1 Summary of Installation Steps

2 What’s New in the Installation

2.1 No JDK Requirements for HP-UX 2-1
2.2 OracleAS Metadata Repository Uses Oracle Database 10g 2-1
2.3 Support for More High Availability Environments 2-2
2.4 Support for Oracle Internet Directory Replication 2-2
2.5 New Screen for Specifying the staticports.ini File 2-2
2.6 Additional Tool for Deinstallation 2-3
2.7 Changed Option Name in Select Configuration Options Screen for J2EE and Web Cache 2-3
2.8 Recording Feature for Silent Installations 2-3
2.9 New Kernel Parameter Required by OracleAS Web Cache 2-3
2.10 Generating Installation Statistics 2-3
2.11 Change in the Default Port Range 2-4
2.12 New Element for Specifying Port Numbers for CORBA Communication 2-4
2.13 Cloning OracleAS Forms and Reports Services Instances 2-5

3 Compatibility with Earlier Releases

4 Requirements

4.1 Using OracleMetaLink to Obtain the Latest Oracle Application Server Hardware and Software Requirements 4-1
4.2 System Requirements 4-2
4.2.1 Memory Requirements for Running Multiple Instances on the Same Computer 4-4
4.2.2 Installing from the Console or X Windows 4-5
4.2.3 Tips for Reducing Memory Usage 4-5
4.3 Software Requirements 4-5
4.4 Kernel Parameters 4-7
5 Things You Should Know Before Starting the Installation

5.1 Obtaining Software from Oracle E-Delivery ............................................................... 5-1
5.1.1 Finding and Downloading the Oracle Application Server 10g Release 2 (10.1.2) E-Pack ... 5-2
5.1.2 Finding Required and Optional Downloads ............................................................. 5-2
5.1.3 Disk Space Requirements ......................................................................................... 5-2
5.1.4 Extracting Software from the Zip Files ................................................................. 5-2

5.2 Basic Concepts ............................................................................................................ 5-2

5.3 Order of Installation ................................................................................................... 5-3
6 Installing OracleAS Infrastructure

6.1 Infrastructure Installation Types ................................................................. 6-1
6.2 Why Would I Select the Different Infrastructure Installation Types? .............. 6-2
6.3 Order of Installation for the Infrastructure .................................................. 6-3
6.4 Can I Install Components on Separate Computers? ...................................... 6-4
6.5 Tips for Installing Oracle Identity Management Components Separately ......... 6-5
6.6 Do I Need the Oracle Delegated Administration Services or the Oracle Directory Integration and Provisioning Components? 6-7
6.7 Can I Configure Components After Installation? ...................................... 6-8
6.8 Can I Use an Existing Database for the OracleAS Metadata Repository? ...... 6-8
6.9 Can I Use an Existing Oracle Internet Directory? ...................................... 6-8
6.10 Registration of OracleAS Metadata Repository in Oracle Internet Directory and Password Randomization 6-8
6.11 Contents of the OracleAS Metadata Repository ........................................ 6-9
6.12 Can I Use Multiple Metadata Repositories? ............................................. 6-10
6.13 What High Availability Options Does Oracle Application Server Support? ...... 6-11
6.14 Restrictions on the Passwords for the SYS, SYSTEM, SYSMAN, and DBSNMP Users 6-12
6.15 Support for NE8ISO8859P10 and CEL8ISO8859P14 Characters Sets ................ 6-12
6.16 What Do I Enter on the “Specify Namespace in Internet Directory” Screen? .... 6-12
6.17 How to Determine Port Numbers Used by Components .......................... 6-12
6.18 Can I Add OCA After Installation? ......................................................... 6-13
6.19 How to Deploy Oracle Delegated Administration Services on a Separate Host .... 6-13
6.20 Installing OracleAS Infrastructure ......................................................... 6-13
6.21 Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory 6-15
6.22 Installing OracleAS Metadata Repository in a New Database .................. 6-16
6.23 Installing Oracle Identity Management Components Only (Including Oracle Internet Directory) 6-18
6.24 Installing Oracle Identity Management Components Only (Excluding Oracle Internet Directory) 6-20
6.25 Installing Oracle Internet Directory Only .................................................. 6-22

</table>
11.12.1.1 Create a staticports.ini File for the Middle Tier .............................................. 11-48
11.12.1.2 Rename the /var/opt/oracle Directory Used for the Infrastructure............... 11-49
11.12.2 Procedure for Installing Middle Tiers Against an OracleAS Cold Failover Cluster Infrastructure 11-49
11.13 Installing Regular Middle-Tiers on OracleAS Cold Failover Cluster Nodes............ 11-50

12 Installing in High Availability Environments: OracleAS Cluster (Identity Management)

12.1 OracleAS Cluster (Identity Management): Introduction ........................................ 12-1
12.2 Preinstallation Steps for OracleAS Cluster (Identity Management)......................... 12-2
12.2.1 Use the Same Path for the Oracle Home Directory (recommended) .................... 12-2
12.2.2 Synchronize Clocks on All Nodes ........................................................................ 12-2
12.2.3 Configure Virtual Server Names and Ports for the Load Balancer ..................... 12-3
12.2.4 Configure Your LDAP Virtual Server ................................................................... 12-3
12.2.4.1 Load Balancer Supports LDAP Service Monitoring....................................... 12-4
12.2.4.2 Load Balancer Does Not Support LDAP Service Monitoring........................... 12-4
12.2.5 Set up Cookie Persistence on the Load Balancer.................................................. 12-4
12.3 About Oracle Internet Directory Passwords ............................................................ 12-4
12.4 About Configuring SSL and Non-SSL Ports for Oracle HTTP Server ................... 12-5
12.4.1 Case 1: Client ---[HTTP]--- Load Balancer ---[HTTP]--- Oracle HTTP Server ....... 12-6
12.4.2 Case 2: Client ---[HTTPS]--- Load Balancer ---[HTTPS]--- Oracle HTTP Server .. 12-6
12.4.3 Case 3: Client ---[HTTPS]--- Load Balancer ---[HTTP]--- Oracle HTTP Server ... 12-7
12.5 Installing an OracleAS Cluster (Identity Management) Configuration...................... 12-7
12.5.1 Installation Order ................................................................................................. 12-8
12.5.2 Installing OracleAS Metadata Repository ............................................................ 12-9
12.5.3 Installing OracleAS Cluster (Identity Management) on the First Node ............... 12-9
12.5.3.1 Create staticports.ini File .............................................................................. 12-9
12.5.3.2 Disable TCP Monitoring on Load Balancer for First Node .............................. 12-9
12.5.3.3 Configure the Load Balancer to Return Immediately to the Calling Client ....... 12-10
12.5.3.4 Ensure that the OracleAS Metadata Repository Is Not Registered with any Oracle Internet Directory 12-10
12.5.3.5 Select the Same Components for Each Node ................................................... 12-10
12.5.3.6 Run the Installer ............................................................................................ 12-10
12.5.4 Installing OracleAS Cluster (Identity Management) on Subsequent Nodes ...... 12-13
12.5.5 If the Cluster Configuration Assistant Failed ...................................................... 12-15
12.6 Installing a Distributed OracleAS Cluster (Identity Management) Configuration .... 12-15
12.6.1 Installation Order ................................................................................................. 12-18
12.6.2 Installing OracleAS Metadata Repository ............................................................ 12-18
12.6.3 Installing Oracle Internet Directory on the First Node ....................................... 12-18
12.6.3.1 Set up staticports.ini File .............................................................................. 12-18
12.6.3.2 Select the Same Components for Each Installation ....................................... 12-18
12.6.3.3 Start the Installer .......................................................................................... 12-18
12.6.4 Installing Oracle Internet Directory on Subsequent Nodes ................................... 12-20
12.6.4.1 Staticports.ini File Not Needed ....................................................................... 12-20
12.6.4.2 Select the Same Components for Each Installation ....................................... 12-20
12.6.4.3 Do Not Select the SSL Check box in the "Register with Oracle Internet Directory" Screen 12-20
12.6.4.4 Start the Installer................................................................. 12-20
12.6.5 Installing OracleAS Single Sign-On and Oracle Delegated Administration Services on Each Node  12-22
12.6.5.1 Set up staticports.ini File ...................................................... 12-22
12.6.5.2 Start the Installer................................................................. 12-23
12.6.5.3 If the Cluster Configuration Assistant Failed......................... 12-24
12.7 Postinstallation Steps............................................................... 12-25
12.7.1 Update targets.xml (Case 2 only)........................................... 12-25
12.8 Installing Middle Tiers Against OracleAS Cluster (Identity Management) Configurations... 12-25

13 Installing in High Availability Environments: OracleAS Disaster Recovery

13.1 OracleAS Disaster Recovery: Introduction ................................... 13-1
13.2 Setting up the OracleAS Disaster Recovery Environment............... 13-3
13.2.1 Ensure Nodes Are Identical at the Operating System Level........... 13-3
13.2.2 Set Up staticports.ini File....................................................... 13-3
13.2.3 Set Up Identical Hostnames on Both Production and Standby Sites 13-4
13.2.4 If You Want to Use OracleAS Cold Failover Cluster on the Production Site 13-8
13.3 Installing Oracle Application Server in an OracleAS Disaster Recovery Environment 13-9
13.3.1 Installing the OracleAS Infrastructure...................................... 13-9
13.3.2 Installing Middle Tiers............................................................. 13-9
13.4 Installing the OracleAS 10g (10.1.2.0.2) Standalone Install of OracleAS Guard into Oracle Homes 13-9
13.5 Patching OracleAS Guard Release 10.1.2.0.0 with Release 10.1.2.0.2................. 13-10
13.6 What to Read Next?.................................................................... 13-11

14 Installing the OracleAS Metadata Repository in an Existing Database

15 Recommended Topologies

15.1 Java Developer Topology ............................................................. 15-1
15.1.1 Description............................................................................. 15-2
15.1.2 Requirements........................................................................ 15-2
15.1.3 Installation Sequence............................................................ 15-2

Index
Preface

The Oracle Application Server Installation Guide covers requirements, new features in the Oracle Universal Installer, Oracle Application Server concepts that affect installation, installation procedures, and troubleshooting tips. In addition, this guide also provides some sample topologies for installing and running Oracle Application Server.

Intended Audience

This guide is intended for users who perform system administration operations, such as creating users and groups, adding users to groups, and installing operating system patches on the computer where Oracle Application Server is going to be installed. Users who are installing Oracle Application Server need root access to run some scripts.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at http://www.oracle.com/accessibility/

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.
TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Related Documents

For additional information, see the following manuals:

- Oracle Application Server Administrator’s Guide
- Oracle Application Server Concepts
- Oracle Application Server High Availability Guide

Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italic</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Summary of Installation Steps

Oracle Application Server is an integrated and powerful product. To optimize its capabilities, you should take time to read this guide so that you and the product get off on the right foot.

This chapter provides an overview of the steps to install Oracle Application Server. The other chapters in this guide describe the steps in detail.

The steps for installing Oracle Application Server are:

1. Read the following documents for the most current information about Oracle Application Server:
   - Oracle Application Server Release Notes
     You can find the latest version of the release notes on Oracle Technology Network at: http://www.oracle.com/technology/documentation

2. Check that the computers where you want to run Oracle Application Server meet the requirements. This includes:
   - Section 4.2, "System Requirements"
   - Section 4.5, "Ports"
   - Section 4.6, "Operating System Groups"
   - Section 4.7, "Operating System User"
   - Section 4.8, "Environment Variables"
   - Section 4.9, "The /etc/hosts File"
   - Section 4.10, "Network Topics"

3. Read Chapter 5, "Things You Should Know Before Starting the Installation" to get a big picture of how the different parts of Oracle Application Server work together. This chapter describes the OracleAS Infrastructure, Oracle Application Server middle tiers, where you can install them, and what values the installer expects on some of the installation screens.

4. Read Chapter 6, "Installing OracleAS Infrastructure" and Chapter 7, "Installing Middle Tiers" to get details on the main parts of Oracle Application Server.

5. If you want to run Oracle Application Server in high availability environments such as OracleAS Cold Failover Cluster or OracleAS Disaster Recovery, read Chapter 10, "Installing in High Availability Environments: Overview”.

6. Learn about recommended topologies. You can install Oracle Application Server on multiple computers to improve scalability, availability, security, and
performance. Chapter 15, "Recommended Topologies" describes the recommended
development and deployment topologies.

7. Install Oracle Application Server (infrastructure and/or middle tiers). Follow the
appropriate procedures in Chapter 6, "Installing OracleAS Infrastructure" and
Chapter 7, "Installing Middle Tiers".

8. After you install Oracle Application Server, access the Welcome page and run
some demos to ensure that the installation was successful.
This chapter describes new features in the Oracle Universal Installer. To see a list of new features in the product itself, visit the Oracle Technology Network site at:

http://www.oracle.com/technology

Contents:

- Section 2.1, "No JDK Requirements for HP-UX"
- Section 2.2, "OracleAS Metadata Repository Uses Oracle Database 10g"
- Section 2.3, "Support for More High Availability Environments"
- Section 2.4, "Support for Oracle Internet Directory Replication"
- Section 2.5, "New Screen for Specifying the staticports.ini File"
- Section 2.6, "Additional Tool for Deinstallation"
- Section 2.7, "Changed Option Name in Select Configuration Options Screen for J2EE and Web Cache"
- Section 2.8, "Recording Feature for Silent Installations"
- Section 2.9, "New Kernel Parameter Required by OracleAS Web Cache"
- Section 2.10, "Generating Installation Statistics"
- Section 2.11, "Change in the Default Port Range"
- Section 2.12, "New Element for Specifying Port Numbers for CORBA Communication"
- Section 2.13, "Cloning OracleAS Forms and Reports Services Instances"

2.1 No JDK Requirements for HP-UX

With the 10g (9.0.4) release, you had to install a compatible JDK before attempting an installation on HP-UX. This release includes the appropriate JDK for HP-UX and it is installed automatically.

2.2 OracleAS Metadata Repository Uses Oracle Database 10g

In 10g (9.0.4), the installer created an Oracle9i Release 1 (9.0.1.5) database and loaded the OracleAS Metadata Repository in that database.

In this release, the installer creates an Oracle Database 10g (10.1.0.4.2) for the OracleAS Metadata Repository.
To configure this database during installation, the installer displays these new screens:

- Specify Database Configuration Options
- Specify Database Schema Passwords

For details, see Section 6.29, "Install Fragment: Database Screens".

### 2.3 Support for More High Availability Environments

In this release, Oracle Application Server supports the following high availability environments:

- OracleAS Cold Failover Cluster
- OracleAS Cluster (Identity Management)
- OracleAS Disaster Recovery

In addition, for each environment, you can distribute the OracleAS Metadata Repository and Oracle Identity Management components over several computers. In earlier releases, you had to install all the components on the same computer.

There are also new screens related to high availability.

For details, see:

- Chapter 10, "Installing in High Availability Environments: Overview"
- Chapter 11, "Installing in High Availability Environments: OracleAS Cold Failover Cluster"
- Chapter 12, "Installing in High Availability Environments: OracleAS Cluster (Identity Management)"
- Chapter 13, "Installing in High Availability Environments: OracleAS Disaster Recovery"

### 2.4 Support for Oracle Internet Directory Replication

In this release, you can install the master Oracle Internet Directory, as well as Oracle Internet Directory replicas using the installer.

During installation, you select the type of replication that you want:

- Fan-out Replication (which is also called LDAP Replication)
- Multimaster Replication (which is also called Advanced Replication)

For details, see Chapter 9, "Installing Oracle Internet Directory in Replicated Mode".

### 2.5 New Screen for Specifying the staticports.ini File

In 10g (9.0.4), if you wanted components to use custom ports, you created a staticports.ini file to map components and port numbers, and when you started the installer, you used a command-line option to specify the file.

In this release, you specify the staticports.ini file in the new "Select Port Configuration Options" screen in the installer. You do not use the command-line options to specify the file.

For details, see Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)".
2.6 Additional Tool for Deinstallation

In this release, there is a new tool called the Deconfig tool which removes entries from Oracle Internet Directory and the OracleAS Metadata Repository. You run this tool before you deinstall an Oracle Application Server instance using the installer.

For details, see Section E.1, "New Tool: Deconfig Tool".

2.7 Changed Option Name in Select Configuration Options Screen for J2EE and Web Cache

In 10g (9.0.4), the Select Configuration Options screen contained these options:

- OracleAS File-Based Cluster
- OracleAS Database-Based Cluster

In this release, these options have been replaced by the "OracleAS Farm Repository" option because the installer does not create a cluster for the instance. The installer places the instance in a farm, but does not place it in a cluster. If you want, you can cluster it after installation.

For details, see Section 7.4, "Configuration Options for the J2EE and Web Cache Middle Tier".

2.8 Recording Feature for Silent Installations

The installer has a record mode, in which it saves your inputs to a response file. You can then use the generated response file to install Oracle Application Server on different computers using the same values.

For details, see Section B.5.2, "Creating Response Files by Using the Record Mode in the Installer".

2.9 New Kernel Parameter Required by OracleAS Web Cache

In earlier releases, you had to check the values of kernel parameters on computers where you plan to install the OracleAS Metadata Repository.

In this release, there is an additional check for the `rlim_fd_max` parameter. This parameter is required by the OracleAS Web Cache component.

For details, see Section 4.4, "Kernel Parameters".

2.10 Generating Installation Statistics

The installer provides command line options for monitoring resources used for installation. The following options are supported:
2.11 Change in the Default Port Range

The default port ranges for the following components have changed:

- Oracle Internet Directory
- OracleAS Certificate Authority
- Oracle Application Server Containers for J2EE
- Oracle Enterprise Manager 10g Application Server Control Console
- Oracle Application Server Web Cache

For details, see Appendix C, "Default Port Numbers".

2.12 New Element for Specifying Port Numbers for CORBA Communication

Oracle Reports 10g Release 2 (10.1.2) introduces the \texttt{ORBPorts} element in the server configuration file to allow you to explicitly specify the port numbers used by Reports Server and engines for communication through CORBA. You can specify either a range of ports or individual ports separated by commas. For example:
<ORBPorts value="15000-15010"/> (Range of values)
<ORBPorts value="15000,16000,17000,18000"/> (Comma-separated values)

Note: The ORBPorts element should be defined only if the TCP port filtering has been enabled on the server where Reports Server is running. If port filtering is enabled, and a few ports can be opened for Reports Server, then use ORBPorts to specify them in the server configuration file for Reports Server and engine communication. If any of the ports are not available, Reports Server or engines may fail to start and an error displays.

By default, the ORBPorts element is not present in the server configuration file. If this element is missing, Reports Server chooses a random port for CORBA communication. For more information about the ORBPorts element, see the chapter "Configuring OracleAS Reports Services" in the Oracle Application Server Reports Services Publishing Reports to the Web manual.

2.13 Cloning OracleAS Forms and Reports Services Instances

Cloning is the process of copying an existing installation to a different location while preserving its configuration. In this release, cloning an installation of OracleAS Forms and Reports Services instance is possible. For more information about cloning, refer to Oracle Application Server Administrator’s Guide.
For information about compatibility with earlier releases, refer to the *Oracle Application Server Upgrade and Compatibility Guide.*
Before installing Oracle Application Server, ensure that your computer meets the requirements described in this chapter.

### 4.1 Using OracleMetaLink to Obtain the Latest Oracle Application Server Hardware and Software Requirements

The Oracle Application Server 10g (10.1.2.0.2) hardware and software requirements included in this guide were accurate at the time this manual was released to manufacturing. For the most up-to-date information about hardware and software requirements, refer to OracleMetaLink:
http://metalink.oracle.com/

After logging into Oracle MetaLink, click **Certify and Availability**. From the resulting Web page, you can view the latest certifications by product, platform, and product availability.

## 4.2 System Requirements

**Table 4–2** lists the system requirements for running Oracle Application Server. The installer checks many of these requirements at the start of the installation process and warns you if any of them is not met. To save time, you can manually check only the ones that are not checked by the installer. Refer to **Table 4–2** to see which requirements are not checked by the installer.

You can also run the system checks performed by the installer without doing an installation, by running the `runInstaller` command as shown. The `runInstaller` command is on the Oracle Application Server CD-ROM (Disk 1) or DVD (in the `application_server` directory).

**CD-ROM:**

```
prompt> mount_point/1012disk1/runInstaller -executeSysPrereqs
```

**DVD:**

```
prompt> mount_point/application_server/runInstaller -executeSysPrereqs
```

The results are displayed on the screen as well as written to a log file. For more information about the types of checks performed, refer to Section 4.11, "Prerequisite Checks Performed by the Installer".

### Table 4–2 System Requirements

<table>
<thead>
<tr>
<th>Item</th>
<th>Requirement</th>
<th>Checked by Installer:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Network</strong></td>
<td>You can install Oracle Application Server on a computer that is connected to a network, or on a ‘standalone’ computer (not connected to the network). &lt;br&gt; If you are installing Oracle Application Server on a standalone computer, you can connect the computer to a network after installation. You have to perform some configuration tasks when you connect it to the network. &lt;br&gt; Refer to <em>Oracle Application Server Administrator’s Guide</em> for details.</td>
<td>No</td>
</tr>
<tr>
<td><strong>IP</strong></td>
<td>The computer’s IP address must be static. Oracle Application Server does not support HP-UX systems using DHCP.</td>
<td></td>
</tr>
<tr>
<td><strong>Hostname</strong></td>
<td>Ensure that your hostnames are not longer than 255 characters. &lt;br&gt; <strong>Note:</strong> The host name should be the same as node name for installing Oracle Application Server successfully.</td>
<td></td>
</tr>
<tr>
<td><strong>Processor Type</strong></td>
<td>64-bit HP-UX PA-RISC processor &lt;br&gt; If the processor is 64-bit the following command returns the value 64: &lt;br&gt; <code># /bin/getconf KERNEL_BITS</code></td>
<td></td>
</tr>
<tr>
<td><strong>Processor Speed</strong></td>
<td>400 MHz or faster</td>
<td>Yes</td>
</tr>
</tbody>
</table>
The memory requirements provided for the various installation types represents enough physical memory to install and run Oracle Application Server. However, for most production sites, you should configure at least 1 GB of physical memory. For sites with substantial traffic, increasing the amount of memory further may improve your performance. For Java applications, you should either increase the maximum heap allocated to the OC4J processes, or configure additional OC4J processes to utilize this memory. Refer to the Oracle Application Server Performance Guide for details.

To determine the optimal amount of memory for your installation, the best practice is to load test your site. Resource requirements can vary substantially for different applications and different usage patterns. In addition, some operating system utilities for monitoring memory can overstate memory usage (partially due to the representation of shared memory). The preferred method for determining memory requirements is to monitor the improvement in performance resulting from the addition of physical memory in your load test. Refer to your platform vendor documentation for information on how to configure memory and processor resources for testing purposes.

OracleAS Infrastructure:

- OracleAS Metadata Repository and Identity Management: 1 GB
- Identity Management only: 1 GB
- OracleAS Metadata Repository only: 1 GB

Oracle Application Server middle tier:

- J2EE and Web Cache: 512 MB
- Portal and Wireless: 1 GB
- Business Intelligence: 1 GB

OracleAS Developer Kits: 256 MB, but 512 MB recommended

Notes:

- The installer checks the amount of memory on your computer and will warn you if your computer does not meet the minimum memory requirements.
- These values assume you are running only one Oracle Application Server instance per computer. If you plan to run multiple instances on the same computer, see Section 4.2.1, "Memory Requirements for Running Multiple Instances on the Same Computer".

To determine the amount of memory, enter the following command:

```
# /usr/sbin/dmesg | grep *Physical
```

Checked by Installer: Yes
4.2.1 Memory Requirements for Running Multiple Instances on the Same Computer

If you plan to run OracleAS Infrastructure and a middle tier on the same computer, ensure the computer meets the memory requirements listed in Table 4–3.

Note that these values have been tested against a small number of users. If you have many users, you might have to increase the amount of memory.
4.2.2 Installing from the Console or X Windows

If you are performing the installation from the console or X Windows, then add the following line to the `/etc/pam.d/xdm` file:

```
session required pam_limits.so
```

4.2.3 Tips for Reducing Memory Usage

If you need to reduce memory consumption:

- Configure only the components that you need.
- Choose the smallest middle-tier type that contains the components that you need.
- After installation, start up only the components that you need. Refer to *Oracle Application Server Administrator’s Guide* for details.
- Run Application Server Control only when you need to administer an instance. In most cases, you do not need Application Server Control running all the time.
- If you are running multiple Oracle Application Server instances on one computer, each Application Server Control can consume a lot of memory. Running Application Server Control only when you need it can free up memory for other components.
- Configure Application Server Control so that it can manage multiple instances. Refer to *Oracle Application Server Administrator’s Guide* for details.

4.3 Software Requirements

Check that the software listed in Table 4–4 is installed on the system. The procedure that follows the table describes how to ensure the correct software is installed on the system.

---

**Note:** Oracle Application Server 10g Release 2 (10.1.2) is certified with the following Operating System specific software. For the most current list of supported Operating System specific software, for example JDK version, Operating System version, check OracleMetaLink (http://metalink.oracle.com).

---

**Table 4–3 Memory Requirements for Running Multiple Instances on the Same Computer**

<table>
<thead>
<tr>
<th>Description</th>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>OracleAS Infrastructure plus J2EE and Web Cache</td>
<td>1 GB</td>
</tr>
<tr>
<td>OracleAS Infrastructure plus Portal and Wireless</td>
<td>1.5 GB</td>
</tr>
<tr>
<td>OracleAS Infrastructure plus Business Intelligence and Forms</td>
<td>1.5 GB</td>
</tr>
</tbody>
</table>

**Table 4–4 Software Requirements for HP-UX PA RISC 11i Systems**

<table>
<thead>
<tr>
<th>Item</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating System</td>
<td>HP-UX 11i (11.11 or 11.23) PA-RISC or higher</td>
</tr>
<tr>
<td>Quality Pack for 11.11</td>
<td>June 2003 Quality Pack GoldQPK11i</td>
</tr>
</tbody>
</table>
To ensure that the system meets these requirements, follow these steps:

1. To determine which version of HP-UX is installed, enter the following command:

```
# uname -a
```

In this example, the version of HP-UX 11i is 11.11.

2. To determine whether the Quality Pack is installed, enter the following command:

```
Patches for 11.11
(or higher versions)
```

```
- BUNDLE11i B.11.23.0409.3 Required Patch Bundle for HP-UX 11i v2 (B.11.23), September 2004
- PHKL_29198 s700_800 11.11 Psets Enablement Patch; top(1)
- PHSS_28871 s700_800 11.11 ld(1) and linker tools cumulative patch
- PHSS_28880 s700_800 11.11 HP aC++ -AA runtime runtimes (aCC A.03.50)
- PHCO_29960 s700_800 11.11 Pthread enhancement and fixes
```

The following patches are required by JDK 1.4.2.05 or higher. JDK 1.4.2.05 is installed with this release. Refer to the HP Support site for a list of all JDK patches.

```
- PHKL_25842 s700_800 11.11 Thread Abort syscall
- PHKL_25993 s700_800 11.11 thread nostop for NFS, rlimit, Ufalloc fix
- PHKL_25994 s700_800 11.11 detach;NOSTOP,Abt,Psets;slpq;FSS;getlwp
- PHKL_25995 s700_800 11.11 ufalloc;VxFS3.5;SPP fragmentation;AIO;EVP
- PHKL_26468 s700_800 11.11 vPar, callout, abstime, shared sync perf
- PHKL_28489 s700_800 11.11 copyin EFAULT, LDCD access type
- PHNE_29887 s700_800 11.11 cumulative ARPA Transport patch
```

The following patches are required if ANSI C and C++ are installed on the system:

```
- PHSS_26792 s700_800 11.X ANSI C compiler B.11.11.04 cumulative patch
- PHSS_26793 s700_800 11.X +O4/PBO Compiler B.11.11.04 cumulative patch
- PHSS_31849 : s700_800 11.23 linker + fdp cumulative patch
- PHSS_31852 : s700_800 11.23 aC++ Runtime (IA: A.06.05, PA: A.03.65)
- PHSS_32511 : s700_800 11.23 HP aC++ Compiler (A.03.63)
- PHSS_32512 : s700_800 11.23 ANSI C compiler B.11.11.12 cumulative patch
- PHSS_32513 : s700_800 11.23 +O4/PBO Compiler B.11.11.12 cumulative patch
```

Following patch is required if ServiceGuard is installed on the system:

```
- PHSS_32740 : s700_800 11.23 Serviceguard A.11.16.00
```

Package

```
Motif 2.1 Development Environment (X11MotifDevKit.MOTIF21-PRG) B.11.11.01
```

Note: This package is not required if you create the symbolic links described in step 5 of the next section.
# /usr/sbin/swlist | grep QPK

If the quality pack is not installed, download it from the following Web site and install it:

http://www.software.hp.com/SUPPORT_PLUS/qpk.html

3. To determine whether a bundle or product is installed, enter the following command:

# /usr/sbin/swlist -l product | more

If a required product is not installed, you must install it. See your operating system or software documentation for information on installing products.

4. To determine whether a patch is installed, enter a command similar to the following:

# /usr/sbin/swlist -l patch | grep PHKL_29198

Alternatively, to list all installed patches, enter the following command:

# /usr/sbin/swlist -l patch | more

If a required patch is not installed, download it from the following URL and install it:

http://itresourcecenter.hp.com

5. If the Motif package listed in Table 4–4 is not installed on the computer, create the following symbolic links:

a. Log in as root.

b. Change to the /usr/lib directory:

# cd /usr/lib

c. Create the required links:

    # ln -s libX11.3 libX11.sl
    # ln -s libXIE.2 libXIE.sl
    # ln -s libXext.3 libXext.sl
    # ln -s libXhp11.3 libXhp11.sl
    # ln -s libXi.3 libXi.sl
    # ln -s libXm.4 libXm.sl
    # ln -s libXp.2 libXp.sl
    # ln -s libXt.3 libXt.sl
    # ln -s libXtst.2 libXtst.sl

### 4.4 Kernel Parameters

The computers on which you plan to install OracleAS Metadata Repository or OracleAS Web Cache require their kernel parameters to be set to the minimum values listed in the following sections:

- Section 4.4.1, "Kernel Parameter Settings for OracleAS Web Cache"
- Section 4.4.2, "Kernel Parameter Settings for OracleAS Metadata Repository"
4.4.1 Kernel Parameter Settings for OracleAS Web Cache

This section applies if you are installing OracleAS Web Cache:

- If you are installing the J2EE and Web Cache middle tier, the OracleAS Web Cache component is optional.
- If you are installing the Portal and Wireless middle tier, the OracleAS Web Cache component is always installed.

Complete the following tasks to set the kernel parameters for OracleAS Web Cache:

1. Start System Administration Manager (SAM) as the root user:
   
   ```
   # /usr/sbin/sam
   ```

2. Choose the Kernel Configuration area, then choose the Configurable Parameters area.

3. Check the value for maxfiles_lim is at least 65536. If necessary, modify that value. See the SAM online help for more information on completing this step.

4. Exit from SAM.

5. If you modified the value, restart the system:
   
   ```
   # /sbin/shutdown -r now
   ```

4.4.2 Kernel Parameter Settings for OracleAS Metadata Repository

Verify that the kernel parameters shown in the following table are set either to the formula shown, or to values greater than or equal to the recommended value shown. The procedures following the table describe how to verify and set the values.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Recommended Formula or Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ksi_alloc_max</td>
<td>(nproc*8)</td>
</tr>
<tr>
<td>max_thread_proc</td>
<td>3000</td>
</tr>
<tr>
<td>maxdsiz</td>
<td>2063835136</td>
</tr>
<tr>
<td>maxdsiz_64bit</td>
<td>2147483648</td>
</tr>
<tr>
<td>maxfiles</td>
<td>2048</td>
</tr>
<tr>
<td>maxfiles_lim</td>
<td>2048</td>
</tr>
<tr>
<td>maxssiz</td>
<td>134217728</td>
</tr>
<tr>
<td>maxssiz_64bit</td>
<td>1073741824</td>
</tr>
<tr>
<td>maxswapchunks</td>
<td>16384</td>
</tr>
<tr>
<td>maxuprc</td>
<td>((nproc*9)/10)</td>
</tr>
<tr>
<td>maxusers</td>
<td>512</td>
</tr>
<tr>
<td>msgmap</td>
<td>(2+msgmni)</td>
</tr>
<tr>
<td>msgmni</td>
<td>4096</td>
</tr>
<tr>
<td>msgseg</td>
<td>32767</td>
</tr>
<tr>
<td>msgtql</td>
<td>4096</td>
</tr>
<tr>
<td>ncallout</td>
<td>6000</td>
</tr>
<tr>
<td>ncsizer</td>
<td>((8*nproc+2048)+vx_nsize)</td>
</tr>
</tbody>
</table>
To view the current value specified for these kernel parameters, and to change them if necessary, follow these steps:

1. Optionally, set the DISPLAY environment variable to specify the display of the local system:
   - Bourne, Bash, or Korn shell:
     
     ```bash
     $ DISPLAY=localhost:0.0 ; export DISPLAY
     ```
   - C shell:
     
     ```bash
     $ setenv DISPLAY localhost:0.0
     ```

2. Start System Administration Manager (SAM):
   
   ```bash
   # /usr/sbin/sam
   ```

3. Choose the Kernel Configuration area, then choose the Configurable Parameters area.

4. Check the value or formula specified for each of these parameters and, if necessary, modify that value or formula.
   
   If necessary, see the SAM online help for more information on completing this step.

5. Exit from SAM.

6. If you modified the value specified for any parameter, reboot the system:
   
   ```bash
   # /sbin/shutdown -r now
   ```

7. If necessary, when the system restarts, log in and switch user to root.

</tbody>
</table>
4.5 Ports

Many Oracle Application Server components, such as Oracle HTTP Server, OracleAS Web Cache, and Oracle Enterprise Manager 10g, use ports. You can have the installer assign default port numbers, or use port numbers that you specify.

- Section 4.5.1, "Checking If a Port Is in Use"
- Section 4.5.2, "Using Default Port Numbers"
- Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)"
- Section 4.5.4, "If Port 1521 Is in Use"

Why the Default Port for Oracle HTTP Server Is Port 7777 and Not Port 80

By default, the installer configures Oracle HTTP Server to use port 7777, not port 80. Port 7777 is the default port because on UNIX, components that use port numbers lower than 1024 require additional steps to be performed as the root user before the components can run. Because the installer does not have root access, it has to use a port greater than 1024.

If you want Oracle HTTP Server to use a different port, such as port 80, use the "static ports" feature, which enables you to specify port numbers for components. Although you can change the port number after installation, it is easier to set the port number during installation.

4.5.1 Checking If a Port Is in Use

To check if a port is being used, you can run the `netstat` command as follows:

```
prompt> netstat -an | grep portnum
```

4.5.2 Using Default Port Numbers

If you want to use the default port numbers for components, you do not have to do anything. Refer to Appendix C, "Default Port Numbers" for a list of the default port numbers and ranges. Make sure that at least one port is available in the port range for each component. If the installer is unable to find a free port in the range, the installation will fail.
4.5.3 Using Custom Port Numbers (the "Static Ports" Feature)

To instruct the installer to assign custom port numbers for components:

1. Create a file containing the component names and port numbers. Section 4.5.3.1, "Format of the staticports.ini File" describes the file format. This file is typically called the staticports.ini file, but you can name it anything you want.

2. In the installer, on the Specify Port Configuration Options screen, select Manual and enter the full path to the staticports.ini file.

If you do not specify the full path to the file, the installer will not be able to find the file. The installer will then assign default ports for all the components, and it will do this without displaying any warning.

Difference from Previous Release: In 10g (9.0.4), you used command-line options to specify the staticports.ini file. In this release, you specify the file in the new Specify Port Configuration Options screen.

4.5.3.1 Format of the staticports.ini File

The staticports.ini file has the following format. Replace port_num with the port number that you want to use for the component.

```
# J2EE and Web Cache
```

Note:

- In the default configuration of the /etc/services file includes ports 389 and 636 (for LDAP and LDAP/SSL). These happen to be the default ports for Oracle Internet Directory. This means that if you want to use these port numbers for Oracle Internet Directory, you must either delete or comment out these lines in the /etc/services file. To comment out a line, add a # at the beginning of the line, as shown:

  ```
  # ldap   389/tcp   # Lightweight Directory Access Protocol
  # ldap   389/udp   # Lightweight Directory Access Protocol
  # ldaps  636/tcp   # LDAP protocol over TLS/SSL (was sldap)
  # ldaps  636/udp   # LDAP protocol over TLS/SSL (was sldap)
  ```

If you do not comment out or remove the lines from /etc/services, then the installer will not assign ports 389 and 636. It assigns a number from the port number range for Oracle Internet Directory. Refer to Appendix C, "Default Port Numbers" for a list of default port numbers.

- The installer will not assign port numbers that are specified in the /etc/services file. If you do not want the installer to assign a specific port number, then add the port number to the /etc/services file. For example, if you want to reserve port 7777 for an application, you can add something like the following line to /etc/services:

  ```
  myApplication      7777/tcp
  ```

  The installer will not assign port 7777 to any component if this line exists in the /etc/services file.
Oracle HTTP Server port = port_num
Oracle HTTP Server Listen port = port_num
Oracle HTTP Server SSL port = port_num
Oracle HTTP Server Listen (SSL) port = port_num
Oracle HTTP Server Diagnostic port = port_num
Java Object Cache port = port_num
DCM Java Object Cache port = port_num
DCM Discovery port = port_num
Oracle Notification Server Request port = port_num
Oracle Notification Server Local port = port_num
Oracle Notification Server Remote port = port_num
Application Server Control port = port_num
Application Server Control RMI port = port_num
Oracle Management Agent port = port_num
Web Cache HTTP Listen port = port_num
Web Cache HTTP Listen (SSL) port = port_num
Web Cache Administration port = port_num
Web Cache Invalidation port = port_num
Web Cache Statistics port = port_num
Log Loader port = port_num
ASG port = port_num

# Business Intelligence and Forms
Reports Services SQL*Net port = port_num
Reports Services discoveryService port = port_num
Reports Services bridge port = port_num

# Infrastructure
Oracle Internet Directory port = port_num
Oracle Internet Directory (SSL) port = port_num
Oracle Certificate Authority SSL Server Authentication port = port_num
Oracle Certificate Authority SSL Mutual Authentication port = port_num
Ultra Search HTTP port number = port_num

The easiest way to create the file is to use the staticports.ini file on the CD-ROM (Disk 1) or DVD as a template:

1. Copy the staticports.ini file from the CD-ROM or DVD to your hard disk.

2. Edit the local copy (the file on the hard disk) to include the desired port numbers.

    You do not need to specify port numbers for all components in the staticports.ini file. If a component is not listed in the file, the installer uses the default port number for that component.

    You cannot change the port used by the OracleAS Metadata Repository (port 1521) during installation, but you can do so after installation. Refer to Oracle Application Server Administrator’s Guide for details.

    The following example sets the Application Server Control port and some OracleAS Web Cache ports. For components not specified, the installer will assign the default port numbers.

    Application Server Control port = 2000
Web Cache Administration port = 2001
Web Cache Invalidation port = 2002
Web Cache Statistics port = 2003

When installation is complete, you can check the ORACLE_HOME/install/portlist.ini file to see the assigned ports.

**Tips on Choosing Port Numbers**

Following are some guidelines for choosing port numbers:

- Port numbers cannot be greater than 65535.
- If you use a port number less than 1024 for a component, you must run the component as the root user.
- If you use a port number less than 1024 for a component, the installer will not be able to start up the component at the end of installation. You may need to configure the component first before you can start it up. Refer to the corresponding component documentation for details.
- You still have to comment out ports 389 and 636 in the /etc/services file if you want to use these port numbers for Oracle Internet Directory. Refer to the Note on page 4-11 for details.
- If you plan to set port numbers for Oracle HTTP Server and OracleAS Web Cache, be sure you read Section 4.5.3.3, "Ports for Oracle HTTP Server and OracleAS Web Cache".

The installer verifies that the ports specified in the file are available by checking memory. This means that it can only detect ports that are being used by running processes. It does not look in configuration files to determine which ports an application is using.

If the installer detects that a specified port is not available, it displays an alert. The installer will not assign a port that is not available. To fix this:

1. Edit the staticports.ini file to specify a different port, or shut down the application that is using the port.
2. Click Retry. The installer re-reads the staticports.ini file and verifies the entries in the file again.

**Using portlist.ini as the staticports.ini File**

The staticports.ini file uses the same format as the ORACLE_HOME/install/portlist.ini file, which is created after an Oracle Application Server installation. If you have installed Oracle Application Server and you want to use the same port numbers in another installation, you can use the portlist.ini file from the first installation as the staticports.ini file for subsequent installations.

However, note this difference: in staticports.ini, the line "Oracle Management Agent port" corresponds to "Enterprise Manager Agent port" in portlist.ini.

**4.5.3.2 Error Conditions that Will Cause the Installer to Use Default Ports Instead of Specified Ports**

Check your staticports.ini file carefully because a mistake can cause the installer to use default ports without displaying any warning. Here are some things that you should check:
- If you specify the same port for more than one component, the installer will use the specified port for the first component, but for the other components, it will use the components’ default ports. The installer does not warn you if you have specified the same port for multiple components.

- If you specify different ports for one component on multiple lines, the installer assigns the default port for the component. The installer does not warn you if you have specified different ports for one component.

- If you specify the same port for one component on multiple lines, the installer assigns the default port for the component. The installer does not warn you if you have specified the same port on multiple lines.

- If you have syntax errors in the staticports.ini file (for example, if you omitted the = character for a line), the installer ignores the line. For the components specified on such lines, the installer assigns the default ports. The installer does not display a warning for lines with syntax errors.

- If you misspell a component name, the installer assigns the default port for the component. Names of components in the file are case sensitive. The installer does not display a warning for lines with unrecognized names.

- If you specify a non-numeric value for the port number, the installer ignores the line and assigns the default port number for the component. It does this without displaying any warning.

- If you specify a relative path to the staticports.ini file (for example, "./staticports.ini" or just "staticports.ini"), the installer will not find the file. The installer continues without displaying a warning and it will assign default ports to all components. You must specify a full path to the staticports.ini file.

4.5.3.3 Ports for Oracle HTTP Server and OracleAS Web Cache

Be sure you understand the following when setting ports for these components.

In the httpd.conf file for Oracle HTTP Server, the Port and the Listen directives specify the ports used by OracleAS Web Cache and Oracle HTTP Server. The correct lines in the staticports.ini file for setting these ports depend on which components you are configuring.

If You Are Configuring OracleAS Web Cache and Oracle HTTP Server

1. Set the port for OracleAS Web Cache.

   OracleAS Web Cache uses the port specified by the Port directive (Figure 4–1). To set this port, use this line in the staticports.ini file:

   Web Cache HTTP Listen port = port_number

   To configure the SSL port for OracleAS Web Cache, use the following line:

   Web Cache HTTP Listen (SSL) port = port_number

   You cannot set the port number using the "Oracle HTTP Server port" line in this case. If your staticports.ini file contains both "Oracle HTTP Server port" and "Web Cache HTTP Listen port", the "Oracle HTTP Server port" line is ignored. For example, if you have these lines in staticports.ini:

   Web Cache HTTP Listen port = 7979
   Oracle HTTP Server port = 8080

4-14 Oracle Application Server Installation Guide
the Port directive would be set to 7979.

2. Set the port for Oracle HTTP Server.

Oracle HTTP Server uses the port specified by the Listen directive. To set this port, use this line in the staticports.ini file:

Oracle HTTP Server Listen port = port_number

To configure the SSL Listen port, use the following line:

Oracle HTTP Server Listen (SSL) port = port_number

Figure 4–1  Configuring Both OracleAS Web Cache and Oracle HTTP Server

If You Are Configuring Oracle HTTP Server Only (no OracleAS Web Cache)

If you are configuring Oracle HTTP Server only, then Oracle HTTP Server uses both Port and Listen directives (Figure 4–2). In this case, you must set both directives to use the same port number.

To set these ports, use the “Oracle HTTP Server port” and “Oracle HTTP Server Listen port” lines in the staticports.ini file. For example:

Oracle HTTP Server port = 8080
Oracle HTTP Server Listen port = 8080

To set the SSL version of these ports, use the following lines. As in the non-SSL version, the port numbers must be the same.

Oracle HTTP Server SSL port = 443
Oracle HTTP Server Listen (SSL) port = 443

If you also specify the Web Cache lines in staticports.ini, they will be ignored because you are not configuring OracleAS Web Cache.

Figure 4–2  Configuring Only Oracle HTTP Server

Note: You must specify the same port number for both directives.
4.5.3.4 Examples
This section describes some common scenarios for using staticports.ini.

- Configure Oracle HTTP Server to Use Ports 80 and 443 With OracleAS Web Cache as the Front-End
- Configure Oracle HTTP Server to Use Ports 80 and 443 Without OracleAS Web Cache

Configure Oracle HTTP Server to Use Ports 80 and 443 With OracleAS Web Cache as the Front-End
In this scenario, create a staticports.ini file that includes the following lines:

Web Cache HTTP Listen port = 80
Oracle HTTP Server Listen port = 81
Web Cache HTTP Listen (SSL) port = 443
Oracle HTTP Server Listen (SSL) port = 444

The ports for Oracle HTTP Server Listen and SSL Listen can be any available port. The example uses ports 81 and 444. These port numbers do not have to be less than 1024. If you select port numbers less than 1024, you have to start up Oracle HTTP Server and OracleAS Web Cache as the root user.

---

**Note:** Because you are using ports less than 1024, you have to configure Oracle HTTP Server and OracleAS Web Cache to run as the root user. You can perform the configuration during installation or after installation.

- If you want to do the configuration during installation, you must follow the steps listed in Section 7.17, "Install Fragment: The Last Few Screens of the Installation" after running root.sh but before clicking OK. You run root.sh near the end of the installation.

- You can choose to perform the configuration after installation, but note that the installer will not be able to start up the components (because they are not yet configured).

For details, see these guides: Oracle HTTP Server Administrator's Guide and Oracle Application Server Web Cache Administrator's Guide.

---

Configure Oracle HTTP Server to Use Ports 80 and 443 Without OracleAS Web Cache
In this scenario, create a staticports.ini file that includes the following lines:

Oracle HTTP Server port = 80
Oracle HTTP Server Listen port = 80
Oracle HTTP Server SSL port = 443
Oracle HTTP Server Listen (SSL) port = 443

---

**Note:** Because you are using ports less than 1024, you have to configure Oracle HTTP Server to run as the root user. Refer to the Note on page 4-16 for details.
4.5.4 If Port 1521 Is in Use

The installer configures port 1521 for the OracleAS Metadata Repository listener (version 10.1.0.3). This port cannot be changed through the staticports.ini file.

**Note:** If your computer has a listener that uses the IPC protocol with the EXTPROC key, you should change the key to have some other value. This is because the OracleAS Metadata Repository listener requires access to the EXTPROC key.

If port 1521 on your computer is already in use by an existing application, such as Oracle database listener or some other application, you might have to take some action before running the installer. Refer to the following sections for details.

- **Section 4.5.4.1, "If Port 1521 Is In Use by an Existing Oracle Database"
- **Section 4.5.4.2, "If Port 1521 Is In Use by Some Other Application"

### 4.5.4.1 If Port 1521 Is In Use by an Existing Oracle Database

If you are installing a new database for the OracleAS Metadata Repository on a computer that is already running an Oracle database, ensure that the listeners for both databases do not conflict.

You might be able to use the same listener for both the existing database and the OracleAS Metadata Repository database. You have to consider the version of the existing listener as well as the port number. Table 4–6 shows scenarios and outcomes.

You can change the OracleAS Metadata Repository listener to use a different port after installation. Refer to [Oracle Application Server Administrator's Guide](#) for details.

### Table 4–6 Scenarios and Outcomes if You Have an Existing Database on the Computer Where You Want to Install the OracleAS Metadata Repository

<table>
<thead>
<tr>
<th>Version of the Existing Listener</th>
<th>Existing Listener Uses Port 1521</th>
<th>Existing Listener Uses a Port Other Than 1521</th>
</tr>
</thead>
<tbody>
<tr>
<td>Earlier than 10.1.0.2</td>
<td>You need two listeners: one for the existing database and one for the OracleAS Metadata Repository. Refer to Scenario 1: Existing Listener Uses Port 1521 and Listener Version Is Earlier Than 10.1.0.2.</td>
<td>You need two listeners: one for the existing database and one for the OracleAS Metadata Repository. Refer to Scenario 3: Existing Listener Uses a Port Other Than 1521.</td>
</tr>
<tr>
<td>10.1.0.2 or later</td>
<td>The existing listener supports both the existing database and the OracleAS Metadata Repository. Refer to Scenario 2: Existing Listener Uses Port 1521 and Listener Version Is 10.1.0.2 or Later.</td>
<td>You need two listeners: one for the existing database and one for the OracleAS Metadata Repository. Refer to Scenario 3: Existing Listener Uses a Port Other Than 1521.</td>
</tr>
</tbody>
</table>

To check the listener version, run the following command:

```bash
prompt> $ORACLE_HOME/bin/lsnrctl VERSION
```

where `ORACLE_HOME` is the home directory for your database. You can also use the same command to check the listener port. Here is an example of the command’s output:

```bash
bin/lsnrctl VERSION
```
Scenario 1: Existing Listener Uses Port 1521 and Listener Version Is Earlier Than 10.1.0.2

Listeners earlier than version 10.1.0.2 are not compatible with the OracleAS Metadata Repository from this Oracle Application Server release. What you need to do is to install the OracleAS Metadata Repository, which installs a version 10.1.0.3 listener. You can then use this new listener to service your existing database and the OracleAS Metadata Repository database.

1. Stop the existing listener before you install the OracleAS Metadata Repository.

   prompt> $ORACLE_HOME/bin/lsnrctl stop

   ORACLE_HOME is the home directory for your existing database.

   If you do not stop the existing listener, the installation will fail.

2. Install the OracleAS Metadata Repository.

   Refer to any of the procedures that install an OracleAS Metadata Repository in Chapter 6, "Installing OracleAS Infrastructure" (for example, Section 6.20, "Installing OracleAS Infrastructure" or Section 6.21, "Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory").

3. Update the configuration file of the new listener, as necessary. The name of the listener configuration file is listener.ora, located in the ORACLE_HOME/network/admin directory.

   a. Check network address entries in the existing listener’s configuration file.

      If the existing listener’s configuration file contains only the following network addresses:

         * TCP Port 1521
         * IPC key EXTPROC

      you do not have to edit the OracleAS Metadata Repository listener’s configuration file for network addresses.

      If the configuration file contains other network addresses, you need to add them to the OracleAS Metadata Repository listener’s configuration file.

   b. Check SID_DESC entries in the existing listener’s configuration file.

      If the existing listener’s configuration file contains SID_DESC entries for the existing database, you need to add these entries to the OracleAS Metadata Repository listener’s configuration file.
c. Do not start the existing listener (version earlier than 10.1.0.2). Now that the new listener supports both databases, you do not need to run the existing listener any more.

Note: Step c is very important. You only need to run one listener (the new listener) to support both databases.

Scenario 2: Existing Listener Uses Port 1521 and Listener Version Is 10.1.0.2 or Later
The existing listener will support both the existing database and the OracleAS Metadata Repository. The installer will perform this configuration automatically.

The listener can be running during installation.

Scenario 3: Existing Listener Uses a Port Other Than 1521
You will end up running two listeners: one for the existing database and one for the OracleAS Metadata Repository, regardless of the version of the existing listener.

The existing listener can be running during installation, because it is not using port 1521.

4.5.4.2 If Port 1521 Is In Use by Some Other Application
If you have some other application listening on port 1521, you need to reconfigure it to listen on a different port. If that is not possible, shut it down while you install the OracleAS Metadata Repository. After installation, you can reconfigure the OracleAS Metadata Repository to use a port other than 1521. Refer to Oracle Application Server Administrator’s Guide for instructions on how to do this.

4.6 Operating System Groups
You need to create operating system groups in these situations:

- If you plan to install Oracle Application Server on a computer that does not have Oracle products, create a group to own the "inventory" directory. Refer to Section 4.6.1, "Create a Group for the Inventory Directory".

- If you plan to install the OracleAS Metadata Repository in a new database (that is, one created by the installer), create groups for database administrators. Refer to Section 4.6.2, "Create Groups for Database Administrators".

To create the oinstall group enter the following command:

```bash
# /usr/sbin/groupadd oinstall
```

For more information about operating system users and groups, see your operating system documentation or contact your system administrator.

4.6.1 Create a Group for the Inventory Directory
If you plan to install Oracle Application Server on a computer that does not have Oracle products, create a group to own the inventory directory. The installer writes its files in the inventory directory to keep track of the Oracle products installed on the computer.

This guide uses the name oinstall for this operating system group.
By having a separate group for the inventory directory, you allow different users to install Oracle products on the computer. Users need write permission for the inventory directory. They can achieve this by belonging to the oinstall group.

For the first time installation of any Oracle product on a computer, the installer displays a screen where you enter a group name for the inventory directory, and a screen where you enter the location of the inventory directory.

The default name of the inventory directory is oraInventory.

If you are unsure if there is already an inventory directory on the computer, look in the /var/opt/oracle/oraInst.loc file. This file lists the location of the inventory directory and the group who owns it. If the file does not exist, the computer does not have Oracle products installed on it.

### 4.6.2 Create Groups for Database Administrators

This section applies only if you plan to install the OracleAS Metadata Repository in a new database created by the installer.

When the database is not mounted and database authentication is unavailable, the database uses operating system groups to determine user privileges. The database recognizes these groups and privileges:

#### Table 4–7 Privileges for the OSDBA and OSOPER Groups

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSDBA</td>
<td>This is the database administrator group. Users in this group are granted SYSDBA privileges.</td>
</tr>
<tr>
<td>OSOPER</td>
<td>Users in this group are granted SYSOPER privileges, which comprise privileges required for basic maintenance. These include database startup and shutdown, and other privileges required for database operation. SYSOPER privileges are a subset of SYSDBA privileges.</td>
</tr>
</tbody>
</table>

You need to create operating system groups for these groups.

If you want an operating system group called dba to have SYSDBA privileges:

1. Create the dba group.
2. Ensure that the user running the installer is a member of the dba group.

If you want a different operating system group to have SYSDBA privileges, or if you want to associate SYSDBA and SYSOPER privileges with different groups, ensure the user running the installer does not belong to the dba group.

If the user running the installer does not belong to the dba group, the installer displays a screen where you can enter the names of groups to have the database administrator privileges. The screen has two fields: one for the OSDBA group and one for the OSOPER group (refer to Table 4–7). You can enter the same operating system group for both fields.

### 4.7 Operating System User

Create an operating system user to install and upgrade Oracle products. This guide refers to this user as the oracle user. The oracle user running the installer must have write permission for these directories:

- the Oracle home directory, which contains files for the product you are installing
the inventory directory, which is used by the installer for all Oracle products

If the computer contains other Oracle products, you might already have a user for this purpose. Look in the /var/opt/oracle/oraInst.loc file. This file lists the location of the inventory directory and the group who owns it. If the file does not exist, the computer does not have Oracle products installed on it.

If you do not already have a user for installing Oracle products, create a user with the following properties:

**Table 4–8 Properties of the Operating System User Who Runs the Installer**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Login name</td>
<td>You can use any name for the user. This guide refers to the user as the oracle user.</td>
</tr>
<tr>
<td>Group identifier</td>
<td>The primary group of the oracle user must have write permission for the oraInventory directory. Refer to Section 4.6.1, “Create a Group for the Inventory Directory” for more information about this group. You can use any name for the group. This guide uses the name oinstall.</td>
</tr>
<tr>
<td>Home directory</td>
<td>The home directory for the oracle user can be consistent with the home directories of other users.</td>
</tr>
<tr>
<td>Login shell</td>
<td>The default login shell can be the C, Bourne, or Korn shell.</td>
</tr>
</tbody>
</table>

**Note:** Use the oracle user only for installing and running Oracle products. Do not use root as the oracle user.

To create the oracle user:

1. Enter a command similar to the following:
   ```
   # /usr/sbin/useradd -g oinstall -G dba[,oper] oracle
   ```
   In this command:
   - The `-g` option specifies the primary group, which must be the Oracle Inventory group, for example oinstall
   - The `-G` option specifies the secondary groups, which must include the OSDBA group and if required, the OSOPER group, for example dba or dba,oper

2. Set the password of the oracle user:
   ```
   # passwd oracle
   ```

To check which groups an operating system user belongs to, run the `groups` command with the name of the user. For example:

```
prompt> groups oracle
``` 

For more information about operating system users and groups, see your operating system documentation or contact your system administrator.

### 4.8 Environment Variables

The operating system user who will be installing Oracle Application Server needs to set (or unset) the following environment variables.
Table 4–9 summarizes whether you set or unset an environment variable.

<table>
<thead>
<tr>
<th>Environment variable</th>
<th>Set or Unset</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORACLE_HOME and ORACLE_SID</td>
<td>Must not be set.</td>
</tr>
<tr>
<td>PATH, CLASSPATH, and Shared Library Path Environment Variables</td>
<td>Must not contain references to directories in any Oracle home directories</td>
</tr>
<tr>
<td>DISPLAY</td>
<td>Set it to the monitor where you want to the installer window to appear.</td>
</tr>
<tr>
<td>TMP and TMPDIR</td>
<td>Optional. If unset, defaults to /tmp.</td>
</tr>
<tr>
<td>TNS_ADMIN</td>
<td>Must not be set.</td>
</tr>
</tbody>
</table>

### 4.8.1 Environment Variable Tips

Here are some tips when working with environment variables:

- If you set environment variables in the `.profile` file, they might not be read. To ensure environment variables are set to the correct values, check their values in the shell where you will be running the installer.

- To check the value of environment variables, use the `env` command. This displays all the currently defined environment variables and their values.

  ```
  % env
  ```

- If you use the `su` command to switch users (for example, switching from the root user to the `oracle` user), check the environment variables when you are the new user because the environment variables might not be passed to the new user. This can happen even if you run `su` with the `-` parameter (`su - user`).

  ```
  # /* root user */
  # su - oracle
  # env
  ```

### 4.8.2 ORACLE_HOME and ORACLE_SID

These environment variables must not be set.

### 4.8.3 PATH, CLASSPATH, and Shared Library Path Environment Variables

Edit your `PATH`, `CLASSPATH`, `SHLIB_PATH`, and `env` environment variables so that they do not reference any Oracle home directories.

### 4.8.4 DISPLAY

Set the `DISPLAY` environment variable to point to the X server that will display the installer. The format of the `DISPLAY` environment variable is:

```
hostname:display_number.screen_number
```

Example (C shell):

```
% setenv DISPLAY test.mydomain.com:0.0
```
Example (Bourne or Korn shell):

$ DISPLAY=test.mydomain.com:0.0; export DISPLAY

You can test the display by running the xclock program:

$ /bin/x11/xclock

Oracle Application Server requires a running X server during installation only. The frame buffer X server installed with your operating system requires that you remain logged in and have the frame buffer running during installation. If you do not wish to do this, then you must use a virtual frame buffer, such as X Virtual Frame Buffer (XVFB) or Virtual Network Computing (VNC).

For information about obtaining and installing XVFB or other virtual frame buffer solutions, search for “frame buffer” on the Oracle Technology Network site. You can access the site at:

http://www.oracle.com/technology

4.8.5 TMP and TMPDIR

The installer uses a temporary directory for swap space. The installer checks for the TMP and TMPDIR environment variables to locate the temporary directory. If this environment variable does not exist, the installer uses the /tmp directory.

If you want the installer to use a temporary directory other than /tmp, set the TMP and TMPDIR environment variables to the full path of an alternate directory. The oracle user must have right permission for this directory and the directory must meet the requirements listed in Table 4–2.

Example (C shell):

% setenv TMP /tmp2
% setenv TMPDIR /tmp2

Example (Bourne or Korn shell):

$ TMP=/tmp2; export TMP
$ TMPDIR=/tmp2; export TMPDIR

If you do not set this environment variable, and the default directory does not have enough space, then the installer displays an error message that says the environment variable is not set. You can either set the environment variable to point to a different directory or free up enough space in the default directory. In either case, you have to restart the installation.

4.8.6 TNS_ADMIN

This section describes two requirements:

- The TNS_ADMIN environment variable must not be set. If set, it can cause errors during installation. Section G.2.11, “Database Configuration Assistant (DBCA) Failures” shows such an error.
- The /var/opt/oracle directory must not contain a tnsnames.ora file.

These requirements are necessary to prevent conflicts between the Net configuration files for different Oracle products.
If you need to set TNS_ADMIN or if you have the tnsnames.ora file in /var/opt/oracle, do the following steps before installing Oracle Application Server.

1. If you have the tnsnames.ora file in /var/opt/oracle, move the file from these directories to a different directory. Alternatively, you can rename the file.

2. Make sure the TNS_ADMIN environment variable is not set.
   
   Example (C shell):
   
   ```
   % unsetenv TNS_ADMIN
   ```
   
   Example (Bourne or Korn shell):
   
   ```
   $ unset TNS_ADMIN
   ```

After installation, you can merge the contents of the newly created tnsnames.ora file with your existing tnsnames.ora file.

4.9 The /etc/hosts File

Although the contents of the /etc/hosts file affect these items:

- Section 4.9.1, "Location of the Default Oracle Identity Management Realm"
- Section 4.9.2, "Hostname for OracleAS Single Sign-On"

the installer provides alternative methods for you to enter the values that you want without editing the hosts file. Refer to the following subsections for details.

4.9.1 Location of the Default Oracle Identity Management Realm

The installer reads the hosts file to construct the location of the default Oracle Identity Management realm. It displays this location in the "Specify Namespace in Internet Directory" screen.

The hosts file should use the following format:

```
ip_address   fully_qualified_hostname   short_hostname
```

Example:

```
123.45.67.89   primaryHost.mydomain.com   primaryHost
```

In the preceding example, the location of the default Oracle Identity Management realm would look like "dc=mydomain,dc=com".

If the file uses a different format, the installer displays an incorrect value in the screen. For example, if the hosts file contains:

```
123.45.67.89   primaryHost   primaryHost.mydomain.com  <--- incorrect format
```

the installer would display "dc=primaryHost,dc=com" as the default Oracle Identity Management realm. This is probably not the value that you want for the default Oracle Identity Management realm.
4.9.2 Hostname for OracleAS Single Sign-On

If you are installing OracleAS Single Sign-On, and your hosts file contains only the hostname of your computer, without the domain name, then you will only be able to sign on to the Single Sign-On server using the hostname by itself (without the domain name).

If you want to require a domain name when connecting to the Single Sign-On server, you can edit the hosts file to include the domain name. If you do not want to edit the file, you can use the OUI_HOSTNAME command-line parameter to the installer to override the value in hosts. For example:

```
prompt> mount_point/1012disk1/runInstaller OUI_HOSTNAME=myserver.mydomain.com
```
name (hostname only) and the full name (hostname and domain name). Both must work.

### 4.10.2 Copying CD-ROMs or DVD to Hard Drive, and Installing from the Hard Drive

Instead of installing from the Oracle Application Server CD-ROMs or DVD, you can copy the contents of the CD-ROMs or DVD to a hard drive and install from there. This might be easier if you plan to install many instances of Oracle Application Server on your network, or if the computers where you want to install Oracle Application Server do not have CD-ROM or DVD drives.

(You can install from remote CD-ROM or DVD drives; see Section 4.10.3, "Installing from a Remote CD-ROM or DVD Drive").

When you install from the hard drive, the installer does not prompt you to swap CD-ROMs. It can find all the files if they are in the proper locations (see Figure 4–3).

#### Space Requirement

Ensure that the hard drive contains enough space to hold the contents of the CD-ROMs or the `application_server` directory on the DVD. Each CD-ROM contains approximately 650 MB. This means that if you are copying three CD-ROMs, you need approximately 1.9 GB of disk space.

On the DVD, the `application_server` directory is approximately 1.6 GB.

This space is in addition to the space required for installing Oracle Application Server (listed in Table 4–2).

#### To Copy the CD-ROMs:

1. Create a directory structure on your hard drive as shown in Figure 4–3.
   - You need to create a parent directory (called `OracleAS_10g` in the example, but you can name it anything you like), and, under the parent directory, create subdirectories called `Disk1`, `Disk2`, and so on. The names of the subdirectories must be `DiskN`, where `N` is the CD-ROM number.

   ![Figure 4–3 Directory Structure for Copying CD-ROMs to Disk]

2. Copy the contents of each CD-ROM into the corresponding directory.
   - `prompt> cp -pr /cdrom_mount_point/10.1.2disk1/* /path/to/hard/drive/Disk1/`
   - `prompt> cp -pr /cdrom_mount_point/10.1.2disk2/* /path/to/hard/drive/Disk2/`
   - ... Repeat for each CD-ROM.

To run the installer from the copied files, invoke the `runInstaller` executable from the `Disk1` directory. Run it from the computer that will be running Oracle Application Server.

`prompt> /path/to/hard/drive/Disk1/runInstaller`
To Copy the application_server Directory from the DVD

1. (optional) Create a directory to contain the application_server directory.

2. Copy the application_server directory from the DVD to your hard disk.

   prompt> cp -pr /dvd_mount_point/application_server /path/to/hard/drive

To run the installer from the copied files, invoke the runInstaller executable from the computer that will be running Oracle Application Server:

   prompt> /path/to/hard/drive/application_server/runInstaller

### 4.10.3 Installing from a Remote CD-ROM or DVD Drive

If the computer where you want to install Oracle Application Server does not have a CD-ROM or DVD-ROM drive, you can copy the discs to the hard drive of a computer with the proper disc drive as described in Section 4.9.2 and then perform a remote installation from that computer using the instructions described in Section 4.10.4, "Installing on Remote Computers".

### 4.10.4 Installing on Remote Computers

You can run the installer on a remote computer ("remote_computer"), but have the installer screens display on your local computer ("local_computer"). The installer will install Oracle Application Server on the remote computer.

1. Allow remote_computer to display on local_computer. You need to run this command on the local computer’s console.

   local_computer> xhost +remote_computer

   If you do not run xhost, you might get an Xlib error similar to "Failed to connect to server", "Connection refused by server," or "Can't open display" when starting the installer.

2. On local_computer, perform a remote login (using telnet or rlogin) to remote_computer. Log in as the oracle user, as described in Section 4.7, "Operating System User". Ensure that the user has set the environment variables correctly, as described in Section 4.8, "Environment Variables".

   local_computer> rlogin -l oracle remote_computer.mydomain.com
   - OR -
   local_computer> telnet remote_computer.mydomain.com

3. Set the DISPLAY environment variable on remote_computer to point to local_computer.

   Example (C shell):

   remote_computer> setenv DISPLAY local_computer.mydomain.com:0.0

   Example (Bourne or Korn shell):

   remote_computer> DISPLAY=local_computer.mydomain.com:0.0; export DISPLAY

4. Run the installer. Refer to Section 5.17, "Starting Oracle Universal Installer".
4.10.5 Installing on NFS-Mounted Storage

To run Oracle Application Server on NFS systems, you have to use a certified NFS-mounted storage system.

Currently Oracle Application Server is certified to run on these NFS systems:

- Network Appliance (NetApp) filers

The NetApp system should be exported to at least the remote install user and remote root user. You can do this using `exportfs` command:

```
prompt> exportfs -i /vol/vol1
```

Before installing, verify that the NFS mount setuid permission is set to `suid`. The `nosuid` option will cause the install to fail.

To check the latest certification list for any updates, visit Oracle Technology Network at:

[http://www.oracle.com/technology](http://www.oracle.com/technology)

4.10.6 Running Multiple Instances from One Installation

Oracle Application Server components are intended to be run only on the computer where they are installed. You cannot run the components on remote computers, even though the computers can access the files through NFS.

![Figure 4–4 Run Oracle Application Server Only on the Computer Where It Is Installed](image)

4.10.7 Support for NIS and NIS+

You can install and run Oracle Application Server in NIS and NIS+ environments.

Prerequisite Checks Performed by the Installer

Oracle home directory

You should install Oracle Application Server in a new directory, unless you are expanding a middle tier (see Section 7.14, "Expanding a Middle Tier") or installing a middle tier in an Oracle home that contains Oracle Developer Suite 10g Release 2 (10.1.2) (see Section 5.5, "Oracle Home Directory"). Here are some examples of installations that are not allowed:

- Any type of Oracle Application Server into an 8.0, 8i, 9.0.1, or 9.2 database Oracle home
- Any type of Oracle Application Server into an Oracle Management Service Oracle home
- Any type of Oracle Application Server into an Oracle Collaboration Suite Oracle home
- Any type of Oracle Application Server into an Oracle HTTP Server standalone Oracle home
- Any type of Oracle Application Server into an OracleAS Web Cache standalone Oracle home
- Any type of Oracle Application Server into an Oracle9i Developer Suite 9.0.2 Oracle home
- Any type of Oracle Application Server into an Oracle Application Server Containers for J2EE standalone Oracle home
- Any type of Oracle Application Server into an Oracle9iAS 1.0.2.2 Oracle home
- Oracle Application Server middle tier into an infrastructure 9.0.2, 9.0.4, or 10g Release 2 (10.1.2) Oracle home
- Oracle Application Server middle tier into an Oracle9iAS 9.0.2, 9.0.3, or 9.0.4 middle tier Oracle home
- OracleAS Developer Kits into an infrastructure 9.0.2, 9.0.4, or 10g Release 2 (10.1.2) Oracle home
- OracleAS Developer Kits into an Oracle9iAS middle tier 9.0.2, 9.0.3, 9.0.4, or 10.1.2 Oracle home
- OracleAS Developer Kits into an Oracle Developer Suite 9.0.2, 9.0.4, or 10g Release 2 (10.1.2) Oracle home
- OracleAS Infrastructure into any Oracle9iAS 9.0.2, 9.0.3, or 9.0.4 Oracle home
- OracleAS Infrastructure into an Oracle Application Server 10g Release 2 (10.1.2) middle tier or OracleAS Developer Kits Oracle home
- OracleAS Infrastructure into an Oracle Developer Suite 9.0.2, 9.0.4, or 10g Release 2 (10.1.2) Oracle home
- OracleAS Infrastructure or middle tier into an Oracle home installed from the Business Intelligence CD-ROM

Port 1521

The installer displays a warning if port 1521 is in use by any application, including database listeners of any version. You need to stop the application that is using port 1521, then click OK in the warning dialog.

If it is a database listener that is using port 1521, you might be able to use it for the metadata repository database. Refer to Section 4.5.4, "If Port 1521 Is in Use" for details.

If it is another application that is using port 1521, you need to stop it or configure it to use a different port. Alternatively, you can change the database listener to use a port other than 1521, but you can do this only after installation. Refer to Oracle Application Server Administrator’s Guide for details.

Static port conflicts

The installer checks the ports listed in the staticports.ini file, if specified. Refer to Section 4.5, "Ports".

Monitor

The installer checks that the monitor is configured to display at least 256 colors.

Things You Should Know Before Starting the Installation

This chapter includes the following sections:

- Section 5.1, "Obtaining Software from Oracle E-Delivery"
  - Section 5.2, "Basic Concepts"
- Section 5.3, "Order of Installation"
- Section 5.4, "Where Do I Install Oracle Application Server?"
- Section 5.5, "Oracle Home Directory"
- Section 5.6, "Can I Use Symbolic Links?"
- Section 5.7, "First-Time Installation of Any Oracle Product"
- Section 5.8, "Installing Additional Languages"
- Section 5.9, "Oracle Application Server Instances and Instance Names"
- Section 5.10, "The ias_admin User and Restrictions on its Password"
- Section 5.11, "Comparing Installing Components Against Configuring Components"
- Section 5.12, "Installing Oracle9i Application Server Release 2 (9.0.2) on the Same Computer"
- Section 5.13, "Where Does the Installer Write Files?"
- Section 5.14, "Can I Modify Other Oracle Application Server Instances During Installation?"
- Section 5.15, "Connecting to Oracle Internet Directory Through SSL Connections"
- Section 5.16, "Setting the Mount Point for the CD-ROM or DVD"
- Section 5.17, "Starting Oracle Universal Installer"

5.1 Obtaining Software from Oracle E-Delivery

You can obtain Oracle products from Oracle E-Delivery at http://edelivery.oracle.com/. Oracle products are distributed as "E-Packs". An E-Pack is an electronic version of the software that is also available to Oracle Customers on CD-ROM or DVD. This section contains the following topics:

- Section 5.1.1, "Finding and Downloading the Oracle Application Server 10g Release 2 (10.1.2) E-Pack"
5.1.1 Finding and Downloading the Oracle Application Server 10g Release 2 (10.1.2) E-Pack

Refer to the CD/Media Pack description or the list of products that you purchased on your Oracle Ordering Document. Then, view the License List to help you decide which Product Pack you need to select in order to search for the appropriate E-Pack(s) to download. Prior to downloading, verify that the product you are looking for is in the License and Options section of the E-Pack README. Oracle recommends that you print the README for reference.

5.1.2 Finding Required and Optional Downloads

Refer to the README link that is on each E-Pack Download page. In addition to listing the licensable products and options contained in the pack, the README lists downloadable files that are required to run each product and which downloadable files are optional. Oracle recommends that you print the README for reference.

5.1.3 Disk Space Requirements

In addition to having the required disk space necessary to install and run your Oracle software, you'll need to have sufficient disk space to download all the required software files and have enough disk space to extract them.

After extracting the software from the Zip files, you can burn them onto CD-ROM and install from them, or install from your computer's hard drive.

5.1.4 Extracting Software from the Zip Files

Verify that the file size of your downloaded file matches the file size displayed on E-Delivery. Unzip each Zip file to its own temporary directory. For example, create a directory called `oraAS10g` on the hard drive:

`/oraAS10g`

Then create a new directory for each Zip file you downloaded:

`/oraAS10g/Disk1`
`/oraAS10g/Disk2`

If you plan to burn the files on a CD-ROM, create a separate CD-ROM from the contents of each directory. Do not burn a CD-ROM containing the Zip file itself; you need the unzipped contents of the Zip files to do the installation. When you burn the files to CD-ROM, the contents of each disc must be at the root of the CD image.

To install from CD-ROM or from your hard drive, see Section 5.17, "Starting Oracle Universal Installer".

5.2 Basic Concepts

Oracle Application Server is made up of:

- Oracle Application Server middle tier
OracleAS Infrastructure

You deploy and run your applications on Oracle Application Server middle tiers. The infrastructure provides services that are used by middle tiers. Infrastructure services can be shared by one or more middle tiers.

When you run the installer, you select whether you want to install the middle tier or the infrastructure. Typically you need both, so you would run the installer twice.

Figure 5–1 shows a simple Oracle Application Server installation. The J2EE and Web Cache middle tier running on computer 1 uses OracleAS Infrastructure running on computer 2. The figure shows the OracleAS Metadata Repository and two Identity Management services (OracleAS Single Sign-On and Oracle Internet Directory).

5.3 Order of Installation

In most cases, you must install OracleAS Infrastructure first, because the middle tiers depend on OracleAS Infrastructure services. The one case where the infrastructure is optional is the J2EE and Web Cache middle-tier type. (But see Section 7.4, "Configuration Options for the J2EE and Web Cache Middle Tier")

5.4 Where Do I Install Oracle Application Server?

You can install the middle tiers and the infrastructure on the same computer or on separate computers. You can get better performance if you install the infrastructure on its own computer, and the middle tiers on other computers.

For example, Figure 5–2 shows a topology with four computers:

- Computer 1 runs a J2EE and Web Cache instance that is not using any infrastructure services.
- Computer 2 runs a Portal and Wireless middle tier that uses infrastructure services from the infrastructure instance running on Computer 4.
- Computer 3 runs another Portal and Wireless middle tier that uses infrastructure services from the infrastructure instance running on Computer 4.
- Computer 4 runs OracleAS Infrastructure.

Refer to Chapter 15, "Recommended Topologies" for topology examples.
5.5 Oracle Home Directory

The directory in which you install Oracle Application Server is called the Oracle home. During installation, you specify the full path to this directory and a name for this Oracle home.

For example, you can install OracleAS Infrastructure in /opt/oracle/OraHome_Infra, and you can name it "Infra".

Names of Oracle homes must be 128 characters or fewer, and can contain only alphanumeric characters and underscores.

**Notes:** Spaces are not allowed anywhere in the Oracle home directory path. For example, you cannot install in "/opt/oracle/app_server/Infra" because of the space character in "app_server". The installer does not check for this until several screens after you have entered the path.

If you plan to install a middle tier and an infrastructure on the same computer, you must install them in different Oracle home directories. The installer does not allow you to install a middle tier and an infrastructure in the same Oracle home. Section 15.2, "Portal and Wireless Developer Topology" describes a configuration where you install a middle tier and an infrastructure on the same computer.

**Tip:** If you install multiple Oracle Application Server instances (for example, an OracleAS Infrastructure and a middle tier) on the same computer, create scripts for setting the environment for each instance. This is to ensure that you run the binaries from the proper Oracle home. Environment variables that you need to set include ORACLE_HOME and PATH.
5.5.1 Installing in an Existing Oracle Home

Generally, you cannot install Oracle Application Server in an existing Oracle home. Refer to "Oracle home directory" on page 4-30 for a list of combinations that are not allowed. Two exceptions to the rule are:

- You can install Oracle Application Server middle tiers into an existing Oracle home that contains Oracle Developer Suite 10g Release 2 (10.1.2). However, before you install, check that in the file ORACLE_HOME/j2ee/home/config/default-web-site.xml, the protocol is set to "ajp13" (not http), and the port is set to 0 (zero).

  \textbf{Note:} If you choose to install Oracle Application Server in an existing Oracle Developer Suite 10g Release 2 (10.1.2) home, you will lose some Oracle Developer Suite functionality. Specifically, you can no longer access directly the OC4J home instance in Oracle Developer Suite using the \texttt{hostname:8888} URL.

- You can install Oracle Application Server middle tier into an existing middle tier if you are expanding it. Refer to Section 7.14, "Expanding a Middle Tier" for details.

5.5.2 Installing in a Non-Empty Oracle Home

You cannot install Oracle Application Server in a directory that already contains some files, except for the cases mentioned in Section 5.5.1, "Installing in an Existing Oracle Home". For example, if you cancel an installation, or if an installation failed, you have to clean up the directory before you can reinstall Oracle Application Server in it. Also, the installer cannot "repair" an installation. Refer to Section G.2.2, "Message About Installing in a Non-Empty Directory" for instructions on how to clean up the directory.

5.6 Can I Use Symbolic Links?

You can create symbolic links before installing Oracle Application Server and use them during installation. For example, if you run the following commands:

```
mkdir /home/basedir
ln -s /home/linkdir /home/basedir
```

then, when you run the installer, you can specify /home/linkdir as the Oracle Home.

After installation, you cannot create symbolic links to the Oracle Home. You also may not move the Oracle Home to a different location and create a symbolic link to the original Oracle Home.

5.7 First-Time Installation of Any Oracle Product

If Oracle Application Server is the first Oracle product to be installed on a computer, the installer displays a screen where you specify an inventory directory (also called the \texttt{oraInventory} directory). This inventory directory is used by the installer to keep track of all Oracle products installed on the computer.

The inventory directory is separate from the Oracle home directory for Oracle Application Server.

To ensure other users in the oinstall group have access to the inventory directory (so that they can install Oracle products), do not use the \texttt{oracle} user’s home directory.
as the inventory directory because home directories might not have the proper permissions set up for the oinstall group. Instead, you can put the inventory directory in the /opt/oracle directory (for example, /opt/oracle/oraInventory).

If you have installed an Oracle product previously on the computer, the installer uses the existing inventory directory. Ensure that you have write permissions on that directory. The best way of ensuring this is to run the installer as the same operating system user who installed the existing Oracle products.

Oracle recommends creating an operating system user to perform all tasks related to installation of Oracle products. Refer to Section 4.7, "Operating System User".

5.8 Installing Additional Languages

By default, the installer installs Oracle Application Server with text in English and in the operating system language. If you need additional languages, click the Product Languages button in the "Select a Product to Install" screen.

When you select additional languages to install, the installer installs text in the selected languages. It also installs fonts required to display the languages.

For some components, languages are installed only if you select them during installation. In this case, if you access the application in a language that is not available, it will fall back on the server locale language.

For other components, available languages are installed regardless of what you select during installation. In this case, however, fonts are installed only for the languages that are explicitly selected. When you access the application, it uses text in your language because the language was installed. However, if you do not have the appropriate fonts to render the text, the text appears as square boxes. This usually applies to the Chinese, Japanese, and Korean languages.

You can install fonts after installation. Refer to Section G.2.7, "User Interface Does Not Display in the Desired Language, or Does Not Display Properly".

---

**Note:** OracleAS Portal is not supported on the ZHT32EUC database character set used for Traditional Chinese. If your environment supports Traditional Chinese, then the ZHT16MSWIN950, AL32UTF8, or ZHT16BIG5 character set must be used. For details about selecting the character set in the Oracle Universal Installer (OUI), refer to Oracle Application Server Globalization Guide.

---

**Note that you cannot install additional languages after installation.** You must install all languages that you need during installation. If you run Oracle Application Server in an environment that uses a language that you did not install, the user interface can display text in that language and/or in English, or it can display square boxes (caused by missing fonts) instead of text.

5.9 Oracle Application Server Instances and Instance Names

When you install the infrastructure or middle tier, what you get is an Oracle Application Server instance. The installer prompts you to provide a name for the Oracle Application Server instance you are installing. For example, you can name an instance "infra" or "J2EE". This name can be different from the Oracle home name.

You cannot change this name after installation.
Oracle Application Server appends the hostname and domain name to the given instance name to form a complete instance name. For example, if you are installing an instance on a computer named c1, and you name the instance infra1, then the full name of the instance is infra1.c1.mydomain.com, assuming the domain name is mydomain.com.

**Valid Characters in Instance Names**

Instance names can consist only of the alphanumeric characters (A-Z, a-z, 0-9) and the _ (underscore) character.

The maximum length for an instance name is 64 characters.

**Restrictions on Oracle Application Server Instance Names**

Do not use the hostname of the computer when naming Oracle Application Server instances.

If you are planning to place the Oracle Application Server instance in an OracleAS Cluster, the instance name must not contain the following:

- hostname or IP address of any computer in the OracleAS Cluster
- Oracle home of any Oracle Application Server installation in the OracleAS Cluster

**How Oracle Application Server Uses Instance Names**

Instance names are important because Oracle Application Server uses them to uniquely identify instances. This means that if you install multiple Oracle Application Server instances on the same computer (for example, an OracleAS Infrastructure and a J2EE and Web Cache instance), you must give them different names.

When you administer Oracle Application Server using Oracle Enterprise Manager 10g Application Server Control (or Application Server Control for short), the instance name appears on the screens. You can click the instance name to see details about the instance, such as the components that are installed in that instance, if the components are running or stopped, and the log files for the components. The Application Server Control is a browser-based administration tool for Oracle Application Server. Refer to Oracle Application Server Administrator’s Guide for details about this administration tool.

In addition, some dcmctl commands require an instance name as a parameter. dcmctl is a command-line tool for administering Oracle Application Server instances. Refer to Distributed Configuration Management Administrator’s Guide for details about dcmctl.

### 5.10 The ias_admin User and Restrictions on its Password

The installer prompts you to specify the password for the ias_admin user. The ias_admin user is the administrative user for Oracle Application Server instances. To manage Oracle Application Server instances using Application Server Control, you log in as ias_admin.

On a computer, you can install multiple Oracle Application Server instances, each with its own unique instance name, but the name of the administrative user is ias_admin for all instances. The password for the ias_admin user can be different for each instance.

**Password for the ias_admin User**

The password for the ias_admin user must conform to Oracle Internet Directory’s password policy:
If you are using the Oracle Internet Directory that is shipped with this release of Oracle Application Server and you did not change the default password policy, passwords have the following restrictions:

- The minimum length is five alphanumeric characters.
- At least one of the characters must be a number.

If you are using any other version of Oracle Internet Directory (for example, you are using an existing Oracle Internet Directory), your Oracle Internet Directory administrator might have defined a different password policy. The password you enter for the ias_admin user must conform to the existing Oracle Internet Directory’s password policy.

In addition to the password policy defined in Oracle Internet Directory, the password for the ias_admin user has these restrictions:

- Passwords must be shorter than 30 characters.
- Passwords can contain only alphanumeric characters from your database character set, the underscore (_), the dollar sign ($), and the number sign (#).
- Passwords must begin with an alphabetic character. Passwords cannot begin with a number, the underscore (_), the dollar sign ($), or the number sign (#).
- Passwords cannot be Oracle reserved words. The Oracle Database SQL Reference lists the reserved words. You can find this guide on Oracle Technology Network http://www.oracle.com/technology/documentation.

You can also avoid using words that sound like they might be reserved words.

---

**Note:** When entering your password, check that the state of the Caps Lock key is what you want it to be. Passwords are case-sensitive.

---

You must remember the password because you need to enter it to perform the following tasks:

- When you log on to Application Server Control to manage Oracle Application Server, you log on as the ias_admin user.
- For middle-tier installations: if you want to install a larger middle tier in an ORACLE_HOME that already contains a middle tier (for example, you want to install the Portal and Wireless type over an existing J2EE and Web Cache type), you must enter the existing password during the installation.

If you forget the password, you can reset it. Refer to Oracle Application Server Administrator’s Guide for details.

### 5.11 Comparing Installing Components Against Configuring Components

When you select components on the Select Configuration Options screen, the installer installs and configures the selected components. For the unselected components, the installer still installs them, but does not configure them.

In most cases, you can configure components that you did not select on the Select Configuration Options screen after installation using the Application Server Control. Refer to Oracle Application Server Administrator’s Guide for details.
5.12 Installing Oracle9i Application Server Release 2 (9.0.2) on the Same Computer

If you want to install the current release of Oracle Application Server and Oracle9i Application Server Release 2 (9.0.2) on the same computer, make sure you install Release 2 (9.0.2) first.

If you install Oracle9i Application Server Release 2 (9.0.2) Infrastructure after installing the current release of Oracle Application Server Infrastructure, you must disable the Net Listener installed by the 9.0.2 infrastructure. The current version of Net Listener is capable of listening for both the current and previous releases of the database. For information on starting and stopping Net Listener, see Oracle Application Server Administrator’s Guide.

For more information on compatibility with earlier releases, see Oracle Application Server Upgrade and Compatibility Guide.

---

**Note:** Oracle9i Application Server Release 2 (9.0.2) is no longer supported. Oracle recommends that you upgrade to the latest release of Oracle Application Server.

5.13 Where Does the Installer Write Files?

The installer writes files to the following directories:

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle home directory</td>
<td>This directory contains Oracle Application Server files. You specify this directory when you install Oracle Application Server.</td>
</tr>
<tr>
<td>Inventory directory</td>
<td>When you install the first Oracle product on a computer, you specify this directory, which the installer uses to keep track of which Oracle products are installed on the computer. In subsequent installations, the installer uses the same inventory directory.</td>
</tr>
<tr>
<td>/etc directory</td>
<td>This directory contains information on locations of Oracle homes on the computer. If you installed Oracle9iAS Release 2 (9.0.2) on your computer, this directory also contains files that provide information for Oracle Enterprise Manager 10g.</td>
</tr>
<tr>
<td>/tmp directory</td>
<td>The installer writes files needed only during installation to a &quot;temporary&quot; directory. By default, the &quot;temporary&quot; directory is /tmp. To specify a different directory, set the TMP environment variable. Refer to Section 4.8.5, &quot;TMP and TMPDIR&quot; for details.</td>
</tr>
</tbody>
</table>

5.14 Can I Modify Other Oracle Application Server Instances During Installation?

During the installation of an Oracle Application Server instance, you should not change the configuration or passwords of other installations in your environment. For example, if there is an OracleAS Infrastructure installation in your environment, you should not modify it during the installation of a middle tier.
5.15 Connecting to Oracle Internet Directory Through SSL Connections

When you install OracleAS Infrastructure or middle tiers, you can specify that Oracle Application Server components connect to Oracle Internet Directory only through SSL connections. On screens where you specify the hostname and port for Oracle Internet Directory, you can select the **Use Only SSL Connections With This Oracle Internet Directory** option.

Note that Oracle HTTP Server is not set up for SSL connections during installation. If you need Oracle HTTP Server to use SSL, you can set it up after installation. Refer to *Oracle HTTP Server Administrator’s Guide* for details.

5.16 Setting the Mount Point for the CD-ROM or DVD

The Oracle Application Server CD-ROMs are in RockRidge format. The DVD is in DVD format.

To mount the first disc:

1. Insert Oracle Application Server disk 1 into the disk drive.
2. Create the `/SD_CDROM` directory if it does not already exist:
   ```
   # /usr/bin/mkdir /SD_CDROM
   ```
3. Enter a command similar to the following:
   ```
   # /usr/sbin/mount -F cdfs -o rr /dev/dsk/cxdytz /SD_CDROM
   ```

In the preceding example, `/SD_CDROM` is the disk mount point directory and `/dev/dsk/cxdytz` is the device name for the disk device, for example `/dev/dsk/c0d2t0`.

5.17 Starting Oracle Universal Installer

1. If your computer does not mount CD-ROMs or DVD automatically, you need to set the mount point manually. Refer to Section 5.16, "Setting the Mount Point for the CD-ROM or DVD" for details.
2. Log in as the `oracle` user.
3. If you are installing Oracle Application Server on a multihomed computer, create the `ORACLE_HOSTNAME` environment variable. Set this variable to point to the hostname of the computer on which you are installing Oracle Application Server.

   **See Also:**
   - Section 4.10.1, "Installing on Multihomed (Multi-IP) Computers"

4. CD-ROM users: Insert Oracle Application Server Disk 1 into the CD-ROM drive.
   DVD users: Insert the Oracle Application Server DVD into the DVD drive.
5. Run the Oracle Universal Installer using the command shown after the notes:
Starting Oracle Universal Installer

Things You Should Know Before Starting the Installation

---

**Note:**

- Be sure you are not logged in as the root user when you start the Oracle Universal Installer. The installer gives an error message if you try to run it as the root user.

- Do not start the installation inside the `mount_point` directory. If you do, then you may not be able to eject the installation disk. The following `cd` command changes your current directory to your home directory.

---

**CD-ROM:**

```bash
prompt> cd
prompt> mount_point/10.1.2disk1/runInstaller
```

**DVD:**

```bash
prompt> cd
prompt> mount_point/application_server/runInstaller
```

This launches Oracle Universal Installer through which you install Oracle Application Server.
6.1 Infrastructure Installation Types

Infrastructure components can be grouped into Oracle Identity Management components and the OracleAS Metadata Repository component. Table 6–2 describes these components:
When you install the infrastructure, the installer asks if you want to install the Oracle Identity Management components, OracleAS Metadata Repository, or both. These are the installation types for the OracleAS Infrastructure:

- Oracle Identity Management and OracleAS Metadata Repository
- Oracle Identity Management
- OracleAS Metadata Repository

In addition to the components listed in Table 6–2, when you install the OracleAS Infrastructure, you also get the Oracle HTTP Server, Oracle Application Server Containers for J2EE, and Oracle Enterprise Manager 10g components. These components are always installed and configured, regardless of which installation type you selected.

Refer to the next section, Section 6.2, "Why Would I Select the Different Infrastructure Installation Types?"
To use an existing database, see Section 6.8, "Can I Use an Existing Database for the OracleAS Metadata Repository?"

### 6.3 Order of Installation for the Infrastructure

If you plan to install both OracleAS Metadata Repository and Oracle Identity Management components on the same computer, select the "Oracle Identity Management and OracleAS Metadata Repository" option. The installer installs the components in the proper order. Refer to Section 6.20, "Installing OracleAS Infrastructure" for the step-by-step procedure.

If you plan to install the infrastructure components on separate computers, install them in this order:

1. Install the OracleAS Metadata Repository.

   You can have the installer create a new database and populate it with the OracleAS Metadata Repository, or you can run the Oracle Application Server Metadata Repository Creation Assistant to install the OracleAS Metadata Repository in an existing database.

   Note that you cannot register the OracleAS Metadata Repository with Oracle Internet Directory at this point, because you do not have an Oracle Internet Directory yet. The registration is done in the next step.

   **See Also:**

   - Section 6.22, "Installing OracleAS Metadata Repository in a New Database"
   - For information on how to install the OracleAS Metadata Repository in an existing database, see the Oracle Application Server Metadata Repository Creation Assistant User’s Guide.

2. Install the Oracle Identity Management components.

   The installer prompts you to enter the connection information for the OracleAS Metadata Repository database.

   Refer to Section 6.23, "Installing Oracle Identity Management Components Only (Including Oracle Internet Directory)" for the step-by-step procedure.

   The installer registers the OracleAS Metadata Repository with the newly created Oracle Internet Directory. Refer to Section 6.10, "Registration of OracleAS Metadata Repository in Oracle Internet Directory and Password Randomization" for details about registration.

**Installing Only the OracleAS Metadata Repository Does Not Give You an Oracle Application Server Instance**

If you install only the OracleAS Metadata Repository when installing the infrastructure, the installer creates a new database and populates it with the OracleAS Metadata Repository schemas. This instance is different from other Oracle Application Server instances in the following ways:

- The installer does not prompt you to name this Oracle Application Server instance.

- At the end of installation, Oracle Enterprise Manager 10g Application Server Control is not started up, because it is not configured for this instance. You do not need it to manage this instance, which consists of only the metadata repository database.
To manage this instance, you use database management tools. For more information, see the chapter "Introduction to Administration Tools" in the Oracle Application Server Administrator’s Guide.

■ At the end of installation, Oracle HTTP Server is also not started up, because you do not need it to manage this instance.

6.4 Can I Install Components on Separate Computers?

You already know that you can install Oracle Application Server instances on separate computers. In addition, you can also distribute components over multiple computers. This is especially useful for infrastructure components. You might want to do this to improve performance, security, scalability, and availability of infrastructure services.

Examples:

■ The OracleAS Infrastructure uses an Oracle database to contain the OracleAS Metadata Repository. You can install this database on its own computer.

■ You can install the Oracle Identity Management components in the infrastructure on one or more computers.

Table 6–3 shows some possible OracleAS Infrastructure configurations:
Can I Install Components on Separate Computers?

Table 6–3  OracleAS Infrastructure Configurations

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description / How to Install</th>
</tr>
</thead>
<tbody>
<tr>
<td>OracleAS Metadata Repository  Identity Management components</td>
<td>In this configuration, the OracleAS Metadata Repository and the Oracle Identity Management components run from the same Oracle home. To install this configuration, install the OracleAS Metadata Repository and the Oracle Identity Management components at the same time. For installation steps, see Section 6.20, &quot;Installing OracleAS Infrastructure&quot;</td>
</tr>
</tbody>
</table>
Can I Install Components on Separate Computers?

Table 6–3  (Continued)OracleAS Infrastructure Configurations

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description / How to Install</th>
</tr>
</thead>
<tbody>
<tr>
<td>OracleAS Metadata Repository</td>
<td>In this configuration, the OracleAS Metadata Repository and the Oracle Identity Management components run on separate computers. To install this configuration: 1. Install the OracleAS Metadata Repository first. Refer to Section 6.22, &quot;Installing OracleAS Metadata Repository in a New Database&quot;. Alternatively, you can install the OracleAS Metadata Repository in an existing database. Refer to Chapter 14, &quot;Installing the OracleAS Metadata Repository in an Existing Database&quot;. 2. Then install the Oracle Identity Management components. Refer to Section 6.23, &quot;Installing Oracle Identity Management Components Only (Including Oracle Internet Directory)&quot;.</td>
</tr>
<tr>
<td>Oracle Internet Directory</td>
<td>In this configuration, the OracleAS Metadata Repository runs on one computer, Oracle Internet Directory runs on a second computer, and the remaining Oracle Identity Management components run on a third computer. To install this configuration: 1. Install the OracleAS Metadata Repository first. Refer to Section 6.22, &quot;Installing OracleAS Metadata Repository in a New Database&quot;. Alternatively, you can install the OracleAS Metadata Repository in an existing database. Refer to Chapter 14, &quot;Installing the OracleAS Metadata Repository in an Existing Database&quot;. 2. Install Oracle Internet Directory. Refer to Section 6.25, &quot;Installing Oracle Internet Directory Only&quot;. 3. Install the remaining Oracle Identity Management components. Refer to Section 6.24, &quot;Installing Oracle Identity Management Components Only (Excluding Oracle Internet Directory)&quot;.</td>
</tr>
<tr>
<td>OracleAS Metadata Repository</td>
<td>In this configuration, you want OCA to use its own OracleAS Metadata Repository (for security reasons). Other Oracle Identity Management components use another OracleAS Metadata Repository. To install this configuration: 1. Install OracleAS Metadata Repository and Oracle Identity Management components, but not OCA. You can install all these items in the same Oracle home (see the first configuration), or you can distribute them. The figure shows a distributed configuration. 2. Install OCA with its own OracleAS Metadata Repository. Refer to Section 6.21, &quot;Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory&quot;.</td>
</tr>
</tbody>
</table>

Note that if you install Oracle Identity Management components on a separate computer from OracleAS Metadata Repository, then the OracleAS Metadata Repository will need network access to the Oracle Identity Management components.
Refer to Chapter 15, "Recommended Topologies", which describes configurations involving multiple computers and distributed components.

6.5 Tips for Installing Oracle Identity Management Components Separately

If you are installing Oracle Identity Management components separately, keep the following guidelines in mind when choosing which components to configure in the Select Configuration Options screen:

- You cannot install and configure more than one OCA against the same OracleAS Metadata Repository. You can install and configure more than one OracleAS Single Sign-On, Oracle Delegated Administration Services, or Oracle Directory Integration and Provisioning against the same OracleAS Metadata Repository. If you want to configure more than one Oracle Internet Directory against the same OracleAS Metadata Repository, see the Oracle Internet Directory Administrator’s Guide.

- You must select at least one component to configure. Otherwise the installation will not succeed.

- If you configure OracleAS Single Sign-On and Oracle Delegated Administration Services in separate installations against the same Oracle Internet Directory, make sure you configure OracleAS Single Sign-On before Oracle Delegated Administration Services. This is because Oracle Delegated Administration Services depends on mod_osso, which will not be set up during installation unless the Oracle Internet Directory it points to already has OracleAS Single Sign-On configured.

- If you have an Oracle Identity Management installation that includes Oracle Directory Integration and Provisioning but does not include Oracle Internet Directory, you will still see an Oracle Internet Directory process in the opmnctl status output. This is because oidmon must be installed and started in order to start the Oracle Directory Integration and Provisioning process.

6.6 Do I Need the Oracle Delegated Administration Services or the Oracle Directory Integration and Provisioning Components?

These components are optional, but you might want to install them because they provide the following services:

- Oracle Delegated Administration Services provide a browser-based interface to Oracle Internet Directory. Users can use the interface to perform tasks such as changing their passwords, searching for other users in the directory, and creating groups. Users can even create additional users (if they have the proper privilege).

- Oracle Directory Integration and Provisioning enables you to integrate applications and third-party LDAP directories with Oracle Internet Directory. You can use Oracle Directory Integration and Provisioning to synchronize data in all directories, and to send notifications to applications when data in Oracle Internet Directory changes (for example, when you add users or groups to Oracle Internet Directory).
6.7 Can I Configure Components After Installation?

If you did not configure a component during installation (that is, you did not select the component in the Select Configuration Options screen), you can configure some components after installation.

You cannot configure Oracle Internet Directory after installation. You need to install and configure Oracle Internet Directory through the installer.

Refer to Section 16.8, "Component Configuration After Installation" for details.

6.8 Can I Use an Existing Database for the OracleAS Metadata Repository?

You can install the OracleAS Metadata Repository in a new database, or in an existing database.

If you want to install the OracleAS Metadata Repository in an existing database, see Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details.

6.9 Can I Use an Existing Oracle Internet Directory?

You can use an existing Oracle Internet Directory instead of having the installer create a new one. You might want to do this if your applications need to authenticate users that are already stored in your Oracle Internet Directory. During the infrastructure installation, do not select "Oracle Internet Directory" in the Select Configuration Options screen.

You need to provide the connect information (hostname, port, username, password) for the existing Oracle Internet Directory.

The Oracle Internet Directory must be version 9.0.4 or later. Note that Oracle Internet Directory version 9.2.x is not supported.

To determine the Oracle Internet Directory version, make sure that Oracle Internet Directory is up and running. Then run the following command:

```prompt> oidldapd -version```

The `oidldapd` command can be found in the `ORACLE_HOME/bin` directory, where `ORACLE_HOME` is the root directory where you installed Oracle Internet Directory.

6.10 Registration of OracleAS Metadata Repository in Oracle Internet Directory and Password Randomization

The OracleAS Metadata Repository and the Oracle Internet Directory work closely together. Before you can use an OracleAS Metadata Repository (in most cases), ensure that it is registered with an Oracle Internet Directory.

An exception to this rule is when you want to use a J2EE and Web Cache middle tier with the Database-Based Farm feature but without the Oracle Identity Management Access feature. In this case, you need an OracleAS Metadata Repository, but it need not be registered with an Oracle Internet Directory.

Table 6–4 shows the scenarios where the installer automatically registers the OracleAS Metadata Repository with an Oracle Internet Directory, and the scenarios where you decide whether to register or not.
6.11 Contents of the OracleAS Metadata Repository

The OracleAS Metadata Repository contains schemas that can be grouped into these categories:

- Product Metadata schemas

These schemas are used by middle-tier components, such as OracleAS Portal and OracleAS Wireless.

Table 6–4 Database Registration Scenarios

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Registration</th>
<th>Schema Passwords</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install and configure the OracleAS Metadata Repository and Oracle Internet Directory in the same installation session</td>
<td>Automatic</td>
<td>Randomized</td>
</tr>
<tr>
<td>For steps, see Section 6.20, &quot;Installing OracleAS Infrastructure&quot;.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Install the OracleAS Metadata Repository against an existing Oracle Internet Directory</td>
<td>Automatic</td>
<td>Randomized</td>
</tr>
<tr>
<td>Refer to Section 6.21, &quot;Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory&quot;.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Install an Oracle Internet Directory against an existing OracleAS Metadata Repository</td>
<td>Automatic</td>
<td>Randomized (the metadata repository schemas are given new randomized passwords)</td>
</tr>
<tr>
<td>Refer to Section 6.25, &quot;Installing Oracle Internet Directory Only&quot;.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Install the OracleAS Metadata Repository only (without installing Oracle Identity Management components) and you choose to register it with Oracle Internet Directory</td>
<td>Yes</td>
<td>Randomized</td>
</tr>
<tr>
<td>This scenario applies to installing it in a new database or in an existing database.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Section 6.22, &quot;Installing OracleAS Metadata Repository in a New Database&quot;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Chapter 14, &quot;Installing the OracleAS Metadata Repository in an Existing Database&quot;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Install the OracleAS Metadata Repository only (without installing Oracle Identity Management components) and you choose not to register it with Oracle Internet Directory</td>
<td>No</td>
<td>The schemas are locked, and the passwords are expired.</td>
</tr>
<tr>
<td>This scenario applies to installing it in a new database or in an existing database.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In the last two scenarios, the installer asks you if you want to register the OracleAS Metadata Repository with an Oracle Internet Directory. If you answer yes, you provide connect information for the Oracle Internet Directory. If you answer no, the installer does not register the OracleAS Metadata Repository with an Oracle Internet Directory.

Note: If you did not register the OracleAS Metadata Repository with an Oracle Internet Directory during installation, you can register it later using the Oracle Application Server Metadata Repository Creation Assistant. Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details.
Oracle Identity Management schemas
These schemas are used by Oracle Identity Management components, such as Oracle Internet Directory, OracleAS Single Sign-On, and OCA.

Management schemas
These schemas are used by components such as DCM.

If you are interested in seeing the names of all the schemas, see the Oracle Application Server Metadata Repository Creation Assistant User’s Guide.

6.12 Can I Use Multiple Metadata Repositories?
You can install multiple metadata repositories to increase performance. This enables different components in your topology to use different metadata repositories. To use multiple metadata repositories, follow these guidelines:

- To enable a Portal and Wireless or a Business Intelligence and Forms middle tier to use a second metadata repository for product metadata:
  a. Install the second metadata repository and register it with the Oracle Internet Directory.
     
     You can do this using the installer or the OracleAS Metadata Repository Creation Assistant. Use the installer to create a new database containing the OracleAS Metadata Repository, or use the OracleAS Metadata Repository Creation Assistant to install the OracleAS Metadata Repository in an existing database. Refer to Chapter 14, “Installing the OracleAS Metadata Repository in an Existing Database” for details.
  b. When you install the Portal and Wireless or the Business Intelligence and Forms middle tier, select the second metadata repository from the list of registered repositories. This is the metadata repository that the middle tier will use for its product metadata.

- To use a second metadata repository for a J2EE and Web Cache middle tier, you have different options, depending on which J2EE and Web Cache features you need:
  - If you need both the Oracle Identity Management Access feature and the Database-Based Farm feature, you need to register the second metadata repository with the Oracle Internet Directory.
  - If you need only the Database-Based Farm feature, you do not need to register the second metadata repository. The reason for this is that you might not have an Oracle Internet Directory.

Figure 6–1 shows a topology that involves two metadata repositories. It uses four computers:

- Computer 1 runs a metadata repository and Oracle Identity Management components. The Oracle Identity Management components use this metadata repository.
- Computer 2 has a metadata repository that is registered with the Oracle Internet Directory running on Computer 1.
- Computer 3 has a Portal and Wireless middle tier. This middle tier knows to use the metadata repository on Computer 1 for its product metadata because it was registered with that metadata repository during installation.
Computer 4 also has a Portal and Wireless middle tier. This middle tier knows to use the metadata repository on Computer 2 for its product metadata because it was registered with that metadata repository during installation.

**Figure 6–1 Multiple Metadata Repositories in Use**

Notes:
- If you are installing multiple metadata repositories on the same computer, each metadata repository must have a unique global database name and system identifier (SID).
- If you are registering multiple metadata repositories with the same Oracle Internet Directory, each metadata repository must have a unique global database name and SID. If not, the Oracle Internet Directory Configuration Assistant will fail when you install the second metadata repository with the same name.

### 6.13 What High Availability Options Does Oracle Application Server Support?

Oracle Application Server can run in the following high availability environments:
- OracleAS Cold Failover Cluster
- OracleAS Cluster (Identity Management)
- OracleAS Disaster Recovery

Refer to Chapter 10, "Installing in High Availability Environments: Overview" for details.
6.14 Restrictions on the Passwords for the SYS, SYSTEM, SYSMAN, and DBSNMP Users

When you install the OracleAS Metadata Repository in a new database, the installer prompts you to set the passwords for the SYS, SYSTEM, SYSMAN, and DBSNMP users, which are privileged users for the database. The passwords for these users have the following restrictions:

- Passwords must be shorter than 30 characters.
- Passwords can contain only alphanumeric characters from your database character set, the underscore (_), the dollar sign ($), and the number sign (#).
- Passwords must begin with an alphabetic character. Passwords cannot begin with a number, the underscore (_), the dollar sign ($), or the number sign (#).
- Passwords cannot be Oracle reserved words. The Oracle SQL Reference lists the reserved words. You can find this guide on Oracle Technology Network: [http://www.oracle.com/technology/documentation](http://www.oracle.com/technology/documentation)

You can also avoid using words that sound like they might be reserved words.

- Passwords cannot be the default passwords, which are change_on_install and manager.

6.15 Support for NE8ISO8859P10 and CEL8ISO8859P14 Characters Sets

If you use characters in the NE8ISO8859P10 or CEL8ISO8859P14 character sets, make sure that your database uses the Unicode character set AL32UTF8. If you are installing a new database, select "AL32UTF8" in the Specify Database Configuration Options screen.

The reason for this is that Java does not support the NE8ISO8859P10 or CEL8ISO8859P14 character sets. If you configure the database to use a character set not supported by Java, you will get an "Unsupported IANA character encoding" error in OracleAS Portal.

6.16 What Do I Enter on the "Specify Namespace in Internet Directory" Screen?

The distinguished name (DN) that you specify on this screen will be designated as the namespace in Oracle Internet Directory where users and groups are administered.

Select the suggested namespace if it meets your deployment requirements. If not, enter a DN that you want in the custom namespace field. The installer determines the suggested namespace from the /etc/hosts file. Refer to Section 4.9, "The /etc/hosts File".

If you plan to integrate your Oracle Identity Management components with a third-party directory, you should specify the DN of a namespace that matches the DN of the default namespace in the third-party directory. Refer to Oracle Internet Directory Administrator’s Guide for details on integration with third-party directories.

6.17 How to Determine Port Numbers Used by Components

During installation, you might need to know port numbers used by certain Oracle Application Server components. For example, if you install OracleAS Infrastructure
against an existing Oracle Internet Directory, the installer prompts for the Oracle Internet Directory hostname and port number.

You can get a list of port numbers in the following ways:

- Use Oracle Enterprise Manager 10g Application Server Control.
  
  Click the Ports link on the Enterprise Manager home page. This takes you to a page that lists all ports in use and the suggested port ranges for different components.

- Look in the ORACLE_HOME/install/portlist.ini file. ORACLE_HOME refers to the directory containing the Oracle Application Server installation.
  
  Note that if you change a component’s port number after installation, the portlist.ini file is not updated. The portlist.ini file is not updated after installation.

6.18 Can I Add OCA After Installation?

If you installed OracleAS Infrastructure but did not select to configure OCA, and later decide that you want to use OCA, you have to install it in a separate Oracle home. You cannot install it in an existing Oracle home.

When you install OCA in a new Oracle home, you can install it on the same or different computer as the OracleAS Infrastructure. You can also install it with its own OracleAS Metadata Repository or install it against an existing OracleAS Metadata Repository:

- Install OCA only.
  
  OCA will share the OracleAS Metadata Repository that you installed earlier. If you are installing OCA on the same computer as the OracleAS Infrastructure instance, you might want to consider this option for performance reasons. (The second option requires running two databases on the same computer; this could degrade performance.)
  
  Refer to Section 6.24, "Installing Oracle Identity Management Components Only (Excluding Oracle Internet Directory)" for details. In the Select Configuration Options screen, select OracleAS Certificate Authority (OCA) only.

- Install OCA with its own OracleAS Metadata Repository.
  
  Refer to Section 15.6, "OCA Topology" for details.

6.19 How to Deploy Oracle Delegated Administration Services on a Separate Host

To configure Oracle Delegated Administration Services in a separate Oracle Home, you perform a standalone installation of it. To do this, select the Identity Management installation type, and, on the Configuration Options screen, select Delegated Administration Services.

6.20 Installing OracleAS Infrastructure

Perform this procedure to install an OracleAS Metadata Repository and Oracle Identity Management components. This procedure provides a complete OracleAS Infrastructure in a single Oracle home.
If you want to use an existing Oracle Internet Directory, see Section 6.21, "Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory".

If you want to use an existing database for the OracleAS Metadata Repository, see Chapter 14, "Installing the OracleAS Metadata Repository in an Existing Database".

Table 6–5  Steps for Installing OracleAS Infrastructure

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start up the installer and complete the first few screens. Refer to Section 6.27, &quot;Install Fragment: The First Few Screens of the Installation&quot; for details. Notes: ■ In the Select Installation Type screen, select Identity Management and OracleAS Metadata Repository.</td>
</tr>
<tr>
<td>3. Select Port Configuration Options</td>
<td>If you want to use default ports for the components, select Automatic. If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file. Click Next.</td>
</tr>
<tr>
<td>4. Specify Namespace in Internet Directory</td>
<td>Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm. Ensure the value shown in Suggested Namespace meets your deployment needs. If not, enter the desired value in Custom Namespace. Refer to Section 6.16, &quot;What Do I Enter on the &quot;Specify Namespace in Internet Directory&quot; Screen?&quot;. Click Next.</td>
</tr>
<tr>
<td>5. OCA screens</td>
<td>If you select OracleAS Certificate Authority (OCA) in the Select Configuration Options screen, the installer displays screens where you need to enter OCA information. Refer to Section 6.30, &quot;Install Fragment: OCA Screens&quot;.</td>
</tr>
<tr>
<td>6. Oracle Database screens</td>
<td>Enter information for the OracleAS Metadata Repository database. Refer to Section 6.29, &quot;Install Fragment: Database Screens&quot;.</td>
</tr>
<tr>
<td>7. Specify Instance Name and ias_admin Password</td>
<td>Instance Name: Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, &quot;Oracle Application Server Instances and Instance Names&quot; for instance name details. Example: infra ias_admin Password and Confirm Password: Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, &quot;The ias_admin User and Restrictions on its Password&quot; for restrictions on the password. Example: welcome99 Click Next.</td>
</tr>
<tr>
<td>8. --</td>
<td>Finish the installation. Refer to Section 6.28, &quot;Install Fragment: The Last Few Screens of the Installation&quot; for details.</td>
</tr>
</tbody>
</table>
6.21 Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory

Perform this procedure to install Oracle Identity Management components (except Oracle Internet Directory) and the OracleAS Metadata Repository.

Prerequisite: Oracle Internet Directory version 9.0.4 or later

You would perform this procedure in cases where you already have an Oracle Internet Directory (and its associated OracleAS Metadata Repository), and you want to:

- Install OCA with its own OracleAS Metadata Repository, or
- Install another OracleAS Metadata Repository for Oracle Internet Directory replication.

It is unlikely that you would use this procedure to install other Oracle Identity Management components (OracleAS Single Sign-On, Oracle Delegated Administration Services, or Oracle Directory Integration and Provisioning), because this procedure installs a new OracleAS Metadata Repository. To install Oracle Identity Management components without OracleAS Metadata Repository, follow the procedure in Section 6.24, "Installing Oracle Identity Management Components Only (Excluding Oracle Internet Directory)".

Table 6–6 Steps for Installing OracleAS Infrastructure Against an Existing Oracle Internet Directory

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Start up the installer and complete the first few screens. Refer to Section 6.27, &quot;Install Fragment: The First Few Screens of the Installation&quot; for details. Notes:</td>
</tr>
<tr>
<td></td>
<td>■ In the Select Installation Type screen, select Identity Management and OracleAS Metadata Repository.</td>
</tr>
<tr>
<td>2.</td>
<td>Do not select Oracle Internet Directory because you want to use an existing one. Do not select OracleAS Single Sign-On. Select OracleAS Delegated Administration Services and/or Oracle Directory Integration and Provisioning if you need the services provided by these components. Refer to Section 6.6, &quot;Do I Need the Oracle Delegated Administration Services or the Oracle Directory Integration and Provisioning Components?&quot; Select OracleAS Certificate Authority (OCA) if you want to configure your own certificate authority which can issue certificates for users and servers. Do not select High Availability and Replication. Click Next.</td>
</tr>
<tr>
<td>3.</td>
<td>If you want to use default ports for the components, select Automatic. If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file. Click Next.</td>
</tr>
<tr>
<td>4.</td>
<td>Hostname: Enter the name of the computer where Oracle Internet Directory is running. Port: Enter the port at which Oracle Internet Directory is listening. Refer to Section 6.17, &quot;How to Determine Port Numbers Used by Components&quot; if you do not know the port number. Use Only SSL Connections with this Oracle Internet Directory: Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory. Click Next.</td>
</tr>
</tbody>
</table>
Perform this procedure to create a new database and populate it with the OracleAS Metadata Repository. This procedure does not install any Oracle Identity Management components.

<td>--------</td>
</tr>
<tr>
<td>4. Run <code>orainstRoot.sh</code></td>
<td>This screen appears only if this is the first installation of any Oracle product on this computer. Run the <code>orainstRoot.sh</code> script in a different shell as the root user. The script is located in the <code>oraInventory</code> directory. After running the script, click <code>Continue</code>.</td>
</tr>
</tbody>
</table>
| 5. Specify File Locations | **Name:** Enter a name to identify this Oracle home. The name can consist of alphanumeric and the underscore (_) characters only, and cannot be longer than 128 characters. Example: `OH_MR`  
**Destination Path:** Enter the full path to the destination directory. This is the Oracle home. If the directory does not exist, the installer creates it. If you want to create the directory beforehand, create it as the `oracle` user, do not create it as the root user. Example: `/opt/oracle/app_server_mr` Click Next. |
| 6. Specify Hardware Cluster Installation Mode | This screen appears only if the computer is part of a hardware cluster. If you are installing an infrastructure, select the computers in the hardware cluster where you want to install the infrastructure. You can select multiple computers, or you can just select the current computer. Click Next. |
| 7. Select a Product to Install | Select **OracleAS Infrastructure**. If you need to install additional languages, click **Product Languages**. Refer to Section 5.8, "Installing Additional Languages" for details. Click Next. |
| 8. Select Installation Type | Select **OracleAS Metadata Repository**. Click Next.  
If you get an error message saying that the TMP environment variable is not set, it means that the default temp directory does not have enough space. You can either set the TMP environment variable to point to a different directory or free up enough space in the default temp directory. For details on the TMP environment variable, see Section 4.8.5, "TMP and TMPDIR". |
| 9. Confirm Pre-Installation Requirements | Verify that your computer meets all the requirements. Click Next. |
| 10. Select Configuration Options | For installing the OracleAS Metadata Repository in a new database, there are no configuration options. Click Next. |
| 11. Register OracleAS Metadata Repository | If you already have an Oracle Internet Directory and know its connect information, select Yes and enter the name of the computer where Oracle Internet Directory is running and the port number. Refer to Section 6.17, "How to Determine Port Numbers Used by Components" if you do not know the port number.  
**Use Only SSL Connections with this Oracle Internet Directory:** Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory. If you do not have an Oracle Internet Directory, or do not know its connect information, select No. Click Next. |
Perform this procedure to install Oracle Identity Management components without installing an OracleAS Metadata Repository.

Follow this procedure to configure Oracle Internet Directory against a remote OracleAS Metadata Repository. You have installed the OracleAS Metadata Repository in an existing database (see Chapter 14, "Installing the OracleAS Metadata Repository in an Existing Database") or in a new database (Section 6.22, "Installing OracleAS Metadata Repository in a New Database").

Prerequisite: OracleAS Metadata Repository that is not already registered with any Oracle Internet Directory.
Table 6–8 Steps for Installing Oracle Identity Management Components Only (Including Oracle Internet Directory)

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| **1.** -- | Start up the installer and complete the first few screens. Refer to Section 6.27, "Install Fragment: The First Few Screens of the Installation" for details.  
Note:  
■ In the Select Installation Type screen, select Oracle Identity Management. |
| **2.** Select Configuration Options | Select Oracle Internet Directory.  
Select OracleAS Single Sign-On.  
Select OracleAS Delegated Administration Services and/or OracleAS Directory Integration and Provisioning if you need the services provided by these components. Refer to Section 6.6, "Do I Need the Oracle Delegated Administration Services or the Oracle Directory Integration and Provisioning Components?"  
Select OracleAS Certificate Authority (OCA) if you want to configure your own certificate authority which can issue certificates for users and servers.  
Do not select High Availability and Replication.  
Click Next. |
| **3.** Select Port Configuration Options | If you want to use default ports for the components, select Automatic.  
If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file.  
Click Next. |
| **4.** Specify Repository | **Username**: Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges.  
**Password**: Enter the user’s password.  
**Hostname and Port**: Enter the name of the computer where the database is running, and the port number at which it is listening. Use the format: host:port.  
**Service Name**: Enter the service name of the database. Note that the service name must include the database domain name.  
Example: orcl.mydomain.com  
Click Next. |
| **5.** Specify Namespace in Internet Directory | Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm.  
Ensure the value shown in Suggested Namespace meets your deployment needs.  
If not, enter the desired value in Custom Namespace. Refer to Section 6.16, "What Do I Enter on the "Specify Namespace in Internet Directory" Screen?".  
Click Next. |
6.24 Installing Oracle Identity Management Components Only (Excluding Oracle Internet Directory)

Perform this procedure to install Oracle Identity Management components without installing an OracleAS Metadata Repository or Oracle Internet Directory.

Use this procedure to install additional OracleAS Single Sign-On, Oracle Delegated Administration Services, or Oracle Directory Integration and Provisioning components against an existing Oracle Internet Directory.

Prerequisites: OracleAS Metadata Repository, Oracle Internet Directory version 9.0.4 or later.
Table 6–9  Steps for Installing Oracle Identity Management Components Only (Excluding Oracle Internet Directory)

</table>
Install Fragment: The First Few Screens of the Installation

The first few screens of the installer are described here because they are the same for all installations. Most installation procedures in this chapter refer to this section as their starting point.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>7. Oracle Database screens</td>
<td>Enter information for the OracleAS Metadata Repository database. Refer to Section 6.29, &quot;Install Fragment: Database Screens&quot;.</td>
</tr>
</tbody>
</table>
| 8. Specify Instance Name and ias_admin Password | **Instance Name**: Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.  
Example: infra_oca  
**ias_admin Password** and **Confirm Password**: Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for restrictions on the password.  
Example: welcome99  
Click Next. |
| 9. --                           | Finish the installation. Refer to Section 6.28, "Install Fragment: The Last Few Screens of the Installation" for details. |

### Table 6–12  First Few Screens of the Installation

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start the installer. Refer to Section 5.17, &quot;Starting Oracle Universal Installer&quot; for details.</td>
</tr>
<tr>
<td>2. Welcome</td>
<td>Click Next.</td>
</tr>
</tbody>
</table>
| 3. Specify Inventory Directory and Credentials | This screen appears only if this is the first installation of any Oracle product on this computer.  
**Enter the full path of the inventory directory**: Enter a full path to the inventory directory. Enter a directory that is different from the Oracle home directory for the product files.  
Example: /opt/oracle/oraInventory  
**Specify operating system group name**: Select the operating system group that will have write permission for the inventory directory.  
Example: oinstall  
Click Next. |
| 4. Run orainstRoot.sh           | This screen appears only if this is the first installation of any Oracle product on this computer.  
Run the orainstRoot.sh script in a different shell as the root user. The script is located in the oraInventory directory.  
After running the script, click Continue. |
5. Specify File Locations

Name: Enter a name to identify this Oracle home. The name can consist of alphanumeric and the underscore (_) characters only, and cannot be longer than 128 characters.

Example: OH_INFRA

Destination Path: Enter the full path to the destination directory. This is the Oracle home. If the directory does not exist, the installer creates it. If you want to create the directory beforehand, create it as the oracle user; do not create it as the root user.

Example: /opt/oracle/infra

Click Next.

6. Specify Hardware Cluster Installation Mode

This screen appears only if the computer is part of a hardware cluster.

If you are installing an infrastructure, select the computers in the hardware cluster where you want to install the infrastructure. You can select multiple computers, or you can just select the current computer.

Click Next.

7. Select a Product to Install

Select OracleAS Infrastructure.

If you need to install additional languages, click Product Languages. Refer to Section 5.8, "Installing Additional Languages" for details.

Click Next.

8. Select Installation Type

The options displayed on this screen depend on what you selected in the Select a Product to Install screen.

The installation types for OracleAS Infrastructure are:

- Oracle Identity Management and OracleAS Metadata Repository
- Oracle Identity Management
- OracleAS Metadata Repository

Click Next.

If you get an error message saying that the TMP environment variable is not set, it means that the default temp directory does not have enough space. You can either set the TMP environment variable to point to a different directory or free up enough space in the default temp directory.

For details on the TMP environment variable, see Section 4.8.5, "TMP and TMPDIR".

9. Upgrade Existing Oracle9iAS Infrastructure

This screen appears if the installer detects an Infrastructure Release 2 (9.0.2) instance on the computer and you selected to install OracleAS Infrastructure.

This screen presents you with the option to upgrade the existing Release 2 (9.0.2) Infrastructure, or install the current version of the OracleAS Infrastructure. If you want to upgrade, see the Oracle Application Server Upgrade and Compatibility Guide.

10. Confirm Pre-Installation Requirements

Verify that your computer meets all the requirements. Click Next.

Table 6–12 First Few Screens of the Installation

6.29 Install Fragment: Database Screens

If you are installing a new database for the OracleAS Metadata Repository, the installer displays the following screens:

### Table 6–14 Database Screens

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. Specify Database Configuration Options | **Global Database Name:** Enter a name for the OracleAS Metadata Repository database. Append a domain name to the database name. This domain name for the global database name can be different from your network domain name. <br> The domain name portion of the global database name has the following naming restrictions:  <br> ■ Can contain only alphanumeric, underscore (_), minus (-), and pound (#) characters  <br> ■ Must not be longer than 128 characters <br> The database name portion of the global database name has the following naming restrictions:  <br> ■ Must contain alphanumeric characters only  <br> ■ Must not be longer than eight characters  <br> ■ Must not contain PORT or HOST in uppercase characters. If you want the name to contain "host" or "port", use lowercase characters.  
Example: orcl.mydomain.com  
**Note:** Be sure that you do not enter two or more periods together, for example, orcl.mydomain.com. The installer does not check for this, and this will lead to errors later during the installation process. |
| 2. Specify Database Schema Passwords | **SID:** Enter the system identifier for the OracleAS Metadata Repository database. Typically this is the same as the global database name, but without the domain name. The SID must be unique across all databases.  
**SIDs** have the following naming restrictions:  <br> ■ Must contain alphanumeric characters only  <br> ■ Must not be longer than eight characters  <br> ■ Must not contain PORT or HOST in uppercase characters. If you want the name to contain "host" or "port", use lowercase characters.  
Example: orcl  
**Database Character Set:** Select the character set to use. Refer to Section 6.15, "Support for NE8ISO8859P10 and CEL8ISO8859P14 Characters Sets" for details.  
**Database File Location:** Enter the full path to the parent directory for the data files directory. This parent directory must already exist, and you must have write permissions in this directory.  
The installer will create a subdirectory in this parent directory, and the subdirectory will have the same name as the SID. The data files will be placed in this subdirectory.  
Example: If you enter /u02/oradata, and the SID is orcl, then the data files will be located in /u02/oradata/orcl.  
Click Next. |

Click Next.
6.30 Install Fragment: OCA Screens

If you select OracleAS Certificate Authority (OCA) in the Select Configuration Options screen when you are installing an OracleAS Infrastructure, the installer displays the screens listed in Table 6–15.

Note that you cannot install more than one OCA against the same OracleAS Metadata Repository. When you are installing Oracle Identity Management components only against an existing OracleAS Metadata Repository, be sure that the metadata repository does not already have an instance of OCA configured against it.

Example: You install OracleAS Metadata Repository and Oracle Identity Management components including OCA on a computer. Then if you try to install additional Oracle Identity Management components (including OCA) on the same or different computer against the same OracleAS Metadata Repository, this installation would fail.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Select OracleAS Metadata Repository</td>
<td>This screen appears only if you are configuring OCA and you are using an existing Oracle Internet Directory and you are using an existing OracleAS Metadata Repository. The Oracle Internet Directory must contain the registration for the OracleAS Metadata Repository that you want to use. Select the OracleAS Metadata Repository that you want OCA to use. Click Next.</td>
</tr>
</tbody>
</table>
2. Specify OCA Distinguished Name
   - **Typical DN**: Use this section if your DN uses only the attributes listed in this section. You do not have to fill in all the attributes specified in this section. Only the `o` (organization) attribute is required. Note that the single quotation mark character (‘) is not a valid character in any of the attributes.
   - **Common name (cn)**: Enter the name that you want on the certificate. This name must be different from your hostname. Example: John Doe.
   - **Organizational unit (ou)**: Enter the name of your division or department. Example: Sales.
   - **Organization (o)**: Enter the name of your company or organization. Example: Oracle Corporation.
   - **Country (c)**: Select your country from the drop-down list.
   - **Custom DN**: If your DN uses attributes not listed in the Typical DN section, specify your DN in this section.

   Click **Next**.

3. Select OCA Key Length
   - **Key Length (bits)**: Select the key length used in RSA algorithm to sign all certificates issued by OCA. Oracle recommends that you use at least a 2048-bit key length. Longer key lengths provide greater security, but require more time to issue each new certificate.

   Click **Next**.

4. Specify OCA Administrator’s Password
   - **Administrator’s Password and Confirm Password**: Specify and confirm the password for the OCA administrator. The password has the following restrictions:
     - It must contain at least eight characters.
     - It must contain at least one alphabetic character.
     - It must contain at least one non-alphabetic character (for example, a number).
     - Its first character cannot be a number.

   You need this password to manage OCA. This password is also used by the OCA Configuration Assistant.

   You can change the password after installation using the `ocactl` command. Refer to OCA Online Help for details.

   Click **Next**.
When you install an Oracle Application Server middle tier, you select which type of middle tier you want. Oracle Application Server has these types of middle tiers:

- J2EE and Web Cache
- Portal and Wireless
- Business Intelligence and Forms

Middle tiers provide components for deploying and running applications. The different types of middle tiers provide different components (see Section 7.2, "Components in the Middle Tier").

**Middle Tiers and Infrastructure**

The Portal and Wireless and the Business Intelligence and Forms middle tiers require an OracleAS Infrastructure, because components in these middle tiers need to access their schemas in the OracleAS Metadata Repository.

### 7.1 Middle-tier Types

**Table 7-1 Contents of This Chapter**

<table>

<td>Section 7.17, &quot;Install Fragment: The Last Few Screens of the Installation&quot;</td>
</tr>
</tbody>
</table>
The J2EE and Web Cache type requires some infrastructure components only if you select the Database-Based Farm and/or the Oracle Identity Management Access options. If you do not select these options during the J2EE and Web Cache middle-tier installation, then you do not need an OracleAS Infrastructure. Refer to Section 7.4, "Configuration Options for the J2EE and Web Cache Middle Tier" for details.

7.2 Components in the Middle Tier

Table 7–2 shows the components that are installed for each type of middle tier.

Note that the components in the smaller middle-tier types are a subset of the larger middle-tier types: the bigger types contain all the components from the smaller types:

- The J2EE and Web Cache type is the smallest type.
- The Portal and Wireless type contains all the components in the J2EE and Web Cache type plus components specific to the Portal and Wireless type.
- The Business Intelligence and Forms type contains all middle-tier components.

<table>
<thead>
<tr>

</tr>
<tr>
<td>OracleAS Forms Services</td>
</tr>
</tbody>
</table>

7.3 Which Components Do I Need?

You deploy your applications on middle-tier instances. Select the middle-tier type that provides the components required by your applications.

If you know what components you will be using in your applications, you can choose the appropriate middle-tier type. For example, if you need portal functionality, then you would install the Portal and Wireless type. You can also install the Business Intelligence and Forms type, because it includes the OracleAS Portal component.

If you do not know what you want, but you have the disk space, you can install the Business Intelligence and Forms type. This ensures that you have all the components. If you do not have the disk space, you can install a smaller middle-tier type, and later expand it to a larger type if necessary. For example, you can expand a J2EE and Web Cache middle tier to a Business Intelligence and Forms middle tier. Refer to Section 7.14, "Expanding a Middle Tier" for details.
Table 7–3 lists some features and appropriate components:

<table>
<thead>
<tr>
<th>If You Need this Feature:</th>
<th>Select a Middle-tier Type that Provides this Component:</th>
</tr>
</thead>
<tbody>
<tr>
<td>J2EE (for developing JavaServer Pages, servlets, and Enterprise JavaBeans applications)</td>

### 7.4 Configuration Options for the J2EE and Web Cache Middle Tier

If you install the J2EE and Web Cache middle tier, the Select Configuration Options screen displays the options listed in Table 7–4.

Some of these options require certain OracleAS Infrastructure components, as listed in the table. You need to install the required infrastructure components before you can install the J2EE and Web Cache middle tier with these options.
What Is a Farm?

A farm is a collection of one or more instances that share the same metadata repository. When instances belong to a farm, you can manage them as a group and you can also cluster them.

Oracle Application Server can store repository information in a database ("database-based repository") or file system ("file-based repository"). Repository information includes things such as the list of instances that belong to a farm, whether or not the instances are clustered, and configuration information for clusters.

For a file-based repository, the repository information is stored with a specific instance. This instance is called the "repository host".

For a database-based repository, the repository information is stored in the OracleAS Metadata Repository.
You can set a J2EE and Web Cache instance to belong to a farm during or after installation. If you are unsure during installation, you can install the instance as a standalone instance (that is, not belonging to a farm). After installation, if you so desire, you can associate the instance with a farm. Conversely, you can install an instance as part of a farm and after installation, you can convert the instance to a standalone instance.

For details about farms, see the Distributed Configuration Management Administrator’s Guide and the Oracle Application Server High Availability Guide.

### 7.4.2 What Is an OracleAS Cluster?

You can cluster instances that belong to a farm. All the instances in a cluster have the same configuration. Any instance in a cluster can handle requests directed to any cluster member.

The installer does not cluster instances for you. You have to do this after installation.

For details about OracleAS Clusters, see the Distributed Configuration Management Administrator’s Guide and the Oracle Application Server High Availability Guide.

### 7.4.3 Special Requirements for Installing J2EE and Web Cache Instances with OracleAS File-Based Repository Across a Firewall

If you are installing J2EE and Web Cache instances that use the OracleAS File-based Repository feature, and the instances are on different sides of a firewall, then you need to ensure that these instances can communicate with each other across the firewall.

A scenario of when you would install the instances in this manner is in the "myJ2EECompany.com" architecture. In this architecture, you install OracleAS Web Cache in the Web tier, and OC4J in the Application tier, and these tiers are separated by a firewall. The myJ2EECompany.com architecture is described in detail in the Oracle Application Server Enterprise Deployment Guide.

To enable instances to communicate with each other across the firewall, you need to open up some ports in the firewall after the first installation. For details, see Chapter 3, "Configuring the Application Infrastructure for myJ2EECompany.com", in the Oracle Application Server Enterprise Deployment Guide.

### 7.5 How to Determine the Password for the DCM Schema

If you install the J2EE and Web Cache middle tier with the OracleAS Database-Based Farm Repository option selected, but without the Oracle Identity Management Access option, the installer prompts you to enter the password for the DCM schema in the OracleAS Metadata Repository.

This password is generated randomly. You have two choices:

- **Change the Random Password** on page 7-5
- **Determine the Random Password Using Oracle Internet Directory** on page 7-6

**Change the Random Password**

If you did not register the OracleAS Metadata Repository with an Oracle Internet Directory, you need to change the random password to a known value. You can do this using the "alter user" SQL command in SQL*Plus. The following example changes the password to "newpassword":

```sql
prompt> $ORACLE_HOME/bin/sqlplus "sys/sys_password as sysdba"
```
SQL> alter user dcm identified by newpassword;

You need to log in as the sys user to change the password.

**Determine the Random Password Using Oracle Internet Directory**

| Note: | This procedure can only be performed by the Oracle Internet Directory superuser (cn=orcladmin). |

If you did register the OracleAS Metadata Repository with an Oracle Internet Directory, you can use the Oracle Directory Manager to determine the random password.

However, if you do have an Oracle Internet Directory and the OracleAS Metadata Repository is registered with it, it might make more sense to select both OracleAS Database-Based Farm Repository and Oracle Identity Management Access in the Select Configuration Options screen. If you select both, the installer does not prompt you to enter the DCM password.

To determine the random password in Oracle Internet Directory:

1. Start up Oracle Directory Manager.
   
   prompt> $ORACLE_HOME/bin/oidadmin

2. Log in to Oracle Internet Directory as the cn=orcladmin superuser.

3. Expand the structure as shown in Figure 7–1. On the left side, select OrclResourceName=DCM, as shown. The password for the DCM schema is shown in the orclpasswordattribute field on the right side.
7.6 How to Determine Port Numbers Used by Components

During installation, you might need to know port numbers used by certain components. For example, when you install Oracle Application Server middle tiers, the installer prompts for the Oracle Internet Directory port.

You can get a list of port numbers in the following ways:

- Use Oracle Enterprise Manager 10g Application Server Control.
  
  Click the Ports link on the Enterprise Manager home page. This takes you to a page that lists all ports in use and the suggested port ranges for different components.

- Look in the `ORACLE_HOME/install/portlist.ini` file. `ORACLE_HOME` refers to the directory containing the Oracle Application Server installation.

  Note that if you change a component’s port number after installation, the `portlist.ini` file is not updated. The `portlist.ini` file is not updated after installation.
7.7 If You Plan to Install Middle Tiers Against an Upgraded Oracle Internet Directory

If you plan to install middle tiers against an Oracle Internet Directory that was upgraded from version 9.2.0.x to the current release, make sure you followed the steps on upgrading Oracle Internet Directory 9.2.0.x as documented in the Oracle Application Server Upgrade and Compatibility Guide. The instructions are in the "Upgrading the Oracle Identity Management Services" chapter.

7.8 Installing a J2EE and Web Cache Without an Infrastructure

Perform this procedure to install a J2EE and Web Cache instance that does not require an infrastructure.

Table 7–5 Steps for Installing J2EE and Web Cache

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start up the installer and complete the first few screens. Refer to Section 7.16, &quot;Install Fragment: The First Few Screens for Installing Middle Tiers&quot; for details. Note: ■ In the Select Installation Type screen, select J2EE and Web Cache. Click Next.</td>
</tr>
<tr>
<td>2. Select Configuration Options</td>
<td>Select Oracle Application Server 10g Web Cache. Do not select Identity Management Access because this option requires Oracle Internet Directory and OracleAS Single Sign-On. Do not select Oracle Application Server 10g Farm Repository. Click Next.</td>
</tr>
<tr>
<td>2. Specify Port Configuration Options</td>
<td>If you want to use default ports for the components, select Automatic. If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field. Click Next.</td>
</tr>
<tr>
<td>3. Specify Instance Name and ias_admin Password</td>
<td>Instance Name: Enter a name for this instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, &quot;Oracle Application Server Instances and Instance Names&quot; for instance name details. Example: J2EE ias_admin Password and Confirm Password: Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, &quot;The ias_admin User and Restrictions on its Password&quot; for restrictions on the password. Example: welcome99 Click Next.</td>
</tr>
<tr>
<td>4. --</td>
<td>Finish the installation. Refer to Section 7.17, &quot;Install Fragment: The Last Few Screens of the Installation&quot;.</td>
</tr>
</tbody>
</table>

7.9 Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access

Perform this procedure to install a J2EE and Web Cache middle tier in a database-based farm repository and with Oracle Identity Management Access.
Prerequisite: OracleAS Infrastructure

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. -- | Start up the installer and complete the first few screens. Refer to Section 7.16, "Install Fragment: The First Few Screens for Installing Middle Tiers" for details.  
Note:  
- In the Select Installation Type screen, select **J2EE and Web Cache**. |
| 2. Select Configuration Options | Select **Oracle Application Server 10g Web Cache**.  
Select **Oracle Application Server 10g Farm Repository**.  
Select **Identity Management Access**.  
Click Next. |
| 3. Specify Port Configuration Options | If you want to use default ports for the components, select **Automatic**.  
If you do not want to use the default ports, and you have created a staticports.ini file, select **Manual** and enter the fullpath to your staticports.ini file in the provided field.  
Click Next. |
| 4. Select Repository Type | Select **Join an Existing OracleAS Database-based Farm**.  
Click Next. |
| 5. Register with Oracle Internet Directory | **Host**: Enter the name of the computer where Oracle Internet Directory is running.  
**Port**: Enter the port at which Oracle Internet Directory is listening. If you do not know the port number, see Section 7.6, "How to Determine Port Numbers Used by Components".  
**Use Only SSL Connections with this Oracle Internet Directory**: Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory.  
Click Next. |
| 6. Specify OID Login | **Username**: Enter the username to log in to Oracle Internet Directory. You must log in as a user who belongs to the necessary groups in Oracle Internet Directory. Which groups are necessary depends on which components you are installing. Refer to Section 8.3, "Groups Required to Configure or Deinstall Components" for details.  
**Password**: Enter the password for the username.  
**Realm**: Enter the realm against which to validate the username. This field appears only if your Oracle Internet Directory has multiple realms.  
Click Next. |
Perform this procedure to install a J2EE and Web Cache middle tier in a database-based farm repository, but without Oracle Identity Management access.

Prerequisite: OracleAS Metadata Repository

</tr>
<tr>
<td>5. Specify File-Based Farm Repository</td>
<td>Enter the location of the existing file-based farm repository on this screen. This screen appears only if you selected Join an Existing OracleAS File-based Farm in the previous screen. Repository Host: Enter the name of the computer where the existing farm is being hosted. Repository Port: Enter the port number for the repository. You can determine the repository host and port by running the &quot;dcmctl getRepositoryID&quot; command: prompt&gt; ORACLE_HOME/dcm/bin/dcmctl getRepositoryID File-based Repository ID mymachine2.mydomain.com:7102 ORACLE_HOME specifies the home directory of any existing Oracle Application Server instance that belongs to the farm that you want to join. In the example, the repository host is mymachine2.mydomain.com, and the port is 7102. Click Next.</td>
</tr>
<tr>
<td>6. Register with Oracle Internet Directory</td>
<td>Host: Enter the name of the computer where Oracle Internet Directory is running. Port: Enter the port at which Oracle Internet Directory is listening. If you do not know the port number, see Section 7.6, &quot;How to Determine Port Numbers Used by Components&quot;. Use Only SSL Connections with this Oracle Internet Directory: Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory. Click Next.</td>
</tr>
</tbody>
</table>
7.13 Installing Portal and Wireless or Business Intelligence and Forms

Perform this procedure to install a Portal and Wireless or a Business Intelligence and Forms middle tier.

Prerequisite: OracleAS Infrastructure
### Table 7–10  Steps for Installing Portal and Wireless or Business Intelligence and Forms

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Start up the installer and complete the first few screens. Refer to Section 7.16, &quot;Install Fragment: The First Few Screens for Installing Middle Tiers&quot; for details. Note: <em>In the Select Installation Type screen, select Portal and Wireless or Business Intelligence and Forms.</em></td>
<td></td>
</tr>
<tr>
<td>2. Select Configuration Options</td>
<td>Select the components that you will be using, and click <strong>Next</strong>. You do not have to select all the components. For Portal and Wireless, the options are: <em>Oracle Application Server 10g Portal</em> <em>Oracle Application Server 10g Wireless</em> For Business Intelligence and Forms, the options are: <em>Oracle Application Server 10g Portal</em> <em>Oracle Application Server 10g Wireless</em> <em>Oracle Business Intelligence Discoverer</em> <em>Oracle Application Server 10g Personalization</em> <em>Oracle Application Server 10g Reports Services</em> <em>Oracle Application Server 10g Forms Services</em></td>
</tr>
<tr>
<td>3. Specify Port Configuration Options</td>
<td>If you want to use default ports for the components, select <strong>Automatic</strong>. If you do not want to use the default ports, and you have created a staticports.ini file, select <strong>Manual</strong> and enter the fullpath to your staticports.ini file in the provided field. Click <strong>Next</strong>.</td>
</tr>
<tr>
<td>4. Register with Oracle Internet Directory</td>
<td><strong>Host:</strong> Enter the name of the computer where Oracle Internet Directory is running. <strong>Port:</strong> Enter the port number at which Oracle Internet Directory is listening. If you do not know the port number, see Section 7.6, &quot;How to Determine Port Numbers Used by Components&quot;. <strong>Use Only SSL Connections with this Oracle Internet Directory:</strong> Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory. Click <strong>Next</strong>.</td>
</tr>
<tr>
<td>5. Specify OID Login</td>
<td><strong>Username:</strong> Enter the username to use to log in to Oracle Internet Directory. You must log in as a user who belongs to the necessary groups in Oracle Internet Directory. Which groups are necessary depends on which components you are installing. Refer to Section 8.3, &quot;Groups Required to Configure or Deinstall Components&quot; for details. <strong>Password:</strong> Enter the user’s password. <strong>Realm:</strong> Enter the realm against which to validate the user. This field appears only if your Oracle Internet Directory contains more than one realm. If the Oracle Internet Directory contains only one realm, then the installer validates the user against that realm. Click <strong>Next</strong>.</td>
</tr>
<tr>
<td>6. Select Oracle Application Server 10g Metadata Repository</td>
<td><strong>Database Connect String:</strong> Select the OracleAS Metadata Repository that you want to use for this middle-tier instance. The installer will register this instance with the selected OracleAS Metadata Repository. Click <strong>Next</strong>.</td>
</tr>
</tbody>
</table>
Expanding a Middle Tier

7.14 Expanding a Middle Tier

After installing a middle tier and using it, you may decide that you need a component that is in a larger middle tier. For example, you installed a J2EE and Web Cache middle tier, and you realize you need OracleAS Portal.

What you can do is to install the Portal and Wireless type (or the Business Intelligence and Forms type) in the same Oracle home as the J2EE and Web Cache instance. The installer installs and configures the additional components in the larger middle tier without changing the configuration of existing components.

You can expand middle tiers in the following ways:

- J2EE and Web Cache to Portal and Wireless
- J2EE and Web Cache to Business Intelligence and Forms
- Portal and Wireless to Business Intelligence and Forms

Expanding a middle tier is the same as installing a new one, with these differences:

- In the Specify File Locations screen, you enter the Oracle home directory of the middle tier you want to expand.
- You need the password of the ias_admin user of the middle tier you want to expand.
  
  Instead of the Specify Instance Name and ias_admin Password screen, the installer displays the Specify ias_admin Password screen. In this screen, you enter the existing password for the ias_admin user.
- The instance name remains the same.

### Table 7–10  (Continued) Steps for Installing Portal and Wireless or Business Intelligence and Forms

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>7. Provide Outgoing Mail Server Information</td>
<td>This screen appears only if you selected Oracle Application Server 10g Reports Services or Oracle Business Intelligence Discoverer in the Select Configuration Options screen. Enter the name of the outgoing mail (SMTP) server for use by OracleAS Reports Services. You can leave it blank and configure it later. Click Next.</td>
</tr>
<tr>
<td>8. Specify Instance Name and ias_admin Password</td>
<td><strong>Instance Name</strong>: Enter a name for this instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, &quot;Oracle Application Server Instances and Instance Names&quot; for instance name details. Example 1: PortalWireless Example 2: BI_Forms <strong>ias_admin Password</strong> and <strong>Confirm Password</strong>: Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, &quot;The ias_admin User and Restrictions on its Password&quot; for restrictions on the password. Example: welcome99 Click Next.</td>
</tr>
<tr>
<td>9.</td>
<td>Finish the installation. Refer to Section 7.17, &quot;Install Fragment: The Last Few Screens of the Installation&quot;.</td>
</tr>
</tbody>
</table>
Remember that the Portal and Wireless and the Business Intelligence and Forms middle tiers require OracleAS Infrastructure.

You cannot "shrink" a middle tier: you cannot go from a larger middle tier to a smaller middle tier.

Note that you cannot expand an infrastructure.

**Procedure: Expanding a Middle Tier**

Perform the following procedure to expand a middle tier:

---

**Note:** You must configure OracleAS Web Cache before expanding a J2EE and Web Cache instance. If you did not configure OracleAS Web Cache during installation, see the *Oracle Application Server Administrator’s Guide* for instructions on configuring additional components after installation.
Table 7–11  Steps for Expanding a Middle Tier

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Stop all processes associated with the middle tier that you want to expand. If you need help on how to stop the processes, see the <em>Oracle Application Server Administrator’s Guide</em>. In particular, be sure that you stop the Application Server Control and DCM before performing the expansion. To stop Application Server Control, run the following command: prompt&gt; $ORACLE_HOME/bin/emctl stop iasconsole To stop OracleAS Web Cache (if configured), run the following command: prompt&gt; $ORACLE_HOME/opmn/bin/opmnctl stopproc ias-component=WebCache To ensure that DCM is stopped, run the following command: prompt&gt; $ORACLE_HOME/dcm/bin/dcmctl shutdown</td>
</tr>
<tr>
<td>2. --</td>
<td>Start up the installer and complete the first few screens. Refer to Section 7.16, &quot;Install Fragment: The First Few Screens for Installing Middle Tiers&quot; for details. Note: ■ In the Specify File Locations screen, enter the Oracle home directory of the middle tier you want to expand. ■ In the Select Installation Type screen, select <strong>Portal and Wireless</strong> or <strong>Business Intelligence and Forms</strong>.</td>
</tr>
<tr>
<td>3. Select Configuration Options</td>
<td>Select the components that you need, and click <strong>Next</strong>. For Portal and Wireless, the options are: ■ Oracle Application Server 10g Portal ■ Oracle Application Server 10g Wireless For Business Intelligence and Forms, the options are: ■ Oracle Application Server 10g Portal ■ Oracle Application Server 10g Wireless ■ Oracle Business Intelligence Discoverer ■ Oracle Application Server 10g Personalization ■ Oracle Application Server 10g Reports Services ■ Oracle Application Server 10g Forms Services</td>
</tr>
<tr>
<td>4. Specify Port Configuration Options</td>
<td>If you want to use default ports for the components, select <strong>Automatic</strong>. If you do not want to use the default ports, and you have created a staticports.ini file, select <strong>Manual</strong> and enter the fullpath to your staticports.ini file in the provided field. Click <strong>Next</strong>.</td>
</tr>
<tr>
<td>5. Register with Oracle Internet Directory</td>
<td><strong>Host</strong>: Enter the name of the computer where Oracle Internet Directory is running. <strong>Port</strong>: Enter the port number at which Oracle Internet Directory is listening. If you do not know the port number, see Section 7.6, &quot;How to Determine Port Numbers Used by Components&quot;. <strong>Use Only SSL Connections with this Oracle Internet Directory</strong>: Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory. Click <strong>Next</strong>.</td>
</tr>
</tbody>
</table>
If you did not shut down DCM when you performed the expansion, you may find that OracleAS Web Cache is not enabled after expanding the middle tier. In this case, perform these steps:

1. Enable OracleAS Web Cache by changing its status to "enabled" in the file `ORACLE_HOME/opmn/conf/opmn.xml`:

   ```xml
   <ias-component id="WebCache" status="enabled">
   
   prompt> ORACLE_HOME/opmn/bin/opmnctl reload
   ```

2. Reload OPMN.

### 7.15 Can I Upgrade and Expand a Middle Tier at the Same Time?

If you have a middle tier from the 10g (9.0.4) release and you want to upgrade it to a 10g Release 2 (10.1.2) middle tier of the same type (for example, J2EE and Web Cache 10g (9.0.4) middle tier to J2EE and Web Cache 10g Release 2 (10.1.2) middle tier), follow the instructions in the Oracle Application Server Upgrade and Compatibility Guide.

If you want to upgrade a middle tier and expand it at the same time (for example, going from J2EE and Web Cache 10g (9.0.4) to Portal and Wireless 10g Release 2 (10.1.2)), you have to perform two procedures:

1. Upgrade the middle tier to the same type middle tier in 10g Release 2 (10.1.2). This procedure is documented in the Oracle Application Server Upgrade and Compatibility Guide.
2. Expand the middle tier in the 10g Release 2 (10.1.2) Oracle home. The previous section, Section 7.14, "Expanding a Middle Tier", has details.

### 7.16 Install Fragment: The First Few Screens for Installing Middle Tiers

The first few screens of the installer are described here because they are the same for all installations. Most installation procedures in this chapter refer to this section as their starting point.

#### Table 7–12 First Few Screens of the Middle-tier Installation

<table>
<thead>
<tr>
<th>Screen Action</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Start the installer. Refer to Section 5.17, “Starting Oracle Universal Installer”.</td>
<td>Click Next.</td>
</tr>
</tbody>
</table>
| 2. Welcome | Enter the full path of the inventory directory: Enter a full path to the inventory directory. Enter a directory that is different from the Oracle home directory for the product files.  
   Example: `/opt/oracle/oraInventory`  
   Specify operating system group name: Select the operating system group that will have write permission for the inventory directory.  
   Example: `oinstall` | Click Next. |
| 3. This screen appears only if this is the first installation of any Oracle product on this computer.  
   Run the `orainstRoot.sh` script in a different shell as the root user. The script is located in the inventory directory.  
   After running the script, click Continue. | Name: Enter a name to identify this Oracle home. The name can consist of alphanumeric and the underscore (_) characters only, and cannot be longer than 128 characters.  
   Example: `OH_J2EE`  
   Destination Path: Enter the full path to the destination directory. This is the Oracle home. If the directory does not exist, the installer creates it. If you want to create the directory beforehand, create it as the `oracle` user; do not create it as the root user.  
   Example: `/opt/oracle/OraJ2EE` | Click Next. |
| 4. This screen appears only if this is the first installation of any Oracle product on this computer.  
   Run the `orainstRoot.sh` script in a different shell as the root user. The script is located in the inventory directory.  
   After running the script, click Continue. | Specify File Locations | Click Next. |
| 5. This screen appears only if the computer is part of a hardware cluster.  
   When you are installing a middle tier, select Local Installation because hardware cluster is not supported for middle tiers. | Specify Hardware Cluster Installation Mode | Click Next. |
Install Fragment: The Last Few Screens of the Installation

Refer to Figure 6–2 for a graphic that summarizes the screen sequence. These screens are the same for installing OracleAS Infrastructure or middle tier.

### 7.17 Install Fragment: The Last Few Screens of the Installation

The last few screens of the installer are described in this section because they are the same for all installations. Most installation procedures in this chapter refer to this section as their end point.

#### Table 7–12 (Continued)First Few Screens of the Middle-tier Installation

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>

<td><strong>Note:</strong> Do not run the script until you see this dialog. 1. When this dialog appears, run the root.sh script in a different shell as the root user. The script is located in this instance’s Oracle home directory. 2. Click <strong>OK</strong>.</td>
</tr>
<tr>
<td>4. Configuration Assistants</td>
<td>This screen shows the progress of the configuration assistants. Configuration assistants configure components.</td>
</tr>
<tr>
<td>5. End of Installation</td>
<td>Click <strong>Exit</strong> to quit the installer.</td>
</tr>
</tbody>
</table>
When you install certain middle-tier or infrastructure components, the installer prompts you for a username to log in to Oracle Internet Directory. For the installation to complete successfully, this user must belong to certain groups in Oracle Internet Directory. The groups that are required depend on what you are installing.

By putting users into groups, you allow other users to perform installations. Users do not have to log in as the cn=orcladmin superuser to perform the installations.

Contents:
- Section 8.1, "Default Users in Oracle Internet Directory"
- Section 8.2, "Groups in Oracle Internet Directory"
- Section 8.3, "Groups Required to Configure or Deinstall Components"
- Section 8.4, "Groups Required to Install Middle Tiers"
- Section 8.5, "Groups Required to Install Additional Metadata Repositories"
- Section 8.6, "Example of Installation with Different Users"
- Section 8.7, "How to Create Users in Oracle Internet Directory"
- Section 8.8, "How to Add Users to Groups in Oracle Internet Directory"
- Section 8.9, "Contents of a New Oracle Internet Directory"
- Section 8.10, "On the Specify Login for Oracle Internet Directory Screen, What Username and Realm Do I Enter?"

### 8.1 Default Users in Oracle Internet Directory

When you install Oracle Internet Directory, it has two users: cn=orcladmin and orcladmin:

- **cn=orcladmin** is the Oracle Internet Directory superuser. This user has all the privileges to perform all tasks in Oracle Internet Directory.

  The initial password for **cn=orcladmin** is the same as the password for the ias_admin user for the Oracle Application Server instance. You specified this password during installation.

  **cn=orcladmin** is the owner of the objects created in the same installation session. For example, if you installed Oracle Internet Directory, OracleAS Metadata
Groups in Oracle Internet Directory

Repository, and Oracle Delegated Administration Services, the cn=orcladmin user is created and becomes a member of the Repository Owners group and the DAS Component Owners group. cn=orcladmin also becomes a member of the iAS Admins group.

Note that you cannot log in to Oracle Internet Directory as the superuser (cn=orcladmin) using Oracle Delegated Administration Services. To log in as cn=orcladmin, you must use the Oracle Directory Manager.

- The orcladmin user is also created when you install Oracle Internet Directory. The DN for this user is: cn=orcladmin,cn=users,<default realm DN>.

The initial password for orcladmin is the same as the password for the ias_admin user for the Oracle Application Server instance. You specified this password during installation.

You can log in to Oracle Internet Directory as orcladmin using Oracle Delegated Administration Services to manage other Oracle Internet Directory users. You can do this because orcladmin is a valid OracleAS Single Sign-On user.

For more information on the cn=orcladmin and orcladmin users, see the Oracle Internet Directory Administrator's Guide.

8.2 Groups in Oracle Internet Directory

Groups in Oracle Internet Directory can be classified into these categories:

- Section 8.2.1, "Global" Groups
- Section 8.2.2, "Groups for Each Metadata Repository"
- Section 8.2.3, "Groups for Each Component"

8.2.1 "Global" Groups

Table 8–1 describes the groups that affect all Oracle Application Server instances and components registered with Oracle Internet Directory.

<table>
<thead>
<tr>
<th>Group</th>

8-2 Oracle Application Server Installation Guide
8.2.2 Groups for Each Metadata Repository

Each metadata repository registered with Oracle Internet Directory has its own groups, as described in Table 8–2. This enables you to assign different owners and users for each repository.

Table 8–2 Groups Associated with Each Metadata Repository Registered with Oracle Internet Directory

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
</table>
| Repository Owners | The user who installs the metadata repository becomes a member of this group. Repository Owners have the following privileges:  
- Add/remove users to/from this group.  
- De-register this repository.  
- Add/remove users to/from the Mid-Tier Admins group for this repository.  
- Add/remove middle-tier instances to/from this repository.  
- All privileges of the Mid-Tier Administrators group. |
| Mid-Tier Administrators | Mid-Tier Administrators have the following privileges:  
- Add/remove middle-tier instances from the Associated Middle Tiers group for this repository. This is required to install a middle tier or to configure a middle-tier component to use a different repository.  
- Access metadata for the repository database object. |
| Associated Middle Tiers | Members of this group are middle-tier instances associated with this metadata repository. The middle-tier instances are added to this group during installation. You do not have to add the instances manually to this group. Members of this group have the following privilege:  
- Access metadata for the repository database object and its schemas. |

8.2.3 Groups for Each Component

Oracle Application Server components also have groups in Oracle Internet Directory. Each component has a Component Owners group and an Associated Middle Tiers group, as described in Table 8–3.

Table 8–3 Groups Associated with Each Component

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
</table>
| Component Owners | Component Owners have the following privileges:  
- Add/remove owners for this component.  
- De-register this component.  
- Associate additional middle tiers with this component. |
| Associated Middle Tiers | Members of this group are middle-tier instances. |

Figure 8–6 shows these groups for the Oracle Delegated Administration Services component.
8.3 Groups Required to Configure or Deinstall Components

Table 8–4 shows the groups that a user needs to belong to in order to configure or deinstall Oracle Application Server components.

The user who installs and configures the components becomes the owner of the components.

<table>
<thead>
<tr>
<th>To Configure This Component</th>

---
Groups Required to Install Middle Tiers

When you install middle tiers, the installer prompts you to log in to Oracle Internet Directory. Log in as a user who is a member of these groups:

- **Section 8.4.1, "Groups Required to Install Against the Desired Metadata Repository"**
- **Section 8.4.2, "Groups Required to Install Middle-Tier Components"**

### 8.4 Groups Required to Install Middle Tiers

Values you need to provide:

- **oidport** - port number on which Oracle Internet Directory is listening. Example: 389.
- **password** - password for the **cn=orcladmin** user.

2. If the command in the preceding step does not return the name of the metadata repository, then run the following commands:

   a. Run this command first to get the "orclreplicaid" value, which you need for the next command.

   ```bash
   prompt> ldapsearch -h oidhostname -p oidport -D cn=orcladmin -w password -b "" -s base "objectclass=" orclreplicaid
   ```

   b. Then run this command.

   ```bash
   prompt> ldapsearch -h oidhostname -p oidport -D cn=orcladmin -w password -b "orclreplicaid=value_from_previous_command,cn=replication configuration" -s base "objectclass=" seealso
   ```

   This returns a "seealso" value in the format: **cn=Metadata repository DB Name,cn=oraclecontext**.

### 8.4.1 Groups Required to Install Against the Desired Metadata Repository

To install middle tiers against a metadata repository, the user must belong to these groups:

- **IAS Admins group**
- **Mid-Tier Admins group for the metadata repository to be used with the middle tier.** When the installer prompts for the OracleAS Metadata Repository to use with this middle tier, the installer displays only the metadata repositories for which the user is a mid-tier admin. For example, in Figure 8–2, userA can see only the repository for orcl.oracle.com, and userB can see only the repository for orcl1.oracle.com.

### 8.4.2 Groups Required to Install Middle-Tier Components

To install middle-tier components, such as OracleAS Portal and OracleAS Wireless, the user must belong to additional groups. Refer to **Table 8–4** for a list of components and required groups.
### 8.4.3 Example

Figure 8–1 shows an Oracle Internet Directory with one metadata repository and one middle-tier instance. userA can install middle tiers against the orcl metadata repository because userA belongs to the Mid-Tier Admins and the IAS Admins groups. userA can also install middle-tier components because userA belongs to the Trusted Application Admins group, the IAS & User Management Application Admins group, and the Component Owners group for Wireless.

### 8.5 Groups Required to Install Additional Metadata Repositories

To install additional metadata repositories, a user must be a member of the IAS Admins group. After installation, the user then becomes a member of the Repository Owners group for that metadata repository.

### 8.6 Example of Installation with Different Users

Figure 8–2 shows an Oracle Internet Directory with two metadata repositories and two middle tiers installed by different users.
Figure 8–2  Oracle Internet Directory with Two Metadata Repositories and Two Middle Tiers

The numbers in the figure correspond to these steps:

1. **Install OracleAS Infrastructure (including Oracle Internet Directory and OracleAS Metadata Repository)**
   
   This first installation creates an Oracle Internet Directory and a metadata repository. The installer registers the metadata repository with Oracle Internet Directory by creating the "orcl.oracle.com" entry.

   The `orcladmin` user becomes a member of the Repository Owners group and the Mid-Tier Admins group for this repository.

2. **Install J2EE and Web Cache Middle Tier**
   
   userA was added to the following groups:

   - Mid-Tier Admins group of "orcl.oracle.com"
     
     This enables userA to use the "orcl.oracle.com" repository for this middle tier. Note that this group is required only if you install the J2EE and Web Cache middle tier with the OracleAS Database-Based Cluster option. If you install the middle tier without this option, userA does not need to belong to this Mid-Tier Admins group.

   - iAS Admins group
     
     The installer registers this middle tier with Oracle Internet Directory by creating the "J2EE" entry. (The "J2EE" is the name of the middle-tier instance, specified by userA.)

     The middle tier becomes a member of the Associated Mid-Tiers group for "orcl.oracle.com".
3. Install OracleAS Infrastructure (OracleAS Metadata Repository only)

userB was added to the iAS Admins group so that userB can perform this installation. Refer to Section 8.5, "Groups Required to Install Additional Metadata Repositories".

The installer registers this new repository with Oracle Internet Directory by creating the "orcl1.oracle.com" entry.

userB becomes a member of the Repository Owners group and the Mid-Tier Admins group for the new repository.

4. Install Portal and Wireless Middle Tier

userB was added to these groups:

- Mid-Tier Admins group of "orcl1.oracle.com", so that userB can use the repository for this middle tier
- Trusted Application Admins, required for installing OracleAS Portal
- IAS & User Management Application Admins, required for installing OracleAS Portal and OracleAS Wireless
- iAS Admins, required for installing OracleAS Portal and OracleAS Wireless

The installer registers this middle tier with Oracle Internet Directory by creating the "PW1" entry.

The middle tier becomes a member of the Associated Mid-Tiers group for "orcl1.oracle.com".

8.7 How to Create Users in Oracle Internet Directory

You can create users in Oracle Internet Directory using the Self-Service Console, which is part of the Oracle Delegated Administration Services. Refer to Oracle Internet Directory Administrator’s Guide for details.

Note: You cannot connect to Oracle Internet Directory as the cn=orcladmin superuser using the Oracle Delegated Administration Services consoles. To connect to Oracle Internet Directory as the superuser, use Oracle Directory Manager.

8.8 How to Add Users to Groups in Oracle Internet Directory

To add users to groups in Oracle Internet Directory, you can use these tools:

- Oracle Directory Manager is a Java-based tool for managing Oracle Internet Directory.
- Oracle Delegated Administration Services is a Web-based tool intended for end-users to perform tasks such as changing their passwords and editing their personal information. If users have the proper privileges, they can also use this tool to create groups and users.

Note: You cannot log in to Oracle Internet Directory as the cn=orcladmin superuser using Oracle Delegated Administration Services. In cases where you have to log in as the superuser to add users to groups (or to perform other Oracle Internet Directory-related tasks), you have to use Oracle Directory Manager.
8.8.1 Using Oracle Directory Manager to Add Users to Groups

When you have to log in as the cn=orcladmin superuser to add users to groups, you have to use Oracle Directory Manager, instead of Oracle Delegated Administration Services.

To add users using Oracle Directory Manager:

1. Start up Oracle Directory Manager. ORACLE_HOME refers to the home directory where Oracle Internet Directory is installed.
   ```
   prompt> cd $ORACLE_HOME/bin
   prompt> ./oidadmin
   ```

2. In the Oracle Directory Manager Connect screen, enter the connect information for Oracle Internet Directory:
   - **User**: Enter cn=orcladmin.
   - **Password**: Enter the password for cn=orcladmin.
   - **Server and Port**: Click the icon at the right of the field to enter the name of the computer running Oracle Internet Directory and the port number on which Oracle Internet Directory is listening.
   - Click **Login**.

3. On the left side, navigate to the group to which you want to add users. Select the group on the left side to display its attributes on the right side.
   - To navigate to "global" groups, see Section 8.8.1.1, "Navigating to "Global" Groups".
   - To navigate to metadata repository groups, see Section 8.8.1.2, "Navigating to Metadata Repository Groups".
   - To navigate to component groups, see Section 8.8.1.3, "Navigating to Component Groups".

4. Add new users to the group by adding the DNs of the users to the uniquemember attribute.

8.8.1.1 Navigating to "Global" Groups

The "global" groups are listed in Table 8–1.

The general navigation path is as follows. Refer to Figure 8–3 for a screenshot.

1. Expand the top-level entry, "Oracle Internet Directory Servers".
2. Expand the specific Oracle Internet Directory.
3. Expand the following entries: **Management > cn=OracleContext > cn=Groups**.
4. Click the group to which you want to add users. Figure 8–3 shows Oracle Directory Manager with the iASAdmins group selected.
8.8.1.2 Navigating to Metadata Repository Groups

The metadata repository groups are listed in Table 8–2.

The general navigation path is as follows. Refer to Figure 8–4 for a screenshot.

1. Expand the top-level entry, "Oracle Internet Directory Servers".
2. Expand the specific Oracle Internet Directory.
3. Expand the following entries: Entry Management > cn=OracleContext > cn=Products > cn=IAS > cn=IAS Infrastructure Databases > orclReferenceName=dbName, where dbName is the name of the OracleAS Metadata Repository database.
4. Click the group to which you want to add users. Figure 8–4 shows Oracle Directory Manager with the Repository Owners group for the orcl.us.oracle.com database selected.
8.8.1.3 Navigating to Component Groups

The component groups are listed in Table 8–3.

The general navigation path is as follows. Refer to Figure 8–5 for a screenshot.

1. Expand the top-level entry, "Oracle Internet Directory Servers".
2. Expand the specific Oracle Internet Directory.
3. Expand the following entries: Entry Management > cn=OracleContext > cn=Products.
4. Expand the particular component (for example, cn=DAS) whose groups you want to add users to.
5. Expand orclApplicationCommonName=appName, where appName is specific to the component and application server instance. If you have installed multiple instances of a component, you would see multiple instances of this entry.
6. Click the group to which you want to add users. Figure 8–5 shows Oracle Directory Manager with the Component Owners group for Oracle Delegated Administration Services selected.
8.8.2 Using Deployment Delegation Console to Add Users to Groups

Using the Deployment Delegation Console, which is installed as part of Oracle Delegated Administration Services, you can add users to or remove users from the following groups:

- Repository Owners
- Mid-Tier Administrators
- Component Owners

**Note:** You can add users to these groups only if these groups have existing members other than the cn=orcladmin superuser. If the only member of these groups is the superuser, then you have to use Oracle Directory Manager to add users to these groups. Refer to Section 8.8.1, "Using Oracle Directory Manager to Add Users to Groups".

To add users to these groups:

1. Ensure that the Oracle Delegated Administration Services and Oracle Internet Directory are running.
2. Display the Deployment Delegation Console page. The URL is:

http://hostname:port/oiddas/ui/oldinstallhome

*hostname* specifies the name of the computer where you installed Oracle Delegated Administration Services.

*port* specifies the port on which Oracle HTTP Server is listening.

3. Click **Login**.

4. Enter a username and password to log in to Oracle Internet Directory, and click **Login**. The login user must have sufficient privileges to allow you to add users to the desired group:

<table>
<thead>
<tr>
<th>To add users to this group:</th>
<th>Log in as a user who belongs to:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repository Owners</td>
<td>the same Repository Owners group.</td>
</tr>
<tr>
<td>Mid-Tier Administrators</td>
<td>the Repository Owners group for the same repository.</td>
</tr>
<tr>
<td>Component Owners</td>
<td>the same Component Owners group.</td>
</tr>
</tbody>
</table>

5. Perform the steps to add the user to the desired group:

<table>
<thead>
<tr>
<th>To add the user to the Repository Owners group</th>
<th>To add the user to the Mid-Tier Administrators group</th>
<th>To add the user to the Component Owners group</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Click the <strong>Repository</strong> tab. This displays all the metadata repositories for which you are an owner.</td>
<td>1. Click the <strong>Repository</strong> tab. This displays all the metadata repositories for which you are an owner.</td>
<td>1. Click the <strong>Components</strong> tab. This displays all the components for which you are an owner.</td>
</tr>
<tr>
<td>2. Select the metadata repository to which you want to add a user, and click <strong>Manage Owners</strong>.</td>
<td>2. Select the metadata repository to which you want to add a user, and click <strong>Manage Administrators</strong>.</td>
<td>2. Select the component to which you want to add a user, and click <strong>Manage Owners</strong>.</td>
</tr>
<tr>
<td>3. On the page that displays the current owners, click <strong>Add</strong>.</td>
<td>3. On the page that displays the current administrators, click <strong>Add</strong>.</td>
<td>3. On the page that displays the current component owners, click <strong>Add</strong>.</td>
</tr>
<tr>
<td>4. Enter the first few characters of the user’s name in the <strong>Search</strong> field and click <strong>Go</strong>. If you leave the <strong>Search</strong> field empty and click <strong>Go</strong>, you would get a list of all users in Oracle Internet Directory.</td>
<td>4. Enter the first few characters of the user’s name in the <strong>Search</strong> field and click <strong>Go</strong>. If you leave the <strong>Search</strong> field empty and click <strong>Go</strong>, you would get a list of all users in Oracle Internet Directory.</td>
<td>4. Enter the first few characters of the user’s name in the <strong>Search</strong> field and click <strong>Go</strong>. If you leave the <strong>Search</strong> field empty and click <strong>Go</strong>, you would get a list of all users in Oracle Internet Directory.</td>
</tr>
<tr>
<td>5. Select the user that you want to add to the Repository Owners group and click <strong>Select</strong>.</td>
<td>5. Select the user that you want to add to the Mid-Tier Administrators group and click <strong>Select</strong>.</td>
<td>5. Select the user that you want to add to the Component Owners group and click <strong>Select</strong>.</td>
</tr>
<tr>
<td>6. Click <strong>Submit</strong> on the Manage Repository Owners page.</td>
<td>6. Click <strong>Submit</strong> on the Manage Administrators page.</td>
<td>6. Click <strong>Submit</strong> on the Manage Component Owners page.</td>
</tr>
</tbody>
</table>
8.9 Contents of a New Oracle Internet Directory

When you install OracleAS Infrastructure with Oracle Internet Directory, OracleAS Metadata Repository, and Oracle Delegated Administration Services, the Oracle Internet Directory contains the following objects (Figure 8–6):

- "Global" groups as listed in Table 8–1
- The cn=orcladmin superuser
- The orcladmin user belonging to the default realm
- An entry for the metadata repository registered with the Oracle Internet Directory. This metadata repository is associated with the groups listed in Table 8–2. The cn=orcladmin superuser is a member of the Repository Owners group.
- An application entity entry for the Oracle Delegated Administration Services component. This component is associated with the groups listed in Table 8–3. The cn=orcladmin superuser is a member of the Component Owners group.

To enable other users to install additional instances of Oracle Delegated Administration Services, log in as cn=orcladmin in Oracle Directory Manager and add the users to the Component Owners group. Refer to Section 8.8.1, "Using Oracle Directory Manager to Add Users to Groups".

![Figure 8–6 Contents of a New Oracle Internet Directory](image)

8.10 On the Specify Login for Oracle Internet Directory Screen, What Username and Realm Do I Enter?

The installer displays the Specify Login for Oracle Internet Directory screen:

- when you are installing OracleAS Infrastructure and you are using an existing Oracle Internet Directory
- when you are installing a middle tier that requires an infrastructure.
This screen prompts you to enter a username and password to log in to Oracle Internet Directory.

**Username**
In the Username field, enter either the simple username or the user’s DN.

Simple username example: jdoe
DN example: cn=orcladmin

The user must belong to specific groups for installing and configuring certain components. Refer to Table 8-4 for details.

If you want to specify the superuser, enter cn=orcladmin, not just orcladmin.

**Realm**
The Realm field appears only if your Oracle Internet Directory contains more than one realm. The username that you enter is authenticated against the specified realm. If you are unsure what the realm name is, contact your Oracle Internet Directory administrator.

Example 1: in a hosted deployment, the realm name could be similar to the name of the hosted company: XYZCorp.

Example 2: within an enterprise, you could have separate realms for internal users and external users. The realm name for the external users could be externalUsers.
On the Specify Login for Oracle Internet Directory Screen, What Username and Realm Do I Enter?
Installing Oracle Internet Directory in Replicated Mode

This chapter describes how to install Oracle Internet Directory in replicated mode, that is, how to install Oracle Internet Directory masters and replicas.

Contents:
- Section 9.1, "Oracle Internet Directory Replication Overview"
- Section 9.2, "Requirements"
- Section 9.3, "Installation Order"
- Section 9.4, "Installing a Master Oracle Internet Directory"
- Section 9.5, "Installing an Oracle Internet Directory Replica"
- Section 9.6, "Accessing OracleAS Single Sign-On and Oracle Delegated Administration Services"

9.1 Oracle Internet Directory Replication Overview

To run Oracle Internet Directory in a replication environment means that you have more than one Oracle Internet Directory, each with its own OracleAS Metadata Repository. The Oracle Internet Directory instances synchronize the data in the metadata repositories so that the data in the repositories are "loosely consistent". This means that the data in the repositories are not guaranteed to be synchronized in "real time", but the data become identical within an acceptable time interval.

For More Information
This chapter provides information from an installation point of view. For in-depth information on replication, see the following guides:
- For information on Oracle Internet Directory replication concepts and administration, see the Oracle Internet Directory Administrator's Guide.
- For information on Oracle Internet Directory replication deployment scenarios, see the Oracle Identity Management Concepts and Deployment Planning Guide.

Types of Replication
There are two types of replication. During installation, you select the type of replication that you want.
- Section 9.1.1, "Fan-Out Replication (LDAP Replication)"
- Section 9.1.2, "Multimaster Replication (Advanced Replication)"
9.1.1 Fan-Out Replication (LDAP Replication)

In fan-out replication, one Oracle Internet Directory is the master, and the other Oracle Internet Directory instances are called the Oracle Internet Directory replicas.

Clients modify the data in the master Oracle Internet Directory only. The master then propagates the changes to the replicas. These replicas, in turn, can update other Oracle Internet Directory replicas.

![Figure 9-1 Example of Fan-Out Replication (LDAP Replication)](image)

In fan-out replication, Oracle Internet Directory instances use the LDAP protocol to communicate with each other. The Select Oracle Internet Directory Replication Mode screen in the installer uses the term **LDAP Replication** to refer to fan-out replication.

The procedure for installing a master Oracle Internet Directory is the same as installing a "regular" (non-replicated) Oracle Internet Directory.

The procedure for installing replicas is different. When installing a replica, you must select the **High Availability and Replication** option in the Select Configuration Options screen, and you need to provide connect information to the master Oracle Internet Directory.

The Oracle Application Server instance that runs the Oracle Internet Directory (master or replica) can also run other Oracle Application Server components, such as the OracleAS Metadata Repository, OracleAS Single Sign-On, Oracle Delegated Administration Services, and/or Oracle Directory Integration and Provisioning.

9.1.2 Multimaster Replication (Advanced Replication)

In multimaster replication, you have one or more master Oracle Internet Directory instances. You can also have other Oracle Internet Directory instances that are replicas. Clients can update data in any Oracle Internet Directory (master or replica). The Oracle Internet Directory instances propagate the changes among themselves.
In multimaster replication, Oracle Internet Directory instances use the Oracle Database Advanced Replication protocol to communicate with each other. The Select Oracle Internet Directory Replication Mode screen in the installer uses the term Advanced Replication to refer to multimaster replication.

The procedure for installing a master Oracle Internet Directory is the same as installing a "regular" (non-replicated) Oracle Internet Directory.

The procedure for installing replicas is different. When installing a replica, you must select the High Availability and Replication option in the Select Configuration Options screen, and you need to provide connect information to the master Oracle Internet Directory.

The Oracle Application Server instance that runs the Oracle Internet Directory (master or replica) can also run other Oracle Application Server components, such as the OracleAS Metadata Repository, OracleAS Single Sign-On, Oracle Delegated Administration Services, and/or Oracle Directory Integration and Provisioning.

### 9.2 Requirements

Check that you meet the following requirements for installing Oracle Internet Directory in replication mode:

- Section 9.2.1, "Database Requirements"
- Section 9.2.2, "Clock Synchronization"

#### 9.2.1 Database Requirements

Each Oracle Internet Directory, whether master or replica, needs its own OracleAS Metadata Repository. You can install it with a new OracleAS Metadata Repository, or against an existing OracleAS Metadata Repository.

If installing against an existing OracleAS Metadata Repository, you can create an existing OracleAS Metadata Repository in two different ways:

- You can install it by selecting the OracleAS Metadata Repository option in the Select Installation Type screen.
- You can install the OracleAS Metadata Repository in an existing database. Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details on how to load the OracleAS Metadata Repository in an existing database.
If you are installing against an existing OracleAS Metadata Repository, the OracleAS Metadata Repository must not be already registered with another Oracle Internet Directory. If you specify an OracleAS Metadata Repository that is already registered with an Oracle Internet Directory, the installer assumes you are installing a high availability environment, and it does not display the replication options.

### 9.2.2 Clock Synchronization

Check that the clocks on the computers running the masters and replicas are within 250 seconds of each other.

### 9.3 Installation Order

To install Oracle Internet Directory in replicated mode, you need a master Oracle Internet Directory and one or more Oracle Internet Directory replicas. You install them in the following order:

1. Install the master Oracle Internet Directory first.
2. Install the Oracle Internet Directory replicas. The installer will prompt you to enter connect information for the master Oracle Internet Directory.

### 9.4 Installing a Master Oracle Internet Directory

The procedure for installing a master Oracle Internet Directory is the same as installing a "regular" (non-replicated) Oracle Internet Directory. You can install the master Oracle Internet Directory against an existing database, or you can install it with a new database.

---

**Note:**

- In the Select Configuration Options screen, you must select Oracle Internet Directory. You can select other components to configure, as desired.
- Also in the Select Configuration Options screen, you do not need to select High Availability and Replication. Select this option only if you are installing this Oracle Application Server instance in a high availability configuration.
- If you select the High Availability and Replication option in Select Configuration Options screen, the installer displays the Select High Availability Option screen. In this, do not select the Replication option, because this option is for installing a replica Oracle Internet Directory, not a master Oracle Internet Directory.

You can use any of the procedures in Chapter 6, "Installing OracleAS Infrastructure" to install a master Oracle Internet Directory. Examples:

- To install a master Oracle Internet Directory with a new database, follow the procedure in Section 6.20, "Installing OracleAS Infrastructure".
- To install a master Oracle Internet Directory with an existing database, follow the procedure in Section 6.23, "Installing Oracle Identity Management Components Only (Including Oracle Internet Directory)" or Section 6.25, "Installing Oracle Internet Directory Only".
You can also install a master Oracle Internet Directory in high availability environments. Refer to Chapter 11, "Installing in High Availability Environments: OracleAS Cold Failover Cluster" and Chapter 12, "Installing in High Availability Environments: OracleAS Cluster (Identity Management)" for details.

9.5 Installing an Oracle Internet Directory Replica

You can install an Oracle Internet Directory replica against an existing database, or you can install it with a new database.

Contents of this section:

- Section 9.5.1, "Overview of Installing a Replica"
- Section 9.5.2, "Installing an Oracle Internet Directory Replica with a New Database"
- Section 9.5.3, "Installing an Oracle Internet Directory Replica against an Existing Database"

9.5.1 Overview of Installing a Replica

When installing an Oracle Internet Directory replica, remember the following:

- In the Select Configuration Options screen, you must select Oracle Internet Directory and High Availability and Replication.
- In the Select High Availability Option screen, select Replication.
- When the installer prompts you to enter connect information for the master Oracle Internet Directory, you need to connect as the Oracle Internet Directory superuser (cn=orcladmin). You need to know the password for the superuser.
- The master Oracle Internet Directory must not already contain a registration for a database with the same global database name or SID as the OracleAS Metadata Repository to be used for the replica.
- The OracleAS Metadata Repository for the replica cannot already be registered with any Oracle Internet Directory.

9.5.2 Installing an Oracle Internet Directory Replica with a New Database

Follow these steps to install an Oracle Internet Directory replica with a new database:
## Table 9–1 Installing an Oracle Internet Directory Replica with a New Database

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. -- | Start up the installer and complete the first few screens. Refer to Section 6.27, “Install Fragment: The First Few Screens of the Installation” for details. Notes:  
- In the Select a Product to Install screen, select Oracle Application Server Infrastructure 10g.  
- In the Select Installation Type screen, select Oracle Identity Management and OracleAS Metadata Repository. |
| 2. Select Configuration Options | Select Oracle Internet Directory.  
Select High Availability and Replication.  
The other options on this screen are optional: Select Oracle Application Server Single Sign-On, Oracle Application Server Delegated Administration Services, Oracle Application Server Directory Integration and Provisioning, and/or Oracle Application Server Certificate Authority (OCA) if you need these components. Click Next. |
| 3. Specify Port Configuration Options | If you do not want to use default ports for the components, select Automatic.  
If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field. Click Next. |
| 4. Select High Availability or Replication Option | This screen is required to install a replica. This screen appears only if you selected High Availability and Replication in the Select Configuration Options screen. Select Replication, and click Next. |
| 5. Select Oracle Internet Directory Replication Mode | Select LDAP Replication if you want fan-out replication.  
Select Advanced Replication if you want multimaster replication. Click Next. |
| 6. Specify Oracle Internet Directory Master Node | Hostname: Enter the name of the computer running the master Oracle Internet Directory.  
Port: Enter the port at which the master Oracle Internet Directory is listening.  
Do not select Use only SSL connections with this Oracle Internet Directory. If you want Oracle Internet Directory to run in SSL-only mode, you can make this configuration change after installation. Refer to Oracle Application Server Administrator’s Guide for details. Click Next. |
| 7. Specify Master Oracle Internet Directory Login | Username: Enter cn=orcladmin because you have to connect to the master Oracle Internet Directory as the superuser.  
Password: Enter the password for the superuser. Click Next. |
| 8. Specify Namespace in Internet Directory | Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm. Ensure the value shown in Suggested Namespace meets your deployment needs. If not, enter the desired value in Custom Namespace. Refer to Section 6.16, "What Do I Enter on the "Specify Namespace in Internet Directory" Screen?". Click Next. |
| 9. OCA screens | If you selected Oracle Application Server Certificate Authority (OCA) in the Select Configuration Options screen, the installer displays screens for configuring OCA. Refer to Section 6.30, "Install Fragment: OCA Screens" for details. |
### Installing an Oracle Internet Directory Replica with a New Database

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 10. Specify Database Configuration Options | **Global Database Name**: Enter a name for the OracleAS Metadata Repository database. Append the domain name of your computer to the database name.  
Example: `orcl.mydomain.com`  
**Note**: Ensure that the master Oracle Internet Directory does not already contain a registration for a database with the same global database name or SID. (The installer checks this for you.)  
**SID**: Enter the system identifier for the OracleAS Metadata Repository database. Typically this is the same as the global database name, but without the domain name. The SID must be unique across all databases. The SID cannot be longer than eight characters.  
Example: `orcl`  
**Select Database Character Set**: Select the character set to use.  
**Specify Database File Location**: Enter the full path to the parent directory for the data files directory. This parent directory must already exist, and you must have write permissions in this directory.  
The installer will create a subdirectory in this parent directory, and the subdirectory will have the same name as the SID. The data files will be placed in this subdirectory.  
Example: If you enter `/u02/oradata`, and the SID is `orcl`, then the data files will be located in `/u02/oradata/orcl`.  
Click Next. |
| 11. Specify Database Schema Passwords | Set the passwords for these privileged database schemas: SYS, SYSTEM, SYSMAN, and DBSNMP. You can set different passwords for each schema, or you can set the same password for all the schemas.  
Refer to Section 6.14, "Restrictions on the Passwords for the SYS, SYSTEM, SYSMAN, and DBSNMP Users" for rules on setting passwords for these accounts.  
Click Next. |
| 12. Specify Instance Name and ias_admin Password | **Instance Name**: Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.  
Example: `infra`  
**ias_admin Password** and **Confirm Password**: Enter and confirm the password for the ias_admin user. This is the administrative user for this infrastructure instance.  
This password will also become the password for the following users:  
- the Oracle Internet Directory superuser ("cn=orcladmin")  
- the Oracle Internet Directory database user ("ods")  
- the replication DN, which is the identity used by the replication server. The DN is: `cn=replication dn, orclreplicaid=replica_ID, cn=replication configuration`, where `replica_ID` is the replica ID of the Oracle Internet Directory being installed.  
Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for password requirements.  
Example: `welcome99`  
Click Next. |
| 13. -- | Finish the installation. Refer to Section 6.28, "Install Fragment: The Last Few Screens of the Installation" for details. |
Installing an Oracle Internet Directory Replica against an Existing Database

Follow these steps to install an Oracle Internet Directory replica against an existing database.

### Table 9-2 Installing an Oracle Internet Directory Replica against an Existing Database

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. Start up the installer and complete the first few screens. Refer to Section 6.27, "Install Fragment: The First Few Screens of the Installation" for details. **Note:**  
  - In the Select a Product to Install screen, select Oracle Application Server Infrastructure 10g.  
  - In the Select Installation Type screen, select Oracle Identity Management. |
| 2. Select Configuration Options | Select Oracle Internet Directory.  
Select High Availability and Replication.  
The other options on this screen are optional:  
Select Oracle Application Server Single Sign-On, Oracle Application Server Delegated Administration Services, Oracle Application Server Directory Integration and Provisioning, and/or Oracle Application Server Certificate Authority (OCA) if you need these components.  
Click Next. |
| 3. Specify Port Configuration Options | If you want to use default ports for the components, select Automatic.  
If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field.  
Click Next. |
| 4. Specify Repository | Enter information for the OracleAS Metadata Repository that you want to use for the replica.  
**Note:**  
  - This OracleAS Metadata Repository cannot already be registered with any Oracle Internet Directory.  
  - The master Oracle Internet Directory, which you will specify in step 7., must not already contain a registration for a database with the same global database name or SID as this OracleAS Metadata Repository. *(The installer does not check this for you.)*  
  
**Username:** Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges.  
**Password:** Enter the user’s password.  
**Hostname and Port:** Enter the name of the computer where the database is running, and the port number at which it is listening. Use the format: host:port.  
**Service Name:** Enter the service name of the database. Note that the service name must include the database domain name.  
Example: orcl.mydomain.com  
Click Next. |
| 5. Select High Availability or Replication Option | This screen is required to install a replica. If you do not see this screen, return to the Select Configuration Options screen and ensure you selected High Availability and Replication.  
Select Replication.  
Click Next. |
Installing Oracle Internet Directory Replica

6. **Select Oracle Internet Directory Replication Mode**
   - **LDAP Replication** if you want fan-out replication.
   - **Advanced Replication** if you want multimaster replication.
   - Click **Next**.

7. **Specify Oracle Internet Directory Master Node**
   - **Hostname**: Enter the name of the computer running the master Oracle Internet Directory.
   - **Port**: Enter the port at which the master Oracle Internet Directory is listening.
   - Do not select **Use only SSL connections with this Oracle Internet Directory**. If you want Oracle Internet Directory to run in SSL-only mode, you can make this configuration change after installation. Refer to *Oracle Application Server Administrator’s Guide* for details.
   - Click **Next**.

8. **Specify Master Oracle Internet Directory Login**
   - **Username**: Enter `cn=orcladmin` because you have to connect to the master Oracle Internet Directory as the superuser.
   - **Password**: Enter the password for the superuser.
   - Click **Next**.

9. **Specify Namespace in Internet Directory**
   - Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm.
   - Ensure the value shown in **Suggested Namespace** meets your deployment needs. If not, enter the desired value in **Custom Namespace**. Refer to Section 6.16, "What Do I Enter on the “Specify Namespace in Internet Directory” Screen?".
   - Click **Next**.

10. **OCA screens**
    - If you selected **Oracle Application Server Certificate Authority (OCA)** in the Select Configuration Options screen, the installer displays screens for configuring OCA. Refer to Section 6.30, "Install Fragment: OCA Screens" for details.

11. **Specify Instance Name and ias_admin Password**
    - **Instance Name**: Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.
    - **Example**: `id_mgmt`
    - **ias_admin Password** and **Confirm Password**: Set the password for the ias_admin user. This is the administrative user for the instance.
    - This password will also become the password for the following users:
      - the Oracle Internet Directory superuser ("cn=orcladmin")
      - the Oracle Internet Directory database user ("ods")
      - the replication DN, which is the identity used by the replication server. The DN is: "cn=replication dn, orclreplicaid=replica_ID, cn=replication configuration", where replica_ID is the replica ID of the Oracle Internet Directory being installed.
    - Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for restrictions on the password.
    - **Example**: `welcome99`
    - Click **Next**.

12. **Finish the installation**
    - Refer to Section 6.28, "Install Fragment: The Last Few Screens of the Installation" for details.
9.6 Accessing OracleAS Single Sign-On and Oracle Delegated Administration Services

To access OracleAS Single Sign-On or Oracle Delegated Administration Services on the replica node, you have to use the password for the orcladmin user on the master Oracle Internet Directory, not the replica Oracle Internet Directory.

Example:

1. Enter the URL for OracleAS Single Sign-On or Oracle Delegated Administration Services in your browser:
   
   For OracleAS Single Sign-On, the URL is: http://host:port/pls/orasso.
   
   For Oracle Delegated Administration Services, the URL is: http://host:port/oiddas.
   
   *host* specifies the name of the computer where you installed the Oracle Internet Directory replica.
   
   *port* specifies the port number on which Oracle HTTP Server is listening.

2. To log in, enter orcladmin as the user name and the password you entered when you installed the master Oracle Internet Directory. If you enter the password for the replica Oracle Internet Directory, the login will not succeed.
This chapter provides an overview of the high availability configurations supported by Oracle Application Server. Subsequent chapters provide the details. This chapter also lists the common requirements.

Contents of this chapter:
- Section 10.1, "Overview of High Availability Configurations"
- Section 10.2, "Installation Order for High Availability Configurations"
- Section 10.3, "Requirements for High Availability Configurations"

### 10.1 Overview of High Availability Configurations

This chapter provides only a brief overview of the high availability configurations in Oracle Application Server. For a complete description of the configurations, see the Oracle Application Server High Availability Guide.

Oracle Application Server supports the following types of high availability configurations:
- Section 10.1.1, "OracleAS Cold Failover Cluster"
- Section 10.1.2, "OracleAS Cluster"
- Section 10.1.3, "OracleAS Disaster Recovery"

For a quick summary of the high availability configurations, see Section 10.1.4, "Summary of Differences".

#### 10.1.1 OracleAS Cold Failover Cluster

Oracle Application Server provides an active-passive model for all its components using OracleAS Cold Failover Clusters. In an OracleAS Cold Failover Cluster configuration, two or more application server instances are configured to serve the same application workload but only one is active at any particular time. These instances can reside on the same machine or on different machines.

The most common properties of an OracleAS Cold Failover Cluster configuration include:
- Shared storage
The passive Oracle Application Server instance in an active-passive configuration has access to the same Oracle binaries, configuration files, and data as the active instance.

■ Virtual hostname

During OracleAS Infrastructure installation, you can specify a virtual hostname in the Specify Virtual Hostname screen. This OracleAS Infrastructure virtual hostname can be managed by a hardware cluster or a load balancer and is used by the middle-tier and OracleAS Infrastructure components to access the OracleAS Infrastructure. This is regardless of whether the OracleAS Infrastructure is in a single node installation, in the OracleAS Cold Failover Cluster solution, or in the OracleAS Cluster solution.

The virtual hostname is the hostname associated with the virtual IP. This is the name that is chosen to give the Oracle Application Server middle-tier a single system view of the OracleAS Infrastructure with the help of a hardware cluster or load balancer. This name-IP entry must be added to the DNS that the site uses, so that the middle-tier nodes can associate with the OracleAS Infrastructure without having to add this entry into their local /etc/hosts (or equivalent) file. For example, if the two physical hostnames of the hardware cluster are node1.mycompany.com and node2.mycompany.com, the single view of this cluster can be provided by the name selfservice.mycompany.com. In the DNS, selfservice maps to the virtual IP address of the OracleAS Infrastructure, which either floats between node1 and node2 via a hardware cluster or maps to node1 and node2 by a load balancer, all without the middle tier knowing which physical node is active and actually servicing a particular request.

See Also: Oracle Application Server High Availability Guide

You cannot specify a virtual hostname during Oracle Application Server middle-tier installation, but you can still use a virtual hostname via a hardware cluster or load balancer by following the postinstallation configuration steps for cold failover cluster middle tiers.

■ Failover procedure

An active-passive configuration also includes a set of scripts and procedures to detect failure of the Active instance and to failover to the Passive instance while minimizing downtime.

The advantages of an OracleAS Cold Failover Cluster configuration include:

■ Increased availability

If the active instance fails for any reason or must be taken offline, an identically configured passive instance is prepared to take over at any time.

■ Reduced operating costs

In an active-passive configuration only one set of processes is up and serving requests. Management of the active instance is generally less than managing an array of active instances.

■ Application independence

Some applications may not be suited to an active-active configuration. This may include applications which rely heavily on application state or on information stored locally. An active-passive configuration has only one instance serving requests at any particular time.
In general, the term OracleAS Cold Failover Cluster describes clustering at the Oracle Application Server instance level. However, if it is necessary to call out the specific type of instances being clustered, this document will use OracleAS Cold Failover Cluster (*type*) to characterize the cluster solution. For example:

- OracleAS Cold Failover Cluster (Identity Management)
- OracleAS Cold Failover Cluster (Middle-Tier)

From the entry point of an Oracle Application Server system (content cache) to the back end layer (data sources), all the tiers that are crossed by a client request can be configured in a redundant manner either in an active-active configuration using OracleAS Clusters or in an active-passive configuration using OracleAS Cold Failover Clusters.

Refer to Chapter 11, "Installing in High Availability Environments: OracleAS Cold Failover Cluster" for installation details.

### 10.1.2 OracleAS Cluster

Oracle Application Server provides an active-active redundant model for all its components with OracleAS Cluster. In an OracleAS Cluster, two or more Oracle Application Server instances are configured to serve the same application workload. These instances can reside on the same machine or on different machines. The active instances may be front-ended by an external load balancer, which can redirect requests to any of the active instances, or by some other application-level configuration, such as address lists, to distribute the requests.

The most common properties of an OracleAS Cluster configuration include:

- Identical instance configuration
  
  The instances are meant to serve the same workload or application. Their configuration guarantees that they deliver the same exact reply to the same request. Some configuration properties may be identical and others may be instance-specific, such as local host name information.

- Managed collectively
  
  Changes made to one system will usually need to be propagated to the other systems in an active-active configuration.

- Operate independently
  
  In order to provide maximum availability, the loss of one Oracle Application Server instance in an active-active configuration should not affect the ability of the other instances to continue to serve requests.

The advantages of an OracleAS Cluster configuration include:

- Increased availability
  
  An active-active configuration is a redundant configuration. Loss of one instance can be tolerated because other instance can continue to serve the same requests.

- Increased scalability and performance
  
  Multiple identically-configured instances provide the capability to have a distributed workload shared among different machines and processes. If configured correctly, new instances can also be added as the demand of the application grows.

In general, the term OracleAS Cluster describes clustering at the Oracle Application Server instance level. However, if it is necessary to call out the specific type of
instances being clustered, this document will use OracleAS Cluster (*type*) to characterize the cluster solution. For example:

- two or more J2EE instances are known as OracleAS Cluster (J2EE)
- two or more OracleAS Portal instances are known as OracleAS Cluster (Portal)
- two or more Oracle Identity Management instances are known as OracleAS Cluster (Identity Management)

For details on OracleAS Cluster (Identity Management), see Chapter 12, "Installing in High Availability Environments: OracleAS Cluster (Identity Management)".

### 10.1.3 OracleAS Disaster Recovery

OracleAS Disaster Recovery configurations have the following characteristics:

- A production site and a standby site that mirrors the production site. Typically, these sites are located some distance from each other to guard against site failures such as floods, fires, or earthquakes. During normal operation, the production site handles all the requests. If the production site goes down, the standby site takes over and handles all the requests.

- Each site has all the hardware and software to run. It contains nodes for running OracleAS Infrastructure and the middle tiers; load balancers; and DNS servers.

OracleAS Disaster Recovery includes OracleAS Infrastructure and middle tiers. For details, see Chapter 13, "Installing in High Availability Environments: OracleAS Disaster Recovery".

### 10.1.4 Summary of Differences

Table 10–1 summarizes the differences among the high availability configurations.

<table>
<thead>
<tr>

</table>

### 10.2 Installation Order for High Availability Configurations

For all high availability configurations, you install the components in the following order:

1. OracleAS Metadata Repository
2. Oracle Identity Management components

If you are distributing the Oracle Identity Management components, you install them in the following order:
10.3 Requirements for High Availability Configurations

This section describes the requirements common to all high availability configurations. In addition to these common requirements, each configuration has its own specific requirements. Refer to the individual chapters for details.

The common requirements are:

- Section 10.3.1, “Check Minimum Number of Nodes”
- Section 10.3.2, “Check That Groups Are Defined Identically on All Nodes”
- Section 10.3.3, “Check the Properties of the oracle User”
- Section 10.3.4, “Check for Previous Oracle Installations on All Nodes”

10.3.1 Check Minimum Number of Nodes

You need at least two nodes in a high availability configuration. If a node fails for any reason, the second node takes over.

10.3.2 Check That Groups Are Defined Identically on All Nodes

Check that the /etc/group file on all nodes in the cluster contains the operating system groups that you plan to use. You should have one group for the oraInventory directory, and one or two groups for database administration. The group names and the group IDs must be the same for all nodes.

Refer to Section 4.6, "Operating System Groups" for details.

10.3.3 Check the Properties of the oracle User

Check that the oracle operating system user, which you log in as to install Oracle Application Server, has the following properties:

- Belongs to the oinstall group and to the osdba group. The oinstall group is for the oraInventory directory, and the osdba group is a database administration group. Refer to Section 4.6, "Operating System Groups" for details.
- Has write privileges on remote directories.

10.3.4 Check for Previous Oracle Installations on All Nodes

Check that all the nodes where you want to install in a high availability configuration do not have existing oraInventory directories.
Details of all Oracle software installations are recorded in the Oracle Installer Inventory directory. Typically, this directory is unique to a node and named `oraInventory`. The directory path of the Oracle Installer Inventory directory is stored in the `oraInst.loc` file.

The existence of this file on a node confirms that the node contains some Oracle software installation. Since the high availability configurations require installations on multiple nodes with Oracle Installer Inventory directories on a file system that may not be accessible on other nodes, the installation instructions in this chapter and subsequent chapters for high availability configurations assume that there have not been any previous installations of any Oracle software on any of the nodes that are used for this high availability configuration. The `oraInst.loc` file and the Oracle Installer Inventory directory should not exist on any of these nodes prior to these high availability installations.

To check if a node contains an `oraInventory` directory that could be detected by the installer:

1. On each node, check for the existence of the `oraInst.loc` file. This file is stored in the `/var/opt/oracle` directory.
   
   If a node does not contain this file, then it does not have an `oraInventory` directory that will be used by the installer. You can check the next node.

2. For nodes that contain the `oraInst.loc` file, rename the file and the `oraInventory` directory. The installer then prompts you to enter a location for a new `oraInventory` directory.

   For example enter the following commands as root:

   ```bash
   # cat /var/opt/oracle/oraInst.loc
   inventory_loc=/localfs/app/oracle/oraInventory
   inst_group=dba
   # mv /var/opt/oracle/oraInst.loc /var/opt/oracle/oraInst.loc.orig
   # mv /localfs/app/oracle/oraInventory /localfs/app/oracle/oraInventory.orig
   ```

Because the `oraInst.loc` file and the Oracle Installer Inventory directory are required only during the installation of Oracle software, and not at runtime, renaming them and restoring them later does not affect the behavior of any installed Oracle software on any node. Make sure that the appropriate `oraInst.loc` file and Oracle Installer Inventory directory are in place before starting the Oracle Universal Installer.

---

**Note:** For an OracleAS Disaster Recovery configuration, the correct `oraInst.loc` file and associated `oraInventory` directory are required during normal operation, not just during installation.
11.1 OracleAS Cold Failover Cluster: Introduction

In OracleAS Cold Failover Cluster configurations, you have an active and a passive node, and shared storage that can be accessed by either node.

During normal operation, the active node runs Oracle Application Server processes and processes requests from clients. If the active node fails, then a failover event
occurs. The passive node takes over and becomes the active node. It mounts the shared storage and runs the processes.

**Configurations**

You can install OracleAS Cold Failover Cluster in these configurations:

- OracleAS Cold Failover Cluster (Infrastructure). Refer to Section 11.3.
- Distributed OracleAS Cold Failover Cluster (Infrastructure). Refer to Section 11.4.
- OracleAS Cold Failover Cluster (Oracle Identity Management). Refer to Section 11.5.
- Distributed OracleAS Cold Failover Cluster (Oracle Identity Management). Refer to Section 11.6.
- OracleAS Cold Failover Cluster (Middle-Tier). Refer to Section 11.9.

### 11.2 Preinstallation Steps for OracleAS Cold Failover Cluster

Before installing Oracle Application Server in an OracleAS Cold Failover Cluster, perform these procedures:

- Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"
- Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"
- Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)"
- Section 11.2.4, "Check That Clusterware Is Running"

**Note:** In addition to the requirements listed in this chapter, ensure that you meet the requirements described in Section 10.3, "Requirements for High Availability Configurations".

### 11.2.1 Map the Virtual Hostname and Virtual IP Address

Each node in an OracleAS Cold Failover Cluster configuration is associated with its own physical IP address. In addition, the active node in the cluster is associated with a virtual hostname and virtual IP address. This allows clients to access the OracleAS Cold Failover Cluster using the virtual hostname.

Virtual hostnames and virtual IP addresses are any valid hostname and IP address in the context of the subnet containing the hardware cluster.

**Note:**

- Map the virtual hostname and virtual IP address only to the active node. Do not map the virtual hostname and IP address to both active and secondary nodes at the same time. When you failover, only then map the virtual hostname and IP address to the secondary node, which is now the active node.
- Before attempting to complete this procedure, ask the system or network administrator to review all the steps required. The procedure will reconfigure the network settings on the cluster nodes and may vary with differing network implementations.
The following example configures a virtual hostname called vhost.mydomain.com, with a virtual IP of 138.1.12.191:

1. Register the virtual hostname and IP address with DNS for the network.
   For example, register the vhost.mydomain.com/138.1.12.191 pair with DNS.

2. Add the following line to the /etc/hosts file on the active node:
   
   ip_address hostname.domain hostname

   For example:
   
   138.1.12.191 vhost.mydomain.com vhost

3. Determine the primary public network interface.
   The primary public network interface for Ethernet encapsulation is typically lan0 on HP-UX.

   /usr/bin/netstat -i

   Using this command, search for a network interface that has an Address value of the physical hostname of the node.

4. Find an available index number for the primary public network interface.

   Using the same command in step 3, determine an available index number for an additional IP address to the primary public network interface.

   For example, on HP-UX, if the following is the output of the /usr/bin/netstat -i command and lan0 is determined to be the primary public interface in step 3, then lan0:2 is available for an additional IP address.

<table>
<thead>
<tr>
<th>Name</th>
<th>Mtu</th>
<th>Network</th>
<th>Address</th>
<th>Ipkts</th>
<th>Opkts</th>
</tr>
</thead>
<tbody>
<tr>
<td>lan0:1</td>
<td>1500</td>
<td>datacenter1</td>
<td>www2.mydomain.com</td>
<td>1050265</td>
<td>734793</td>
</tr>
<tr>
<td>lan*:</td>
<td>1500</td>
<td>none</td>
<td>none</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>lan0</td>
<td>1500</td>
<td>datacenter1</td>
<td>www1.mydomain.com</td>
<td>39783928</td>
<td>41833023</td>
</tr>
<tr>
<td>lo0</td>
<td>4136</td>
<td>loopback</td>
<td>localhost</td>
<td>1226188</td>
<td>1226196</td>
</tr>
</tbody>
</table>

   Do not use 0 as the index number because interface:0 is typically the same as just interface on most systems. For example, lan0:0 is the same as lan0 on HP-UX.

5. Add the virtual IP address to the primary public network interface by running the following command, as the root user, using the available index number from step 4:

   /usr/sbin/ifconfig primary_public_interface:available_index ip_address

   For example, enter the following command if lan0:2 is available:

   /usr/sbin/ifconfig lan0:2 138.1.12.191

   **Note:** You must use the same NETMASK and BROADCAST values for this interface as those used for the primary public network interface (lan0 in this example). Modify the ifconfig commands in this step to include the appropriate netmask and broadcast options.
6. Check that the virtual IP address is configured correctly:

1. Use the instructions listed in step 3 to confirm the new entry for the primary public interface:available_index entry created in step 5.

2. Try to connect to the node using the virtual hostname and virtual IP address from another node. For example, entering both of the following commands from a different node should provide a login to the node you configured in this procedure:

   \texttt{telnet hostname.domain}
   \texttt{telnet ip_address}

   For example, enter:

   \texttt{telnet vhost.mydomain.com}
   \texttt{telnet 138.1.12.191}

\textbf{On Failover}

If the active node fails, then the secondary node takes over. If you do not have a clusterware agent to map the virtual IP from the failed node to the secondary node, then you have to do it manually. You have to remove the virtual IP mapping from the failed node, and map it to the secondary node.

1. On the failed node, remove the virtual IP address by running the following command as the root user:

   \texttt{/usr/sbin/ifconfig configured_interface down}

   For example, enter the following command if \texttt{lan0:2} is configured with the virtual IP address:

   \texttt{/usr/sbin/ifconfig lan0:2 down}

   \textbf{Note:} Use the commands in step 3 of the previous procedure to confirm that the virtual IP address has been removed.

2. On the secondary node, add the virtual IP address.

   On the secondary node, follow steps 2 to 6 of the previous procedure to add and confirm the virtual IP address on the secondary node.

\section*{11.2.2 Set Up a File System That Can Be Mounted from Both Nodes}

Although the hardware cluster has shared storage, you need to create a file system on this shared storage such that both nodes of the OracleAS Cold Failover Cluster can mount this file system. You will use this file system for the following directories:

- Oracle home directory for the Oracle Application Server instance
- The \texttt{oraInventory} directory

For disk space requirements, see \texttt{Section 4.2, "System Requirements"}.

If you are running a volume manager on the cluster to manage the shared storage, refer to the volume manager documentation for steps to create a volume. Once a volume is created, you can create the file system on that volume.
If you do not have a volume manager, you can create a file system on the shared disk directly. Ensure that the hardware vendor supports this, that the file system can be mounted from either node of the OracleAS Cold Failover Cluster, and that the file system is repairable from either node if a node fails.

To check that the file system can be mounted from either node, do the following steps:

1. Set up and mount the file system from node 1.
2. Unmount the file system from node 1.
3. Mount the file system from node 2 using the same mount point that you used in step 1.
4. Unmount it from node 2, and mount it on node 1, because you will be running the installer from node 1.

---

**Note:** Only one node of the OracleAS Cold Failover Cluster should mount the file system at any given time. File system configuration files on all nodes of the cluster should not include an entry for the automatic mount of the file system upon a node restart or execution of a global mount command. For example, on UNIX platforms, do not include an entry for this file system in `/etc/fstab` file.

---

### 11.2.3 Review Recommendations for Automatic Storage Management (ASM)

If you plan to use ASM instances for the OracleAS Metadata Repository database, consider these recommendations:

- If you plan to use ASM with Oracle database instances from multiple database homes on the same node, then you should run the ASM instance from an Oracle home that is different from the database homes.

- The ASM home should be installed on every cluster node. This prevents the accidental removal of ASM instances that are in use by databases from other homes during the de-installation of a database Oracle home.

### 11.2.4 Check That Clusterware Is Running

If you plan to automate failovers in the OracleAS Cold Failover Cluster, then each node in a cluster must be running hardware vendor clusterware.

To check that the clusterware is running, use the command appropriate for your clusterware.

### 11.3 Installing an OracleAS Cold Failover Cluster (Infrastructure) Configuration

Figure 11–1 shows an OracleAS Cold Failover Cluster (Infrastructure) configuration.
Figure 11–1 OracleAS Cold Failover Cluster (Infrastructure) Configuration

The figure shows:

- two nodes running clusterware
- storage devices local to each node
- storage device that can be accessed by both nodes. You install OracleAS Infrastructure on this shared storage device.

During normal operation, one node ("node 1") acts as the active node. It mounts the shared storage to access the OracleAS Infrastructure files, runs OracleAS Infrastructure processes, and handles all requests.

If the active node goes down for any reason, the clusterware fails over OracleAS Infrastructure processes to the other node ("node 2"), which now becomes the active node. It mounts the shared storage, runs the processes, and handles all requests.

These nodes appear as one computer to clients through the use of a virtual address. To access the OracleAS Infrastructure, clients, including middle-tier components and applications, use the virtual address associated with the cluster. The virtual address is associated with the active node (node 1 during normal operation, node 2 if node 1 goes down). Clients do not need to know which node (node 1 or node 2) is servicing requests.

You use the virtual hostname in URLs that access the infrastructure. For example, if vhost.mydomain.com is the virtual hostname, the URLs for the Oracle HTTP Server and the Application Server Control would look like the following:

<table>
<thead>
<tr>
<th>URL for</th>
<th>Example URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle HTTP Server, Welcome page</td>
<td><a href="http://vhost.mydomain.com:7777">http://vhost.mydomain.com:7777</a></td>
</tr>
<tr>
<td>Oracle HTTP Server, secure mode</td>
<td><a href="https://vhost.mydomain.com:4443">https://vhost.mydomain.com:4443</a></td>
</tr>
</tbody>
</table>
You can install and run the middle tiers on other nodes (nodes that are not running OracleAS Infrastructure). During installation, you set up the middle tiers to use services from the OracleAS Infrastructure installed on the shared storage device.

You can also install and run the middle tiers on the cluster nodes without using an OracleAS Cold Failover Cluster configuration for the middle tiers. In this case, you install middle tiers using the regular installation process. If you do this, make sure the middle tier ports will not conflict with the OracleAS Infrastructure ports when a failover occurs.

If you want to install and run the middle tiers in an OracleAS Cold Failover Cluster configuration on the same cluster that is running the OracleAS Infrastructure, see Section 11.10, "Installing OracleAS Cold Failover Cluster (Infrastructure) and OracleAS Cold Failover Cluster (Middle-Tier) on the Same Nodes".

### 11.3.1 OracleAS Cold Failover Cluster (Infrastructure): Overview of Installation Steps

To set up an OracleAS Cold Failover Cluster (Infrastructure) configuration, perform these steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1. Perform Preinstallation Steps | Pre-installation tasks, described in Section 11.2, include:  
  - Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"  
  - Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"  
  - Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)" |
| 2. Install OracleAS Infrastructure | Install OracleAS Infrastructure on the shared storage. |
| 3. Perform Post-Installation Steps | This post-installation step configures the CSS daemon. This step is required only if you are using ASM (Automatic Storage Management) feature of the Oracle database, and you do not have an existing Oracle database. |

### 11.3.2 OracleAS Cold Failover Cluster (Infrastructure): Details of Installation Steps

This section lists the steps for installing OracleAS Infrastructure in an OracleAS Cold Failover Cluster (Infrastructure) configuration.

**Step 1 Perform Preinstallation Steps**

Perform the preinstallation steps listed in Section 11.2, "Preinstallation Steps for OracleAS Cold Failover Cluster".

**Step 2 Install OracleAS Infrastructure**

For OracleAS Cold Failover Cluster (Infrastructure), you install both OracleAS Metadata Repository and Oracle Identity Management in the same Oracle home by selecting **Identity Management and OracleAS Metadata Repository** in the Select
Installing an OracleAS Cold Failover Cluster (Infrastructure) Configuration

Installation Type screen. This option creates a new database for the OracleAS Metadata Repository and a new Oracle Internet Directory.

**Key Points**

- The destination directory must be on the shared disk.
- Remember to select **High Availability and Replication** in the Select Configuration Options screen. By default, this option is not selected.
- You enter the virtual hostname in the Specify Virtual Hostname screen.

**Installer Screens**

Run the installer and follow the screen sequence shown in Table 11–2:

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start up the installer. Refer to Section 5.17, &quot;Starting Oracle Universal Installer&quot; for details.</td>
</tr>
<tr>
<td>2. Welcome</td>
<td>Click Next.</td>
</tr>
</tbody>
</table>
| 3. Specify Inventory Directory and Credentials | This screen appears only if this is the first installation of any Oracle product on this computer.  
**Enter the full path for the inventory directory**: Enter a full path to a directory where you want the installer to store its files. The installer uses these files to keep track of all Oracle products that are installed on this computer. Enter a directory that is different from the Oracle home directory.  
**Note**: You must enter a directory in the file system that can be mounted from either node in the OracleAS Cold Failover Cluster configuration.  
Example: /mnt/app/oracle/oraInventory  
**Specify operating system group name**: Select the operating system group that will have write permission for the inventory directory.  
Example: oinstall  
Click Next. |
| 4. Run orainstRoot.sh                       | This screen appears only if this is the first installation of any Oracle product on this computer.  
Run the orainstRoot.sh script in a different shell as the root user. The script is located in the oraInventory directory.  
After running the script, click Continue. |
| 5. Specify File Locations                   | **Name**: Enter a name to identify this Oracle home. The name can consist of alphanumeric and the underscore (_) characters only, and cannot be longer than 128 characters.  
Example: OH_INFRA  
**Destination Path**: Enter the full path to the destination directory. This is the Oracle home.  
**Note**:  
- You must enter a directory in the file system that can be mounted from either node in the OracleAS Cold Failover Cluster configuration.  
- You must enter a new Oracle home name and directory. Do not select an existing Oracle home from the drop down list.  
Example: /mnt/app/oracle/OraInfra  
Click Next. |
Installing in High Availability Environments: OracleAS Cold Failover Cluster

6. Select a Product to Install
   Select OracleAS Infrastructure to install an infrastructure.
   If you need to install additional languages, click Product Languages. Refer to Section 5.8, "Installing Additional Languages" for details.
   Click Next.

7. Select Installation Type
   Select Oracle Identity Management and OracleAS Metadata Repository. Click Next.
   If you get an error message saying that the TMP environment variable is not set, it means that the default temp directory does not have enough space. You can either set the TMP environment variable to point to a different directory or free up enough space in the default temp directory.
   For details on the TMP environment variable, see Section 4.8.5, "TMP and TMPDIR".

8. Confirm Pre-Installation Requirements
   Verify that you meet all the listed requirements, and click Next.

9. Select Configuration Options
   Select Oracle Internet Directory.
   Select Oracle Application Server Single Sign-On.
   Select Oracle Application Server Delegated Administration Services.
   Select Oracle Application Server Directory Integration and Provisioning.
   Select Oracle Application Server Certificate Authority (OCA) if you want a certificate authority.
   Select High Availability and Replication.
   Click Next.

10. Specify Port Configuration Options
    If you want to use default ports for the components, select Automatic.
    If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field.
    Click Next.

11. Select High Availability or Replication Option
    Select Virtual Host, and click Next.

12. Specify Namespace in Internet Directory
    Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm.
    Ensure the value shown in Suggested Namespace meets your deployment needs.
    If not, enter the desired value in Custom Namespace. Refer to Section 6.16, "What Do I Enter on the "Specify Namespace in Internet Directory" Screen?".
    Click Next.

13. Specify Virtual Hostname
    **Note:** This is a critical screen when installing the infrastructure in an OracleAS Cold Failover Cluster. If you do not see this screen, check the following:
    - Return to the Select High Availability or Replication Option screen and ensure that you selected Virtual Host.
    - Return to the Select Configuration Options screen and ensure that you selected High Availability and Replication.
    **Virtual Hostname:** Enter the virtual hostname for the OracleAS Cold Failover Cluster configuration.
    Example: vhost.mydomain.com
    Click Next.
Step 3  Perform Post-Installation Steps

The following step is required only if you meet both of these requirements:

- You plan to use the Automatic Storage Management (ASM) feature of Oracle Database 10g for the OracleAS Metadata Repository.
- Your computer does not have an existing Oracle Database 10g.
If you meet these requirements, you need to configure the Cluster Synchronization Services (CSS) daemon on the other node. The CSS daemon synchronizes ASM instances with the database instances that use the ASM instances for database file storage.

To configure the CSS daemon:

1. Stop all the processes in the OracleAS Cold Failover Cluster (Infrastructure) home.
2. Stop the CSS daemon. You can do this by running the following command as root:

   ```
   # /sbin/init.d/init.cssd stop
   ```

3. Fail over the IP and the disk to the other node.
4. On the other node, run the following command as root:

   ```
   # $ORACLE_HOME/root.sh
   ```

   ORACLE_HOME is where you installed the OracleAS Cold Failover Cluster (Infrastructure).

### 11.4 Installing a Distributed OracleAS Cold Failover Cluster (Infrastructure) Configuration

Figure 11–2 shows a distributed OracleAS Cold Failover Cluster (Infrastructure) configuration.

This configuration is similar to the configuration described in Section 11.3, "Installing an OracleAS Cold Failover Cluster (Infrastructure) Configuration", except that the OracleAS Single Sign-On and Oracle Delegated Administration Services components are installed separately on other nodes in an active-active configuration.
In a distributed OracleAS Cold Failover Cluster (Infrastructure) configuration, you run the OracleAS Metadata Repository, Oracle Internet Directory, and Oracle Directory Integration and Provisioning in an *active-passive* configuration.

However, the OracleAS Single Sign-On and Oracle Delegated Administration Services components run in an *active-active* configuration. You have a load balancer to direct requests to the nodes running these components.
11.4.1 Distributed OracleAS Cold Failover Cluster (Infrastructure): Overview of Installation Steps

To set up a distributed OracleAS Cold Failover Cluster (Infrastructure) configuration, perform these steps:

**Table 11–3 Overview of Installation Steps for Distributed OracleAS Cold Failover Cluster (Infrastructure)**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1. Perform Preinstallation Steps | Pre-installation tasks, described in Section 11.2, include:  
  - Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"  
  - Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"  
  - Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)"  
  - Section 11.2.4, "Check That Clusterware Is Running" |
| 2. Install OracleAS Infrastructure | In this step, you install OracleAS Infrastructure on the shared storage. You install all components except OracleAS Single Sign-On, Oracle Delegated Administration Services, and OCA. |
| 3. Perform Post-Installation Steps | This post-installation step configures the CSS daemon. This step is required only if you are using ASM (Automatic Storage Management) feature of the Oracle database, and you do not have an existing Oracle database. |

11.4.2 Distributed OracleAS Cold Failover Cluster (Infrastructure): Details of Installation Steps

**Step 1 Perform Preinstallation Steps**

Perform the preinstallation steps listed in Section 11.2, "Preinstallation Steps for OracleAS Cold Failover Cluster".

**Step 2 Install OracleAS Infrastructure**

In a distributed OracleAS Cold Failover Cluster (Infrastructure) configuration, you install both OracleAS Metadata Repository and Oracle Identity Management components (except for OracleAS Single Sign-On, Oracle Delegated Administration Services, and OCA) in the same Oracle home by selecting Identity Management and OracleAS Metadata Repository in the Select Installation Type screen. This option creates a new database for the OracleAS Metadata Repository and a new Oracle Internet Directory.

The steps are the same as those listed in step 2, "Install OracleAS Infrastructure" on page 11-7, except that in the Select Configuration Options screen, do not select OracleAS Single Sign-On, Oracle Application Server Delegated Administration Services, and OracleAS Certificate Authority (OCA).

**Step 3 Perform Post-Installation Steps**

The following step is required only if you meet both of these requirements:

- You plan to use the Automatic Storage Management (ASM) feature of Oracle Database 10g for the OracleAS Metadata Repository.
Your computer does not have an existing Oracle Database 10g.

If you meet these requirements, you need to configure the CSS daemon on the other node. The CSS daemon synchronizes ASM instances with the database instances that use the ASM instances for database file storage.

To configure the CSS daemon:

1. Stop all the processes in the OracleAS Cold Failover Cluster (Infrastructure) home.
2. Stop the CSS daemon. You can do this by running the following command as root:
   
   ```
   # /sbin/init.d/init.cssd stop
   ```
3. Fail over the IP and the disk to the other node.
4. On the other node, run the following command as root:

   ```
   $ORACLE_HOME/root.sh
   ```

   `$ORACLE_HOME` is where you installed the OracleAS Cold Failover Cluster (Infrastructure).

**Step 4  Install OracleAS Single Sign-On and Oracle Delegated Administration Services**

You install OracleAS Single Sign-On and Oracle Delegated Administration Services on the local disks of each node. You perform these installations separately.

**Preinstallation Steps**

This installation is actually an OracleAS Cluster (Identity Management) installation. As such, you perform the OracleAS Cluster (Identity Management) setup steps in Chapter 12, "Installing in High Availability Environments: OracleAS Cluster (Identity Management)":

- Section 12.2.1, "Use the Same Path for the Oracle Home Directory (recommended)"
- Section 12.2.2, "Synchronize Clocks on All Nodes"
- Section 12.2.3, "Configure Virtual Server Names and Ports for the Load Balancer"
- Section 12.2.5, "Set up Cookie Persistence on the Load Balancer"

**Installation Steps**

The steps are the same as those listed in Section 12.6.5, "Installing OracleAS Single Sign-On and Oracle Delegated Administration Services on Each Node".

### 11.5 Installing an OracleAS Cold Failover Cluster (Oracle Identity Management) Configuration

Figure 11–3 shows an OracleAS Cold Failover Cluster (Oracle Identity Management) configuration.

This configuration is suitable if you have the OracleAS Metadata Repository database in a separate highly available environment and you want to use an active-passive configuration for the Oracle Identity Management components. You install the Oracle Identity Management components on a shared disk different from the share disk that contains the OracleAS Metadata Repository database.

This configuration includes:
Installing an OracleAS Cold Failover Cluster (Oracle Identity Management) Configuration

- two clustered nodes
- storage devices local to each node
- two shared disks that can be accessed by both nodes. One shared disk contains the Oracle home for the database (on which you will load the OracleAS Metadata Repository), and on the other shared disk, you will install Oracle Identity Management.

During normal operation, node 1, which is the primary node, is the active node. It mounts both shared disks to access the Oracle Identity Management and database files, runs the Oracle Identity Management and database processes, and handles all requests.

If node 1 goes down for any reason, the clusterware fails over the Oracle Identity Management and database processes to node 2. Node 2 becomes the active node, mounts both shared disks, runs the processes, and handles all requests.

To access the active node in an OracleAS Cold Failover Cluster, clients, including middle-tier components and applications, use the virtual hostname associated with the OracleAS Cold Failover Cluster. The virtual hostname is associated with the active node (node 1 during normal operation, node 2 if node 1 goes down). Clients do not need to know which node (primary or secondary) is servicing requests.

You also use the virtual hostname in URLs that access the infrastructure. For example, if vhost.mydomain.com is the name of the virtual host, the URLs for the Oracle HTTP Server and the Application Server Control would look like the following:

<table>
<thead>
<tr>
<th>URL for:</th>
<th>Example URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle HTTP Server, Welcome page</td>
<td><a href="http://vhost.mydomain.com:7777">http://vhost.mydomain.com:7777</a></td>
</tr>
<tr>
<td>Oracle HTTP Server, secure mode</td>
<td><a href="https://vhost.mydomain.com:4443">https://vhost.mydomain.com:4443</a></td>
</tr>
<tr>
<td>Application Server Control</td>
<td><a href="http://vhost.mydomain.com:1156">http://vhost.mydomain.com:1156</a></td>
</tr>
</tbody>
</table>
11.5.1 OracleAS Cold Failover Cluster (Oracle Identity Management): Overview of Installation Steps

To create an OracleAS Cold Failover Cluster (Oracle Identity Management) configuration against an existing cold failover cluster database, perform these steps:

Table 11–4 Overview of Installation Steps for OracleAS Cold Failover Cluster (Oracle Identity Management) Configuration

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1.   | Perform Preinstallation Steps  
Pre-installation tasks, described in Section 11.2, include:  
- Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"  
- Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"  
- Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)"  
- Section 11.2.4, "Check That Clusterware Is Running"  
2.   | Install OracleAS Metadata Repository  
Install OracleAS Metadata Repository on your existing cold failover cluster database.  
3.   | Install the Oracle Identity Management Components  
Install the Oracle Identity Management components. |
11.5.2 OracleAS Cold Failover Cluster (Oracle Identity Management): Details of Installation Steps

Perform the following steps to install Oracle Application Server in an OracleAS Cold Failover Cluster (Oracle Identity Management) configuration.

**Step 1 Perform Preinstallation Steps**
Perform the preinstallation steps listed in Section 11.2, "Preinstallation Steps for OracleAS Cold Failover Cluster".

**Step 2 Install OracleAS Metadata Repository**
Use the OracleAS Metadata Repository Creation Assistant to install the OracleAS Metadata Repository in an existing database. Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details.

If you do not have an existing database, you can use the installer to create one. Note that you have to create the database with a virtual hostname. Refer to Section 11.8, "Installing Only the OracleAS Metadata Repository in an OracleAS Cold Failover Cluster Environment" for details.

**Step 3 Install the Oracle Identity Management Components**
You install the Oracle Identity Management on the other shared disk. Follow the installation steps described in Table 11–5.

**Key Points**

- When the installer prompts you for the Oracle home path, enter a path on the shared disk. Make sure that both nodes can access this path.
- In the Select High Availability or Replication Option screen, select Virtual Host.
- In the Specify Virtual Hostname screen, enter the virtual hostname.

**Installer Screens**

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start up the installer and complete the first few screens. Refer to Section 6.27, &quot;Install Fragment: The First Few Screens of the Installation&quot; for details. Note: In the Select Installation Type screen, select Oracle Identity Management.</td>
</tr>
<tr>
<td>3. Specify Port Configuration Options</td>
<td>If you want to use default ports for the components, select Automatic. If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field. Click Next.</td>
</tr>
</tbody>
</table>
11.6 Installing a Distributed OracleAS Cold Failover Cluster (Oracle Identity Management) Configuration

This configuration is suitable:

4. Specify Repository
   **Username:** Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges.
   **Password:** Enter the user’s password.
   **Hostname and Port:** Enter the name of the computer where the database is running, and the port number at which it is listening. Use the format: `host:port`.
   **Service Name:** Enter the service name of the database. Note that the service name must include the database domain name.
   Example: `orcl.mydomain.com`
   Click Next.

5. Select High Availability or Replication Option
   Select Virtual Host, and click Next.

6. Specify Namespace in Internet Directory
   Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm.
   Ensure the value shown in Suggested Namespace meets your deployment needs. If not, enter the desired value in Custom Namespace. Refer to Section 6.16, "What Do I Enter on the "Specify Namespace in Internet Directory" Screen?".
   Click Next.

7. Specify Virtual Hostname
   **Note:** This is a critical screen when installing the infrastructure in an OracleAS Cold Failover Cluster. If you do not see this screen, check the following:
   - Return to the "Select High Availability or Replication Option" screen and ensure that you selected Virtual Host.
   - Return to the Select Configuration Options screen and ensure that you selected High Availability and Replication.
   **Virtual Hostname:** Enter the virtual hostname for the OracleAS Cold Failover Cluster configuration.
   Example: `vhost.mydomain.com`
   Click Next.

8. OCA screens
   If you selected Oracle Application Server Certificate Authority (OCA) in the Select Configuration Options screen, the installer displays screens for configuring OCA. Refer to Section 6.30, "Install Fragment: OCA Screens" for details.

9. Specify Instance Name and ias_admin Password
   **Instance Name:** Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.
   Example: `id_mgmt`
   **ias_admin Password** and **Confirm Password:** Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for restrictions on the password.
   Example: `welcome99`
   Click Next.

10. --
    Finish the installation. Refer to Section 6.28, "Install Fragment: The Last Few Screens of the Installation" for details.
Installing in High Availability Environments: OracleAS Cold Failover Cluster

If you want to run Oracle Internet Directory and Oracle Directory Integration and Provisioning on the same tier as your database, and Oracle Delegated Administration Services and OracleAS Single Sign-On on a different tier.

If you want to install the OracleAS Metadata Repository in an existing cold failover cluster database.

Figure 11–4 shows a distributed OracleAS Cold Failover Cluster (Oracle Identity Management) configuration.

It consists of:

- Two nodes running Oracle Delegated Administration Services and OracleAS Single Sign-On. These nodes are accessed through a load balancer.
- Two nodes running clusterware. These nodes will run the existing cold failover cluster database, Oracle Internet Directory, and Oracle Directory Integration and Provisioning.
- Storage devices local to each node.
- Two shared disks. One shared disk contains the database Oracle home. On the other shared disk, you will install Oracle Internet Directory and Oracle Directory Integration and Provisioning.
- Firewalls to separate the tiers.

**Tier Running the Oracle Internet Directory, Oracle Directory Integration and Provisioning, and Database**

In this tier, during normal operation, the active node mounts the shared disks to access the Oracle Identity Management and database; runs the Oracle Internet Directory, Oracle Directory Integration and Provisioning, and database processes; and handles all requests.

If the active node goes down for any reason, the clusterware fails over the processes to the secondary node (node 2), which becomes the new active node, mounts the shared disks, runs the processes, and handles all requests.

To access the active node, clients, including middle-tier components and applications, use the virtual hostname. The virtual hostname is associated with the active node (which is the primary node during normal operation, the secondary node upon failover). Clients do not need to know which node (primary or secondary) is servicing requests.

You need to use the virtual hostname in URLs to access the active node. For example, if vhost.mydomain.com is the virtual hostname, the URLs for the Oracle HTTP Server and the Application Server Control for this tier would look like the following:

<table>
<thead>
<tr>
<th>URL for:</th>
<th>Example URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle HTTP Server, Welcome page</td>
<td><a href="http://vhost.mydomain.com:7777">http://vhost.mydomain.com:7777</a></td>
</tr>
<tr>
<td>Oracle HTTP Server, secure mode</td>
<td><a href="https://vhost.mydomain.com:4443">https://vhost.mydomain.com:4443</a></td>
</tr>
<tr>
<td>Application Server Control</td>
<td><a href="http://vhost.mydomain.com:1156">http://vhost.mydomain.com:1156</a></td>
</tr>
</tbody>
</table>

**Tier Running Oracle Delegated Administration Services and OracleAS Single Sign-On**

Note that the nodes in this tier are not clustered. Both nodes are active at the same time, and you install the files locally on each node. To access these nodes, clients go through a load balancer. For example, if the name of the load balancer is
loadbalance1.mydomain.com, the URLs for the Oracle HTTP Server and the Application Server Control for this tier would look like the following:

<table>
<thead>
<tr>
<th>URL for:</th>
<th>Example URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle HTTP Server, Welcome page</td>
<td><a href="http://vhost.mydomain.com:7777">http://vhost.mydomain.com:7777</a></td>
</tr>
<tr>
<td>Oracle HTTP Server, secure mode</td>
<td><a href="https://vhost.mydomain.com:4443">https://vhost.mydomain.com:4443</a></td>
</tr>
<tr>
<td>Application Server Control</td>
<td><a href="http://vhost.mydomain.com:1156">http://vhost.mydomain.com:1156</a></td>
</tr>
</tbody>
</table>

**Figure 11–4  Distributed OracleAS Cold Failover Cluster (Oracle Identity Management) Configuration**

Distributed OracleAS Cold Failover Cluster (Identity Management) Configuration

On this tier, Identity Management includes:
- OracleAS Single Sign-On
- Oracle Delegated Administration Services

Note that the nodes in this tier are active-active.

11.6.1 Distributed OracleAS Cold Failover Cluster (Oracle Identity Management): Overview of Installation Steps

To create a distributed OracleAS Cold Failover Cluster (Oracle Identity Management) configuration against an existing cold failover cluster database, perform these steps:
Table 11–6 Overview of Installation Steps for Distributed OracleAS Cold Failover Cluster (Oracle Identity Management) Configuration

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Perform Preinstallation Steps</td>
<td>Pre-installation tasks, described in Section 11.2, include:</td>
</tr>
<tr>
<td></td>
<td>■ Section 11.2.1, &quot;Map the Virtual Hostname and Virtual IP Address&quot;</td>
</tr>
<tr>
<td></td>
<td>■ Section 11.2.2, &quot;Set Up a File System That Can Be Mounted from Both Nodes&quot;</td>
</tr>
<tr>
<td></td>
<td>■ Section 11.2.3, &quot;Review Recommendations for Automatic Storage Management (ASM)&quot;</td>
</tr>
<tr>
<td></td>
<td>■ Section 11.2.4, &quot;Check That Clusterware Is Running&quot;</td>
</tr>
<tr>
<td>2. Install OracleAS Metadata Repository</td>
<td>Install OracleAS Metadata Repository on your existing cold failover cluster database.</td>
</tr>
</tbody>
</table>

11.6.2 Distributed OracleAS Cold Failover Cluster (Oracle Identity Management): Details of Installation Steps

Step 1 Perform Preinstallation Steps
Perform the preinstallation steps listed in Section 11.2, "Preinstallation Steps for OracleAS Cold Failover Cluster".

Step 2 Install OracleAS Metadata Repository
Use the OracleAS Metadata Repository Creation Assistant to install the OracleAS Metadata Repository in an existing database. Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details.

If you do not have an existing database, you can use the installer to create one. Note that you have to create the database with a virtual hostname. The database should run in an active-passive configuration, typically on a hardware cluster. Refer to Section 11.8, "Installing Only the OracleAS Metadata Repository in an OracleAS Cold Failover Cluster Environment" for details.

Step 3 Install Oracle Internet Directory and Oracle Directory Integration and Provisioning
Install the Oracle Internet Directory and Oracle Directory Integration and Provisioning components on the other shared disk. Follow the installation steps described in Table 11–7.

Key Points
- In the Select Installation Type screen, select Oracle Identity Management.
- In the Select Configuration Options screen, select Oracle Internet Directory, Oracle Application Server Directory Integration and Provisioning, and High Availability and Replication.
- In the Select High Availability or Replication Option screen, select Virtual Host.
- In the Specify Virtual Hostname screen, enter the virtual hostname.
### Installer Screens

#### Table 11–7 Installing Oracle Internet Directory and Oracle Directory Integration and Provisioning

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. -- | Start up the installer and complete the first few screens. Refer to Section 6.27, “Install Fragment: The First Few Screens of the Installation” for details.  
Note: In the Select Installation Type screen, select Oracle Identity Management. |
| 2. Select Configuration Options | Select Oracle Internet Directory.  
Do not select Oracle Application Server Single Sign-On.  
Do not select Oracle Application Server Delegated Administration Services.  
Select Oracle Application Server Directory Integration and Provisioning.  
Do not select Oracle Application Server Certificate Authority (OCA).  
Select High Availability and Replication.  
Click Next. |
| 3. Specify Port Configuration Options | If you want to use default ports for the components, select Automatic.  
If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field.  
Click Next. |
| 4. Specify Repository | Username: Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges.  
Password: Enter the user’s password.  
Hostname and Port: Enter the name of the computer where the database is running, and the port number at which it is listening. Use the format: \host:\port.  
Service Name: Enter the service name of the database. Note that the service name must include the database domain name.  
Example: orcl.mydomain.com  
Click Next. |
| 5. Select High Availability or Replication Option | Select Virtual Host, and click Next. |
| 6. Specify Namespace in Internet Directory | Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm.  
Ensure the value shown in Suggested Namespace meets your deployment needs.  
If not, enter the desired value in Custom Namespace. Refer to Section 6.16, "What Do I Enter on the "Specify Namespace in Internet Directory” Screen?”.  
Click Next. |
Installing Oracle Delegated Administration Services and OracleAS Single Sign-On in an OracleAS Cold Failover Cluster

Step 4 Install OracleAS Single Sign-On and Oracle Delegated Administration Services

Install these components in an OracleAS Cluster (Identity Management) configuration. In this configuration, you install them on the local disks of each node. You perform these installations separately.

Preinstallation steps: Because this installation is actually an OracleAS Cluster (Identity Management) installation, you can follow the OracleAS Cluster (Identity Management) setup steps in Chapter 12, "Installing in High Availability Environments: OracleAS Cluster (Identity Management)"

- Section 12.2.1, "Use the Same Path for the Oracle Home Directory (recommended)"
- Section 12.2.2, "Synchronize Clocks on All Nodes"
- Section 12.2.3, "Configure Virtual Server Names and Ports for the Load Balancer"
- Section 12.2.5, "Set up Cookie Persistence on the Load Balancer"

Installation steps: The installation steps are described in Section 12.6.5, "Installing OracleAS Single Sign-On and Oracle Delegated Administration Services on Each Node".

11.7 Installing Oracle Delegated Administration Services and OracleAS Single Sign-On in an OracleAS Cold Failover Cluster

The configuration described in this section is similar to that described in Section 11.4, "Installing a Distributed OracleAS Cold Failover Cluster (Infrastructure) Configuration". The difference is that in the configuration described in this section,
OracleAS Single Sign-On and Oracle Delegated Administration Services run in an OracleAS Cold Failover Cluster configuration.

You need two sets of clustered nodes. Refer to Figure 11–5. One set runs the OracleAS Metadata Repository and Oracle Internet Directory, and another set runs Oracle Delegated Administration Services and OracleAS Single Sign-On.

For each set, you need a shared storage and a virtual hostname. You install Oracle homes for the various Oracle Application Server components on the shared storage.

**Figure 11–5 Oracle Delegated Administration Services and OracleAS Single Sign-On in a Cold Failover Cluster**
11.7.1 Oracle Delegated Administration Services and OracleAS Single Sign-On in OracleAS Cold Failover Cluster: Overview of Installation Steps

Table 11–8 Overview of Steps for Installing Oracle Delegated Administration Services and OracleAS Single Sign-On in an OracleAS Cold Failover Cluster

<table>
<thead>

11.7.2 Oracle Delegated Administration Services and OracleAS Single Sign-On in OracleAS Cold Failover Cluster: Details of Installation Steps

**Step 1 Perform Preinstallation Steps**
Perform the preinstallation steps listed in Section 11.2, "Preinstallation Steps for OracleAS Cold Failover Cluster".

**Step 2 (optional) Create staticports.ini Files**
If you wish, you may set up two staticports.ini files, one for each set of nodes. For information on staticports.ini, see Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)".
Step 3  Install OracleAS Metadata Repository and Oracle Internet Directory

Install OracleAS Metadata Repository and Oracle Internet Directory in the same Oracle home by selecting Identity Management and OracleAS Metadata Repository in the Select Installation Type screen. This option creates a new database for the OracleAS Metadata Repository and a new Oracle Internet Directory.

The steps are the same as those listed in step 2, "Install OracleAS Infrastructure" on page 11-7, with these differences:

- In the Select Configuration Options screen, select these components/options:
  - Oracle Internet Directory
  - Oracle Application Server Directory Integration and Provisioning
  - High Availability and Replication

Do not select these components:

- Oracle Application Server Single Sign-On
- Oracle Application Server Delegated Administration Services
- Oracle Application Server Certificate Authority (OCA)

- In the Specify Port Configuration Options screen, select Manual and enter the fullpath to the staticports.ini file that you created in the previous step.

Step 4  Install Oracle Delegated Administration Services and OracleAS Single Sign-On from Node 3

From node 3, install Oracle Delegated Administration Services and OracleAS Single Sign-On on the shared disk by following the steps in Table 11–9.

Key Points

- When the installer prompts you for the Oracle home path, enter a path on the shared disk. Make sure that both nodes can access this path.
- In the Select High Availability or Replication Option screen, select Virtual Host.
- In the Specify Virtual Hostname screen, enter the virtual hostname.
Table 11–9 Installing Oracle Delegated Administration Services and OracleAS Single Sign-On

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1. -- | Start up the installer and complete the first few screens. Refer to Section 6.27, "Install Fragment: The First Few Screens of the Installation" for details.  
Note:  
In the Select Installation Type screen, select Oracle Identity Management. |
| 2. Select Configuration Options | Do not select Oracle Internet Directory.  
Select Oracle Application Server Single Sign-On.  
Select Oracle Application Server Delegated Administration Services.  
Do not select Oracle Application Server Directory Integration and Provisioning.  
Do not select Oracle Application Server Certificate Authority (OCA).  
Select High Availability and Replication.  
Click Next. |
| 3. Specify Port Configuration Options | Select Manual and enter the fullpath to your staticports.ini file in the provided field. You created the staticports.ini file in step 2, "(optional) Create staticports.ini Files" on page 11-25.  
Click Next. |
| 4. Select High Availability or Replication Option | Select Virtual Host, and click Next. |
| 5. Register with Oracle Internet Directory | Enter connect information for the Oracle Internet Directory that you installed earlier.  
Hostname: Enter the virtual hostname to access the Oracle Internet Directory host.  
Port: Enter the port on which Oracle Internet Directory is listening. Refer to Section 6.17, "How to Determine Port Numbers Used by Components" if you do not know the port number.  
Use Only SSL Connections with this Oracle Internet Directory: Select this option if you want to use only SSL to connect to Oracle Internet Directory.  
Click Next. |
| 6. Specify Oracle Internet Directory Login | Username: Enter the username to log in to the Oracle Internet Directory.  
Password: Enter the password for the username.  
Realm: Enter the realm against which to validate the username. This field appears only if your Oracle Internet Directory has multiple realms.  
Click Next. |
Table 11–9  (Continued)Installing Oracle Delegated Administration Services and OracleAS Single Sign-On

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
</table>
| 7. Specify Virtual Hostname | Note: This is a critical screen when installing in an OracleAS Cold Failover Cluster. If you do not see this screen, check the following:  
  ■ Return to the Select High Availability or Replication Option screen and ensure that you selected Virtual Host.  
  ■ Return to the Select Configuration Options screen and ensure that you selected High Availability and Replication.  
  Virtual Hostname: Enter the virtual hostname for the OracleAS Cold Failover Cluster configuration.  
  Example: vhost_2.mydomain.com  
  Click Next. |
| 8. Specify Instance Name and ias_admin Password | Instance Name: Enter a name for the instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, “Oracle Application Server Instances and Instance Names” for instance name details.  
  Example: sso_das  
  ias_admin Password and Confirm Password: Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, “The ias_admin User and Restrictions on its Password” for restrictions on the password.  
  Example: welcome99  
  Click Next. |
| 9. -- | Finish the installation. Refer to Section 6.28, “Install Fragment: The Last Few Screens of the Installation” for details. |

Step 5  Stop the OracleAS Infrastructure Processes on Node 1
Stop the processes that are running in the Oracle home where you installed the OracleAS Metadata Repository and Oracle Internet Directory.

1. Stop the Application Server Control.
   
   prompt> ORACLE_HOME/bin/emctl stop iasconsole

2. Stop the components.
   
   prompt> ORACLE_HOME/opmn/bin/opmnctl stopall

3. Stop the OracleAS Metadata Repository.
   a. Set the ORACLE_HOME environment variable to the OracleAS Infrastructure home.

   b. Set the ORACLE_SID environment variable to the SID of the OracleAS Metadata Repository (for example, orcl).

   c. Stop the OracleAS Metadata Repository instance.

      prompt> ORACLE_HOME/bin/sqlplus /nolog
      SQL> connect SYS as SYSDBA
      SQL> shutdown
      SQL> quit

   d. Stop the listener.

      prompt> ORACLE_HOME/bin/lsnrctl stop
e. Stop the Oracle Enterprise Manager 10g 10g Database Control.
   
   prompt> ORACLE_HOME/bin/emctl stop dbconsole

Step 6  Stop the OracleAS Infrastructure Processes on Node 3

Stop the processes that are running in the Oracle home where you installed Oracle Delegated Administration Services and OracleAS Single Sign-On.

1. Stop the Application Server Control.
   
   prompt> ORACLE_HOME/bin/emctl stop iasconsole

2. Stop the components.
   
   prompt> ORACLE_HOME/opmn/bin/opmnctl stopall

Step 7  Perform Post-Installation Steps

The following step is required only if you meet both of these requirements:

- You plan to use the Automatic Storage Management (ASM) feature of Oracle Database 10g for the OracleAS Metadata Repository.
- Your computer does not have an existing Oracle Database 10g.

If you meet these requirements, you need to configure the CSS daemon on the other node. The CSS daemon synchronizes ASM instances with the database instances that use the ASM instances for database file storage.

To configure the CSS daemon:

1. Stop all the processes in the OracleAS Cold Failover Cluster (Infrastructure) home.

2. Stop the CSS daemon. You can do this by running the following command as root.
   
   # /sbin/init.d/init.cssd stop

3. Fail over the IP and the disk to the other node.

4. On the other node, run the following command as root:
   
   # $ORACLE_HOME/root.sh

   ORACLE_HOME is where you installed the OracleAS Cold Failover Cluster (Infrastructure).

11.8 Installing Only the OracleAS Metadata Repository in an OracleAS Cold Failover Cluster Environment

This section describes how to install the OracleAS Metadata Repository in a new database (that is, the installer will create a new database for you and populate it with the OracleAS Metadata Repository). You can use this database in an OracleAS Cold Failover Cluster environment.

Prerequisites:

- Check that you have configured a virtual hostname and virtual IP.
## Table 11–10 Installing the OracleAS Metadata Repository Only

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <strong>Start up the installer and complete the first few screens. Refer to Section 6.27, “Install Fragment: The First Few Screens of the Installation” for details.</strong>&lt;br&gt;Note: In the Select Installation Type screen, select Oracle Identity Management and Metadata Repository. Note: Do not select the Metadata Repository option. This option creates a new database with the OracleAS Metadata Repository, but this database is not configured for OracleAS Cold Failover Cluster.</td>
<td></td>
</tr>
<tr>
<td>2. <strong>Select Configuration Options</strong>&lt;br&gt;Do not select Oracle Internet Directory.&lt;br&gt;Do not select Oracle Application Server Single Sign-On.&lt;br&gt;Do not select Oracle Application Server Delegated Administration Services.&lt;br&gt;Do not select Oracle Application Server Directory Integration and Provisioning.&lt;br&gt;Do not select Oracle Application Server Certificate Authority (OCA).&lt;br&gt;Select High Availability and Replication.&lt;br&gt;Click Next.</td>
<td></td>
</tr>
<tr>
<td>3. <strong>Specify Port Configuration Options</strong>&lt;br&gt;Select Automatic.&lt;br&gt;Click Next.</td>
<td></td>
</tr>
<tr>
<td>4. <strong>Select High Availability Option</strong>&lt;br&gt;Select Virtual Host.&lt;br&gt;Click Next.</td>
<td></td>
</tr>
<tr>
<td>5. <strong>Register Oracle Application Server Metadata Repository</strong>&lt;br&gt;If you already have an Oracle Internet Directory and know its connect information, select Yes and enter the name of the computer where Oracle Internet Directory is running and the port number. Refer to Section 6.17, “How to Determine Port Numbers Used by Components” if you do not know the port number.&lt;br&gt;<strong>Use Only SSL Connections with this Oracle Internet Directory</strong>: Select this option if you want Oracle Application Server components to use only SSL to connect to Oracle Internet Directory.&lt;br&gt;If you do not have an Oracle Internet Directory, or do not know its connect information, select No.&lt;br&gt;Click Next.</td>
<td></td>
</tr>
<tr>
<td>6. <strong>Specify Oracle Internet Directory login</strong>&lt;br&gt;This screen appears only if you selected Yes in the previous screen.&lt;br&gt;<strong>Username</strong>: Enter the username for logging into Oracle Internet Directory. The user must belong to the iAS Admins group in Oracle Internet Directory.&lt;br&gt;<strong>Password</strong>: Enter the password.&lt;br&gt;<strong>Realm</strong>: This field appears only if your Oracle Internet Directory contains multiple realms. Enter the name of the realm against which to authenticate the user.&lt;br&gt;Click Next.</td>
<td></td>
</tr>
<tr>
<td>7. <strong>Specify Virtual Hostname</strong>&lt;br&gt;<strong>Virtual Hostname</strong>: Enter the name of the virtual host.&lt;br&gt;Click Next.</td>
<td></td>
</tr>
</tbody>
</table>
You can also install Oracle Application Server middle tiers in an OracleAS Cold Failover Cluster configuration with separate Oracle Homes on the local storage of each node (see Figure 11–6) or a single Oracle Home on a shared disk (see Figure 11–7).

OracleAS Cold Failover Cluster (Middle-Tier) configurations have an active node and a passive node. Unlike OracleAS Cold Failover Cluster (Infrastructure), you can install OracleAS Cold Failover Cluster (Middle-Tier) on a shared disk or you can install in separate Oracle Homes, one on each node of the cluster. Each installation option for OracleAS Cold Failover Cluster (Middle-Tier) has different benefits:

- A single Oracle Home installation is easier to manage, patch, and maintain because you only need to update the configuration on one Oracle Home.
- Separate Oracle Homes allow for rolling upgrades and patches of the instance.

Note that single Oracle Home install is not supported for installations that include OracleAS Wireless.

The following sections contain instructions for installing OracleAS Cold Failover Cluster (Middle-Tier):

- Section 11.9.1, "Installing in Separate Oracle Homes"
- Section 11.9.2, "Installing in a Single Oracle Home"

Additionally, instructions for expanding an existing installation are in the following section:

- Section 11.9.3, "Expanding the Middle Tiers"

Virtual Hostname

Clients access the active node (for example, node 1) using the virtual hostname (vhost_mt.mydomain.com in Figure 11–6 and Figure 11–7). If node 1 fails, the virtual hostname points to node 2, and node 2 becomes the active node.
11.9.1 Installing in Separate Oracle Homes

To install OracleAS Cold Failover Cluster (Middle-Tier) in separate Oracle Homes, perform the following steps.
11.9.1.1 Preinstallation Steps
Before installing the middle tier, perform the following generic preinstallation steps listed in the following sections:

- Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"
- Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"
- Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)"
- Section 11.2.4, "Check That Clusterware Is Running"

In addition, you also need to perform the following steps:

- Section 11.9.1.1.1, "Set up staticports.ini File"
- Section 11.9.1.1.2, "Create an Alias for the Hostnames"

11.9.1.1.1 Set up staticports.ini File
Both installations must use the same ports. To do this, set up a staticports.ini file to use when installing the middle tiers. Refer to Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details on creating the staticports.ini file.

**Note:** The ports used for the middle tiers must be different from the ones used for the infrastructure installed on the same cluster.

11.9.1.1.2 Create an Alias for the Hostnames
If you plan to include OracleAS Web Cache in the Oracle Application Server instances, you should create an alias for the hostnames.

You do this by adding a line to the /etc/hosts file on each node.

Lines in the hosts file have the following format. You can have one or more aliases.

```
ip_address official_hostname aliases...
```

For example, if the nodes are called node1 and node2, and you want the alias to be called cfcwebcache, then you would add these lines to the hosts file:

- In the hosts file on node1, add this line:
  
  `123.45.67.22  node1.mydomain.com  node1  cfcwebcache.mydomain.com`

- In the hosts file on node2, add this line:
  
  `123.45.67.33  node2.mydomain.com  node2  cfcwebcache.mydomain.com`

11.9.1.2 Installing the Middle Tiers
Install the middle tiers on the local storage of each node.

**Tip:** To save time, you can install the middle tiers on both nodes at the same time, instead of doing them sequentially.

Note the following when performing the installations:
Use the same Oracle home paths for both installations.

Specify the staticports.ini file that you created in Section 11.9.1.1, "Preinstallation Steps" during the installation.

Use the same instance name for both installations. This is not mandatory, but recommended.

To install J2EE and Web Cache middle tiers, see Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access".

To install Portal and Wireless or Business Intelligence and Forms middle tiers, see Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".

11.9.1.3 Postinstallation Steps

Before the middle tiers can run in cold failover cluster mode, perform the following post-installation steps:

- Section 11.9.1.3.1, "(optional) Configure the Middle-Tier Instances to Use SSL"
- Section 11.9.1.3.2, "Back up the Installations (Middle-Tier and OracleAS Infrastructure)"
- Section 11.9.1.3.3, "Enable the Virtual IP for the OracleAS Cold Failover Cluster (Middle-Tier) on the Active Node"
- Section 11.9.1.3.4, "(optional) Create a File System on the Shared Disk for OracleAS JMS File-Based Persistence"
- Section 11.9.1.3.5, "Update Component Configuration on Node 1"
- Section 11.9.1.3.6, "Update Component Configuration on Node 2"
- Section 11.9.1.3.7, "Back up Files"

The last section, Section 11.9.1.3.8, "Restoring Files to a Known State", describes how to revert to a known state if an unrecoverable error occurred during conversion.

11.9.1.3.1 (optional) Configure the Middle-Tier Instances to Use SSL

If you want the middle-tier instances to use SSL, follow the steps in the Oracle Application Server Administrator’s Guide. You should perform this SSL configuration before you configure the middle tiers for OracleAS Cold Failover Cluster.

11.9.1.3.2 Back up the Installations (Middle-Tier and OracleAS Infrastructure)

Before running the chgtocfmt script (in Section 11.9.1.3.5, "Update Component Configuration on Node 1"), you should back up the middle tiers on both nodes and also your OracleAS Infrastructure, including the OracleAS Metadata Repository and the Oracle Identity Management components. You can do this using the OracleAS Backup and Recovery Tool, described in the Oracle Application Server Administrator’s Guide. You then have backup files, from which you can perform a restore operation on your files in case you encounter errors during conversion.

You can also use the -b option to the chgtocfmt script to back up your files, but note the following points:

- The -b option backs up only the middle-tier instance. It does not back up your OracleAS Infrastructure. You should use the -b option only for standalone J2EE and Web Cache middle tiers (that is, middle tiers that do not require an OracleAS Infrastructure).
The \(-b\) option calls the OracleAS Backup and Recovery Tool to perform the backup. This means that before you can use the \(-b\) option, you need to have configured the OracleAS Backup and Recovery Tool beforehand.

11.9.1.3.3 Enable the Virtual IP for the OracleAS Cold Failover Cluster (Middle-Tier) on the Active Node

On node1, log in as root and run the following command:

```
# /usr/sbin/ifconfig interface_name virtual_IP
```

Refer to Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address" for details.

11.9.1.3.4 (optional) Create a File System on the Shared Disk for OracleAS JMS File-Based Persistence

If you are using OracleAS JMS with file-based persistence, create a file system on the shared disk for the OracleAS JMS queues, and mount this file system from node1.

11.9.1.3.5 Update Component Configuration on Node 1

Perform the following steps to update some component configuration on the middle-tier Oracle home that you installed on node 1.

1. Run the conversion command \texttt{chgtocfmt} on node 1.

```
prompt> $ORACLE_HOME/bin/chgtocfmt \-v vhost\_mt.mydomain.com \-p password \-n \-s \-b \-e \-w cfcwebcache.mydomain.com
```

where

- \(-v\) specifies the fully qualified virtual hostname to which the install is being converted. The virtual hostname should be enabled on the current host.
- \(-p\) specifies the password for the Oracle Internet Directory.
- \(-n\) indicates that the install is not on a shared disk.
- \(-s\) indicates that SSL is enabled on the middle-tier.
- \(-b\) indicates to perform a backup of the current configuration before converting the instance to run in the OracleAS Cold Failover Cluster (Middle-Tier). The OracleAS Backup and Recovery Tool must be preconfigured to use this option. To do this, see the \textit{Oracle Application Server Administrator's Guide}.
- \(-e\) indicates that you are expanding a OracleAS Cold Failover Cluster (Middle-Tier) installation. Only use this option if you adding new components or configuring additional components in an existing OracleAS Cold Failover Cluster (Middle-Tier).
- \(-w\) specifies the alias located in \texttt{/etc/hosts} that is used for the OracleAS Web Cache on this node.

2. Check the following log files for errors:

- \texttt{chgtocmt.log}
Installing OracleAS Cold Failover Cluster (Middle-Tier)

- chgip0.log
- chgip1.log

These files are located in the ORACLE_HOME/chgip/log directory.

3. Verify the changes on node 1.

To verify the installation, access the Application Server Control page using the virtual hostname in the URL (for example: http://vhost_mt.mydomain.com:1156).

The default port number is 1156. You can verify the port number by looking in the ORACLE_HOME/install/portlist.ini file.

4. Modify OracleAS JMS

a. In the jms.xml file for the OC4J instance that you plan to use, set the host attribute in jms-server to the virtual hostname (example: vhost_mt.mydomain.com).

```xml
<jms-server host="vhost_mt.mydomain.com" port="9127">
  ...
</jms-server>
```

b. If for a queue, file-based message persistence is being used, the location for the file should ideally be on a shared disk. In this case, the shared disk needs to fail over with the virtual IP. To configure this, the value of the persistence-file attribute for queue should be a file on the shared disk.

```xml
<queue name="Demo Queue" location="jms/demoQueue"
  persistence-file="/path/to/shared_file_system/demoQueueFile">
  <description>A dummy queue</description>
</queue>
```

c. Update the DCM repository and restart the components.

```
prompt> $ORACLE_HOME/dcm/bin/dcmctl updateConfig -ct oc4j
prompt> $ORACLE_HOME/bin/emctl stop iasconsole
prompt> $ORACLE_HOME/opmn/bin/opmnctl stopall
prompt> $ORACLE_HOME/opmn/bin/opmnctl startall
prompt> $ORACLE_HOME/bin/emctl start iasconsole
```

5. Fail over the Virtual IP to Node 2

a. Stop all Oracle Application Server processes on node 1.

```
prompt> $ORACLE_HOME/bin/emctl stop iasconsole
prompt> $ORACLE_HOME/opmn/bin/opmnctl stopall
```

b. Fail over the virtual hostname vhost_mt.mydomain.com from node 1 to node 2.

On node1, run the following command as root:

```
# /usr/sbin/ifconfig interface_name down
```

On node2, run the following command as root:

```
# /usr/sbin/ifconfig interface_name virtual_IP
```

11.9.1.3.6 Update Component Configuration on Node 2

Perform these steps on the middle-tier Oracle home that you installed on node 2.
1. Run the conversion command `chgtocfmt` on node 2 as you did in Step 1 in Section 11.9.1.3.5.

2. Check the log files on node 2 as you did in Step 2 in Section 11.9.1.3.5.

3. Verify the changes on node 2 as you did in Step 3 in Section 11.9.1.3.5.

4. Modify OracleAS JMS on node 2 as you did in Step 4 in Section 11.9.1.3.5

**11.9.1.3.7 Back up Files**

After successfully converting the middle tiers to an OracleAS Cold Failover Cluster (Middle-Tier) topology, you should back up your files again because previous backups that you have are no longer valid (because of the configuration changes you just made). You should back up all your middle tiers (on both nodes), plus your OracleAS Infrastructure.

You can perform the backups using the OracleAS Backup and Recovery Tool, which is documented in the *Oracle Application Server Administrator's Guide*.

**11.9.1.3.8 Restoring Files to a Known State**

This section describes how to restore files to a known state, if errors occurred during the conversion.

If an unrecoverable error occurred during conversion, you can restore the middle tiers and OracleAS Infrastructure to a known state using the backup files that you created in Section 11.9.1.3.2, "Back up the Installations (Middle-Tier and OracleAS Infrastructure)". You use the OracleAS Backup and Recovery Tool to perform the restore operation.

If you do not have backup files, you can try reversing the changes made by the `chgtocfmt` script by running the script again, but this time you use the `physical hostname` for both the `-v` and `-w` options. For example:

```
prompt> SORACLE_HOME/bin/chgtocfmt -v physhost_mt.mydomain.com -p password -n [-s] [-b] [-e] [-w physhost_mt.mydomain.com]
```

Note that re-running the script may not work. If the script gave errors when you were converting to a virtual host-based environment, you might get the same errors when you re-run the script to convert back to a physical host-based environment.

**11.9.2 Installing in a Single Oracle Home**

To install OracleAS Cold Failover Cluster (Middle-Tier) on a shared disk, perform the following steps.

---

**Note:** Single Oracle Home install is not supported for installations that include OracleAS Wireless.

---

**11.9.2.1 Preinstallation Steps**

Before installing the middle tier, perform the following generic preinstallation steps listed in the following sections:

- Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"
- Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"
- Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)"
Installing OracleAS Cold Failover Cluster (Middle-Tier)

Section 11.2.4, "Check That Clusterware Is Running"

In addition, you also need to perform the following steps:

- Section 11.9.2.1.1, "Create an Alias for the Hostnames"
- Section 11.9.2.1.2, "(optional) Set up staticports.ini File"
- Section 11.9.2.1.3, "Enable the Virtual IP for the OracleAS Cold Failover Cluster (Middle-Tier) on the Active Node"

11.9.2.1.1 Create an Alias for the Hostnames

If you plan to include OracleAS Web Cache in the Oracle Application Server instances, you should create an alias for the hostnames.

You do this by adding a line to the /etc/hosts file on each node.

Lines in the hosts file have the following format. You can have one or more aliases.

```
ip_address official_hostname aliases...
```

For example, if the nodes are called node1 and node2, and you want the alias to be called cfcwebcache, then you would add these lines to the hosts file:

- In the hosts file on node1, add this line:
  
  `123.45.67.22  node1.mydomain.com  node1  cfcwebcache.mydomain.com`

- In the hosts file on node2, add this line:
  
  `123.45.67.33  node2.mydomain.com  node2  cfcwebcache.mydomain.com`

11.9.2.1.2 (optional) Set up staticports.ini File

If you wish, you may set up a staticports.ini file to use when installing the middle tier. Refer to Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details on creating the staticports.ini file.

11.9.2.1.3 Enable the Virtual IP for the OracleAS Cold Failover Cluster (Middle-Tier) on the Active Node

On node1, log in as root and run the following command:

```
# /usr/sbin/ifconfig interface_name virtual_IP
```

Refer to Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address" for details.

11.9.2.2 Installing the Middle Tier

Install the middle tier on the shared disk of the hardware cluster from either node of the cluster.

Note: If you created a staticports.ini file in Section 11.9.2.1, "Preinstallation Steps", specify it during the installation.

To install J2EE and Web Cache middle tiers, see Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access".

To install Portal and Wireless or Business Intelligence and Forms middle tiers, see Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".
11.9.2.3 Post-Installation Steps

Before the middle tiers can run in cold failover cluster mode, perform the following post-installation steps:

- Section 11.9.2.3.1, "(optional) Configure the Middle-Tier Instances to Use SSL"
- Section 11.9.2.3.2, "Back up the Installations (Middle-Tier and OracleAS Infrastructure)"
- Section 11.9.2.3.3, "(optional) Create a File System on the Shared Disk for OracleAS JMS File-Based Persistence"
- Section 11.9.2.3.4, "Update Component Configuration"
- Section 11.9.2.3.5, "Back up Files"
- Section 11.9.2.3.6, "Restoring Files to a Known State"

11.9.2.3.1 (optional) Configure the Middle-Tier Instances to Use SSL

If you want the middle-tier instances to use SSL, follow the steps in the Oracle Application Server Administrator's Guide. You should perform this SSL configuration before you configure the middle tiers for OracleAS Cold Failover Cluster.

11.9.2.3.2 Back up the Installations (Middle-Tier and OracleAS Infrastructure)

Before running the chgtocfmt script (in Section 11.9.2.3.4, "Update Component Configuration"), you should back up the middle tiers on both nodes and also your OracleAS Infrastructure, including the OracleAS Metadata Repository and the Oracle Identity Management components. You can do this using the OracleAS Backup and Recovery Tool, described in the Oracle Application Server Administrator's Guide. You then have backup files, from which you can perform a restore operation your files in case you encounter errors during the conversion.

You can also use the -b option to the chgtocfmt script to back up your files, but note the following points:

- The -b option backs up only the middle-tier instance. It does not back up your OracleAS Infrastructure. You should use the -b option only for standalone J2EE and Web Cache middle tiers (that is, middle tiers that do not require an OracleAS Infrastructure).

- The -b option calls the OracleAS Backup and Recovery Tool to perform the backup. This means that before you can use the -b option, you need to have configured the OracleAS Backup and Recovery Tool beforehand.

11.9.2.3.3 (optional) Create a File System on the Shared Disk for OracleAS JMS File-Based Persistence

If you are using OracleAS JMS with file-based persistence, create a file system on the shared disk for the OracleAS JMS queues, and mount this file system from node 1.

11.9.2.3.4 Update Component Configuration

Perform the following steps to update some component configuration on the middle-tier Oracle home on the shared disk.

1. Run the conversion command chgtocfmt on node 1.
Installation of OracleAS Cold Failover Cluster (Middle-Tier)

1. Check the following log files for errors:
   - chgtocmt.log
   - chgip0.log
   - chgip1.log

   These files are located in the ORACLE_HOME/chgip/log directory.

2. Verify the changes on node 1.

3. Modify OracleAS JMS
   a. In the jms.xml file for the OC4J instance that you plan to use, set the host attribute in jms-server to the virtual hostname (example: vhost_mt.mydomain.com).

---

**Note:** If you changed any of the component port numbers after installation, you must manually update the file located at ORACLE_HOME/install/portlist.ini before performing this step.

```bash
```

where

- `-v` specifies the fully qualified virtual hostname to which the install is being converted. The virtual hostname should be enabled on the current host.
- `-p` specifies the password for the Oracle Internet Directory.
- `-n` indicates that the install is not on a shared disk.
- `-s` indicates that SSL is enabled on the middle-tier.
- `-b` indicates to perform a backup of the current configuration before converting the instance to run in the OracleAS Cold Failover Cluster (Middle-Tier). This option invokes the OracleAS Backup and Recovery Tool to perform the backup. This means that you must have configured the OracleAS Backup and Recovery Tool before you can use this option. To do this, see the Oracle Application Server Administrator's Guide.

Although you can use the `-b` option for all middle tiers, it is highly recommended that you use it only for standalone middle tiers (middle tiers not associated with an OracleAS Infrastructure). The reason is that it backs up only the middle tier; it does not back up the OracleAS Infrastructure. For middle tiers that use an OracleAS Infrastructure, use the OracleAS Backup and Recovery Tool to back up both the middle tiers and OracleAS Infrastructure.

- `-e` indicates that you are expanding a OracleAS Cold Failover Cluster (Middle-Tier) installation. Only use this option if you are adding new components or configuring additional components in an existing OracleAS Cold Failover Cluster (Middle-Tier).
- `-w` specifies the alias located in /etc/hosts that is used for the OracleAS Web Cache on this node.
<jms-server host="vhost_mt.mydomain.com" port="9127">

...  
</jms-server>

b. If for a queue, file-based message persistence is being used, the location for the file should ideally be on a shared disk. In this case, the shared disk needs to fail over with the virtual IP. To configure this, the value of the persistence-file attribute for queue should be a file on the shared disk.

<queue name="Demo Queue" location="jms/demoQueue"
persistence-file="/path/to/shared_file_system/demoQueueFile">
<description>A dummy queue</description>
</queue>

c. Update the DCM repository and restart the components.

prompt> $ORACLE_HOME/dcm/bin/dcmctl updateConfig -ct oc4j
prompt> $ORACLE_HOME/bin/emctl stop iasconsole
prompt> $ORACLE_HOME/opmn/bin/opmnctl stopall
prompt> $ORACLE_HOME/opmn/bin/opmnctl startall
prompt> $ORACLE_HOME/bin/emctl start iasconsole

5. Copy /etc/oratab and /var/opt/oracle/oraInst.loc from node 1 to node 2.

6. Fail over the Virtual IP to node 2.

a. Stop all Oracle Application Server processes on node 1.

prompt> $ORACLE_HOME/bin/emctl stop iasconsole
prompt> $ORACLE_HOME/opmn/bin/opmnctl stopall

b. Fail over the virtual hostname vhost_mt.mydomain.com from node 1 to node 2.

On node 1, run the following command as root:

# /usr/sbin/ifconfig interface_name down

On node 2, run the following command as root:

# /usr/sbin/ifconfig interface_name virtual_IP

c. Fail over the shared disk hosting the Oracle home.

7. Verify the installation on node 2 as you did in Step 3.

11.9.2.3.5 Back up Files

After successfully converting the middle tier to an OracleAS Cold Failover Cluster (Middle-Tier) topology, you should back up your files again because previous backups that you have are no longer valid (because of the configuration changes you just made). You should back up all your middle tier, plus your OracleAS Infrastructure.

You can perform the backups using the OracleAS Backup and Recovery Tool, which is documented in Oracle Application Server Administrator’s Guide.

11.9.2.3.6 Restoring Files to a Known State

This section describes how to restore files to a known state, if errors occurred during the conversion.

If an unrecoverable error occurred during conversion, you can restore the middle tiers and OracleAS Infrastructure to a known state using the backup files that you created.
in Section 11.9.1.3.2, "Back up the Installations (Middle-Tier and OracleAS Infrastructure)". You use the OracleAS Backup and Recovery Tool to perform the restore operation.

If you do not have backup files, you can try reversing the changes made by the chgtocfmt script by running the script again, but this time you use the physical hostname for both the \texttt{v} and \texttt{w} options. For example:

\small

\begin{verbatim}
prompt> $ORACLE_HOME/bin/chgtocfmt -v physhost_mt.mydomain.com -p password -n [-s] [-b] [-e] [-w physhost_mt.mydomain.com]
\end{verbatim}

Note that rerunning the script may not work. If the script gave errors when you were converting to a virtual host-based environment, you might get the same errors when you re-run the script to convert back to a physical host-based environment.

### 11.9.3 Expanding the Middle Tiers

After installing the OracleAS Cold Failover Cluster (Middle-Tier), you may decide you need a component that is not installed or configured on the middle tier.

If you decide to add additional components, see Section 7.14, "Expanding a Middle Tier" for installation instructions. If you need to configure components that were not previously configured, see the Oracle Application Server Administrator's Guide. For installations in separate Oracle homes, you will need to expand the middle tiers on both nodes of the cluster.

Note that the OracleAS Wireless component is not supported for an OracleAS Cold Failover Cluster (Middle-Tier) installed in single Oracle home.

After adding or configuring additional components, you need to run the chgtocfmt command using the \texttt{-e} option. All of the other options should be the same as the first time you ran it. For example, if you ran this command the first time:

\small

\begin{verbatim}
prompt> $ORACLE_HOME/bin/chgtocfmt -v vhost_mt.mydomain.com -p password -w cfcwebcache.mydomain.com
\end{verbatim}

then you should run the following command after expanding the middle tiers:

\small

\begin{verbatim}
prompt> $ORACLE_HOME/bin/chgtocfmt -v vhost_mt.mydomain.com -p password -w cfcwebcache.mydomain.com -e
\end{verbatim}

For installations in separate Oracle homes, you will need to run the chgtocfmt command on both nodes of the cluster.

### 11.10 Installing OracleAS Cold Failover Cluster (Infrastructure) and OracleAS Cold Failover Cluster (Middle-Tier) on the Same Nodes

This configuration is a combination of Section 11.3, "Installing an OracleAS Cold Failover Cluster (Infrastructure) Configuration" and Section 11.9, "Installing OracleAS Cold Failover Cluster (Middle-Tier)". This section describes how to install these configurations on the same nodes.

Figure 11–8 shows where you would install the components, and on which nodes they would be running.

In normal mode, OracleAS Infrastructure runs on node 1, while the middle tier runs on node 2. Unlike normal cold failover cluster configurations, both nodes are active in this case but running different components (either the OracleAS Infrastructure components or the middle-tier components).
Virtual Hostnames
You need two virtual hostnames: one virtual hostname (for example, vhost_infra) points to the node running OracleAS Infrastructure, and the other virtual hostname (for example, vhost_mt) points to the node running the middle tier.

Failover
If node 1 fails (Figure 11–9), the OracleAS Infrastructure processes fail over to node 2. The virtual hostname that was pointing to node 1 now points to node 2.

If node 2 fails (Figure 11–10), the middle-tier processes fail over to node 1. The virtual hostname that was pointing to node 2 now points to node 1. Note that you need to configure the middle tier after installation for it to fail over to the other node.

Location of Oracle Homes
You install the OracleAS Infrastructure on the shared storage, and the middle tier on the local storage of each node. You install the middle tier twice, once for each node.

To access the OracleAS Infrastructure or the middle tier, clients use the virtual hostname associated with the node running the OracleAS Infrastructure or middle-tier components.

You also use the virtual hostname in URLs. For example, if vhost_infra.mydomain.com is the name of the virtual host for the OracleAS Infrastructure, the URLs for the Oracle HTTP Server and the Application Server Control would look like the following:

<table>
<thead>
<tr>
<th>URL for:</th>
<th>Example URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle HTTP Server, Welcome page</td>
<td><a href="http://vhost.mydomain.com:7777">http://vhost.mydomain.com:7777</a></td>
</tr>
<tr>
<td>Oracle HTTP Server, secure mode</td>
<td><a href="https://vhost.mydomain.com:4443">https://vhost.mydomain.com:4443</a></td>
</tr>
<tr>
<td>Application Server Control</td>
<td><a href="http://vhost.mydomain.com:1156">http://vhost.mydomain.com:1156</a></td>
</tr>
</tbody>
</table>
Installing OracleAS Cold Failover Cluster (Infrastructure) and OracleAS Cold Failover Cluster (Middle-Tier) on the Same Nodes

OracleAS Infrastructure
orainventory Directory
11.10.1 Installation Steps

To create this configuration:

1. Set up the environment.
   - Section 11.2.1, "Map the Virtual Hostname and Virtual IP Address"
   - Section 11.2.2, "Set Up a File System That Can Be Mounted from Both Nodes"
   - Section 11.2.3, "Review Recommendations for Automatic Storage Management (ASM)"
   - Section 11.2.4, "Check That Clusterware Is Running"

2. Create an alias for the hostnames.
   You do this by adding a line to the /etc/hosts file on each node.
   Lines in the hosts file use the following format. You can have one or more aliases.
   
   ip_address official_hostname aliases...
   
   For example, if the nodes are called node1 and node2, and you want the alias to be called cfcwebcache, then you would add these lines to the hosts file:

   - In the hosts file on node1, add this line:
     
     123.45.67.22 node1.mydomain.com node1 cfcwebcache.mydomain.com
     
   - In the hosts file on node2, add this line:
3. Install OracleAS Infrastructure on the shared storage. Refer to Section 11.3.2, "OracleAS Cold Failover Cluster (Infrastructure): Details of Installation Steps".

4. Create a staticports.ini file for the middle tiers. This is to ensure that the middle tiers use the same ports, and that the ports are different from the ports used by the OracleAS Infrastructure.

When either node fails, a failover event occurs and all the OracleAS Infrastructure and middle-tier components will run on the same node. For the components to continue working, there must not be any port conflicts.

5. Install the middle tier on the local storage of each node.

Notes for installing the middle tiers:
- You need to use the same Oracle home path for both nodes.
- You need to use the same Oracle Application Server instance name.
- When the installer prompts you to enter the hostname for the Oracle Internet Directory, enter the virtual hostname for the OracleAS Infrastructure.
- To install a J2EE and Web Cache middle tier, see Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access".
- To install a Portal and Wireless middle tier, see Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".

11.10.2 Post-Installation Steps

Perform the post-installation steps for node1 and node2 listed in Section 11.9.2.3, "Post-Installation Steps".

11.11 Post-Installation Steps for OracleAS Cold Failover Cluster

- Section 11.11.1, "Edit the ORACLE_HOME/Apache/Apache/htdocs/index.html File"
- Section 11.11.2, "Copy /var/opt/oracle and /etc/oratab to the Other Node"
- Section 11.11.3, "Create a Clusterware Agent for Automatic Failover"

11.11.1 Edit the ORACLE_HOME/Apache/Apache/htdocs/index.html File

In the ORACLE_HOME/Apache/Apache/htdocs/index.html file, change all occurrences of the physical hostname (example: node1) to the virtual hostname (example: vhost), where node1 appears as a hostname.

Note that if node1 is used as part of the Oracle Application Server instance name, do not change it.

11.11.2 Copy /var/opt/oracle and /etc/oratab to the Other Node

After the OracleAS Infrastructure installation is complete, copy the /var/opt/oracle directory and the /etc/oratab file from the node where you performed the installation to the other node in Oracle Application Server Cold Failover Cluster. This ensures that you can run the installer to update the Oracle home from either node in the cluster.
11.11.3 Create a Clusterware Agent for Automatic Failover

An OracleAS Cold Failover Cluster environment provides the framework for a manual failover of OracleAS Infrastructure. To achieve automatic failover, you must set up an agent using the clusterware. An example of automatic failover is setting up the secondary node to monitor the heartbeat of the primary node and when the secondary node detects that the primary node is down, the virtual IP address, shared storage, and all the OracleAS Infrastructure processes are failed over to the secondary node.

11.12 Installing Middle Tiers Against an OracleAS Cold Failover Cluster Infrastructure

This section describes how to install middle tiers that are not in a cold failover cluster configuration against an OracleAS Cold Failover Cluster infrastructure.

If you want to install middle tiers that can take advantage of cold failover cluster features, see Section 11.9, "Installing OracleAS Cold Failover Cluster (Middle-Tier)" or Section 11.10, "Installing OracleAS Cold Failover Cluster (Infrastructure) and OracleAS Cold Failover Cluster (Middle-Tier) on the Same Nodes".

For non-cold failover cluster middle tiers to work with OracleAS Infrastructure in an OracleAS Cold Failover Cluster, you can install the middle tiers on computers outside the cluster, or on nodes within the cluster.

Note: The preferred solution is to install and run the non-cold failover cluster middle tiers on nodes outside the OracleAS Cold Failover Cluster.

11.12.1 If You Plan to Install Middle Tiers on OracleAS Cold Failover Cluster Nodes

If you plan to install a non-cold failover cluster middle tier on an OracleAS Cold Failover Cluster node (primary or secondary), perform these tasks before installing the middle tier:

- Section 11.12.1.1, "Create a staticports.ini File for the Middle Tier"
- Section 11.12.1.2, "Rename the /var/opt/oracle Directory Used for the Infrastructure"

11.12.1.1 Create a staticports.ini File for the Middle Tier

Ensure that the ports used by the middle tier are not the same as the ports used by the infrastructure. The reason is that the infrastructure can fail over from the primary to the secondary node (and vice versa), and there must not be any port conflicts on either node. The same ports must be reserved for the infrastructure on both nodes.

If the infrastructure is running on the same node where you want to install the middle tier, the installer can detect which ports are in use and select different ports for the middle tier. For example, if the infrastructure is running on the primary node, and you run the installer on the primary node to install the middle tier, then the installer can assign different ports for the middle tier.

However, if the infrastructure is running on a node different from where you want to install the middle tier, the installer cannot detect which ports are used by the infrastructure. For example, if the infrastructure is running on the primary node but you want to install the middle tier on the secondary node, the installer is unable to detect which ports the infrastructure is using. In this situation, you need to set up a
staticports.ini file to specify port numbers for the middle tier. Refer to Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details.

To see which ports the infrastructure is using, view the ORACLE_HOME/install/portlist.ini file, where ORACLE_HOME refers to the directory where you installed the infrastructure.

11.12.1.2 Rename the /var/opt/oracle Directory Used for the Infrastructure

Set up the environment so that the middle tier will have its own inventory directory, instead of using the same inventory directory used by the infrastructure. To do this, you need to rename the /var/opt/oracle directory to something else so that the installer will prompt you to enter a new inventory directory. The following example renames it to oracle.loc.infra.

prompt> su
Password: root_password
# cd /var/opt
# mv oracle oracle.infra

When the installer prompts for the inventory directory, specify a directory on the local storage or on a disk other than the one where you installed the OracleAS Infrastructure.

When the middle-tier installation is complete, do the following rename operations:

prompt> su
Password: root_password
# cd /var/opt
# mv oracle oracle.mt see (1)
# mv oracle.infra oracle see (2)

(1) This command renames the oracle directory created by the installer when it installed the middle tier.

(2) This command renames the oracle.infra directory back to oracle.

The /var/opt/oracle directory is not used during Oracle Application Server runtime. The only time you need it is when you run the installer (for example, to de-install an instance or to expand an instance).

Be sure the correct oracle directory is in place before you run the installer.

11.12.2 Procedure for Installing Middle Tiers Against an OracleAS Cold Failover Cluster Infrastructure

To install middle tiers against OracleAS Infrastructure in an OracleAS Cold Failover Cluster, follow the procedures as documented in Chapter 7, "Installing Middle Tiers", but with these differences:

- In the Register with Oracle Internet Directory screen, enter the virtual hostname in the Hostname field.

- If you are installing the middle tier on an OracleAS Cold Failover Cluster node, you must follow these additional requirements:
  - Read Section 11.12.1, "If You Plan to Install Middle Tiers on OracleAS Cold Failover Cluster Nodes".
11.13 Installing Regular Middle-Tiers on OracleAS Cold Failover Cluster Nodes

If you install middle-tiers that are not in a cold failover cluster configuration on the same nodes as an OracleAS Cold Failover Cluster infrastructure, then the ports used for the middle tiers must be different from the ones used for any OracleAS Infrastructure installed on the same cluster. The ports must also be different from those used for other Oracle Homes on the same node. To check the ports assigned to components in any Oracle Home, see the Ports page on the Application Server Control Console.

When you install the middle-tiers, you should use a `staticports.ini` file. Refer to Chapter 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details.
This chapter describes how to install Oracle Application Server in OracleAS Cluster (Identity Management) configurations.

- Section 12.1, "OracleAS Cluster (Identity Management): Introduction"
- Section 12.2, "Preinstallation Steps for OracleAS Cluster (Identity Management)"
- Section 12.3, "About Oracle Internet Directory Passwords"
- Section 12.4, "About Configuring SSL and Non-SSL Ports for Oracle HTTP Server"
- Section 12.5, "Installing an OracleAS Cluster (Identity Management) Configuration"
- Section 12.6, "Installing a Distributed OracleAS Cluster (Identity Management) Configuration"
- Section 12.7, "Postinstallation Steps"
- Section 12.8, "Installing Middle Tiers Against OracleAS Cluster (Identity Management) Configurations"

12.1 OracleAS Cluster (Identity Management): Introduction

In OracleAS Cluster (Identity Management) configurations, the Oracle Identity Management components and the OracleAS Metadata Repository run on separate nodes. All the nodes in an OracleAS Cluster (Identity Management) configuration are active. Requests from clients, such as middle tiers, are directed to a load balancer, which then directs the requests to one of the active nodes. Refer to Figure 12–1.

These nodes can belong to a hardware cluster, but this is not required. These configurations are called "OracleAS Cluster (Identity Management)" because the OracleAS Single Sign-On and Oracle Delegated Administration Services components are clustered. This means that these components are configured identically across nodes.

Database (OracleAS Metadata Repository) Requirement

You need an existing database before installing an OracleAS Cluster (Identity Management) configuration. You will install the OracleAS Metadata Repository on this database using the OracleAS Metadata Repository Creation Assistant. You can use any database configuration supported by OracleAS Metadata Repository Creation Assistant. Refer to Oracle Application Server Metadata Repository Creation Assistant User's Guide for the supported database configurations. For OracleAS Cluster (Identity Management) configurations, you should use an existing database.
Management) configurations, Oracle recommends using a high availability database configuration such as Real Application Clusters or cold failover cluster.

You can only install one OracleAS Cluster (Identity Management) on an OracleAS Metadata Repository.

---

**Note:** For OracleAS Cluster (Identity Management) configurations, you never select the "Oracle Identity Management and OracleAS Metadata Repository" option in the installer. You always select the Oracle Identity Management option. This is why you need an existing database for the OracleAS Metadata Repository.

---

**Always Select the Same Components**

Because the installer clusters the components in an OracleAS Cluster (Identity Management) configuration, you need to select the same components in the Select Configuration Options screen for all the nodes in the cluster.

For example, if you select Oracle Internet Directory, OracleAS Single Sign-On, and Oracle Delegated Administration Services for the installation on node 1, then you have to select the same set of components in subsequent installations.

Clustering will fail if you select different components in each installation.

**Configurations**

You can install OracleAS Cluster (Identity Management) in these configurations:

- OracleAS Cluster (Identity Management). Refer to Section 12.5.
- Distributed OracleAS Cluster (Identity Management). Refer to Section 12.6.

---

**12.2 Preinstallation Steps for OracleAS Cluster (Identity Management)**

Before installing an OracleAS Cluster (Identity Management) configuration, you need to set up the following items:

- Section 12.2.1, "Use the Same Path for the Oracle Home Directory (recommended)"
- Section 12.2.2, "Synchronize Clocks on All Nodes"
- Section 12.2.3, "Configure Virtual Server Names and Ports for the Load Balancer"
- Section 12.2.4, "Configure Your LDAP Virtual Server"
- Section 12.2.5, "Set up Cookie Persistence on the Load Balancer"

---

**12.2.1 Use the Same Path for the Oracle Home Directory (recommended)**

For all the nodes that will be running Oracle Identity Management components, use the same full path for the Oracle home. This practice is recommended, but not required.

**12.2.2 Synchronize Clocks on All Nodes**

Synchronize the system clocks on all nodes so they are running within 250 seconds of each other. When synchronizing the system clocks, make sure the clocks are set to the same time zone.
Note: If you do not synchronize the clocks, then there will be inconsistent operation attributes in the directory entries and inconsistent behavior of the password state policies. As a result, you will see unwanted instance failovers.

12.2.3 Configure Virtual Server Names and Ports for the Load Balancer

Configure your load balancer with two virtual server names and associated ports:

- Configure a virtual server name for LDAP connections. For this virtual server, you need to configure two ports: one for SSL and one for non-SSL connections.

  Note: Ensure that the same ports that you configured for the LDAP virtual server are available on the nodes on which you will be installing Oracle Internet Directory.

  The installer will configure Oracle Internet Directory to use the same port numbers that are configured on the LDAP virtual server. In other words, Oracle Internet Directory on all the nodes and the LDAP virtual server will use the same port numbers. Even if the port numbers are set in the staticports.ini file, the port numbers entered in the installer for the load balancer will take precedence.

- Configure a virtual server name for HTTP connections. For this virtual server, you also need to configure a port for either SSL or non-SSL connections. If you want the client to connect to the load balancer using HTTPS, configure a port for SSL connections. If you want the client to connect to the load balancer using HTTP, configure a port for non-SSL connections.

  Note: The ports for the HTTP virtual server can be different from the Oracle HTTP Server Listen ports.

The installer will prompt you for the virtual server names and port numbers. Enter the same virtual server name in the installer that you used to configure the LDAP and HTTP virtual servers. The virtual server name may or may not be fully-qualified. For example, if you used a fully-qualified host name when you configured the LDAP virtual server, then you must enter the same fully-qualified host name in the installer.

  Note: The installer does not check the load balancer. Make sure the load balancer is properly configured and enabled before running the installer.

In addition, check the following:

- Check that the virtual server names are associated with IP addresses and are part of your DNS. The nodes that will be running Oracle Application Server must be able to resolve these virtual server names.

12.2.4 Configure Your LDAP Virtual Server

Configure the LDAP virtual server on your load balancer to direct requests to node 1 initially. The procedure to add additional nodes differs depending upon whether or not your load balancer supports LDAP service monitoring.
Note that these procedures apply only to the LDAP virtual server configured on your load balancer. They do not apply to the HTTP virtual server configured on your load balancer.

12.2.4.1 Load Balancer Supports LDAP Service Monitoring
If your load balancer supports LDAP service monitoring, then you can add all the nodes to the LDAP virtual server before starting the installation.

For example, if you have three nodes:
1. Configure the LDAP virtual server to direct requests to node 1 only.
2. Add node 2 to the LDAP virtual server.
3. Add node 3 to the LDAP virtual server.
4. Install Oracle Identity Management components on node 1.
5. Install Oracle Identity Management components on node 2.
6. Install Oracle Identity Management components on node 3.

12.2.4.2 Load Balancer Does Not Support LDAP Service Monitoring
If your load balancer does not support LDAP service monitoring, then configure your LDAP virtual server to direct requests to node 1 only before starting the installation. After you complete an installation on a node, then you can add that node to the virtual server.

For example, if you have three nodes:
1. Configure the LDAP virtual server to direct requests to node 1 only.
2. Install Oracle Identity Management components on node 1.
3. Install Oracle Identity Management components on node 2.
4. Add node 2 to the LDAP virtual server.
5. Install Oracle Identity Management components on node 3.
6. Add node 3 to the LDAP virtual server.

12.2.5 Set up Cookie Persistence on the Load Balancer
On your load balancer, set up cookie persistence for HTTP traffic. Specifically, set up cookie persistence for URIs starting with /oiddas/. This is the URI for Oracle Delegated Administration Services. If your load balancer does not allow you to set cookie persistence at the URI level, then set the cookie persistence for all HTTP traffic. In either case, set the cookie to expire when the browser session expires. Refer to your load balancer documentation for details.

12.3 About Oracle Internet Directory Passwords
In OracleAS Cluster (Identity Management) configurations, you install Oracle Internet Directory on multiple nodes, and in each installation, you enter the instance password in the "Specify Instance Name and ias_admin Password" screen.

The password specified in the first installation is used as the password for the cn=orcladmin and orcladmin users not just in the first Oracle Internet Directory, but in all Oracle Internet Directory installations in the cluster.
This means that to access the Oracle Internet Directory on any node, you have to use the password that you entered in the first installation. You cannot use the passwords that you entered in subsequent installations.

Accessing the Oracle Internet Directory includes:

- Logging into Oracle Delegated Administration Services (URL: `http://hostname:port/oiddas`)
- Connecting to Oracle Internet Directory using the Oracle Directory Manager

You still need the passwords that you entered in subsequent installations for logging into Application Server Control.

## 12.4 About Configuring SSL and Non-SSL Ports for Oracle HTTP Server

When you are installing OracleAS Cluster (Identity Management) configurations, the installer displays the "Specify HTTP Load Balancer Host and Listen Ports" screen.

This screen has two sections:

- In the load balancer section, you specify the load balancer’s HTTP virtual server name and port number. You also indicate whether the port is for SSL or non-SSL requests.
- In the Oracle HTTP Server section, you specify the port number that you want for the Oracle HTTP Server Listen port. You also indicate whether the port is for SSL or non-SSL requests.

The virtual server and the Oracle HTTP Server Listen port can use different port numbers.

You use this screen to set up the type of communication (SSL or non-SSL) between client, load balancer, and Oracle HTTP Server. Three cases are possible:

- Case 1: Communications between clients and the load balancer use HTTP, and communications between the load balancer and Oracle HTTP Server also use HTTP. Refer to Section 12.4.1, "Case 1: Client ---[HTTP]---> Load Balancer ---[HTTP]---> Oracle HTTP Server".
- Case 2: Communications between clients and the load balancer use HTTPS, and communications between the load balancer and Oracle HTTP Server also use HTTPS. Refer to Section 12.4.2, "Case 2: Client ---[HTTPS]---> Load Balancer ---[HTTPS]---> Oracle HTTP Server".
- Case 3: Communications between clients and the load balancer use HTTPS, but communications between the load balancer and Oracle HTTP Server use HTTP. Refer to Section 12.4.3, "Case 3: Client ---[HTTPS]---> Load Balancer ---[HTTP]---> Oracle HTTP Server".

**Note:** Because the values you specify in this dialog override the values specified in the staticports.ini file, you should not specify port numbers for the Oracle HTTP Server Listen port in the staticports.ini file.
12.4.1 Case 1: Client ---[HTTP]--- Load Balancer ---[HTTP]--- Oracle HTTP Server

HTTP Listener: Port: Enter the port number that you want to use as the Oracle HTTP Server Listen port. This will be the value of the Listen directive in the httpd.conf file.
Enable SSL: Do not select this option. The installer tries the default port number for the SSL port.

HTTP Load Balancer: Hostname: Enter the name of the virtual server on the load balancer configured to handle HTTP requests.
HTTP Load Balancer: Port: Enter the port number that the HTTP virtual server listens on. This will be the value of the Port directive in the httpd.conf file.
Enable SSL: Do not select this option.

<table>
<thead>
<tr>
<th>Values in Screen</th>
<th>Resulting Values in Configuration Files</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Listener: Port: 8000</td>
<td>In httpd.conf: Port 80 Listen 8000</td>
</tr>
<tr>
<td>Enable SSL: Unchecked</td>
<td>In ssl.conf: Port &lt;default port number assigned by installer&gt; Listen &lt;default port number assigned by installer&gt;</td>
</tr>
</tbody>
</table>

12.4.2 Case 2: Client ---[HTTPS]--- Load Balancer ---[HTTPS]--- Oracle HTTP Server

HTTP Listener: Port: Enter the port number that you want Oracle HTTP Server to listen on. This will be the value of the Listen directive in the ssl.conf file.
Enable SSL: Select this option.

HTTP Load Balancer: Hostname: Enter the name of the virtual server on the load balancer configured to handle HTTPS requests.
HTTP Load Balancer: Port: Enter the port number that the HTTP virtual server listens on. This will be the value of the Port directive in the ssl.conf file.
Enable SSL: This option has been automatically selected and cannot be deselected. This is because you selected Enable SSL for the HTTP Listener.

In opmn.xml, the installer sets the ssl-enabled line in the Oracle HTTP Server section to true.

<table>
<thead>
<tr>
<th>Values in Screen</th>
<th>Resulting Values in Configuration Files</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Listener: Port: 90</td>
<td>In httpd.conf: Port &lt;default port number assigned by installer&gt; Listen &lt;default port number assigned by installer&gt;</td>
</tr>
<tr>
<td>Enable SSL: Checked</td>
<td>In ssl.conf: Port 443 Listen 90</td>
</tr>
</tbody>
</table>

Note that in this case you will have to perform an additional post-configuration step. Refer to Section 12.7.1, "Update targets.xml (Case 2 only)".
12.4.3 Case 3: Client --- [HTTPS] --- > Load Balancer --- [HTTP] --- > Oracle HTTP Server

HTTP Listener: Port: Enter the port number that you want Oracle HTTP Server to listen on. This will be the value of the `Listen` directive in the `httpd.conf` file.
Enable SSL: Do not select this option.

HTTP Load Balancer: Hostname: Enter the name of the virtual server on the load balancer configured to handle HTTPS requests.

HTTP Load Balancer: Port: Enter the port number that the HTTP virtual server listens on. This will be the value of the `Port` directive in the `httpd.conf` file.
Enable SSL: Select this option.

Note that in this configuration, the load balancer must have SSL acceleration capabilities, or you must add a separate SSL Accelerator. The conversion from HTTPS to HTTP happens before Oracle HTTP Server receives the request. The SSL accelerator must be properly configured prior to installation. The installer does not check for this.

The installer will change the following lines:

- In `opmn.xml`, the installer sets the `ssl-enabled` line in the Oracle HTTP Server section to `true`.
- In `httpd.conf`, the installer adds the following lines:

  ```
  LoadModule certheaders_module libexec/mod_certheaders.so
  SimulateHttps on
  ```

<table>
<thead>
<tr>
<th>Values in Screen</th>
<th>Resulting Values in Configuration Files</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Listener: Port: 9000</td>
<td>In <code>httpd.conf</code>: Port 443 Listen 9000</td>
</tr>
<tr>
<td>Enable SSL: Unchecked</td>
<td></td>
</tr>
<tr>
<td>HTTP Load Balancer: Port: 443</td>
<td></td>
</tr>
<tr>
<td>Enable SSL: Checked</td>
<td>In <code>ssl.conf</code>: Port &lt;default port number assigned by installer&gt; Listen &lt;default port number assigned by installer&gt;</td>
</tr>
</tbody>
</table>

12.5 Installing an OracleAS Cluster (Identity Management) Configuration

In this configuration, you need an existing database that is already running in a configuration supported by the OracleAS Metadata Repository Creation Assistant. Oracle recommends running the database in a high availability environment, such as a Real Application Clusters database. You also need additional nodes (at least two nodes) to run Oracle Identity Management components. In this configuration, Oracle Internet Directory, OracleAS Single Sign-On, and Oracle Delegated Administration Services run on each node. If you want to distribute these components, see Section 12.6, "Installing a Distributed OracleAS Cluster (Identity Management) Configuration".

These nodes are accessed through a load balancer. Refer to Figure 12–1.

You install the OracleAS Metadata Repository in your existing database, then install Oracle Identity Management components against this database.
Installing an OracleAS Cluster (Identity Management) Configuration

**Section 12.5.1, "Installation Order"**

To create an OracleAS Cluster (Identity Management) configuration:

1. Install the OracleAS Metadata Repository in your existing database.
2. Install the Oracle Identity Management on each node. You run the installer on each node separately.
3. Install middle tiers.

**Subsections:**
- Section 12.5.2, "Installing OracleAS Metadata Repository"
- Section 12.5.3, "Installing OracleAS Cluster (Identity Management) on the First Node"
- Section 12.5.4, "Installing OracleAS Cluster (Identity Management) on Subsequent Nodes"
- Section 12.5.5, "If the Cluster Configuration Assistant Failed"
12.5.2 Installing OracleAS Metadata Repository

To install the OracleAS Metadata Repository in your existing database, you use the OracleAS Metadata Repository Creation Assistant. Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details.

12.5.3 Installing OracleAS Cluster (Identity Management) on the First Node

Run the installer on each node where you want to install Oracle Identity Management components.

Note that the procedure for installing Oracle Identity Management components on the first node is different from installing the components on subsequent nodes. To install the components on subsequent nodes, see Section 12.5.4, "Installing OracleAS Cluster (Identity Management) on Subsequent Nodes".

Subsections:

- Section 12.5.3.1, "Create staticports.ini File"
- Section 12.5.3.2, "Disable TCP Monitoring on Load Balancer for First Node"
- Section 12.5.3.3, "Configure the Load Balancer to Return Immediately to the Calling Client"
- Section 12.5.3.4, "Ensure that the OracleAS Metadata Repository Is Not Registered with any Oracle Internet Directory"
- Section 12.5.3.5, "Select the Same Components for Each Node"
- Section 12.5.3.6, "Run the Installer"

12.5.3.1 Create staticports.ini File

If you want to use custom ports for components other than Oracle HTTP Server or Oracle Internet Directory, you need to create a staticports.ini file for this installation.

If you want custom ports for Oracle HTTP Server or Oracle Internet Directory, you specify them in the "Specify HTTP Load Balancer Host and Listen Ports" and the "Specify LDAP Virtual Host and Listen Ports" screens.

If you specify custom ports for Oracle HTTP Server and Oracle Internet Directory also in the staticports.ini file, and you also specify ports in the screens mentioned, the ports specified in the screens take precedence.

To avoid specifying Oracle HTTP Server and Oracle Internet Directory ports in the staticports.ini file, the staticports.ini file must not contain these lines:

```
Oracle HTTP Server port = port_num
Oracle HTTP Server Listen port = port_num
Oracle HTTP Server SSL port = port_num
Oracle HTTP Server Listen (SSL) port = port_num
Oracle Internet Directory port = port_num
Oracle Internet Directory (SSL) port = port_num
```

If you have a staticports.ini file, you should also use the same file for installations on subsequent nodes.

12.5.3.2 Disable TCP Monitoring on Load Balancer for First Node

Before installing on the first node, you must make sure that TCP monitoring is not enabled for the Virtual IP on the first node.
12.5.3.3 Configure the Load Balancer to Return Immediately to the Calling Client

It is highly recommended that you configure the load balancer virtual server to return immediately to the calling client when the backend services to which it forwards traffic are unavailable. This is preferred over the client disconnecting on its own after a timeout based on the TCP/IP settings on the client machine.

If your load balancer is not configured this way, the Java Security Configuration Assistant may report the following:

WARNING: DCM service may not be available at this time to synchronize $ORACLE_HOME/j2ee/home/config/jazn-data.xml file.

Refer to Section G.2.17, "WARNING: DCM service may not be available at this time" for information on how to correct this problem after the installation is finished.

See Also: The Oracle Application Server High Availability Guide for more information on load balancer requirements.

12.5.3.4 Ensure that the OracleAS Metadata Repository Is Not Registered with any Oracle Internet Directory

When you perform the installation on the first node, you need to specify an OracleAS Metadata Repository that is not registered with any Oracle Internet Directory. The installer checks for this. If the installer finds that the OracleAS Metadata Repository is already registered with an Oracle Internet Directory, then it assumes that you are installing on subsequent nodes, and that you want to join the cluster that was created when you installed on the first node. It prompts you for the existing cluster name, and the connect information for the Oracle Internet Directory.

12.5.3.5 Select the Same Components for Each Node

You must select the same components in the Select Configuration Options screen when installing on each node. For example, if you select Oracle Internet Directory, OracleAS Single Sign-On, and Oracle Delegated Administration Services on the first node, you must select these same set of components on subsequent nodes.

12.5.3.6 Run the Installer

Follow the steps in Table 12–4.

Key Points for Installing on the First Node

- In the Select Configuration Options screen, select High Availability and Replication, in addition to selecting the components.
- In the Select High Availability or Replication Option screen, select OracleAS Cluster (Identity Management).
Table 12–4  Steps for Installing OracleAS Cluster (Identity Management) on the First Node

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start up the installer and complete the first few screens. Refer to Section 6.27, &quot;Install Fragment: The First Few Screens of the Installation&quot; for details. Notes: In the Select Installation Type screen, select Oracle Identity Management.</td>
</tr>
<tr>
<td>3. Specify Port Configuration Options</td>
<td>Select Manual and enter the fullpath to your staticports.ini file in the provided field. You need to use staticports.ini file for OracleAS Cluster (Identity Management) configurations. Refer to Section 12.5.3.1, &quot;Create staticports.ini File&quot;. Click Next.</td>
</tr>
<tr>
<td>4. Specify Repository</td>
<td>When you install on the first node, you need to specify an OracleAS Metadata Repository that is not registered with an Oracle Internet Directory. When you install on subsequent nodes, then the OracleAS Metadata Repository is registered with the Oracle Internet Directory on the first node. Username: Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges. Password: Enter the user’s password. Hostname and Port: Enter the names of all the nodes where the Real Application Clusters database is running, and the port numbers. Use the format: host1.domain.com:port1, host2.domain.com:port2, ... Service Name: Enter the service name of the database. Note that the service name must include the database domain name. Example: orcl.mydomain.com Click Next.</td>
</tr>
<tr>
<td>5. Select High Availability or Replication Option</td>
<td>Select OracleAS Cluster (Identity Management), and click Next.</td>
</tr>
<tr>
<td>6. Specify New OracleAS Cluster Name</td>
<td>Enter a name for the new OracleAS Cluster (Identity Management). Note that the cluster name is case-sensitive. Oracle recommends that you record the cluster name for use during installations on subsequent nodes. Example: cluster1 Click Next.</td>
</tr>
<tr>
<td>7. Specify Namespace in Internet Directory</td>
<td>Select the suggested namespace, or enter a custom namespace for the location of the default Oracle Identity Management realm. Ensure the value shown in Suggested Namespace meets your deployment needs. If not, enter the desired value in Custom Namespace. Refer to Section 6.16, &quot;What Do I Enter on the &quot;Specify Namespace in Internet Directory&quot; Screen?&quot;. Click Next.</td>
</tr>
</tbody>
</table>
### Specify LDAP Virtual Host and Ports

The values you enter on this screen depend on your scenario. There are two possible scenarios:

**Scenario 1:** You have configured a virtual server on your load balancer to handle LDAP traffic from Oracle Delegated Administration Services and OracleAS Single Sign-On to Oracle Internet Directory.

**Scenario 2:** You do not have a load balancer.

**Hostname:** In scenario 1, enter the name of the virtual server in this field. Enter the same virtual server name that you configured on the load balancer. In scenario 2, enter the name of the computer running Oracle Internet Directory.

Notes on the port values (see Section 12.2.3, "Configure Virtual Server Names and Ports for the Load Balancer" for details):

- The port numbers specified on this screen take precedence over the Oracle Internet Directory port numbers specified in the staticports.ini file.
- The same port numbers will be used for the Oracle Internet Directory on subsequent nodes and for the load balancer.

**SSL Port:** In scenario 1, enter the port configured on the virtual server to handle SSL LDAP connections. In scenario 2, enter the port that you want Oracle Internet Directory to use for SSL connections. The standard port number for SSL LDAP connections is 636, but you can use any port that you want.

**Non-SSL Port:** In scenario 1, enter the port configured on the virtual server to handle non-SSL LDAP connections. In scenario 2, enter the port that you want Oracle Internet Directory to use for non-SSL connections. The standard port number for non-SSL LDAP connections is 389, but you can use any port that you want.

Click Next.

### Specify HTTP Load Balancer Host and Ports

Refer to Section 12.4, "About Configuring SSL and Non-SSL Ports for Oracle HTTP Server" for details.

**HTTP Listener: Port:** Enter the port number that you want Oracle HTTP Server to listen on. **Enable SSL:** Select this option if you want to configure Oracle HTTP Server for SSL on this port.

**HTTP Load Balancer: Hostname:** Enter the name of the HTTP virtual server configured on your load balancer. Enter the same virtual server name that you configured on the load balancer.

**HTTP Load Balancer: Port:** Enter the port for the HTTP virtual server. **Enable SSL:** Select this option if this port is for SSL communications only.

Click Next.

### Specify Instance Name and ias_admin Password

**Instance Name:** Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.

Example: i_d_mgmt

**ias_admin Password** and **Confirm Password:** Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for restrictions on the password.

Example: welcome99

Click Next.

### Finish the installation

Finish the installation. Refer to Section 6.28, "Install Fragment: The Last Few Screens of the Installation" for details.
12.5.4 Installing OracleAS Cluster (Identity Management) on Subsequent Nodes

You run the installer on each node where you want to install Oracle Identity Management components. Use this procedure to install Oracle Identity Management components on nodes other than the first. For the first node, see Section 12.5.3, "Installing OracleAS Cluster (Identity Management) on the First Node".

**Key Points for Installing on Subsequent Nodes**

- Use the same staticports.ini file that you used for installing on the first node to ensure that the same component on all nodes uses the same port number.
- In the Specify HTTP Load Balancer Host and Ports screen, enter the name of the HTTP virtual server of the load balancer, and the associated port. You also enter the port number for Oracle HTTP Server on this screen.

Follow the steps in Table 12–5.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <strong>Start up the installer and complete the first few screens. Refer to Section 6.27, &quot;Install Fragment: The First Few Screens of the Installation&quot; for details.</strong></td>
<td>Notes: In the Select Installation Type screen, select Oracle Identity Management.</td>
</tr>
</tbody>
</table>
| 2. **Select Configuration Options** | Select Oracle Internet Directory.  
Select Oracle Application Server Single Sign-On.  
Select Oracle Application Server Delegated Administration Services.  
Select Oracle Application Server Directory Integration and Provisioning.  
Do not select Oracle Application Server Certificate Authority (OCA).  
Select High Availability and Replication.  
Click Next. |
| 3. **Specify Port Configuration Options** | Select Manual and enter the full path to your staticports.ini file in the provided field. You need to use staticports.ini file for OracleAS Cluster (Identity Management) configurations. Refer to Section 12.5.3.1, "Create staticports.ini File".  
Click Next. |
| 4. **Specify Repository** | Specify the OracleAS Metadata Repository that is registered with the Oracle Internet Directory on the first node.  
Username: Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges.  
Password: Enter the user’s password.  
Hostname and Port: Enter the names of all the nodes where the Real Application Clusters database is running, and the port numbers. Use the format: host1.domain.com:port1, host2.domain.com:port2, ...  
Service Name: Enter the service name of the database. Note that the service name must include the database domain name.  
Example: orcl.mydomain.com  
Click Next. |
| 5. **Warning** | This warning reminds you that you are installing this instance as part of an OracleAS Cluster (Identity Management), and that you need to synchronize the clocks on the nodes in the cluster. Refer to Section 12.2.2, "Synchronize Clocks on All Nodes". Click OK. |
6. **Specify Existing OracleAS Cluster Name**

   Specify an existing OracleAS Cluster (Identity Management) for the current instance to join. The cluster was created during a previous identical installation. Note that the cluster name is case-sensitive.

   Example: `cluster1`

   Click Next.

7. **Specify ODS Password**

   Enter the password for the ODS schema in the OracleAS Metadata Repository. The ODS schema is the main schema used by Oracle Internet Directory.

   By default, the ODS password is the same as the `ias_admin` password (the password that you entered on the Specify Instance Name and `ias_admin` Password screen).

   Click Next.

8. **Specify LDAP Virtual Host and Ports**

   The values you enter on this screen are the same as the values you entered when you did the installation on the first node. The installer uses these values to connect to the Oracle Internet Directory on the first node.

   **Hostname**: Enter the LDAP virtual server name of the load balancer. Enter the same virtual server name that you configured on the load balancer.

   **SSL Port**: Enter the port configured on this load balancer to handle LDAP SSL connections.

   **Non-SSL Port**: Enter the port configured on this load balancer to handle LDAP non-SSL connections. If the load balancer is running in SSL-only mode, this field will not appear on the screen.

   Click Next.

9. **Warning**

   This warning reminds you to set up the LDAP virtual server to direct requests to existing OracleAS Cluster (Identity Management) nodes, and then add this node to the LDAP virtual server after installation. Refer to Section 12.2.4, "Configure Your LDAP Virtual Server". Click OK.

10. **Specify Oracle Internet Directory Login**

    **Username**: Enter the username to log in to Oracle Internet Directory. You need to log in as the Oracle Internet Directory superuser (`cn=orcladmin`).

    **Password**: Enter the password for the username.

    **Realm**: Enter the realm against which to validate the username. This field appears only if your Oracle Internet Directory has multiple realms.

    Click Next.
If the Cluster Configuration Assistant failed, you can cluster the instance after installation. In this case, to cluster the instance, you must use the "dcmctl joincluster" command instead of Application Server Control. You cannot use Application Server Control in this case because Application Server Control cannot cluster instances that contain disabled components. In this case, the "home" OC4J instance is disabled.

12.6 Installing a Distributed OracleAS Cluster (Identity Management) Configuration

In this configuration, you need an existing database that is already running in a configuration that is supported by OracleAS Metadata Repository Creation Assistant. Oracle recommends running the database in a high availability environment, such as a Real Application Clusters database. This database will contain the OracleAS Metadata Repository.

You also need two nodes to run OracleAS Single Sign-On and Oracle Delegated Administration Services components, and two additional nodes to run Oracle Internet Directory. These nodes are accessed through load balancers. Refer to Figure 12–2.
Oracle Directory Integration and Provisioning Is Started on the First Node Only
The installer starts Oracle Directory Integration and Provisioning only on the first node, even though you selected it on subsequent nodes as well. On subsequent nodes, the installer configures Oracle Directory Integration and Provisioning, but does not start it.

If You Want Oracle Internet Directory to Listen on SSL Ports Only
If you want Oracle Internet Directory to listen on SSL ports only, perform this configuration after you have installed OracleAS Single Sign-On and Oracle Delegated Administration Services. You need Oracle Internet Directory to be listening on both SSL and non-SSL ports when you install OracleAS Single Sign-On and Oracle Delegated Administration Services.
Figure 12–2  Distributed OracleAS Cluster (Identity Management) Configuration

Distributed OracleAS Cluster (Identity Management) Configuration

On this tier, Identity Management includes:
- Oracle Delegated Administration Services
- OracleAS Single Sign-On

![Diagram of Distributed OracleAS Cluster (Identity Management) Configuration]

Subsections:
- Section 12.6.1, "Installation Order"
- Section 12.6.2, "Installing OracleAS Metadata Repository"
- Section 12.6.3, "Installing Oracle Internet Directory on the First Node"
- Section 12.6.4, "Installing Oracle Internet Directory on Subsequent Nodes"
- Section 12.6.5, "Installing OracleAS Single Sign-On and Oracle Delegated Administration Services on Each Node"
12.6.1 Installation Order

To create a distributed OracleAS Cluster (Identity Management) configuration:

1. Install OracleAS Metadata Repository in your existing database.
2. Install Oracle Internet Directory on each node. You run the installer on each node separately.

**Note:** If you want to configure Oracle Internet Directory to listen on SSL ports only, perform this configuration after you have installed OracleAS Single Sign-On and Oracle Delegated Administration Services. Oracle Internet Directory needs to be listening on both SSL and non-SSL ports when you install OracleAS Single Sign-On and Oracle Delegated Administration Services.

3. Install OracleAS Single Sign-On and Oracle Delegated Administration Services on each node. You run the installer on each node separately.
4. Install middle tiers.

12.6.2 Installing OracleAS Metadata Repository

To install the OracleAS Metadata Repository in your existing database, you use the OracleAS Metadata Repository Creation Assistant. Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for details.

12.6.3 Installing Oracle Internet Directory on the First Node

You run the installer on each node separately to install the Oracle Identity Management components.

12.6.3.1 Set up staticports.ini File

When installing Oracle Internet Directory on the first node, you do not need a load balancer. You can set up and configure the load balancer later. However you must ensure that the port numbers used by Oracle Internet Directory and by the load balancer are the same.

To do this, create a staticports.ini file to specify port numbers that you want Oracle Internet Directory to use. Your load balancer will use the same port numbers for LDAP communications. The staticports.ini file should contain these lines:

```
Oracle Internet Directory port = port_num
Oracle Internet Directory (SSL) port = port_num
```

12.6.3.2 Select the Same Components for Each Installation

If you are setting up the second node as a failover to the first node, then you must select the same set of components in the Select Configuration Options screen for each installation. For example, if you select Oracle Internet Directory and Oracle Directory Integration and Provisioning on the first node, you need to select them when installing on subsequent nodes.

12.6.3.3 Start the Installer

To install Oracle Internet Directory on the first node, follow the steps in Table 12–6.
To install Oracle Internet Directory on subsequent nodes, see Section 12.6.4, "Installing Oracle Internet Directory on Subsequent Nodes".

You must select the same components in the Select Configuration Options screen on all nodes. For example, if you select both Oracle Internet Directory and Oracle Directory Integration and Provisioning on the first node, you must select them on subsequent nodes in this tier.

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. --</td>
<td>Start up the installer and complete the first few screens. Refer to Section 6.27, &quot;Install Fragment: The First Few Screens of the Installation&quot; for details. Notes: In the Select Installation Type screen, select Oracle Identity Management.</td>
</tr>
<tr>
<td>3. Specify Port Configuration Options</td>
<td>Select Manual and enter the fullpath to your staticports.ini file in the provided field. You need to use staticports.ini file for OracleAS Cluster (Identity Management) configurations. Refer to Section 12.6.3.1, &quot;Set up staticports.ini File&quot;. Click Next.</td>
</tr>
<tr>
<td>4. Specify Repository</td>
<td>When you install on the first node, you need to specify an OracleAS Metadata Repository that is not already registered with an Oracle Internet Directory. When you install on subsequent nodes, then the OracleAS Metadata Repository is registered with the Oracle Internet Directory on the first node. Username: Enter the username to use to log in to the OracleAS Metadata Repository database. The user must have DBA privileges. Password: Enter the user’s password. Hostname and Port: Enter the name of the computer where the database is running, and the port number at which it is listening. Use the format: host:port. Service Name: Enter the service name of the database. Note that the service name must include the database domain name. Example: orcl.mydomain.com Click Next.</td>
</tr>
<tr>
<td>5. Select High Availability or Replication Option</td>
<td>Select OracleAS Cluster (Identity Management), and click Next.</td>
</tr>
</tbody>
</table>
12.6.4 Installing Oracle Internet Directory on Subsequent Nodes

Before performing the steps in this section, you must have installed Oracle Internet Directory on the first node as described in Section 12.6.3, "Installing Oracle Internet Directory on the First Node".

12.6.4.1 Staticports.ini File Not Needed

You do not need a staticports.ini file for this installation because the installer will configure this Oracle Internet Directory to use the same ports as the Oracle Internet Directory on the first node.

The Oracle Internet Directory on the first node must be up and running.

12.6.4.2 Select the Same Components for Each Installation

If you are setting up the second node as a failover to the first node, then you must select the same set of components in the Select Configuration Options screen for each installation. For example, if you select OracleAS Single Sign-On and Oracle Delegated Administration Services on the first node, you need to select them when installing on subsequent nodes.

12.6.4.3 Do Not Select the SSL Check box in the "Register with Oracle Internet Directory" Screen

Do not select the "Use only SSL connections with this Oracle Internet Directory" check box in the "Register with Oracle Internet Directory" screen.

12.6.4.4 Start the Installer

To install Oracle Internet Directory on subsequent nodes, follow these steps:
Table 12–7  Steps for Installing Oracle Internet Directory in a Distributed OracleAS Cluster (Identity Management) on Subsequent Nodes

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>

<tr>
<td>5.  Warning</td>
<td>This warning reminds you that you are installing this instance as part of an OracleAS Cluster (Identity Management), and that you need to synchronize the clocks on the nodes in the cluster. Refer to Section 12.2.2, &quot;Synchronize Clocks on All Nodes&quot;. Click OK.</td>
</tr>
</tbody>
</table>
12.6.5 Installing OracleAS Single Sign-On and Oracle Delegated Administration Services on Each Node

You run the installer on each node separately to install these Oracle Identity Management components.

12.6.5.1 Set up staticports.ini File

If you want to use custom ports for components other than Oracle HTTP Server, you need to create a staticports.ini file for this installation.

If you want custom ports for Oracle HTTP Server, you specify them in the "Specify HTTP Load Balancer Host and Listen Ports" screen.

If you specify custom ports for Oracle HTTP Server also in the staticports.ini file, and you also specify ports in the screen mentioned, the ports specified in the screen take precedence.

To avoid specifying Oracle HTTP Server ports in the staticports.ini file, the staticports.ini file must not contain these lines:

Oracle HTTP Server port = port_num
Oracle HTTP Server Listen port = port_num
Oracle HTTP Server SSL port = port_num
Oracle HTTP Server Listen (SSL) port = port_num

If you have a staticports.ini file, you should also use the same file for installations on subsequent nodes.
12.6.5.2 Start the Installer

Some key points to start the installer are:

- In the Specify OracleAS Cluster screen, for the first node, select Create a New Cluster. For the second node, select Join an Existing Cluster to join the cluster that you created when installing on the first node.

- In the Specify HTTP Load Balancer Host and Ports screen, enter the name of the HTTP virtual server of the load balancer, and the associated port. You also enter the port number for Oracle HTTP Server on this screen.

- In the Specify HTTP Load Balancer Host and Ports screen, you need to specify the same HTTP virtual server name and port number for all nodes. However, you can specify different port numbers for Oracle HTTP Server on each node, as long as your load balancer is configured to communicate with the specified port on that node.

</tr>
</tbody>
</table>

Installing in High Availability Environments: OracleAS Cluster (Identity Management) 12-23
7. Specify LDAP Virtual Host and Ports
   The installer will use the values on this screen to connect to Oracle Internet Directory.
   **Hostname:** Enter the LDAP virtual server name of the load balancer. Enter the same virtual server name that you configured on the load balancer.
   **SSL Port:** Enter the port configured on this load balancer to handle LDAP SSL connections.
   If the Oracle Internet Directory is configured for SSL only, select the **Use only SSL connections with this LDAP Virtual Host** option. Otherwise, enter the non-SSL port number for this load balancer in the **Non-SSL Port** field.
   Click Next.

8. Specify Oracle Internet Directory Login
   **Username:** Enter the username to log in to Oracle Internet Directory, accessed through the load balancer host and port specified in the previous screen.
   Log in as the Oracle Internet Directory superuser **(cn=orcladmin)**, or as a user who belongs to the necessary groups in Oracle Internet Directory. Which groups are necessary depends on which components you are installing. Refer to Section 8.3, "Groups Required to Configure or Deinstall Components" for details.
   **Password:** Enter the password for the username.
   **Realm:** Enter the realm against which to validate the username. This field appears only if your Oracle Internet Directory has multiple realms.
   Click Next.

9. Specify HTTP Load Balancer Host and Ports
   Refer to Section 12.4, "About Configuring SSL and Non-SSL Ports for Oracle HTTP Server" for details.
   The values entered on this screen should be the same for every node.
   **HTTP Listener: Port:** Enter the port number that you want Oracle HTTP Server to listen on. **Enable SSL:** Select this option if you want to configure Oracle HTTP Server for SSL on this port.
   **HTTP Load Balancer: Hostname:** Enter the name of the HTTP virtual server configured on your load balancer. Enter the same virtual server name that you configured on the load balancer.
   **HTTP Load Balancer: Port:** Enter the port for the HTTP virtual server. **Enable SSL:** Select this option if this port is for SSL communications only.
   Click Next.

10. Specify Instance Name and ias_admin Password
    **Instance Name:** Enter a name for this infrastructure instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.
    Example: das_sso
    **ias_admin Password** and **Confirm Password:** Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for restrictions on the password.
    Example: welcome99
    Click Next.

11. --
    Finish the installation. Refer to Section 6.28, "Install Fragment: The Last Few Screens of the Installation" for details.

### 12.6.5.3 If the Cluster Configuration Assistant Failed
You can cluster the instance after installation. Refer to Section 12.5.5, "If the Cluster Configuration Assistant Failed" for details.
12.7 Postinstallation Steps

After installing Oracle Identity Management components on all nodes, reconfigure your load balancer to direct requests to all nodes. Before you started the installation, you had configured the load balancer to direct requests to node 1 only. Refer to Section 12.2.4, "Configure Your LDAP Virtual Server".

12.7.1 Update targets.xml (Case 2 only)

The following configuration steps are needed only in the installation scenario described in Section 12.4.2, "Case 2: Client ---[HTTPS]--- Load Balancer ---[HTTPS]--- Oracle HTTP Server".

In this case the oracle_sso_server entry in the targets.xml file, on each physical host of the cluster, must be reconfigured to monitor the local SSL port.

```
Note:
Keep in mind that the hostname should remain the same. Do not change the hostname.
```

Perform the following steps to update targets.xml on each node of the cluster:

1. Back up the targets.xml file:
   ```
   cp ORACLE_HOME/sysman/emd/targets.xml ORACLE_HOME/sysman/emd/targets.xml.BACKUP
   
   2. Open the file and find the oracle_sso_server target type. Within this target entry, locate and edit the following two attributes:
      - HTTPPort - the server SSL port number
      - HTTPProtocol - the server protocol, which in this case is HTTPS
   
   For example, you could update the two attributes this way:
   ```
   <Property NAME="HTTPPort" VALUE="4443"/>
   <Property NAME="HTTPProtocol" VALUE="HTTPS"/>
   ```

3. Save and close the file.
4. Reload the OracleAS console:
   ```
   ORACLE_HOME/bin/emctl reload
   ```

12.8 Installing Middle Tiers Against OracleAS Cluster (Identity Management) Configurations

Preinstallation
Before starting the middle-tier installation, configure the LDAP load balancer that you are using for Oracle Internet Directory so that it points to only one Oracle Internet Directory node.

Installation
When installing middle tiers against OracleAS Cluster (Identity Management) configurations, follow the steps described in Chapter 7, "Installing Middle Tiers".
When the installer prompts for the Oracle Internet Directory host and port, enter the LDAP virtual host name configured on the load balancer and the associated port.

**Postinstallation**

After installing the middle tiers, you can reconfigure the LDAP load balancer to point to all the Oracle Internet Directory nodes.
This chapter describes how to install Oracle Application Server in OracleAS Disaster Recovery configurations. OracleAS Disaster Recovery is one of the high availability environments supported by Oracle Application Server.

Contents of this chapter:

- Section 13.1, "OracleAS Disaster Recovery: Introduction"
- Section 13.2, "Setting up the OracleAS Disaster Recovery Environment”
- Section 13.3, "Installing Oracle Application Server in an OracleAS Disaster Recovery Environment”
- Section 13.4, "Installing the OracleAS 10g (10.1.2.0.2) Standalone Install of OracleAS Guard into Oracle Homes”
- Section 13.5, "Patching OracleAS Guard Release 10.1.2.0.0 with Release 10.1.2.0.2”
- Section 13.6, "What to Read Next?”

### 13.1 OracleAS Disaster Recovery: Introduction

Use the OracleAS Disaster Recovery environment when you want to have two physically separate sites in your environment. One site is the production site, and the other site is the standby site. The production site is active, while the standby site is passive; the standby site becomes active when the production site goes down.

OracleAS Disaster Recovery supports a number of basic topologies for the configuration of the Infrastructure and middle tier on production and standby sites. OracleAS Disaster Recovery supports these basic topologies:

- Symmetrical topologies -- strict mirror of the production site with collocated Oracle Identity Management and OracleAS Metadata Repository Infrastructure
- Asymmetrical topologies -- simple asymmetric standby topology with collocated Oracle Identity Management and OracleAS Metadata Repository Infrastructure
- Separate OracleAS Metadata Repository for OracleAS Portal with collocated Oracle Identity Management and OracleAS Metadata Repository Infrastructure (the Departmental Topology)
- Distributed Application OracleAS metadata Repositories with Non collocated Oracle Identity Management and OracleAS Metadata Repository Infrastructure

In a symmetric topology, each node in the standby site corresponds to a node in the production site. This includes the nodes running both OracleAS Infrastructure and...
middle tiers. In an asymmetric topology, the number of instances required on the standby site are fewer than the number on the production site and the number of instances required on the standby site must be the minimum set of instances required to run your site in the event of a switchover or failover operation.

As a small variation to this environment, you can set up the OracleAS Infrastructure on the production site in an OracleAS Cold Failover Cluster environment. Refer to Section 13.2.4, "If You Want to Use OracleAS Cold Failover Cluster on the Production Site" for details.

For these supported topologies, OracleAS Guard will be installed in every Oracle home on every system that is part of your production and standby topology configured for the OracleAS Disaster Recovery solution.

OracleAS Guard can be installed as a standalone install kit located on OracleAS Utility media #2. Refer to Section 13.4, "Installing the OracleAS 10g (10.1.2.0.2) Standalone Install of OracleAS Guard into Oracle Homes" for more information about when this standalone kit should be installed.

Figure 13–1 shows an example symmetric OracleAS Disaster Recovery environment. Each site has two nodes running middle tiers and a node running OracleAS Infrastructure.

**Data Synchronization**

For OracleAS Disaster Recovery to work, data between the production and standby sites must be synchronized so that failover can happen very quickly. Configuration changes done at the production site must be synchronized with the standby site.

You need to synchronize two types of data. The synchronization method depends on the type of data:

- Use Oracle Data Guard to synchronize data in the OracleAS Metadata Repository databases on the production and standby sites. You can configure Oracle Data Guard to perform the synchronization.
- Use the backup and recovery scripts to synchronize data outside of the database (such as data stored in configuration files).

Refer to *Oracle Application Server High Availability Guide* for details on how to use Oracle Data Guard and the backup and recovery scripts.
13.2 Setting up the OracleAS Disaster Recovery Environment

Before you can install Oracle Application Server in an OracleAS Disaster Recovery environment, you have to perform these steps:

- Section 13.2.1, "Ensure Nodes Are Identical at the Operating System Level"
- Section 13.2.2, "Set Up staticports.ini File"
- Section 13.2.3, "Set Up Identical Hostnames on Both Production and Standby Sites"
- Section 13.2.4, "If You Want to Use OracleAS Cold Failover Cluster on the Production Site"

13.2.1 Ensure Nodes Are Identical at the Operating System Level

Ensure that the nodes are identical with respect to the following items:

- The nodes are running the same version of the operating system.
- The nodes have the same operating system patches and packages.
- You can install Oracle Application Server in the same directory path on all nodes.

13.2.2 Set Up staticports.ini File

The same component must use the same port number on the production and standby sites. For example, if Oracle HTTP Server is using port 80 on the production site, it must also use port 80 on the standby site. To ensure this is the case, create a staticports.ini file for use during installation. This file enables you to specify port numbers for each component. Refer to Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details.
13.2.3 Set Up Identical Hostnames on Both Production and Standby Sites

The names of the corresponding nodes on the production and standby sites must be identical, so that when you synchronize data between the sites, you do not have to edit the data to fix the hostnames.

For the Infrastructure Nodes

For the node running the infrastructure, set up a virtual name. To do this, specify an alias for the node in the /etc/hosts file.

For example, on the infrastructure node on the production site, the following line in the hosts file sets the alias to asinfra:

```
138.1.2.111   prodinfra   asinfra
```

On the standby site, the following line sets the node’s alias to asinfra.

```
213.2.2.110   standbyinfra   asinfra
```

When you install OracleAS Infrastructure on the production and standby sites, you specify this alias (asinfra) in the Specify Virtual Hostname screen. The configuration data will then contain this alias for the infrastructure nodes.

For the Middle-Tier Nodes

For the nodes running the middle tiers, you cannot set up aliases like you did for the infrastructure nodes because the installer does not display the Specify Virtual Hostname screen for middle-tier installations. When installing middle tiers, the installer determines the hostname automatically by calling the `gethostname()` function. You want to be sure that for each middle-tier node on the production site, the corresponding node on the standby site returns the same hostname.

To do this, set up a local, or internal, hostname, which could be different from the public, or external, hostname. You can change the names of the nodes on the standby site to match the names of the corresponding nodes on the production site, or you can change the names of the nodes on both production and standby sites to be the same. This depends on other applications that you might be running on the nodes, and whether changing the node name will affect those applications.

1. On the nodes whose local names you want to change, reconfigure the node so that the `hostname` command returns the new local hostname.

   __Note:__ The procedure to change the hostname of a system differs between different operating systems. Contact the system administrator of your system to perform this step. Note also that changing the hostname of a system will affect installed software that has a dependency on the previous hostname. Consider the impact of this before changing the hostname.

2. Enable the other nodes in the OracleAS Disaster Recovery environment to be able to resolve the node using the new local hostname. You can do this in one of two ways:

   **Method 1:** Set up separate internal DNS servers for the production and standby sites. This configuration allows nodes on each site (production or standby) to resolve hostnames within the site. Before the internal DNS servers are the corporate, or external, DNS servers. The internal DNS servers forward
non-authoritative requests to the external DNS servers. The external DNS servers
do not know about the existence of the internal DNS servers. Refer to Figure 13–2.

Figure 13–2 Method 1: Using DNS Servers

Production Site

<table>
<thead>
<tr>
<th>Internal DNS Server for the Production Site</th>
</tr>
</thead>
<tbody>
<tr>
<td>asinfra asmid1 asmid2</td>
</tr>
</tbody>
</table>

Standby Site

<table>
<thead>
<tr>
<th>Internal DNS Server for the Standby Site</th>
</tr>
</thead>
<tbody>
<tr>
<td>asinfra asmid1 asmid2</td>
</tr>
</tbody>
</table>

Method 1 Details

a. Make sure the external DNS names are defined in the external DNS zone.
Example:

- prodmid1.us.oracle.com IN A 138.1.2.333
- prodmid2.us.oracle.com IN A 138.1.2.444
- prodinf.us.oracle.com IN A 138.1.2.111
- standbymid1.us.oracle.com IN A 213.2.2.330
- standbymid2.us.oracle.com IN A 213.2.2.331
- standbyinf.us.oracle.com IN A 213.2.2.110

b. At the production site, create a new zone at the production site using a
domain name different from your external domain name. To do this, populate
the zone data files with entries for each node in the OracleAS Disaster
Recovery environment.

For the infrastructure node, use the virtual name or alias.

For the middle-tier nodes, use the node name (the value in
/etc/rc.config.d/netconf).

The following example uses "asha" as the domain name for the new zone.

- asmid1.asha IN A 138.1.2.333
- asmid2.asha IN A 138.1.2.444
- asinfra.asha IN A 138.1.2.111

Do the same for the standby site. Use the same domain name that you used for
the production site.

- asmid1.asha IN A 213.2.2.330
- asmid1.asha IN A 213.2.2.331
- asinfra.asha IN A 213.2.2.110

c. Configure the DNS resolver to point to the internal DNS servers instead of the
external DNS server.
In the /etc/resolv.conf file for each node on the production site, replace the existing name server IP address with the IP address of the internal DNS server for the production site.

Do the same for the nodes on the standby site, but use the IP address of the internal DNS server for the standby site.

d. Create a separate entry for Oracle Data Guard in the internal DNS servers. This entry is used by Oracle Data Guard to ship redo data to the database on the standby site.

In the next example, the "remote_infra" entry points to the infrastructure node on the standby site. This name is used by the TNS entries on both the production and standby sites so that if a switchover occurs, the entry does not have to be changed.

**Figure 13–3 Entry for Oracle Data Guard in the Internal DNS Servers**

<table>
<thead>
<tr>
<th>Production Site</th>
<th>Standby Site</th>
</tr>
</thead>
<tbody>
<tr>
<td>asinfra = 138.1.2.111</td>
<td>asinfra = 213.2.2.110</td>
</tr>
<tr>
<td>remote_infra = 213.2.2.110</td>
<td>remote_infra = 138.1.2.111</td>
</tr>
</tbody>
</table>

On the production site, the DNS entries look like this:

- asmid1.asha IN A 138.1.2.333
- asmid2.asha IN A 138.1.2.444
- asinfra.asha IN A 138.1.2.111
- remote_infra.asha IN A 213.2.2.110

On the standby site, the DNS entries look like this:

- asmid1.asha IN A 213.2.2.330
- asmid2.asha IN A 213.2.2.331
- asinfra.asha IN A 213.2.2.110
- remote_infra.asha IN A 138.1.2.111

**Method 2**: Edit the /etc/hosts file on each node on both sites. This method does not involve configuring DNS servers, but you have to maintain the hosts file on each node in the OracleAS Disaster Recovery environment. For example, if an IP address changes, you have to update the files on all the nodes, and restart the nodes.

**Method 2 Details**

a. On each node on the production site, include these lines in the /etc/hosts file. The IP addresses resolve to nodes on the production site.

```
127.0.0.1 localhost
138.1.2.333 asmid1.oracle.com asmid1
138.1.2.444 asmid2.oracle.com asmid2
```

---

**Note**: In the hosts file, be sure that the line that identifies the current node comes immediately after the localhost definition (the line with the 127.0.0.1 address).
b. On each node on the standby site, include these lines in the `hosts` file. The IP addresses resolve to nodes on the standby site.

```
b. On each node on the standby site, include these lines in the `hosts` file. The IP addresses resolve to nodes on the standby site.

**Note:** In the `hosts` file, be sure that the line that identifies the current node comes immediately after the localhost definition (the line with the 127.0.0.1 address).

13.2.4 If You Want to Use OracleAS Cold Failover Cluster on the Production Site

On the production site of a OracleAS Disaster Recovery system, you can set up the OracleAS Infrastructure to run in a OracleAS Cold Failover Cluster configuration. In this case, you have two nodes in a hardware cluster, and you install the OracleAS Infrastructure on a shared disk. Refer to Chapter 11, “Installing in High Availability Environments: OracleAS Cold Failover Cluster” for details.

Figure 13–4  Infrastructure in an OracleAS Cold Failover Cluster Configuration

To set up OracleAS Cold Failover Cluster in this environment, use the virtual IP address (instead of the physical IP address) for asinfra.asha on the production site. The following example assumes 138.1.2.120 is the virtual IP address.

```
asmid1.asha          IN  A  138.1.2.333
asmid2.asha          IN  A  138.1.2.444
asinfra.asha         IN  A  138.1.2.120  this is a virtual IP address
remote_infra.asha    IN  A  213.2.2.110
```

On the standby site, you still use the physical IP address for asinfra.asha, but the remote_infra.asha uses the virtual IP address.

```
asmid1.asha          IN  A  213.2.2.330  physical IP address
asmid2.asha          IN  A  213.2.2.331
asinfra.asha         IN  A  213.2.2.110
remote_infra.asha    IN  A  138.1.2.120  virtual IP address
```
13.3 Installing Oracle Application Server in an OracleAS Disaster Recovery Environment

Install Oracle Application Server as follows:

Note: For all of the installations, be sure to use staticports.ini to specify port numbers for the components. Refer to Section 13.2.2, "Set Up staticports.ini File".

1. Install OracleAS Infrastructure on the production site.
2. Install OracleAS Infrastructure on the standby site.
3. Start the OracleAS Infrastructure in each site before installing the middle tiers for that site.
4. Install middle tiers on the production site.
5. Install middle tiers on the standby site.

13.3.1 Installing the OracleAS Infrastructure

You must install the Oracle Identity Management and the OracleAS Metadata Repository components of OracleAS Infrastructure on the same node. You cannot distribute the components over multiple nodes.

The installation steps are similar to that for OracleAS Cold Failover Cluster. Refer to Section 11.3, "Installing an OracleAS Cold Failover Cluster (Infrastructure) Configuration" for the screen sequence. Note the following points:

- Select Configuration Options screen: Select High Availability and Replication. Refer to Table 11–2, step 9.
- Specify Virtual Hostname screen: Enter an alias as the virtual address (for example, asinfra.oracle.com). Refer to Table 11–2, step 13.

13.3.2 Installing Middle Tiers

You can install any type of middle tier that you like:

For installing J2EE and Web Cache, see Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access".

For installing Portal and Wireless or Business Intelligence and Forms, see Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".

Note: When the installer prompts you to register with Oracle Internet Directory, and asks you for the Oracle Internet Directory hostname, enter the alias of the node running OracleAS Infrastructure (for example, asinfra.oracle.com).

13.4 Installing the OracleAS 10g (10.1.2.0.2) Standalone Install of OracleAS Guard into Oracle Homes

OracleAS 10g (10.1.2.0.2) standalone install of OracleAS Guard is located on Utilities Disk 2. This standalone install of OracleAS Guard can be installed in the following environments:
Patching OracleAS Guard Release 10.1.2.0.0 with Release 10.1.2.0.2

- In its own home in the case when you are cloning an instance or topology to a new standby system (see the section on standby site cloning in Oracle Application Server High Availability Guide for more information).

- Oracle database server home for an OracleAS Metadata Repository configuration created using OracleAS Metadata Repository Creation Assistant.

- OracleAS Disaster Recovery full site upgrade from OracleAS 10g (9.0.4) to OracleAS 10g (10.1.2.0.2) (see the chapter on OracleAS Disaster Recovery site upgrade procedure in Oracle Application Server High Availability Guide for more information).

- OracleAS Guard patch upgrade from OracleAS 10g (10.1.2.0.0) to OracleAS 10g (10.1.2.0.2) (see Section 13.5, "Patching OracleAS Guard Release 10.1.2.0.0 with Release 10.1.2.0.2" for more information).

If this is an upgrade installation of OracleAS Guard, make a copy of your dsa.conf configuration file to save your current settings for your OracleAS Guard environment. After running the OracleAS 10g (10.1.2.0.2) standalone install kit of OracleAS Guard, you can restore your saved dsa.conf configuration file with your settings to continue using the same settings for the upgraded OracleAS Guard environment.

To run the OracleAS 10g (10.1.2.0.2) standalone install kit of OracleAS Guard, run the kit in the following directory path:

On UNIX systems:

/Disk2/asg/install/runInstaller

Choose the type of install that you want. Choose Typical for most installations. Choose Custom or Reinstall for upgrading from an older release of OracleAS Guard to the current release.

Enter the ias_admin account password to continue the installation.

13.5 Patching OracleAS Guard Release 10.1.2.0.0 with Release 10.1.2.0.2

If you already have an OracleAS Disaster Recovery environment set up using OracleAS Guard Release 10.1.2.0.0, you can patch OracleAS Guard in your environment to take advantage of new features and support for the topologies described in Section 13.1, "OracleAS Disaster Recovery: Introduction". To patch your OracleAS Disaster Recovery environment, follow these basic steps:

1. Stop the OracleAS Guard server in all OracleAS 10.1.2.0.0 Oracle homes on both production and standby sites using the following opmnctl command:

   On UNIX systems:

   `ORACLE_HOME/opmn/bin/opmnctl stopall`

2. Install the OracleAS 10g (10.1.2.0.2) standalone install of OracleAS Guard into each Oracle home on the production and standby sites.

   If multiple Oracle homes exist on the same system, ensure that different ports are configured for each of the OracleAS Guard servers in this configuration file.

   Because this is an upgrade installation of OracleAS Guard, make a copy of your dsa.conf configuration file to save your current settings for your OracleAS Guard environment. After running the OracleAS 10g (10.1.2.0.2) standalone install kit of OracleAS Guard, you can restore your saved dsa.conf configuration file with your settings to continue using the same settings for the upgraded OracleAS Guard environment.
On UNIX systems:

\texttt{ORACLE\_HOME/dsa/dsa.conf}

3. Start the OracleAS Guard server in all OracleAS 10.1.2.0.0 Oracle homes on both production and standby sites using the following \texttt{opmnctl} command:

On UNIX systems:

\texttt{ORACLE\_HOME/opmn/bin/opmnctl startall}
\texttt{ORACLE\_HOME/opmn/bin/opmnctl startproc ias-component=DSA}

### 13.6 What to Read Next?

For information on how to manage your OracleAS Disaster Recovery environment, such as setting up Oracle Data Guard and configuring the OracleAS Metadata Repository database, see the \textit{Oracle Application Server High Availability Guide}. 

---

Install in High Availability Environments: OracleAS Disaster Recovery  13-11
Installing the OracleAS Metadata Repository in an Existing Database

Refer to Oracle Application Server Metadata Repository Creation Assistant User’s Guide for information about how to install the OracleAS Metadata Repository in an existing database.
This chapter describes how to install and configure the infrastructure and the middle tier in different topologies. The topologies illustrate the flexibility of Oracle Application Server.

Each section in this chapter describes a topology. For each topology, the section shows a diagram of the topology, and lists the assumptions, special requirements, and installation steps.

Table 15–1 lists the recommended topologies:

<table>
<thead>
<tr>
<th>Topology Description</th>
<th>Environment</th>
<th>Requires Infrastructure?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Section 15.1, &quot;Java Developer Topology&quot;</td>
<td>Development</td>
<td>No</td>
</tr>
<tr>
<td>Section 15.2, &quot;Portal and Wireless Developer Topology&quot;</td>
<td>Development</td>
<td>Yes</td>
</tr>
<tr>

<tr>
<td>Section 15.6, &quot;OCA Topology&quot;</td>
<td>Deployment</td>
<td>Yes</td>
</tr>
</tbody>
</table>

For More Topologies: For enterprise topologies, see the Oracle Application Server Enterprise Deployment Guide.

### 15.1 Java Developer Topology

This is a single-computer development topology on which you can build, run, and test J2EE applications. It does not require an OracleAS Infrastructure.

**Target Users**

J2EE application developers

Figure 15–1 shows a diagram of this topology.
15.1.1 Description

This topology includes the components in the J2EE and Web Cache middle tier:

- Oracle HTTP Server
- Oracle Application Server Containers for J2EE
- OracleAS Web Cache

For a development tool, you can install the Oracle JDeveloper IDE, available as part of the Oracle Developer Suite.

Note:

- You can configure this J2EE and Web Cache instance to use an OracleAS Infrastructure at any time after installation.
- This instance cannot use OracleAS Single Sign-On, unless you configure it with an Oracle Internet Directory. You can install an Oracle Internet Directory if you install the OracleAS Infrastructure.

15.1.2 Requirements

The requirements are the same as those listed in Chapter 4, "Requirements".

15.1.3 Installation Sequence

You need to perform two installations:

- Install J2EE and Web Cache, as described in Section 7.8, "Installing a J2EE and Web Cache Without an Infrastructure".
- Install Oracle JDeveloper. Refer to Oracle Developer Suite Installation Guide for details.

You install these products in separate Oracle homes. The Oracle homes must be new directories (that is, they are not Oracle homes for other Oracle products).

You can install J2EE and Web Cache middle tier and Oracle JDeveloper in any order.

15.2 Portal and Wireless Developer Topology

This is a single-computer development topology containing an OracleAS Infrastructure and a Portal and Wireless middle tier. The OracleAS Infrastructure installation creates a new Oracle database and Oracle Internet Directory.
Target Users
Application developers, who can run and test their applications that access features provided by the included components.

15.2.1 Description
This topology enables application developers to develop and test their Portal and Wireless applications. This topology requires a more powerful computer than the topology described in Section 15.1, "Java Developer Topology" because this topology runs an OracleAS Infrastructure and a Portal and Wireless middle tier on the same computer. The infrastructure and the middle tier are installed in different Oracle homes.

Figure 15–2 Portal and Wireless Developer Topology

15.2.2 Requirements
The requirements are the same as those listed in Chapter 4, "Requirements".

15.2.3 Installation Sequence
Create this topology in the following order:

1. Install OracleAS Infrastructure.
   Follow the steps in Section 6.20, "Installing OracleAS Infrastructure" to install an infrastructure with a new Oracle database to contain the OracleAS Metadata Repository. The procedure also installs a new Oracle Internet Directory.

2. Install the Portal and Wireless middle tier.
   Follow the steps in Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".

You install them in different Oracle homes.

15.3 Integration Business-to-Business (B2B) Topology
This development topology enables you to design, deploy, monitor, and manage integrations between enterprises (also known as business-to-business (B2B)
integrations). OracleAS Integration B2B enables trading partners to conduct business using RosettaNet, Electronic Data Interchange (EDI), or a custom business protocol.

**Target Audience**
- Users who design, deploy, monitor, and administer B2B integrations

### 15.3.1 Description

This development topology includes:
- OracleAS Infrastructure
- J2EE and Web Cache middle tier

If you have the Oracle Application Server DVD, you can find OracleAS Integration B2B in the `b2b` directory.

![Figure 15–3 Integration B2B Topology](image)

### 15.3.2 Requirements

The requirements are the same as those listed in Chapter 4, "Requirements".

For OracleAS Integration B2B requirements, see the *Oracle Application Server Integration B2B Installation Guide*, which is on the OracleAS Integration B2B CD-ROM or in the `b2b` directory on the Oracle Application Server DVD.

### 15.3.3 Assumptions

This topology makes the following assumptions:
When you install OracleAS Infrastructure, you create a new Oracle Internet Directory.

When you install OracleAS Infrastructure, you create a new database for the OracleAS Metadata Repository. This OracleAS Metadata Repository is also used by OracleAS Integration B2B.

### 15.3.4 Installation Sequence

Install the items in the following order (see Figure 15–3).

1. In Oracle_Home_1, install an OracleAS Infrastructure with Oracle Identity Management services and OracleAS Metadata Repository. Refer to Section 6.20, "Installing OracleAS Infrastructure" for specific steps.

   This creates a database to contain the OracleAS Metadata Repository. It also creates an Oracle Internet Directory.

2. In Oracle_Home_2, install a J2EE and Web Cache middle tier. Refer to Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access".

   When the installer prompts for Oracle Internet Directory, enter the connect information for the Oracle Internet Directory created in step 1.

   When the installer prompts for the OracleAS Metadata Repository, select the OracleAS Metadata Repository installed in step 1.

### 15.4 Departmental Topology with Separate OracleAS Metadata Repository for OracleAS Portal

This topology is a smaller scale version of the topology described in the Oracle Application Server Enterprise Deployment Guide. It consists of an OracleAS Infrastructure with two metadata repositories, and multiple middle tiers.

It uses two metadata repositories in the following way:

- One OracleAS Metadata Repository is used by Oracle Identity Management components, such as Oracle Internet Directory and OracleAS Single Sign-On.

- The second OracleAS Metadata Repository is used by the Portal and Wireless middle tier. Components in this middle tier, such as OracleAS Portal and OracleAS Wireless, use this OracleAS Metadata Repository.

**Target Users**

This topology can be used by individual departments within an organization. Users who access this topology are internal to the organization. As such, this topology does not consider security requirements that involve external users.
15.4.1 Description

This topology (Figure 15–4) consists of an OracleAS Infrastructure, plus several middle tiers, including at least one Portal and Wireless middle tier. This topology uses two metadata repositories:

- one for Oracle Identity Management services (installed on computer 1). All the middle tiers use this metadata repository for Oracle Identity Management services.
- one for product metadata (installed on computer 2). The Portal and Wireless middle tier uses this metadata repository.

Expanding the Topology

You can install Oracle Application Server middle tiers on additional computers, as needed. Set these middle tiers to use either metadata repository.

Adding High Availability Features

You can install OracleAS Infrastructure in any of the high availability environments described in Chapter 10, "Installing in High Availability Environments: Overview".

15.4.2 Requirements

The requirements are the same as those listed in Chapter 4, "Requirements".
15.4.3 Assumptions

This topology makes the following assumptions:

- When you install OracleAS Infrastructure, you create a new Oracle Internet Directory.

15.4.4 Installation Sequence

Install the items in the following order. The computers are listed in Figure 15–4.

1. Computer 1: Install OracleAS Infrastructure with Oracle Identity Management services and OracleAS Metadata Repository. Refer to Section 6.20, "Installing OracleAS Infrastructure" for specific steps.

   This creates a database to contain the OracleAS Metadata Repository. It also creates an Oracle Internet Directory.

   When the installer prompts you to register the OracleAS Metadata Repository, enter the connect information for the Oracle Internet Directory created in step 1.

   The Portal and Wireless middle tier will use this second metadata repository for its product metadata. Refer to Section 6.12, "Can I Use Multiple Metadata Repositories?"

3. Computer 3: Install a Portal and Wireless middle tier. Refer to Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".

   When the installer prompts for Oracle Internet Directory, enter the connect information for the Oracle Internet Directory created in step 1. This Oracle Internet Directory contains the registration for the OracleAS Metadata Repository installed in steps 1 and 2.

   When the installer prompts for the OracleAS Metadata Repository, select the OracleAS Metadata Repository installed in step 2.

4. Computer 4: Install a J2EE and Web Cache middle tier. Refer to Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access".

   When the installer prompts for Oracle Internet Directory, enter the connect information for the Oracle Internet Directory created in step 1.

   When the installer prompts for the OracleAS Metadata Repository, select the OracleAS Metadata Repository installed in step 1.

15.5 Development Life Cycle Support Topology

This topology is a combination of other topologies to support moving applications from test to stage to production environments.

- Test environment: Application developers test their applications in their own environments. Examples of testing environments:
  - Section 15.1, "Java Developer Topology"
  - Section 15.2, "Portal and Wireless Developer Topology"
  - Section 15.3, "Integration Business-to-Business (B2B) Topology"
■ Stage environment: QA personnel test all applications before deploying them to the production environment. In this environment, you can use the topology described in Section 15.4, “Departmental Topology with Separate OracleAS Metadata Repository for OracleAS Portal”. This topology in a stage environment runs applications from all departments, not just from a single department.

■ Production environment: Applications are ready for use by users internal and external to the enterprise.

15.5.1 Moving Applications from Test to Stage

To move applications from a test to a stage environment, you deploy them on middle tiers in the stage environment. The applications use the Oracle Identity Management and OracleAS Metadata Repository of the stage environment.

If an application uses custom data in a database, you need to move that data from that database to a database in the stage environment.

15.5.2 Moving Applications from Stage to Production

You can move applications from a stage environment to a production by deploying the applications and moving any application-specific data from the stage environment to the production environment.

Another method is to configure the middle tier in the stage environment to use a different infrastructure (that is, point the middle tier to use the infrastructure in the production environment). You can use this feature to move middle tiers (and their applications) from stage to production.

You still need to move application-specific data stored in a stage database to a database in the production environment.

This method is convenient if you need additional computers for the production environment. In one step, you add a computer that already has a middle tier and deployed applications.

Refer to Oracle Application Server Administrator’s Guide for details.

15.6 OCA Topology

In this topology, OCA has its own OracleAS Metadata Repository, and they run on a computer separate from other OracleAS Infrastructure components (Figure 15–5). The other components use a different OracleAS Metadata Repository.
15.6.1 Description

Although you can install OCA on the same computer as the other infrastructure components, you achieve greater security by installing OCA and its own OracleAS Metadata Repository on a separate computer:

- By not sharing the OracleAS Metadata Repository with other components, you isolate OCA from security breaks, whether accidental or malicious.
- You can place the computer on which OCA is running in a secure room.

15.6.2 Requirements

The requirements for the computers are listed in Chapter 4, "Requirements".

15.6.3 Installation Sequence

Install the items in the following order:

1. Computer 1: Install infrastructure components except for OCA. Refer to Section 6.20, "Installing OracleAS Infrastructure" for steps.

   **Note:** Do not select OracleAS Certificate Authority (OCA) in the Select Configuration Options screen, because you will install OCA on Computer 2.

3. Install middle tiers. Ensure the middle tiers use the OracleAS Metadata Repository installed on Computer 1. Procedures for installing middle tiers are:
- Section 7.9, "Installing J2EE and Web Cache in a Database-Based Farm Repository and with Oracle Identity Management Access"
- Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms"
16 Postinstallation Tasks

Contents:

- Section 16.1, "State of Oracle Application Server Instances After Installation"
- Section 16.2, "Passwords for Oracle Application Server Components"
- Section 16.3, "NFS Installations"
- Section 16.4, "OracleAS File-Based Clustering"
- Section 16.5, "Backup and Recovery"
- Section 16.6, "SSL"
- Section 16.7, "Operating System Locale and NLS_LANG Environment Variable"
- Section 16.8, "Component Configuration After Installation"
- Section 16.9, "Components that Require Postinstallation Tasks"
- Section 16.10, "What to Do Next?"

16.1 State of Oracle Application Server Instances After Installation

After installation, the components that you have configured are started up (unless you have configured them to use ports lower than 1024, in which case you have to start them up manually).

You can view the Welcome page and the Application Server Control page in a browser. The URLs for these pages are shown in the last screen of the installer. You can view the contents of the last screen in the file ORACLE_HOME/install/setupinfo.txt.

You can use scripts or you can use the Oracle Enterprise Manager 10g Application Server Control to start and stop Oracle Application Server instances. Refer to Oracle Application Server Administrator's Guide for details.

16.2 Passwords for Oracle Application Server Components

By default, all passwords for Oracle Application Server components, with the exception of the OracleAS Metadata Repository schema passwords, are set to be the same as the Oracle Application Server instance password. For security reasons, you should change the passwords of the various components to have different values.

Refer to Oracle Application Server Administrator's Guide and the component guides in the Oracle Application Server Documentation Library for details on how to alter the passwords for the components you have installed.
16.3 NFS Installations

If you installed Oracle Application Server on an NFS disk, you need to edit the LockFile directive in the ORACLE_HOME/Apache/Apache/conf/httpd.conf file so that it points to a local disk. This file is used by the Oracle HTTP Server component. Refer to Oracle HTTP Server Administrator’s Guide for details.

16.4 OracleAS File-Based Clustering

If you want to set up OracleAS Clusters managed using a file-based repository, you need to perform the steps listed in the Oracle Application Server High Availability Guide. Note that when you run the "dcmctl joinFarm" command, it invokes "opmnctl stopall", which stops all components. After the "dcmctl joinFarm" command completes, you have to run "opmnctl startall" to restart the components.

16.5 Backup and Recovery

After installation would be a good time to start backing up the files, and to set up your backup and recovery strategy. Refer to Oracle Application Server Administrator’s Guide for details.

16.6 SSL

By default, most components are not configured for SSL. To enable SSL, see the SSL section in the Oracle Application Server Administrator’s Guide.

16.7 Operating System Locale and NLS_LANG Environment Variable

If you installed Oracle Application Server in a non-English language environment, check your settings as described in these sections:

■ Section 16.7.1, "Check the Operating System Locale"
■ Section 16.7.2, "Check the NLS_LANG Setting"

16.7.1 Check the Operating System Locale

To make sure the default locale is set properly, verify that the LC_ALL or LANG environment variables are set with the appropriate values. To check the current setting, run the locale command:

prompt> locale

16.7.2 Check the NLS_LANG Setting

To check the NLS_LANG setting:

1. Make sure the value of the NLS_LANG environment variable is compatible with the default locale setting of the operating system. Refer to Oracle Application Server Globalization Guide for details, including a list of files that set this variable. You might need to edit the value of the NLS_LANG variable in these files.

2. Check that the NLS_LANG setting in the ORACLE_HOME/opmn/conf/opmn.xml file is identical to the NLS_LANG environment variable.
Example: The NLS_LANG setting in the `opmn.xml` file might look something like this:

```xml
<environment>
  <variable id="TMP" value="/tmp"/>
  <variable id="NLS_LANG" value="JAPANESE_JAPAN.JA16SJIS"/>
</environment>
```

16.8 Component Configuration After Installation

If you did not configure a component during installation (that is, you did not select the component in the Select Configuration Options screen), you can configure some components after installation. Some components have dependencies that you have to complete before you can configure the component. Section 16.8.1, "Configuring mod_osso (Required for Oracle Delegated Administration Services)" describes how to configure mod_osso, which has to be configured before you can configure Oracle Delegated Administration Services.

16.8.1 Configuring mod_osso (Required for Oracle Delegated Administration Services)

If you did not configure Oracle Delegated Administration Services during installation, you can do it after installation using Oracle Enterprise Manager 10g Application Server Control.

Oracle Delegated Administration Services requires OracleAS Single Sign-On and mod_osso. mod_osso is an Oracle HTTP Server module that communicates with the Single Sign-On server. If mod_osso is not configured, you have to configure it before you can configure Oracle Delegated Administration Services. Here are the steps:

1. Ensure that OracleAS Single Sign-On is configured against Oracle Internet Directory. This is done for you if you have installed and configured these two components from the installer.

2. Check if mod_osso is configured in the ORACLE_HOME where you want to configure Oracle Delegated Administration Services.

Examine the following line in the `ORACLE_HOME/Apache/Apache/conf/httpd.conf` file. ORACLE_HOME refers to the directory where you want to configure Oracle Delegated Administration Services.

```bash
include "ORACLE_HOME/Apache/Apache/conf/mod_osso.conf"
```

If the line starts with #, then it is commented out and mod_osso is not configured in this installation. Perform step 3 to configure mod_osso.

If the line is not commented out, mod_osso is already configured. You can go ahead and configure Oracle Delegated Administration Services using Application Server Control. Go to step 5.

3. To configure mod_osso manually, perform these steps:

   a. Set the `ORACLE_HOME` environment variable to the full path of the directory where you want to configure Oracle Delegated Administration Services.

   b. Set the `SHLIB_PATH` environment variable to contain `$ORACLE_HOME/lib32` and `$ORACLE_HOME/network/lib`.

   c. Run the following command (all on one line). Note: for the `-classpath` parameter, do not type any space characters after the colon (:) characters, as indicated by `<no spaces>`:
prompt> $ORACLE_HOME/jdk/bin/java
   -classpath .:$ORACLE_HOME/sso/lib/ossoreg.jar:<no spaces>
   $ORACLE_HOME/jlib/ojmisc.jar:<no spaces>
   $ORACLE_HOME/jlib/repository.jar:<no spaces>
   $ORACLE_HOME/jlib/tools.jar:$ORACLE_HOME/jlib/infratool.jar
   oracle.ias.configtool.UseInfrastructure i
   -f $ORACLE_HOME/config/infratool_mod_osso.properties
   -h OIDhost -p OIDport -u OIDadminName -w OIDclearTextPassword
   -o ORACLE_HOME -m ASinstanceName
   -infra infraGlobalDBName -mh host -sslo true
   -sslp sslPort -sslf false

Table 16–1 describes the parameters where you have to supply values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h OIDhost</td>
<td>Specifies the name of the computer where Oracle Internet Directory is running. You can determine this value from the OIDhost parameter in the ORACLE_HOME/config/ias.properties file.</td>
</tr>
<tr>
<td>-p OIDport</td>
<td>Specifies the port number on which Oracle Internet Directory is listening. You can determine this value from the OIDport parameter in the ORACLE_HOME/config/ias.properties file.</td>
</tr>
<tr>
<td>-u OIDadminName</td>
<td>Specifies the login name for Oracle Internet Directory. Use the superuser: cn=orcladmin.</td>
</tr>
<tr>
<td>-w OIDclearTextPassword</td>
<td>Specifies the password for the Oracle Internet Directory user.</td>
</tr>
<tr>
<td>-o ORACLE_HOME</td>
<td>Specifies the full path to the directory where you installed OracleAS Infrastructure.</td>
</tr>
<tr>
<td>-m ASinstanceName</td>
<td>Specifies the name of the OracleAS Infrastructure instance where you want to configure mod_osso. You can determine this value from the IASname parameter in the ORACLE_HOME/config/ias.properties file.</td>
</tr>
<tr>
<td>-infra infraGlobalDBName</td>
<td>Specifies the name of the OracleAS Metadata Repository database. You can determine this value from the InfrastructureDBCommonName parameter in the ORACLE_HOME/config/ias.properties file.</td>
</tr>
<tr>
<td>-mh host</td>
<td>Specifies the full hostname (including the domain name) of the computer where you want to configure Oracle Delegated Administration Services.</td>
</tr>
<tr>
<td>-sslp sslPort</td>
<td>Specifies the SSL port for Oracle Internet Directory. You can determine this value from the OIDsslport parameter in the ORACLE_HOME/config/ias.properties file.</td>
</tr>
</tbody>
</table>

4. Restart OC4J and Oracle HTTP Server. You can do this using the opmnctl command.

    prompt> $ORACLE_HOME/opmn/bin/opmnctl restartproc ias-component=OC4J
    prompt> $ORACLE_HOME/opmn/bin/opmnctl restartproc ias-component=HTTP_Server

5. Once mod_osso is configured, you can configure Oracle Delegated Administration Services using the Application Server Control. Refer to Oracle Internet Directory Administrator’s Guide for details.
16.9 Components that Require Postinstallation Tasks

If you plan to use any of the components listed in Table 16–2, you need to perform some steps specific to the component after installation before you can use the component. Table 16–2 lists the component guides that describe the steps.

Table 16–2 Components Requiring Postinstallation Steps

<table>
<thead>
<tr>
<th>Component</th>
<th>Guide That Describes the Postinstallation Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>OracleAS Portal</td>
<td>Oracle Application Server Portal Configuration Guide</td>
</tr>
<tr>
<td>OracleAS Wireless</td>
<td>Oracle Application Server Wireless Administrator’s Guide</td>
</tr>
<tr>
<td>Oracle Ultra Search</td>
<td>Oracle Ultra Search Administrator’s Guide</td>
</tr>
<tr>
<td>OracleBI Discoverer</td>
<td>To prepare your relational data for analysis, enable users and roles, and set up security, refer to the Oracle Discoverer Administration Guide. Note: You can find this guide on the Oracle Business Intelligence Tools CD. To find out about middle tier postinstallation tasks, refer to the Oracle Business Intelligence Discoverer Configuration Guide.</td>
</tr>
<tr>

<td>Oracle Application Server Certificate Authority Administrator’s Guide</td>
</tr>
</tbody>
</table>

16.10 What to Do Next?

After installing Oracle Application Server, you should read the Oracle Application Server Administrator’s Guide. Specifically, you should read the "Getting Started After Installing Oracle Application Server” chapter.

You should also perform a complete Oracle Application Server environment backup after installing Oracle Application Server. This enables you to restore a working environment in case something goes wrong. For details on how to perform a complete Oracle Application Server environment backup, see the Oracle Application Server Administrator’s Guide.

You should also perform a complete Oracle Application Server environment backup after each successful patchset upgrade and after each successful configuration change.
What to Do Next?
Installing OracleAS Developer Kits

OracleAS Developer Kits provide APIs that enable you to develop OracleAS Portal, OracleAS Wireless, XML, and LDAP applications. You use Developer Kits in development environments, not in staging or production environments. Note that the OracleAS Developer Kits do not provide a complete IDE (integrated development environment). If you need an IDE, you can install Oracle JDeveloper, available with Oracle Developer Suite or with all editions of Oracle Application Server.

Perform the following procedure to install OracleAS Developer Kits.

Table A–1  Steps for Installing the OracleAS Developer Kits

<table>
<thead>
<tr>
<th>Screen</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.  --</td>
<td>Start up the installer. Refer to Section 5.17, “Starting Oracle Universal Installer” for details.</td>
</tr>
<tr>
<td>2.  Welcome</td>
<td>Click Next.</td>
</tr>
<tr>
<td>3.  Specify Inventory Directory and Credentials</td>
<td>This screen appears only if this is the first installation of any Oracle product on this computer.</td>
</tr>
</tbody>
</table>

**Enter the full path of the inventory directory:** Enter a full path to a directory for the installer’s files. Enter a directory that is different from the Oracle home directory for the product files.

Example: `/opt/oracle/oraInventory`

**Specify operating system group name:** Select the name of the operating system group that will have write permission for the inventory directory.

Example: `oinstall`

Click Next.

<table>
<thead>
<tr>
<th>4.  Run orainstRoot.sh</th>
<th>Run the orainstRoot.sh script in a different shell as the root user. The script is located in the oraInventory directory. You need to do this only if the OracleAS Developer Kits is the first Oracle product to be installed on this computer. After running the script, click Continue.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>5.  Specify File Locations</th>
<th>Name: Enter a name to identify this Oracle home. This is not the name of the directory. Example: <code>OH_DEVKIT</code></th>
</tr>
</thead>
</table>

**Path (under Destination):** Enter the full path to the destination directory. This is the Oracle home.

Example: `/opt/oracle/OraDevKit`

Click Next.
6. Select a Product to Install

Select OracleAS Developer Kits.

If you need to install additional languages, click Product Languages. Refer to Section 5.8, "Installing Additional Languages" for details.

Click Next.

7. Specify Port Configuration Options

If you want to use default ports for the components, select Automatic.

If you do not want to use the default ports, and you have created a staticports.ini file, select Manual and enter the fullpath to your staticports.ini file in the provided field.

Click Next.

8. Specify Instance Name and ias_admin Password

Instance Name: Enter a name for this instance. Instance names can contain alphanumeric characters and the _ (underscore) character. If you have more than one Oracle Application Server instance on a computer, the instance names must be unique. Refer to Section 5.9, "Oracle Application Server Instances and Instance Names" for instance name details.

Example: devkits

ias_admin Password and Confirm Password: Set the password for the ias_admin user. This is the administrative user for the instance. Refer to Section 5.10, "The ias_admin User and Restrictions on its Password" for restrictions on the password.

Example: welcome99

Click Next.

9. Summary

Verify your selections and click Install.

10. Install Progress

This screen shows the progress of the installation.

11. Run root.sh

Run the root.sh script in a different shell as the root user. The script is located in this instance’s Oracle home directory. Click OK.

12. Configuration Assistants

This screen shows the progress of the configuration assistants. Configuration assistants configure components.

13. End of Installation

Click Exit to quit the installer.
Silent and Non-Interactive Installation

This appendix describes how to install Oracle Application Server in silent mode. This appendix contains the following topics:

- Section B.1, "Silent Installation"
- Section B.2, "Non-Interactive Installation"
- Section B.3, "Preinstallation"
- Section B.4, "Notes for Silent and Non-Interactive Installations"
- Section B.5, "Create the Response File"
- Section B.6, "Start the Installation"
- Section B.7, "Postinstallation"
- Section B.8, "Security Tips for Silent and Non-Interactive Installations"
- Section B.9, "Deinstallation"

B.1 Silent Installation

Silent installation eliminates the need to monitor the Oracle Application Server installation because there is no graphical output and no input by the user.

Silent installation of Oracle Application Server is accomplished by supplying the Oracle Universal Installer with a response file and specifying the -silent flag on the command line. The response file is a text file containing variables and parameter values which provide answers to the installer prompts.

If this is a first time installation of Oracle Application Server, you must create the oraInst.loc file before starting. File creation is described in Section B.3, "Preinstallation".

Following installation of Oracle Application Server, you need to run the root.sh script as the root user. The root.sh script detects settings of environment variables and enables you to enter the full path of the local bin directory.

Use silent installation of Oracle Application Server when there are similar installations on more than one computer. Additionally, use silent install when performing the Oracle Application Server installation from a remote location using the command line.
B.2 Non-Interactive Installation

Non-interactive installations also use a response file to automate the Oracle Application Server installation. In non-interactive installations, there is graphical output and users may enter input.

Non-interactive installation of Oracle Application Server is also accomplished by supplying the Oracle Universal Installer with a response file but without specifying the \(-\text{silent}\) flag on the command line. The response file is a text file containing variables and parameter values which provide answers to the installer prompts. If you have not provided responses to all of the installer prompts, you need to enter information during the installation.

If this is a first time installation of Oracle Application Server, you must create the \(\text{oraInst.loc}\) file before starting. File creation is described in Section B.3, "Preinstallation".

Following installation of Oracle Application Server, you need to run the \(\text{root.sh}\) script as the root user. The \(\text{root.sh}\) script detects settings of environment variables and enables you to enter the full path of the local bin directory.

Use non-interactive installation of Oracle Application Server when there are specific screens you want to observe during installation.

B.3 Preinstallation

1. Log in as the \text{root} user.
   
   \(\text{prompt}> \text{su}\)

2. Create an empty file.
   
   \(\#\)

3. Exit from the \text{root} user.
   
   \(\# \text{ exit}\)

B.4 Notes for Silent and Non-Interactive Installations

This section describes special cases that are applicable when you are performing silent or non-interactive installations.

\- Section B.4.1, "Installing OracleAS Certificate Authority"
\- Section B.4.2, "Expanding a Middle Tier"

B.4.1 Installing OracleAS Certificate Authority

If you are installing OCA, check the following:

\- If you are installing OCA against an existing Oracle Internet Directory, make sure the Oracle Internet Directory has OracleAS Single Sign-On configured. If not, the OCA Configuration Assistant will fail.

\- If you are installing OCA with a new Oracle Internet Directory, make sure you are also configuring OracleAS Single Sign-On. If not, the OCA Configuration Assistant will fail.
In interactive mode, the installer performs the checks for you and displays a warning if the requirements are not met. However, in silent or non-interactive mode, the installer is not able to display a warning.

B.4.2 Expanding a Middle Tier

If you are expanding a middle tier, check the following:

- Stop all processes associated with the middle tier that you want to expand. Refer to Section 7.14, "Expanding a Middle Tier".
- Start the expansion installation in a new shell window, that is, a shell window that is started up after the first installation has completed.

B.5 Create the Response File

Before doing a silent or non-interactive installation, you must provide information specific to your installation in a response file. The installer will fail if you attempt an installation using a response file that is not configured correctly. Response files are text files that you can create or edit in a text editor.

B.5.1 Creating Response Files from Templates

Templates for response files are available in the stage/Response directory on Disk 1 of the Oracle Application Server CD-ROM. Response file templates are available for the following installation types:

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Filename</th>
</tr>
</thead>
<tbody>
<tr>
<td>J2EE and Web Cache</td>
<td>oracle.iappserver.iapptop.J2EE.rsp</td>
</tr>
<tr>
<td>Portal and Wireless</td>
<td>oracle.iappserver.iapptop.Portals.rsp</td>
</tr>
<tr>
<td>Business Intelligence and Forms</td>
<td>oracle.iappserver.iapptop.Business.rsp</td>
</tr>
<tr>
<td>OracleAS Infrastructure: Oracle Identity Management and OracleAS Metadata Repository</td>
<td>oracle.iappserver.infrastructure.Infrastructure.rsp</td>
</tr>
<tr>
<td>OracleAS Infrastructure: Oracle Identity Management only</td>
<td>oracle.iappserver.infrastructure.Infrastructure_ID.rsp</td>
</tr>
<tr>
<td>OracleAS Infrastructure: OracleAS Metadata Repository only</td>
<td>oracle.iappserver.infrastructure.Infrastructure_Meta.rsp</td>
</tr>
<tr>
<td>OracleAS Developer Kits</td>
<td>oracle.iappserver.devcorner.DevKit.rsp</td>
</tr>
</tbody>
</table>

Refer to the template files for descriptions of the parameters in the file.

**Note:** For Boolean parameters, specify either "true" or "false".

B.5.2 Creating Response Files by Using the Record Mode in the Installer

You can run the installer in record mode to save your inputs to a file that you can use later as a response file. This feature is useful if you need to perform the same installation on different computers.

To run the installer in record mode:
1. Start up the installer with the `-record` and `-destinationFile` parameters.

   ```
prompt> /path/to/runInstaller -record -destinationFile newResponseFile
   ```

   Replace `newResponseFile` with the full path to the response file that you want the installer to create. Example: `/opt/oracle/myPortalResponse.rsp`.

2. Enter your values in the installer screens. The installer will write these values to the file specified in the `-destinationFile` parameter.

   When you get to the Summary screen, the installer automatically writes all your values to the specified file. At this point, you can complete the installation on this computer, or you can exit without performing the installation.

   Secure information, such as passwords, is not written to the file, so you must modify the response file before you can use it.

   For all installations, modify these parameters:

   ```
   ACCEPT_LICENSE_AGREEMENT=true
   oracle.iappserver.instance:szl_InstanceInformation="{"instancename", "instancepassword", "instancepassword"}
   PreReqConfigSelections=""
   nValidationRepositoryHost=0
   nValidationRepository=0
   nValidationStartProcPortals=0
   nValidationStartProcBusiness=0
   nValidationClusterSupport=0
   nValidationStartProcCore=0
   nValidationClusterRepository=0
   oracle.iappserver.instance:nValidationInstanceInfo=0
   silent=true
   SHOW_ROOTSH_CONFIRMATION=false
   ```

   For middle-tier installations, modify these parameters:

   ```
   oracle.iappserver.iapptop:startupProcesses=""
   oracle.iappserver.iapptop:SHOW_IAS_COMPONENT_CONFIG_PAGE=false
   oracle.iappserver.iapptop:n_ValidationPreReqConfigSelections=0
   oracle.iappserver.iapptop:nValidationPortListSelect=0
   oracle.iappserver.iapptop:nValidationOID2=0
   oracle.iappserver.iapptop:nValidationInstanceInfo=0
   oracle.iappserver.iapptop:nValidationOID=0
   ```

   For infrastructure installations, modify these parameters:

   ```
   oracle.iappserver.infrastructure:startupProcesses=""
   oracle.iappserver.infrastructure:SHOW_IAS_COMPONENT_CONFIG_PAGE=false
   oracle.iappserver.infrastructure:n_ValidationPreReqConfigSelections=0
   oracle.iappserver.infrastructure:nValidationPortListSelect=0
   oracle.iappserver.infrastructure:nValidationInstanceInfo=0
   oracle.iappserver.infrastructure:nValidationOID=0
   ```

   Refer to the generated response file for descriptions of the parameters in the file.

B.5.3 Example Response Files

The following sections shows example response files for the following Oracle Application Server installation types:

- Section B.5.3.1, "Example Response File for Standalone J2EE and Web Cache"
- Section B.5.3.2, "Example Response File for OracleAS Infrastructure"
Section B.5.3.3, "Example Response File for Portal and Wireless"

Note: Be sure that you read the description of each parameter=value in the provided sample files, and edit value accordingly for your environment.

B.5.3.1 Example Response File for Standalone J2EE and Web Cache

The following shows an example of a response file for a silent installation of standalone instance of J2EE and Web Cache as described in Section 7.8, "Installing a J2EE and Web Cache Without an Infrastructure".

Note that if you do not copy the CD-ROMs to the hard drive, the installer will prompt you to switch CD-ROMs during installation. To complete the installation without any prompting, you must copy the contents of the CD-ROMs to the hard drive and specify the LOCATION_FOR_DISKn parameters.

B.5.3.3 Example Response File for Portal and Wireless

The following shows an example of a response file for a silent installation of Portal and Wireless as described in Section 7.13, "Installing Portal and Wireless or Business Intelligence and Forms".

Note that if you do not copy the CD-ROMs to the hard drive, the installer will prompt you to switch CD-ROMs during installation. To complete the installation without any prompting, you must copy the contents of the CD-ROMs to the hard drive and specify the LOCATION FOR DISKn parameters.

RESPONSEFILE_VERSION=2.2.1.0.0

```
Postinstallation

B.6 Start the Installation

To make the installer use the response file, specify the location of the response file that you want to use as a parameter when starting the installer.

To perform a non-interactive installation:

prompt> setenv DISPLAY hostname:0.0
prompt> runInstaller -responseFile absolute_path_and_filename

To perform a silent installation, use the -silent parameter:

prompt> runInstaller -silent -responseFile absolute_path_and_filename

B.7 Postinstallation

The success or failure of the non-interactive and silent installations is logged in the installActions<time_stamp>.log file. Additionally, the silent installation
creates the silentInstall<time_stamp>.log file. The log files are created in the oraInventory directory.

The silentInstall<time_stamp>.log file contains the following line if the installation was successful:

The installation of OracleAS <Installation Type> was successful.

The installActions<time_stamp>.log file contains specific information for each Oracle Application Server installation type.

See Also: Appendix F, "Configuration Assistants"

---

**Note:** Application Server Control Configuration Assistant and DCM Repository Backup Assistant success messages appear for first time installation of Oracle Application Server.

---

**Note:** If you perform a silent installation with the staticports.ini file for ports less than 1024, the OPMN Configuration Assistant fails, and all the remaining configuration assistants do not run.

After the failure, perform the operations described in Section 7.17, "Install Fragment: The Last Few Screens of the Installation".

You must run the configuration assistants from the command line. The commands for running the configuration assistants are available from the file ORACLE_HOME/bin/configtoolcmds.pl.

---

**B.8 Security Tips for Silent and Non-Interactive Installations**

One of the pieces of information in the response file is the installation password. The password information is in clear text.

To minimize security issues regarding the password in the response file, follow these guidelines:

- Set the permissions on the response files so that they are readable only by the operating system user who will be performing the silent or non-interactive installation.

- If possible, remove the response files from the system after the silent or non-interactive installation is completed.

If you are installing the OracleAS Metadata Repository in silent or non-interactive mode, the installer creates these log files:

- ORACLE_HOME/admin/<ORACLE_SID>/create/<ORACLE_SID>.log

- ORACLE_HOME/cfgtoollogs/<ORACLE_SID>.log

where <ORACLE_SID> is the value of your database SID.

These log files contain database password information. If possible, you should remove these files from the system after reviewing their contents. These log files are not required for the operation of OracleAS Metadata Repository.
B.9 Deinstallation

You can perform a silent deinstallation of Oracle Application Server by supplying a silent deinstallation parameter to the response file you used for installation.

Add the following parameter to your installation response file:

`REMOVE_HOMES={"<ORACLE_HOME to be removed>"}`

For example:

`REMOVE_HOME="/local_location/oracle_home"`

---

**Note:** You still need to follow the deinstallation steps described in Appendix E, "Deinstallation and Reinstallation". One of the key steps is to run the deconfig tool before running the silent deinstallation command. The silent deinstallation command only replaces the step where you run the installer interactively to deinstall the instance.

---

To perform a silent deinstallation, use the `-deinstall` parameter when entering the command:

```
prompt> runInstaller -silent -deinstall -responseFile absolute_path_and_filename
```
By default, the installer assigns port numbers to components from a set of default port numbers. This appendix contains a list of these port numbers.

If you want to use a different set of port numbers, you have to create a file called staticports.ini, in which you list the port numbers that you want to use. Refer to Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details.

C.1 Method of Assigning Default Port Numbers

The installer assigns default port numbers to each component using the following method:

1. The installer checks if the default port number is in use. If it is not in use, the installer assigns it to the component.
2. If the default port number is already in use by an Oracle product or by any running application, the installer tries the lowest number in the port number range. It keeps trying the port numbers in the range until it finds one that is available.

C.2 Default Port Numbers

Table C–1 lists the default port numbers for components. The last column, Name in staticports.ini, specifies the component name as it appears in the staticports.ini file, which enables you to override the default port numbers. Refer to Section 4.5.3, "Using Custom Port Numbers (the "Static Ports" Feature)" for details.

</table>
If you plan to install Oracle Application Server behind firewalls, you need to open certain ports in the firewall during installation (and also during runtime).

When you are installing middle-tiers or Oracle Identity Management components, you need access to the Oracle Internet Directory, OracleAS Metadata Repository, Oracle Notification Server, and OracleAS Web Cache (the invalidation port). You need to open ports used by these components in the firewall, as shown in Figure D–1:

- LDAP: port 389
- LDAP SSL: port 636
- SQL*Net 2: port 1521
- Oracle Notification Server: port 6200
- Web Cache Invalidation: port 9401

**Note:** The port numbers listed here are the default ports for the components. You may have different ports in your environment.

Deinstallation and Reinstallation

This appendix guides you through the deinstallation and reinstallation process for Oracle Application Server.

- Section E.1, "New Tool: Deconfig Tool"
- Section E.2, "Deinstallation Procedure: Overview"
- Section E.3, "Deinstalling OracleAS Cold Failover Cluster Installations"
- Section E.4, "Deinstalling OracleAS Single Sign-On Instances in OracleAS Cluster (Identity Management)"
- Section E.5, "Deinstalling OracleAS Cluster (Identity Management)"
- Section E.6, "Deinstalling Middle Tiers"
- Section E.7, "Deinstalling OracleAS Infrastructure"
- Section E.8, "Deinstalling OracleAS Developer Kits"
- Section E.9, "Harmless Errors in the Log File"
- Section E.10, "Cleaning Up Oracle Application Server Processes"
- Section E.11, "Reinstallation"
- Section E.12, "Troubleshooting"

E.1 New Tool: Deconfig Tool

In this release, there is a new tool called the Deconfig tool that you need to run as part of the deinstallation procedure. This tool removes entries in OracleAS Metadata Repository and Oracle Internet Directory for the Oracle Application Server instance that you want to deinstall.

The Deconfig tool does not remove partner application entries. If you need to remove partner application entries, follow the steps in Section G.3.1, "Obsolete Partner URLs Still Remain on the OracleAS Single Sign-On Administration Screen".

The Deconfig tool does not remove OracleAS Clusters from the farm. If you are deinstalling OracleAS Cluster, you will need to run the dcmctl removecluster command after deinstalling the instances. Refer to Section E.5, "Deinstalling OracleAS Cluster (Identity Management)" for details.

To run the Deconfig tool, run the Perl interpreter on the ORACLE_HOME/bin/deconfig.pl script. Use the Perl interpreter provided with Oracle Application Server.

prompt> cd $ORACLE_HOME/bin
New Tool: Deconfig Tool

prompt> $ORACLE_HOME/perl/bin/perl deconfig.pl [-u oid_user] [-w password] [-r realm] [-dbp sys_db_password]

If you run it without any parameters, then the tool prompts you for the necessary information.

E.1.1 Parameters

- **-u oid_user**
  Specify the Oracle Internet Directory user.
  
  You can specify the Oracle Internet Directory user using the user’s simple name or the user’s distinguished name (DN). For example, the user’s simple name can be jdoe@mycompany.com, which corresponds to the DN cn=jdoe,l=us,dc=mycompany,dc=com.
  
  The Oracle Internet Directory user needs to have privileges for deinstalling the components that are configured in the Oracle Application Server instance that you want to deinstall. These privileges are the same as for installing and configuring the component.
  
  For example, if you are deinstalling an OracleAS Infrastructure instance that is running Oracle Delegated Administration Services and OracleAS Single Sign-On, make sure the user has privileges to configure these components. For a list of components and groups that grant the privileges, see Section 8.3, "Groups Required to Configure or Deinstall Components".
  
  If you want to run the tool as the Oracle Internet Directory superuser, then be sure to use cn=orcladmin, and not just orcladmin. These are two different users. If you want more details about these users, see Section 8.1, "Default Users in Oracle Internet Directory".

- **-w password**
  Specify the password for the Oracle Internet Directory user.

- **-r realm**
  Specify the realm in which to authenticate the user. This value is required only if your Oracle Internet Directory has more than one realm.

- **-dbp sys_db_password**
  Specify the password for the SYS user in the database. This is the OracleAS Metadata Repository database used by Oracle Internet Directory.
  
  This value is required only if you are deinstalling an Oracle Identity Management-only instance that has Oracle Internet Directory configured.
  
  If you specify this parameter and it is not needed, the password value is simply not used.

- **-help or -h**
  You can also run the Deconfig tool with the -h or -help parameter to display help:
  
  **prompt>** $ORACLE_HOME/perl/bin/perl deconfig.pl -h
  - or -
  **prompt>** $ORACLE_HOME/perl/bin/perl deconfig.pl -help
E.1.2 Log Files Generated by the Deconfig Tool

The Deconfig tool writes its log file to the ORACLE_HOME/cfgtoollogs/DeconfigureWrapper.log file.

E.2 Deinstallation Procedure: Overview

Follow these high-level steps to deinstall Oracle Application Server (the details are provided in later sections):

1. Deinstall middle-tier instances first.
   a. Run the Deconfig tool on the instance.
   b. Run the installer and click the Deinstall Products button.
   c. Clean up any remaining files.

2. Then deinstall OracleAS Infrastructure instances.
   a. Run the Deconfig tool on the instance.
   b. Run the installer and click the Deinstall Products button.
   c. Clean up any remaining files.

Note:

- If you used OracleAS Metadata Repository Creation Assistant to install the OracleAS Metadata Repository on an existing database, and you want to remove the OracleAS Metadata Repository, then select the "Remove" option in OracleAS Metadata Repository Creation Assistant. You can also use OracleAS Metadata Repository Creation Assistant to remove the registration from Oracle Internet Directory.

- If you remove an infrastructure instance, then all middle-tier instances that depend on that infrastructure will no longer work.

If you want to keep the middle-tier instances, you can configure them to use services from another infrastructure. Refer to Oracle Application Server Administrator's Guide for details.

Items to Remove or Clean Up

To deinstall Oracle Application Server instances, you have to clean up the items listed in Table E–1. The procedures are described later in this appendix.

Table E–1  Items to Deinstall

<table>
<thead>
<tr>
<th>Item to Clean Up</th>
<th>Tool to Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>Files from the Oracle home directory</td>
<td>Installer</td>
</tr>
<tr>
<td></td>
<td>If the installer does not remove all the files, you can remove the remaining files using the rm command.</td>
</tr>
<tr>
<td>Entries for the deleted instance in the Inventory directory</td>
<td>Installer</td>
</tr>
<tr>
<td>Instance name from Farm page</td>
<td>Installer</td>
</tr>
<tr>
<td>Entries for the deleted instance in Oracle Internet Directory</td>
<td>Deconfig tool</td>
</tr>
</tbody>
</table>
The installer does not permit custom deinstallation of individual components.

E.3 Deinstalling OracleAS Cold Failover Cluster Installations

If you are deinstalling an OracleAS Cold Failover Cluster installation:

1. Stop the clusterware agents or packages that monitor and fail over the environment. Refer to your clusterware documentation for details.
2. Then perform the steps described in this appendix.

E.4 Deinstalling OracleAS Single Sign-On Instances in OracleAS Cluster (Identity Management)

If you have multiple OracleAS Single Sign-On instances installed in a cluster against the same Oracle Internet Directory and you would like to deinstall some of the instances but keep others running, perform the following steps before running the Deconfig tool.

Note that if the OracleAS Single Sign-On instance that you wish to deinstall was the last instance to be installed against the Oracle Internet Directory, you should not perform this step. Instead, perform the steps in Section E.7, "Deinstalling OracleAS Infrastructure".

1. Open the file located at ORACLE_HOME/deconfig/DeconfigWrapper.properties for editing.
2. Search for the line that begins with "SSO=". For example, the line might look like the following:

   SSO=/OraHome_1/jdk/bin/java -jar /OraHome_1/sso/lib/ossoca.jar deinstall /OraHome_1 "%OID_USER%" %OID_PASSWORD%

3. Comment out the line by adding a pound (#) character at the beginning of the line. In the preceding example, the line would be changed to look like the following:

   # SSO=/OraHome_1/jdk/bin/java -jar /OraHome_1/sso/lib/ossoca.jar deinstall /OraHome_1 "%OID_USER%" %OID_PASSWORD%

After modifying the file, perform the steps in Section E.7, "Deinstalling OracleAS Infrastructure" to complete the deinstallation.

E.5 Deinstalling OracleAS Cluster (Identity Management)

To deinstall an OracleAS Cluster (Identity Management), perform the following steps.

1. Deinstall all instances that contain OracleAS Single Sign-On except for the last instance installed. Use the steps in Section E.4, "Deinstalling OracleAS Single Sign-On Instances in OracleAS Cluster (Identity Management)" to perform the deinstallation.
2. Deinstall the last OracleAS Single Sign-On instance using the steps in Section E.7, "Deinstalling OracleAS Infrastructure".
3. If you are using a Distributed OracleAS Cluster (Identity Management), deinstall the Oracle Internet Directory instances using the steps in Section E.7, "Deinstalling OracleAS Infrastructure".
E.6 Deinstalling Middle Tiers

To deinstall middle tiers:

1. Log in as the operating system user who installed the instance you want to deinstall.

2. Stop all processes associated with the instance you want to deinstall.
   Refer to Oracle Application Server Administrator’s Guide for details on how to stop the processes.

3. Run the Deconfig tool.
   
   ```
   prompt> cd $ORACLE_HOME/bin
   prompt> $ORACLE_HOME/perl/bin/perl deconfig.pl [parameters]
   ```
   Refer to Section E.1, "New Tool: Deconfig Tool" for parameter details.

4. Start the installer.
   
   ```
   prompt> $ORACLE_HOME/oui/bin/runInstaller
   ```

5. Follow these steps in the installer.
   a. Welcome screen: Click Deinstall Products.
   b. Inventory screen: Select the instance you want to deinstall, and click Remove.
   c. Confirmation screen: Verify the components selected for deinstallation. Click Yes to continue.
   d. Deinstallation Progress screen: Monitor the progress of the deinstallation.
   e. Exit the installer when the deinstallation is complete.

6. Delete any remaining files in the Oracle home directory of the deleted instance.
   
   ```
   prompt> rm -rf $ORACLE_HOME
   ```

7. Remove the line for the deinstalled middle tier from the file.
   Towards the end of the file, you should see lines that specify the Oracle home directory. Remove the line for the Oracle home that you deinstalled. For example, if your Oracle home is /private1/j2ee, the line would look like the following:
   
   ```
   *:/private1/j2ee:N
   ```

8. Note that OracleAS Portal entries in Oracle Internet Directory are not removed by the Deconfig tool or the installer.

E.7 Deinstalling OracleAS Infrastructure

This section describes how to deinstall OracleAS Infrastructure instances. It includes the following topics:
- Section E.7.1, "Deinstallation Order"
- Section E.7.2, "Deinstallation Steps"

E.7.1 Deinstallation Order

The OracleAS Infrastructure instance could contain all the OracleAS Infrastructure components, or it could contain only a subset of the components, because you have a
distributed OracleAS Infrastructure installation. Here are some common scenarios and their deinstallation order:

**If you have an Oracle Identity Management + OracleAS Metadata Repository instance**, you have only one instance to deinstall.

**If you installed Oracle Identity Management and OracleAS Metadata Repository separately:**
1. Deinstall the Oracle Identity Management instance.
2. Deinstall the OracleAS Metadata Repository.

**If you have a distributed Oracle Identity Management:**
1. Deinstall the instance(s) that are running OracleAS Single Sign-On, Oracle Delegated Administration Services, Oracle Directory Integration and Provisioning, and/or OCA.
2. Deinstall the instance running Oracle Internet Directory.
3. Deinstall the OracleAS Metadata Repository.

### E.7.2 Deinstallation Steps

1. Log in as the operating system user who installed the instance you want to deinstall.
2. If OCA is configured on the instance you want to deinstall, run the following commands:

   ```bash
   prompt> $ORACLE_HOME/oca/bin/ocactl stop
   prompt> $ORACLE_HOME/oca/bin/cmdeinst ocaAdminPassword oidAdminPassword
   ```

   Replace `ocaAdminPassword` with the password of the OCA administrator.
   Replace `oidAdminPassword` with the password of the Oracle Internet Directory user who installed OCA. The user must belong to the following groups:
   - Trusted Application Admins
   - iAS Admins
   - Repository Owners group for the metadata repository used by OCA

   The "ocactl stop" command stops OCA services. The cmdeinst command performs the following actions:
   - removes OCA entries from Oracle Internet Directory
   - removes data from tables in the `oca` schema
   - removes OCA files created by the OCA Configuration Assistant during installation

3. If Oracle Directory Integration and Provisioning is configured and running in the instance you want to deinstall, stop the Oracle Directory Integration and Provisioning server.

   Ensure that Oracle Internet Directory is running.

   You can stop Oracle Directory Integration and Provisioning by running the following command:

   ```bash
   prompt> cd $ORACLE_HOME/bin
   prompt> oidctl connect=db_connect_string server=odisrv instance=1 stop
   ```
Deinstalling OracleAS Infrastructure

\( db\_connect\_string \) is the TNS alias as listed in the file ORACLE_HOME/network/admin/tnsnames.ora.

For any additional Oracle Directory Integration and Provisioning servers that you started, you must stop them too. Refer to instructions in the Oracle Identity Management Integration Guide.

4. If Oracle Internet Directory is configured as a replica, you need to delete this node from the directory replication group (DRG). Refer to Chapter 25, "Oracle Internet Directory Replication Administration", in the Oracle Internet Directory Administrator’s Guide for steps.

5. Run the Deconfig tool.

\[
\text{prompt}> \text{cd } \$\text{ORACLE\_HOME/bin} \\
\text{prompt}> \$\text{ORACLE\_HOME/perl/bin/perl deconfig.pl [parameters]} \\
\]

Refer to Section E.1, "New Tool: Deconfig Tool" for parameter details.

---

**Note:** If you are deinstalling an instance that includes the Oracle Internet Directory or OracleAS Single Sign-On components, you need to run the Deconfig tool as the Oracle Internet Directory superuser (cn=orcladmin). If the instance does not include Oracle Internet Directory or OracleAS Single Sign-On, then you need to run the tool as a user with the proper privileges, as shown in Table 8–4.

6. Start the installer.

\[
\text{prompt}> \$\text{ORACLE\_HOME/oui/bin/runInstaller} \\
\]

7. Follow these steps in the installer.

a. Welcome screen: Click Deinstall Products.

b. Inventory screen: Select the instance you want to deinstall, and click Remove.

c. Confirmation screen: Verify the components selected for deinstallation. Click Yes to continue.

d. Deinstallation Progress screen: Monitor the progress of the deinstallation.

e. Exit the installer when the deinstallation is complete.

8. Delete any remaining files in the deleted instance’s Oracle home directory.

\[
\text{prompt}> \text{rm -rf } \$\text{ORACLE\_HOME} \\
\]

9. Remove lines for the deinstalled infrastructure instance from the file.

Towards the end of the file, you should see lines that specify the Oracle home directory. If you are deinstalling an infrastructure instance that contains a metadata repository, there will be two lines in the file:

- one line that begins with a *
- one line that begins with the database SID

You need to remove both lines.

For example, if the infrastructure instance is installed in /private1/infra, and it includes a metadata repository whose SID is orcl, the lines would look like the following:

orcl:/private1/infra:N
Deinstalling OracleAS Developer Kits

E.8 Deinstalling OracleAS Developer Kits

1. Log in as the operating system user who installed OracleAS Developer Kits.
2. Stop all processes associated with the instance you want to deinstall.
   Refer to Oracle Application Server Administrator’s Guide for details on how to stop the processes.
3. Start the installer.
   prompt> $ORACLE_HOME/oui/bin/runInstaller
4. Follow these steps in the installer.
   a. Welcome screen: Click Deinstall Products.
   b. Inventory screen: Select the instance you want to deinstall, and click Remove.
   c. Confirmation screen: Verify the components selected for deinstallation. Click Yes to continue.
   d. Deinstallation Progress screen: Monitor the progress of the deinstallation.
   e. Exit the installer when the deinstallation is complete.
5. Delete any remaining files in the deleted instance’s Oracle home directory.
   prompt> rm -rf $ORACLE_HOME
6. Remove the line for the deinstalled OracleAS Developer Kits from the file.
   Towards the end of the file, you should see lines that specify the Oracle home directory. Remove the line for the Oracle home that you deinstalled. For example, if your Oracle home is /private1/devkit, the line would look like the following:

   *:/private1/devkit:N

E.9 Harmless Errors in the Log File

If you get the following “unable to delete file” and “unable to find make file” errors in the oraInstalltimestamp.err file after you deinstall J2EE and Web Cache or Portal and Wireless instances, these are harmless error messages.

Ignoring Exception during de-install
oracle.sysman.oii.oii.OiiDeinstallException:
An error occurred during runtime. oracle.sysman.oii.oii.OiiDeinstallException:
An error occurred during runtime.
...
Ignoring Exception during de-install
oracle.sysman.oii.oii.OiiDeinstallException:
Unable to delete file
/home/j2ee/sysman/emd/targets.xml
oracle.sysman.oii.oii.OiiDeinstallException: Unable to delete file
/home/j2ee/sysman/emd/targets.xml
at instantiateFileEx.deinstallAction(instantiateFileEx.java:935)
...
Ignoring Exception during de-install
Unable to find make file:
/home/j2ee/network/lib/ins_net_client.mk
oracle.sysman.oii.oii1.Oii1DeinstallException: Unable to find make file:
/home/j2ee/network/lib/ins_net_client.mk
at ssmakeux.deinstallAction(ssmakeux.java:246)
...

E.10 Cleaning Up Oracle Application Server Processes
If you do not shut down Oracle Application Server processes before starting the
installation, then you have to kill the processes because the files for these processes are
deleted. To check for processes that are still running, run the ps command:

prompt> ps -ef

To kill a process, use the kill command:

prompt> kill -9 process_id

You can determine the process_id from the ps command.
If you need to shut down the dcmctl shell process, you can try exiting the shell by
typing exit.

E.11 Reinstallation
The installer does not allow reinstallation of an Oracle Application Server instance in a
directory that already contains an Oracle Application Server instance. To reinstall
Oracle Application Server in the same directory, you have to deinstall and then install
it.

E.12 Troubleshooting
Refer to Section G.3, "Deinstallation Problems and Solutions" for help with common
deinstallation problems.
This appendix lists the configuration assistants and the location of their log files.

- Section F.1, "Troubleshooting Configuration Assistants"
- Section F.2, "Description of Oracle Application Server Configuration Assistants"

### F.1 Troubleshooting Configuration Assistants

Contents:

- Section F.1.1, "General Tips"
- Section F.1.2, "Configuration Assistant Result Codes"

#### F.1.1 General Tips

If a configuration assistant fails, try the following steps to correct the problem:

1. Review the log files for the failed configuration assistant. Configuration assistant log files are listed in Section F.2, "Description of Oracle Application Server Configuration Assistants". Try to fix the issue that caused the error.

2. If the failed configuration assistant has any dependencies, then run the dependencies again. You must do this even if the dependency completed successfully.

3. Run the failed configuration assistant again by selecting the configuration assistant in the installer and clicking **Retry**.

   If the configuration assistant fails again after you click **Retry**, remove the `/tmp/EM_CONFIG_INSTALL.lk` file and re-run the configuration assistant again.

   If the configuration assistant fails again after you click **Retry**, remove the component entry from the `ORACLE_HOME/sysman/emd/targets.xml` file. For example, the following lines show the OracleAS Web Cache entry in the `targets.xml` file:

   ```xml
   <Target TYPE="oracle_webcache" NAME="instance2.domain.com_Web Cache" DISPLAY_NAME="Web Cache">
      <Property NAME="HTTPPort" VALUE="7777" />
      <Property NAME="logFileName" VALUE="webcache.log" />
      <Property NAME="authrealm" VALUE="Oracle Web Cache Administrator" />
      <Property NAME="AdminPort" VALUE="4000" />
      <Property NAME="HTTPProtocol" VALUE="http" />
      <Property NAME="logFileDir" VALUE="/sysman/log" />
      <Property NAME="HTTPMachine" VALUE="domain.com" />
      <Property NAME="HTTPQuery" VALUE="" />
   </Target>
   ```
4. If an optional configuration assistant fails, and it does not have any dependencies, run the remaining configuration assistants. Uncheck the cancelled optional configuration assistant, highlight and check the next listed configuration assistant, and click Retry.

5. If configuration assistant failure occurs when running configuration assistant execution commands on the command line, then re-run the configuration assistant execution command again.

You can use the generated script file named configtoolcmds.pl located in the ORACLE_HOME/bin directory to run the failed configuration assistant again. The configtoolcmds.pl script is generated after you exit the installer. During silent or non-interactive installation, the configtoolcmds.pl script is generated immediately after configuration assistant failure.

6. If you see a "Fatal Error. Reinstall" message, find the cause of the problem by analyzing the log files. You cannot recover from a fatal error by correcting the problem and continuing. You must remove the current installation and reinstall Oracle Application Server. The following tasks describe the recovery procedure:
   a. Deinstall the failed installation using the procedure described in Appendix E, "Deinstallation and Reinstallation".
   b. Correct the cause of the fatal error.
   c. Reinstall Oracle Application Server.
   d. If the fatal error reoccurs, then you must remove all Oracle installations from your computer.

F.1.2 Configuration Assistant Result Codes

If a configuration assistant fails, the bottom half of the installation screen displays the error message, and the configuration assistant writes its result code (Table F–1) to the following log file:

oraInventory/logs/installActions.timestamp.log

<table>
<thead>
<tr>
<th>Result Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Configuration assistant succeeded</td>
</tr>
<tr>
<td>1</td>
<td>Configuration assistant failed</td>
</tr>
<tr>
<td>-1</td>
<td>Configuration assistant cancelled</td>
</tr>
</tbody>
</table>
### F.2 Description of Oracle Application Server Configuration Assistants

Table F–2 lists the Oracle Application Server configuration assistants in alphabetical order. Different installations use different configuration assistants depending on installation type and configuration options you selected.

Note that the following paths use "/" as the directory delimiter. You might need to change it for your system.

<table>
<thead>
<tr>
<th>Configuration Assistant</th>
<th>Description</th>
<th>Log File Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADF Configuration Assistant</td>
<td>Integrates Oracle Application Development Framework Runtime Libraries with Oracle Enterprise Manager 10g Application Server Control. This configuration assistant requires the ORACLE_HOME/jlib/emConfigInstall.jar file.</td>

<td>-------------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| Discoverer Configuration Assistant | Performs the following tasks:  
- reads the contents of the discoconfig5.properties file  
- adds entries to the targets.xml file  
- adds a provider with a few parameters  
- adds an entry to opmn.xml  
- reloads OPMN  
- registers the Discoverer session | ORACLE_HOME/oraInventory/logs/installActimestamp.log  
ORACLE_HOME/cfgtoollogs/configtooltimestamp.log |
| File-Based Farm Repository Configuration Assistant | Configures a file-based repository for Oracle Application Server components. | ORACLE_HOME/config/infratool_filebased_repository.log  
ORACLE_HOME/cfgtoollogs/infratool_filebased_repository.log |
| Forms Configuration Assistant | Configures the OracleAS Forms Services server and integrates OracleAS Forms Services with Oracle Enterprise Manager 10g Application Server Control. It adds an entry to targets.xml file. Before running this configuration assistant, make sure that OracleAS Infrastructure is up and running. | ORACLE_HOME/forms90/config/formsConfig.log |
| HTTP Server Configuration Assistant | Configures Oracle HTTP Server, registers it with Oracle Enterprise Manager 10g Application Server Control, and adds an entry to the ORACLE_HOME/sysman/emd/targets.xml file. | ORACLE_HOME/Apache/Apache/logs  
ORACLE_HOME/Apache/Apache/httpd.log  
ORACLE_HOME/cfgtoollogs/configtooltimestamp.log |
| Infrastructure Database Registration Assistant | Registers the OracleAS Metadata Repository with Oracle Internet Directory. | ORACLE_HOME/cfgtoollogs/infratool_ldaporacfg.log |
| Infrastructure Instance Configuration Assistant | Updates the ORACLE_HOME/config/ias.properties file, registers the instance with Oracle Internet Directory, and creates the ldap.ora file with Oracle Internet Directory credentials in the ORACLE_HOME/network/admin file. Before running this configuration assistant, check that the SHLIB_PATH environment variable includes ORACLE_HOME/lib32 and ORACLE_HOME/network/lib: | ORACLE_HOME/config/infratool_instance_jazn.log  
ORACLE_HOME/cfgtoollogs/infratool_instance_jazn.log |
| Infrastructure mod_osso Configuration Assistant | Registers mod_osso, plugs mod_osso into Oracle HTTP Server, and provides integration with OracleAS Single Sign-On to authenticate users. The registration enables Oracle HTTP Server installed with OracleAS Infrastructure to act as a partner application to OracleAS Single Sign-On. Applications that run under Oracle HTTP Server can register and protect their URL with mod_osso. When the URL is requested, mod_osso authenticates the user with OracleAS Single Sign-On to allow access to the URL. | ORACLE_HOME/config/infratool_mod_osso.log

</table>
This appendix describes solutions to common problems that you might encounter when installing Oracle Application Server. It contains the following sections:

- Section G.1, "General Troubleshooting Tips"
- Section G.2, "Installation Problems and Solutions"
- Section G.3, "Deinstallation Problems and Solutions"
- Section G.4, "Need More Help?"

G.1 General Troubleshooting Tips

If you encounter an error during installation:

- Read the Oracle Application Server Release Notes for the latest updates. The release notes are available with the platform-specific documentation. The most current version of the release notes is available on Oracle Technology Network:
  
  http://www.oracle.com/technology/documentation

- Verify that your computer meets the requirements specified in Chapter 4, "Requirements".

- If you are installing a middle tier, check that the OracleAS Infrastructure with which you want to associate the middle tier is running during installation.

- If you entered incorrect information on one of the installation screens, return to that screen by clicking Back until you see the screen.

- If a configuration assistant failed, check the log file for that configuration assistant. Section F.2, "Description of Oracle Application Server Configuration Assistants" lists the configuration assistants and the location of their log files. If you do not see log files from some configuration assistants in the ORACLE_HOME/cfgtoollogs directory, exit the installer. This causes the installer to copy the log files to that directory.

- If an error occurred while the installer is copying or linking files:
  1. Note the error and review the installation log files.
  2. Remove the failed installation by following the steps in Appendix E, "Deinstallation and Reinstallation".
  3. Correct the issue that caused the error.
  4. Restart the installation.
G.2 Installation Problems and Solutions

This section describes common installation problems and solutions:

- Section G.2.1, "Location of Log Files"
- Section G.2.2, "Message About Installing in a Non-Empty Directory"
- Section G.2.3, "Installer Disappears After Running the Preinstallation Checks"
- Section G.2.4, "Unable to Clean Up a Failed Installation"
- Section G.2.5, "Forgot the Password for the cn=orcladmin Account"
- Section G.2.6, "cn=orcladmin Account Becomes Locked"
- Section G.2.7, "User Interface Does Not Display in the Desired Language, or Does Not Display Properly"
- Section G.2.8, "Installer Does Not Display Correct Database Name for OracleAS Metadata Repository"
- Section G.2.9, "Configuration Assistant Failures - General"
- Section G.2.10, "OracleAS Randomize Password Configuration Assistant Failures"
- Section G.2.11, "Database Configuration Assistant (DBCA) Failures"
- Section G.2.12, "Harmless Error Message from Database Configuration Assistant (DBCA)"
- Section G.2.13, "OPMN Configuration Assistant - Start HTTP Server Failures"
- Section G.2.14, "OPMN Configuration Assistant - Start DAS Instance Failures"
- Section G.2.15, "OPMN Configuration Assistant - Start OCA Failures"
- Section G.2.16, "Re-running chgtocfmt Does Not Work"
- Section G.2.17, "WARNING: DCM service may not be available at this time"

G.2.1 Location of Log Files

There are two sets of log files:

- The installer writes the following log files:
  - oraInventory_location/logs/installAction*timestamp*.log
  - oraInventory_location/logs/oraInstall*timestamp*.err
  - oraInventory_location/logs/oraInstall*timestamp*.out
  - Oracle_Home/install/make.log

- The configuration assistants write log files in the ORACLE_HOME/cfgtoollogs directory.

Note that if you want to access the log files created by the configuration assistants, you need to exit the installer first. The log files are inaccessible if the installer is still in use.

G.2.2 Message About Installing in a Non-Empty Directory

**Problem**
The installer displays a message that you are installing into a non-empty directory.
Solution
If you started an installation and went beyond the Specify File Locations screen, but did not complete the installation, the installer has already created the Oracle home directory that you specified. If you later try to install again in the same directory, which contains some files created by the installer, the installer gives a warning that the directory is not empty.

Steps to take:
1. In the warning dialog, click No to return to the Specify File Locations screen.
2. In the Specify File Locations screen, click Installed Products. This displays the Inventory screen.
   - If your Oracle home is listed in the Inventory screen, then you have to deinstall the Oracle home. Refer to Appendix E, "Deinstallation and Reinstallation" for details.
   - If your Oracle home is not listed in the Inventory screen, then you can just delete the files from the Oracle home and continue with the installation.

G.2.3 Installer Disappears After Running the Preinstallation Checks

Problem
The installer disappears after running preinstallation checks.

Solution
The directory that is the mount point of the CD-ROM or DVD was mounted with incorrect permissions, and this caused the pwd command to not work correctly. When you run pwd, it returns "cannot determine current directory".

To fix:
1. Unmount the CD-ROM.
2. Change permissions of the mount directory to 755.
3. Remount the CD-ROM.

The installer should now run correctly.

G.2.4 Unable to Clean Up a Failed Installation

If your installation was not successful, you have to deinstall it first before you can install Oracle Application Server again. Refer to Appendix E, "Deinstallation and Reinstallation" for instructions.

G.2.5 Forgot the Password for the cn=orcladmin Account

Problem
You forgot the password for the cn=orcladmin account.

Solution
You can reset the password in the database. The DSE root attribute name is orclsupassword.

Note that after a certain number of failed attempts to connect, the cn=orcladmin account becomes locked. In this case, you have to unlock the account. Refer to the
G.2.6  cn=orcladmin Account Becomes Locked

Problem
The cn=orcladmin account becomes locked after ten failed attempts to connect. This is controlled by the password policy. Ten failed attempts is the default value.

Solution
If you know the cn=orcladmin password, you can unlock the account by running the following command:

```prompt>
ORACLE_HOME/bin/oidpasswd connect=dbsid unlock_su_acct=true
```

where `dbsid` is the SID for the database. For example:

```prompt>
ORACLE_HOME/bin/oidpasswd connect=orcl unlock_su_acct=true
OID DB user password: enter_ODS_password
OID superuser account unlocked successfully.
```

The command prompts for the password of the ODS schema. By default, the ODS password is the same as for the cn=orcladmin and ias_admin accounts, which you entered during installation.

To change the password policy, see the Oracle Internet Directory Administrator’s Guide.

G.2.7  User Interface Does Not Display in the Desired Language, or Does Not Display Properly

Problem
Messages do not appear in the desired language, or messages are not displayed correctly.

Solution
Currently, Oracle Application Server does not support adding or removing languages after installation.

If you are serving non-English content, be sure you add all the languages that you need during installation. To add languages during installation, click the Product Languages button in the "Select a Product to Install" screen. To see which languages are installed by default, see Section 5.8, "Installing Additional Languages".

If you are serving non-English content and forgot to click the Product Languages in the installation, the user interface might not display properly because the required fonts were not installed. You can fix this by installing the fonts from the "OracleAS Metadata Repository Upgrade Assistant and Utilities" CD-ROM or from the Oracle Application Server DVD.

1. Insert and mount the "OracleAS Metadata Repository Upgrade Assistant and Utilities" CD-ROM or the Oracle Application Server DVD.

2. CD-ROM: Copy the contents of the `utilities/fonts` directory on the CD-ROM to the `ORACLE_HOME/jdk/jre/lib/fonts` directory.

   DVD: Copy the contents of the `repca_utilities/utilities/fonts` directory on the DVD to the `ORACLE_HOME/jdk/jre/lib/fonts` directory.
G.2.8 Installer Does Not Display Correct Database Name for OracleAS Metadata Repository

**Problem**
During middle-tier installation, in the Select OracleAS Metadata Repository screen, which is the screen where you select the OracleAS Metadata Repository that you want to use for the middle tier, the installer does not display correctly the names of the available OracleAS Metadata Repository databases.

**Solution**
Check the log file `oraInventory/logs/installActiontimestamp.log`. If you see the following lines:

*** Select OracleAS Metadata Repository Page***
Error:*** Alert: Error validating repository on multiple hosts and ports. A database hostname or port is missing.

then it means that your OracleAS Metadata Repository database name contains `PORT` or `HOST` in uppercase characters. To fix the problem, change the name of the database so that it does not contain `PORT` or `HOST` in uppercase characters.

G.2.9 Configuration Assistant Failures - General

This section describes general tips for troubleshooting configuration assistant failures. Refer to the next sections for specific configuration assistant failures.

**See Also:** Appendix F, "Configuration Assistants"

**Problem**
Configuration assistant failed

**Solution**
Configuration assistants fail from a variety of causes. Some things you can check are:

- Check that the listener, database, and Oracle Internet Directory associated with the OracleAS Infrastructure are up and running. If not, start them up and click the Retry button to rerun the configuration assistant that failed.
- Check the log files for the failed configuration assistant to determine the problem. The log files are located in the `ORACLE_HOME/cfgtoollogs` directory.

Fix the problem indicated in the log file, and click Retry to rerun the failed configuration assistant.

G.2.10 OracleAS Randomize Password Configuration Assistant Failures

Before rerunning OracleAS Randomize Password Configuration Assistant, you need to perform these steps:

2. Enter the Oracle Internet Directory hostname, port, user name, and password.
3. Expand **Entry Management > cn=OracleContext > cn=Products > cn=IAS > cn=IAS Infrastructure Databases**.
4. Select `orclreferencename=your_globaldb_name`.

Troubleshooting  G-5
5. For each schema under the `your_globaldb_name` tree, there is an `orclreferencename` entry. For the `orclreferencename` entry:
   - Change the value of the `orclpassword` attribute to the schema name. For example, if `wireless` is the schema name, change the `orclpassword` attribute value to `wireless`.
   - Change `orclflexattribute1` to `false`.

   Click `Apply`.

   Perform these steps for all the schemas except `ODS` and `OEM_REPOSITORY`.

6. Using SQL*Plus, log in to the database where the OracleAS Randomize Password Configuration Assistant failure is occurring, and run the following script.

   ```sql
   prompt> sqlplus "sys/password as sysdba"
   SQL> @ORACLE_HOME/assistants/dbca/admin/unlock.sql
   
   `password` specifies the password for the SYS user.

7. Rerun the OracleAS Randomize Password Configuration Assistant.

G.2.11 Database Configuration Assistant (DBCA) Failures

Problem

DBCA fails with the following error:

```
Open wallet failedoracle.net.config.ServiceAliasException
at oracle.net.config.ServiceAlias.<init>(Compiled Code)
at oracle.net.config.Service.<init>(Compiled Code)
at oracle.net.config.DatabaseService.<init>(Compiled Code)
at oracle.sysman.assistants.util.NetworkUtils.registerDBWithDirSrvc(NetworkUtils.java:1137)
at oracle.sysman.assistants.dbca.backend.DirServiceStep.executePreReqImpl(Compiled Code)
at oracle.sysman.assistants.dbca.backend.PrerequisiteStep.executeImpl(PrerequisiteStep.java:149)
at oracle.sysman.assistants.dbca.backend.Step.execute(Compiled Code)
at oracle.sysman.assistants.dbca.backend.PostDBCreationStep.executeImpl(Compiled Code)
at oracle.sysman.assistants.dbca.backend.Step.execute(Compiled Code)
at oracle.sysman.assistants.dbca.backend.Host$ModeRunner.run(Compiled Code)
at java.lang.Thread.run(Thread.java:466)
ERROR :oracle.sysman.assistants.util.NetAPIException
```

Solution

This error occurs if the `TNS_ADMIN` environment variable is set. The `TNS_ADMIN` environment variable should not be set (see Section 4.8.6, "TNS_ADMIN"). If it is set, unset it and rerun DBCA by clicking the `Retry` button in the Configuration Assistants screen.

G.2.12 Harmless Error Message from Database Configuration Assistant (DBCA)

If you see the following "error copying OC4J config files" message in your log file, the message is harmless and can be ignored.

```
Nov 25, 2004 9:07:30 PM oracle.sysman.emcp.EMConfig updateReposVars
INFO: Updating file /ASInstalls/ASInfra/syman/emdrep/config/repository.variables
```
Installation Problems and Solutions

G.2.13 OPMN Configuration Assistant - Start HTTP Server Failures

Problem
The OPMN Configuration Assistant - Start HTTP Server fails when you re-run it.

Solution
The problem is that Oracle HTTP Server is already running. Before re-running the configuration assistant, stop Oracle HTTP Server with the following command:

prompt> $ORACLE_HOME/opmn/bin/opmnctl stopproc ias-component=HTTP_Server

Then re-run the OPMN Configuration Assistant - Start HTTP Server.

G.2.14 OPMN Configuration Assistant - Start DAS Instance Failures

Problem
The OPMN Configuration Assistant - Start DAS Instance fails when you re-run it.

Solution
The problem is that the Oracle Delegated Administration Services instance is already running. Before re-running the configuration assistant, stop the Oracle Delegated Administration Services instance with the following command:

prompt> $ORACLE_HOME/opmn/bin/opmnctl stopproc ias-component=OC4J_Security

Then re-run the OPMN Configuration Assistant - Start DAS Instance.

G.2.15 OPMN Configuration Assistant - Start OCA Failures

Problem
The OPMN Configuration Assistant - Start OCA fails when you re-run it.
Solution

The problem is that the OCA instance is already running. Before re-running the configuration assistant, stop the OCA instance with the following command:

```
prompt> $ORACLE_HOME/opmn/bin/opmnctl stopproc ias-component=OC4J instancename=oca
```

Then re-run the OPMN Configuration Assistant - Start OCA.

G.2.16 Re-running chgtocfmt Does Not Work

Problem

Re-running the chgtocfmt script to change back to the original configuration does not work. The hostnames are not converted back to the physical hostname, but the script does not show any errors.

Solution

You can re-run the chgtocfmt script to change back to the original configuration only if you installed the middle tier in a single Oracle home (that is, on the shared disk). Re-running the script in a separate Oracle home installation does not work. To make it work in a separate Oracle home installation, try this workaround:

1. In the `ORACLE_HOME/config/ias.properties` file, set the `VirtualHostName` parameter to the virtual hostname that you used in the first run of the chgtocfmt script.
2. Re-run the chgtocfmt script.
3. In the `ORACLE_HOME/config/ias.properties` file, set the `VirtualHostName` parameter to the physical hostname.

G.2.17 WARNING: DCM service may not be available at this time

Problem

When installing the first node of an OracleAS Cluster (Identity Management), the Java Security Configuration Assistant may return the following message:

```
WARNING: DCM service may not be available at this time to synchronize $ORACLE_HOME/j2ee/home/config/jazn-data.xml file.
```

This is due to a failure in updating the DCM repository and could happen if your load balancer virtual server is not configured to return immediately to the calling client when the backend services to which it forwards traffic are unavailable.

Solution

Perform the following steps to correct the problem:

1. Run the following command after installation completes:
   
   ```
prompt> $ORACLE_HOME/dcm/bin/dcmctl updateConfig -ct jazn
   ```

2. Verify that the `dcmctl updateConfig` command did not return any errors.

3. Use the following command to verify that the password is correct:
   
   ```
prompt> $ORACLE_HOME/jdk/bin/java
   -Doracle.security.jazn.config=./jazn/install/jazn.xml
   -jar jazn.jar -checkpasswd jazn.com admin -pw admin_password
   ```
G.3 Deinstallation Problems and Solutions

This section describes common problems related to deinstallation:

- Section G.3.1, "Obsolete Partner URLs Still Remain on the OracleAS Single Sign-On Administration Screen"
- Section G.3.2, "Unable to Reuse Instance Name of a Deleted Instance"
- Section G.3.3, "Unable to Reuse Database Name"
- Section G.3.4, "Deconfiguration Failed on Distributed OracleAS Cluster (Identity Management)"

G.3.1 Obsolete Partner URLs Still Remain on the OracleAS Single Sign-On Administration Screen

**Problem**
After deinstallation, some partner application entries that are obsolete remain on the OracleAS Single Sign-On Administration screen.

**Solution**
Run the command to de-register the entries for the obsolete partner applications. The command is similar to the command for registration, except that the `-update_mode` parameter is set to `DELETE`.

Make sure your `SHLIB_PATH` environment variable contains `$ORACLE_HOME/lib32`, and that your `SHLIB_PATH` environment variable contains `$ORACLE_HOME/lib`. Then run the command (all on one line):

```
prompt> $ORACLE_HOME/jdk/bin/java -jar $ORACLE_HOME/sso/lib/ossoreg.jar -oracle_home_path $ORACLE_HOME -site_name hostname.domain -config_mod_osso TRUE -mod_osso_url http://hostname.domain:port -u userid -update_mode DELETE
```

For `-site_name hostname.domain`, specify the computer where the middle tier is installed. Include also the domain name.

For `-mod_osso_url http://hostname.domain:port`, specify the computer where the middle tier is installed, and the port number on which Oracle HTTP Server is listening.

For `-u userid`, specify the operating system user who can start up the middle-tier processes.

For a detailed explanation of the parameters, see chapter 4 of the *Oracle Application Server Single Sign-On Administrator’s Guide*.

G.3.2 Unable to Reuse Instance Name of a Deleted Instance

**Problem**
You get an error when you try to name a new Oracle Application Server instance using the name of an instance that you deleted.
Solution
The name of the deleted instance must be removed from Oracle Internet Directory before you can reuse it. To remove entries for a deleted instance from Oracle Internet Directory, perform these steps:

1. Start up Oracle Directory Manager. Oracle home refers to the home where you installed Oracle Internet Directory.

   prompt> $ORACLE_HOME/bin/oidadmin

2. In the Connect screen, enter the Oracle Internet Directory connect information. Log in as the Oracle Internet Directory superuser (cn=orcladmin).

3. Expand Entry Management > cn=OracleContext > cn=Products > cn=IAS > cn=IAS Instances.

4. Under cn=IAS Instances, select the instance that you want to delete.

5. From the menu, select Edit > Delete.

7. Select cn=IASAdmins.

8. In the Properties tab, remove the instance from the uniquemember field by editing the field. Do not select Edit > Delete from the menu.

9. Click Apply.

G.3.3 Unable to Reuse Database Name

Problem
You get an error when you try to use the same global database name or SID as the one that you deleted.

Solution
You might see this problem if you deinstall OracleAS Metadata Repository but not Oracle Internet Directory, and you want to reuse the Oracle Internet Directory and the same database name or SID when you install another OracleAS Metadata Repository. The Oracle Internet Directory still contains the name of the deleted OracleAS Metadata Repository. You need to remove this name before you can reuse it.

**Note:** Do not perform this procedure if you are deinstalling a middle tier.

1. Start up Oracle Directory Manager. Oracle home refers to the home where you installed Oracle Internet Directory.

   prompt> $ORACLE_HOME/bin/oidadmin

2. In the Connect screen, enter the Oracle Internet Directory connect information. Log in as the Oracle Internet Directory superuser (cn=orcladmin).

3. Expand Entry Management > cn=OracleContext > cn=Products > cn=Portal > cn=UltraSearch > cn=Database Instances > orclApplicationCommonName=infrastructure_database_name.

4. Delete all the child entries under orclApplicationCommonName=infrastructure_database_name, starting with the inner-most child entry. To delete an entry,
right-click each child entry and select **Delete** from the pop-up menu. Click **Yes** in the Confirmation dialog. When deleting child entries, you may get some error messages. You can ignore these error messages.

5. After you have deleted all the entries under `orclApplicationCommonName=infrastructure_database_name`, right-click this entry and delete it.

6. Expand **Entry Management**.

   Expand the Default Subscriber entry. You need to expand each term separately. For example: if your default subscriber is "dc=us,dc=oracle,dc=com", you need to expand "dc=com", then expand "dc=oracle", then expand "dc=us".

   Then expand `cn=OracleContext > cn=Products > cn=Portal > cn=UltraSearch > cn=Database Instances > cn=infrastructure_database_name`.

7. Delete all the child entries under `cn=infrastructure_database_name`, starting with the inner-most child entry. To delete an entry, right-click each child entry and select **Delete** from the pop-up menu. Click **Yes** in the Confirmation dialog. When deleting child entries, you may get some error messages. You can ignore these error messages.

8. After you have deleted all the entries under `cn=infrastructure_database_name`, right-click this entry and delete it.

9. Click **Apply**.

### G.3.4 Deconfiguration Failed on Distributed OracleAS Cluster (Identity Management)

#### Problem

When running deconfiguring the first OracleAS Single Sign-On node on a Distributed OracleAS Cluster (Identity Management) configured as in Section 12.4.2, "Case 2: Client ---[HTTPS]--- Load Balancer ---[HTTPS]--- Oracle HTTP Server", the Deconfig tool fails. The log file located at `$ORACLE_HOME/sso/log/ssoreg.log` has the following error:

Unable to open file `$ORACLE_HOME/Apache/Apache/conf/osso/osso.conf`. Please check the file path.
SSO registration tool failed. Please check the error in this log file, correct the problem and re-run the tool.

#### Solution

The Deconfig tool failed because it was unable to find the `$ORACLE_HOME/Apache/Apache/conf/osso/osso-https.conf` file. Perform the following steps to correct this problem:

1. Create a link from `osso-https.conf` to `osso.conf`:

   ```bash
   cd $ORACLE_HOME/Apache/Apache/conf/osso
   ln osso-https.conf osso.conf
   ```

2. Run the Deconfig tool again.

### G.4 Need More Help?

If this appendix does not solve the problem you encountered, try these other sources:
Need More Help?

- *Oracle Application Server Release Notes*, available on the Oracle Technology Network:
  
  [http://www.oracle.com/technology/documentation](http://www.oracle.com/technology/documentation)
