_STRATEGY or a VALIDATE_DIMENSION run. Use the value DBMS_OLAP.RUNID_ALL to specify all such runs.</td>
</tr>
</tbody>
</table>
PURGE_WORKLOAD Procedure

This procedure removes workloads when they are no longer needed. You can delete all workloads or a specific collection.

Syntax

```sql
DBMS_OLAP.PURGE_WORKLOAD (
   workload_id   IN   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_id</td>
<td>An ID number originally assigned by the create_id call. If the value of workload_id is set to DBMS_OLAP.WORKLOAD_ALL, then all workloads for the current user will be deleted.</td>
</tr>
</tbody>
</table>

Note: See Deprecated Subprograms on page 58-9.
RECOMMEND_MVIEW_STRATEGY Procedure

Note: See Deprecated Subprograms on page 58-9.

This procedure generates a set of recommendations about which materialized views should be created, retained, or dropped, based on information in the workload (gathered by Oracle Trace, the user workload, or the SQL cache), and an analysis of table and column cardinality statistics gathered by the DBMS_STATS.GATHER_TABLE_STATS procedure.

RECOMMEND_MVIEW_STRATEGY requires that you have run the GATHER_TABLE_STATS procedure to gather table and column cardinality statistics and have collected and formatted the workload statistics.

The workload is aggregated to determine the count of each request in the workload, and this count is used as a weighting factor during the optimization process. If the workload_id is not provided, then RECOMMEND_MVIEW_STRATEGY uses a hypothetical workload based on dimension definitions and other embedded statistics.

The space of all dimensional materialized views that include the specified fact tables identifies the set of materialized views that optimize performance across the workload. The recommendation results are stored in system tables, which can be accessed through the view SYSTEM.MVIEW_RECOMMENDATIONS.

Syntax

DBMS_OALAP.RECOMMEND_MVIEW_STRATEGY (run_id IN NUMBER, workload_id IN NUMBER, filter_id IN NUMBER, storage_in_bytes IN NUMBER, retention_pct IN NUMBER, retention_list IN VARCHAR2, fact_table_filter IN VARCHAR2);
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_id</td>
<td>An ID generated by the DBMS_OLAP.CREATE_ID procedure to uniquely identify results of a run.</td>
</tr>
<tr>
<td>workload_id</td>
<td>An optional workload ID that maps to a workload in the current repository. Use the parameter DBMS_OLAP.WORKLOAD_ALL to choose all workloads.</td>
</tr>
<tr>
<td></td>
<td>If the workload_id is set to NULL, the call will use a hypothetical workload.</td>
</tr>
<tr>
<td>filter_id</td>
<td>An optional filter ID that maps to a set of user-supplied filter items. Use the parameter DBMS_OLAP.FILTER_NONE to avoid filtering.</td>
</tr>
<tr>
<td>storage_in_bytes</td>
<td>Maximum storage, in bytes, that can be used for storing materialized views. This number must be nonnegative.</td>
</tr>
<tr>
<td>retention_pct</td>
<td>Number between 0 and 100 that specifies the percent of existing materialized view storage that must be retained, based on utilization on the actual or hypothetical workload.</td>
</tr>
<tr>
<td></td>
<td>A materialized view is retained if the cumulative space, ranked by utilization, is within the retention threshold specified (or if it is explicitly listed in retention_list). Materialized views that have a NULL utilization (for example, nondimensional materialized views) are always retained.</td>
</tr>
<tr>
<td>retention_list</td>
<td>Comma-delimited list of materialized view table names. A drop recommendation is not made for any materialized view that appears in this list.</td>
</tr>
<tr>
<td>fact_table_filter</td>
<td>Optional list of fact tables used to filter real or ideal workload.</td>
</tr>
</tbody>
</table>

Usage Notes

Periodically, the unused results can be purged from the system by calling the PURGE_RESULTS procedure.
SET_CANCELLED Procedure

**Note:** See Deprecated Subprograms on page 58-9.

If the Summary Advisor takes too long to make its recommendations using the procedures RECOMMEND_MVIEW_STRATEGY, you can stop it by calling the procedure SET_CANCELLED and passing in the run_id for this recommendation process.

**Syntax**

```sql
DBMS_OLAP.SET_CANCELLED (  
    run_id    IN  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_id</td>
<td>Id that uniquely identifies an advisor analysis operation. This call can be used to cancel a long running workload collection as well as an Advisor analysis session.</td>
</tr>
</tbody>
</table>
VALIDATE_DIMENSION Procedure

This procedure verifies that the hierarchical and attribute relationships, and join relationships, specified in an existing dimension object are correct. This provides a fast way to ensure that referential integrity is maintained.

The validation results are stored in system tables, which can be accessed through the view SYSTEM.MVIEW_EXCEPTIONS.

Syntax

```sql
DBMS_OLAP.VALIDATE_DIMENSION (
    dimension_name    IN VARCHAR2,
    dimension_owner   IN VARCHAR2,
    incremental       IN BOOLEAN,
    check_nulls       IN BOOLEAN,
    run_id            IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension_name</td>
<td>Name of the dimension to analyze.</td>
</tr>
<tr>
<td>dimension_owner</td>
<td>Name of the dimension owner.</td>
</tr>
<tr>
<td>incremental</td>
<td>If TRUE, then tests are performed only for the rows specified in the sumdelta$ table for tables of this dimension; otherwise, check all rows.</td>
</tr>
</tbody>
</table>
| check_nulls   | - If TRUE, then all level columns are verified to be nonnull; otherwise, this check is omitted.  
               - Specify FALSE when nonnullness is guaranteed by other means, such as NOT NULL constraints. |
| run_id        | An ID generated by the DBMS_OLAP.CREATE_ID procedure to identify a run. |

Note: See Deprecated Subprograms on page 58-9.
Usage Notes

Periodically, the unused results can be purged from the system by calling the PURGE_RESULTS procedure.
VALIDATE_WORKLOAD_CACHE Procedure

Note: See Deprecated Subprograms on page 58-9.

This procedure validates the SQL Cache workload before performing load operations.

Syntax

```plsql
DBMS_OLAP.VALIDATE_WORKLOAD_CACHE (  
    valid            OUT NUMBER,  
    error            OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>valid</td>
<td>Return <code>DBMS_OLAP.VALID</code> or <code>DBMS_OLAP.INVALID</code> Indicate whether a workload is valid.</td>
</tr>
<tr>
<td>error</td>
<td>VARCHAR2, return error set.</td>
</tr>
</tbody>
</table>
VALIDATE_WORKLOAD_TRACE Procedure

**Syntax**

```sql
DBMS_OLAP.VALIDATE_WORKLOAD_TRACE (
    owner_name       IN  VARCHAR2,
    valid            OUT NUMBER,
    error            OUT VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner of the trace workload table.</td>
</tr>
<tr>
<td>valid</td>
<td>Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID Indicate whether a workload is valid.</td>
</tr>
<tr>
<td>error</td>
<td>VARCHAR2, return error text.</td>
</tr>
</tbody>
</table>

**Note:** See Deprecated Subprograms on page 58-9.

This procedure validates the Oracle Trace workload before performing load operations.

This procedure validates the Oracle Trace workload before performing load operations.
VALIDATE_WORKLOAD_USER Procedure

This procedure validates the user-supplied workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_USER (  
  owner_name       IN  VARCHAR2,  
  table_name       IN  VARCHAR2,  
  valid            OUT NUMBER,  
  error            OUT VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner of the user workload table.</td>
</tr>
<tr>
<td>table_name</td>
<td>User workload table name.</td>
</tr>
<tr>
<td>valid</td>
<td>Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID Indicate whether a workload is valid.</td>
</tr>
<tr>
<td>error</td>
<td>VARCHAR2, return error set.</td>
</tr>
</tbody>
</table>

Note: See Deprecated Subprograms on page 58-9.
The DBMS_OUTLN package, synonymous with OUTLN_PKG, contains the functional interface for subprograms associated with the management of stored outlines.

See Also: For more information about using the DBMS_OUTLN package, see Using Plan Stability in Oracle Database Performance Tuning Guide.

This chapter contains the following topics:
- Using DBMS_OUTLN
  - Overview
  - Security Model
- Summary of DBMS_OUTLN Subprograms
Using DBMS_OUTLN

Using DBMS_OUTLN

- Overview
- Security Model

Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).
### Summary of DBMS_OUTLN Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_USED Procedure on page 59-4</td>
<td>Clears the outline 'used' flag</td>
</tr>
<tr>
<td>CREATE_OUTLINE Procedure on page 59-5</td>
<td>Generates outlines from the shared cursor identified by hash value and child number</td>
</tr>
<tr>
<td>DROP_BY_CAT Procedure on page 59-6</td>
<td>Drops outlines that belong to a specified category</td>
</tr>
<tr>
<td>DROP_UNUSED Procedure on page 59-7</td>
<td>Drops outlines that have never been applied in the compilation of a SQL statement</td>
</tr>
<tr>
<td>EXACT_TEXT_SIGNATURES Procedure on page 59-8</td>
<td>Updates outline signatures to those that compute based on exact text matching</td>
</tr>
<tr>
<td>UPDATE_BY_CAT Procedure on page 59-9</td>
<td>Changes the category of outlines in one category to a new category</td>
</tr>
<tr>
<td>UPDATE_SIGNATURES Procedure on page 59-10</td>
<td>Updates outline signatures to the current version's signature</td>
</tr>
</tbody>
</table>
CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (
    name    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the outline.</td>
</tr>
</tbody>
</table>
**CREATE_OUTLINE Procedure**

This procedure generates an outline from the shared cursor identified by hash value and child number.

**Syntax**

```sql
DBMS_OUTLN.CREATE_OUTLINE (
    hash_value    IN NUMBER,
    child_number  IN NUMBER,
    category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash_value</td>
<td>Hash value identifying the target shared cursor.</td>
</tr>
<tr>
<td>child_number</td>
<td>Child number of the target shared cursor.</td>
</tr>
<tr>
<td>category</td>
<td>Category in which to create outline (optional).</td>
</tr>
</tbody>
</table>
DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the DEFAULT category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

DBMS_OUTLN.DROP_BY_CAT (  
   cat VARCHAR2);  

Parameters

Table 59–4 DROP_BY_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat</td>
<td>Category of outlines to drop.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the DEFAULT category:

DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use DROP_UNUSED for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.
EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

DBMS.OUTLN.EXACT_TEXT_SIGNATURES;

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.
**UPDATE_BY_CAT Procedure**

This procedure changes the category of all outlines in one category to a new category.

**Syntax**

```
DBMS.OUTLN.UPDATE_BY_CAT (  
    oldcat    VARCHAR2 default 'DEFAULT',
    newcat    VARCHAR2 default 'DEFAULT');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldcat</td>
<td>The current category of outlines.</td>
</tr>
<tr>
<td>newcat</td>
<td>The new category of outlines.</td>
</tr>
</tbody>
</table>
**UPDATE_SIGNATURES Procedure**

This procedure updates outline signatures to the current version’s signature.

**Syntax**

```plsql
DBMS.OUTLN.UPDATE_SIGNATURES;
```

**Usage Notes**

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.
The DBMS_OUTLN_EDIT package is an invoker's rights package.

**See Also:** For more information about using the DBMS_OUTLN_EDIT package, see UsingPlan Stability in Oracle Database Performance Tuning Guide.

This chapter contains the following topic:

- Summary of DBMS_OUTLN_EDIT Subprograms
### Summary of DBMS_OUTLN_EDIT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CHANGE_JOIN_POS Procedure</strong> on page 60-3</td>
<td>Changes the join position for the hint identified by outline name and hint number to the position specified by newpos</td>
</tr>
<tr>
<td><strong>CREATE_EDIT_TABLES Procedure</strong> on page 60-4</td>
<td>Creates outline editing tables in calling a user's schema</td>
</tr>
<tr>
<td><strong>DROP_EDIT_TABLES Procedure</strong> on page 60-5</td>
<td>Drops outline editing tables in calling the user's schema</td>
</tr>
<tr>
<td><strong>GENERATE_SIGNATURE Procedure</strong> on page 60-6</td>
<td>Generates a signature for the specified SQL text</td>
</tr>
<tr>
<td><strong>REFRESH_PRIVATE_OUTLINE Procedure</strong> on page 60-7</td>
<td>Refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints</td>
</tr>
</tbody>
</table>
CHANGE_JOIN_POS Procedure

This function changes the join position for the hint identified by outline name and hint number to the position specified by newpos.

Syntax

DBMS_OUTLN_EDIT.CHANGE_JOIN_POS (    name VARCHAR2    hintno NUMBER    newpos NUMBER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the private outline to be modified.</td>
</tr>
<tr>
<td>hintno</td>
<td>Hint number to be modified.</td>
</tr>
<tr>
<td>newpos</td>
<td>New join position for the target hint.</td>
</tr>
</tbody>
</table>
CREATE_EDIT_TABLES Procedure

This procedure creates outline editing tables in calling a user's schema.

Syntax

```sql
DBMS_OUTLN_EDIT.CREATE_EDIT_TABLES;
```

Usage Notes

Beginning with release 10i you will not need to use this statement because the outline editing tables will already exist as temporary tables in the SYSTEM schema.
DROP_EDIT_TABLES Procedure

This procedure drops outline editing tables in calling the user's schema.

Syntax

DBMS_OUTLN_EDIT.DROP_EDIT_TABLES;
GENERATE_SIGNATURE Procedure

This procedure generates a signature for the specified SQL text.

Syntax

DBMS_OUTLN.GENERATE_SIGNATURE (
  sqltxt IN VARCHAR2,
  signature OUT RAW);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqltxt</td>
<td>The specified SQL.</td>
</tr>
<tr>
<td>signature</td>
<td>The signature to be generated.</td>
</tr>
</tbody>
</table>
REFRESH_PRIVATE_OUTLINE Procedure

This procedure refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints.

Syntax

DBMS_OUTLN_EDIT.REFRESH_PRIVATE_OUTLINE (name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the private outline to be refreshed.</td>
</tr>
</tbody>
</table>
REFRESH_PRIVATE_OUTLINE Procedure
The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- Using DBMS_OUTPUT
  - Security Model
  - Types
  - Operational Notes
  - Exceptions
  - Deprecated Subprograms
  - Exceptions
  - Summary of DBMS_OUTPUT Subprograms
Using DBMS_OUTPUT

Security Model

At the end of this script, a public synonym (DBMS_OUTPUT) is created and EXECUTE permission on this package is granted to public.

Types

Type CHARARR is a table type.

Operational Notes

The PUT_LINE Procedures and PUT_LINE Procedures in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the GET_LINE Procedure.

If you do not call GET_LINE, or if you do not display the messages on your screen in SQL*Plus or Enterprise Manager, then the buffered messages are ignored. A trigger might want to print out some debugging information. To do this, the trigger would do:

```sql
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the DBMS_OUTPUT package, then this PUT_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), get the line of information back. For example:
BEGIN
    DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;

It could then display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to GET_LINES Procedure which can return an array of lines.

Enterprise Manager and SQL*Plus implement a SET SERVEROUTPUT ON command to know whether to make calls to GET_LINE(S) after issuing INSERT, UPDATE, DELETE or anonymous PL/SQL calls (these are the only ones that can cause triggers or stored procedures to be executed).

---

**Note:** Messages sent using DBMS_OUTPUT are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

---

### Exceptions

DBMS_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10027</td>
<td>Buffer overflow</td>
</tr>
<tr>
<td>ORU-10028</td>
<td>Line length overflow</td>
</tr>
</tbody>
</table>

---

### Deprecated Subprograms

The PUT Procedures that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

### Examples

**Example 1: Debugging Stored Procedures and Triggers**

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about
an object and format this output, as shown in "Example 2: Retrieving Information
About an Object" on page 61-5.

This function queries the employee table and returns the total salary for a specified
department. The function includes several calls to the PUT_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages    NUMBER(11, 2) := 0;
  counter        NUMBER(10) := 1;
BEGIN
  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal
                 + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
                 '; Wages = '|| TO_CHAR(total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
                 TO_CHAR(total_wages));
RETURN total_wages;
END dept_salary;
```

Assume the EMP table contains the following rows:

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>SAL</th>
<th>COMM</th>
<th>DEPT</th>
</tr>
</thead>
<tbody>
<tr>
<td>-----</td>
<td>-----</td>
<td>-----</td>
<td>----</td>
</tr>
<tr>
<td>1002</td>
<td>1500</td>
<td>500</td>
<td>20</td>
</tr>
<tr>
<td>1203</td>
<td>1000</td>
<td></td>
<td>30</td>
</tr>
<tr>
<td>1289</td>
<td>1000</td>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>1347</td>
<td>1000</td>
<td>250</td>
<td>20</td>
</tr>
</tbody>
</table>

Assume the user executes the following statements in the Enterprise Manager SQL
Worksheet input pane:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
```
Using DBMS_OUTPUT

Loop number = 2; Wages = 3250
Total wages = 3250

PL/SQL procedure successfully executed.

Example 2: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

/******************************************************************/
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                */
/******************************************************************/
CREATE OR REPLACE PROCEDURE explain_out
  (statement_id IN VARCHAR2) AS

  CURSOR explain_rows IS
    SELECT level, id, position, operation, options,
           object_name
    FROM plan_table
    WHERE statement_id = explain_out.statement_id
    CONNECT BY PRIOR id = parent_id
    AND statement_id = explain_out.statement_id
    START WITH id = 0
    ORDER BY id;

BEGIN

  -- Loop through information retrieved from PLAN_TABLE:
  FOR line IN explain_rows LOOP

    -- At start of output, include heading with estimated cost.
    IF line.id = 0 THEN
      DBMS_OUTPUT.PUT_LINE ('Plan for statement ' || statement_id || ', estimated cost = ' || line.position);
    END IF;

  END LOOP;

END;

*/
Examples

END IF;

-- Output formatted information. LEVEL determines indentation level.

DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||
   line.operation || ' ' || line.options || ' ' ||
   line.object_name);
END LOOP;

END;

## Summary of DBMS_OUTPUT Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedure on page 61-8</td>
<td>Disables message output</td>
</tr>
<tr>
<td>ENABLE Procedure on page 61-9</td>
<td>Enables message output</td>
</tr>
<tr>
<td>GET_LINE Procedure on page 61-10</td>
<td>Retrieves one line from buffer</td>
</tr>
<tr>
<td>GET_LINES Procedure on page 61-10</td>
<td>Retrieves an array of lines, from buffer</td>
</tr>
<tr>
<td>PUT Procedures on page 61-13</td>
<td>Places a line in the buffer</td>
</tr>
<tr>
<td>PUT_LINE Procedures on page 61-15</td>
<td>Places partial line in buffer</td>
</tr>
<tr>
<td>NEW_LINE Procedure on page 61-12</td>
<td>Terminates a line created with PUT</td>
</tr>
</tbody>
</table>

**Note:** The PUT Procedures that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.
DISABLE Procedure

This procedure disables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and purges the buffer of any remaining information.

As with ENABLE, you do not need to call this procedure if you are using the SERVEROUTPUT option of Enterprise Manager or SQL*Plus.

Syntax

DBMS_OUTPUT.DISABLE;

Pragmas

pragma restrict_references(disable,WNDS,RNDS);
ENABLE Procedure

This procedure enables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. Calls to these procedures are ignored if the DBMS_OUTPUT package is not enabled.

Syntax

```sql
DBMS_OUTPUT.ENABLE (
    buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```sql
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer_size</td>
<td>Amount of information, in bytes, to buffer.</td>
</tr>
</tbody>
</table>

Usage Notes

**Note:** It is not necessary to call this procedure when you use the SERVEROUTPUT option of Enterprise Manager or SQL*Plus.

If there are multiple calls to ENABLE, then `buffer_size` is the largest of the values specified. The maximum size is 1,000,000, and the minimum is 2,000.

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000:</td>
<td>Buffer overflow, limit of <code>&lt;buffer_limit&gt;</code> bytes.</td>
</tr>
<tr>
<td>ORU-10027:</td>
<td></td>
</tr>
</tbody>
</table>
GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```sql
DBMS_OUTPUT.GET_LINE (    line OUT VARCHAR2,    status OUT INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>Returns a single line of buffered information, excluding a final newline character: The maximum length is 255 bytes.</td>
</tr>
<tr>
<td>status</td>
<td>If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.</td>
</tr>
</tbody>
</table>

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using Enterprise Manager or SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.
**GET_LINES Procedure**

This procedure retrieves an array of lines from the buffer.

**Syntax**

```sql
DBMS_OUTPUT.GET_LINES (  
  lines       OUT  CHARARR,  
  numlines    IN OUT  INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lines</td>
<td>Returns an array of lines of buffered information. CHARARR is a table of VARCHAR2(255). The maximum length of each line in the array is 255 bytes.</td>
</tr>
<tr>
<td>numlines</td>
<td>Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using Enterprise Manager or SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.
NEW_LINE Procedure

This procedure puts an end-of-line marker. GET_LINE(S) returns "lines" as delimited by "newlines". Every call to PUT_LINE or NEW_LINE generates a line that is returned by GET_LINE(S).

Syntax

DBMS_OUTPUT.NEW_LINE;

Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000, ORU-10027:</td>
<td>Buffer overflow, limit of &lt;buf_limit&gt; bytes.</td>
</tr>
<tr>
<td>ORA-20000, ORU-10028:</td>
<td>Line length overflow, limit of 255 bytes for each line.</td>
</tr>
</tbody>
</table>
PUT Procedures

This procedure places a line in the buffer.

**Note:** The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

**Syntax**

DBMS_OUTPUT.PUT (item IN VARCHAR2);

DBMS_OUTPUT.PUT (item IN NUMBER);

**Parameters**

**Table 61–8 PUT and PUT_LINE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Item to buffer.</td>
</tr>
</tbody>
</table>

**Exceptions**

**Table 61–9 PUT and PUT_LINE Procedure Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000</td>
<td>Buffer overflow, limit of &lt;buf_limit&gt; bytes.</td>
</tr>
<tr>
<td>ORU-10027:</td>
<td></td>
</tr>
<tr>
<td>ORA-20000,</td>
<td>Line length overflow, limit of 255 bytes for each line.</td>
</tr>
<tr>
<td>ORU-10028:</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Notes**

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
If your line exceeds the buffer limit, then you receive an error message.

Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, Enterprise Manager or SQL*Plus do not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```sql
SQL> SET SERVER OUTPUT ON
SQL> BEGIN
    2   DBMS_OUTPUT.PUT_LINE ('hello');
    3   DBMS_LOCK.SLEEP (10);
    4   END;
```
PUT_LINE Procedures

This procedure places a partial line in the buffer.

---

**Note:** The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

---

**Syntax**

```sql
DBMS_OUTPUT.PUT_LINE (item IN VARCHAR2);

DBMS_OUTPUT.PUT      (item IN NUMBER);
```

**Parameters**

**Table 61–10  PUT and PUT_LINE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Item to buffer.</td>
</tr>
</tbody>
</table>

**Exceptions**

**Table 61–11  PUT and PUT_LINE Procedure Exceptions**

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000,</td>
<td>Buffer overflow, limit of &lt;buf_limit&gt; bytes.</td>
</tr>
<tr>
<td>ORU-10027:</td>
<td></td>
</tr>
<tr>
<td>ORA-20000,</td>
<td>Line length overflow, limit of 255 bytes for each line.</td>
</tr>
<tr>
<td>ORU-10028:</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Notes**

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.

- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
If your line exceeds the buffer limit, then you receive an error message.

Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, Enterprise Manager or SQL*Plus do not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```sql
SQL> SET SERVER OUTPUT ON
SQL> BEGIN
  2    DBMS_OUTPUT.PUT_LINE ('hello');
  3    DBMS_LOCK.SLEEP (10);
  4    END;
```
The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

**See Also:** There are several rules concerning partitions and indexes. For more information, see Oracle Database Concepts and Oracle Database Administrator’s Guide.

This chapter contains the following topics:

- **Using DBMS_PCLXUTIL**
  - Overview
  - Operational Notes
  - Rules and Limits
- **Summary of DBMS_PCLXUTIL Subprograms**
Using DBMS_PCLXUTIL

Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

   The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

   ```sql
   CREATE INDEX <idx_name> on <tab_name>(...) local(...) unusable;
   ```

   This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

   ```sql
   EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
   ```

   For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

2. Local index maintenance

   By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The force_opt parameter provides a way to override this and build local indexes for all partitions.
ALTER INDEX <idx_name> local(...) unusable;

Rebuild only the desired (sub)partitions (that are marked unusable):
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);

Rebuild all (sub)partitions using force_opt = TRUE:
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

Rules and Limits

**Note:** For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8i.

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the job_queue_processes initialization parameter. Clearly, if the job processes are not started before calling BUILD_PART_INDEX(), then the package will not function properly. The background processes are specified by the following init.ora parameters:

  job_queue_processes=n  #the number of background processes = n

- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package
prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the j*.trc trace files.
## Summary of DBMS_PCLXUTIL Subprograms

### Table 62–1   DBMS_PCLXUTIL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_PART_INDEX Procedure</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes</td>
</tr>
</tbody>
</table>
BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```sql
DBMS_PCLXUTIL.BUILD_PART_INDEX (    jobs_per_batch  IN NUMBER   DEFAULT 1,    procs_per_job   IN NUMBER   DEFAULT 1,    tab_name        IN VARCHAR2 DEFAULT NULL,    idx_name        IN VARCHAR2 DEFAULT NULL,    force_opt       IN BOOLEAN  DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobs_per_batch</td>
<td>The number of concurrent partition-wise &quot;local index builds&quot;.</td>
</tr>
<tr>
<td>procs_per_job</td>
<td>The number of parallel query slaves to be utilized for each local index build (1 &lt;= procs_per_job &lt;= max_slaves).</td>
</tr>
<tr>
<td>tab_name</td>
<td>The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).</td>
</tr>
<tr>
<td>idx_name</td>
<td>The name given to the local index (an exception is raised if a local index is not created on the table tab_name).</td>
</tr>
<tr>
<td>force_opt</td>
<td>If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.</td>
</tr>
</tbody>
</table>

Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```
The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

Using DBMS_PIPE

Using DBMS_PIPE

- Overview
- Security Model
- Constants
- Operational Notes
- Exceptions
- Examples

Overview

Pipe functionality has several potential applications:

- External service interface: You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.

- Independent transactions: The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).

- Alerters (non-transactional): You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.

- Debugging: Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.

- Concentrator: This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.
Security Model

Security can be achieved by use of GRANT EXECUTE on the DBMS_PIPE package by creating a pipe using the private parameter in the CREATE_PIPE function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either Public Pipes or Private Pipes.

Constants

maxwait  constant integer := 86400000; /* 1000 days */

This is the maximum time to wait attempting to send or receive a message.

Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of DBMS_PIPE is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

Public Pipes

You may create a public pipe either implicitly or explicitly. For implicit public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.
You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

**Writing and Reading Pipes**

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

**Private Pipes**

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`
An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to PACK_MESSAGE before calling SEND_MESSAGE. Similarly, you must call RECEIVE_MESSAGE to retrieve the message before accessing the items in the message by calling UNPACK_MESSAGE.

Exceptions

DBMS_PIPE package subprograms can return the following errors:

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-23321</td>
<td>Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.</td>
</tr>
</tbody>
</table>

Examples

- Example 1: Debugging
- Example 2: Execute System Commands
- Example 3: External Service Interface

Example 1: Debugging

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```sql
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
  status  NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
  DBMS_PIPE.PACK_MESSAGE(msg);
  status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
  IF status != 0 THEN
    raise_application_error(-20099, 'Debug error');
  END IF;
END;
```
The following Pro*C code receives messages from the PLSQL_DEBUG pipe in "Example 1: Debugging" and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```c
#include <stdio.h>
#include <string.h>
EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int     status;
    int     msg_length;
    char    retval[2000];
EXEC SQL END DECLARE SECTION;
EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "SCOTT/TIGER");
    username.len = strlen(username.arr);
    EXEC SQL WHENEVER SQLError DO sql_error();
    EXEC SQL CONNECT :username;
    printf("connected\n");
    
    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)
    {
        EXEC SQL EXECUTE
        DECLARE
            len INTEGER;
            typ INTEGER;
            sta INTEGER;
            chr VARCHAR2(2000);
        BEGIN
            chr := '\';
```
Example 2: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the `system()` call or executing a SQL command using embedded SQL.

`DAEMON.SQL` is the source code for the PL/SQL package. This package contains procedures that use the `DBMS_PIPE` package to send and receive message to and
from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro*C daemon to execute the command `system("ls -la")`.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

**DAEMON.SQL Example.** This is the code for the PL/SQL DAEMON package:

```sql
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                        timeout NUMBER DEFAULT 10)
                        RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                           timeout NUMBER DEFAULT 10)
                           RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                           timeout NUMBER DEFAULT 10)
                           RETURN NUMBER IS

    status       NUMBER;
    result       VARCHAR2(20);
    command_code NUMBER;
    pipe_name    VARCHAR2(30);
    BEGIN

```

63-8  PL/SQL Packages and Types Reference
pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

DBMS_PIPE.PACK_MESSAGE('SYSTEM');
DBMS_PIPE.PACK_MESSAGE(pipe_name);
DBMS_PIPE.PACK_MESSAGE(command);
status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
IF status <> 0 THEN
RAISE_APPLICATION_ERROR(-20010,
'Execute_system: Error while sending. Status = ' ||
status);
END IF;

status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
IF status <> 0 THEN
RAISE_APPLICATION_ERROR(-20011,
'Execute_system: Error while receiving.
Status = ' || status);
END IF;

DBMS_PIPE.UNPACK_MESSAGE(result);
IF result <> 'done' THEN
RAISE_APPLICATION_ERROR(-20012,
'Execute_system: Done not received.');
END IF;

DBMS_PIPE.UNPACK_MESSAGE(command_code);
DBMS_OUTPUT.PUT_LINE('System command executed. result = ' ||
command_code);
RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
timeout NUMBER DEFAULT 10)
RETURN NUMBER IS
status NUMBER;
result VARCHAR2(20);
command_code NUMBER;
pipe_name VARCHAR2(30);

BEGIN
pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

DBMS_PIPE.PACK_MESSAGE('SQL');
DBMS_PIPE.PACK_MESSAGE(pipe_name);
Example

```plsql
DBMS_PIPE.PACK_MESSAGE(command);
status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
IF status <> 0 THEN
   RAISE_APPLICATION_ERROR(-20020,
      'Execute_sql: Error while sending. Status = ' || status);
END IF;

status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
IF status <> 0 THEN
   RAISE_APPLICATION_ERROR(-20021,
      'execute_sql: Error while receiving.
      Status = ' || status);
END IF;

DBMS_PIPE.UNPACK_MESSAGE(result);
IF result <> 'done' THEN
   RAISE_APPLICATION_ERROR(-20022,
      'execute_sql: done not received.');</end IF;

DBMS_PIPE.UNPACK_MESSAGE(command_code);
DBMS_OUTPUT.PUT_LINE
   ('SQL command executed. sqlcode = ' || command_code);
RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
   status NUMBER;
BEGIN
   DBMS_PIPE.PACK_MESSAGE('STOP');
   status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
   IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20030,
         'stop: error while sending. status = ' || status);
   END IF;
END stop;
END daemon;
```

demon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.
Using DBMS_PIPE

Note: To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

proc iname=daemon userid=scott/tiger sqlcheck=semantics

Then C-compile and link in the normal way.

#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;
EXEC SQL BEGIN DECLARE SECTION;
    char *uid = "scott/tiger";
    int status;
    VARCHAR command[20];
    VARCHAR value[2000];
    VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:
");
    printf("\%"s\n", msg_buffer);
    printf("Daemon quitting.
");
    exit(1);
}

void
sql_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;
EXEC SQL WHENEVER SQLERROR CONTINUE;
sqlglm(msg_buffer, &buffer_size, &msg_length);
printf("Daemon error while executing:
");
printf("%.*s\n", msg_length, msg_buffer);
printf("Daemon continuing.\n");
}
main()
{
command.len = 20; /* initialize length components*/
value.len = 2000;
return_name.len = 30;
EXEC SQL WHENEVER SQLERROR DO connect_error();
EXEC SQL CONNECT :uid;
printf("Daemon connected.\n");
EXEC SQL WHENEVER SQLERROR DO sql_error();
printf("Daemon waiting...\n");
while (1) {
 EXEC SQL EXECUTE
 BEGIN
  :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
  IF :status = 0 THEN
   DBMS_PIPE.UNPACK_MESSAGE(:command);
  END IF;
 END;
END-EXEC;
IF (status == 0)
{
 command.arr[command.len] = '\0';
 IF (!strcmp((char *) command.arr, "STOP"))
  {
   printf("Daemon exiting.\n");
   break;
  }
 ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
  {
   EXEC SQL EXECUTE
 BEGIN
    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
    DBMS_PIPE.UNPACK_MESSAGE(:value);
   END;
 END-EXEC;
  value.arr[value.len] = '\0';
  printf("Will execute system command '%s'\n", value.arr);
Using DBMS_PIPE

```
status = system(value.arr);
EXEC SQL EXECUTE
    BEGIN
        DBMS_PIPE.PACK_MESSAGE('done');
        DBMS_PIPE.PACK_MESSAGE(:status);
        :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
    END;
END-EXEC;

IF (status)
{
    printf("Daemon error while responding to system command.");
    printf(" status: %d\n", status);
}

ELSE IF (!strcmp((char *) command.arr, "SQL")) {
    EXEC SQL EXECUTE
        BEGIN
            DBMS_PIPE.UNPACK_MESSAGE(:return_name);
            DBMS_PIPE.UNPACK_MESSAGE(:value);
        END;
END-EXEC;
value.arr[value.len] = '\0';
printf("Will execute sql command '%s'\n", value.arr);
EXEC SQL WHENEVER SQLERROR CONTINUE;
EXEC SQL EXECUTE IMMEDIATE :value;
status = sqlca.sqlcode;
EXEC SQL WHENEVER SQLERROR DO sql_error();
EXEC SQL EXECUTE
    BEGIN
        DBMS_PIPE.PACK_MESSAGE('done');
        DBMS_PIPE.PACK_MESSAGE(:status);
        :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
    END;
END-EXEC;

IF (status)
{
    printf("Daemon error while responding to sql command.");
    printf(" status: %d\n", status);
}
```

DBMS_PIPE 63-13
Examples

} ELSE {
  printf
    ("Daemon error: invalid command '%s' received.\n", command.arr);
} }
ELSE {
  printf("Daemon error while waiting for signal.");
  printf(" status = %d\n", status);
}
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

Example 3: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol_version</td>
<td>VARCHAR2</td>
<td>- '1', 10 bytes or less</td>
</tr>
<tr>
<td>returnpipe</td>
<td>VARCHAR2</td>
<td>- 30 bytes or less</td>
</tr>
<tr>
<td>service</td>
<td>VARCHAR2</td>
<td>- 30 bytes or less</td>
</tr>
<tr>
<td>arg1</td>
<td>VARCHAR2/NUMBER/DATE</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>argn</td>
<td>VARCHAR2/NUMBER/DATE</td>
<td></td>
</tr>
</tbody>
</table>

The recommended format for returning the result is:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>VARCHAR2</td>
<td>- 'SUCCESS' if OK, otherwise error message</td>
</tr>
<tr>
<td>arg1</td>
<td>VARCHAR2/NUMBER/DATE</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>argn</td>
<td>VARCHAR2/NUMBER/DATE</td>
<td></td>
</tr>
</tbody>
</table>

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

<loop forever>
BEGIN dbms_stock_server.get_request(:stocksymbol); END;

63-14  PL/SQL Packages and Types Reference
<figure out price based on stocksymbol (probably from some radio signal), set error if can't find such a stock>
BEGIN dbms_stock_server.return_price(:error, :price); END;

A client would do:
BEGIN :price := stock_request('YOURCOMPANY'); end;

The stored procedure, dbms_stock_server, which is called by the preceding "stock price request server" is:

CREATE OR REPLACE PACKAGE dbms_stock_server IS
PROCEDURE get_request(symbol OUT VARCHAR2);
PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS

PROCEDURE returnerror(reason VARCHAR2) IS
  s INTEGER;
BEGIN
  dbms_pipe.pack_message(reason);
  s := dbms_pipe.send_message(returnpipe);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:' || to_char(s) ||
                               ' sending on pipe');
  END IF;
END;

PROCEDURE get_request(symbol OUT VARCHAR2) IS
  protocol_version VARCHAR2(10);
  s INTEGER;
  service VARCHAR2(30);
BEGIN
  s := dbms_pipe.receive_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:' || to_char(s) ||
                               ' reading pipe');
  END IF;
  dbms_pipe.unpack_message(protocol_version);
  IF protocol_version <> '1' THEN
    raise_application_error(-20000, 'Bad protocol: ' ||
                              protocol_version);
  END IF;
Examples

```plsql
PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
  s INTEGER;
BEGIN
  IF errormsg is NULL THEN
    dbms_pipe.pack_message('SUCCESS');
    dbms_pipe.pack_message(price);
  ELSE
    dbms_pipe.pack_message(errormsg);
  END IF;
  s := dbms_pipe.send_message(returnpipe);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:' || to_char(s) || ' sending on pipe');
  END IF;
END;
END;

The procedure called by the client is:

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2) RETURN VARCHAR2 IS
  s INTEGER;
  price VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1');  -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:' || to_char(s) || ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:' || to_char(s) ||
```
' receiving on pipe');
END IF;
dbms_pipe.unpack_message(errormsg);
IF errmsg <> 'SUCCESS' THEN
   raise_application_error(-20000, errmsg);
END IF;
dbms_pipe.unpack_message(price);
RETURN price;
END;

You would typically only grant execute on dbms_stock_service to the stock service application server, and would only grant execute on stock_request to those users allowed to use the service.

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the private flag is TRUE, then the pipe creator is assigned as the owner of the private pipe.

 Explicitly-created pipes can only be removed by calling REMOVE_PIPE, or by shutting down the instance.

Syntax

DBMS_PIPE.CREATE_PIPE ( 
  pipename IN VARCHAR2, 
  maxpipesize IN INTEGER DEFAULT 8192, 
  private IN BOOLEAN DEFAULT TRUE) 
RETURN INTEGER;

Pragmas

pragma restrict_references(create_pipe,WNDS,RNDS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of the pipe you are creating. You must use this name when you call SEND_MESSAGE and RECEIVE_MESSAGE. This name must be unique across the instance. Caution: Do not use pipe names beginning with ORA$. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.</td>
</tr>
</tbody>
</table>
CREATE_PIPE Function

**Table 63–3  (Cont.) CREATE_PIPE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxpipesize</td>
<td>The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default maxpipesize is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value use the existing, larger value.</td>
</tr>
<tr>
<td>private</td>
<td>Uses the default, TRUE, to create a private pipe. Public pipes can be implicitly created when you call SEND_MESSAGE.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 63–4  CREATE_PIPE Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</td>
</tr>
</tbody>
</table>

**Exceptions**

**Table 63–5  CREATE_PIPE Function Exception**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error: Pipe with the same name already exists, and you are not allowed to use it.</td>
</tr>
</tbody>
</table>
PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to PACK_MESSAGE. Then, call SEND_MESSAGE to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type VARCHAR2, NCHAR, NUMBER, DATE, RAW and ROWID items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than VARCHAR is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (item  IN  VARCHAR2);
DBMS_PIPE.PACK_MESSAGE (item  IN  NCHAR);
DBMS_PIPE.PACK_MESSAGE (item  IN  NUMBER);
DBMS_PIPE.PACK_MESSAGE (item  IN  DATE);
DBMS_PIPE.PACK_MESSAGE_RAW (item  IN  RAW);
DBMS_PIPE.PACK_MESSAGE_ROWID (item  IN  ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```
In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call SEND_MESSAGE to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.
SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to PACK_MESSAGE. You can create a pipe explicitly using CREATEPIPE, otherwise, it is created implicitly.

Syntax

```sql
DBMS_PIPE.SEND_MESSAGE (  
ipasename IN VARCHAR2,  
timeout IN INTEGER DEFAULT MAXWAIT,  
maxpipesize IN INTEGER DEFAULT 8192)  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called CREATE_PIPE. Caution: Do not use pipe names beginning with 'ORA$. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.</td>
</tr>
<tr>
<td>timeout</td>
<td>Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days).</td>
</tr>
</tbody>
</table>
### Return Values

**Table 63–8  **SEND_MESSAGE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</td>
</tr>
<tr>
<td>1</td>
<td>Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</td>
</tr>
<tr>
<td>3</td>
<td>An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.</td>
</tr>
<tr>
<td>ORA–23322</td>
<td>Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA–23322, indicating the naming conflict.</td>
</tr>
</tbody>
</table>

**maxpipesize**

Maximum size allowed for the pipe, in bytes.

The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.

The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value.

Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.
## Exceptions

### Table 63-9  SEND_MESSAGE Function Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.</td>
</tr>
</tbody>
</table>
RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```sql
DBMS_PIPE.RECEIVE_MESSAGE (  
    pipename     IN VARCHAR2,
    timeout      IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(receive_message,WNDS,RNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of the pipe on which you want to receive a message. Names beginning with ORA$ are reserved for use by Oracle.</td>
</tr>
<tr>
<td>timeout</td>
<td>Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Timed out. If the pipe was implicitly-created and is empty, then it is removed.</td>
</tr>
<tr>
<td>2</td>
<td>Record in the pipe is too large for the buffer. (This should not happen.)</td>
</tr>
<tr>
<td>3</td>
<td>An interrupt occurred.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>User has insufficient privileges to read from the pipe.</td>
</tr>
</tbody>
</table>
Usage Notes

To receive a message from a pipe, first call RECEIVE_MESSAGE. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call RECEIVE_MESSAGE does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to UNPACK_MESSAGE to access the individual items in the message. The UNPACK_MESSAGE procedure is overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.</td>
</tr>
</tbody>
</table>
NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer. After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call NEXT_ITEM_TYPE.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No more items</td>
</tr>
<tr>
<td>6</td>
<td>NUMBER</td>
</tr>
<tr>
<td>9</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>11</td>
<td>ROWID</td>
</tr>
<tr>
<td>12</td>
<td>DATE</td>
</tr>
<tr>
<td>23</td>
<td>RAW</td>
</tr>
</tbody>
</table>
UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call UNPACK_MESSAGE.

---

**Note:** The UNPACK_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

---

**Syntax**

```sql
DBMS_PIPE.UNPACK_MESSAGE (  
    item  OUT VARCHAR2);  

DBMS_PIPE.UNPACK_MESSAGE (  
    item  OUT NCHAR);  

DBMS_PIPE.UNPACK_MESSAGE (  
    item  OUT NUMBER);  

DBMS_PIPE.UNPACK_MESSAGE (  
    item  OUT DATE);  

DBMS_PIPE.UNPACK_MESSAGE_RAW (  
    item  OUT RAW);  

DBMS_PIPE.UNPACK_MESSAGE_ROWID (  
    item  OUT ROWID);  
```

**Pragmas**

```sql
pragma restrict_references(unpack_message,WNDS,RNDS);  
pragma restrict_references(unpack_message_raw,WNDS,RNDS);  
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);  
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Argument to receive the next unpacked item from the local message buffer.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.
**REMOVE_PIPE Function**

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

**Syntax**

```
DBMS_PIPE.REMOVE_PIPE (pipename IN VARCHAR2)
RETURN INTEGER;
```

**Pragmas**

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of pipe that you want to remove.</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td></td>
<td>If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td></td>
<td>If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.</td>
</tr>
</tbody>
</table>
## Exceptions

### Table 63–17  REMOVEPIPE Function Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.</td>
</tr>
</tbody>
</table>
**PURGE Procedure**

This procedure empties the contents of the named pipe. An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling **PURGE** lets you free the memory associated with an implicitly-created pipe.

**Syntax**

```
DBMS_PIPE.PURGE (
    pipename  IN  VARCHAR2);
```

**Pragmas**

```
pragma restrict_references(purge,WNDS,RNDS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Because **PURGE** calls **RECEIVE_MESSAGE**, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an **ORA-23322** (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

**Exceptions**

Permission error if pipe belongs to another user.
RESET_BUFFER Procedure

This procedure resets the PACK_MESSAGE and UNPACK_MESSAGE positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

DBMS_PIPE.RESET_BUFFER;

Pragmas

pragma restrict_references(reset_buffer,WNDS,RNDS);
UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the PIPENAME parameter for your SEND_MESSAGE and RECEIVE_MESSAGE calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.
The DBMS_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- Using DBMS_PROFILER
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
- Summary of DBMS_PROFILER Subprograms
Using DBMS_PROFILER

Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

Note: It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The PROFTAB.SQL script creates tables with the columns, datatypes, and definitions as shown in Table 64–1, Table 64–2, and Table 64–3.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>runid</td>
<td>NUMBER</td>

</tbody>
</table>
With Oracle database version 8.x, a sample textual report writer (profrep.sql) is provided with the PL/SQL demo scripts.

**Security Model**

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

**Operational Notes**

- **Typical Run**
- **Two Methods of Exception Generation**
Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a "run". A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the START_PROFILER and STOP_PROFILER functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables.

**Note:** The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the FLUSH_DATA or the STOP_PROFILER function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the FLUSH_DATA function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The PROFTAB.SQL script creates the tables and other data structures required for persistently storing the profiler data.

Note that running PROFTAB.SQL drops the current tables. The PROFTAB.SQL script is in the RDBMS/ADMIN directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code.
for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, "warm up" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the SYSADMIN should use a modified PROFLOAD.SQL script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

**Note:** Do not alter the actual fields of the tables.

**See Also:** "FLUSH_DATA Function and Procedure" on page 64-9.

**Two Methods of Exception Generation**

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.
Exceptions

Table 64–4  DBMS_PROFILER Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version_mismatch</td>
<td>Corresponds to error_version.</td>
</tr>
<tr>
<td>profiler_error</td>
<td>Corresponds to either &quot;error_param&quot; or &quot;error_io&quot;.</td>
</tr>
</tbody>
</table>

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'
  ```
  error_param constant binary_integer := 1;
  ```

- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'
  ```
  error_io    constant binary_integer := 2;
  ```

- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the DBMS_PROFILER package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.
  ```
  error_version constant binary_integer := -1;
  ```
Summary of DBMS_PROFILER Subprograms

Table 64–5  DBMS_PROFILER Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLUSH_DATA Function and Procedure on page 64-9</td>
<td>Flushes profiler data collected in the user's session</td>
</tr>
<tr>
<td>GET_VERSION Procedure on page 64-10</td>
<td>Gets the version of this API</td>
</tr>
<tr>
<td>INTERNAL_VERSION_CHECK Function on page 64-11</td>
<td>Verifies that this version of the DBMS_PROFILER package can work with the implementation in the database</td>
</tr>
<tr>
<td>PAUSE_PROFILER Function and Procedure on page 64-12</td>
<td>Pauses profiler data collection</td>
</tr>
<tr>
<td>RESUME_PROFILER Function and Procedure on page 64-13</td>
<td>Resumes profiler data collection</td>
</tr>
<tr>
<td>START_PROFILER Functions and Procedures on page 64-14</td>
<td>Starts profiler data collection in the user's session</td>
</tr>
<tr>
<td>STOP_PROFILER Function and Procedure on page 64-15</td>
<td>Stops profiler data collection in the user's session</td>
</tr>
</tbody>
</table>
FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

Note: Use the PROFTAB.SQL script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```sql
DBMS_PROFILER.FLUSH_DATA
RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```
GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major  OUT BINARY_INTEGER,  
    minor  OUT BINARY_INTEGER);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version of DBMS_PROFILER.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version of DBMS_PROFILER.</td>
</tr>
</tbody>
</table>
INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK
RETURN BINARY_INTEGER;
```
PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```sql
DBMS_PROFILER.PAUSE_PROFILER
RETURN BINARY_INTEGER;

DBMS_PROFILER.PAUSE_PROFILER;
```
RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```sql
DBMS_PROFILER.RESUME_PROFILER
RETURN BINARY_INTEGER;

DBMS_PROFILER.RESUME_PROFILER;
```
This function starts profiler data collection in the user’s session.

There are two overloaded forms of the START_PROFILER function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```sql
DBMS_PROFILER.START_PROFILER(
  run_comment   IN VARCHAR2 := sysdate,
  run_comment1  IN VARCHAR2 := '',
  run_number    OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```sql
DBMS_PROFILER.START_PROFILER(
  run_comment IN VARCHAR2 := sysdate,
  run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```sql
DBMS_PROFILER.START_PROFILER(
  run_comment   IN VARCHAR2 := sysdate,
  run_comment1  IN VARCHAR2 := '',
  run_number    OUT BINARY_INTEGER);
```

```sql
DBMS_PROFILER.START_PROFILER(
  run_comment IN VARCHAR2 := sysdate,
  run_comment1 IN VARCHAR2 := '');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_comment</td>
<td>Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.</td>
</tr>
<tr>
<td>run_number</td>
<td>Stores the number of the run so you can store and later recall the run’s data.</td>
</tr>
<tr>
<td>run_comment1</td>
<td>Allows you to make interesting comments about the run.</td>
</tr>
</tbody>
</table>
STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user’s session.
This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER
  RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.STOP_PROFILER;
```
The DBMS_PROPAGATION_ADM package, one of a set of Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

**See Also:** Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and propagations

This chapter contains the following topic:
- Summary of DBMS_PROPAGATION_ADM Subprograms
### Table 65–1  DBMS_PROPAGATION_ADM Package Subprograms

**Note:** All procedures commit unless specified otherwise.
ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

See Also: Oracle Streams Concepts and Administration and Chapter 82, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
    propagation_name IN VARCHAR2,
    rule_set_name IN VARCHAR2 DEFAULT NULL,
    remove_rule_set IN BOOLEAN DEFAULT false,
    negative_rule_set_name IN VARCHAR2 DEFAULT NULL,
    remove_negative_rule_set IN BOOLEAN DEFAULT false);
```
ALTER_PROPAGATION Procedure

Parameters

Table 65–2  ALTER_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate events. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [schema_name.] rule_set_name. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to false, then retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to true, then removes any existing positive rule set.</td>
</tr>
<tr>
<td>remove_rule_set</td>
<td>If true, then removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all events. If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all events in its queue that are not discarded by the negative rule set. If false, then retains the positive rule set for the specified propagation. If the rule_set_name parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
negative_rule_set_name  | The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard events.
If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default.
An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.
If you specify NULL and the remove_negative_rule_set parameter is set to false, then retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to true, then removes any existing negative rule set.
If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
If false, then retains the negative rule set for the specified propagation.
If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to false.

remove_negative_rule_set  | If true, then removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all events.
If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all events in its queue that are not discarded by the positive rule set.
If false, then retains the negative rule set for the specified propagation.

<table>
<thead>
<tr>
<th>Parameter</th>

For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to false, then retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to true, then removes any existing negative rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first. If false, then retains the negative rule set for the specified propagation. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates events in a local source queue to a destination queue. The destination queue may or may not be in the same database as the source queue.

This procedure also starts propagation and establishes a default schedule for its propagation job. The default schedule has the following properties:

- The start time is \texttt{SYSDATE()}
- The duration is \texttt{NULL}, which means infinite.
- The next time is \texttt{NULL}, which means that propagation restarts as soon as it finishes the current duration.
- The latency is five seconds, which is the wait time for a message to be propagated to a destination queue after it is enqueued into a queue with no messages requiring propagation to the same destination queue.

\textbf{See Also:}

- Chapter 82, "DBMS_RULE_ADM"
- Oracle Streams Concepts and Administration

\textbf{Syntax}

\begin{verbatim}
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
    propagation_name        IN  VARCHAR2,
    source_queue            IN  VARCHAR2,
    destination_queue       IN  VARCHAR2,
    destination_dblink      IN  VARCHAR2  DEFAULT NULL,
    rule_set_name           IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL);
\end{verbatim}
Parameters

Table 65–3  CREATE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| propagation_name   | The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner.  
                      | **Note:** The propagation_name setting cannot be altered after the propagation is created.                                                   |
| source_queue       | The name of the source queue, specified as `[schema_name.]queue_name`. The current database must contain the source queue.  
                      | For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |
| destination_queue  | The name of the destination queue, specified as `[schema_name.]queue_name`.  
                      | For example, to specify a destination queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. |
| destination_dblink | The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue.  
                      | If NULL, then the source queue and destination queue must be in the same database.  
                      | **Note:** Connection qualifiers are not allowed.                                                                                         |

If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</td>
</tr>
</tbody>
</table>
Usage Notes

If no propagation job exists for the database link specified when this procedure is run, then a propagation job is created for use by the propagation. If a propagation job is created, then the user who runs this procedure owns the propagation job. If a propagation job already exists for the specified database link, then the existing propagation job is used.

You can administer a propagation job using the following procedures in the DBMS_AQADM package:

- To alter the default schedule for a propagation job, use the ALTER_PROPAGATION_SCHEDULE procedure.
- To stop propagation, use the DISABLE_PROPAGATION_SCHEDULE procedure and specify the source queue for the queue_name parameter and the database link for the destination parameter.
- To restart propagation, use the ENABLE_PROPAGATION_SCHEDULE procedure and specify the source queue for the queue_name parameter and the database link for the destination parameter. Restarting propagation may be necessary if a propagation job is disabled automatically due to errors.

These types of changes affect all propagations that use the propagation job.

The user who owns the source queue is the user who propagates events. This user must have the necessary privileges to propagate events. These privileges include the following:

- Execute privilege on the rule set used by the propagation
- Execute privilege on all rule-based transformation functions used in the rule set
- Enqueue privilege on the destination queue if the destination queue is in the same database

If the propagation propagates events to a destination queue in a remote database, then the owner of the source queue must be able to use the propagation's database link and the user to which the database link connects at the remote database must have enqueue privilege on the destination queue.
Note:

- Currently, a single propagation job propagates all events that use a particular database link, even if the database link is used by multiple propagations to propagate events to multiple destination queues.

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users may or may not be the same.
DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all captured and user-enqueued events for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name       IN  VARCHAR2,
    drop_unused_rule_sets  IN  BOOLEAN  DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If true, then drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If false, then does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

See Also: Oracle Streams Concepts and Administration for more information about Streams data dictionary views

The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
DROP_PROPAGATION Procedure

- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

**Note:** When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.
The DBMS_RANDOM package provides a built-in random number generator. DBMS_RANDOM is not intended for cryptography.

This chapter contains the following topics:

- Using DBMS_RANDOM
  - Security Model
  - Operational Notes
- Summary of DBMS_RANDOM Subprograms
Using DBMS_RANDOM

- Security Model
- Operational Notes

Security Model

This package should be installed as SYS. By default, the package is initialized with the current user name, current time down to the second, and the current session.

Operational Notes

- DBMS_RANDOM.RANDOM produces integers in \([-2^{31}, 2^{31})\).
- DBMS_RANDOM.VALUE produces numbers in \([0,1)\) with 38 digits of precision.

DBMS_RANDOM can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, userid, and process id if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of DBMS_RANDOM.SEED. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.
## Summary of DBMS_RANDOM Subprograms

**Table 66–1 DBMS_RANDOM Package Subprograms**

<table>

<td>(38-digit precision), while the overloaded function gets a</td>
</tr>
<tr>
<td></td>
<td>random Oracle number x, where x is greater than or equal to</td>
</tr>
<tr>
<td></td>
<td>low and less than high</td>
</tr>
</tbody>
</table>

**Note:** The INITIALIZE Procedure, RANDOM Procedure and the TERMINATE Procedure are all obsolete and, while currently supported, are included in this release for legacy reasons only.
**INITIALIZE Procedure**

This procedure initializes the generator (but see Usage Notes).

**Syntax**

```plaintext
DBMS_RANDOM.INITIALIZE (
   val  IN  BINARY_INTEGER);
```

**Pragmas**

```
PRAGMA restrict_references (initialize, WNDS)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>The seed number used to generate a random number.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure is obsolete as it simply calls the SEED Procedures on page 66-7.
NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL
RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS)
```

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Returns a random number.</td>
</tr>
</tbody>
</table>
RANDOM Procedure

This procedure generates a random number (but see Usage Notes).

Syntax

```
DBMS_RANDOM.RANDOM
    RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDs)
```

Return Values

**Table 66–4  RANDOM Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>binary_integer</td>
<td>Returns a random integer greater or equal to (-\text{power}(2,31)) and less than (\text{power}(2,31)).</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is obsolete and, although it is currently supported, it should not be used.
SEED Procedures

This procedure resets the seed.

Syntax

```sql
DBMS_RANDOM.SEED (
    seed  IN  BINARY_INTEGER);

DBMS_RANDOM.SEED (
    seed  IN  VARCHAR2);
```

Pragmas

```sql
PRAGMA restrict_references (seed, WINDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>Seed number or string used to generate a random number.</td>
</tr>
</tbody>
</table>

Usage Notes

The seed can be a string up to length 2000.
STRING Function

This function gets a random string.

Syntax

```sql
DBMS_RANDOM.STRING
opt IN CHAR,
len IN NUMBER)
RETURN VARCHAR2;
```

Pragmas

```sql
PRAGMA restrict_references (string, WNDS)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opt</td>
<td>Specifies what the returning string looks like:</td>
</tr>
<tr>
<td></td>
<td>- 'u', 'U' - returning string in uppercase alpha characters</td>
</tr>
<tr>
<td></td>
<td>- 'l', 'L' - returning string in lowercase alpha characters</td>
</tr>
<tr>
<td></td>
<td>- 'a', 'A' - returning string in mixed case alpha characters</td>
</tr>
<tr>
<td></td>
<td>- 'x', 'X' - returning string in uppercase alpha-numeric characters</td>
</tr>
<tr>
<td></td>
<td>- 'p', 'P' - returning string in any printable characters.</td>
</tr>
<tr>
<td></td>
<td>Otherwise the returning string is in uppercase alpha characters.</td>
</tr>
<tr>
<td>len</td>
<td>The length of the returning string.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR2</td>
<td>Returns a VARCHAR2.</td>
</tr>
</tbody>
</table>
**TERMINATE Procedure**

When you are finished with the package, call the TERMINATE procedure (but see Usage Notes).

**Syntax**

DBMS_RANDOM.TERMINATE

**Usage Notes**

This procedure performs no function and, although it is currently supported, it is obsolete and should not be used.
VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number x, where x is greater than or equal to low and less than high.

Syntax

```sql
DBMS_RANDOM.VALUE
RETURN NUMBER;

DBMS_RANDOM.VALUE(
  low IN NUMBER,
  high IN NUMBER)
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low</td>
<td>The lowest number in a range from which to generate a random number. The number generated may be equal to low.</td>
</tr>
<tr>
<td>high</td>
<td>The highest number below which to generate a random number. The number generated will be less than high.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Returns an Oracle Number.</td>
</tr>
</tbody>
</table>
The DBMS_RECTIFIER_DIFF package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

- Documentation of DBMS_RECTIFIER_DIFF
Documentation of DBMS_RECTIFIER_DIFF

For a complete description of this package within the context of Replication, see DBMS_RECTIFIER_DIFF in the Oracle Database Advanced Replication Management API Reference.
The DBMS_REDEFINITION package provides an interface to perform an online redefinition of tables.

See Also: Oracle Database Administrator’s Guide for more information.

This chapter contains the following topics:

- Using DBMS_REDEFINITION
  - Overview
  - Constants
  - Operational Notes
- Summary of DBMS_REDEFINITION Subprograms
Using DBMS_REDEFINITION

Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. Materialized view logs need to be defined on the master tables to support incrementally maintainable materialized views. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

Constants

The following constants are defined for this package:

- cons_orig_params constant PLS_INTEGER := 1;
- cons_use_pk constant BINARY_INTEGER := 1;
- cons_use_rowid constant BINARY_INTEGER := 2;
- cons_index constant PLS_INTEGER := 2;
- cons_constraint constant PLS_INTEGER := 3;
- cons_trigger constant PLS_INTEGER := 4;

Operational Notes

- cons_use_pk and cons_use_rowid are constants used as input to the "options_flag" parameter in both the START_REDEF_TABLE Procedure and CAN_REDEF_TABLE Procedure. cons_use_rowid is used to indicate that the redefinition should be done using rowids while cons_use_pk implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
cons_index, cons_trigger and cons_constraint are used to specify the type of the dependent object being (un)registered in REGISTER_DEPENDENT_OBJECT Procedure and UNREGISTER_DEPENDENT_OBJECT Procedure (parameter "dep_type").
cons_index ==> dependent object is of type INDEX
cons_trigger ==> dependent object is of type TRIGGER
cons_constraint==> dependent object type is of type CONSTRAINT
cons_orig_params as used as input to the "copy_indexes" parameter in COPY_TABLE_DEPENDENTS Procedure. Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.
## Summary of DBMS_REDEFINITION Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ABORT_REDEF_TABLE</strong> Procedure on page 68-5</td>
<td>Cleans up errors that occur during the redefinition process.</td>

<tr>
<td><strong>CAN_REDEF_TABLE</strong> Procedure on page 68-6</td>
<td>Determines if a given table can be redefined online.</td>
</tr>
<tr>
<td><strong>COPY_TABLEDEPENDENTS</strong> Procedure on page 68-7</td>
<td>Copies the dependent objects of the original table onto the interim table.</td>
</tr>
<tr>
<td><strong>FINISH_REDEF_TABLE</strong> Procedure on page 68-9</td>
<td>Completes the redefinition process.</td>
</tr>
<tr>
<td><strong>REGISTER_DEPENDENT_OBJECT</strong> Procedure on page 68-10</td>
<td>Registers a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.</td>
</tr>
<tr>
<td><strong>START_REDEF_TABLE</strong> Procedure on page 68-11</td>
<td>Initiates the redefinition process.</td>
</tr>
<tr>
<td><strong>SYNC_INTERIM_TABLE</strong> Procedure on page 68-13</td>
<td>Keeps the interim table synchronized with the original table.</td>
</tr>
<tr>
<td><strong>UNREGISTER_DEPENDENT_OBJECT</strong> Procedure on page 68-14</td>
<td>Unregisters a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.</td>
</tr>
</tbody>
</table>
**ABORT_REDEF_TABLE Procedure**

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after `start_redef_table` has been called and before `finish_redef_table` is called.

**Syntax**

```sql
DBMS_REDEFINITION.ABORT_REDEF_TABLE (  
    uname IN VARCHAR2,  
    orig_table IN VARCHAR2,  
    int_table IN VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the tables.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
</tbody>
</table>
CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (  
  uname    IN  VARCHAR2,  
  tname    IN  VARCHAR2,  
  options_flag  IN  PLS_INTEGER := 1);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the table.</td>
</tr>
<tr>
<td>tname</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>options_flag</td>
<td>Indicates the type of redefinition method to use. If the value of this flag is dbms_redefinition.cons_use_pk, then the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). If the value of this flag is dbms_redefinition.cons_use_rowid, then the redefinition is done using rowids. The default method of redefinition is using primary keys.</td>
</tr>
</tbody>
</table>

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.
COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This API will be used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined onto the interim table (which represents the post-redefinition table).

All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS(
    uname                    IN VARCHAR2,
    orig_table               IN VARCHAR2,
    int_table                IN VARCHAR2,
    copy_indexes             IN  PLS_INTEGER := 0,
    copy_triggers            IN  BOOLEAN := TRUE,
    copy_constraints         IN  BOOLEAN := TRUE,
    copy_privileges          IN  BOOLEAN := TRUE,
    ignore_errors            IN BOOLEAN := FALSE,
    num_errors               OUT PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the tables.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table being redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
</tbody>
</table>
Usage Notes

It is the user’s responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user’s responsibility that the cloned triggers are unaffected by the redefinition.
FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
  uname       IN VARCHAR2,
  orig_table  IN VARCHAR2,
  int_table   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the tables.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
</tbody>
</table>

REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```sql
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT(
    uname              IN VARCHAR2,
    orig_table        IN VARCHAR2,
    int_table         IN VARCHAR2,
    dep_type          IN  PLS_INTEGER,
    dep_owner         IN VARCHAR2,
    dep_orig_name     IN VARCHAR2,
    dep_int_name      IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the tables.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
<tr>
<td>dep_type</td>
<td>The type of the dependent object.</td>
</tr>
<tr>
<td>dep_owner</td>
<td>The owner of the dependent object.</td>
</tr>
<tr>
<td>dep_orig_name</td>
<td>The name of the original dependent object.</td>
</tr>
<tr>
<td>dep_int_name</td>
<td>The name of the interim dependent object.</td>
</tr>
</tbody>
</table>

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from `DBA_REDEFINITION_ERRORS` if an entry exists for that object.
START_REDEF_TABLE Procedure

After verifying that the table can be redefined online, you manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```sql
DBMS_REDEFINITION.START_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    col_mapping    IN VARCHAR2 := NULL,  
    options_flag   IN BINARY_INTEGER := 1  
    orderby_cols   IN VARCHAR2 := NULL );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the tables.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
<tr>
<td>col_mapping</td>
<td>The mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the <code>SELECT</code> clause of a query.) If <code>NULL</code>, all the columns in the original table are selected and have the same name after redefinition.</td>
</tr>
<tr>
<td>options_flag</td>
<td>Indicates the type of redefinition method to use. If the value of this flag is <code>dbms_redefinition.cons_use_pk</code>, then the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). If the value of this flag is <code>dbms_redefinition.cons_use_rowid</code>, then the redefinition is done using rowids. The default method of redefinition is using primary keys.</td>
</tr>
</tbody>
</table>
### Table 68–7 (Cont.) START_REDEF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orderby_cols</td>
<td>This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)</td>
</tr>
</tbody>
</table>
SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table. This step is useful in minimizing the amount of synchronization needed to be done by finish_redef_table before completing the online redefinition. This procedure can be called between long running operations (such as create index) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

Syntax

```plaintext
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (  
   uname       IN VARCHAR2,  
   orig_table  IN  VARCHAR2,  
   int_table   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the table.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
</tbody>
</table>
UNREGISTERDEPENDENTOBJECT Procedure

This procedure unregisters a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPENDENT_OBJECT(
    uname          IN VARCHAR2,
    orig_table     IN VARCHAR2,
    int_table      IN VARCHAR2,
    dep_type       IN PLS_INTEGER,
    dep_owner      IN VARCHAR2,
    dep_orig_name  IN VARCHAR2,
    dep_int_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>The schema name of the tables.</td>
</tr>
<tr>
<td>orig_table</td>
<td>The name of the table to be redefined.</td>
</tr>
<tr>
<td>int_table</td>
<td>The name of the interim table.</td>
</tr>
<tr>
<td>dep_type</td>
<td>The type of the dependent object.</td>
</tr>
<tr>
<td>dep_owner</td>
<td>The owner of the dependent object.</td>
</tr>
<tr>
<td>dep_orig_name</td>
<td>The name of the original dependent object.</td>
</tr>
<tr>
<td>dep_int_name</td>
<td>The name of the interim dependent object.</td>
</tr>
</tbody>
</table>
The `DBMS_REFRESH` package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- Documentation of `DBMS_REFRESH`
Documentation of DBMS_REFRESH

For a complete description of this package within the context of Replication, see DBMS_REFRESH in the Oracle Database Advanced Replication Management API Reference.
The DBMS_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

**See Also:** For detailed information about using the DBMS_REPAIR package, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- **Using DBMS_REPAIR**
  - Overview
  - Security Model
  - Constants
  - Exceptions
  - Examples
- **Summary of DBMS_REPAIR Subprograms**
Using DBMS_REPAIR

Overview

Note: The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

Security Model

The package is owned by SYS. Execution privilege is not granted to other users.

Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

Table 70–1 lists the parameters and the enumerated constants.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Constant</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>TABLE_OBJECT, INDEX_OBJECT, CLUSTER_OBJECT</td>
</tr>
<tr>
<td>action</td>
<td>CREATE_ACTION, DROP_ACTION, PURGE_ACTION</td>
</tr>
<tr>
<td>table_type</td>
<td>REPAIR_TABLE, ORPHAN_TABLE</td>
</tr>
<tr>
<td>flags</td>
<td>SKIP_FLAG, NOSKIP_FLAG</td>
</tr>
</tbody>
</table>
Note: The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

Exceptions

<table>
<thead>
<tr>
<th>Table 70–2 DBMS_REPAIR Exceptions</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>942</td>
<td>Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn’t exist.</td>
<td>-</td>
</tr>
<tr>
<td>955</td>
<td>Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.</td>
<td>-</td>
</tr>
<tr>
<td>24120</td>
<td>An invalid parameter was passed to the specified DBMS_REPAIR procedure.</td>
<td>Specify a valid parameter value or use the parameter's default.</td>
</tr>
<tr>
<td>24122</td>
<td>An incorrect block range was specified.</td>
<td>Specify correct values for the BLOCK_START and BLOCK_END parameters.</td>
</tr>
<tr>
<td>24123</td>
<td>An attempt was made to use the specified feature, but the feature is not yet implemented.</td>
<td>Do not attempt to use the feature.</td>
</tr>
<tr>
<td>24124</td>
<td>An invalid ACTION parameter was specified.</td>
<td>Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.</td>
</tr>
<tr>
<td>24125</td>
<td>An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.</td>
<td>Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.</td>
</tr>
<tr>
<td>24127</td>
<td>TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.</td>
<td>Do not specify TABLESPACE when performing actions other than CREATE_ACTION.</td>
</tr>
<tr>
<td>24128</td>
<td>A partition name was specified for an object that is not partitioned.</td>
<td>Specify a partition name only if the object is partitioned.</td>
</tr>
</tbody>
</table>
Examples

```sql
/* Fix the bitmap status for all the blocks in table mytab in schema sys */
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT, 1, 45, 1);
```

Table 70–2 (Cont.)  DBMS_REPAIR Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>24129</td>
<td>An attempt was made to pass a table name parameter without the specified prefix.</td>
<td>Pass a valid table name parameter.</td>
</tr>
<tr>
<td>24130</td>
<td>An attempt was made to specify a repair or orphan table that does not exist.</td>
<td>Specify a valid table name parameter.</td>
</tr>
<tr>
<td>24131</td>
<td>An attempt was made to specify a repair or orphan table that does not have a correct definition.</td>
<td>Specify a table name that refers to a properly created table.</td>
</tr>
<tr>
<td>24132</td>
<td>An attempt was made to specify a table name is greater than 30 characters long.</td>
<td>Specify a valid table name parameter.</td>
</tr>
</tbody>
</table>

Examples
Summary of DBMS_REPAIR Subprograms

<td>SKIP_CORRUPT_BLOCKS Procedure on page 70-17</td>
</tr>
</tbody>
</table>
ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```sql
DBMS_REPAIR.ADMIN_TABLES (  
  table_name IN VARCHAR2,  
  table_type IN BINARY_INTEGER,  
  action IN BINARY_INTEGER,  
  tablespace IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.</td>
</tr>
<tr>
<td>table_type</td>
<td>Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See &quot;Constants&quot; on page 70-2.</td>
</tr>
<tr>
<td>action</td>
<td>Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_&lt;table_name&gt; is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See &quot;Constants&quot; on page 70-2.</td>
</tr>
</tbody>
</table>
### Table 70–4 (Cont.) ADMIN_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace</td>
<td>Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.</td>
</tr>
</tbody>
</table>
CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```sql
DBMS_REPAIR.CHECK_OBJECT (  
  schema_name       IN  VARCHAR2,  
  object_name       IN  VARCHAR2,  
  partition_name    IN  VARCHAR2       DEFAULT NULL,  
  object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,  
  repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',  
  flags             IN  BINARY_INTEGER DEFAULT NULL,  
  relative_fno      IN  BINARY_INTEGER DEFAULT NULL,  
  block_start       IN  BINARY_INTEGER DEFAULT NULL,  
  block_end         IN  BINARY_INTEGER DEFAULT NULL,  
  corrupt_count     OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the object to be checked.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table or index to be checked.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name to be checked.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT.</td>
</tr>
<tr>
<td>repair_table_name</td>
<td>Name of the repair table to be populated. The table must exist in the SYS schema. Use the admin_tables procedure to create a repair table. The default name is REPAIR_TABLE.</td>
</tr>
</tbody>
</table>

Table 70–5  CHECK_OBJECT Procedure Parameters
Table 70–5  (Cont.) CHECK_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative file number: Used when specifying a block range.</td>
</tr>
<tr>
<td>block_start</td>
<td>First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.</td>
</tr>
<tr>
<td>block_end</td>
<td>Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of block_start or block_end is specified, then the other defaults to the first or last block in the file respectively.</td>
</tr>
<tr>
<td>corrupt_count</td>
<td>Number of corruptions reported.</td>
</tr>
</tbody>
</table>

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.
DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```sql
DBMS_REPAIR.DUMP_ORPHAN_KEYS (  
    schema_name       IN  VARCHAR2,  
    object_name       IN  VARCHAR2,  
    partition_name    IN  VARCHAR2 DEFAULT NULL,  
    object_type       IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,  
    repair_table_name IN  VARCHAR2 DEFAULT 'REPAIR_TABLE',  
    orphan_table_name IN  VARCHAR2 DEFAULT 'ORPHAN_KEYS_TABLE',  
    flags             IN  BINARY_INTEGERDEFAULT NULL,  
    key_count         OUT  BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name.</td>
</tr>
<tr>
<td>object_name</td>
<td>Object name.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name to be processed.</td>
</tr>
<tr>
<td></td>
<td>If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. The default is INDEX_OBJECT</td>
</tr>
</tbody>
</table>

See "Constants" on page 70-2.
### Table 70-6  (Cont.) DUMP_ORPHAN_KEYS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repair_table_name</td>
<td>Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the SYS schema. The admin_tables procedure is used to create the table.</td>
</tr>
<tr>
<td>orphan_table_name</td>
<td>Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the SYS schema. The admin_tables procedure is used to create the table.</td>
</tr>
<tr>
<td>flags</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>key_count</td>
<td>Number of index entries processed.</td>
</tr>
</tbody>
</table>
This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the `check_object` procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

### Syntax

```sql
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (  
  schema_name IN VARCHAR2,
  object_name IN VARCHAR2,
  partition_name IN VARCHAR2 DEFAULT NULL,
  object_type IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2 DEFAULT 'REPAIR_TABLE',
  flags IN BINARY_INTEGER DEFAULT NULL,
  fix_count OUT BINARY_INTEGER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema_name</code></td>
<td>Schema name.</td>
</tr>
<tr>
<td><code>object_name</code></td>
<td>Name of the object with corrupt blocks to be fixed.</td>
</tr>
<tr>
<td><code>partition_name</code></td>
<td>Partition or subpartition name to be processed.</td>
</tr>
<tr>
<td></td>
<td>If this is a partitioned object, and if <code>partition_name</code> is not specified,</td>
</tr>
<tr>
<td></td>
<td>then all partitions and subpartitions are processed. If this is a</td>
</tr>
<tr>
<td></td>
<td>partitioned object, and if the specified partition contains subpartitions,</td>
</tr>
<tr>
<td></td>
<td>then all subpartitions are processed.</td>
</tr>
<tr>
<td><code>object_type</code></td>
<td>Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code>.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot; on page 70-2.</td>
</tr>
<tr>
<td><code>repair_table_name</code></td>
<td>Name of the repair table with the repair directives.</td>
</tr>
<tr>
<td></td>
<td>Must exist in the <code>SYS</code> schema.</td>
</tr>
<tr>
<td><code>flags</code></td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td><code>fix_count</code></td>
<td></td>
</tr>
</tbody>
</table>
### Table 70–7 (Cont.) FIX_CORRUPT_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fix_count</td>
<td>Number of blocks fixed.</td>
</tr>
</tbody>
</table>
REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```sql
DBMS_REPAIR.REBUILD_FREELISTS (
    schema_name    IN VARCHAR2,
    object_name    IN  VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL,
    object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object whose freelists are to be rebuilt.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name whose freelists are to be rebuilt.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT.</td>
</tr>
</tbody>
</table>

If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.

See "Constants" on page 70-2.
SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```sql
DBMS_REPAIR.SEGMENT_FIX_STATUS (segment_owner   IN VARCHAR2,
segment_name    IN VARCHAR2,
segment_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
file_number     IN BINARY_INTEGER DEFAULT NULL,
block_number    IN BINARY_INTEGER DEFAULT NULL,
status_value    IN BINARY_INTEGER DEFAULT NULL,
partition_name  IN VARCHAR2 DEFAULT NULL,);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_owner</td>
<td>Schema name of the segment.</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.</td>
</tr>
<tr>
<td>segment_type</td>
<td>Optional Type of the segment (for example, TABLE_OBJECT or INDEX-OBJECT). Default is NULL.</td>
</tr>
<tr>
<td>file_number</td>
<td>(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.</td>
</tr>
<tr>
<td>block_number</td>
<td>(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.</td>
</tr>
</tbody>
</table>
SEGMENT_FIX_STATUS Procedure

Table 70–9  (Cont.) SEGMENT_FIX_STATUS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status_value</td>

**SKIP_CORRUPT_BLOCKS Procedure**

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

---

**Note:** When Oracle performs an index range scan on a corrupt index after `DBMS_REPAIR.SKIP_CORRUPT_BLOCKS` has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

---

**Syntax**

```sql
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS ( 
    schema_name IN VARCHAR2,
    object_name IN VARCHAR2,
    object_type IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
    flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema_name</code></td>
<td>Schema name of the object to be processed.</td>
</tr>
<tr>
<td><code>object_name</code></td>
<td>Name of the object.</td>
</tr>
<tr>
<td><code>object_type</code></td>
<td>Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>CLUSTER_OBJECT</code>.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot; on page 70-2.</td>
</tr>
<tr>
<td><code>flags</code></td>
<td>If <code>SKIP_FLAG</code> is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If <code>NOSKIP_FLAG</code> is specified, then scans that encounter software corrupt blocks return an <code>ORA-1578</code>.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot; on page 70-2.</td>
</tr>
</tbody>
</table>
SKIP_CORRUPT_BLOCKS Procedure
The DBMS_REPCAT package provides routines to administer and update the replication catalog and environment.

- Documentation of DBMS_REPCAT
Documentation of DBMS_REPCAT

For a complete description of this package within the context of Replication, see DBMS_REPCAT in the Oracle Database Advanced Replication Management API Reference.
The DBMS_REPCAT_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

- Documentation of DBMS_REPCAT_ADMIN
For a complete description of this package within the context of Replication, see DBMS_REPCAT_ADMIN in the Oracle Database Advanced Replication Management API Reference.
The DBMS_REPCAT_INSTANTIATE package instantiates deployment templates.

- Documentation of DBMS_REPCAT_INSTANTIATE
For a complete description of this package within the context of Replication, see DBMS_REPCAT_INSTANTIATE in the Oracle Database Advanced Replication Management API Reference.
The DBMS_REPCAT_RGT package controls the maintenance and definition of refresh group templates.

- Documentation of DBMS_REPCAT_RGT
For a complete description of this package within the context of Replication, see DBMS_REPCAT_RGT in the Oracle Database Advanced Replication Management API Reference.
The DBMS_REPUTIL package contains subprograms to generate shadow tables, triggers, and packages for table replication, as well as subprograms to generate wrappers for replication of standalone procedure invocations and packaged procedure invocations. This package is referenced only by the generated code.

- [Documentation of DBMS_REPUTIL](#)
Documentation of DBMS_REPUTIL

For a complete description of this package within the context of Replication, see DBMS_REPUTIL in the Oracle Database Advanced Replication Management API Reference.
The DBMS_RESOURCE_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

**See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator’s Guide*.

</tbody>
</table>

Examples

One of the advantages of plans is that they can refer to each other. The entries in a plan can either be consumer groups or subplans. For example, the following is also a set of valid CPU plan directives:
If these plan directives were in effect and there were an infinite number of runnable sessions in all consumer groups, then the MAILDB plan would be assigned 30% of the available CPU resources, while the BUGDB plan would be assigned 70% of the available CPU resources. Breaking this further down, sessions in the "Postman" consumer group would be run 12% (40% of 30%) of the time, while sessions in the "Online" consumer group would be run 56% (80% of 70%) of the time. Figure 76–1 diagram depicts this scenario:

<table>
<thead>
<tr>
<th>Subplan/Group</th>
<th>CPU_Level 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAILDB Plan</td>
<td>30%</td>
</tr>
<tr>
<td>BUGDB Plan</td>
<td>70%</td>
</tr>
</tbody>
</table>

Conceptually the active sessions are underneath the consumer groups. In other words, a session belongs to a resource consumer group, and this consumer group is used by a plan to determine allocation of processing resources.

A multiplan (plan with one or more subplans) definition of CPU plan directives cannot be collapsed into a single plan with one set of plan directives, because each plan is its own entity. The CPU quanta that is allotted to a plan or subplan gets used only within that plan, unless that plan contains no consumer groups with active sessions. Therefore, in this example, if the Bug Maintenance Group did not use any of its quanta, then it would get recycled within that plan, thus going back to level 1.
within the BUGDB PLAN. If the multiplan definition in the preceding example got collapsed into a single plan with multiple consumer groups, then there would be no way to explicitly recycle the Bug Maintenance Group's unused quanta. It would have to be recycled globally, thus giving the mail sessions an opportunity to use it.

The resources for a database can be partitioned at a high level among multiple applications and then repartitioned within an application. If a given group within an application does not need all the resources it is assigned, then the resource is only repartitioned within the same application.

The following example uses the default plan and consumer group allocation methods:

```
BEGIN
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'bugdb_plan',
   COMMENT => 'Resource plan/method for bug users sessions');
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'maildb_plan',
   COMMENT => 'Resource plan/method for mail users sessions');
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'mydb_plan',
   COMMENT => 'Resource plan/method for bug and mail users sessions');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Online_group',
   COMMENT => 'Resource consumer group/method for online bug users sessions');

</tbody>
</table>
CLEAR_PENDING_AREA Procedure

This procedure lets you clear pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```
CREATE_CONSUMER_GROUP Procedure

This procedure lets you create entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (  
    consumer_group  IN VARCHAR2,  
    comment         IN VARCHAR2,  
    cpu_mth         IN VARCHAR2 DEFAULT 'ROUND-ROBIN');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_group</td>
<td>The name of the consumer group.</td>
</tr>
<tr>
<td>comment</td>
<td>The user's comment.</td>
</tr>
<tr>
<td>cpu_mth</td>
<td>The resource allocation method for distributing CPU among sessions in the consumer group. The default is ROUND-ROBIN, which uses a round-robin scheduler to ensure sessions are fairly executed. RUN-TO-COMPLETION specifies that sessions with the largest active time are scheduled ahead of other sessions.</td>
</tr>
</tbody>
</table>
CREATE_PENDING_AREA Procedure

This procedure lets you make changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```sql
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the VALIDATE procedure to confirm whether the changes you have made are valid. You do not have to do your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

**Note:** Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

The following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
Summary of DBMS_RESOURCE_MANAGER Subprograms

- No plan may be deleted that is currently being used as a top plan by an active instance.
- For Oracle8i, the plan directive parameter, parallel_degree_limit_p1, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 32 plan directives coming from any given plan (that is, no plan can have more than 32 children).
- There cannot be more than 32 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for OTHER_GROUPS somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the OTHER_GROUPS directive.

If any of the preceding rules are broken when checked by the VALIDATE or SUBMIT procedures, then an informative error message is returned. You may then make changes to fix the problem(s) and reissue the validate or submit procedures.
CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
    plan IN VARCHAR2,
    comment IN VARCHAR2,
    cpu_mth IN VARCHAR2 DEFAULT 'EMPHASIS',
    active_sess_pool_mth IN VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
    parallel_degree_limit_mth IN VARCHAR2 DEFAULT 'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
    queueing_mth IN VARCHAR2 DEFAULT 'FIFO_TIMEOUT',);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>The name of the resource plan.</td>
</tr>
<tr>
<td>comment</td>
<td>User's comment.</td>
</tr>
<tr>
<td>cpu_mth</td>
<td>The resource allocation method for specifying how much CPU each consumer</td>
</tr>
<tr>
<td></td>
<td>group or sub-plan gets. EMPHASIS, the default method, is for multilevel</td>
</tr>
<tr>
<td></td>
<td>plans that use percentages to specify how CPU is distributed among</td>
</tr>
<tr>
<td></td>
<td>consumer groups. RATIO is for single-level plans that use ratios to</td>
</tr>
<tr>
<td></td>
<td>specify how CPU is distributed.</td>
</tr>
<tr>
<td>active_sess_pool_mth</td>
<td>The Active session pool resource allocation method. Limits the number of</td>
</tr>
<tr>
<td></td>
<td>active sessions. All other sessions are inactive and wait in a queue to</td>
</tr>
<tr>
<td></td>
<td>be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method</td>
</tr>
<tr>
<td></td>
<td>available.</td>
</tr>
<tr>
<td>parallel_degree_limit_</td>
<td></td>
</tr>
<tr>
<td>mth</td>
<td>The resource allocation method for specifying a limit on the degree of</td>
</tr>
<tr>
<td></td>
<td>parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default</td>
</tr>
<tr>
<td></td>
<td>and only method available.</td>
</tr>
<tr>
<td>queueing_mth</td>
<td>The Queuing resource allocation method. Controls order in which queued</td>
</tr>
<tr>
<td></td>
<td>inactive sessions will execute. FIFO_TIMEOUT is the default and only method</td>
</tr>
<tr>
<td></td>
<td>available.</td>
</tr>
</tbody>
</table>
Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.
CREATE_PLAN_DIRECTIVE Procedure

This procedure lets you create resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (  
  plan                      IN VARCHAR2,  
  group_or_subplan          IN VARCHAR2,  
  comment                   IN VARCHAR2,  
  cpu_p1                    IN NUMBER   DEFAULT NULL,  
  cpu_p2                    IN NUMBER   DEFAULT NULL,  
  cpu_p3                    IN NUMBER   DEFAULT NULL,  
  cpu_p4                    IN NUMBER   DEFAULT NULL,  
  cpu_p5                    IN NUMBER   DEFAULT NULL,  
  cpu_p6                    IN NUMBER   DEFAULT NULL,  
  cpu_p7                    IN NUMBER   DEFAULT NULL,  
  cpu_p8                    IN NUMBER   DEFAULT NULL,  
  active_sess_pool_p1       IN NUMBER   DEFAULT NULL,  
  queueing_p1               IN NUMBER   DEFAULT NULL,  
  parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,  
  switch_group              IN VARCHAR2 DEFAULT NULL,  
  switch_time               IN NUMBER   DEFAULT NULL,  
  switch_estimate           IN BOOLEAN  DEFAULT FALSE,  
  max_est_exec_time         IN NUMBER   DEFAULT NULL,  
  undo_pool                 IN NUMBER   DEFAULT NULL,  
  max_idle_time             IN NUMBER   DEFAULT NULL,  
  max_idle_blocker_time     IN NUMBER   DEFAULT NULL,  
  switch_time_in_call       IN NUMBER   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>The name of the resource plan.</td>
</tr>
<tr>
<td>group_or_subplan</td>
<td>The name of the consumer group or subplan.</td>
</tr>
<tr>
<td>comment</td>
<td>Comment for the plan directive.</td>
</tr>
<tr>
<td>cpu_pl</td>
<td>For EMPHASIS, specifies the CPU percentage at the first level. For RATIO,</td>
</tr>
<tr>
<td></td>
<td>specifies the weight of cpu usage. Default is NULL for all CPU parameters.</td>
</tr>
</tbody>
</table>
### Table 76–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpu_p2</td>
<td>For EMPHASIS, specifies the CPU percentage at the second level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>cpu_p3</td>
<td>For EMPHASIS, specifies the CPU percentage at the third level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>cpu_p4</td>
<td>For EMPHASIS, specifies the CPU percentage at the fourth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>cpu_p5</td>
<td>For EMPHASIS, specifies the CPU percentage at the fifth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>cpu_p6</td>
<td>For EMPHASIS, specifies the CPU percentage at the sixth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>cpu_p7</td>
<td>For EMPHASIS, specifies the CPU percentage at the seventh level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>cpu_p8</td>
<td>For EMPHASIS, specifies the CPU percentage at the eighth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>active_sess_pool_p1</td>
<td>Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>queueing_p1</td>
<td>Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>parallel_degree_limit_p1</td>
<td>Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>switch_group</td>
<td>Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met.</td>
</tr>
<tr>
<td>switch_time</td>
<td>Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>switch_estimate</td>
<td>If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.</td>
</tr>
</tbody>
</table>
CREATE_PLAN_DIRECTIVE Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_est_exec_time</td>
<td>Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>undo_pool</td>
<td>Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>max_idle_time</td>
<td>Indicates the maximum session idle time. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>max_idle_blocker_time</td>
<td>The maximum amount of time in seconds that a session can be idle while blocking another session’s acquisition of a resource.</td>
</tr>
<tr>
<td>switch_time_in_call</td>
<td>Specifies time (in seconds) that a session can execute before an action is taken. At the end of the top call, the consumer group of the session is restored to its original consumer group. Default is NULL, which means unlimited. Both SWITCH_TIME_IN_CALL and SWITCH_TIME cannot be specified.</td>
</tr>
</tbody>
</table>

Usage Notes

- All parameters default to NULL. However, for the EMPHASIS CPU resource allocation method, this case would starve all the users.
- For max_idle_time and max_idle_blocker_time, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter switch_time_in_call is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using switch_time_in_call, the resource usage of one client will not affect a future client that happens to be executed on the same session.
CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the CREATE_CONSUMER_GROUP and CREATE_RESOURCE_PLAN_DIRECTIVES procedures separately.

Syntax

```sql
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (  
    SIMPLE_PLAN      IN  VARCHAR2  DEFAULT,  
    CONSUMER_GROUP1  IN  VARCHAR2  DEFAULT,  
    GROUP1_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP2  IN  VARCHAR2  DEFAULT,  
    GROUP2_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP3  IN  VARCHAR2  DEFAULT,  
    GROUP3_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP4  IN  VARCHAR2  DEFAULT,  
    GROUP4_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP5  IN  VARCHAR2  DEFAULT,  
    GROUP5_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP6  IN  VARCHAR2  DEFAULT,  
    GROUP6_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP7  IN  VARCHAR2  DEFAULT,  
    GROUP7_CPU       IN  NUMBER    DEFAULT,  
    CONSUMER_GROUP8  IN  VARCHAR2  DEFAULT,  
    GROUP8_CPU       IN  NUMBER    DEFAULT);  
```
DELETE_CONSUMER_GROUP Procedure

This procedure lets you delete entries which define resource consumer groups.

Syntax

```sql
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP ( consumer_group IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_group</td>
<td>The name of the consumer group to be deleted.</td>
</tr>
</tbody>
</table>
DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```sql
DBMS_RESOURCE_MANAGER.DELETE_PLAN (plan IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>The name of the resource plan to delete.</td>
</tr>
</tbody>
</table>
DELETE_PLAN_DIRECTIVE Procedure

This procedure lets you delete resource plan directives.

Syntax

```plsql
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (
    plan              IN VARCHAR2,
    group_or_subplan  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Table 76–9 DELETE_PLAN_DIRECTIVE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>plan</td>
</tr>
<tr>
<td>group_or_subplan</td>
</tr>
</tbody>
</table>
DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (plan IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>The name of the plan.</td>
</tr>
</tbody>
</table>

Usage Notes

If `DELETE_PLAN_CASCADE` encounters any error, then it rolls back, and nothing is deleted.
SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```sql
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(
    attribute IN VARCHAR2,
    value IN VARCHAR2,
    consumer_group IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The mapping attribute to add/modify. It can be one of the Constants listed.</td>
</tr>
<tr>
<td>value</td>
<td>The attribute value to match.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>The name of the mapped consumer group, or NULL to delete a mapping.</td>
</tr>
</tbody>
</table>

Usage Notes

If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the consumer_group argument is NULL, then any mapping from the given attribute and value will be deleted.
SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
    explicit               IN NUMBER,
    oracle_user            IN NUMBER,
    service_name           IN NUMBER,
    client_os_user         IN NUMBER,
    client_program         IN NUMBER,
    client_machine         IN NUMBER,
    module_name            IN NUMBER,
    module_name_action     IN NUMBER,
    service_module         IN NUMBER,
    service_module_action  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>explicit</td>
<td>The priority of the explicit mapping.</td>
</tr>
<tr>
<td>oracle_user</td>
<td>The priority of the Oracle user name mapping.</td>
</tr>
<tr>
<td>service_name</td>
<td>The priority of the client service name mapping.</td>
</tr>
<tr>
<td>client_os_user</td>
<td>The priority of the client operating system user name mapping.</td>
</tr>
<tr>
<td>client_program</td>
<td>The priority of the client program mapping.</td>
</tr>
<tr>
<td>client_machine</td>
<td>The priority of the client machine mapping.</td>
</tr>
<tr>
<td>module_name</td>
<td>The priority of the application module name mapping.</td>
</tr>
<tr>
<td>module_name_action</td>
<td>The priority of the application module name and action mapping.</td>
</tr>
<tr>
<td>service_module</td>
<td>The priority of the service name and application module name mapping.</td>
</tr>
<tr>
<td>service_module_action</td>
<td>The priority of the service name, application module name, and action mapping.</td>
</tr>
</tbody>
</table>
 Usage Notes

Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.
**SET_INITIAL_CONSUMER_GROUP Procedure**

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user           IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>The name of the user.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>The user's initial consumer group.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The `ADMINISTER_RESOURCE_MANAGER` or the `ALTER USER` system privilege are required to be able to execute this procedure. The user, or `PUBLIC`, must be directly granted switch privilege to a consumer group before it can be set to be the user’s initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

---

**Note:** These semantics are similar to those for `ALTER USER DEFAULT ROLE`.

If the initial consumer group for a user has never been set, then the user’s initial consumer group is automatically the consumer group: `DEFAULT_CONSUMER_GROUP`.

`DEFAULT_CONSUMER_GROUP` has switch privileges granted to `PUBLIC`; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have `DEFAULT_CONSUMER_GROUP` as their initial consumer
group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT_CONSUMER_GROUP.
SUBMIT_PENDING_AREA Procedure

This procedure lets you submit pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

**Note:** A call to SUBMIT_PENDING_AREA may fail even if VALIDATE_PENDING_AREA succeeds. This may happen if a plan being deleted is loaded by an instance after a call to VALIDATE_PENDING_AREA, but before a call to SUBMIT_PENDING_AREA.

Syntax

```sql
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure lets you change the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (  
    session_id      IN NUMBER,  
    session_serial  IN NUMBER,  
    consumer_group  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>SID column from the view V$SESSION.</td>
</tr>
<tr>
<td>session_serial</td>
<td>SERIAL# column from view V$SESSION.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>The name of the consumer group to switch to.</td>
</tr>
</tbody>
</table>
**SWITCH_CONSUMER_GROUP_FOR_USER Procedure**

This procedure lets you change the resource consumer group for all sessions with a given user ID. It also change the consumer group of any (PQ) slave sessions that are related to the top user session.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
    user            IN VARCHAR2,
    consumer_group  IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>The name of the user.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>The name of the consumer group to switch to.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The `SWITCH_CONSUMER_GROUP_FOR_SESS Procedure` and `SWITCH_CONSUMER_GROUP_FOR_USER` procedures let you to raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.

These procedures cause the session to be moved into the newly specified consumer group immediately.
SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```sql
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
    plan_name     IN     VARCHAR2,
    sid           IN     VARCHAR2 DEFAULT '*');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_name</td>
<td>The name of the plan to which to switch.</td>
</tr>
<tr>
<td>sid</td>
<td>The sid parameter is relevant only in a Real Application Clusters environment. This parameter lets you to change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.</td>
</tr>
</tbody>
</table>
UPDATE_CONSUMER_GROUP Procedure

This procedure lets you update entries which define resource consumer groups.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (  
  consumer_group  IN VARCHAR2,
  new_comment     IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth     IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_group</td>
<td>The name of consumer group.</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user's comment.</td>
</tr>
<tr>
<td>new_cpu_mth</td>
<td>The name of new method for CPU resource allocation.</td>
</tr>
</tbody>
</table>

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.
UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
    plan IN VARCHAR2,
    new_comment IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth IN VARCHAR2 DEFAULT NULL,
    new_active_sess_pool_mth IN VARCHAR2 DEFAULT NULL,
    new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
    new_queueing_mth IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>The name of resource plan.</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user's comment.</td>
</tr>
<tr>
<td>new_cpu_mth</td>
<td>The name of new allocation method for CPU resources.</td>
</tr>
<tr>
<td>new_active_sess_pool_mth</td>
<td>The name of new method for maximum active sessions.</td>
</tr>
<tr>
<td>new_parallel_degree_limit_mth</td>
<td>The name of new method for degree of parallelism.</td>
</tr>
<tr>
<td>new_queueing_mth</td>
<td>Specifies type of queuing policy to use with active session pool feature.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the parameters to UPDATE_PLAN Procedure are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.
**UPDATE_PLAN_DIRECTIVE Procedure**

This procedure lets you update resource plan directives.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (    plan                          IN VARCHAR2,
    group_or_subplan              IN VARCHAR2,
    new_comment                   IN VARCHAR2 DEFAULT NULL,
    new_cpu_p1                    IN NUMBER    DEFAULT NULL,
    new_cpu_p2                    IN NUMBER    DEFAULT NULL,
    new_cpu_p3                    IN NUMBER    DEFAULT NULL,
    new_cpu_p4                    IN NUMBER    DEFAULT NULL,
    new_cpu_p5                    IN NUMBER    DEFAULT NULL,
    new_cpu_p6                    IN NUMBER    DEFAULT NULL,
    new_cpu_p7                    IN NUMBER    DEFAULT NULL,
    new_cpu_p8                    IN NUMBER    DEFAULT NULL,
    new_active_sess_pool_p1       IN NUMBER    DEFAULT NULL,
    new_queueing_p1               IN NUMBER    DEFAULT NULL,
    new_parallel_degree_limit_p1  IN NUMBER    DEFAULT NULL,
    new_switch_group              IN VARCHAR2 DEFAULT NULL,
    new_switch_time               IN NUMBER    DEFAULT NULL,
    new_switch_estimate           IN BOOLEAN   DEFAULT FALSE,
    new_max_est_exec_time         IN NUMBER    DEFAULT NULL,
    new_undo_pool                 IN NUMBER    DEFAULT NULL,
    new_max_idle_time             IN NUMBER    DEFAULT NULL,
    new_max_idle_blocker_time     IN NUMBER    DEFAULT NULL,
    new_switch_time_in_call       IN NUMBER    DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>The name of the resource plan.</td>
</tr>
<tr>
<td>group_or_subplan</td>
<td>The name of the consumer group or subplan.</td>
</tr>
<tr>
<td>new_comment</td>
<td>Comment for the plan directive.</td>
</tr>
<tr>
<td>new_cpu_p1</td>
<td>For EMPHASIS, specifies the CPU percentage at the first level. For RATIO, specifies the weight of CPU usage. Default is NULL for all CPU parameters.</td>
</tr>
</tbody>
</table>
**Table 76–19 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_cpu_p2</td>
<td>For EMPHASIS, specifies the CPU percentage at the second level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_cpu_p3</td>
<td>For EMPHASIS, specifies the CPU percentage at the third level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_cpu_p4</td>
<td>For EMPHASIS, specifies the CPU percentage at the fourth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_cpu_p5</td>
<td>For EMPHASIS, specifies the CPU percentage at the fifth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_cpu_p6</td>
<td>For EMPHASIS, specifies the CPU percentage at the sixth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_cpu_p7</td>
<td>For EMPHASIS, specifies the CPU percentage at the seventh level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_cpu_p8</td>
<td>For EMPHASIS, specifies the CPU percentage at the eighth level. Not applicable for RATIO.</td>
</tr>
<tr>
<td>new_active_sess_pool_p1</td>
<td>Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_queueing_p1</td>
<td>Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_switch_group</td>
<td>Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_switch_time</td>
<td>Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.</td>
</tr>
<tr>
<td>new_switch_estimate</td>
<td>Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_max_est_exec_time</td>
<td>If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.</td>
</tr>
<tr>
<td>new_undo_pool</td>
<td>Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.</td>
</tr>
</tbody>
</table>
## Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.

- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.

- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>new_parallel_degree_limit_pl</code></td>
<td>Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td><code>new_max_idle_time</code></td>
<td>Indicates the maximum session idle time. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td><code>new_max_idle_blocker_time</code></td>
<td>The maximum amount of time in seconds that a session can be idle while blocking another session’s acquisition of a resource.</td>
</tr>
<tr>
<td><code>new_switch_time_in_call</code></td>
<td>Specifies time (in seconds) that a session can execute before an action is taken. At the end of the top call, the consumer group of the session is restored to its original consumer group. Default is NULL, which means unlimited. Both <code>SWITCH_TIME_IN_CALL</code> and <code>SWITCH_TIME</code> cannot be specified.</td>
</tr>
</tbody>
</table>
VALIDATE_PENDING_AREA Procedure

This procedure lets you validate pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```
The DBMS_RESOURCE_MANAGER_PRIVS package maintains privileges associated with the Resource Manager.

See Also: For more information on using the Database Resource Manager, see Oracle Database Administrator’s Guide.

This chapter contains the following topics:

- Summary of DBMSRESOURCE_MANAGER_PRIVS Subprograms
## Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

### Table 77–1  DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_SWITCH_CONSUMER_GROUP Procedure on page 77-3</td>
<td>Grants the privilege to switch to resource consumer groups</td>
</tr>
<tr>
<td>GRANT_SYSTEM_PRIVILEGE Procedure on page 77-5</td>
<td>Performs a grant of a system privilege</td>
</tr>
<tr>
<td>REVOKE_SWITCH_CONSUMER_GROUP Procedure on page 77-6</td>
<td>Revokes the privilege to switch to resource consumer groups.</td>
</tr>
<tr>
<td>REVOKE_SYSTEM_PRIVILEGE Procedure on page 77-8</td>
<td>Performs a revoke of a system privilege</td>
</tr>
</tbody>
</table>
GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (  
grantee_name   IN VARCHAR2,  
consumer_group IN VARCHAR2,  
grant_option   IN BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee_name</td>
<td>Name of the user or role to whom privilege is to be granted.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of consumer group.</td>
</tr>
<tr>
<td>grant_option</td>
<td>TRUE if grantee should be allowed to grant access, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

Examples

BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
    dbms_resource_manager.oracle_user, 'scott', 'mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
    grantee_name   IN VARCHAR2,
    privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
    admin_option   IN BOOLEAN);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee_name</td>
<td>Name of the user or role to whom privilege is to be granted.</td>
</tr>
<tr>
<td>privilege_name</td>
<td>Name of the privilege to be granted.</td>
</tr>
<tr>
<td>admin_option</td>
<td>TRUE if the grant is with admin_option, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: ADMINISTER_RESOURCE_MANAGER. Database administrators have this system privilege with the admin option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the admin option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called scott without the admin option:

BEGIN
    DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (grantee_name => 'scott', privilege_name => 'ADMINISTER_RESOURCE_MANAGER', admin_option => FALSE);
END;
/

REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```sql
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (  
    revokee_name   IN VARCHAR2,  
    consumer_group IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>revokee_name</td>
<td>Name of user/role from which to revoke access.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of consumer group.</td>
</tr>
</tbody>
</table>

Usage Notes

If you revoke a user’s switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the `DEFAULT_CONSUMER_GROUP` consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from `PUBLIC`, then any users who could previously only use the consumer group through `PUBLIC` will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to `mail_maintenance_group` from Scott:

```sql
BEGIN  
    DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (  
        'scott', 'mail_maintenance_group');
```

77-6 PL/SQL Packages and Types Reference
END;
/

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```sql
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
    revokee_name   IN VARCHAR2,
    privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>revokee_name</td>
<td>Name of the user or role from whom privilege is to be revoked.</td>
</tr>
<tr>
<td>privilege_name</td>
<td>Name of the privilege to be revoked.</td>
</tr>
</tbody>
</table>

Examples

The following call revokes the ADMINISTER_RESOURCE_MANAGER from user scott:

```sql
BEGIN
    DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```
With the DBMS_RESUMABLE package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- Using DBMS_RESUMABLE
  - Operational Notes
- Summary of DBMS_RESUMABLE Subprograms
Using DBMS_RESUMABLE

- Operational Notes

Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the DBMS_RESUMABLE.ABORT() procedure.
## Summary of DBMS_RESUMABLE Subprograms

### Table 78–1  DBMS_RESUMABLE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORT Procedure on page 78-4</td>
<td>Aborts a suspended resumable space allocation</td>
</tr>
<tr>
<td>GET_SESSION_TIMEOUT Function on page 78-5</td>
<td>Returns the current timeout value of the resumable space allocations for a session with session_id</td>
</tr>
<tr>
<td>GET_TIMEOUT Function on page 78-6</td>
<td>Returns the current timeout value of resumable space allocations for the current session</td>
</tr>
<tr>
<td>SET_SESSION_TIMEOUT Procedure on page 78-7</td>
<td>Sets the timeout of resumable space allocations for a session with session_id</td>
</tr>
<tr>
<td>SET_TIMEOUT Procedure on page 78-8</td>
<td>Sets the timeout of resumable space allocations for the current session</td>
</tr>
<tr>
<td>SPACE_ERROR_INFO Function on page 78-9</td>
<td>Looks for space-related errors in the error stack, otherwise returning FALSE</td>
</tr>
</tbody>
</table>
ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter session_id is the session ID in which the statement is executed. For a parallel DML/DDL, session_id is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the AFTER SUSPEND trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (
    session_id  IN NUMBER);
```

Parameters

```
Table 78–2  ABORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>The session identifier of the resumable space allocation.</td>
</tr>
</tbody>
</table>
```

Usage Notes

To call an ABORT procedure, you must be the owner of the session with session_id, have ALTER SYSTEM privileges, or be a DBA.
GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```sql
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (  
    session_id  IN NUMBER
)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>session_id</code></td>
<td>The session identifier of the resumable space allocation.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>The current timeout value of resumable space allocations for a session with <code>session_id</code>. The timeout is returned in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

If `session_id` does not exist, the GET_SESSION_TIMEOUT function returns -1.
GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```sql
DBMS_RESUMABLE.GET_TIMEOUT
RETURN NUMBER;
```

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>The current timeout value of resumable space allocations for the current session. The returned value is in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.
**SET_SESSION_TIMEOUT Procedure**

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

**Syntax**

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (
    session_id  IN NUMBER,
    timeout     IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>session_id</code></td>
<td>The session identifier of the resumable space allocation.</td>
</tr>
<tr>
<td><code>timeout</code></td>
<td>The timeout of the resumable space allocation.</td>
</tr>
</tbody>
</table>
SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```sql
DBMS_RESUMABLE.SET_TIMEOUT (
  timeout  IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The timeout of the resumable space allocation.</td>
</tr>
</tbody>
</table>
SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return FALSE. Otherwise, TRUE is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
    error_type      OUT VARCHAR2,
    object_type     OUT VARCHAR2,
    object_owner    OUT VARCHAR2,
    table_space_name OUT VARCHAR2,
    object_name     OUT VARCHAR2,
    sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_type</td>
<td>The space error type. It will be one of the following:</td>
</tr>
<tr>
<td></td>
<td>✔️ NO MORE SPACE</td>
</tr>
<tr>
<td></td>
<td>✔️ MAX EXTENTS REACHED</td>
</tr>
<tr>
<td></td>
<td>✔️ SPACE QUOTA EXCEEDED</td>
</tr>
</tbody>
</table>

</tbody>
</table>
The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS_RLS is available with the Enterprise Edition only.

See Also: Oracle Database Security Guide for usage information on DBMS_RLS.

This chapter contains the following topics:

- Using DBMS_RLS
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_RLS Subprograms
Using DBMS_RLS

Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (  
   'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer’s right.
Using DBMS_RLS

Note: The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', FALSE);

Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view’s definer for security check and object lookup.

Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v$vpd_policies.

A synonym can reference only a view or a table.
# Summary of DBMS_RLS Subprograms

</tbody>
</table>
ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 79-3

A COMMIT is also performed at the end of the operation.

Syntax

DBMS_RLS.ADD_POLICY (  
  object_schema            IN VARCHAR2 NULL,  
  object_name              IN VARCHAR2,  
  policy_name              IN VARCHAR2,  
  function_schema          IN VARCHAR2 NULL,  
  policy_function          IN VARCHAR2,  
  statement_types          IN VARCHAR2 NULL,  
  update_check             IN BOOLEAN  FALSE,  
  enable                   IN BOOLEAN  TRUE,  
  static_policy            IN BOOLEAN  FALSE,  
  policy_type              IN BINARY_INTEGER NULL,  
  long_predicate           IN BOOLEAN  FALSE,  
  sec_relevant_cols        IN VARCHAR2,  
  sec_relevant_cols_opt    IN BINARY_INTEGER NULL);  

Parameters

Table 79–2  ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym (current default schema, if NULL).</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be added. It must be unique for the same table or view.</td>
</tr>
<tr>
<td>function_schema</td>
<td>Schema of the policy function (current default schema, if NULL).</td>
</tr>
</tbody>
</table>
**ADD_POLICY Procedure**

**Table 79–2 (Cont.) ADD_POLICY Procedure Parameters (Cont.)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_function</td>
<td>Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.</td>
</tr>
<tr>
<td>statement_types</td>
<td>Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.</td>
</tr>
<tr>
<td>update_check</td>
<td>Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.</td>
</tr>
<tr>
<td>enable</td>
<td>Indicates if the policy is enabled when it is added. The default is TRUE.</td>
</tr>
<tr>
<td>static_policy</td>
<td>The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SY$ or the privilege user who has the EXEMPT ACCESS POLICY privilege.</td>
</tr>
<tr>
<td>policy_type</td>
<td>Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 79–3. Specifying any of these policy types overrides the value of static_policy.</td>
</tr>
<tr>
<td>long_predicate</td>
<td>Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.</td>
</tr>
<tr>
<td>sec_relevant_cols</td>
<td>Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.</td>
</tr>
<tr>
<td>sec_relevant_cols_opt</td>
<td>Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See “Usage Notes” on page 79-7 for restrictions and additional information about this option.</td>
</tr>
</tbody>
</table>
### Table 79–3 DBMS_RLS.ADD_POLICY Policy Types

<table>
<thead>
<tr>
<th>Policy Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC</td>
<td>Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.</td>
</tr>
<tr>
<td>SHARED_STATIC</td>
<td>Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.</td>
</tr>
<tr>
<td>CONTEXT_SENSITIVE</td>
<td>Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.</td>
</tr>
<tr>
<td>SHARED_CONTEXT_SENSITIVE</td>
<td>Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.</td>
</tr>
<tr>
<td>DYNAMIC</td>
<td>The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function on each statement parsing or execution. Applies to only one object.</td>
</tr>
</tbody>
</table>

### Usage Notes

- **SYS** is free of any security policy.
- The policy functions which generate dynamic predicates are called by the server. Following is the interface for the function:

```sql
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2) RETURN VARCHAR2
--- object_schema is the schema owning the table of view.
--- object_name is the name of table, view, or synonym to which the policy applies.
```
The policy functions must have the purity level of \texttt{WNDS} (write no database state).

**See Also:** The *Oracle Database Application Developer’s Guide - Fundamentals* has more details about the \texttt{RESTRICT_REFERENCES} pragma.

- Dynamic predicates generated out of different policies for the same object have the combined effect of a conjunction (\texttt{ANDed}) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like
  
  \begin{verbatim}
  "select c1, c2, ... from tab tab where <predicate>"
  \end{verbatim}

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with \texttt{sec_relevant_cols_opt} \texttt{=>} \texttt{dbms_rls.ALL_ROWS}) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user’s query, but the sensitive column values display as \texttt{NULL}. The restrictions for this option are as follows:
  - Only applies to \texttt{SELECT} statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect \texttt{NULL} values, then you should use the default behavior of column-level VPD, which is specified with the \texttt{sec_relevant_cols} parameter.
  - If you use \texttt{UPDATE AS SELECT} with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:
    
    \begin{verbatim}
    select * from employees
    \end{verbatim}
where salary = 10

This query may not return rows if the salary column returns a NULL value because the column masking option has been set.

Examples

As the first of two examples, the following creates a policy that applies to the hr.employee table. This is a column-level VPD policy that will be enforced only if a SELECT or an INDEX statement refers to the salary, birthdate, or SSN columns of the table explicitly, or implicitly through a view. It is also a CONTEXT_SENSITIVE policy, so the server will invoke the policy function hr.hrfun at parse time. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the long_predicate parameter is omitted from the call.

BEGIN
  dbms_rls.add_policy(object_schema => 'hr',
                       object_name => 'employee',
                       policy_name => 'hr_policy',
                       function_schema =>'hr',
                       policy_function => 'hrfun',
                       statement_types =>'select,index',
                       policy_type => dbms_rls.CONTEXT_SENSITIVE,
                       sec_relevant_cols=>'salary,birthdate,ssn');
END;
/

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a SHARED_STATIC policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, subfun, if that search fails.

BEGIN
  dbms_rls.add_policy(object_schema => 'hr',
                       object_name => 'employee',
                       policy_name => 'hosting_policy',
                       function_schema =>'hr',
                       policy_function => 'subfun',
                       policy_type => dbms_rls.SHARED_STATIC);
END;
/
DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 79-3

A COMMIT is also performed at the end of the operation.

Syntax

```sql
DBMS_RLS.DROP_POLICY (  
    object_schema IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2,  
    policy_name   IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view or synonym (current default schema if NULL).</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym.</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be dropped from table, view, or synonym.</td>
</tr>
</tbody>
</table>
REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 79-3

A COMMIT is also performed at the end of the operation.

Syntax

DBMS_RLS.REFRESH_POLICY ( 
    object_schema IN VARCHAR2 NULL, 
    object_name   IN VARCHAR2 NULL, 
    policy_name   IN VARCHAR2 NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym with which the policy is associated.</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be refreshed.</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure returns an error if it tries to refresh a disabled policy.
ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 79-3

A COMMIT is also performed at the end of the operation.

Syntax

```sql
DBMS_RLS.ENABLE_POLICY (  
  object_schema IN VARCHAR2 NULL,  
  object_name   IN VARCHAR2,  
  policy_name   IN VARCHAR2,  
  enable        IN BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing table, view, or synonym (current default schema if NULL).</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym with which the policy is associated.</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be enabled or disabled.</td>
</tr>
<tr>
<td>enable</td>
<td>TRUE to enable the policy, FALSE to disable the policy.</td>
</tr>
</tbody>
</table>
CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```sql
DBMS_RLS.CREATE_POLICY_GROUP (
    object_schema   VARCHAR2,
    object_name     VARCHAR2,
    policy_group    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>policy_group</td>
<td>Name of the policy group that the policy belongs to.</td>
</tr>
</tbody>
</table>

Usage Notes

The group must be unique for each table or view.
ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```sql
DBMS_RLS.ADD_GROUPED_POLICY(
    object_schema   VARCHAR2,
    object_name     VARCHAR2,
    policy_group    VARCHAR2,
    policy_name     VARCHAR2,
    function_schema VARCHAR2,
    policy_function VARCHAR2,
    statement_types VARCHAR2,
    update_check    BOOLEAN,
    enabled         BOOLEAN,
    static_policy   IN BOOLEAN  FALSE,
    policy_type     IN BINARY_INTEGER NULL,
    long_predicate  IN BOOLEAN  FALSE,
    sec_relevant_cols IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>policy_group</td>
<td>The name of the policy group that the policy belongs to.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The name of the policy; must be unique for the same table or view.</td>
</tr>
<tr>
<td>function_schema</td>
<td>The schema owning the policy function.</td>
</tr>
<tr>
<td>policy_function</td>
<td>The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.</td>
</tr>
<tr>
<td>statement_types</td>
<td>Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.</td>
</tr>
<tr>
<td>update_check</td>
<td>BOOLEAN</td>
</tr>
<tr>
<td>enabled</td>
<td>BOOLEAN</td>
</tr>
<tr>
<td>static_policy</td>
<td>IN BOOLEAN FALSE</td>
</tr>
<tr>
<td>policy_type</td>
<td>IN BINARY_INTEGER NULL</td>
</tr>
<tr>
<td>long_predicate</td>
<td>IN BOOLEAN FALSE</td>
</tr>
<tr>
<td>sec_relevant_cols</td>
<td>IN VARCHAR2</td>
</tr>
</tbody>
</table>
Summary of DBMS_RLS Subprograms

---

**Table 79–8 (Cont.) ADD_GROUPED_POLICY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>update_check</td>
<td>For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.</td>
</tr>
<tr>
<td>enable</td>
<td>Indicates if the policy is enable when it is added. The default is TRUE.</td>
</tr>
<tr>
<td>static_policy</td>
<td>The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.</td>
</tr>
<tr>
<td>policy_type</td>
<td>Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 79–3. Specifying any of these policy types overrides the value of static_policy.</td>
</tr>
<tr>
<td>long_predicate</td>
<td>Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.</td>
</tr>
<tr>
<td>sec_relevant_cols</td>
<td>Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.</td>
</tr>
<tr>
<td>sec_relevant_cols_opt</td>
<td>Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See &quot;Usage Notes&quot; on page 79-7 for restrictions and additional information about this option.</td>
</tr>
</tbody>
</table>

---

**Usage Notes**

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
The policy group must have been created by using the \texttt{CREATE_POLICY\_GROUP} Procedure on page 79-13.

The policy name must be unique within a policy group for a specific object.

Policies from the default policy group, \texttt{SYS\_DEFAULT}, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with \texttt{EXEMPT\ ACCESS\ POLICY} system privilege.
**ADD_POLICY_CONTEXT Procedure**

This procedure adds the context for the active application.

**Syntax**

```sql
DBMS_RLS.ADD_POLICY_CONTEXT (object_schema VARCHAR2, object_name VARCHAR2, namespace VARCHAR2, attribute VARCHAR2);
```

**Parameters**

*Table 79–9  ADD_POLICY_CONTEXT Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>namespace</td>
<td>The namespace of the driving context</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute of the driving context</td>
</tr>
</tbody>
</table>

**Usage Notes**

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
ADD_POLICY_CONTEXT Procedure

- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.

- To add a policy to table hr.employees in group access_control_group, the following command is issued:

  DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');
**DELETE_POLICY_GROUP Procedure**

This procedure deletes a policy group.

**Syntax**

```sql
DBMS_RLS.DELETE_POLICY_GROUP (
    object_schema VARCHAR2,
    object_name VARCHAR2,
    policy_group VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>policy_group</td>
<td>The name of the policy group that the policy belongs to.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.
DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```sql
DBMS_RLS.DROP_GROUPED_POLICY (
    object_schema VARCHAR2,
    object_name VARCHAR2,
    policy_group VARCHAR2,
    policy_name VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym to which the policy is dropped.</td>
</tr>
<tr>
<td>policy_group</td>
<td>The name of the policy group that the policy belongs to.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The name of the policy.</td>
</tr>
</tbody>
</table>
DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```sql
DBMS_RLS.DROP_POLICY_CONTEXT (
    object_schema   VARCHAR2,
    object_name     VARCHAR2,
    namespace       VARCHAR2,
    attribute       VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym to which the policy is dropped.</td>
</tr>
<tr>
<td>namespace</td>
<td>The namespace of the driving context.</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute of the driving context.</td>
</tr>
</tbody>
</table>
ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (  
  object_schema VARCHAR2,  
  object_name VARCHAR2,  
  group_name VARCHAR2,  
  policy_name VARCHAR2,  
  enable BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym with which the policy is associated.</td>
</tr>
<tr>
<td>group_name</td>
<td>The name of the group of the policy.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The name of the policy to be enabled or disabled.</td>
</tr>
<tr>
<td>enable</td>
<td>TRUE enables the policy; FALSE disables the policy.</td>
</tr>
</tbody>
</table>

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.
DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

DBMS_RLS.DISABLE_GROUPED_POLICY (  
object_schema VARCHAR2,  
object_name VARCHAR2,  
group_name VARCHAR2,  
policy_name VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym with which the policy is associated.</td>
</tr>
<tr>
<td>group_name</td>
<td>The name of the group of the policy.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The name of the policy to be enabled or disabled.</td>
</tr>
</tbody>
</table>

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.
REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

DBMS_RLS.REFRESH_GROUPED_POLICY (
    object_schema VARCHAR2,
    object_name VARCHAR2,
    group_name VARCHAR2,
    policy_name VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>The schema containing the table, view, or synonym.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, view, or synonym with which the policy is associated.</td>
</tr>
<tr>
<td>group_name</td>
<td>The name of the group of the policy.</td>
</tr>
<tr>
<td>policy_name</td>
<td>The name of the policy.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

Note: DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

- Using DBMS_ROWID
  - Security Model
  - Types
  - Exceptions
  - Exceptions
  - Examples
- Summary of DBMS_ROWID Subprograms
Using DBMS_ROWID

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Types

- Extension and Restriction Types
- Verification Types
- Object Types
- Conversion Types

Extension and Restriction Types

The types are as follows:
- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```plaintext
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note: Extended ROWIDs are only used in Oracle database version 8.1i and higher.
Using DBMS_ROWID

Verification Types

Table 80–1  Verification Types

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALID</td>
<td>Valid ROWID</td>
</tr>
<tr>
<td>INVALID</td>
<td>Invalid ROWID</td>
</tr>
</tbody>
</table>

For example:
rowid_is_valid  constant integer := 0;
rowid_is_invalid constant integer := 1;

Object Types

Table 80–2  Object Types

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNDEFINED</td>
<td>Object Number not defined (for restricted ROWIDs)</td>
</tr>
</tbody>
</table>

For example:
rowid_object_undefined constant integer := 0;

Conversion Types

Table 80–3  Conversion Types

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERNAL</td>
<td>Convert to/from column of ROWID type</td>
</tr>
<tr>
<td>EXTERNAL</td>
<td>Convert to/from string format</td>
</tr>
</tbody>
</table>

For example:
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
Exceptions

Table 80–4   Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID_INVALID</td>
<td>Invalid rowid format</td>
</tr>
<tr>
<td>ROWID_BAD_BLOCK</td>
<td>Block is beyond end of file</td>
</tr>
</tbody>
</table>

For example:

ROWID_INVALID exception;
   pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
   pragma exception_init(ROWID_BAD_BLOCK, -28516);

Operational Notes

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.

- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

  Note: ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

  ```sql
  SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
  FROM emp
  WHERE ename = 'KING';
  ```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
  - A problem with the current procedure or function
– Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
– Calling a package procedure or function that touches the initialization code in a package or that sets the default values

Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
    object_no   INTEGER;
    row_id      ROWID;
    ...
BEGIN
    SELECT ROWID INTO row_id FROM emp
        WHERE empno = 7499;
    object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
    DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
    ...
```
### Summary of DBMS_ROWID Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ROWID_BLOCK_NUMBER</strong> Function on page 80-7</td>
<td>Returns the block number of a ROWID</td>
</tr>
<tr>
<td><strong>ROWID_CREATE</strong> Function on page 80-8</td>
<td>Creates a ROWID, for testing only</td>
</tr>
<tr>
<td><strong>ROWID_INFO</strong> Procedure on page 80-10</td>
<td>Returns the type and components of a ROWID</td>
</tr>
<tr>
<td><strong>ROWID_OBJECT</strong> Function on page 80-12</td>
<td>Returns the object number of the extended ROWID</td>
</tr>
<tr>
<td><strong>ROWID_RELATIVE_FNO</strong> Function on page 80-13</td>
<td>Returns the file number of a ROWID</td>
</tr>
<tr>
<td><strong>ROWID_ROW_NUMBER</strong> Function on page 80-14</td>
<td>Returns the row number</td>
</tr>
<tr>
<td><strong>ROWID_TO_ABSOLUTE_FNO</strong> Function on page 80-15</td>
<td>Returns the absolute file number associated with the ROWID for a row in a specific table</td>
</tr>
<tr>
<td><strong>ROWID_TO_EXTENDED</strong> Function on page 80-17</td>
<td>Converts a ROWID from restricted format to extended</td>
</tr>
<tr>
<td><strong>ROWID_TO_RESTRICTED</strong> Function on page 80-19</td>
<td>Converts an extended ROWID to restricted format</td>
</tr>
<tr>
<td><strong>ROWID_TYPE</strong> Function on page 80-20</td>
<td>Returns the ROWID type: 0 is restricted, 1 is extended</td>
</tr>
<tr>
<td><strong>ROWID_VERIFY</strong> Function on page 80-21</td>
<td>Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function</td>
</tr>
</tbody>
</table>
**ROWID_BLOCK_NUMBER Function**

This function returns the database block number for the input ROWID.

**Syntax**

```sql
DBMS_ROWID.ROWID_BLOCK_NUMBER (
    row_id      IN   ROWID,
    ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

**Pragmas**

```sql
pragma RESTRICT_REFERENCES(rowid_block_number, WDNS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
<tr>
<td>ts_type_in</td>
<td>The type of the tablespace (bigfile/smallfile) to which the row belongs.</td>
</tr>
</tbody>
</table>

**Examples**

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```sql
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
    FROM some_table
    WHERE key_value = 42);
```
ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters. This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (  
  rowid_type    IN NUMBER,  
  object_number IN NUMBER,  
  relative_fno  IN NUMBER,  
  block_number  IN NUMBER,  
  row_number    IN NUMBER)  
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowid_type</td>
<td>Type (restricted or extended). Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.</td>
</tr>
<tr>
<td>object_number</td>
<td>Data object number (rowid_object_undefined for restricted).</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative file number.</td>
</tr>
<tr>
<td>block_number</td>
<td>Block number in this file.</td>
</tr>
<tr>
<td>row_number</td>
<td>Returns row number in this block.</td>
</tr>
</tbody>
</table>

Examples

Create a dummy extended ROWID:
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);

Find out what the rowid_object function returns:

obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);

The variable obj_number now contains 9999.
ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID. This is a procedure, and it cannot be used in a SQL statement.

Syntax

```sql
DBMS_ROWID.ROWID_INFO (
  rowid_in         IN   ROWID,
  ts_type_in       IN   VARCHAR2 DEFAULT 'SMALLFILE',
  rowid_type       OUT  NUMBER,
  object_number    OUT  NUMBER,
  relative_fno     OUT  NUMBER,
  block_number     OUT  NUMBER,
  row_number       OUT  NUMBER);
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowid_in</td>
<td>ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.</td>
</tr>
<tr>
<td>ts_type_in</td>
<td>The type of the tablespace (bigfile/smallfile) to which the row belongs.</td>
</tr>
<tr>
<td>rowid_type</td>
<td>Returns type (restricted/extended).</td>
</tr>
<tr>
<td>object_number</td>
<td>Returns data object number (rowid_object_undefined for restricted).</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Returns relative file number.</td>
</tr>
<tr>
<td>block_number</td>
<td>Returns block number in this file.</td>
</tr>
<tr>
<td>row_number</td>
<td>Returns row number in this block.</td>
</tr>
</tbody>
</table>

See Also: "ROWID_TYPE Function" on page 80-20
Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

DBMS_ROWID.ROWID_INFO(my_rowid, 'BIGFILE', rid_type, obj_num, file_num, block_num, row_num);

DBMS_OUTPUT.PUT_LINE('The type is ' || rid_type);
DBMS_OUTPUT.PUT_LINE('Data object number is ' || obj_num);
-- and so on...
ROWID_OBJECT Function

This function returns the data object number for an extended ROWID. The function returns zero if the input ROWID is a restricted ROWID.

Syntax

DBMS_ROWID.ROWID_OBJECT (rowid_id IN ROWID) RETURN NUMBER;

Pragmas

pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);

Parameters

Table 80–9  ROWID_OBJECT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
</tbody>
</table>

Note: The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

SELECT dbms_rowid.rowid_object(ROWID) FROM emp WHERE empno = 7499;
**ROWID_RELATIVE_FNO Function**

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

**Syntax**

```sql
DBMS_ROWID.ROWID_RELATIVE_FNO (  
  rowid_id      IN   ROWID,  
  ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

**Pragmas**

```sql
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
<tr>
<td>ts_type_in</td>
<td>The type of the tablespace (bigfile/smallfile) to which the row belongs.</td>
</tr>
</tbody>
</table>

**Examples**

The example PL/SQL code fragment returns the relative file number:

```sql
DECLARE
  file_number    INTEGER;
  rowid_val      ROWID;
BEGIN
  SELECT ROWID INTO rowid_val
  FROM dept
  WHERE loc = 'Boston';
  file_number :=
    dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
  ...
```
This function extracts the row number from the ROWID IN parameter.

Syntax

DBMS_ROWID.ROWID_ROW_NUMBER (row_id IN ROWID) RETURN NUMBER;

Pragmas

PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
</tbody>
</table>

Examples

Select a row number:

```sql
SELECT dbms_rowid.rowid_row_number(ROWID)
FROM emp
WHERE ename = 'ALLEN';
```
ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table. The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```sql
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (
    row_id    IN ROWID,
    schema_name IN VARCHAR2,
    object_name IN VARCHAR2)
RETURN NUMBER;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema which contains the table.</td>
</tr>
<tr>
<td>object_name</td>
<td>Table name.</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    abs_fno        INTEGER;
    rowid_val      CHAR(18);
    object_name    VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
    FROM emp
    WHERE empno = 9999;
    abs_fno := dbms_rowid.rowid_to_absolute_fno(
        rowid_val, 'SCOTT', object_name);
```

Table 80–12  ROWID_TO_ABSOLUTE_FNO Function Parameters
Note: For partitioned objects, the name must be a table name, not a partition or a sub/partition name.
ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format. Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (  
    old_rowid       IN ROWID,  
    schema_name     IN VARCHAR2,  
    object_name     IN VARCHAR2,  
    conversion_type IN INTEGER)  
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_rowid</td>
<td>ROWID to be converted.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema which contains the table (optional).</td>
</tr>
<tr>
<td>object_name</td>
<td>Table name (optional).</td>
</tr>
<tr>
<td>conversion_type</td>
<td>The following constants are defined:</td>
</tr>
<tr>
<td></td>
<td>rowid_convert_internal (=0)</td>
</tr>
<tr>
<td></td>
<td>rowid_convert_external (=1)</td>
</tr>
</tbody>
</table>

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.
**Examples**

Assume that there is a table called `RIDS` in the schema `SCOTT`, and that the table contains a column `ROWID_COL` that holds `ROWIDs` (restricted), and a column `TABLE_COL` that point to other tables in the `SCOTT` schema. You can convert the `ROWIDs` to extended format with the statement:

```
UPDATE SCOTT.RIDS
SET rowid_col =
  dbms_rowid.rowid_to_extended (rowid_col, 'SCOTT', TABLE_COL, 0);
```

**Usage Notes**

If the schema and object names are provided as `IN` parameters, then this function verifies `SELECT` authority on the table named, and converts the restricted `ROWID` provided to an extended `ROWID`, using the data object number of the table. That `ROWID_TO_EXTENDED` returns a value, however, does not guarantee that the converted `ROWID` actually references a valid row in the table, either at the time that the function is called, or when the extended `ROWID` is actually used.

If the schema and object name are not provided (are passed as `NULL`), then this function attempts to fetch the page specified by the restricted `ROWID` provided. It treats the file number stored in this `ROWID` as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended `ROWID` value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.

If an extended `ROWID` value is supplied, the data object number in the input extended `ROWID` is verified against the data object number computed from the table name parameter. If the two numbers do not match, the `INVALID_ROWID` exception is raised. If they do match, the input `ROWID` is returned.

**See Also:** The `ROWID_VERIFY Function` has a method to determine if a given `ROWID` can be converted to the extended format.
ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```sql
DBMS_ROWID.ROWID_TO_RESTRICTED (  
    old_rowid       IN ROWID,  
    conversion_type IN INTEGER)  
RETURN ROWID;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_rowid</td>
<td>ROWID to be converted.</td>
</tr>
<tr>
<td>conversion_type</td>
<td>The following constants are defined:</td>
</tr>
<tr>
<td></td>
<td>rowid_convert_internal (:=0)</td>
</tr>
<tr>
<td></td>
<td>rowid_convert_external (:=1)</td>
</tr>
</tbody>
</table>

ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
    rowid_id IN ROWID)
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
</tbody>
</table>

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```
ROWID_VERIFY Function

This function verifies the ROWID. It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

Note: You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```sql
DBMS_ROWID.ROWID_VERIFY (  
  rowid_in        IN ROWID,  
  schema_name     IN VARCHAR2,  
  object_name     IN VARCHAR2,  
  conversion_type IN INTEGER  
RETURN NUMBER;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowid_in</td>
<td>ROWID to be verified.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema which contains the table.</td>
</tr>
<tr>
<td>object_name</td>
<td>Table name.</td>
</tr>
<tr>
<td>conversion_type</td>
<td>The following constants are defined:</td>
</tr>
<tr>
<td></td>
<td>rowid_convert_internal (:=0)</td>
</tr>
<tr>
<td></td>
<td>rowid_convert_external (:=1)</td>
</tr>
</tbody>
</table>

Examples

Considering the schema in the example for the ROWID_TO_EXTENDED function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.
ROWID_VERIFY Function

SELECT ROWID, rowid_col
FROM SCOTT.RIDS
WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;

### Summary of DBMS_RULE Subprograms

<table>
<thead>
<tr>
<th>Table 81–1</th>
<th>DBMS_RULE Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>CLOSE_ITERATOR Procedure on page 81-4</td>
<td>Closes an open iterator</td>
</tr>
<tr>
<td>EVALUATE Procedures on page 81-5</td>
<td>Evaluates the rules in the specified rule set that use the evaluation context specified</td>
</tr>
<tr>
<td>GET_NEXT_HIT Function on page 81-10</td>
<td>Returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator; returns NULL if there are no more rules that evaluated to TRUE or MAYBE.</td>
</tr>
</tbody>
</table>
CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

DBMS_RULE.CLOSE_ITERATOR(
    iterator  IN  NUMBER);

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator</td>
<td>The iterator to be closed</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

See Also:  "EVALUATE Procedures" on page 81-5
EVALUATE Procedures

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The true_rules and maybe_rules parameters are mutually exclusive with the true_rules_iterator and maybe_rules_iterator parameters. In addition, the procedure with the true_rules and maybe_rules parameters includes the stop_on_first_hit parameter, but the other procedure does not.

Syntax

```
DBMS_RULE.EVALUATE(
    rule_set_name   IN   VARCHAR2,
    evaluation_context   IN   VARCHAR2,
    event_context        IN   SYS.RE$NV_LIST               DEFAULT NULL,
    table_values   IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
    column_values   IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
    variable_values   IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
    attribute_values   IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
    stop_on_first_hit   IN   BOOLEAN                      DEFAULT false,
    simple_rules_only   IN   BOOLEAN                      DEFAULT false,
    true_rules   OUT  SYS.RE$RULE_HIT_LIST,
    maybe_rules   OUT  SYS.RE$RULE_HIT_LIST);
```

```
DBMS_RULE.EVALUATE(
    rule_set_name IN   VARCHAR2,
    evaluation_context IN   VARCHAR2,
    event_context         IN   SYS.RE$NV_LIST               DEFAULT NULL,
    table_values IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
    column_values IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
    variable_values    IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
    attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
    stop_on_first_hit IN BOOLEAN                      DEFAULT false,
    simple_rules_only IN BOOLEAN                      DEFAULT false,
    true_rules_iterator OUT  BINARY_INTEGER,
    maybe_rules_iterator  OUT  BINARY_INTEGER);
```
Parameters

Table 81–3 EVALUATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>Name of the rule set in the form [schema_name.]rule_set_name. For example, to evaluate all of the rules in a rule set named hr_rules in the hr schema, enter hr.hr_rules for this parameter. If the schema is not specified, then the schema of the current user is used.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An evaluation context name in the form [schema_name.]evaluation_context_name. If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.</td>
</tr>
<tr>
<td>event_context</td>
<td>A list of name-value pairs that identify events that cause evaluation</td>
</tr>
<tr>
<td>table_values</td>
<td>Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.</td>
</tr>
<tr>
<td>column_values</td>
<td>Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in table_values.</td>
</tr>
<tr>
<td>variable_values</td>
<td>A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.</td>
</tr>
<tr>
<td>attribute_values</td>
<td>Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in variable_values.</td>
</tr>
<tr>
<td>stop_on_first_hit</td>
<td>If true, then the rules engine stops evaluation as soon as it finds a TRUE rule. If true and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data. If false, then the rules engine continues to evaluate rules even after it finds a TRUE rule.</td>
</tr>
</tbody>
</table>
Summary of DBMS_RULE Subprograms

### Usage Notes

#### Note:

Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>simple_rules_only</code></td>
<td>If <code>true</code>, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If <code>false</code>, then evaluates all rules.</td>
</tr>
<tr>
<td><code>true_rules</code></td>
<td>Receives the output of the <code>EVALUATE</code> procedure into a varray of <code>RE$RULE_HIT_LIST</code> type. If no rules evaluate to <code>TRUE</code>, then <code>true_rules</code> is empty.</td>
</tr>
<tr>
<td><code>maybe_rules</code></td>
<td>If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty. If <code>stop_on_first_hit</code> is <code>true</code>, then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code>, then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code>. If <code>stop_on_first_hit</code> is <code>false</code>, then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code>.</td>
</tr>
<tr>
<td><code>true_rules_iterator</code></td>
<td>Contains the iterator for accessing rules that are <code>TRUE</code>.</td>
</tr>
<tr>
<td><code>maybe_rules_iterator</code></td>
<td>Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL.</td>
</tr>
</tbody>
</table>
The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as `TRUE`, without a value for table "tab":

\[(x.a.b = 1) \text{ or } (tab.c > 10)\]

The results of an evaluation are the following:

- **TRUE** rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.

- **MAYBE** rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `true`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to
TRUE one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to MAYBE one at a time.

If you use an iterator, then you use the GET_NEXT_HIT function in the DBMS_RULE package to retrieve the next rule that evaluates to TRUE or MAYBE from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The CLOSE_ITERATOR procedure in the DBMS_RULE package is run with the iterator specified.
- The iterator returns NULL because no more rules evaluate to TRUE or MAYBE.
- The session in which the iterator is running ends.

To run the DBMS_RULE.EVALUATE procedure, a user must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE_SET privilege on the rule set
- Have EXECUTE_ANY_RULE_SET system privilege
- Be the rule set owner

**Note:** The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

**See Also:**

- Chapter 181, "Rule TYPES" for more information about the types used with the DBMS_RULE package
- "GET_NEXT_HIT Function" on page 81-10
- "CLOSE_ITERATOR Procedure" on page 81-4
GET_NEXT_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

Syntax

```sql
DBMS_RULE.GET_NEXT_HIT(
    iterator IN NUMBER)
RETURN SYS.RE$RULE_HIT;
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator</td>
<td>The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the CLOSE_ITERATOR procedure in the DBMS_RULE package to close it.

**Note:** This function raises an error if the rule set being evaluated was modified after the call to the DBMS_RULE.EVALUATE procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

<td>Revokes the specified system privilege from the specified user or role</td>
</tr>
</tbody>
</table>

**Note:** All procedures commit unless specified otherwise.
ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```plsql
DBMS_RULE_ADM.ADD_RULE(
  rule_name IN VARCHAR2,
  rule_set_name IN VARCHAR2,
  evaluation_context IN VARCHAR2 DEFAULT NULL,
  rule_comment IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are adding to the rule set, specified as [schema_name.]rule_name. For example, to add a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set to which you are adding the rule, specified as [schema_name.]rule_set_name. For example, to add the rule to a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An evaluation context name in the form [schema_name.]evaluation_context_name. If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.</td>
</tr>
<tr>
<td>rule_comment</td>
<td>Optional description, which may contain the reason for adding the rule to the rule set.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
Be the owner of the rule set
Also, the rule set owner must meet at least one of the following requirements:
- Have `EXECUTE_ON_RULE` privilege on the rule
- Have `EXECUTE_ANY_RULE` system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:
- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.
ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```sql
DBMS_RULE_ADM.ALTER_RULE(
    rule_name         IN  VARCHAR2,
    condition        IN  VARCHAR2        DEFAULT NULL,
    evaluation_context        IN  VARCHAR2        DEFAULT NULL,
    remove_evaluation_context  IN  BOOLEAN         DEFAULT false,
    action_context        IN  SYS.RE$NV_LIST  DEFAULT NULL,
    remove_action_context      IN  BOOLEAN         DEFAULT false,
    rule_comment               IN  VARCHAR2        DEFAULT NULL,
    remove_rule_comment        IN  BOOLEAN         DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td>The name of the rule you are altering, specified as <code>[schema_name.]rule_name</code>. For example, to alter a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><code>condition</code></td>
<td>The condition to be associated with the rule. If non-NULL, then the rule's condition is changed.</td>
</tr>
<tr>
<td><code>evaluation_context</code></td>
<td>An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code>. If the schema is not specified, then the current user is the default. If non-NULL, then the rule's evaluation context is changed.</td>
</tr>
<tr>
<td><code>remove_evaluation_context</code></td>
<td>If true, then sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If false, then retains any evaluation context for the specified rule. If the evaluation_context parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
Summary of DBMS_RULE_ADM Subprograms

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule
- Have ALTER_ANYRULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

### Table 82–3 (Cont.) ALTER_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_context</td>
<td>If non-NULL, then changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.</td>
</tr>
<tr>
<td>remove_action_context</td>
<td>If true, then sets the action context for the rule to NULL, which effectively removes the action context from the rule. If false, then retains any action context for the specified rule. If the action_context parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
<tr>
<td>rule_comment</td>
<td>If non-NULL, then changes the description of the rule</td>
</tr>
<tr>
<td>remove_rule_comment</td>
<td>If true, then sets the comment for the rule to NULL, which effectively removes the comment from the rule. If false, then retains any comment for the specified rule. If the rule_comment parameter is non-NULL, then this parameter should be set to false.</td>
</tr>
</tbody>
</table>
See Also: Chapter 181, "Rule TYPES" for more information about the types used with the DBMS_RULE_ADM package
CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(
    evaluation_context_name IN  VARCHAR2,
    table_aliases IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
    variable_types IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
    evaluation_function IN  VARCHAR2                   DEFAULT NULL,
    evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Table 82–4 CREATE_EVALUATION_CONTEXT Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>evaluation_context_name</td>
</tr>
<tr>
<td>table_aliases</td>
</tr>
<tr>
<td>variable_types</td>
</tr>
<tr>
<td>evaluation_function</td>
</tr>
<tr>
<td>evaluation_context_comment</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have CREATE_EVALUATION_CONTEXT_OBJ system privilege
- Have CREATE_ANY_EVALUATION_CONTEXT system privilege

**See Also:** Chapter 181, "Rule TYPES" for more information about the types used with the DBMS_RULE_ADM package

The evaluation function must have the following signature:

```sql
FUNCTION evaluation_function_name(
  rule_set_name       IN   VARCHAR2,
  evaluation_context  IN   VARCHAR2,
  event_context       IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values        IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values       IN   SYS.RE$COLUMN_VALUE_LIST      DEFAULT NULL,
  variable_values     IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit   IN   BOOLEAN                      DEFAULT false,
  simple_rules_only   IN   BOOLEAN                      DEFAULT false,
  true_rules          OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules         OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

**Note:** Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- **DBMS_RULE_ADM.EVALUATION_SUCCESS:** The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the DBMS_RULE.EVALUATE procedure.
- **DBMS_RULE_ADM.EVALUATION_CONTINUE:** The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- **DBMS_RULE_ADM.EVALUATION_FAILURE:** The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.
CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```sql
DBMS_RULE_ADM.CREATE_RULE(
    rule_name  IN  VARCHAR2,
    condition  IN  VARCHAR2,
    evaluation_context IN  VARCHAR2        DEFAULT NULL,
    action_context IN  SYS.RE$NV_LIST  DEFAULT NULL,
    rule_comment IN  VARCHAR2        DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code>. For example, to create a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>condition</td>
<td>The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition: <code>department_id = 30</code></td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code>, which is associated with the rule. If the schema is not specified, then the current user is the default. If evaluation_context is not specified, then the rule inherits the evaluation context from its rule set.</td>
</tr>
<tr>
<td>action_context</td>
<td>The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.</td>
</tr>
<tr>
<td>rule_comment</td>
<td>An optional description of the rule</td>
</tr>
</tbody>
</table>
CREATE_RULE Procedure

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE_RULE_OBJ system privilege
- Have CREATE_ANY_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also: Chapter 181, "Rule TYPES" for more information about the types used with the DBMS_RULE_ADM package
**CREATE_RULE_SET Procedure**

This procedure creates a rule set.

**Syntax**

```sql
DBMS_RULE_ADM.CREATE_RULE_SET(
  rule_set_name  IN  VARCHAR2,
  evaluation_context  IN  VARCHAR2  DEFAULT NULL,
  rule_set_comment IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set you are creating, specified as [schema_name.]rule_set_name. For example, to create a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An optional evaluation context name in the form [schema_name.]evaluation_context_name, which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>rule_set_comment</td>
<td>An optional description of the rule set</td>
</tr>
</tbody>
</table>

**Usage Notes**

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have CREATE_RULE_SET_OBJ system privilege
- Have CREATE_ANY_RULE_SET system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
CREATE RULE_SET Procedure

- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner
### DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

**Syntax**

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(
    evaluation_context_name  IN  VARCHAR2,
    force IN  BOOLEAN   DEFAULT false);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>evaluation_context_name</td>
<td>The name of the evaluation context you are dropping, specified as <code>[schema_name.]evaluation_context_name</code>. For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>true</code>, then removes the rule evaluation context from all rules and rule sets that use it. If <code>false</code> and no rules or rule sets use the rule evaluation context, then drops the rule evaluation context. If <code>false</code> and one or more rules or rule sets use the rule evaluation context, then raises an exception. <strong>Caution:</strong> Setting <code>force</code> to <code>true</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege
DROP_RULE Procedure

This procedure drops a rule.

Syntax

DBMS_RULE_ADM.DROP_RULE(
  rule_name  IN  VARCHAR2,  
  force      IN  BOOLEAN    DEFAULT false);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are dropping, specified as [schema_name.]rule_name. For example, to drop a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>force</td>
<td>If true, then removes the rule from all rule sets that contain it. If false and no rule sets contain the rule, then drops the rule. If false and one or more rule sets contain the rule, then raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP_ANY_RULE system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.
**DROP_RULE_SET Procedure**

This procedure drops a rule set.

**Syntax**

```sql
DBMS_RULE_ADM.DROP_RULE_SET(
    rule_set_name  IN  VARCHAR2,
    delete_rules IN  BOOLEAN   DEFAULT false);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set you are dropping, specified as [schema_name.]rule_set_name. For example, to drop a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>delete_rules</td>
<td>If true, then also drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If false, then the rules in the rule set are retained.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To run this procedure, a user must meet at least one of the following requirements:

- Have DROP_ANY_RULE_SET system privilege
- Be the owner of the rule set

**Note:** The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.
GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```sql
DBMS_RULEADM.GRANT_OBJECT_PRIVILEGE(
  privilege   IN  BINARY_INTEGER,
  object_name IN  VARCHAR2,
  grantee    IN  VARCHAR2,
  grant_option  IN  BOOLEAN   DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the object privilege to grant to the grantee on the object. See &quot;Usage Notes&quot; on page 82-18 for the available object privileges.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object for which you are granting the privilege to the grantee, specified as [schema_name.]object_name. For example, to grant the privilege on a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.</td>
</tr>
<tr>
<td>grantee</td>
<td>The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.</td>
</tr>
<tr>
<td>grant_option</td>
<td>If true, then the specified user or users granted the specified privilege can grant this privilege to others. If false, then the specified user or users granted the specified privilege cannot grant this privilege to others.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
Have the same privilege as the privilege being granted with the grant option.
In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 82-11 lists the object privileges.

### Table 82-11 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT</td>
<td>Alter and execute a particular evaluation context in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALL_ON_RULE</td>
<td>Alter and execute a particular rule in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET</td>
<td>Alter and execute a particular rule set in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT</td>
<td>Alter a particular evaluation context in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALTER_ON_RULE</td>
<td>Alter a particular rule in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET</td>
<td>Alter a particular rule set in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT</td>
<td>Execute a particular evaluation context in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE</td>
<td>Execute a particular rule in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET</td>
<td>Execute a particular rule set in another user's schema</td>
</tr>
</tbody>
</table>

**Examples**

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```sql
BEGIN
    DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
        privilege => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
        object_name => 'strmadmin.hr_dml',
        grantee => 'hr',
        grant_option => false);
END;
/
```
GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants the specified system privilege to the specified user or role.

Syntax

```plsql
DBMS_RULEADM.GRANT_SYSTEM_PRIVILEGE(
    privilege IN BINARY_INTEGER,
    grantee IN VARCHAR2,
    grant_option IN BOOLEAN DEFAULT false);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the system privilege to grant to the grantee.</td>
</tr>
<tr>
<td>grantee</td>
<td>The name of the user or role for which the privilege is granted</td>
</tr>
<tr>
<td>grant_option</td>
<td>If true, then the specified user or users granted the specified privilege can grant the system privilege to others. If false, then the specified user or users granted the specified privilege cannot grant the system privilege to others.</td>
</tr>
</tbody>
</table>

Usage Notes

Table 82–13 lists the system privileges.

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS.DBMS_RULEADM.ALTER_ANY_EVALUATION_CONTEXT</td>
<td>Alter any evaluation context owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULEADM.ALTER_ANY_RULE</td>
<td>Alter any rule owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULEADM.ALTER_ANY_RULE_SET</td>
<td>Alter any rule set owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULEADM.CREATE_ANY_EVALUATION_CONTEXT</td>
<td>Create a new evaluation context in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULEADM.CREATE_EVALUATION_CONTEXT_OBJ</td>
<td>Create a new evaluation context in the grantee's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULEADM.CREATE_ANY_RULE</td>
<td>Create a new rule in any schema</td>
</tr>
</tbody>
</table>
For example, to grant the strmadmin user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee => 'strmadmin',
    grant_option => false);
END;
/```

**Table 82–13 System Privileges for Evaluation Contexts, Rules, and Rule Sets**

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ</td>
<td>Create a new rule in the grantee’s schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET</td>
<td>Create a new rule set in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ</td>
<td>Create a new rule set in the grantee’s schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT</td>
<td>Drop any evaluation context in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.DROP_ANY_RULE</td>
<td>Drop any rule in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET</td>
<td>Drop any rule set in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT</td>
<td>Execute any evaluation context owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE</td>
<td>Execute any rule owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET</td>
<td>Execute any rule set owned by any user</td>
</tr>
</tbody>
</table>

**Note:** When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter 07_DICTIONARY_ACCESSIBILITY is set to false, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter 07_DICTIONARY_ACCESSIBILITY is set to false.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the 07_DICTIONARY_ACCESSIBILITY initialization parameter to true. Then privileges granted on "ANY" object will allow access to any schema, including SYS.
REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

DBMS_RULE_ADM.REMOVE_RULE(
    rule_name            IN  VARCHAR2,
    rule_set_name            IN  VARCHAR2,
    evaluation_context       IN  VARCHAR2  DEFAULT NULL,
    all_evaluation_contexts  IN  BOOLEAN   DEFAULT false);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are removing from the rule set, specified as [schema_name.]rule_name. For example, to remove a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set from which you are removing the rule, specified as [schema_name.]rule_set_name. For example, to remove the rule from a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Summary of DBMS_RULE_ADM Subprograms

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

**Note:** This procedure does not drop a rule from the database. To drop a rule from the database, use the DROP_RULE procedure.

---

Table 82–14 REMOVE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>evaluation_context_name</td>
<td>The name of the evaluation context associated with the rule you are removing, specified as [schema_name.]evaluation_context_name. For example, to specify an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the ADD_RULE procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then an error is raised. Specify NULL if you did not specify an evaluation context when you added the rule to the rule set. If you specify NULL and there are one or more evaluation contexts associated with the rule, then an error is raised.</td>
</tr>
<tr>
<td>all_evaluation_contexts</td>
<td>If true, then the rule is removed from the rule set with all of its associated evaluation contexts. If false, then only the rule with the specified evaluation context is removed. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.</td>
</tr>
</tbody>
</table>
REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```sql
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
    privilege IN BINARY_INTEGER,
    object_name IN VARCHAR2,
    revokee IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the object privilege on the object to revoke from the revokee. See &quot;GRANT_OBJECT_PRIVILEGE Procedure&quot; on page 82-18 for a list of the object privileges.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object for which you are revoking the privilege from the revokee, specified as <code>[schema_name.]object_name</code>. For example, to revoke an object privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.</td>
</tr>
<tr>
<td>revokee</td>
<td>The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.</td>
</tr>
</tbody>
</table>
REVOKE_SYSTEM_PRIVILEGE Procedure

Revoke the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
    privilege  IN  BINARY_INTEGER,
    revokee    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the system privilege to revoke from the revokee. See &quot;GRANT_SYSTEM_PRIVILEGE Procedure&quot; on page 82-20 for a list of the system privileges.</td>
</tr>
<tr>
<td>revokee</td>
<td>The name of the user or role from which the privilege is revoked</td>
</tr>
</tbody>
</table>
The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that are callable from any PL/SQL program.

See Also: Oracle Database Administrator’s Guide for more information regarding how to use DBMS_SCHEDULER

This chapter contains the following topics:

- Using DBMS_SCHEDULER
  - Rules and Limits
- Summary of DBMS_SCHEDULER Subprograms
Using DBMS_SCHEDULER

- Rules and Limits

Rules and Limits

The following rules apply when using the DBMS_SCHEDULER package:

- Only SYS can do anything in SYS schema.

- Several of the procedures accept comma-delimited lists of object names. When a list of names is provided, the Scheduler will stop executing the list on the very first object that returns an error. This means that the Scheduler will not perform the task on the objects in the list after the one that caused the error. For example, DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3'); If job3 could not be stopped, then job1 and job2 will be stopped, but the jobs in jobclass1, jobclass2, and jobclass3 will not be stopped.

- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.
### Summary of DBMS_SCHEDULER Subprograms

<td>Stops a currently running job or all jobs in a job class</td>
</tr>
</tbody>
</table>
ADD_WINDOW_GROUP_MEMBER Procedure

This procedure adds one or more windows to an existing window group.

Syntax

```sql
DBMS_SCHEDULER.ADD_WINDOW_GROUP_MEMBER (
    group_name          IN VARCHAR2,
    window_list         IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the window group.</td>
</tr>
<tr>
<td>window_list</td>
<td>The name of the window or windows.</td>
</tr>
</tbody>
</table>

Usage Notes

If an already open window is added to a window group, the Scheduler will not pick up jobs that point to this window group until the next window in the window group opens.

Adding a window to a group requires the MANAGE SCHEDULER privilege.

Note that a window group cannot be a member of another window group.
CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler will switch the resource plan to the one that was in effect outside the window or in the case of overlapping windows to another window.

Syntax

```sql
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name             IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window.</td>
</tr>
</tbody>
</table>

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated. A job that is running will not stop when the window it is running in closes unless the attribute `stop_on_close` was set to TRUE for the job. However, the resources allocated to the job may change because the resource plan may change.

When a running job has a window group as its schedule, the job will not be stopped when its window is closed if another window that is also a member of the same window group then becomes active. This is the case even if the job has the attribute `stop_on_close` set to TRUE.

Closing a window requires the MANAGE SCHEDULER privilege.
COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```sql
DBMS_SCHEDULER.COPY_JOB(
    old_job IN VARCHAR2,
    new_job IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_job</td>
<td>The name of the existing job.</td>
</tr>
<tr>
<td>new_job</td>
<td>The name of the new job.</td>
</tr>
</tbody>
</table>
CREATE_JOB Procedures

This procedure creates a job.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```sql
DBMS_SCHEDULER.CREATE_JOB (  
    job_name IN VARCHAR2,  
    job_type IN VARCHAR2,  
    job_action IN VARCHAR2,  
    number_of_arguments IN PLS_INTEGER DEFAULT 0,  
    start_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    repeat_interval IN VARCHAR2 DEFAULT NULL,  
    end_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',  
    enabled IN BOOLEAN DEFAULT FALSE,  
    auto_drop IN BOOLEAN DEFAULT TRUE,  
    comments IN VARCHAR2 DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```sql
DBMS_SCHEDULER.CREATE_JOB (  
    job_name IN VARCHAR2,  
    program_name IN VARCHAR2,  
    schedule_name IN VARCHAR2,  
    job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',  
    enabled IN BOOLEAN DEFAULT FALSE,  
    auto_drop IN BOOLEAN DEFAULT TRUE,  
    comments IN VARCHAR2 DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```sql
DBMS_SCHEDULER.CREATE_JOB (  
    job_name IN VARCHAR2,  
    program_name IN VARCHAR2,  
    start_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    repeat_interval IN VARCHAR2 DEFAULT NULL,  
    end_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',  
    enabled IN BOOLEAN DEFAULT FALSE,
```
CREATE_JOB Procedures

auto_drop IN BOOLEAN DEFAULT TRUE,
comments IN VARCHAR2 DEFAULT NULL);

Creates a job using a named schedule object and an inlined program or program:

DBMS_SCHEDULER.CREATE_JOB (job_name IN VARCHAR2,
schedule_name IN VARCHAR2,
job_type IN VARCHAR2,
job_action IN VARCHAR2,
number_of_arguments IN PLS_INTEGER DEFAULT 0,
job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
enabled IN BOOLEAN DEFAULT FALSE,
auto_drop IN BOOLEAN DEFAULT TRUE,
comments IN VARCHAR2 DEFAULT NULL);

Parameters

Table 83–5 CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>This attribute specifies the name of the job and uniquely identifies the job. The name has to be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema.</td>
</tr>
</tbody>
</table>

If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure call generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" on page 83-48 for more information.
Summary of DBMS_SCHEDULER Subprograms

job_type
This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. The three supported values are:

- plsql_block
  This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is plsql_block. In this case, the number of arguments must be 0.

- stored_procedure
  This specifies that the job is an external PL/SQL procedure. By reusing PL/SQL’s External Procedure feature, this can also be a Java stored procedure or an external C routine.

- executable
  This specifies that the job is a job external to the database. External jobs are anything that can be executed from the operating system’s command line.

Anydata arguments are not supported with a job or program type of executable.

job_action
This attribute specifies the action of the job. The following actions are possible:

For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, my_proc(); or BEGIN my_proc(); END; or DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END. Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: DECLARE ...

For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job.

PL/SQL functions or procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is stored_procedure.

For an executable, the action is the name of the external executable, including the full path name and any command-line arguments.

If job_action is not specified, an error is generated when creating the job.

Table 83–5  (Cont.) CREATE_JOB Procedure Parameters(Cont.)

</tr>
</tbody>
</table>
| job_action | This attribute specifies the action of the job. The following actions are possible: For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, my_proc(); or BEGIN my_proc(); END; or DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END. Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: DECLARE ...

For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job.

PL/SQL functions or procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is stored_procedure.

For an executable, the action is the name of the external executable, including the full path name and any command-line arguments.

If job_action is not specified, an error is generated when creating the job. |
This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.

The name of the program associated with this job.

This attribute specifies the first date on which this job is scheduled to start. If `start_date` and `repeat_interval` are left null, then the job is scheduled to run as soon as the job is enabled.

For repeating jobs that use a calendaring expression to specify the repeat interval, `start_date` is used as a reference date. The first time the job will be scheduled to run is the first match of the calendaring expression that is on or after the current date.

The Scheduler cannot guarantee that a job will execute on an exact time because the system may be overloaded and thus resources unavailable.

This attribute specifies how often the job should repeat. You can specify the repeat interval by using calendaring or PL/SQL expressions.

The expression specified is evaluated to determine the next time the job should run. If `repeat_interval` is not specified, the job will run only once at the specified start date. See Table 83–9 for further information.

The name of the schedule, window, or window group associated with this job.

This attribute specifies the date after which the job will expire and will no longer be executed. When `end_date` is reached, the job is disabled. The `STATE` of the job will be set to `COMPLETED`, and the `enabled` flag will be set to `FALSE`.

If no value for `end_date` is specified, the job will repeat forever unless `max_runs` or `max_failures` is set, in which case the job stops when either value is reached.

The value for `end_date` must be after the value for `start_date`. If it is not, an error is generated when the job is enabled.

This attribute specifies the job class that the job belongs to. If no job class is specified, then the job is assigned to the default class. Note that the owner of a job must have EXECUTE privileges on a job class in order to run a job using the resources of that class. If an invalid value for `job_class` is specified, an error is generated.

This attribute specifies a comment about the job. By default, this attribute is NULL.

---

</tr>
<tr>
<td>comments</td>
<td>This attribute specifies a comment about the job. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>
Usage Notes

Jobs are created disabled by default, thus you must explicitly enable them so they will become active and scheduled.

To create a job in your own schema, you need to have the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema.

Associating a job with a particular class or program requires EXECUTE privileges for that class.

Table 83-5 (Cont.) CREATE_JOB Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured and the job exists as a database object but the Scheduler will ignore it and the job coordinator will not pick the job for processing. In order for the job coordinator to process the job, the job has to be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.</td>
</tr>
<tr>
<td>auto_drop</td>
<td>This flag specifies whether the job will be automatically dropped once it has been executed for non-repeating jobs or when its status is changed to COMPLETED for repeating jobs. The metadata is removed from the database if this flag is set to TRUE. If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped and can be queried using the *_SCHEDULER_JOBS views. This metadata can be removed from the table using the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.</td>
</tr>
</tbody>
</table>
CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

Syntax

```sql
DBMS_SCHEDULER.CREATE_JOB_CLASS (    job_class_name    IN VARCHAR2,    resource_consumer_group IN VARCHAR2 DEFAULT NULL,    service             IN VARCHAR2 DEFAULT NULL,    logging_level       IN PLS_INTEGER DEFAULT NULL,    log_history          IN PLS_INTEGER DEFAULT NULL,    comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class_name</td>
<td>The name of the class being created. A schema other than SYS cannot be specified.</td>
</tr>
<tr>
<td></td>
<td>This attribute specifies the name of the job class and uniquely identifies the job class. The name has to be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</td>
</tr>
<tr>
<td>resource_consumer_group</td>
<td>This attribute specifies the resource consumer group this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with will determine the resources that will be allocated to the job class.</td>
</tr>
<tr>
<td></td>
<td>If the resource consumer group that a job class is associated with is dropped, the job class will then be associated with the default resource consumer group.</td>
</tr>
<tr>
<td></td>
<td>If no resource consumer group is specified, the job class is associated with the default resource consumer group.</td>
</tr>
<tr>
<td></td>
<td>If the specified resource consumer group does not exist when creating the job class, an error occurs.</td>
</tr>
<tr>
<td></td>
<td>If resource_consumer_group is specified, you cannot specify a service (it must be NULL). Also, if a service is specified, resource_consumer_group must be NULL.</td>
</tr>
</tbody>
</table>
service
This attribute specifies the service the job class belongs to. The service that a job class belongs to specifies that the jobs in this class will have affinity to the particular service specified. In a RAC environment, this means that the jobs in this class will only run on those database instances that are assigned to the specific service.

If the service that a job class belongs to is dropped, the job class will then belong to the default service.

If no service is specified, the job class will belong to the default service, which means it will have no service affinity and any one of the database instances within the cluster might run the job.

If the specified service does not exist when creating the job class, then an error occurs.

logging_level
This attribute specifies how much information is logged. The three possible options are:

DBMS_SCHEDULER.LOGGING_OFF
No logging will be performed for any jobs in this class.

DBMS_SCHEDULER.LOGGING_RUNS
The Scheduler will write detailed information to the job log for all runs of each job in this class.

DBMS_SCHEDULER.LOGGING_FULL
In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>This attribute specifies the service the job class belongs to. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.</td>
</tr>
</tbody>
</table>
CREATE_JOB_CLASS Procedure

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE SCHEDULER system privilege.

Table 83–6  (Cont.) CREATE_JOB_CLASS Procedure Parameters (Cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| log_history | This enables you to control the amount of logging the Scheduler performs. To prevent the job log and the window log from growing indiscriminately, the Scheduler has an attribute that specifies how much history (in days) to keep. Once a day, the Scheduler will automatically purge all log entries from both the job log as well as the window log that are older than the specified history. The default is 30 days. You can change the default by using the SET_SCHEDULER_ATTRIBUTE procedure. For example, to change it to 90 days, issue the following statement:

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE ('log_history','90');
```

The range of valid values is 1 through 999. |
| comments    | This attribute is for an optional comment about the job class. By default, this attribute is NULL. |
CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```sql
DBMS_SCHEDULER.CREATE_PROGRAM (
 program_name             IN VARCHAR2,
 program_type             IN VARCHAR2,
 program_action           IN VARCHAR2,
 number_of_arguments      IN PLS_INTEGER DEFAULT 0,
 enabled                  IN BOOLEAN DEFAULT FALSE,
 comments                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>This attribute specifies a unique identifier for the program. The name has to be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
<tr>
<td>program_type</td>
<td>This attribute specifies the type of program you are creating. If it is not specified then you will get an error. There are three supported values for program_type:</td>
</tr>
<tr>
<td>plsql_block</td>
<td>This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is plsql_block. In this case, the number of arguments must be 0.</td>
</tr>
<tr>
<td>stored_procedure</td>
<td>This specifies that the program is a stored procedure. It can be a PL/SQL, Java, or a C routine outside the database. PL/SQL functions or procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is stored_procedure.</td>
</tr>
<tr>
<td>executable</td>
<td>This specifies that the program is external to the database. External programs implies anything that can be executed from the operating system's command line. AnyData arguments are not supported with job or program type executable</td>
</tr>
</tbody>
</table>
Usage Notes

To create a program in his own schema, a user needs the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled field is set to TRUE). It cannot be executed by a job until it is enabled.
For other users to use your programs, they must have EXECUTE privileges, therefore once a program has been created, you have to grant EXECUTE privilege on it.
CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```sql
DBMS_SCHEDULER.CREATE_SCHEDULE (  
schedule_name          IN VARCHAR2,  
start_date             IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,  
repeat_interval        IN VARCHAR2,  
end_date               IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,  
comments               IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>This attribute specifies a unique identifier for the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
<tr>
<td>start_date</td>
<td>This attribute specifies the first date on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date. It depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval, if it is not specified.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>This attribute specifies how often the schedule should repeat. It is expressed using a calendar expression. See Table 83–9 for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.</td>
</tr>
<tr>
<td>end_date</td>
<td>The date after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date will be valid forever. end_date has to be after the start_date. If this is not the case, then an error will be generated when the schedule is created.</td>
</tr>
<tr>
<td>comments</td>
<td>This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.</td>

Syntax for repeat_interval

Calendaring Syntax  The calendaring syntax is as follows:

```
repeat_interval = frequency_clause
 [';'' interval_clause'] [';'' bymonth_clause'] [';'' byweekno_clause']
 [';'' byyearday_clause'] [';'' bymonthday_clause'] [';'' byday_clause']
 [';'' byhour_clause'] [';'' byminute_clause'] [';'' bysecond_clause']

frequency_clause = "FREQ" "=" frequency
   frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
                   "HOURLY" | "MINUTELY" | "SECONDLY"

interval_clause = "INTERVAL" "=" intervalnum
   intervalnum = 1 through 99

bymonth_clause = "BYPARTITION" "=" monthlist
   monthlist = monthday ( "," monthday)*
   month = numeric_month | char_month
   numeric_month = 1 | 2 | 3 ... 12
   char_month = "JAN" | "FEB" | "MAR" | "APR" | "MAY" | "JUN" |
                   "JUL" | "AUG" | "SEP" | "OCT" | "NOV" | "DEC"

byweekno_clause = "BYWEEKNO" "=" weeknumber_list
   weeknumber_list = weekday ( "," weeknumber)*
   week = [minus] weekno
   minus = "-"
   weekno = 1 through 53

byyearday_clause = "BYYEARDAY" "=" yearday_list
   yearday_list = yearday ( "," yearday)*
   yearday = [minus] yeardaynum
   yeardaynum = 1 through 366

bymonthday_clause = "BYPARTITION" "=" monthday_list
   monthday_list = monthday ( "," monthday)*
   monthday = [minus] monthdaynum
   monthdaynum = 1 through 31

byday_clause = "BYDAY" "=" byday_list
   byday_list = byday ( "," byday)*
   byday = [weekdaynum] day
   weekdaynum = [minus] daynum
   daynum = 1 through 53 /* if frequency is yearly */
   daynum = 1 through 5  /* if frequency is monthly */
   day = "MON" | "TUE" | "WED" | "THU" | "FRI" | "SAT" | "SUN"

byhour_clause = "BYHOUR" "=" hour_list
   hour_list = hour ( "," hour)*
   hour = 0 through 23

byminute_clause = "BYMINUTE" "=" minute_list
   minute_list = minute ( "," minute)*
```

CREATE_SCHEDULE Procedure

minute = 0 through 59
bysecond_clause = "BYSECOND" "=" second_list
  second_list = second ( "," second)*
  second = 0 through 59

In calendaring syntax, * means 0 or more.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>freq</td>
<td>This specifies the type of recurrence. It must be specified. The possible values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY.</td>
</tr>
<tr>
<td>interval</td>
<td>This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 999.</td>
</tr>
<tr>
<td>bymonth</td>
<td>This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.</td>
</tr>
<tr>
<td>byweekno</td>
<td>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. That last definition is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th. The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year. As an example, in the year 1998 the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01; and January 1st, 1999, is in the ISO week 1998-53. byweekno is only valid for YEARLY. Examples of invalid specifications are &quot;FREQ=YEARLY; BYWEEKNO=1; BYMOUNT=12&quot; and &quot;FREQ=YEARLY; BYWEEKNO=53; BYMOUNT=1&quot;.</td>
</tr>
<tr>
<td>byyearday</td>
<td>This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SCHEDULER Subprograms

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in one’s own schema or the CREATE ANY JOB privilege to create a schedule in someone else’s schema by specifying schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

repeat_interval

When using a calendaring expression, consider the following rules:

- The calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semi-colon and each clause can be present at most once.
- Spaces are allowed between syntax elements and the strings are case insensitive.
- The list of values for a specific BY clause do not need to be ordered.

Table 83–9 (Cont.) Values for repeat_interval

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bymonthday</td>
<td>This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, \texttt{BYMONTHDAY}=-1 means the last day of the month and \texttt{BYMONTHDAY}=-2 means the next to last day of the month.</td>
</tr>
<tr>
<td>byday</td>
<td>This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, \texttt{-1 FRI} is the last Friday of the month.</td>
</tr>
<tr>
<td>byhour</td>
<td>This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10AM.</td>
</tr>
<tr>
<td>byminute</td>
<td>This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.</td>
</tr>
<tr>
<td>bysecond</td>
<td>This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.</td>
</tr>
</tbody>
</table>
CREATE_SCHEDULE Procedure

- When not enough BY clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "FREQ=YEARLY" with a start date of 02/15/2003 becomes "FREQ=YEARLY;BMONTH=FEB;BMONTHDAY=15" which means every year on the 15th of February.

"FREQ=YEARLY;BMONTH=JAN, JUL" with start date 01/21/2003 becomes "FREQ=YEARLY;BMONTH=JAN, JUL;BMONTHDAY=21", which means every year on January 21 and July 21.

- The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a BYDAY clause. For example, "FREQ=YEARLY;BYWEKNO=2" with a start date of 01/01/2003 will return:

01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,

Note that when the byweekno clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is
"FREQ=YEARLY;BYWEEKNO=1, 53" for the specified week numbers in 2004, it will return the dates:

12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04,
12/27/04, 12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05

- For those BY clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying BYMONTHDAY=31 will not give you the last day of every month, because not every month has 31 days. Instead, BYMONTHDAY=-1 will give you the last day of the month.

This is not supported for BY clauses that are fixed in size. In other words, bymonth, byhour, byminute, and bysecond are not supported.

- The basic values for the byday clause are the days of the week. When the frequency is YEARLY, or MONTHLY, you are allowed to specify a positive or negative number in front of each day of the week. In the case of YEARLY, BYDAY=40MON, indicates the 40th Monday of the year. In the case of MONTHLY, BYDAY=-2SAT, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number
ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- The calendaring syntax does not allow you to specify a time zone. Instead the scheduler retrieves the time zone from the start_date argument. If jobs must follow daylight savings adjustments you must make sure that you specify a region name for the time zone of the start_date. For example specifying the start_date time zone as 'US/Eastern' in New York will make sure that daylight saving adjustments are automatically applied. If instead the time zone of the start_date is set to an absolute offset, such as '-5:00', daylight savings adjustments are not followed and your job execution will be off by an hour half of the year.

- When start_date is NULL, the scheduler will determine the time zone for the repeat interval as follows:
  1. It will check whether the session time zone is a region name. The session time zone can be set by either:
     - issuing an ALTER SESSION statement, for example:
       SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
     - or by setting the ORA_SDTZ environment variable.
  2. If the session time zone is an absolute offset instead of a region name, the scheduler will use the value of the DEFAULT_TIMEZONE scheduler attribute. For more information see the SET_SCHEDULER_ATTRIBUTE Procedure.
  3. If the DEFAULT_TIMEZONE attribute is NULL, the scheduler will use the time zone of systimestamp when the job or window is enabled.
CREATE_WINDOW Procedures

This procedure creates a Scheduler window consisting of a recurring time window and an associated resource plan.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a window using a named schedule object:

```sql
DBMS_SCHEDULER.CREATE_WINDOW (  
  window_name IN VARCHAR2,  
  resource_plan IN VARCHAR2,  
  schedule_name IN VARCHAR2,  
  duration IN INTERVAL DAY TO SECOND,  
  window_priority IN VARCHAR2 DEFAULT 'LOW',  
  comments IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```sql
DBMS_SCHEDULE.CREATE_WINDOW (  
  window_name IN VARCHAR2,  
  resource_plan IN VARCHAR2,  
  start_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  repeat_interval IN VARCHAR2,  
  end_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
  duration IN INTERVAL DAY TO SECOND,  
  window_priority IN VARCHAR2 DEFAULT 'LOW',  
  comments IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>This attribute uniquely identifies the window, and is of the form [SYS.]name. The name has to be unique in the SQL namespace, thus no other database object should have the same name.</td>
</tr>

CREATE_WINDOW Procedures

**Table 83–10 (Cont.) CREATE_WINDOW Procedure Parameters (Cont.)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>repeat_interval</td>
<td>This attribute specifies how often the window should repeat. It is expressed using the Scheduler’s calendaring syntax. A PL/SQL expression cannot be used to specify the repeat interval for a window. The expression specified is evaluated to determine the next time the window should open. If no repeat_interval is specified, the window will open only once at the specified start date.</td>
</tr>
<tr>
<td>end_date</td>
<td>This attribute specifies the date after which the window will no longer open. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window will be set to FALSE. A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified then the window will keep repeating forever. The end_date has to be after the start_date. If this is not the case, then an error is generated when the window is created.</td>
</tr>
<tr>
<td>window_priority</td>
<td>This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority will be used to determine which window will be opened. The two possible values for this attribute are high and low. A high priority window has precedence over a low priority window, which implies that the low priority window does not open if it overlaps with a high priority window. By default, a window is created with a priority of low.</td>
</tr>
<tr>
<td>comments</td>
<td>This attribute specifies an optional comment about the window. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Creating a window requires the MANAGE SCHEDULER privilege. Windows always reside in the SYS schema.
CREATE_WINDOW_GROUP Procedure

This procedure creates a new window group.

Syntax

DBMS_SCHEDULER.CREATE_WINDOW_GROUP (  
group_name IN VARCHAR2,  
window_list IN VARCHAR2 DEFAULT NULL,  
comments IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the window group.</td>
</tr>
<tr>
<td>window_list</td>
<td>A list of the windows assigned to the window group. If a window that does not exist is specified then, an error is generated and the window group is not created. Windows can also be added using the ADD_WINDOW_GROUP_MEMBER procedure. A window group cannot be a member of another window group. Can be NULL.</td>
</tr>
<tr>
<td>comments</td>
<td>A comment about the window group.</td>
</tr>
</tbody>
</table>

Usage Notes

Creating a window group requires the MANAGE SCHEDULER privilege. Window groups reside in the SYS schema. Window groups, like windows, are created with access to PUBLIC, therefore, no privileges are required to access window groups.

A window group cannot contain another window group.
DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a program argument whose value is of a complex type and must be encapsulated within an AnyData object.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (  
  program_name            IN VARCHAR2,  
  argument_position       IN PLS_INTEGER,  
  argument_name           IN VARCHAR2 DEFAULT NULL,  
  argument_type           IN VARCHAR2,  
  default_value           IN SYS.ANYDATA,  
  out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the argument being set. It is optional, but must be unique if it is specified, so no other argument must exist with this name for this program if it is non-NULL.</td>
</tr>
<tr>
<td>argument_position</td>
<td>This specifies the position of the argument when it is being passed to the executable, and is required. Argument numbers go from one up to the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_type</td>
<td>The type of argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.</td>
</tr>
<tr>
<td>default_value</td>
<td>The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.</td>
</tr>
<tr>
<td>out_argument</td>
<td>This parameter is reserved for future use. It must be set to FALSE.</td>
</tr>
</tbody>
</table>
Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.
DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. You can retrieve specific Scheduler metadata through this argument. You cannot set values for jobs using this argument. Valid metadata attributes are: job_name, job_owner, job_start, window_start, and window_end.

Syntax

DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (  
  program_name            IN VARCHAR2,  
  metadata_attribute      IN VARCHAR2,  
  argument_position       IN PLS_INTEGER,  
  argument_name           IN VARCHAR2 DEFAULT NULL);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered.</td>
</tr>
<tr>
<td>metadata_attribute</td>
<td>The metadata to be retrieved.</td>
</tr>
<tr>
<td>argument_position</td>
<td>Specifies the position of the argument when it is being passed to the executable, and is required. This cannot be greater than the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the argument being set. It is optional. This must be unique if it is specified, so no other argument must exist with this name for this program if it is non-NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.
DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines program arguments. This does not affect whether a program is enabled or not. Defining a program argument can be used to assign a default value or a name to the argument.

This procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Defines a program argument with a default value:

```sql
PROCEDURE define_program_argument(
    program_name            IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_name           IN VARCHAR2 DEFAULT NULL,
    argument_type           IN VARCHAR2,
    out_argument            IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument without a default value:

```sql
PROCEDURE define_anydata_argument(
    program_name            IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_name           IN VARCHAR2 DEFAULT NULL,
    argument_type           IN VARCHAR2,
    default_value           IN SYS.ANYDATA,
    out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 83–14 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the argument being set. It is optional, but must be unique if it is specified, so no other argument must exist with this name for this program if it is non-NULL.</td>
</tr>
</tbody>
</table>
### DEFINE_PROGRAM_ARGUMENT Procedure

#### Table 83–14 (Cont.) DEFINE_PROGRAM_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>argument_position</td>
<td>This specifies the position of the argument when it is being passed to the executable, and is required. Argument numbers go from one up to the number_of_arguments specified for the program. This must be unique so it will replace any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_type</td>
<td>The type of argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.</td>
</tr>
<tr>
<td>default_value</td>
<td>The default value to be assigned to the argument if none is specified by the job.</td>
</tr>
<tr>
<td>out_argument</td>
<td>This parameter is reserved for future use. It must be set to FALSE.</td>
</tr>
</tbody>
</table>

### Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.
DISABLE Procedure

This procedure disables a program, job, window, or window group.

Syntax

```
DBMS_SCHEDULER.DISABLE (
    name              IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a window group name is specified, then the window group will be disabled, but the windows that are members of the window group, will not be disabled.</td>
</tr>
<tr>
<td>force</td>
<td>Whether to ignore dependencies. See preceding notes for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

Disabling an object that is already disabled does not generate an error. Because the DISABLE procedure is used for several Scheduler objects, when disabling windows and window groups, they must be preceded by SYS.

The purpose of the force option is to point out dependencies. No dependent objects are altered.

To run DISABLE for a window or window group, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being disabled or have ALTER privileges on that object or have the CREATE ANY JOB privilege.
DISABLE Procedure

Job
Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its state in the job queue is changed to disabled.

If force is set to FALSE and the job is currently running, an error is returned.

If force is set to TRUE, the job is disabled, but the currently running instance is allowed to finish.

Program
When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If force is set to FALSE, the program must be unreferenced by any job otherwise an error will occur.

If force is set to TRUE, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the DISABLE call, and are allowed to continue

Any argument that pertains to the program will not be affected when the program is disabled.

Window
This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If force is set to FALSE, the window must not be open or referenced by any job otherwise an error will occur.

If force is set to TRUE, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is re-enabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Group
When a window group is disabled, jobs, other than a running job, that has the window group as its schedule will not run even if the member windows open.
However, if the job had one of the window group members as its schedule, it would still run.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If \texttt{force} is set to \texttt{FALSE}, the window group must not have any members that are open or referenced by any job otherwise an error will occur.

If \texttt{force} is set to \texttt{TRUE}:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.
DROP_JOB Procedure

This procedure drops a job or all jobs in a job class. It results in the job being removed from the job queue, its metadata being removed, and no longer being visible in the *_SCHEDULER_JOBS views. Therefore, no more runs of the job will be executed. Dropping a job also drops all argument values set for that job.

Syntax

```sql
DBMS_SCHEDULER.DROP_JOB (  
    job_name                IN VARCHAR2,  
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, and an instance of the job is running at the time of the call, the call results in an error. If force is set to TRUE, the Scheduler attempts to first stop (issues the STOP_JOB call) the running job instance and then drop the job.</td>
</tr>
</tbody>
</table>
**DROP_JOB_CLASS Procedure**

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

**Syntax**

```sql
DBMS_SCHEDULER.DROP_JOBCLASS (  
   job_class_name  IN VARCHAR2,  
   force           IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class_name</td>
<td>The name of the job class. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, a class must be unreferenced by any jobs to be dropped otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful will the class be dropped. Running jobs that belong to the job class are not affected.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Dropping a class requires the `MANAGE_SCHEDULER` system privilege.

`DROP_JOB` requires that you be the owner of the job or have `ALTER` privileges on that job. You can also drop a job if you have the `CREATE ANY JOB` privilege.
**DROP_PROGRAM Procedure**

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

**Syntax**

```sql
DBMS_SCHEDULER.DROP_PROGRAM (  
   program_name            IN VARCHAR2,  
   force                   IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be dropped. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, the program must be unreferenced by any job otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code>, all jobs referencing the program are disabled before dropping the program. Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call, and are allowed to continue.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.
DROP_PROGRAM_ARGUMENT Procedures

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Drops a program argument either by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (  
    program_name           IN VARCHAR2,  
    argument_position      IN PLS_INTEGER);  
```

Drops a program argument either by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (  
    program_name           IN VARCHAR2,  
    argument_name          IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the argument being dropped.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument to be dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.
DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE ( 
    schedule_name    IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name of the schedule. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, the schedule must be unreferenced by any job or window otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code>, any jobs or windows that use this schedule will be disabled before the schedule is dropped. Running jobs and open windows that point to the schedule are not affected.</td>
</tr>
</tbody>
</table>

Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.
DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. All references to the window are removed from window groups.

Syntax

```sql
DBMS_SCHEDULER.DROP_WINDOW (  
    window_name           IN VARCHAR2,  
    force                 IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the window must not be open or referenced by any job otherwise an error will occur. If force is set to TRUE, the window will be dropped and those jobs that have the window as their schedule will be disabled. However, jobs that have a window group of which the dropped window was a member as their schedule will not be disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply. Running jobs that have the window as their schedule will be allowed to continue, unless the stop_on_window_close flag was set to TRUE for the job. If this is the case, the job will be stopped when the window is dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a window requires the MANAGE_SCHEDULER privilege.
DROP_WINDOW_GROUP Procedure

This procedure drops a window group but not the windows that are members of this window group.

Syntax

```sql
DBMS_SCHEDULER.DROP_WINDOW_GROUP (  
    group_name              IN VARCHAR2  
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the window group.</td>
</tr>
<tr>
<td>force</td>
<td>If <code>force</code> is set to <code>FALSE</code>, the window group must be unreferenced by any job otherwise an error will occur. If <code>force</code> is set to <code>TRUE</code>, the window group will be dropped and those jobs that have the window group as their schedule will be disabled. Running jobs that have the window group as their schedule are allowed to continue, even if the <code>stop_on_window_close</code> flag was set to <code>TRUE</code> when for the job. If a member of the window group that is being dropped is open, the window group can still be dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

If you want to drop all the windows that are members of this group but not the window group itself, you can use the `DROP_WINDOW` procedure and provide name of the window group to the call.

To drop a window group, you must have the `MANAGE_SCHEDULER` privilege.
ENABLE Procedure

This procedure enables a program, job, window, or window group. When an object is enabled, the enabled flag is set to TRUE. By default, jobs and programs are created disabled and windows and window groups are created enabled.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| name      | The name of the Scheduler object being enabled. Can be a comma-delimited list.
|           | If a job class name is specified, then all the jobs in the job class are enabled.
|           | If a window group name is specified, then the window group will be enabled, but the windows that are members of the window group, will not be enabled. |

Usage Notes

Because the ENABLE procedure is used for several Scheduler objects, when enabling windows or window groups, they must be preceded by SYS.

To run ENABLE for a window or window group, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being enabled or have ALTER privileges on that object or have the CREATE ANY JOB privilege.
EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler's calendar syntax. This procedure evaluates the calendar string and tells you what the next execution date of a job or window will be. This is very useful for testing the correct definition of the calendar string without having to actually schedule the job or window.

This procedure can also be used to get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation of this procedure.

Syntax

```plsql
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (    calendar_string    IN  VARCHAR2,    start_date         IN  TIMESTAMP WITH TIME ZONE,    return_date_after  IN  TIMESTAMP WITH TIME ZONE,    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calendar_string</td>
<td>The calendar string to be evaluated.</td>
</tr>
<tr>
<td>start_date</td>
<td>The date after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.</td>
</tr>
<tr>
<td>return_date_after</td>
<td>With the start_date and the calendar string, the Scheduler has sufficient information to determine all valid execution dates. By setting this argument, the Scheduler knows which one of all possible matches to return. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.</td>
</tr>
<tr>
<td>next_run_date</td>
<td>The first timestamp that matches the calendar string and start date that occurs after the value passed in for the return_date_after argument.</td>
</tr>
</tbody>
</table>
Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';

Session altered.

DECLARE
  start_date TIMESTAMP;
  return_date_after TIMESTAMP;
  next_run_date TIMESTAMP;
BEGIN
  start_date :=
    to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
  return_date_after := start_date;
  FOR i IN 1..5 LOOP
    DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING('FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
      start_date, return_date_after, next_run_date);
    DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
  END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.
GENERATE_JOB_NAME Function

This function returns a unique name for a job. The name will be of the form \{prefix\}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB$_1$, JOB$_2$, JOB$_3$, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```sql
DBMS_SCHEDULER.GENERATE_JOB_NAME (  
    prefix        IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>The name of the prefix being returned.</td>
</tr>
</tbody>
</table>

Usage Notes

If the prefix is explicitly set to NULL, the name will be just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function will never return the same job name twice, there is a small chance that the returned name happens to match an already existing database object.
GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to output values of the following types: VARCHAR2, TIMESTAMP WITH TIMEZONE, BOOLEAN, PLS_INTEGER, and INTERVAL DAY TO SECOND.

Syntax

```sql
DBMS_SCHEDULER.GET_ATTRIBUTE (  
    name IN VARCHAR2,  
    attribute IN VARCHAR2,  
    value OUT [VARCHAR2, TIMESTAMP WITH TIMEZONE,  
                PLS_INTEGER, BOOLEAN, INTERVAL DAY TO SECOND]);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute being retrieved.</td>
</tr>
<tr>
<td>value</td>
<td>The existing value of the attribute.</td>
</tr>
</tbody>
</table>

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or a window group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.
GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute. The attributes you can retrieve are `max_job_slave_processes`, `log_history`, and `current_open_window`. The Scheduler attribute `current_open_window` can only be retrieved (it can never be set) and it will contain the name of the currently active window, if any.

**Syntax**

```sql
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE ( attribute IN VARCHAR2,
                                           value   OUT VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of the Scheduler attribute.</td>
</tr>
<tr>
<td>value</td>
<td>The existing value of the attribute.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To run `GET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE_SCHEDULER` privilege.
OPEN_WINDOW Procedure

This procedure opens a window independent of its schedule. This window will open and the resource plan associated with it, will take effect immediately for the duration specified or for the normal duration of the window if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW {
    window_name   IN VARCHAR2,
    duration      IN INTERVAL DAY TO SECOND,
    force         IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window.</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the window. It is of type interval day to second. If it is not specified, then the window will be opened for the regular duration as specified in the window metadata.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, opening an already open window, will generate an error. If force is set to TRUE: You can open a window that is already open. The window stays open for the duration specified in the call, from the time the OPEN_WINDOW command was issued. Consider an example to illustrate this. window1 was created with a duration of four hours. It has how been open for two hours. If at this point you reopen window1 using the OPEN_WINDOW call and do not specify a duration, then window1 will be open for another four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes. The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</td>
</tr>
</tbody>
</table>

The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.
Usage Notes

If there are jobs running when the window opens, the resources allocated to them might change due to the switch in resource plan.

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated, and will be as determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

A window can fail to open if the resource plan has been manually switched using the ALTER SYSTEM statement with the force option.

Opening a window requires the MANAGE SCHEDULER privilege for that window.

**PURGE_LOG Procedure**

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure is used to purge additional rows from the job and window log.

**Syntax**

```sql
DBMS_SCHEDULER.PURGE_LOG (  
  log_history             IN PLS_INTEGER  DEFAULT 0,  
  which_log               IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',  
  job_name                IN VARCHAR2     DEFAULT NULL);
```

**Parameters**

*Table 83–29  PURGE_LOG Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_history</td>
<td>This specifies how much history (in days) to keep. The valid range is 0 - 999. If set to 0, no history is kept.</td>
</tr>
<tr>
<td>which_log</td>
<td>This specifies which type of log. Valid values for which_log are job_log, window_log, and job_and_window_log.</td>
</tr>
<tr>
<td>job_name</td>
<td>This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.</td>
</tr>
</tbody>
</table>

**Examples**

The following will completely purge all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following will purge all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following will purge all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and are older than 1 day:

```
DBMS_SCHEDULER>PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```
REMOVE_WINDOW_GROUP_MEMBER Procedure

This procedure removes one or more windows from an existing window group.

Syntax

```
DBMS_SCHEDULER.REMOVE_WINDOW_GROUP_MEMBER (
    group_name IN VARCHAR2,
    window_list IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the window group.</td>
</tr>
<tr>
<td>window_list</td>
<td>The name of the window or windows.</td>
</tr>
</tbody>
</table>

Usage Notes

If any of the windows specified is either invalid, does not exist, or is not a member of the given group, the call fails. Removing a window from a group requires the MANAGE SCHEDULER privilege.

Dropping an open window from a window group has no impact on running jobs that has the window as its schedule since the jobs would only be stopped when a window closes.
RESET_JOB_ARGUMENT_VALUE Procedures

This procedure resets (clears) the value previously set to an argument for a job. RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```sql
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name               IN VARCHAR2,
    argument_position      IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```sql
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name               IN VARCHAR2,
    argument_name          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job being queried.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being altered.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being altered.</td>
</tr>
</tbody>
</table>

Usage Notes

If the corresponding program argument has no default value, the job will be disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.
RUN_JOB Procedure

This procedure runs a job immediately.

Syntax

```sql
DBMS_SCHEDULER.RUN_JOB (  
    job_name               IN VARCHAR2,  
    use_current_session    IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job being run.</td>
</tr>
<tr>
<td>use_current_session</td>
<td>This specifies whether the job run should occur in the same session as the one that the procedure was invoked from. When use_current_session is set to TRUE: - You can test a job and see any possible errors on the command line. - run_count, last_start_date, last_run_duration, and failure_count are not updated. - RUN_JOB can be run in parallel with a regularly scheduled job run. When use_current_session is set to FALSE: - You need to check the job log to find error information. - run_count, last_start_date, last_run_duration, and failure_count are updated. - RUN_JOB fails if a regularly scheduled job is running.</td>
</tr>
</tbody>
</table>

Usage Notes

A job must be enabled for RUN_JOB to run. The job can be run in two different modes. One is in the current user session. In this case, the call to RUN_JOB will block until it has completed the job. Any errors that occur during the execution of the job will be returned as errors to the RUN_JOB procedure. The other option is to run the job immediately like a regular job. In this case, RUN_JOB returns immediately and the job will be picked up by the coordinator and passed on to a job slave for execution. The scheduler views and logs must be queried for the outcome of the job.
Multiple user sessions can use RUN_JOB in their sessions simultaneously when use_current_session is set to TRUE.

RUN_JOB requires that you be the owner of the job or have ALTER privileges on that job. You can also run a job if you have the CREATE ANY JOB privilege.
SET_ATTRIBUTE Procedure

This procedure changes an attribute of a Scheduler object. It is overloaded to accept values of the following types: VARCHAR2, TIMESTAMP WITH TIMEZONE, BOOLEAN, PLS_INTEGER, and INTERVAL DAY TO SECOND. To set an attribute to NULL, the SET_ATTRIBUTE_NULL procedure should be used. What attributes can be set depends on the object being altered. With the exception of the object name, all object attributes can be changed.

SET_ATTRIBUTE is overloaded.

Syntax

DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN [VARCHAR2, TIMESTAMP WITH TIMEZONE,
                              PLS_INTEGER, BOOLEAN, INTERVAL DAY TO SECOND]);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>attribute</td>
<td>See Table 83–34, Table 83–35, Table 83–36, Table 83–37, Table 83–38, and Table 83–38.</td>
</tr>
<tr>
<td>value</td>
<td>The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler will first disable it, make the change and then re-enable it. If any errors are encountered during the enable process, the object is not re-enabled and an error is generated.

If an object is altered and it was in the disabled, it will remain disabled after it is altered.

To run SET_ATTRIBUTE for a window, window group, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object.
being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job
If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only seen in future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run will be scheduled using the new schedule attributes. Schedule attributes of a job include schedule_name, start_date, end_date, and repeat_interval.

If any of the program attributes of a job are altered while the job is running, the new program attributes will take effect the next time the job runs. Program attributes of a job include program_name, job_action, job_type, and number_of_arguments. This is also the case for job argument values that have been set.

Granting ALTER on a job will let a user alter all attributes of that job except its program attributes (program_name, job_type, job_action, program_action, and number_of_arguments) and will not allow a user to use a PL/SQL expression to specify the schedule for a job.

We recommend you not to alter a job that was automatically created for you by the database. Jobs that were created by the database have the column SYSTEM set to TRUE in several views.

Program
If any currently running jobs use the program that is altered, they will continue to run with the program definition prior to the alter. The job will run with the new program definition the next time the job executes.

Schedule
If a schedule is altered, the change will not affect running jobs and open windows that use this schedule. The change will only be in effect the next time the jobs runs or the window opens.

Job Class
With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the MANAGE SCHEDULER privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.
Window
When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

To change resource plans, you must first set the `RESOURCE_MANAGER_PLAN` initialization parameter in the `init.ora` file or issue an `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN = my_plan` statement before the window opens.

Job Attribute Values
Table 83–34 lists job attribute values.

Table 83–34   Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>logging_level</code></td>
<td>This attribute specifies how much information is logged. The three possible options are: &lt;br&gt;<code>DBMS_SCHEDULER.LOGGING_OFF</code>  &lt;br&gt;No logging will be performed for any jobs in this class.  &lt;br&gt;<code>DBMS_SCHEDULER.LOGGING_RUNS</code>  &lt;br&gt;The Scheduler will write detailed information to the job log for all runs of each job in this class.  &lt;br&gt;<code>DBMS_SCHEDULER.LOGGING_FULL</code>  &lt;br&gt;In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.</td>
</tr>
</tbody>
</table>
Summary of DBMS_SCHEDULER Subprograms

This attribute specifies whether a job can be restarted in case of failure. By default, jobs are restartable and this attribute is set to TRUE. Setting this to TRUE means that if a job fails while running, it will be restarted from the beginning point of the job.

Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job.

Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.

The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler will retry the job a maximum of six times. The first time, it will wait for one second and multiply this wait time with a factor of 10 each time thereafter.

Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.

The Scheduler will stop retrying a job when:
- one of the retries succeeds
- all of its six retries have failed
- the next retry would occur after the next regularly scheduled run of the job

The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.

This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views.

max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job will be started regardless of how many previous instances have failed.

This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED.

max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it will repeat forever or until end_date or max_failures is reached.
### Table 83–34 (Cont.) Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| `job_weight`      | This attribute is for expert users of parallel technology only. If your job will be using parallel technology, you can set the value of this attribute to the degree of parallelism of your SQL inside the job.  
  `job_weight` has a range of 1-100, with 1 being the default. |
| `instance_stickiness` | This attribute should only be used for a database running in RAC mode. By default, it is set to TRUE. If you set `instance_stickiness` to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it will not start new jobs for a significant period of time, another instance will run the job. If the interval between runs is large, `instance_stickiness` will be ignored and the job will be handled as if it were a non-sticky job.  
  If `instance_stickiness` is set to FALSE, each instance of the job runs on the first instance available.  
  For non-RAC environments, this attribute is not useful because there is only one instance. |
| `stop_on_window_close` | This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should be stopped once the associated window is closed. The job is stopped using the `stop_job` procedure with force set to FALSE.  
  By default, `stop_on_window_close` is set to FALSE. Therefore, if you do not set this attribute, the job will be allowed to continue after the window closes.  
  Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans. |
| `job_priority`   | This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.  
  If no job priority is specified when creating a job, the default priority of 3 is assigned to it. |
In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1PM.

If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log will be made to reflect the skipped run.

The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.

This is a string specifying the action. The possible values are:

- PLSQL BLOCK: a PLSQL anonymous block
- STORED_PROCEDURE: name of the database stored procedure (C, Java or PL/SQL), optionally qualified with a schema and/or package name).
- EXECUTABLE: Name of an executable of shell script including the full path name and any command-line flags to it.

If this is set, program_name should be NULL.

The type of this job. Can be any of: PLSQL_BLOCK, STORED_PROCEDURE, and EXECUTABLE.

If this is set, program_name should be NULL.

The number of arguments if the program is inlined. If this is set, program_name should be NULL.

The name of a schedule or window or window group to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.

Either a PL/SQL function returning the next date on which to run, or calendar syntax expression. If this is set, schedule_name should be NULL.

The original date on which this job started or will be scheduled to start. If this is set, schedule_name should be NULL.

The date after which the job will no longer run. It will be dropped if auto_drop is set or disabled with the state changed to COMPLETED if it is. If this is set, schedule_name should be NULL.

Summary of DBMS_SCHEDULER Subprograms

Window Attribute Values

Table 83–37 lists window attribute values.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>The service the job class belongs to. The default is NULL, which implies the default service. This should be the name of the service database object and not the service name as defined in tnsnames.ora. If service is set, resource_consumer_group must be NULL.</td>
</tr>
<tr>
<td>logging_level</td>
<td>This attribute specifies how much information is logged. The three possible options are: DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler will write detailed information to the job log for all runs of each job in this class. DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler will record all operations performed on all jobs in this class. In other words, every time a job is created, enabled, disabled, altered, and so on will be recorded in the log.</td>
</tr>
<tr>
<td>log_history</td>
<td>This enables you to control the amount of logging the Scheduler performs. To prevent the job log and the window log from growing indiscriminately, the Scheduler has an attribute that specifies how much history (in days) to keep. Once a day, the Scheduler will automatically purge all log entries from both the job log as well as the window log that are older than the specified history. The default is 30 days. You can change the default by using the SET_SCHEDULER_ATTRIBUTE procedure. For example, to change it to 90 days, issue the following statement: DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE ('log_history','90'); The range of valid values is 1 through 999.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the class.</td>

</table>
Table 83–39  (Cont.) Schedule Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>end_date</td>
<td>The cutoff date after which the schedule will not specify any dates.</td>
</tr>
<tr>
<td>start_date</td>
<td>The start or reference date used by the calendar syntax.</td>
</tr>
</tbody>
</table>
SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of a Scheduler object to NULL. What attributes can be set depends on the object being altered. If the object is enabled, it will be disabled before being altered and be reenabled afterward. If the object cannot be re-enabled, an error is generated and the object will be left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (  
    name       IN VARCHAR2,  
    attribute  IN VARCHAR2);  
```

Parameters

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute being changed.</td>
</tr>
</tbody>
</table>
```

Usage Notes

To run SET_ATTRIBUTE_NULL for a window, window group, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.
**SET_JOB_ANYDATA_VALUE Procedures**

This procedure sets a value to an argument of the associated program for a job, encapsulated in an AnyData object. It overrides any default value set for the program argument. This does not affect whether the job is enabled or not. NULL is a valid assignment for a program argument. Arguments can be specified by position or by name. No type checking of the argument is done at any time by the Scheduler.

*SET_JOB_ANYDATA_VALUE* is overloaded.

**Syntax**

Sets a program argument by its position.

```sql
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name                IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_value          IN SYS.ANYDATA);
```

Sets a program argument by its name.

```sql
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name                IN VARCHAR2,
    argument_name           IN VARCHAR2,
    argument_value          IN SYS.ANYDATA);
```

**Parameters**

*Table 83-41 SET_JOB_ANYDATA_VALUE Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to be altered.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being set.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being set.</td>
</tr>
<tr>
<td>argument_value</td>
<td>The new value to be assigned to the program argument, encapsulated in an AnyData object.</td>
</tr>
</tbody>
</table>
Usage Notes

SET_JOB_ANYDATA_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.
SET_JOB_ARGUMENT_VALUE Procedures

This procedure sets a value to an argument of the associated program for a job. It overrides any default value set for the program argument. This does not affect whether a job is enabled or not. NULL is a valid assignment for a program argument. Arguments can be specified by position or by name. No type checking of the argument is done at any time by the Scheduler.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```sql
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (  
    job_name                  IN VARCHAR2,  
    argument_position         IN PLS_INTEGER,  
    argument_value            IN VARCHAR2);  
```

Sets an argument value by name:

```sql
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (  
    job_name                  IN VARCHAR2,  
    argument_name             IN VARCHAR2,  
    argument_value            IN VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to be altered.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being set.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being set.</td>
</tr>
<tr>
<td>argument_value</td>
<td>The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_ARGUMENT_VALUE procedure.</td>
</tr>
</tbody>
</table>
Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.
SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately. The attributes you can set are default_timezone, max_job_slave_processes and log history.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (
  attribute  IN VARCHAR2,
  value      IN VARCHAR2);
```
### Parameters

#### Table 83–43  SET_SCHEDULER_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of the Scheduler attribute. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- <code>default_timezone</code>: It is very important that this attribute is set. Whenever a repeat interval is specified without setting the start date, the scheduler needs to know which time zone it must apply to the repeat interval syntax. For example, if the repeat interval is specified as &quot;FREQ=DAILY;BYHOUR=22&quot; the job will repeat every day at 10pm, but 10pm in which time zone? If no start_date is specified the scheduler will pick up the time zone from this <code>default_timezone</code> attribute. If you want your job or window to follow daylight savings adjustments, you must set this attribute to the proper region name. For instance, if your database resides in Paris, you would set this to 'Europe/Warsaw'. Daylight saving adjustments will not be followed if you specify an absolute offset, for instance '-8:00' would only be correct for half of the year in San Francisco. If no value is specified for this attribute, the scheduler uses the time zone of <code>systimestamp</code> when the job or window is enabled. This is always an absolute offset and will not follow daylight savings adjustments.</td>
</tr>
<tr>
<td></td>
<td>- <code>log_history</code>: This enables you to control the amount of logging the Scheduler performs.</td>
</tr>
<tr>
<td></td>
<td>- <code>max_job_slave_processes</code>: This enables you to set a maximum number of slave processes for a particular system configuration and load. The default value is <code>NULL</code>, and the valid range is 1-999. Even though the Scheduler automatically determines what the optimum number of slave processes is for a given system configuration and load, you still might want to set a fixed limit on the Scheduler. If this is the case, you can set this attribute. Although the number set by <code>max_job_slave_processes</code> is a real maximum, it does not mean the Scheduler will start the specified number of slaves. For example, even though this attribute is set to 10, the Scheduler might still determine that is should not start more than 3 slave processes. However, if it wants to start 15, but it is set to 10, it will not start more than 10.</td>
</tr>
<tr>
<td>value</td>
<td>The new value of the attribute.</td>
</tr>
</tbody>
</table>
Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.
STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class. Any instance of the job will be stopped. After stopping the job, the state of a one-time job will be set to SUCCEEDED whereas the state of a repeating job will be set to SCHEDULED or COMPLETED depending on whether the next run of the job is scheduled.

Syntax

```
DBMS_SCHEDULER.STOP_JOB (  
    job_name         IN VARCHAR2  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are stopped. The job class is not affected by this call.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned. If force is set to TRUE, the Scheduler will immediately terminate the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed. Use of the force option requires the MANAGE SCHEDULER system privilege. Setting force to TRUE is not supported for jobs of type executable.</td>
</tr>
</tbody>
</table>

Usage Notes

STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that have the MANAGE SCHEDULER privilege.
The DBMS_SERVER_ALERT package let you issue alerts when some threshold has been violated. If the warning threshold is reached, this generates a severity level 5 alert. If the critical threshold is reached, this generates a severity level 1 alert.

The chapter contains the following topics:

- **Using DBMS_SERVER_ALERT**
  - Object Types Defined as Constants
  - Relational Operators Defined as Constants
  - Supported Metrics
- **Summary of DBMS_SERVER_ALERT Subprograms**
Using DBMS_SERVER_ALERT

- Object Types Defined as Constants
- Relational Operators Defined as Constants
- Supported Metrics

Object Types Defined as Constants

You can qualify the metrics by an individual object for the following object types.

Table 84–1 Object Types Defined as Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_TYPE_SYSTEM</td>
<td>Metrics collected on the system level for each instance.</td>
</tr>
<tr>
<td>OBJECT_TYPE_FILE</td>
<td>Metrics collected on the file level. These are used for AVERAGE_FILE_READ_TIME and AVERAGE_FILE_WRITE_TIME metrics.</td>
</tr>
<tr>
<td>OBJECT_TYPE_SERVICE</td>
<td>Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.</td>
</tr>
<tr>
<td>OBJECT_TYPE_TABLESPACE</td>
<td>Metrics collected on the tablespace level. Currently only TABLESPACE_PCT_FULL is collected.</td>
</tr>
<tr>
<td>OBJECT_TYPE_EVENT_CLASS</td>
<td>Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.</td>
</tr>
<tr>
<td>OBJECT_TYPE_SESSION</td>
<td>Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.</td>
</tr>
</tbody>
</table>

Relational Operators Defined as Constants

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server will support the following operators.
## Supported Metrics

### Table 84–2 Relational Operators Defines as Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPERATOR_CONTAINS</td>
<td>A metrics value contained in a list of threshold values is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_DO_NOT_CHECK</td>
<td>Will not apply default threshold to <code>OBJECT_TYPE_ TABLESPACE</code>.</td>
</tr>
<tr>
<td>OPERATOR_EQ</td>
<td>A metrics value equal to the threshold one is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_GE</td>
<td>A metrics value greater or equal than the threshold is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_GT</td>
<td>A metrics value greater than the threshold is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_LE</td>
<td>A metrics value less or equal than the threshold is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_LT</td>
<td>A metrics value less than the threshold is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_NE</td>
<td>A metrics value not equal to the threshold one is considered a violation.</td>
</tr>
</tbody>
</table>

### Summary of DBMS_SERVER_ALERT Subprograms

#### Table 84–4  DBMS_SERVER_ALERT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPAND_MESSAGE Function on page 84-12</td>
<td>Expands alert messages</td>
</tr>
<tr>
<td>GET_THRESHOLD Procedure on page 84-13</td>
<td>Gets threshold settings for given metrics</td>
</tr>
<tr>
<td>SET_THRESHOLD Procedure on page 84-14</td>
<td>Set warning and critical thresholds for given metrics</td>
</tr>
</tbody>
</table>
EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```sql
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
    user_language IN VARCHAR2,
    message_id   IN NUMBER,  
    argument_1   IN VARCHAR2,
    argument_2   IN VARCHAR2,
    argument_3   IN VARCHAR2,
    argument_4   IN VARCHAR2, 
    argument_5   IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_language</td>
<td>The language of the current session.</td>
</tr>
<tr>
<td>message_id</td>
<td>Id of the alert message</td>
</tr>
<tr>
<td>argument_1</td>
<td>The first argument in the alert message.</td>
</tr>
<tr>
<td>argument_2</td>
<td>The second argument in the alert message.</td>
</tr>
<tr>
<td>argument_3</td>
<td>The third argument in the alert message.</td>
</tr>
<tr>
<td>argument_4</td>
<td>The fourth argument in the alert message.</td>
</tr>
<tr>
<td>argument_5</td>
<td>The fifth argument in the alert message.</td>
</tr>
</tbody>
</table>
GET_THRESHOLD Procedure

This procedure gets the threshold setting for given metrics.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD(
metrics_id               IN   NUMBER,
warning_operator         OUT  NUMBER,
warning_value            OUT  VARCHAR2,
critical_operator        OUT  NUMBER,
critical_value           OUT  VARCHAR2,
observation_period       OUT  NUMBER,
consecutive_occurrences  OUT  NUMBER,
instance_name            IN   VARCHAR2,
object_type              IN   NUMBER,
oBJECT_name              IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics_id</td>
<td>The internal name of the metrics.</td>
</tr>
<tr>
<td>warning_operator</td>
<td>The operator for the comparing the actual value with the warning threshold.</td>
</tr>
<tr>
<td>warning_value</td>
<td>The warning threshold value.</td>
</tr>
<tr>
<td>critical_operator</td>
<td>The operator for the comparing the actual value with the critical threshold.</td>
</tr>
<tr>
<td>critical_value</td>
<td>The critical threshold value.</td>
</tr>
<tr>
<td>observation_period</td>
<td>The period at which the metrics values are computed and verified against the threshold setting.</td>
</tr>
<tr>
<td>consecutive_occurrences</td>
<td>The number of observation periods the metrics value should violate the threshold value before the alert is issued.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance for which the threshold is set. This is NULL for database-wide alerts.</td>
</tr>
<tr>
<td>object_type</td>
<td>Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object.</td>
</tr>
</tbody>
</table>
SET_THRESHOLD Procedure

This procedure will set warning and critical thresholds for given metrics.

Syntax

```sql
DBMS_SERVER_ALERT.SET_THRESHOLD(
    metrics_id               IN   NUMBER,
    warning_operator         IN   NUMBER,
    warning_value            IN  VARCHAR2,
    critical_operator        IN  NUMBER,
    critical_value           IN  VARCHAR2,
    observation_period       IN  NUMBER,
    consecutive_occurrences  IN  NUMBER,
    instance_name            IN   VARCHAR2,
    object_type              IN   NUMBER,
    object_name              IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics_id</td>
<td>The internal name of the metrics.</td>
</tr>
<tr>
<td>warning_operator</td>
<td>The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE).</td>
</tr>
<tr>
<td>warning_value</td>
<td>The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.</td>
</tr>
<tr>
<td>critical_operator</td>
<td>The operator for the comparing the actual value with the critical threshold.</td>
</tr>
<tr>
<td>critical_value</td>
<td>The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.</td>
</tr>
<tr>
<td>observation_period</td>
<td>The period at which the metrics values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.</td>
</tr>
<tr>
<td>consecutive_occurrences</td>
<td>The number of observation periods the metrics value should violate the threshold value before the alert is issued.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance for which the threshold is set. This is NULL for database-wide alerts.</td>
</tr>
<tr>
<td>object_type</td>
<td></td>
</tr>
<tr>
<td>object_name</td>
<td></td>
</tr>
</tbody>
</table>
### Table 84–7  (Cont.) SET_THRESHOLD Procedure Parameters

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>See Object Types Defined as Constants on page 84-2.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object. This is NULL for SYSTEM.</td>
</tr>
</tbody>
</table>
The DBMS_SERVICE package lets you create, delete, activate and deactivate services for a single instance.

The chapter contains the following topics:

- Using DBMS_SERVICE
  - Security Model
- Summary of DBMS_SERVICE Subprograms

See Also:

- Oracle Real Application Clusters Administrator's Guide for administering services in Real Application Clusters.
Using DBMS_SERVICE

Security Model

The client using this package should have the ALTER SYSTEM execution privilege and the V$SESSION table read privilege.
Summary of DBMS_SERVICE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_SERVICE Procedure</td>
<td>Creates service</td>
</tr>
<tr>
<td>on page 85-4</td>
<td></td>
</tr>
<tr>
<td>DELETE_SERVICE Procedure</td>
<td>Deletes service</td>
</tr>
<tr>
<td>on page 85-5</td>
<td></td>
</tr>
<tr>
<td>DISCONNECT_SESSION Procedure</td>
<td>Disconnects service</td>
</tr>
<tr>
<td>on page 85-6</td>
<td></td>
</tr>
<tr>
<td>START_SERVICE Procedure</td>
<td>Activates service</td>
</tr>
<tr>
<td>on page 85-7</td>
<td></td>
</tr>
<tr>
<td>STOP_SERVICE Procedure</td>
<td>Stops service</td>
</tr>
<tr>
<td>on page 85-8</td>
<td></td>
</tr>
</tbody>
</table>
CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the service_names parameter or by means of the ALTER SYSTEM SET service_names command.

Syntax

```sql
DBMS_SERVICE.CREATE_SERVICE(
    service_name IN VARCHAR2,
    network_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>The name of the service limited to 64 characters in the Data Dictionary.</td>
</tr>
<tr>
<td>network_name</td>
<td>The network name of the service as used in SQLNet connect descriptors for client connections.</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_SERVICE.CREATE_SERVICE('ernie.us.oracle.com','ernie.us.oracle.com');
```
DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Syntax

```sql
DBMS_SERVICE.DELETE_SERVICE(
    service_name   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>The name of the service limited to 64 characters in the Data Dictionary.</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_SERVICE.DELETE_SERVICE('ernie.us.oracle.com');
```
DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```sql
DBMS_SERVICE.DISCONNECT_SESSION(
    service_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>The name of the service limited to 64 characters in the Data Dictionary</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be used in the context of a single instance as well as with Real Application Clusters.

Examples

```sql
DBMS_SERVICE.DISCONNECT_SESSION('ernie.us.oracle.com');
```

This disconnects sessions with service_name 'ernie.us.oracle.com'.

Table 85–4 DISCONNECT_SESSION Procedure Parameters
START_SERVICE Procedure

This procedure starts a service.

Syntax

DBMS_SERVICE.START_SERVICE(
   service_name  IN VARCHAR2,
   instance_name IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>The name of the service limited to 64 characters in the Data Dictionary.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance where the service should be activated (optional).</td>
</tr>
</tbody>
</table>

Examples

DBMS_SERVICE.START_SERVICE('erne.us.oracle.com');
STOP_SERVICE Procedure

This procedure stops a service.

Syntax

DBMS_SERVICE.STOP_SERVICE(
  service_name   IN VARCHAR2, I
  instance_name  IN VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>The name of the service limited to 64 characters in the Data Dictionary.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance where the service should be stopped (optional).</td>
</tr>
</tbody>
</table>

Examples

DBMS_SERVICE.STOP_SERVICE('ernie.us.oracle.com');
This package provides access to SQL ALTER SESSION and SET ROLE statements, and other session information, from PL/SQL. You can use DBMS_SESSION to set preferences and security levels.

This chapter contains the following topics:

- Using DBMS_SESSION
  - Security Model
  - Operational Notes
- Summary of DBMS_SESSION Subprograms
Using DBMS_SESSION

- Security Model
- Operational Notes

Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

Operational Notes

You should not attempt to turn `close_cached_open.Cursors` on or off.
## Summary of DBMS_SESSION Subprograms

Table 86–1  DBMS_SESSION Package Subprograms

</tr>
</thead>
<tbody>
<tr>
<td>SWITCH_CURRENT_CONSUMER_GROUP Procedure on page 86-29</td>
<td>Facilitates changing the current resource consumer group of a user's current session</td>
</tr>
<tr>
<td>UNIQUE_SESSION_ID Function on page 86-30</td>
<td>Returns an identifier that is unique for all sessions currently connected to this database</td>
</tr>
</tbody>
</table>
CLEAR_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
    namespace VARCHAR2,
    client_identifier VARCHAR2
    attribute VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>The namespace in which the application context is to be cleared. Required.</td>
</tr>
<tr>
<td></td>
<td>For a session-local context, namespace must be specified. If namespace is</td>
</tr>
<tr>
<td></td>
<td>defined as Session Local Context, then client_identifier is optional since</td>
</tr>
<tr>
<td></td>
<td>it is only associated with a globally accessed context.</td>
</tr>
<tr>
<td></td>
<td>For a globally accessed context, namespace must be specified. NULL is a</td>
</tr>
<tr>
<td></td>
<td>valid value for client_identifier because a session with no identifier set</td>
</tr>
<tr>
<td></td>
<td>can see a context that looks like the (namespace, attribute, value,</td>
</tr>
<tr>
<td></td>
<td>username, null) set using SET_CONTEXT.</td>
</tr>
<tr>
<td>client_identifier</td>
<td>Applies to a global context and is optional for other types of contexts;</td>
</tr>
<tr>
<td></td>
<td>64-byte maximum.</td>
</tr>
<tr>
<td>attribute</td>
<td>The specific attribute in the namespace to be cleared. Optional. the</td>
</tr>
<tr>
<td></td>
<td>default is NULL. If you specify attribute as NULL, then (namespace,</td>
</tr>
<tr>
<td></td>
<td>attribute, value) for that namespace are cleared from the session. If</td>
</tr>
<tr>
<td></td>
<td>attribute is not specified, then all context information that has the</td>
</tr>
<tr>
<td></td>
<td>namespace and client_identifier arguments is cleared.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure must be invoked directly or indirectly by the trusted package.
CLEAR_ALL_CONTEXT Procedure

Syntax

```sql
DBMS_SESSION.CLEAR_ALL_CONTEXT
namespace VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>The namespace where the application context information is to be cleared. Required.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure must be invoked directly or indirectly by the trusted package.
CLEAR_IDENTIFIER Procedure

This procedure removes the set_client_id in the session.

Syntax

DBMS_SESSION.CLEAR_IDENTIFIER;

Usage Notes

This procedure is executable by public.
CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:

```
ALTER SESSION CLOSE DATABASE LINK <name>
```

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
    dblink VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of the database link to close.</td>
</tr>
</tbody>
</table>
FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

---

**Note:** This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.

- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the
sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.
