Primary Author: Denis Raphaely

Contributing Author: Rhonda Day, Craig Foch, Steve Fogel, Paul Lane, Chuck Murray, Sue Pelski, Kathy Rich, Antonio Romero, Vivian Schupmann, Margaret Taft, Kathy Taylor, Randy Urbano, Rodney Ward

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

What's New in PL/SQL Packages and Types Reference?	lxxx
Oracle Database 10g Release 2 (10.2) New Features	lxxx
Oracle Database 10g Release 1 (10.1) New Features.....	lxxxiii
1 Introduction	
Package Overview	1-2
Package Components	1-3
Using Oracle Supplied Packages	1-4
Creating New Packages	1-5
Referencing Package Contents	1-8
Summary of Oracle Supplied PL/SQL Packages	1-9
2 CTX_ADM	
Documentation of CTX_ADM.....	2-2
3 CTX_CLS	
Documentation of CTX_CLS.....	3-2
4 CTX_DDL	
Documentation of CTX_DDL	4-2
5 CTX_DOC	
Documentation of CTX_DOC.....	5-2

6	CTX_OUTPUT	
	Documentation of CTX_OUTPUT	6-2
7	CTX_QUERY	
	Documentation of CTX_QUERY	7-2
8	CTX_REPORT	
	Documentation of CTX_REPORT	8-2
9	CTX_THES	
	Documentation of CTX_THES.....	9-2
10	CTX_ULEXER	
	Documentation of CTX_ULEXER	10-2
11	DBMS_ADVANCED_REWRITE	
	Using DBMS_ADVANCED_REWRITE.....	11-2
	Security Model.....	11-3
	Summary of DBMS_ADVANCED_REWRITE Subprograms	11-4
	ALTER_REWRITE_EQUIVALENCE Procedure.....	11-5
	BUILD_SAFE_REWRITE_EQUIVALENCE Procedure.....	11-6
	DECLARE_REWRITE_EQUIVALENCE Procedures	11-7
	DROP_REWRITE_EQUIVALENCE Procedure.....	11-9
	VALIDATE_REWRITE_EQUIVALENCE Procedure	11-10
12	DBMS_ADVISOR	
	Using DBMS_ADVISOR.....	12-2
	Security Model.....	12-3
	Summary of DBMS_ADVISOR Subprograms	12-4
	ADD_SQLWKLD_REF Procedure.....	12-6
	ADD_SQLWKLD_STATEMENT Procedure	12-7
	CANCEL_TASK Procedure	12-9
	CREATE_FILE Procedure	12-10
	CREATE_OBJECT Procedure.....	12-11
	CREATE_SQLWKLD Procedure	12-13
	CREATE_TASK Procedures	12-14
	DELETE_SQLWKLD Procedure	12-16
	DELETE_SQLWKLD_REF Procedure.....	12-17
	DELETE_SQLWKLD_STATEMENT Procedure	12-18
	DELETE_TASK Procedure.....	12-19
	EXECUTE_TASK Procedure	12-20
	GET_REC_ATTRIBUTES Procedure.....	12-21
	GET_TASK_REPORT Function.....	12-22
	GET_TASK_SCRIPT Function.....	12-23

IMPLEMENT_TASK Procedure	12-25
IMPORT_SQLWKLD_SCHEMA Procedure	12-26
IMPORT_SQLWKLD_SQLCACHE Procedure	12-28
IMPORT_SQLWKLD_STS Procedure	12-30
IMPORT_SQLWKLD_SUMADV Procedure	12-32
IMPORT_SQLWKLD_USER Procedure	12-34
INTERRUPT_TASK Procedure	12-36
MARK_RECOMMENDATION Procedure	12-37
QUICK_TUNE Procedure	12-38
RESET_SQLWKLD Procedure	12-39
RESET_TASK Procedure	12-40
SET_DEFAULT_SQLWKLD_PARAMETER Procedure	12-41
SET_DEFAULT_TASK_PARAMETER Procedures	12-42
SET_SQLWKLD_PARAMETER Procedure	12-43
SET_TASK_PARAMETER Procedure	12-49
TUNE_MVIEW Procedure	12-60
UPDATE_OBJECT Procedure	12-62
UPDATE_REC_ATTRIBUTES Procedure	12-64
UPDATE_SQLWKLD_ATTRIBUTES Procedure	12-66
UPDATE_SQLWKLD_STATEMENT Procedure	12-67
UPDATE_TASK_ATTRIBUTES Procedure	12-69

13 DBMS_ALERT

Using DBMS_ALERT	13-2
Overview	13-3
Security Model	13-4
Constants	13-5
Restrictions	13-6
Exceptions	13-7
Operational Notes	13-8
Examples	13-10
Summary of DBMS_ALERT Subprograms	13-11
REGISTER Procedure	13-12
REMOVE Procedure	13-13
REMOVEALL Procedure	13-14
SET_DEFAULTS Procedure	13-15
SIGNAL Procedure	13-16
WAITANY Procedure	13-17
WAITONE Procedure	13-18

14 DBMS_APPLICATION_INFO

Using DBMS_APPLICATION_INFO	14-2
Overview	14-3
Security Model	14-4
Operational Notes	14-5
Summary of DBMS_APPLICATION_INFO Subprograms	14-6

READ_CLIENT_INFO Procedure	14-7
READ_MODULE Procedure	14-8
SET_ACTION Procedure	14-9
SET_CLIENT_INFO Procedure.....	14-10
SET_MODULE Procedure	14-11
SET_SESSION_LONGOPS Procedure	14-12

15 DBMS_APPLY_ADM

Summary of DBMS_APPLY_ADM Subprograms	15-2
ALTER_APPLY Procedure	15-4
COMPARE_OLD_VALUES Procedure	15-9
CREATE_APPLY Procedure	15-11
CREATE_OBJECT_DEPENDENCY Procedure.....	15-18
DELETE_ALL_ERRORS Procedure	15-19
DELETE_ERROR Procedure.....	15-20
DROP_APPLY Procedure	15-21
DROP_OBJECT_DEPENDENCY.....	15-22
EXECUTE_ALL_ERRORS Procedure	15-23
EXECUTE_ERROR Procedure	15-24
GET_ERROR_MESSAGE Function	15-27
SET_DML_HANDLER Procedure.....	15-28
SET_ENQUEUE_DESTINATION Procedure	15-33
SET_EXECUTE Procedure	15-35
SET_GLOBAL_INSTANTIATION_SCN Procedure.....	15-37
SET_KEY_COLUMNS Procedures	15-39
SET_PARAMETER Procedure	15-41
SET_SCHEMA_INSTANTIATION_SCN Procedure.....	15-46
SET_TABLE_INSTANTIATION_SCN Procedure	15-48
SET_UPDATE_CONFLICT_HANDLER Procedure.....	15-50
SET_VALUE_DEPENDENCY Procedure	15-53
START_APPLY Procedure.....	15-54
STOP_APPLY Procedure	15-55

16 DBMS_AQ

Using DBMS_AQ	16-2
Constants	16-3
Data Structures	16-4
Operational Notes	16-7
Summary of DBMS_AQ Subprograms.....	16-8
BIND_AGENT Procedure	16-9
DEQUEUE Procedure.....	16-10
DEQUEUE_ARRAY Function.....	16-13
ENQUEUE Procedure	16-15
ENQUEUE_ARRAY Function.....	16-17
LISTEN Procedures.....	16-18
POST Procedure	16-20
REGISTER Procedure	16-21

UNBIND_AGENT Procedure	16-22
UNREGISTER Procedure	16-23

17 DBMS_AQADM

Using DBMS_AQADM	17-2
Constants	17-3
Subprogram Groups	17-4
Queue Table Subprograms	17-5
Privilege Subprograms	17-6
Queue Subprograms	17-7
Subscriber Subprograms	17-8
Notification Subprograms	17-9
Propagation Subprograms	17-10
Oracle Streams AQ Agent Subprograms	17-11
Alias Subprograms	17-12
Summary of DBMS_AQADM Subprograms	17-13
ADD_ALIAS_TO_LDAP Procedure	17-15
ADD_SUBSCRIBER Procedure	17-16
ALTER_AQ_AGENT Procedure	17-17
ALTER_PROPAGATION_SCHEDULE Procedure	17-18
ALTER_QUEUE Procedure	17-19
ALTER_QUEUE_TABLE Procedure	17-20
ALTER_SUBSCRIBER Procedure	17-21
CREATE_AQ_AGENT Procedure	17-22
CREATE_NP_QUEUE Procedure	17-23
CREATE_QUEUE Procedure	17-24
CREATE_QUEUE_TABLE Procedure	17-26
DEL_ALIAS_FROM_LDAP Procedure	17-29
DISABLE_DB_ACCESS Procedure	17-30
DISABLE_PROPAGATION_SCHEDULE Procedure	17-31
DROP_AQ_AGENT Procedure	17-32
DROP_QUEUE Procedure	17-33
DROP_QUEUE_TABLE Procedure	17-34
ENABLE_DB_ACCESS Procedure	17-35
ENABLE_JMS_TYPES Procedure	17-36
ENABLE_PROPAGATION_SCHEDULE Procedure	17-37
GET_WATERMARK Procedure	17-38
GRANT_QUEUE_PRIVILEGE Procedure	17-39
GRANT_SYSTEM_PRIVILEGE Procedure	17-40
MIGRATE_QUEUE_TABLE Procedure	17-41
PURGE_QUEUE_TABLE Procedure	17-42
QUEUE_SUBSCRIBERS Function	17-44
REMOVE_SUBSCRIBER Procedure	17-45
REVOKE_QUEUE_PRIVILEGE Procedure	17-46
REVOKE_SYSTEM_PRIVILEGE Procedure	17-47
SCHEDULE_PROPAGATION Procedure	17-48
SET_WATERMARK Procedure	17-50

START_QUEUE Procedure	17-51
STOP_QUEUE Procedure	17-52
UNSCHEDULE_PROPAGATION Procedure	17-53
VERIFY_QUEUE_TYPES Procedure	17-54
18 DBMS_AQELM	
Summary of DBMS_AQELM Subprograms	18-2
SET_MAILHOST Procedure	18-3
SET_MAILPORT Procedure	18-4
SET_SENDFROM Procedure	18-5
19 DBMS_AQIN	
Using DBMS_AQIN	19-2
Overview	19-3
20 DBMS_CAPTURE_ADM	
Summary of DBMS_CAPTURE_ADM Subprograms	20-2
ABORT_GLOBAL_INSTANTIATION Procedure	20-3
ABORT_SCHEMA_INSTANTIATION Procedure	20-4
ABORT_TABLE_INSTANTIATION Procedure	20-5
ALTER_CAPTURE Procedure	20-6
BUILD Procedure	20-11
CREATE_CAPTURE Procedure	20-12
DROP_CAPTURE Procedure	20-17
INCLUDE_EXTRA_ATTRIBUTE Procedure	20-19
PREPARE_GLOBAL_INSTANTIATION Procedure	20-21
PREPARE_SCHEMA_INSTANTIATION Procedure	20-22
PREPARE_TABLE_INSTANTIATION Procedure	20-23
SET_PARAMETER Procedure	20-24
START_CAPTURE Procedure	20-26
STOP_CAPTURE Procedure	20-27
21 DBMS_CDC_PUBLISH	
Using DBMS_CDC_PUBLISH	21-2
Overview	21-3
Deprecated Subprograms	21-4
Security Model	21-5
Views	21-6
Summary of DBMS_CDC_PUBLISH Subprograms	21-7
ALTER_AUTOLOG_CHANGE_SOURCE Procedure	21-8
ALTER_CHANGE_SET Procedure	21-10
ALTER_CHANGE_TABLE Procedure	21-13
ALTER_HOTLOG_CHANGE_SOURCE Procedure	21-15
CREATE_AUTOLOG_CHANGE_SOURCE Procedure	21-17
CREATE_CHANGE_SET Procedure	21-19
CREATE_CHANGE_TABLE Procedure	21-22

CREATE_HOTLOG_CHANGE_SOURCE Procedure.....	21-26
DROP_CHANGE_SET Procedure.....	21-28
DROP_CHANGE_SOURCE Procedure.....	21-29
DROP_CHANGE_TABLE Procedure.....	21-30
DROP_SUBSCRIPTION Procedure.....	21-31
PURGE Procedure.....	21-32
PURGE_CHANGE_SET Procedure.....	21-33
PURGE_CHANGE_TABLE Procedure.....	21-34
22 DBMS_CDC_SUBSCRIBE	
Using DBMS_CDC_SUBSCRIBE	22-2
Overview	22-3
Deprecated Subprograms	22-5
Security Model.....	22-6
Views.....	22-7
Summary of DBMS_CDC_SUBSCRIBE Subprograms	22-8
ACTIVATE_SUBSCRIPTION Procedure.....	22-9
CREATE_SUBSCRIPTION Procedure.....	22-10
DROP_SUBSCRIPTION Procedure.....	22-12
EXTEND_WINDOW Procedure.....	22-13
PURGE_WINDOW Procedure.....	22-14
SUBSCRIBE Procedure.....	22-15
23 DBMS_CHANGE_NOTIFICATION	
Using DBMS_CHANGE_NOTIFICATION	23-2
Overview	23-3
Security Model.....	23-4
Constants	23-5
Operational Notes	23-6
Examples	23-7
Data Structures	23-10
SYS.CHNF\$_DESC Object Type	23-11
SYS.CHNF\$_TDESC Object Type.....	23-12
SYS.CHNF\$_TDESC_ARRAY Object (Array) Type	23-13
SYS.CHNF\$_RDESC Object Type.....	23-14
SYS.CHNF\$_RDESC_ARRAY Object (Array) Type	23-15
SYS.CHNF\$_REG_INFO Object Type.....	23-16
Summary of DBMS_CHANGE_NOTIFICATION Subprograms	23-18
DEREGISTER Procedure.....	23-19
ENABLE_REG Procedure	23-20
NEW_REG_START Function	23-21
REG_END Procedure	23-22
24 DBMS_CRYPTO	
Using the DBMS_CRYPTO Subprograms.....	24-2
Overview	24-3

Security Model.....	24-4
Types.....	24-5
Algorithms.....	24-6
Restrictions.....	24-8
Exceptions.....	24-9
Operational Notes.....	24-10
Examples.....	24-12
Summary of DBMS_CRYPTO Subprograms.....	24-13
DECRYPT Function.....	24-14
DECRYPT Procedures.....	24-15
ENCRYPT Function.....	24-16
ENCRYPT Procedures.....	24-17
HASH Function.....	24-18
MAC Function.....	24-19
RANDOMBYTES Function.....	24-20
RANDOMINTEGER Function.....	24-21
RANDOMNUMBER Function.....	24-22

25 DBMS_DATA_MINING

Using DBMS_DATA_MINING.....	25-2
Overview.....	25-3
New Functionality.....	25-4
Model Names.....	25-5
Constants.....	25-6
Data Types.....	25-10
Exceptions.....	25-12
User Views.....	25-14
Summary of DBMS_DATA_MINING Subprograms.....	25-15
APPLY Procedure.....	25-17
COMPUTE_CONFUSION_MATRIX Procedure.....	25-20
COMPUTE_LIFT Procedure.....	25-23
COMPUTE_ROC Procedure.....	25-26
CREATE_MODEL Procedure.....	25-30
DROP_MODEL Procedure.....	25-33
EXPORT_MODEL Procedure.....	25-34
GET_ASSOCIATION_RULES Function.....	25-37
GET_DEFAULT_SETTINGS Function.....	25-40
GET_FREQUENT_ITEMSETS Function.....	25-41
GET_MODEL_DETAILS_ABN Function.....	25-43
GET_MODEL_DETAILS_AI Function.....	25-45
GET_MODEL_DETAILS_KM Function.....	25-46
GET_MODEL_DETAILS_NB Function.....	25-49
GET_MODEL_DETAILS_NMF Function.....	25-51
GET_MODEL_DETAILS_OC Function.....	25-52
GET_MODEL_DETAILS_SVM Function.....	25-55
GET_MODEL_DETAILS_XML Function.....	25-57
GET_MODEL_SETTINGS Function.....	25-58

GET_MODEL_SIGNATURE Function	25-59
IMPORT_MODEL Procedure.....	25-60
RANK_APPLY Procedure	25-63
RENAME_MODEL Procedure.....	25-66

26 DBMS_DATA_MINING_TRANSFORM

Using DBMS_DATA_MINING_TRANSFORM	26-2
Overview	26-3
Types	26-4
Transformation Methods	26-5
Steps in Defining a Transformation.....	26-7
Sample Transformation.....	26-9
Summary of DBMS_DATA_MINING_TRANSFORM Subprograms	26-10
CREATE_BIN_CAT Procedure	26-12
CREATE_BIN_NUM Procedure	26-13
CREATE_CLIP Procedure	26-14
CREATE_MISS_CAT Procedure.....	26-15
CREATE_MISS_NUM Procedure.....	26-16
CREATE_NORM_LIN Procedure	26-17
INSERT_AUTOBIN_NUM_EQWIDTH Procedure	26-18
INSERT_BIN_CAT_FREQ Procedure	26-20
INSERT_BIN_NUM_EQWIDTH Procedure	26-22
INSERT_BIN_NUM_QTILE Procedure	26-24
INSERT_CLIP_TRIM_TAIL Procedure	26-26
INSERT_CLIP_WINSOR_TAIL Procedure	26-28
INSERT_MISS_CAT_MODE Procedure	26-30
INSERT_MISS_NUM_MEAN Procedure.....	26-31
INSERT_NORM_LIN_MINMAX Procedure	26-32
INSERT_NORM_LIN_SCALE Procedure	26-33
INSERT_NORM_LIN_ZSCORE Procedure	26-34
XFORM_BIN_CAT Procedure	26-35
XFORM_BIN_NUM Procedure.....	26-37
XFORM_CLIP Procedure.....	26-40
XFORM_MISS_CAT Procedure	26-42
XFORM_MISS_NUM Procedure	26-43
XFORM_NORM_LIN Procedure.....	26-44

27 DBMS_DATAPUMP

Using DBMS_DATAPUMP	27-2
Overview	27-3
Security Model.....	27-4
Constants	27-5
Data Structures	27-6
Data Structures - Object Types.....	27-7
Summary of DBMS_DATAPUMP Subprograms	27-12
ADD_FILE Procedure.....	27-13

ATTACH Function.....	27-16
DATA_FILTER Procedures	27-18
DETACH Procedure	27-20
GET_DUMPFILE_INFO Procedure.....	27-21
GET_STATUS Procedure	27-23
LOG_ENTRY Procedure	27-26
METADATA_FILTER Procedure	27-27
METADATA_REMAP Procedure	27-30
METADATA_TRANSFORM Procedure	27-32
OPEN Function.....	27-35
SET_PARALLEL Procedure	27-38
SET_PARAMETER Procedures.....	27-40
START_JOB Procedure.....	27-44
STOP_JOB Procedure	27-46
WAIT_FOR_JOB Procedure.....	27-48
28 DBMS_DB_VERSION	
Using DBMS_DB_VERSION	28-2
Overview	28-3
Constants	28-4
Examples	28-5
29 DBMS_DDL	
Using DBMS_DDL	29-2
Deprecated Subprograms	29-3
Security Model.....	29-4
Operational Notes	29-5
Summary of DBMS_DDL Subprograms	29-6
ALTER_COMPILE Procedure	29-7
ALTER_TABLE_NOT_REFERENCEABLE Procedure.....	29-8
ALTER_TABLE_REFERENCEABLE Procedure	29-9
CREATE_WRAPPED Procedures.....	29-10
IS_TRIGGER_FIRE_ONCE Function	29-12
SET_TRIGGER_FIRING_PROPERTY Procedure.....	29-13
WRAP Functions	29-14
30 DBMS_DEBUG	
Using DBMS_DEBUG.....	30-2
Overview	30-3
Constants	30-4
Variables	30-5
Exceptions	30-6
Operational Notes	30-8
Data Structures	30-14
BREAKPOINT_INFO Record Type.....	30-15
PROGRAM_INFO Record Type	30-16

RUNTIME_INFO Record Type	30-17
BACKTRACE_TABLE Table Type	30-18
BREAKPOINT_TABLE Table Type	30-19
INDEX_TABLE Table Type	30-20
VC2_TABLE Table Type	30-21
Summary of DBMS_DEBUG Subprograms	30-22
ATTACH_SESSION Procedure	30-24
CONTINUE Function	30-25
DEBUG_OFF Procedure	30-26
DEBUG_ON Procedure	30-27
DELETE_BREAKPOINT Function	30-28
DELETE_OER_BREAKPOINT Function	30-29
DETACH_SESSION Procedure	30-30
DISABLE_BREAKPOINT Function	30-31
ENABLE_BREAKPOINT Function	30-32
EXECUTE Procedure	30-33
GET_INDEXES Function	30-35
GET_MORE_SOURCE Procedure	30-36
GET_LINE_MAP Function	30-37
GET_RUNTIME_INFO Function	30-38
GET_TIMEOUT_BEHAVIOUR Function	30-39
GET_VALUE Function	30-40
INITIALIZE Function	30-42
PING Procedure	30-44
PRINT_BACKTRACE Procedure	30-45
PRINT_INSTANTIATIONS Procedure	30-46
PROBE_VERSION Procedure	30-47
SELF_CHECK Procedure	30-48
SET_BREAKPOINT Function	30-49
SET_OER_BREAKPOINT Function	30-50
SET_TIMEOUT Function	30-51
SET_TIMEOUT_BEHAVIOUR Procedure	30-52
SET_VALUE Function	30-53
SHOW_BREAKPOINTS Procedures	30-55
SHOW_FRAME_SOURCE Procedure	30-56
SHOW_SOURCE Procedures	30-57
SYNCHRONIZE Function	30-59
TARGET_PROGRAM_RUNNING Procedure	30-60
31 DBMS_DEFER	
Documentation of DBMS_DEFER	31-2
32 DBMS_DEFER_QUERY	
Documentation of DBMS_DEFER_QUERY	32-2

33	DBMS_DEFER_SYS	
	Documentation of DBMS_DEFER_SYS	33-2
34	DBMS_DESCRIBE	
	Using DBMS_DESCRIBE	34-2
	Overview	34-3
	Security Model.....	34-4
	Types	34-5
	Exceptions	34-6
	Examples	34-7
	Summary of DBMS_DESCRIBE Subprograms	34-10
	DESCRIBE_PROCEDURE Procedure	34-11
35	DBMS_DIMENSION	
	Using DBMS_DIMENSION	35-2
	Security Model.....	35-3
	Summary of DBMS_DIMENSION Subprograms	35-4
	DESCRIBE_DIMENSION Procedure	35-5
	VALIDATE_DIMENSION Procedure.....	35-6
36	DBMS_DISTRIBUTED_TRUST_ADMIN	
	Using DBMS_DISTRIBUTED_TRUST_ADMIN.....	36-2
	Overview	36-3
	Security Model.....	36-4
	Examples	36-5
	Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms	36-6
	ALLOW_ALL Procedure	36-7
	ALLOW_SERVER Procedure	36-8
	DENY_ALL Procedure	36-9
	DENY_SERVER Procedure.....	36-10
37	DBMS_EPG	
	Using DBMS_EPG	37-2
	Overview	37-3
	Security Model.....	37-4
	Exceptions	37-5
	Data Structures	37-6
	Subprogram Groups	37-7
	Configuration Subprograms.....	37-8
	Authorization Subprograms.....	37-9
	Summary of DBMS_EPG Subprograms	37-10
	AUTHORIZE_DAD Procedure.....	37-11
	CREATE_DAD Procedure	37-12
	DEAUTHORIZE_DAD Procedure	37-13
	DELETE_DAD_ATTRIBUTE Procedure	37-14

DELETE_GLOBAL_ATTRIBUTE Procedure	37-15
DROP_DAD Procedure.....	37-16
GET_ALL_DAD_ATTRIBUTES Procedure.....	37-17
GET_ALL_DAD_MAPPINGS Procedure.....	37-18
GET_ALL_GLOBAL_ATTRIBUTES Procedure	37-19
GET_DAD_ATTRIBUTE Function	37-20
GET_DAD_LIST Procedure.....	37-21
GET_GLOBAL_ATTRIBUTE Function.....	37-22
MAP_DAD Procedure.....	37-23
SET_DAD_ATTRIBUTE Procedure.....	37-24
SET_GLOBAL_ATTRIBUTE Procedure	37-27
UNMAP_DAD Procedure	37-28
38 DBMS_ERRLOG	
Using DBMS_ERRLOG	38-2
Security Model.....	38-3
Summary of DBMS_ERRLOG Subprograms.....	38-4
CREATE_ERROR_LOG Procedure	38-5
39 DBMS_EXPFIL	
Summary of Expression Filter Subprograms.....	39-2
ADD_ELEMENTARY_ATTRIBUTE Procedures	39-3
ADD_FUNCTIONS Procedure	39-5
ASSIGN_ATTRIBUTE_SET Procedure	39-7
BUILD_EXCEPTIONS_TABLE Procedure.....	39-9
CLEAR_EXPRSET_STATS Procedure.....	39-10
COPY_ATTRIBUTE_SET Procedure.....	39-11
CREATE_ATTRIBUTE_SET Procedure	39-12
DEFAULT_INDEX_PARAMETERS Procedure	39-14
DEFAULT_XPINDEX_PARAMETERS Procedure	39-16
DEFRAG_INDEX Procedure	39-18
DROP_ATTRIBUTE_SET Procedure.....	39-19
GET_EXPRSET_STATS Procedure	39-20
GRANT_PRIVILEGE Procedure.....	39-21
INDEX_PARAMETERS Procedure	39-22
MODIFY_OPERATOR_LIST Procedure.....	39-24
REVOKE_PRIVILEGE Procedure.....	39-25
UNASSIGN_ATTRIBUTE_SET Procedure	39-26
VALIDATE_EXPRESSIONS Procedure.....	39-27
XPINDEX_PARAMETERS Procedure	39-28
40 DBMS_FGA	
Using DBMS_FGA	40-2
Security Model.....	40-3
Operational Notes	40-4
Summary of DBMS_FGA Subprograms.....	40-5

ADD_POLICY Procedure	40-6
DISABLE_POLICY Procedure.....	40-11
DROP_POLICY Procedure	40-12
ENABLE_POLICY Procedure	40-13
41 DBMS_FILE_GROUP	
Using DBMS_FILE_GROUP	41-2
Overview	41-3
Constants	41-4
Summary of DBMS_FILE_GROUP Subprograms	41-5
ADD_FILE Procedure.....	41-6
ALTER_FILE Procedure.....	41-8
ALTER_FILE_GROUP Procedure	41-10
ALTER_VERSION Procedure	41-12
CREATE_FILE_GROUP Procedure.....	41-14
CREATE_VERSION Procedure.....	41-16
DROP_FILE_GROUP Procedure	41-17
DROP_VERSION Procedure	41-18
GRANT_OBJECT_PRIVILEGE Procedure	41-19
GRANT_SYSTEM_PRIVILEGE Procedure	41-20
PURGE_FILE_GROUP Procedure.....	41-21
REMOVE_FILE Procedure.....	41-22

93 DBMS_SCHEDULER

Using DBMS_SCHEDULER	93-2
Rules and Limits.....	93-3
Operational Notes	93-4
Summary of DBMS_SCHEDULER Subprograms	93-14
ADD_EVENT_QUEUE_SUBSCRIBER Procedure	93-17
ADD_WINDOW_GROUP_MEMBER Procedure	93-18
ALTER_CHAIN Procedure	93-19
ALTER_RUNNING_CHAIN Procedure	93-20
CLOSE_WINDOW Procedure.....	93-22
COPY_JOB Procedure	93-23

CREATE_CHAIN Procedure.....	93-24
CREATE_EVENT_SCHEDULE Procedure	93-25
CREATE_JOB Procedures.....	93-27
CREATE_JOB_CLASS Procedure	93-32
CREATE_PROGRAM Procedure.....	93-34
CREATE_SCHEDULE Procedure.....	93-36
CREATE_WINDOW Procedures.....	93-37
CREATE_WINDOW_GROUP Procedure	93-39
DEFINE_ANYDATA_ARGUMENT Procedure.....	93-40
DEFINE_CHAIN_EVENT_STEP Procedure.....	93-41
DEFINE_CHAIN_RULE Procedure	93-42
DEFINE_CHAIN_STEP Procedure	93-45
DEFINE_METADATA_ARGUMENT Procedure	93-46
DEFINE_PROGRAM_ARGUMENT Procedures	93-48
DISABLE Procedure	93-50
DROP_CHAIN Procedure	93-52
DROP_CHAIN_RULE Procedure	93-53
DROP_CHAIN_STEP Procedure.....	93-54
DROP_JOB Procedure	93-55
DROP_JOB_CLASS Procedure.....	93-56
DROP_PROGRAM Procedure	93-57
DROP_PROGRAM_ARGUMENT Procedures.....	93-58
DROP_SCHEDULE Procedure	93-59
DROP_WINDOW Procedure	93-60
DROP_WINDOW_GROUP Procedure.....	93-61
ENABLE Procedure	93-62
EVALUATE_CALENDAR_STRING Procedure	93-63
EVALUATE_RUNNING_CHAIN Procedure	93-65
GENERATE_JOB_NAME Function	93-66
GET_ATTRIBUTE Procedure.....	93-67
GET_SCHEDULER_ATTRIBUTE Procedure.....	93-68
OPEN_WINDOW Procedure	93-69
PURGE_LOG Procedure	93-70
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure	93-71
REMOVE_WINDOW_GROUP_MEMBER Procedure	93-72
RESET_JOB_ARGUMENT_VALUE Procedures.....	93-73
RUN_CHAIN Procedures.....	93-74
RUN_JOB Procedure	93-76
SET_ATTRIBUTE Procedure	93-78
SET_ATTRIBUTE_NULL Procedure.....	93-87
SET_JOB_ANYDATA_VALUE Procedures	93-88
SET_JOB_ARGUMENT_VALUE Procedures	93-89
SET_SCHEDULER_ATTRIBUTE Procedure	93-90
STOP_JOB Procedure	93-92

94 DBMS_SERVER_ALERT

Using DBMS_SERVER_ALERT	94-2
-------------------------------	------

Object Types.....	94-3
Relational Operators.....	94-4
Supported Metrics.....	94-5
Summary of DBMS_SERVER_ALERT Subprograms.....	94-11
EXPAND_MESSAGE Function.....	94-12
GET_THRESHOLD Procedure.....	94-13
SET_THRESHOLD Procedure.....	94-14

95 DBMS_SERVICE

Using DBMS_SERVICE.....	95-2
Overview.....	95-3
Security Model.....	95-4
Constants.....	95-5
Exceptions.....	95-7
Summary of DBMS_SERVICE Subprograms.....	95-8
CREATE_SERVICE Procedure.....	95-9
DELETE_SERVICE Procedure.....	95-10
DISCONNECT_SESSION Procedure.....	95-11
MODIFY_SERVICE Procedure.....	95-12
START_SERVICE Procedure.....	95-13
STOP_SERVICE Procedure.....	95-14

96 DBMS_SESSION

Using DBMS_SESSION.....	96-2
Security Model.....	96-3
Operational Notes.....	96-4
Summary of DBMS_SESSION Subprograms.....	96-5
CLEAR_ALL_CONTEXT Procedure.....	96-6
CLEAR_CONTEXT Procedure.....	96-7
CLEAR_IDENTIFIER Procedure.....	96-8
CLOSE_DATABASE_LINK Procedure.....	96-9
FREE_UNUSED_USER_MEMORY Procedure.....	96-10
IS_ROLE_ENABLED Function.....	96-12
IS_SESSION_ALIVE Function.....	96-13
LIST_CONTEXT Procedures.....	96-14
MODIFY_PACKAGE_STATE Procedure.....	96-15
SESSION_TRACE_DISABLE Procedure.....	96-19
SESSION_TRACE_ENABLE Procedure.....	96-20
RESET_PACKAGE Procedure.....	96-21
SET_CONTEXT Procedure.....	96-23
SET_IDENTIFIER.....	96-25
SET-NLS Procedure.....	96-26
SET_ROLE Procedure.....	96-27
SET_SQL_TRACE Procedure.....	96-28
SWITCH_CURRENT_CONSUMER_GROUP Procedure.....	96-29
UNIQUE_SESSION_ID Function.....	96-31

97 DBMS_SHARED_POOL

Using DBMS_SHARED_POOL	97-2
Overview	97-3
Operational Notes	97-4
Summary of DBMS_SHARED_POOL Subprograms	97-5
ABORTED_REQUEST_THRESHOLD Procedure	97-6
KEEP Procedure	97-7
SIZES Procedure	97-8
UNKEEP Procedure	97-9

98 DBMS_SPACE

Using DBMS_SPACE	98-2
Security Model	98-3
Data Structures	98-4
ASA_RECO_ROW Record Type	98-5
ASA_RECO_ROW_TB Table Type	98-6
Summary of DBMS_SPACE Subprograms	98-7
ASA_RECOMMENDATIONS Function	98-8
CREATE_INDEX_COST Procedure	98-9
CREATE_TABLE_COST Procedures	98-10
FREE_BLOCKS Procedure	98-12
OBJECT_DEPENDENT_SEGMENTS Function	98-14
OBJECT_GROWTH_TREND Function	98-16
SPACE_USAGE Procedure	98-18
UNUSED_SPACE Procedure	98-20

99 DBMS_SPACE_ADMIN

Using DBMS_SPACE_ADMIN	99-2
Security Model	99-3
Constants	99-4
Operational Notes	99-6
Summary of DBMS_SPACE_ADMIN Subprograms	99-7
ASSM_SEGMENT_VERIFY Procedure	99-8
ASSM_TABLESPACE_VERIFY Procedure	99-9
SEGMENT_CORRUPT Procedure	99-10
SEGMENT_DROP_CORRUPT Procedure	99-11
SEGMENT_DUMP Procedure	99-12
SEGMENT_VERIFY Procedure	99-13
TABLESPACE_FIX_BITMAPS Procedure	99-14
TABLESPACE_FIX_SEGMENT_STATES Procedure	99-15
TABLESPACE_MIGRATE_FROM_LOCAL Procedure	99-16
TABLESPACE_MIGRATE_TO_LOCAL Procedure	99-17
TABLESPACE_REBUILD_BITMAPS Procedure	99-18
TABLESPACE_REBUILD_QUOTAS Procedure	99-19
TABLESPACE_RELOCATE_BITMAPS Procedure	99-20
TABLESPACE_VERIFY Procedure	99-21

100 DBMS_SQL

Using DBMS_SQL	100-2
Overview	100-3
Security Model.....	100-4
Constants	100-5
Types	100-6
Exceptions	100-9
Operational Notes	100-10
Examples	100-14
Summary of DBMS_SQL Subprograms	100-24
BIND_ARRAY Procedures	100-25
BIND_VARIABLE Procedures	100-28
CLOSE_CURSOR Procedure	100-32
COLUMN_VALUE Procedure	100-33
COLUMN_VALUE_LONG Procedure	100-36
DEFINE_ARRAY Procedure	100-37
DEFINE_COLUMN Procedure	100-39
DEFINE_COLUMN_LONG Procedure	100-41
DESCRIBE_COLUMNS Procedure	100-42
DESCRIBE_COLUMNS2 Procedure	100-43
EXECUTE Function.....	100-44
EXECUTE_AND_FETCH Function.....	100-45
FETCH_ROWS Function.....	100-46
IS_OPEN Function	100-47
LAST_ERROR_POSITION Function.....	100-48
LAST_ROW_COUNT Function	100-49
LAST_ROW_ID Function.....	100-50
LAST_SQL_FUNCTION_CODE Function.....	100-51
OPEN_CURSOR Function	100-52
PARSE Procedure.....	100-53
VARIABLE_VALUE Procedures	100-55

101 DBMS_SQLTUNE

Using DBMS_SQLTUNE	101-2
Overview	101-3
Security Model.....	101-5
Data Structures	101-6
SQLSET_ROW Object Type.....	101-7
Subprogram Groups	101-9
SQL Tuning Advisor Subprograms.....	101-10
SQL Profile Subprograms	101-11
SQL Tuning Set Subprograms	101-12
Summary of DBMS_SQLTUNE Subprograms	101-13
ACCEPT_SQL_PROFILE Procedure and Function	101-16
ADD_SQLSET_REFERENCE Function	101-19
ALTER_SQL_PROFILE Procedure	101-20
CANCEL_TUNING_TASK Procedure	101-22

CAPTURE_CURSOR_CACHE_SQLSET Procedure.....	101-23
CREATE_SQLSET Procedure and Function	101-25
CREATE_STGTAB_SQLPROF Procedure.....	101-26
CREATE_STGTAB_SQLSET Procedure	101-27
CREATE_TUNING_TASK Functions	101-28
DELETE_SQLSET Procedure	101-32
DROP_SQL_PROFILE Procedure.....	101-33
DROP_SQLSET Procedure	101-34
DROP_TUNING_TASK Procedure.....	101-35
EXECUTE_TUNING_TASK Procedure.....	101-36
INTERRUPT_TUNING_TASK Procedure	101-37
LOAD_SQLSET Procedure.....	101-38
PACK_STGTAB_SQLPROF Procedure	101-42
PACK_STGTAB_SQLSET Procedure.....	101-43
REMAP_STGTAB_SQLPROF Procedure.....	101-45
REMAP_STGTAB_SQLSET Procedure.....	101-46
REMOVE_SQLSET_REFERENCE Procedure.....	101-47
REPORT_TUNING_TASK Function.....	101-48
RESET_TUNING_TASK Procedure	101-49
RESUME_TUNING_TASK Procedure.....	101-50
SCRIPT_TUNING_TASK Function.....	101-51
SELECT_CURSOR_CACHE Function	101-53
SELECT_SQLSET Function.....	101-57
SELECT_WORKLOAD_REPOSITORY Functions	101-59
SQLTEXT_TO_SIGNATURE Function.....	101-61
UNPACK_STGTAB_SQLPROF Procedure	101-62
UNPACK_STGTAB_SQLSET Procedure	101-63
UPDATE_SQLSET Procedures	101-65

102 DBMS_STAT_FUNCS

Summary of DBMS_STAT_FUNCS Subprograms	102-2
EXPONENTIAL_DIST_FIT Procedure	102-3
NORMAL_DIST_FIT Procedure.....	102-4
POISSON_DIST_FIT Procedure.....	102-5
SUMMARY Procedure	102-6
UNIFORM_DIST_FIT Procedure.....	102-7
WEIBULL_DIST_FIT Procedure	102-8

103 DBMS_STATS

Using DBMS_STATS	103-2
Overview	103-3
Types.....	103-4
Constants.....	103-5
Operational Notes	103-6
Deprecated Subprograms	103-10
Examples	103-11

Summary of DBMS_STATS Subprograms	103-13
ALTER_DATABASE_TAB_MONITORING Procedure.....	103-17
ALTER_SCHEMA_TAB_MONITORING Procedure.....	103-18
ALTER_STATS_HISTORY_RETENTION Procedure.....	103-19
CONVERT_RAW_VALUE Procedures.....	103-20
CONVERT_RAW_VALUE_NVARCHAR Procedure.....	103-21
CONVERT_RAW_VALUE_ROWID Procedure.....	103-22
CREATE_STAT_TABLE Procedure.....	103-23
DELETE_COLUMN_STATS Procedure.....	103-24
DELETE_DATABASE_STATS Procedure.....	103-25
DELETE_DICTIONARY_STATS Procedure.....	103-26
DELETE_FIXED_OBJECTS_STATS Procedure.....	103-27
DELETE_INDEX_STATS Procedure.....	103-28
DELETE_SCHEMA_STATS Procedure.....	103-29
DELETE_SYSTEM_STATS Procedure.....	103-30
DELETE_TABLE_STATS Procedure.....	103-31
DROP_STAT_TABLE Procedure.....	103-33
EXPORT_COLUMN_STATS Procedure.....	103-34
EXPORT_DATABASE_STATS Procedure.....	103-35
EXPORT_DICTIONARY_STATS Procedure.....	103-36
EXPORT_FIXED_OBJECTS_STATS Procedure.....	103-37
EXPORT_INDEX_STATS Procedure.....	103-38
EXPORT_SCHEMA_STATS Procedure.....	103-39
EXPORT_SYSTEM_STATS Procedure.....	103-40
EXPORT_TABLE_STATS Procedure.....	103-41
FLUSH_DATABASE_MONITORING_INFO Procedure.....	103-42
GATHER_DATABASE_STATS Procedures.....	103-43
GATHER_DICTIONARY_STATS Procedure.....	103-46
GATHER_FIXED_OBJECTS_STATS Procedure.....	103-49
GATHER_INDEX_STATS Procedure.....	103-50
GATHER_SCHEMA_STATS Procedures.....	103-52
GATHER_SYSTEM_STATS Procedure.....	103-56
GATHER_TABLE_STATS Procedure.....	103-58
GENERATE_STATS Procedure.....	103-61
GET_COLUMN_STATS Procedures.....	103-62
GET_INDEX_STATS Procedures.....	103-64
GET_PARAM Function.....	103-67
GET_STATS_HISTORY_AVAILABILITY Function.....	103-68
GET_STATS_HISTORY_RETENTION Function.....	103-69
GET_SYSTEM_STATS Procedure.....	103-70
GET_TABLE_STATS Procedure.....	103-72
IMPORT_COLUMN_STATS Procedure.....	103-74
IMPORT_DATABASE_STATS Procedure.....	103-75
IMPORT_DICTIONARY_STATS Procedure.....	103-76
IMPORT_FIXED_OBJECTS_STATS Procedure.....	103-77
IMPORT_INDEX_STATS Procedure.....	103-78
IMPORT_SCHEMA_STATS Procedure.....	103-79

IMPORT_SYSTEM_STATS Procedure.....	103-80
IMPORT_TABLE_STATS Procedure.....	103-81
LOCK_SCHEMA_STATS Procedure	103-82
LOCK_TABLE_STATS Procedure	103-83
PREPARE_COLUMN_VALUES Procedures.....	103-84
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure.....	103-86
PREPARE_COLUMN_VALUES_ROWID Procedure	103-88
PURGE_STATS Procedure.....	103-90
RESET_PARAM_DEFAULTS Procedure	103-91
RESTORE_DATABASE_STATS Procedure	103-92
RESTORE_DICTIONARY_STATS Procedure	103-93
RESTORE_FIXED_OBJECTS_STATS Procedure.....	103-94
RESTORE_SCHEMA_STATS Procedure.....	103-95
RESTORE_SYSTEM_STATS Procedure.....	103-96
RESTORE_TABLE_STATS Procedure	103-97
SET_COLUMN_STATS Procedures	103-98
SET_INDEX_STATS Procedures.....	103-100
SET_PARAM Procedure	103-103
SET_SYSTEM_STATS Procedure.....	103-105
SET_TABLE_STATS Procedure	103-107
UNLOCK_SCHEMA_STATS Procedure.....	103-109
UNLOCK_TABLE_STATS Procedure.....	103-110
UPGRADE_STAT_TABLE Procedure.....	103-111

104 DBMS_STORAGE_MAP

Using DBMS_STORAGE_MAP	104-2
Overview	104-3
Operational Notes	104-4
Summary of DBMS_STORAGE_MAP Subprograms	104-5
DROP_ALL Function.....	104-6
DROP_ELEMENT Function	104-7
DROP_FILE Function	104-8
LOCK_MAP Procedure.....	104-9
MAP_ALL Function.....	104-10
MAP_ELEMENT Function	104-11
MAP_FILE Function	104-12
MAP_OBJECT Function.....	104-13
RESTORE Function	104-14
SAVE Function	104-15
UNLOCK_MAP Procedure	104-16

105 DBMS_STREAMS

Using DBMS_STREAMS.....	105-2
Security Model.....	105-3
Summary of DBMS_STREAMS Subprograms	105-4
COMPATIBLE_10_2 Function.....	105-5

COMPATIBLE_10_1 Function.....	105-6
COMPATIBLE_9_2 Function.....	105-7
CONVERT_ANYDATA_TO_LCR_DDL Function.....	105-8
CONVERT_ANYDATA_TO_LCR_ROW Function.....	105-9
CONVERT_LCR_TO_XML Function.....	105-10
CONVERT_XML_TO_LCR Function.....	105-11
GET_INFORMATION Function.....	105-12
GET_STREAMS_NAME Function.....	105-13
GET_STREAMS_TYPE Function.....	105-14
GET_TAG Function.....	105-15
SET_TAG Procedure.....	105-16

106 DBMS_STREAMS_ADM

Using DBMS_STREAMS_ADM.....	106-2
Overview.....	106-3
Deprecated Subprograms.....	106-4
Security Model.....	106-5
Operational Notes.....	106-7
Summary of DBMS_STREAMS_ADM Subprograms.....	106-22
ADD_COLUMN Procedure.....	106-25
ADD_GLOBAL_PROPAGATION_RULES Procedure.....	106-28
ADD_GLOBAL_RULES Procedure.....	106-33
ADD_MESSAGE_PROPAGATION_RULE Procedure.....	106-38
ADD_MESSAGE_RULE Procedure.....	106-42
ADD_SCHEMA_PROPAGATION_RULES Procedure.....	106-45
ADD_SCHEMA_RULES Procedure.....	106-50
ADD_SUBSET_PROPAGATION_RULES Procedure.....	106-55
ADD_SUBSET_RULES Procedure.....	106-59
ADD_TABLE_PROPAGATION_RULES Procedure.....	106-64
ADD_TABLE_RULES Procedure.....	106-69
CLEANUP_INSTANTIATION_SETUP Procedure.....	106-74
DELETE_COLUMN Procedure.....	106-78
GET_SCN_MAPPING Procedure.....	106-80
MAINTAIN_GLOBAL Procedure.....	106-82
MAINTAIN_SCHEMAS Procedure.....	106-85
MAINTAIN_SIMPLE_TABLESPACE Procedure.....	106-89
MAINTAIN_SIMPLE_TTS Procedure.....	106-94
MAINTAIN_TABLES Procedure.....	106-97
MAINTAIN_TABLESPACES Procedure.....	106-101
MAINTAIN_TTS Procedure.....	106-108
POST_INSTANTIATION_SETUP Procedure.....	106-111
PRE_INSTANTIATION_SETUP Procedure.....	106-115
PURGE_SOURCE_CATALOG Procedure.....	106-119
RECOVER_OPERATION Procedure.....	106-120
REMOVE_QUEUE Procedure.....	106-122
REMOVE_RULE Procedure.....	106-123
REMOVE_STREAMS_CONFIGURATION Procedure.....	106-125

RENAME_COLUMN Procedure	106-127
RENAME_SCHEMA Procedure	106-130
RENAME_TABLE Procedure.....	106-132
SET_MESSAGE_NOTIFICATION Procedure	106-134
SET_RULE_TRANSFORM_FUNCTION Procedure.....	106-138
SET_UP_QUEUE Procedure.....	106-141
107 DBMS_STREAMS_AUTH	
Summary of DBMS_STREAMS_AUTH Subprograms	107-2
GRANT_ADMIN_PRIVILEGE Procedure	107-3
GRANT_REMOTE_ADMIN_ACCESS Procedure.....	107-5
REVOKE_ADMIN_PRIVILEGE Procedure	107-6
REVOKE_REMOTE_ADMIN_ACCESS Procedure	107-8
108 DBMS_STREAMS_MESSAGING	
Summary of DBMS_STREAMS_MESSAGING Subprograms	108-2
DEQUEUE Procedure.....	108-3
ENQUEUE Procedure	108-5
109 DBMS_STREAMS_TABLESPACE_ADM	
Using DBMS_STREAMS_TABLESPACE_ADM	109-2
Overview	109-3
Types.....	109-4
Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms	109-6
ATTACH_SIMPLE_TABLESPACE Procedure.....	109-7
ATTACH_TABLESPACES Procedure	109-9
CLONE_SIMPLE_TABLESPACE Procedure	109-14
CLONE_TABLESPACES Procedure	109-16
DETACH_SIMPLE_TABLESPACE Procedure.....	109-20
DETACH_TABLESPACES Procedure	109-22
PULL_SIMPLE_TABLESPACE Procedure.....	109-26
PULL_TABLESPACES Procedure	109-28
110 DBMS_TRACE	
Using DBMS_TRACE	110-2
Overview	110-3
Security Model.....	110-4
Constants	110-5
Restrictions	110-6
Operational Notes	110-7
Summary of DBMS_TRACE Subprograms	110-10
CLEAR_PLSQL_TRACE Procedure	110-11
PLSQL_TRACE_VERSION Procedure	110-12
SET_PLSQL_TRACE Procedure	110-13

111 DBMS_TRANSACTION

Using DBMS_TRANSACTION	111-2
Security Model.....	111-3
Summary of DBMS_TRANSACTION Subprograms.....	111-4
ADVISE_COMMIT Procedure	111-6
ADVISE_NOTHING Procedure	111-7
ADVISE_ROLLBACK Procedure	111-8
BEGIN_DISCRETE_TRANSACTION Procedure.....	111-9
COMMIT Procedure	111-10
COMMIT_COMMENT Procedure	111-11
COMMIT_FORCE Procedure.....	111-12
LOCAL_TRANSACTION_ID Function.....	111-13
PURGE_LOST_DB_ENTRY Procedure.....	111-14
PURGE_MIXED Procedure	111-16
READ_ONLY Procedure.....	111-17
READ_WRITE Procedure	111-18
ROLLBACK Procedure	111-19
ROLLBACK_FORCE Procedure	111-20
ROLLBACK_SAVEPOINT Procedure	111-21
SAVEPOINT Procedure	111-22
STEP_ID Function	111-23
USE_ROLLBACK_SEGMENT Procedure	111-24

112 DBMS_TRANSFORM

Summary of DBMS_TRANSFORM Subprograms	112-2
CREATE_TRANSFORMATION Procedure.....	112-3
DROP_TRANSFORMATION Procedure	112-5
MODIFY_TRANSFORMATION Procedure	112-6

113 DBMS_TDB

Using DBMS_TDB.....	113-2
Overview	113-3
Security Model.....	113-4
Constants	113-5
Views.....	113-6
Operational Notes	113-7
Summary of DBMS_TDB Subprograms.....	113-8
CHECK_DB Function	113-9
CHECK_EXTERNAL Function	113-11

114 DBMS_TTS

Using DBMS_TTS.....	114-2
Security Model.....	114-3
Exceptions	114-4
Operational Notes	114-5
Summary of DBMS_TTS Subprograms	114-6

DOWNGRADE Procedure.....	114-7
TRANSPORT_SET_CHECK Procedure.....	114-8
115 DBMS_TYPES	
Using DBMS_TYPES	115-2
Constants	115-3
Exceptions	115-4
116 DBMS_UTILITY	
Using DBMS_UTILITY	116-2
Security Model.....	116-3
Constants	116-4
Types	116-5
Deprecated Subprograms	116-6
Exceptions	116-7
Summary of DBMS_UTILITY Subprograms	116-8
ACTIVE_INSTANCES Procedure	116-10
ANALYZE_DATABASE Procedure	116-11
ANALYZE_PART_OBJECT Procedure	116-12
ANALYZE_SCHEMA Procedure	116-13
CANONICALIZE Procedure.....	116-14
COMMA_TO_TABLE Procedures.....	116-15
COMPILE_SCHEMA Procedure	116-16
CREATE_ALTER_TYPE_ERROR_TABLE Procedure.....	116-17
CURRENT_INSTANCE Function	116-18
DATA_BLOCK_ADDRESS_BLOCK Function	116-19
DATA_BLOCK_ADDRESS_FILE Function	116-20
DB_VERSION Procedure	116-21
EXEC_DDL_STATEMENT Procedure.....	116-22
FORMAT_CALL_STACK Function	116-23
FORMAT_ERROR_BACKTRACE Function	116-24
FORMAT_ERROR_STACK Function.....	116-27
GET_CPU_TIME Function.....	116-28
GET_DEPENDENCY Procedure	116-29
GET_HASH_VALUE Function	116-30
GET_PARAMETER_VALUE Function	116-31
GET_TIME Function.....	116-33
INVALIDATE Procedure.....	116-34
IS_CLUSTER_DATABASE Function.....	116-37
MAKE_DATA_BLOCK_ADDRESS Function.....	116-38
NAME_RESOLVE Procedure.....	116-39
NAME_TOKENIZE Procedure	116-41
PORT_STRING Function	116-42
TABLE_TO_COMMA Procedures.....	116-43
VALIDATE Procedure.....	116-44

117 DBMS_WARNING

Using DBMS_WARNING	117-2
Security Model.....	117-3
Summary of DBMS_WARNING Subprograms	117-4
ADD_WARNING_SETTING_CAT Procedure.....	117-5
ADD_WARNING_SETTING_NUM Procedure.....	117-6
GET_CATEGORY Function.....	117-7
GET_WARNING_SETTING_CAT Function.....	117-8
GET_WARNING_SETTING_NUM Function.....	117-9
GET_WARNING_SETTING_STRING Function.....	117-10
SET_WARNING_SETTING_STRING Procedure.....	117-11

118 DBMS_WORKLOAD_CAPTURE

Using DBMS_WORKLOAD_CAPTURE.....	118-2
Overview	118-3
Security Model.....	118-4
Summary of DBMS_WORKLOAD_CAPTURE Subprograms	118-5
ADD_FILTER Procedures	118-6
DELETE_CAPTURE_INFO Procedure	118-7
DELETE_FILTER Procedure.....	118-8
EXPORT_AWR Procedure.....	118-9
FINISH_CAPTURE Procedure.....	118-10
GET_CAPTURE_INFO Function	118-11
IMPORT_AWR Function	118-12
REPORT Function	118-13
START_CAPTURE Procedure.....	118-14

119 DBMS_WORKLOAD_REPOSITORY

Using DBMS_WORKLOAD_REPOSITORY.....	119-2
Examples	119-3
Summary of DBMS_WORKLOAD_REPOSITORY Subprograms	119-4
ASH_REPORT_HTML Function.....	119-5
ASH_REPORT_TEXT Function.....	119-7
AWR_DIFF_REPORT_HTML Function	119-9
AWR_DIFF_REPORT_TEXT Function	119-10
AWR_REPORT_HTML Function	119-11
AWR_REPORT_TEXT Function	119-12
AWR_SQL_REPORT_HTML Function.....	119-13
AWR_SQL_REPORT_TEXT Function.....	119-14
CREATE_BASELINE Function and Procedure	119-15
CREATE_SNAPSHOT Function and Procedure	119-16
DROP_BASELINE Procedure	119-17
DROP_SNAPSHOT_RANGE Procedure.....	119-18
MODIFY_SNAPSHOT_SETTINGS Procedures.....	119-19

120 DBMS_WM

Documentation of DBMS_WM	120-2
--------------------------------	-------

121 DBMS_XDB

Using DBMS_XDB	121-2
Overview	121-3
Constants	121-4
Summary of DBMS_XDB Subprograms	121-5
ACLCHECKPRIVILEGES Function	121-7
APPENDRESOURCEMETADATA Procedure	121-8
CFG_GET Function	121-9
CFG_REFRESH Procedure	121-10
CFG_UPDATE Procedure	121-11
CHANGEPRIVILEGES Function	121-12
CHECKPRIVILEGES Function	121-13
CREATEFOLDER Function	121-14
CREATEOIDPATH Function	121-15
CREATERESOURCE Functions	121-16
DELETERESOURCE Procedure	121-18
DELETERESOURCEMETADATA Procedures	121-19
EXISTSRESOURCE Function	121-20
GETACLDOCUMENT Function	121-21
GETFTPPORT Function	121-22
GETHTTPPORT Function	121-23
GETLOCKTOKEN Procedure	121-24
GETPRIVILEGES Function	121-25
GETRESOID Function	121-26
GETXDB_TABLESPACE Function	121-27
LINK Procedure	121-28
LOCKRESOURCE Function	121-29
MOVEXDB_TABLESPACE Procedure	121-30
PURGERESOURCEMETADATA Procedure	121-31

Summary of OWA_CACHE Subprograms	141-4
DISABLE Procedure	141-5
GET_ETAG Function.....	141-6
GET_LEVEL Function	141-7
SET_CACHE Procedure.....	141-8
SET_EXPIRES Procedure	141-9
SET_NOT_MODIFIED Procedure	141-10
SET_SURROGATE_CONTROL Procedure.....	141-11
142 OWA_COOKIE	
Using OWA_COOKIE	142-2
Overview	142-3
Types.....	142-4
Rules and Limits.....	142-5
Summary of OWA_COOKIE Subprograms	142-6
GET Function	142-7
GET_ALL Procedure	142-8
REMOVE Procedure	142-9
SEND procedure	142-10
143 OWA_CUSTOM	
Using OWA_CUSTOM	143-2
Constants	143-3
Summary of OWA_CUSTOM Subprograms	143-4
AUTHORIZE Function.....	143-5
144 OWA_IMAGE	
Using OWA_IMAGE	144-2
Overview	144-3
Types.....	144-4
Variables	144-5
Examples	144-6
Summary of OWA_IMAGE Subprograms	144-7
GET_X Function	144-8
GET_Y Function	144-9

145	OWA_OPT_LOCK	
	Using OWA_OPT_LOCK	145-2
	Overview	145-3
	Types	145-4
	Summary of OWA_OPT_LOCK Subprograms	145-5
	CHECKSUM Functions	145-6
	GET_ROWID Function	145-7
	STORE_VALUES Procedure	145-8
	VERIFY_VALUES Function	145-9
146	OWA_PATTERN	
	Using OWA_PATTERN	146-2
	Types	146-3
	Operational Notes	146-4
	Summary of OWA_PATTERN Subprograms	146-6
	AMATCH Function	146-7
	CHANGE Functions and Procedures	146-9
	GETPAT Procedure	146-11
	MATCH Function	146-12
147	OWA_SEC	
	Using OWA_SEC	147-2
	Operational Notes	147-3
	Summary of OWA_SEC Subprograms	147-4
	GET_CLIENT_HOSTNAME Function	147-5
	GET_CLIENT_IP Function	147-6
	GET_PASSWORD Function	147-7
	GET_USER_ID Function	147-8
	SET_AUTHORIZATION Procedure	147-9
	SET_PROTECTION_REALM Procedure	147-10
148	OWA_TEXT	
	Using OWA_TEXT	148-2
	Types	148-3
	Summary of OWA_TEXT Subprograms	148-4
	ADD2MULTI Procedure	148-5
	NEW_ROW_LIST Function and Procedure	148-6
	PRINT_MULTI Procedure	148-7
	PRINT_ROW_LIST Procedure	148-8
	STREAM2MULTI Procedure	148-9
149	OWA_UTIL	
	Using OWA_UTIL	149-2
	Overview	149-3
	Types	149-4

Summary of OWA_UTIL Subprograms	149-5
BIND_VARIABLES Function	149-6
CALENDARPRINT Procedures	149-7
CELLSPRINT Procedures	149-8
CHOOSE_DATE Procedure	149-10
GET_CGI_ENV Function	149-11
GET_OWA_SERVICE_PATH Function.....	149-12
GET_PROCEDURE Function	149-13
HTTP_HEADER_CLOSE Procedure.....	149-14
LISTPRINT Procedure.....	149-15
MIME_HEADER Procedure	149-16
PRINT_CGI_ENV Procedure	149-17
REDIRECT_URL Procedure	149-18
SHOWPAGE Procedure.....	149-19
SHOWSOURCE Procedure.....	149-20
SIGNATURE procedure.....	149-21
STATUS_LINE Procedure.....	149-22
TABLEPRINT Function.....	149-23
TODATE Function	149-26
WHO_CALLED_ME Procedure	149-27
150 SDO_CS	
Documentation of SDO_CS	150-2
151 SDO_GCDR	
Documentation of SDO_GCDR	151-2
152 SDO_GEOM	
Documentation of SDO_GEOM	152-2
153 SDO_GEOR	
Documentation of SDO_GEOR.....	153-2
154 SDO_GEOR_UTL	
Documentation of SDO_GEOR_UTL	154-2
155 SDO_LRS	
Documentation of SDO_LRS.....	155-2
156 SDO_MIGRATE	
Documentation of SDO_MIGRATE.....	156-2
157 SDO_NET	
Documentation of SDO_NET	157-2

158	SDO_NET_MEM	
	Documentation of SDO_NET_MEM.....	158-2
159	SDO_SAM	
	Documentation of SDO_SAM.....	159-2
160	SDO_TOPO	
	Documentation of SDO_TOPO.....	160-2
161	SDO_TOPO_MAP	
	Documentation of SDO_TOPO_MAP	161-2
162	SDO_TUNE	
	Documentation of SDO_TUNE.....	162-2
163	SDO_UTIL	
	Documentation of SDO_UTIL.....	163-2
164	UTL_COLL	
	Summary of UTL_COLL Subprograms	164-2
	IS_LOCATOR Function	164-3
165	UTL_COMPRESS	
	Using UTL_COMPRESS.....	165-2
	Constants.....	165-3
	Exceptions	165-4
	Operational Notes	165-5
	Summary of UTL_COMPRESS Subprograms.....	165-6
	ISOPEN Function	165-7
	LZ_COMPRESS Functions and Procedures.....	165-8
	LZ_COMPRESS_ADD Procedure.....	165-10
	LZ_COMPRESS_CLOSE	165-11
	LZ_COMPRESS_OPEN.....	165-12
	LZ_UNCOMPRESS Functions and Procedures.....	165-13
	LZ_UNCOMPRESS_EXTRACT Procedure.....	165-14
	LZ_UNCOMPRESS_OPEN Function.....	165-15
	LZ_UNCOMPRESS_CLOSE Procedure	165-16
166	UTL_DBWS	
	Using UTL_DBWS	166-2
	Supported Keys and Default Settings for Standard Call Properties.....	166-3
	Summary of UTL_DBWS Subprograms	166-4
	CREATE_CALL Function	166-5
	CREATE_SERVICE Function	166-6

GET_IN_PARAMETER_TYPES Function	166-7
GET_OUT_PARAMETER_TYPES Function	166-8
GET_OUTPUT_VALUES Function	166-9
GET_PORTS Function	166-10
GET_PROPERTY Function	166-11
GET_RETURN_TYPE Function	166-12
GET_SERVICES Function	166-13
INVOKE Function	166-14
RELEASE_ALL_SERVICES Procedure	166-15
RELEASE_CALL Procedure	166-16
RELEASE_SERVICE Procedure	166-17
REMOVE_PROPERTY Procedure	166-18
SET_PROPERTY Procedure	166-19

167 UTL_ENCODE

Summary of UTL_ENCODE Subprograms	167-2
BASE64_DECODE Function	167-3
BASE64_ENCODE Function	167-4
MIMEHEADER_DECODE Function	167-5
MIMEHEADER_ENCODE Function	167-6
QUOTED_PRINTABLE_DECODE Function	167-7
QUOTED_PRINTABLE_ENCODE Function	167-8
TEXT_DECODE Function	167-9
TEXT_ENCODE Function	167-10
UUDECODE Function	167-11
UUENCODE Function	167-12

168 UTL_FILE

Using UTL_FILE	168-2
Security Model	168-3
Types	168-4
Operational Notes	168-5
Rules and Limits	168-6
Exceptions	168-7
Examples	168-8
Summary of UTL_FILE Subprograms	168-10
FCLOSE Procedure	168-12
FCLOSE_ALL Procedure	168-13
FCOPY Procedure	168-14
FFLUSH Procedure	168-15
FGETATTR Procedure	168-16
FGETPOS Function	168-17
FOPEN Function	168-18
FOPEN_NCHAR Function	168-20
FREMOVE Procedure	168-21
FRENAME Procedure	168-22

FSEEK Procedure	168-23
GET_LINE Procedure	168-24
GET_LINE_NCHAR Procedure.....	168-25
GET_RAW Function	168-26
IS_OPEN Function	168-27
NEW_LINE Procedure	168-28
PUT Procedure	168-29
PUT_LINE Procedure	168-30
PUT_LINE_NCHAR Procedure.....	168-31
PUT_NCHAR Procedure	168-32
PUTF Procedure	168-33
PUTF_NCHAR Procedure	168-35
PUT_RAW Function	168-36

169 UTL_HTTP

Using UTL_HTTP	169-2
Overview	169-3
Constants	169-4
Datatypes.....	169-8
Operational Notes	169-12
Exceptions	169-17
Examples	169-19
Subprogram Groups	169-22
Simple HTTP Fetches in a Single Call Subprograms	169-23
Session Settings Subprograms.....	169-24
HTTP Requests Subprograms	169-25
HTTP Responses Subprograms.....	169-26
HTTP Cookies Subprograms.....	169-27
HTTP Persistent Connections Subprograms.....	169-28
Error Conditions Subprograms.....	169-29
Summary of UTL_HTTP Subprograms	169-30
ADD_COOKIES Procedure	169-34
BEGIN_REQUEST Function	169-35
CLEAR_COOKIES Procedure	169-37
CLOSE_PERSISTENT_CONN Procedure	169-38
CLOSE_PERSISTENT_CONNS Procedure	169-39
END_REQUEST Procedure	169-41
END_RESPONSE Procedure	169-42
GET_AUTHENTICATION Procedure.....	169-43
GET_BODY_CHARSET Procedure	169-44
GET_COOKIE_COUNT Function	169-45
GET_COOKIE_SUPPORT Procedure	169-46
GET_COOKIES Function	169-47
GET_DETAILED_EXCP_SUPPORT Procedure	169-48
GET_DETAILED_SQLCODE Function	169-49
GET_DETAILED_SQLERRM Function	169-50
GET_FOLLOW_REDIRECT Procedure	169-51

GET_HEADER Procedure	169-52
GET_HEADER_BY_NAME Procedure.....	169-53
GET_HEADER_COUNT Function	169-54
GET_PERSISTENT_CONN_COUNT Function.....	169-55
GET_PERSISTENT_CONN_SUPPORT Procedure.....	169-56
GET_PERSISTENT_CONNS Procedure	169-57
GET_PROXY Procedure.....	169-58
GET_RESPONSE Function	169-59
GET_RESPONSE_ERROR_CHECK Procedure	169-60
GET_TRANSFER_TIMEOUT Procedure.....	169-61
READ_LINE Procedure.....	169-62
READ_RAW Procedure	169-63
READ_TEXT Procedure	169-64
REQUEST Function.....	169-66
REQUEST_PIECES Function	169-68
SET_AUTHENTICATION Procedure.....	169-71
SET_BODY_CHARSET Procedures	169-72
SET_COOKIE_SUPPORT Procedures.....	169-74
SET_DETAILED_EXCP_SUPPORT Procedure	169-76
SET_FOLLOW_REDIRECT Procedures	169-77
SET_HEADER Procedure	169-78
SET_PERSISTENT_CONN_SUPPORT Procedure.....	169-79
SET_PROXY Procedure.....	169-81
SET_RESPONSE_ERROR_CHECK Procedure.....	169-82
SET_TRANSFER_TIMEOUT Procedure.....	169-83
SET_WALLET Procedure.....	169-84
WRITE_LINE Procedure	169-85
WRITE_RAW Procedure.....	169-86
WRITE_TEXT Procedure.....	169-87

170 UTL_I18N

Using UTL_I18N	170-2
Overview	170-3
Constants	170-4
Summary of UTL_I18N Subprograms	170-6
ESCAPE_REFERENCE Function	170-8
GET_COMMON_TIME_ZONES Function	170-9
GET_DEFAULT_CHARSET Function	170-10
GET_DEFAULT_ISO_CURRENCY Function	170-11
GET_DEFAULT_LINGUISTIC_SORT Function	170-12
GET_LOCAL_LANGUAGES Function	170-13
GET_LOCAL_LINGUISTIC_SORTS Function	170-14
GET_LOCAL_TERRITORIES Function	170-15
GET_LOCAL_TIME_ZONES Function	170-16
GET_TRANSLATION Function.....	170-18
MAP_CHARSET Function.....	170-19
MAP_FROM_SHORT_LANGUAGE Function	170-21

MAP_LANGUAGE_FROM_ISO Function.....	170-22
MAP_LOCALE_TO_ISO Function	170-23
MAP_TERRITORY_FROM_ISO Function.....	170-24
MAP_TO_SHORT_LANGUAGE Function.....	170-25
RAW_TO_CHAR Functions	170-26
RAW_TO_NCHAR Functions.....	170-28
STRING_TO_RAW Function.....	170-30
TRANSLITERATE Function	170-31
UNESCAPE_REFERENCE Function.....	170-33
171 UTL_INADDR	
Using UTL_INADDR	171-2
Exceptions	171-3
Examples	171-4
Summary of UTL_INADDR Subprograms	171-5
GET_HOST_ADDRESS Function	171-6
GET_HOST_NAME Function	171-7
172 UTL_LMS	
Using UTL_LMS	172-2
Security Model.....	172-3
Summary of UTL_LMS Subprograms.....	172-4
FORMAT_MESSAGE Function.....	172-5
GET_MESSAGE Function	172-6
173 UTL_MAIL	
Using UTL_MAIL.....	173-2
Security Model.....	173-3
Operational Notes	173-4
Summary of UTL_MAIL Subprograms	173-5
SEND Procedure	173-6
SEND_ATTACH_RAW Procedure	173-7
SEND_ATTACH_VARCHAR2 Procedure.....	173-8
174 UTL_NLA	
Using UTL_NLA.....	174-2
Overview	174-3
Rules and Limits.....	174-4
Subprogram Groups	174-5
BLAS Level 1 (Vector-Vector Operations) Subprograms	174-6
BLAS Level 2 (Matrix-Vector Operations) Subprograms.....	174-7
BLAS Level 3 (Matrix-Matrix Operations) Subprograms	174-9
LAPACK Driver Routines (Linear Equations) Subprograms.....	174-10
LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms.....	174-11
Summary of UTL_NLA Subprograms.....	174-12
BLAS_ASUM Functions	174-17

BLAS_AXPY Procedures.....	174-18
BLAS_COPY Procedures.....	174-19
BLAS_DOT Functions	174-20
BLAS_GBMV Procedures	174-21
BLAS_GEMM Procedures.....	174-24
BLAS_GEMV Procedures	174-26
BLAS_GER Procedures	174-28
BLAS_IAMAX Functions	174-30
BLAS_NRM2 Functions	174-31
BLAS_ROT Procedures	174-32
BLAS_ROTG Procedures	174-33
BLAS_SCAL Procedures	174-34
BLAS_SPMV Procedures	174-35
BLAS_SPR Procedures	174-37
BLAS_SPR2 Procedures	174-39
BLAS_SBMV Procedures	174-41
BLAS_SWAP Procedures	174-43
BLAS_SYMM Procedures	174-44
BLAS_SYMV Procedures	174-46
BLAS_SYR Procedures	174-48
BLAS_SYR2 Procedures	174-50
BLAS_SYR2K Procedures	174-52
BLAS_SYRK Procedures	174-55
BLAS_TBMV Procedures	174-57
BLAS_TBSV Procedures.....	174-59
BLAS_TPMV Procedures	174-61
BLAS_TPSV Procedures.....	174-63
BLAS_TRMM Procedures.....	174-65
BLAS_TRMV Procedures.....	174-68
BLAS_TRSM Procedures.....	174-70
BLAS_TRSV Procedures.....	174-73
LAPACK_GBSV Procedures	174-75
LAPACK_GEES Procedures.....	174-77
LAPACK_GELS Procedures.....	174-79
LAPACK_GESDD Procedures	174-81
LAPACK_GESV Procedures	174-84
LAPACK_GESVD Procedures	174-86
LAPACK_GEEV Procedures	174-89
LAPACK_GTSV Procedures	174-92
LAPACK_PBSV Procedures	174-94
LAPACK_POSV Procedures	174-96
LAPACK_PPSV Procedures	174-98
LAPACK_PTSV Procedures	174-100
LAPACK_SBEV Procedures	174-102
LAPACK_SBEVD Procedures.....	174-104
LAPACK_SPEV Procedures	174-106
LAPACK_SPEVD Procedures.....	174-108

LAPACK_SPSV Procedures	174-110
LAPACK_STEV Procedures	174-112
LAPACK_STEVD Procedures	174-114
LAPACK_SYEV Procedures	174-116
LAPACK_SYEVD Procedures	174-118
LAPACK_SYSV Procedures	174-120

175 UTL_RAW

Using UTL_RAW	175-2
Overview	175-3
Operational Notes	175-4
Summary of UTL_RAW Subprograms	175-5
BIT_AND Function	175-7
BIT_COMPLEMENT Function	175-8
BIT_OR Function	175-9
BIT_XOR Function	175-10
CAST_FROM_BINARY_DOUBLE Function	175-11
CAST_FROM_BINARY_FLOAT Function	175-12
CAST_FROM_BINARY_INTEGER Function	175-13
CAST_FROM_NUMBER Function	175-14
CAST_TO_BINARY_DOUBLE Function	175-15
CAST_TO_BINARY_FLOAT Function	175-17
CAST_TO_BINARY_INTEGER Function	175-19
CAST_TO_NUMBER Function	175-20
CAST_TO_RAW Function	175-21
CAST_TO_VARCHAR2 Function	175-22
CAST_TO_NVARCHAR2 Function	175-23
COMPARE Function	175-24
CONCAT Function	175-25
CONVERT Function	175-26
COPIES Function	175-27
LENGTH Function	175-28
OVERLAY Function	175-29
REVERSE Function	175-31
SUBSTR Function	175-32
TRANSLATE Function	175-34
TRANSLITERATE Function	175-36
XRANGE Function	175-38

176 UTL_RECOMP

Using UTL_RECOMP	176-2
Overview	176-3
Operational Notes	176-4
Examples	176-5
Summary of UTL_RECOMP Subprograms	176-6
RECOMP_PARALLEL Procedure	176-7
RECOMP_SERIAL Procedure	176-8

177 UTL_REF

Using UTL_REF	177-2
Overview	177-3
Security Model.....	177-4
Types.....	177-5
Exceptions	177-6
Summary of UTL_REF Subprograms	177-7
DELETE_OBJECT Procedure	177-8
LOCK_OBJECT Procedure	177-10
SELECT_OBJECT Procedure	177-11
UPDATE_OBJECT Procedure.....	177-12

178 UTL_SMTP

Using UTL_SMTP	178-2
Overview	178-3
Types.....	178-4
Reply Codes	178-6
Exceptions	178-8
Rules and Limits.....	178-9
Examples	178-10
Summary of UTL_SMTP Subprograms	178-11
CLOSE_DATA Function and Procedure	178-12
COMMAND Function and Procedure.....	178-13
COMMAND_REPLIES Function.....	178-14
DATA Function and Procedure	178-15
EHLO Function and Procedure.....	178-16
HELO Function and Procedure.....	178-17
HELP Function	178-18
MAIL Function and Procedure	178-19
NOOP Function and Procedure	178-20
OPEN_CONNECTION Functions.....	178-21
OPEN_DATA Function and Procedure.....	178-23
QUIT Function and Procedure.....	178-24
RCPT Function.....	178-25
RSET Function and Procedure	178-26
VERFY Function	178-27
WRITE_DATA Procedure.....	178-28
WRITE_RAW_DATA Procedure.....	178-30

179 UTL_TCP

Using UTL_TCP	179-2
Overview	179-3
Types.....	179-4
Exceptions	179-6
Rules and Limits.....	179-7
Examples	179-8

Summary of UTL_TCP Subprograms	179-10
AVAILABLE Function.....	179-11
CLOSE_ALL_CONNECTIONS Procedure	179-13
CLOSE_CONNECTION Procedure	179-14
FLUSH Procedure	179-15
GET_LINE Function	179-16
GET_RAW Function	179-17
GET_TEXT Function	179-18
OPEN_CONNECTION Function	179-19
READ_LINE Function	179-21
READ_RAW Function.....	179-23
READ_TEXT Function.....	179-24
WRITE_LINE Function	179-26
WRITE_RAW Function	179-27
WRITE_TEXT Function	179-28
180 UTL_URL	
Using UTL_URL	180-2
Overview	180-3
Exceptions	180-4
Examples	180-5
Summary of UTL_URL Subprograms	180-6
ESCAPE Function.....	180-7
UNESCAPE Function	180-9
181 WPG_DOCLOAD	
Using WPG_DOCLOAD	181-2
Constants	181-3
Summary of WPG_DOCLOAD Subprograms	181-4
DOWNLOAD_FILE Procedures	181-5
182 ANYDATA TYPE

Send Us Your Comments

Oracle Database PL/SQL Packages and Types Reference, 10g Release 2 (10.2) B14258-02

Oracle welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual?

If you find any errors or have any other suggestions for improvement, please indicate the title and part number of the documentation and the chapter, section, and page number (if available). You can send comments to us in the following ways:

- Electronic mail: infodev_us@oracle.com
- FAX: (650) 506-7227. Attn: Server Technologies Documentation Manager
- Postal service:

Oracle Corporation
Server Technologies Documentation
500 Oracle Parkway, Mailstop 4op11
Redwood Shores, CA 94065
USA

If you would like a reply, please give your name, address, telephone number, and electronic mail address (optional).

If you have problems with the software, please contact your local Oracle Support Services.

Preface

This Preface contains these topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Structure](#)
- [Related Documents](#)
- [Conventions](#)

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming:

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Structure

See [Table 1-1, "Summary of Oracle Supplied PL/SQL Packages"](#) for information about the organization of this reference.

Related Documents

You can find links in specific chapters to related documents. For general information, see these Oracle resources:

- *Oracle Database Application Developer's Guide - Fundamentals*
- *Oracle Database PL/SQL User's Guide and Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

<http://oraclestore.oracle.com/>

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

<http://otn.oracle.com/membership/>

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

<http://otn.oracle.com/documentation/>

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- [Conventions in Text](#)
- [Conventions in Code Examples](#)

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an index-organized table .
<i>Italics</i>	Italic typeface indicates book titles or emphasis.	<i>Oracle Database Concepts</i> Ensure that the recovery catalog and target database do <i>not</i> reside on the same disk.
UPPERCASE monospace (fixed-width) font	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width) font	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. <i>Note:</i> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Set the QUERY_REWRITE_ENABLED initialization parameter to true. Connect as oe user. The JRepUtil class implements these methods.
<i>lowercase italic monospace (fixed-width) font</i>	Lowercase italic monospace font represents placeholders or variables.	You can specify the <i>parallel_clause</i> . Run <i>old_release</i> .SQL where <i>old_release</i> refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[]	Anything enclosed in brackets is optional.	DECIMAL (<i>digits</i> [, <i>precision</i>])
{ }	Braces are used for grouping items.	{ENABLE DISABLE}
	A vertical bar represents a choice of two options.	{ENABLE DISABLE} [COMPRESS NOCOMPRESS]

Convention	Meaning	Example
...	Ellipsis points mean repetition in syntax descriptions. In addition, ellipsis points can mean an omission in code examples or text.	CREATE TABLE ... AS <i>subquery</i> ; SELECT <i>col1, col2, ... , coln</i> FROM employees;
Other symbols	You must use symbols other than brackets ([]), braces ({}), vertical bars (), and ellipsis points (...) exactly as shown.	acctbal NUMBER(11,2); acct CONSTANT NUMBER(4) := 3;
<i>Italics</i>	Italicized text indicates placeholders or variables for which you must supply particular values.	CONNECT SYSTEM/ <i>system_password</i> DB_NAME = <i>database_name</i>
UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	SELECT last_name, employee_id FROM employees; SELECT * FROM USER_TABLES; DROP TABLE hr.employees;
lowercase	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files. Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	SELECT last_name, employee_id FROM employees; sqlplus hr/hr CREATE USER mjones IDENTIFIED BY ty3MU9;

What's New in PL/SQL Packages and Types Reference?

Introduction

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

Note: This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

This chapter contains the following topics:

- [Package Overview](#)
- [Summary of Oracle Supplied PL/SQL Packages](#)

See Also: *Oracle Database Application Developer's Guide - Fundamentals* for information on how to create your own packages

Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Packages have many advantages over standalone procedures and functions. For example, they:

- Let you organize your application development more efficiently.
- Let you grant privileges more efficiently.
- Let you modify package objects without recompiling dependent schema objects.
- Enable Oracle to read multiple package objects into memory at once.
- Let you *overload* procedures or functions. Overloading means creating multiple procedures with the same name in the same package, each taking arguments of different number or datatype.
- Can contain global variables and cursors that are available to all procedures and functions in the package.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];
```

```
CREATE PACKAGE BODY name AS -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
[BEGIN
    -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created and the `CATPROC.SQL` script is run. For example, to create the `DBMS_ALERT` package, the `DBMSALRT.SQL` and `PRVTALRT.PLB` scripts must be run when connected as the user `SYS`. These scripts are run automatically by the `CATPROC.SQL` script.

Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have `EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

Note: It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

You can declare and define program objects in the package body.

- You must define public objects declared in the package specification.
- You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

See Also:

- *Oracle Database PL/SQL User's Guide and Reference*
- *Oracle Database Application Developer's Guide - Fundamentals* for more information on creating new packages
- *Oracle Database Concepts*

for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
    mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
    deptno NUMBER) RETURN NUMBER;
  PROCEDURE fire_emp (emp_id NUMBER);
  PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
    mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
    deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
    new_empno    NUMBER(10);

BEGIN
  SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
  INSERT INTO emp VALUES (new_empno, name, job, mgr,
    hiredate, sal, comm, deptno);
  RETURN (new_empno);
END hire_emp;

PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument `emp_id`. If no employee is found, then an exception is raised.

```
BEGIN
  DELETE FROM emp WHERE empno = emp_id;
  IF SQL%NOTFOUND THEN
    raise_application_error(-20011, 'Invalid Employee
    Number: ' || TO_CHAR(emp_id));
  END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. `Emp_id` is a number that corresponds to an employee number. `Sal_incr` is the amount by which to increase the employee's salary.

```
BEGIN

-- If employee exists, then update salary with increase.

UPDATE emp
  SET sal = sal + sal_incr
  WHERE empno = emp_id;
IF SQL%NOTFOUND THEN
  raise_application_error(-20011, 'Invalid Employee
```

```
        Number: ' || TO_CHAR(emp_id));  
    END IF;  
END sal_raise;  
END employee_management;
```

Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence  
> START WITH 8000 INCREMENT BY 10;
```

Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name  
package_name.item_name  
package_name.subprogram_name
```

Summary of Oracle Supplied PL/SQL Packages

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
 - Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.
-
-

Table 1–1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
CTX_ADM	Lets you administer servers and the data dictionary.
CTX_CLS	Lets you generate CTXRULE rules for a set of documents.
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes.
CTX_DOC	Lets you request document services.
CTX_OUTPUT	Lets you manage the index log.
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions.
CTX_REPORT	Lets you create various index reports.
CTX_THES	Lets you to manage and browse thesauri.
CTX_ULEXER	For use with the user-lexer.
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite.
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements.
DBMS_ALERT	Provides support for the asynchronous notification of database events.
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes.
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process.
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message.
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP.
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces.
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams.
DBMS_CDC_PUBLISH	Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application.
DBMS_CDC_SUBSCRIBE	Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package.
DBMS_CHANGE_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms.
DBMS_DATA_MINING	Lets you use data mining to discover hidden patterns and use that knowledge to make predictions.
DBMS_DATA_MINING_TRANSFORM	Provides set of data transformation utilities available for use with the DBMS_DATA_MINING package for preparing mining data.
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata.
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs.
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units.
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DBMS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking.
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted.
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener.
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back.
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.
DBMS_FGA	Provides fine-grained security functions.
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories.
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases.
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting.
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems.
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command.
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Lets you schedule administrative procedures that you want performed at periodic intervals; it is also the interface for the job queue.
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers.
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP.
DBMS_LIBCACH	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution.
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILES (read-only).
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services.
DBMS_LOGMNR	Provides functions to initialize and run the log reader.
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents.
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary.
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing.
DBMS_MGWMSG	Describes object types—used by the canonical message types to convert message bodies—and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering.
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_OBFUSCATION_TOOLKIT	Provides procedures for Data Encryption Standards.
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function.
DBMS_OFFLINE_OG	Provides public APIs for offline instantiation of master groups.
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites.
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines. Synonymous with OUTLN_PKG
DBMS_OUTLN_EDIT	Lets you edit an invoker's rights package.
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later.
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes.
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions.
DBMS_PREDICTIVE_ANALYTICS	Automates the data mining process from data preprocessing through model building to scoring new data.
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks.
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue.
DBMS_RANDOM	Provides a built-in random number generator.
DBMS_RECTIFIER_DIFF	Provides APIs used to detect and resolve data inconsistencies between two replicated sites.
DBMS_REDEFINITION	Lets you perform an online reorganization of tables.
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time. Requires the Distributed Option.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_REPAIR	Provides data corruption repair procedures.
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.
DBMS_REPCAT_INSTANTIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema.
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups.
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution.
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager.
DBMS_RLS	Provides row level security administrative interface.
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents.
DBMS_RULE	Describes the EVALUATE procedure used in Streams.
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams.
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program.
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated.
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance.
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures.
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism.
DBMS_SPACE	Provides segment space information not available through standard SQL.
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL.
DBMS_SQL	Lets you use dynamic SQL to access the database.
DBMS_SQLTUNE	Provides the interface to tune SQL statements.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_STAT_FUNCS	Provides statistical functions.
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects.
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations.
DBMS_STREAMS	Describes the interface to convert <code>SYS.AnyData</code> objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level.
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators.
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a <code>SYS.AnyData</code> queue.
DBMS_STREAMS_TABLESPACE_ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing.
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities.
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing.
DBMS_TDB	Reports whether a database can be transported between platforms using the <code>RMAN CONVERT DATABASE</code> command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TTS	Checks if the transportable set is self-contained.
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types.
DBMS_UTILITY	Provides various utility routines.
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings.
DBMS_WORKLOAD_REPOSITORY	lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions.
DBMS_XDB	Describes Resource Management and Access Control APIs for PL/SQL
DBMS_XDB_VERSION	Describes versioning APIs
DBMS_XDBT	Describes how an administrator can create a <code>ConText</code> index on the XML DB hierarchy and configure it for automatic maintenance

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format.
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents.
DMBS_XMLQUERY	Provides database-to-XMLType functionality.
DBMS_XMLSAVE	Provides XML-to-database-type functionality.
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas.
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables.
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command.
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents.
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process.
HTF	Hypertext functions generate HTML tags.
HTMLDB_APPLICATION	Enables users to take advantage of global variables
HTMLDB_CUSTOM_AUTH	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.
HTMLDB_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.
HTMLDB_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.
HTP	Hypertext procedures generate HTML tags.
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications.
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser.
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image.
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates.
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string.
OWA_SEC	Provides an interface for custom authentication.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.
SDO_CS	Provides functions for coordinate system transformation.
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.
SDO_GEOM	Provides functions implementing geometric operations on spatial objects.
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.
SDO_LRS	Provides functions for linear referencing system support.
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases.
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network.
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_SAM	Contains functions and procedures for spatial analysis and data mining.
SDO_TOPO	Provides procedures for creating and managing Spatial topologies.
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object).
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial.
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial.
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update.
UTL_COMPRESS	Provides a set of data compression utilities.
UTL_DBWS	Provides database web services.
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts.
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges.
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications.
UTL_INADDR	Provides a procedure to support internet addressing.
UTL_LMS	Retrieves and formats error messages in different languages.
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt.
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYS
UTL_RAW	Provides SQL functions for RAW datatypes that concat, substr to and from RAWs .
UTL_RECOMP	Recompiles invalid PL/SQL modules, Java classes, indextypes and operators in a database, either sequentially or in parallel.
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object.
UTL_SMTP	Provides PL/SQL functionality to send emails.
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world.
UTL_URL	Provides escape and unescape mechanisms for URL characters.
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Streams AQ Types	Describes the types used in Advanced Queuing
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams
interMedia ORDAudio Type	Supports the storage and management of audio data.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
interMedia ORDDoc Type	Supports the storage and management of heterogeneous media data including image, audio, and video.
interMedia ORDImage Type	Supports the storage, management, and manipulation of image data.
interMedia ORDImageSignature Type	Supports content-based retrieval of images (image matching).
interMedia SQL/MM Still Image Type	Provides support for the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates.
interMedia ORDVideo Type	Supports the storage and management of video data.
RULES TYPES	Describes the types used with rules, rule sets, and evaluation contexts
XMLType	Describes the types and functions used for native XML support in the server.

This Oracle Text package lets you administer servers and the data dictionary. Note that you must install this package in order to use it.

- [Documentation of CTX_ADM](#)

Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see CTX_ADM in the *Oracle Text Reference*.

This Oracle Text package enables generation of CTXRULE rules for a set of documents.

- [Documentation of CTX_CLS](#)

Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see CTX_CLS in the *Oracle Text Reference*.

This Oracle Text package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- [Documentation of CTX_DDL](#)

Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see CTX_DDL in the *Oracle Text Reference*.

This Oracle Text package lets you request document services. Note that you must install this package in order to use it.

- [Documentation of CTX_DOC](#)

Documentation of CTX_DOC

For a complete description of this package within the context of Oracle Text, see CTX_DOC in the *Oracle Text Reference*.

CTX_OUTPUT

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- [Documentation of CTX_OUTPUT](#)

Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see CTX_OUTPUT in the *Oracle Text Reference*.

CTX_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- [Documentation of CTX_QUERY](#)

Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the *Oracle Text Reference*.

CTX_REPORT

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- [Documentation of CTX_REPORT](#)

Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see CTX_REPORT in the *Oracle Text Reference*.

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- [Documentation of CTX_THES](#)

Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see CTX_THES in the *Oracle Text Reference*.

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- [Documentation of CTX_ULEXER](#)

Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX_ULEXER in the *Oracle Text Reference*.

DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also: *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- [Using DBMS_ADVANCED_REWRITE](#)
 - Security Model
- [Summary of DBMS_ADVANCED_REWRITE Subprograms](#)

Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the DBMS_ADVANCED_REWRITE package.

- [Security Model](#)

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user `er` can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user `er` can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists all the package subprograms in alphabetical order.

Table 11-1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure on page 11-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure on page 11-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures on page 11-7	Creates a declaration indicating that <code>source_stmt</code> is functionally equivalent to <code>destination_stmt</code> for as long as the equivalence declaration remains enabled, and that <code>destination_stmt</code> is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure on page 11-9	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure on page 11-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the <code>validate</code> parameter

ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name          VARCHAR2,
    mode          VARCHAR2);
```

Parameters

Table 11–2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration to alter. The name can be of the form <code>owner . name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
mode	The following modes are supported, in increasing order of power: <code>disabled</code> : Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. <code>text_match</code> : Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. <code>general</code> : Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code> . <code>recursive</code> : Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration. Oracle Corporation recommends you use the least powerful mode that is sufficient to solve your performance problem.

BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in `QUERY_REWRITE_INTEGRITY = trusted` and `stale_tolerated` modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name            VARCHAR2,
    source_stmt     VARCHAR2,
    destination_stmt VARCHAR2,
    validate        BOOLEAN    := TRUE,
    mode            VARCHAR2   := 'TEXT_MATCH');
```

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name            VARCHAR2,
    source_stmt     CLOB,
    destination_stmt CLOB,
    validate        BOOLEAN    := TRUE,
    mode            VARCHAR2   := 'TEXT_MATCH');
```

Parameters

Table 11–3 *DECLARE_REWRITE_EQUIVALENCE Procedure Parameters*

Parameter	Description
<code>name</code>	A name for the equivalence declaration. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate <code>CREATE MATERIALIZED VIEW</code> privileges to alter an equivalence declaration.
<code>source_stmt</code>	A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format. This is the query statement that is the target of optimization.
<code>destination_stmt</code>	A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format.
<code>validate</code>	A Boolean indicating whether to validate that the specified <code>source_stmt</code> is functionally equivalent to the specified <code>destination_stmt</code> . If <code>validate</code> is specified as <code>TRUE</code> , <code>DECLARE_REWRITE_EQUIVALENCE</code> evaluates the two sub- <code>SELECT</code> s and compares their results. If the results are not the same, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not create the rewrite equivalence and returns an error condition. If <code>FALSE</code> , <code>DECLARE_REWRITE_EQUIVALENCE</code> does not validate the equivalence.

Table 11-3 (Cont.) DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
mode	<p>The following modes are supported, in increasing order of power:</p> <ul style="list-style-type: none"> ▪ <code>disabled</code>: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. ▪ <code>text_match</code>: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. ▪ <code>general</code>: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code>. ▪ <code>recursive</code>: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration. <p>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</p>

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's `source_stmt` or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's `destination_stmt` or the materialized view's container table, respectively.

DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (  
    name          VARCHAR2);
```

Parameters

Table 11–4 *DROP_REWRITE_EQUIVALENCE Procedure Parameters*

Parameter	Description
name	A name for the equivalence declaration to drop. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "[VALIDATE_REWRITE_EQUIVALENCE Procedure](#)" on page 11-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (  
    name          VARCHAR2);
```

Parameters

Table 11-5 *VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters*

Parameter	Description
name	A name for the equivalence declaration to validate. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the <code>source_stmt</code> and <code>destination_stmt</code> of the specified equivalence declaration.

DBMS_ADVISOR

DBMS_ADVISOR is part of the Server Manageability suite of Advisors, a set of expert systems that identifies and helps resolve performance problems relating to the various database server components.

See Also:

- *Oracle Database Administrator's Guide* for information regarding the Segment Advisor
- *Oracle Database Performance Tuning Guide* for information regarding the SQL Tuning Advisor and SQL Access Advisor
- *Oracle Database 2 Day DBA* and *Oracle Database Administrator's Guide* for information regarding the Undo Advisor

This chapter contains the following topics:

- [Using DBMS_ADVISOR](#)
 - Security Model
- [Summary of DBMS_ADVISOR Subprograms](#)

Using DBMS_ADVISOR

This section contains topics which relate to using the DBMS_ADVISOR package.

- [Security Model](#)

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package. In addition, there is an `ADVISOR` privilege, which is required by `DBMS_ADVISOR` procedures.

Summary of DBMS_ADVISOR Subprograms

Table 12–1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure on page 12-6	Adds a workload reference to an Advisor task	SQL Access Advisor only
ADD_SQLWKLD_STATEMENT Procedure on page 12-7	Adds a single statement to a workload	SQL Access Advisor only
CANCEL_TASK Procedure on page 12-9	Cancels a currently executing task operation	All Advisors
CREATE_FILE Procedure on page 12-10	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	All Advisors
CREATE_OBJECT Procedure on page 12-11	Creates a new task object	All Advisors
CREATE_SQLWKLD Procedure on page 12-13	Creates a new workload object	SQL Access Advisor only
CREATE_TASK Procedures on page 12-14	Creates a new Advisor task in the repository	All Advisors
DELETE_SQLWKLD Procedure on page 12-16	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_REF Procedure on page 12-17	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_STATEMENT Procedure on page 12-18	Deletes one or more statements from a workload	SQL Access Advisor only
DELETE_TASK Procedure on page 12-19	Deletes the specified task from the repository	All Advisors
EXECUTE_TASK Procedure on page 12-20	Executes the specified task	All Advisors
GET_REC_ATTRIBUTES Procedure on page 12-21	Retrieves specific recommendation attributes from a task	All Advisors
GET_TASK_REPORT Function on page 12-22	Creates and returns a report for the specified task	All Advisors
GET_TASK_SCRIPT Function on page 12-23	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	All Advisors
IMPLEMENT_TASK Procedure on page 12-25	Implements the tuning recommendations for a task	All Advisors
IMPORT_SQLWKLD_SCHEMA Procedure on page 12-26	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_SQLCACHE Procedure on page 12-28	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_STS Procedure on page 12-30	Imports data into a workload from a SQL Tuning Set into a SQL workload data object	SQL Access Advisor only

Table 12–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
IMPORT_SQLWKLD_SUMADV Procedure on page 12-32	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_USER Procedure on page 12-34	Imports data into a workload from the current SQL cache	SQL Access Advisor only
INTERRUPT_TASK Procedure on page 12-36	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	All Advisors
MARK_RECOMMENDATION Procedure on page 12-37	Sets the annotation_status for a particular recommendation	All Advisors
QUICK_TUNE Procedure on page 12-38	Performs an analysis on a single SQL statement	All Advisors
RESET_TASK Procedure on page 12-40	Resets a task to its initial state	All Advisors
SET_DEFAULT_SQLWKLD_PARAMETER Procedure on page 12-41	Imports data into a workload from schema evidence	SQL Access Advisor only
SET_DEFAULT_TASK_PARAMETER Procedures on page 12-42	Modifies a default task parameter	All Advisors
SET_SQLWKLD_PARAMETER Procedure on page 12-43	Sets the value of a workload parameter	SQL Access Advisor only
SET_TASK_PARAMETER Procedure on page 12-49	Sets the specified task parameter value	All Advisors
TUNE_MVIEW Procedure on page 12-60	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor only
UPDATE_OBJECT Procedure on page 12-62	Updates a task object	All Advisors
UPDATE_REC_ATTRIBUTES Procedure on page 12-64	Updates an existing recommendation for the specified task	All Advisors
UPDATE_SQLWKLD_ATTRIBUTES Procedure on page 12-66	Updates a workload object	SQL Access Advisor only
UPDATE_SQLWKLD_STATEMENT Procedure on page 12-67	Updates one or more SQL statements in a workload	SQL Access Advisor only
UPDATE_TASK_ATTRIBUTES Procedure on page 12-69	Updates a task's attributes	All Advisors

ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
    task_name          IN VARCHAR2,
    workload_name      IN VARCHAR2);
```

Parameters

Table 12–2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure <code>DELETE_REFERENCE</code> .

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
END;
/
```

ADD_SQLWKLD_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  module             IN VARCHAR2,
  action             IN VARCHAR2,
  cpu_time           IN NUMBER := 0,
  elapsed_time       IN NUMBER := 0,
  disk_reads         IN NUMBER := 0,
  buffer_gets        IN NUMBER := 0,
  rows_processed     IN NUMBER := 0,
  optimizer_cost     IN NUMBER := 0,
  executions         IN NUMBER := 1,
  priority           IN NUMBER := 2,
  last_execution_date IN DATE := 'SYSDATE',
  stat_period        IN NUMBER := 0,
  username           IN VARCHAR2,
  sql_text           IN CLOB);
```

Parameters

Table 12-3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.
stat_period	Time interval in seconds from which statement statistics were calculated.

Table 12-3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
username	The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 12-40 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. `cpu_time`, `elapsed_time`, `disk_reads`, `buffer_gets`, and `optimizer_cost` are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the `order_list` task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter `order_list`. The `order_list` parameter accepts any combination of the keys: `buffer_gets`, `optimizer_cost`, `cpu_time`, `disk_reads`, `elapsed_time`, `executions`, and `priority`. A typical setting of `priority`, `optimizer_cost` would indicate the SQL Access Advisor will sort the workload data by `priority` and `optimizer_cost` and process the highest cost statements first. Any statements added to the workload would need to include appropriate `priority` and `optimizer_cost` values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the `order_list` task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
END;
/
```

CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
    task_name      IN  VARCHAR2);
```

Parameters

Table 12–4 CANCEL_TASK Procedure Parameter

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command effective restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
    buffer      IN  CLOB,
    location   IN  VARCHAR2,
    filename   IN  VARCHAR2);
```

Parameters

Table 12–5 CREATE_FILE Procedure Parameters

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100,400,5041,103,640445,680000,2,
                                         1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                         FROM sh.sales');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
                             'MY_DIR','script.sql');

END;
/
```

CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
  task_name          IN VARCHAR2,
  object_type        IN VARCHAR2,
  attr1              IN VARCHAR2 := NULL,
  attr2              IN VARCHAR2 := NULL,
  attr3              IN VARCHAR2 := NULL,
  attr4              IN CLOB      := NULL,
  object_id          OUT NUMBER);
```

```
DBMS_ADVISOR.CREATE_OBJECT (
  task_name          IN VARCHAR2,
  object_type        IN VARCHAR2,
  attr1              IN VARCHAR2 := NULL,
  attr2              IN VARCHAR2 := NULL,
  attr3              IN VARCHAR2 := NULL,
  attr4              IN CLOB      := NULL,
  attr5              IN VARCHAR2 := NULL,
  object_id          OUT NUMBER);
```

Parameters

Table 12–6 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or

LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                             'SELECT * FROM SH.SALES', obj_id);

END;
/
```

CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
  workload_name      IN OUT VARCHAR2,
  description        IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE');
```

Parameters

Table 12-7 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
description	Specifies an optional workload description. Descriptions can be up to 256 characters.
template	An optional SQL Workload name of an existing workload data object or data object template.
is_template	An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

Once a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_name         IN VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);
```

Parameters

Table 12–8 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`
Parameters are preset to favor an OLTP application environment.
- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`
Parameters are preset to favor a data warehouse application environment.
- `DBMS_ADVISOR.SQLACCESS_GENERAL`
Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name          IN VARCHAR2);
```

Parameters

Table 12–9 *DELETE_SQLWKLD Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

DELETE_SQLWKLD_REF Procedure

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
  task_name          IN VARCHAR2,
  workload_name      IN NUMBER);
```

Parameters

Table 12–10 *DELETE_SQLWKLD_REF Procedure Parameters*

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

DELETE_SQLWKLD_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  sql_id             IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  search             IN VARCHAR2,
  deleted            OUT NUMBER);
```

Parameters

Table 12–11 *DELETE_SQLWKLD_STATEMENT Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>ADVISOR_ALL</code> .
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 12–12 *DELETE_TASK Procedure Parameters*

Parameter	Description
task_name	<p>A single Advisor task name that will be deleted from the repository.</p> <p>The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME.</p> <p>If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.</p>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 12–13 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                        FROM sh.sales');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name     IN VARCHAR2,
  value              OUT VARCHAR2,
  owner_name         IN VARCHAR2 := NULL);
```

Parameters

Table 12–14 *GET_REC_ATTRIBUTES Procedure Parameters*

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (  
    task_name      IN VARCHAR2,  
    type           IN VARCHAR2 := 'TEXT',  
    level          IN VARCHAR2 := 'TYPICAL',  
    section        IN VARCHAR2 := 'ALL',  
    owner_name     IN VARCHAR2 := NULL)  
RETURN CLOB;
```

Parameters

Table 12–15 GET_TASK_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.

Return Values

Returns the buffer receiving the script.

GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
  task_name      IN VARCHAR2
  type           IN VARCHAR2 := 'IMPLEMENTATION',
  rec_id        IN NUMBER := NULL,
  act_id        IN NUMBER := NULL,
  owner_name    IN VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 12–16 GET_TASK_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	Optional task owner name.

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
```

```
DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
DBMS_ADVISOR.EXECUTE_TASK(task_name);
  buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

IMPLEMENT_TASK Procedure

Implements the recommendations of the specified task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (  
    task_name          IN VARCHAR2,  
    rec_id             IN NUMBER := NULL,  
    exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 12–17 *IMPLEMENT_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

IMPORT_SQLWKLD_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 12–18 *IMPORT_SQLWKLD_SCHEMA Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the `VALID_TABLE_LIST` parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle Corporation recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKL_SCHEMA(workload_name, 'REPLACE', 1, saved,
    failed);
END;
/
```

IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 12–19 *IMPORT_SQLWKLD_SQLCACHE Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
saved_rows	Returns the number of rows saved as output parameters.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
```

```
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKL_SQLCACHE(workload_name, 'REPLACE', 1, saved,
    failed);
END;
/
```

IMPORT_SQLWKLD_STS Procedure

This procedure loads a SQL workload from an existing SQL Tuning Set. A SQL Tuning Set is typically created from the server workload repository using various time and data filters.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
  workload_name      IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
  workload_name      IN VARCHAR2,
  sts_owner          IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 12–20 *IMPORT_SQLWKLD_STS Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>sts_owner</code>	The optional owner of the SQL Tuning Set.
<code>sts_name</code>	The name of an existing SQL Tuning Set workload from which the data will be imported. If the <code>sts_owner</code> value is not provided, the owner will default to the current user.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ■ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task. ■ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is <code>NEW</code> .
<code>priority</code>	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
<code>saved_rows</code>	Returns the number of rows actually saved in the repository.
<code>failed_rows</code>	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
    saved, failed);
END;
/
```

IMPORT_SQLWKLD_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  sumadv_id          IN NUMBER,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 12–21 *IMPORT_SQLWKLD_SUMADV Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
sumadv_id	Specifies the Summary Advisor workload identifier number.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKL_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/
```

IMPORT_SQLWKLD_USER Procedure

This procedure collects a SQL workload from a specified user table.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  owner_name         IN VARCHAR2,
  table_name         IN VARCHAR2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 12–22 *IMPORT_SQLWKLD_USER Procedure Parameters*

Parameter	Description
<code>workload_name</code>	The workload object name that uniquely identifies an existing workload.
<code>import_mode</code>	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ <code>APPEND</code> Indicates that the collected workload will be added to any existing workload in the task. ▪ <code>NEW</code> Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ <code>REPLACE</code> Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is <code>NEW</code> .
<code>owner_name</code>	Specifies the owner name of the table or view from which workload data will be collected.
<code>table_name</code>	Specifies the name of the table or view from which workload data will be collected.
<code>saved_rows</code>	Returns the number of rows actually saved in the workload object.
<code>failed_rows</code>	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
```

```
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKL(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKL_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKL_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

Table 12–23 *INTERRUPT_TASK Procedure Parameters*

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.EXECUTE_TASK(task_name);  
END;  
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN  
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');  
END;  
/
```

MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
  task_name      IN VARCHAR2
  id              IN NUMBER,
  action         IN VARCHAR2);
```

Parameters

Table 12–24 *MARK_RECOMMENDATION Procedure Parameters*

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: <ul style="list-style-type: none"> ▪ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. ▪ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. ▪ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
```

QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
    advisor_name      IN VARCHAR2,
    task_name         IN VARCHAR2,
    attr1             IN CLOB,
    attr2             IN VARCHAR2 := NULL,
    attr3             IN NUMBER := NULL,
    task_or_template  IN VARCHAR2 := NULL);
```

Parameters

Table 12–25 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of `SQLACCESS_GENERAL`. The workload will only contain the specified statement, and all task parameters will be defaulted.

`attr1` must be the single SQL statement to tune. For the SQL Access Advisor, `attr2` is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
        'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

RESET_SQLWKLD Procedure

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
    workload_name      IN VARCHAR2);
```

Parameters

Table 12–26 *RESET_SQLWKLD Procedure Parameters*

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                        FROM sh.sales WHERE promo_id = 10');

    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to `INITIAL`.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 12-27 *RESET_TASK Procedure Parameters*

Parameter	Description
<code>task_name</code>	The task name that uniquely identifies an existing task.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,640445,680000,2,
        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
        FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);

    DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```

SET_DEFAULT_SQLWKLD_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter      IN VARCHAR2,
  value          IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter      IN VARCHAR2,
  value          IN NUMBER);
```

Parameters

Table 12–28 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name      IN VARCHAR2
    parameter         IN VARCHAR2,
    value             IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
    advisor_name      IN VARCHAR2
    parameter         IN VARCHAR2,
    value             IN NUMBER);
```

Parameters

Table 12–29 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
    DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (DBMS_ADVISOR.SQLACCESS_ADVISOR,
        'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_SQLWKLD_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
  workload_name      IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
  workload_name      IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

Parameters

Table 12–30 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

SQL Workload Object Parameters

Table 12–31 lists SQL Access Advisor object parameters.

Table 12–31 SQL Workload Object Parameters

Name	Datatype	Description
ACTION_LIST	STRINGLIST	<p>Use VALID_ACTION_LIST instead.</p> <p>Contains a fully qualified list of actions that are eligible for saving in a workload.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a workload import operation, if a SQL statements action does not match a name in the action list, it will not be stored in the workload object. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
COMMENTED_FILTER_LIST	NUMBER	<p>Use INVALID_SQLSTRING_LIST instead.</p> <p>Comma-delimited list of strings. When set, SQL Access Advisor will filter out any SQL statement that contain any of the specified strings in the first 20 characters of its text.</p>
DAYS_TO_EXPIRE	NUMBER	<p>Specifies the expiration time in days for the current SQL Workload object. The value is relative to the last modification date.</p> <p>Once the data expires, it will become a candidate for removal by an automatic purge operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ an integer in the range of 0 to 2147483647 ▪ ADVISOR_UNLIMITED ▪ ADVISOR_UNUSED <p>The default value is 30.</p>
END_TIME	STRING	<p>Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> ▪ DD is the numeric date ▪ MM is the numeric month ▪ YYYY is the numeric year ▪ HH is the hour in 24 hour format ▪ MI is the minute ▪ SS is the second
INVALID_ACTION_LIST	STRINGLIST	<p>Contains a fully qualified list of actions that are not eligible for saving in a workload.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During workload collection, if a SQL statement's action matches a name in the action list, it will not be processed by the operation. An action name is case sensitive.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
INVALID_ MODULE_LIST	STRINGLIST	<p>Contains a fully qualified list of application modules that are not eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During workload collection, if a SQL statement's module matches a name in the list, it will not be processed by the operation. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single application ▪ comma-delimited module list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
INVALID_ SQLSTRING_LIST		<p>Contains a fully qualified list of text strings that are not eligible when populating a SQL workload object. The list of elements is comma-delimited, and quoted values are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During workload collection, if a SQL statement contains a string in the SQL string list, it will not be processed by the operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single string ▪ comma-delimited string list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
INVALID_TABLE_ LIST	TABLELIST	<p>Contains a fully qualified list of tables that are not eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for both schemas and tables. The default value is all tables within the users scope are eligible for tuning. The supported wildcard character is %. A % wildcard matches any set of consecutive characters.</p> <p>When a SQL statement is processed, it will not be accepted if any referenced table matches an entry in the invalid table list.</p> <p>The valid syntax for a table reference is:</p> <ul style="list-style-type: none"> ▪ schema.table ▪ schema ▪ schema.% (equivalent to schema) <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single table reference ▪ comma-delimited table reference list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p> <p>Note that SQL Access Advisor maintains an internal list of non-tunable tables regardless of the contents of the INVALID_TABLE_LIST parameter. No table that is owned by SYS, SYSTEM or any other pre-defined Oracle schema can be tuned.</p>
INVALID_ USERNAME_LIST	STRINGLIST	<p>Contains a fully qualified list of usernames that are not eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During workload collection, if a SQL statements' username matches a name in the username list, it will not be processed by the operation. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
JOURNALING	NUMBER	<p>Controls the logging of messages to the journal (USER_ADVISOR_JOURNAL view). The higher the setting, the more information is logged to the journal.</p> <p>The valid settings are:</p> <ul style="list-style-type: none"> ▪ 0: no journal messages ▪ 1: fatal error messages ▪ 2: simple error messages ▪ 3: non-fatal warning messages ▪ 4-9: information messages (4 is the default)
MODULE_LIST	STRINGLIST	<p>Use VALID_MODULE_LIST instead.</p> <p>Contains a fully qualified list of application modules that are eligible for saving in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a workload import operation, if a SQL statements application module does not match a name in the module list, it will not be stored in the workload object.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single module ▪ comma-delimited module list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
ORDER_LIST	STRING	<p>Contains the primary natural order in which the SQL Access Advisor processes workload elements during the import operation.</p> <p>Possible values are: BUFFER_GETS, OPTIMIZER_COST, CPU_TIME, DISK_READS, ELAPSED_TIME, EXECUTIONS, and PRIORITY.</p>
REPORT_DATE_FORMAT		<p>This parameter is not used.</p>
SQL_LIMIT	NUMBER	<p>Specifies the maximum number of SQL statements to be saved during a workload import operation. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements.</p> <p>When used in conjunction with the parameter ORDER_LIST, Access Advisor will process and save the most interesting SQL statements by ordering the statements according to the specified sort keys.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ an integer in the range of 1 to 2147483647 ▪ ADVISOR_UNLIMITED ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
START_TIME	STRING	<p>Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> ▪ DD is the numeric date ▪ MM is the numeric month ▪ YYYY is the numeric year ▪ HH is the hour in 24 hour format ▪ MI is the minute ▪ SS is the second

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
USERNAME_LIST	STRINGLIST	<p>Use VALID_USERNAME_LIST instead.</p> <p>Contains a fully qualified list of usernames that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a workload import operation, if a SQL statements username does not match a name in the username list, it will not be stored in the workload object. A Username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_ACTION_LIST	STRINGLIST	<p>Contains a fully qualified list of actions that are eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During workload collection, if a SQL statement's action does not match a name in the action list, it will not be processed by the operation. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_MODULE_LIST	STRINGLIST	<p>Contains a fully qualified list of application modules that are eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During workload collection, if a SQL statement's module does not match a name in the module list, it will not be processed by the operation. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single application ▪ comma-delimited module list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
VALID_ SQLSTRING_LIST	STRINGLIST	<p>Contains a fully qualified list of text strings that are eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted values are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During workload collection, if a SQL statement does not contain a string in the SQL string list, it will not be processed by the operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single string ▪ comma-delimited string list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_TABLE_ LIST	TABLELIST	<p>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. The supported wildcard character is %. A % wildcard matches any set of consecutive characters.</p> <p>When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid.</p> <p>When using the IMPORT_SQLWKLD_SCHEMA procedure, the valid_table_list parameter cannot contain wildcards such as SCO% or SCOTT.EMP%. The only form of wildcards supported is SCOTT.%, which specifies all tables in a given schema.</p> <p>The valid syntax for a table reference is:</p> <ul style="list-style-type: none"> ▪ schema.table ▪ schema ▪ schema.% (equivalent to schema) <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single table reference ▪ comma-delimited table reference list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_ USERNAME_LIST	STRINGLIST	<p>Contains a fully qualified list of usernames that are eligible when populating a SQL workload object. The list of elements is comma-delimited, and quoted names are supported.</p> <p>During workload collection, if a SQL statement's username does not match a name in the username list, it will not be processed by the operation. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Examples

```

DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
END;
/

```

SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
  task_name          IN VARCHAR2
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
  task_name          IN VARCHAR2
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

Parameters

Table 12–32 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is <code>DEFAULT</code> , the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See "[RESET_TASK Procedure](#)" on page 12-40 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

[Table 12–33](#) lists SQL Access Advisor task parameters.

Table 12–33 SQL Access Advisor Task Parameters

Parameter	Datatype	Description
ACTION_LIST	STRINGLIST	<p>Use <code>VALID_ACTION_LIST</code> instead.</p> <p>Contains a fully qualified list of actions that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ <code>ADVISOR_UNUSED</code> <p>The default value is <code>ADVISOR_UNUSED</code>.</p>
COMMENTED_FILTER_LIST	NUMBER	<p>Use <code>INVALID_SQLSTRING_LIST</code> instead.</p> <p>Comma-delimited list of strings. When set, the SQL Access Advisor will filter out any SQL statement that contain any of the specified strings in the first 20 characters of its text.</p>
CREATION_COST	STRING	<p>When set to <code>true</code> (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to <code>false</code>, the cost of creation is ignored.</p>
DAYS_TO_EXPIRE	NUMBER	<p>Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation.</p> <p>Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date.</p> <p>Once the task expires, it becomes a candidate for removal by an automatic purge operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ an integer in the range of 0 to 2147483647 ▪ <code>ADVISOR_UNLIMITED</code> ▪ <code>ADVISOR_UNUSED</code> <p>The default value is 30.</p>
DEF_INDEX_OWNER	STRING	<p>Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ Existing schema name. Quoted identifiers are supported. ▪ <code>ADVISOR_UNUSED</code> <p>The default value is <code>ADVISOR_UNUSED</code>.</p>
DEF_INDEX_TABLESPACE	STRING	<p>Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ Existing tablespace name. Quoted identifiers are supported. ▪ <code>ADVISOR_UNUSED</code> No tablespace clause will be present in the script for indexes. <p>The default value is <code>ADVISOR_UNUSED</code>.</p>
DEF_MVIEW_OWNER	STRING	<p>Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ Existing schema name. Quoted identifiers are supported. ▪ <code>ADVISOR_UNUSED</code> <p>The default value is <code>ADVISOR_UNUSED</code>.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
DEF_MVIEW_ TABLESPACE	STRING	<p>Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are</p> <ul style="list-style-type: none"> ▪ Existing tablespace name. Quoted identifiers are supported. ▪ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. <p>The default value is ADVISOR_UNUSED.</p>
DEF_MVLOG_ TABLESPACE	STRING	<p>Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ Existing tablespace name. Quoted identifiers are supported. ▪ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. <p>The default value is ADVISOR_UNUSED.</p>
DML_ VOLATILITY	STRING	<p>When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, it may favor a Btree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application.</p> <p>See the related parameter <code>refresh_mode</code>.</p>
END_TIME	STRING	<p>Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> ▪ DD is the numeric date ▪ MM is the numeric month ▪ YYYY is the numeric year ▪ HH is the hour in 24 hour format ▪ MI is the minute ▪ SS is the second
EVALUATION_ ONLY	STRING	<p>If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ FALSE ▪ TRUE <p>The default value is FALSE.</p>
EXECUTION_ TYPE	STRINGLIST	<p>The type of recommendations that is desired. Possible values:</p> <ul style="list-style-type: none"> ▪ FULL All supported recommendation types will be considered. ▪ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. ▪ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. ▪ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. <p>The default value is FULL.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
IMPLEMENT_ EXIT_ON_ERROR	STRING	<p>When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ TRUE ▪ FALSE <p>The default value is TRUE.</p>
INDEX_NAME_ TEMPLATE	STRING	<p>Specifies the method by which new index names are formed.</p> <p>If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. Once formatted, the maximum size of a name is 30 characters.</p> <p>Valid keywords are:</p> <ul style="list-style-type: none"> ▪ Any literal value up to 22 characters. ▪ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. ▪ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. ▪ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. <p>The default template is <TABLE>_IDX\$\$_ <TASK_ID><SEQ>.</p>
INVALID_ ACTION_LIST	STRINGLIST	<p>Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
INVALID_ MODULE_LIST	STRINGLIST	<p>Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single application ▪ comma-delimited module list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
INVALID_SQLSTRING_LIST	STRINGLIST	<p>Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
INVALID_USERNAME_LIST	STRINGLIST	<p>Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
JOURNALING	NUMBER	<p>Controls the logging of messages to the journal (USER_ADVISOR_JOURNAL view). The higher the setting, the more information is logged to the journal.</p> <p>Valid settings are:</p> <ul style="list-style-type: none"> ■ 0: no journal messages ■ 1: fatal error messages ■ 2: simple error messages ■ 3: non-fatal warning messages ■ 4-9: information messages (4 is the default)
MODE	STRING	<p>Specifies the mode by which Access Advisor will operate during an analysis.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> ■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. ■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. <p>The default value is COMPREHENSIVE.</p>
MODULE_LIST	STRINGLIST	<p>Use VALID_MODULE_LIST instead.</p> <p>Contains a fully qualified list of application modules that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a workload import operation, if a SQL statement's application module does not match a name in the module list, it will not be stored in the workload object.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
MVIEW_NAME_TEMPLATE	STRING	<p>Specifies the method by which new materialized view names are formed.</p> <p>If the <i>TASK_ID</i> is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the <i>TASK_ID</i> in the template.</p> <p>The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> ▪ Any literal value up to 22 characters. ▪ <i>TASK_ID</i> Causes the current task identifier number to be inserted in hexadecimal form. ▪ <i>SEQ</i> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. <p>The default template is: <code>MV\$\$\$_<TASK_ID><SEQ></code>.</p>
ORDER_LIST	STRINGLIST	<p>Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using <i>ORDER_LIST</i> values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ <i>BUFFER_GETS</i> Sets the order using the SQL statement's buffer-get count value. ▪ <i>CPU_TIME</i> Sets the order using the SQL statement's CPU time value. ▪ <i>DISK_READS</i> Sets the order using the SQL statement's disk-read count value. ▪ <i>ELAPSED_TIME</i> Sets the order using the SQL statement's elapsed time value. ▪ <i>EXECUTIONS</i> Sets the order using the SQL statement's execution frequency value. ▪ <i>OPTIMIZER_COST</i> Sets the order using the SQL statement's optimizer cost value. ▪ <i>I/O</i> Sets the order using the SQL statement's I/O count value. ▪ <i>PRIORITY</i> Sets the order using the user-supplied business priority value. <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is <i>PRIORITY, OPTIMIZER_COST</i>.</p>
RECOMMEND_MV_EXACT_TEXT_MATCH	STRING	<p>When considering candidate materialized views, exact text match solutions will only be included if this parameter contains <i>TRUE</i>.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ <i>TRUE</i> ▪ <i>FALSE</i> <p>The default value is <i>TRUE</i>.</p>
REFRESH_MODE	STRING	<p>Specifies whether materialized views are refreshed <i>ON_DEMAND</i> or <i>ON_COMMIT</i>. This will be used to weigh the impact of materialized view refresh when the parameter <i>dm1_volatility</i> is set to <i>TRUE</i>.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ <i>ON_DEMAND</i> ▪ <i>ON_COMMIT</i> <p>The default value is <i>ON_DEMAND</i>.</p>
REPORT_DATE_FORMAT	STRING	<p>This is the default date and time formatting template. The default format is <code>DD/MM/YYYYHH24:MI</code>.</p>
SHOW_RETAINS	STRING	<p>Controls the display of <i>RETAIN</i> actions within an implementation script and the SQL Access Advisor wizard.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ <i>TRUE</i> ▪ <i>FALSE</i> <p>The default value is <i>TRUE</i>.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
SQL_LIMIT	NUMBER	<p>Specifies the number of SQL statements to be analyzed. The <code>SQL_LIMIT</code> filter is applied after all other filters have been applied. For example, if only statements referencing the table <code>foo.bar</code> are to be accepted, the <code>SQL_LIMIT</code> value will be only apply to those statements.</p> <p>When used in conjunction with the parameter <code>ORDER_LIST</code>, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ an integer in the range of 1 to 2147483647 ▪ <code>ADVISOR_UNLIMITED</code> ▪ <code>ADVISOR_UNUSED</code> <p>The default value is <code>ADVISOR_UNUSED</code>.</p>
START_TIME	STRING	<p>Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of <code>MM-DD-YYY HH24:MI:SS</code>, where:</p> <ul style="list-style-type: none"> ▪ <code>DD</code> is the numeric date ▪ <code>MM</code> is the numeric month ▪ <code>YYYY</code> is the numeric year ▪ <code>HH</code> is the hour in 24 hour format ▪ <code>MI</code> is the minute ▪ <code>SS</code> is the second
STORAGE_CHANGE	NUMBER	<p>Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as <code>FULL</code>.</p> <p>When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the <code>STORAGE_CHANGE</code> value to the space quantity currently used by existing access structures. A negative <code>STORAGE_CHANGE</code> value may force SQL Access Advisor to remove existing structures in order to shrink space demand.</p> <p>Possible values:</p> <ul style="list-style-type: none"> ▪ Any valid integer including negative values, zero and positive values. <p>The default value is <code>ADVISOR_UNLIMITED</code>.</p>
USERNAME_LIST	STRINGLIST	<p>Use <code>VALID_USERNAME_LIST</code> instead.</p> <p>Contains a fully qualified list of usernames that are eligible for processing in a workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>Possible values:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ <code>ADVISOR_UNUSED</code> <p>The default value is <code>ADVISOR_UNUSED</code>.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
VALID_ACTION_LIST	STRINGLIST	<p>Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_MODULE_LIST	STRINGLIST	<p>Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_SQLSTRING_LIST	STRINGLIST	<p>Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
VALID_TABLE_LIST	TABLELIST	<p>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters.</p> <p>When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid.</p> <p>The valid syntax for a table reference is:</p> <ul style="list-style-type: none"> ▪ schema.table ▪ schema ▪ schema.% (equivalent to schema) ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single table reference ▪ comma-delimited reference list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
VALID_USERNAME_LIST	STRINGLIST	<p>Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED.</p>
WORKLOAD_SCOPE	STRING	<p>Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL.</p> <p>FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables.</p> <p>PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.</p>

Segment Advisor Parameters

Table 12–35 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 12–34 Segment Advisor Task Parameters

Parameter	Default Value	Possible Values	Description
MODE	COMPREHENSIVE	LIMITED: Analysis restricted to statistics available in Automatic Workload Repository. COMPREHENSIVE: Comprehensive analysis based on sampling and Automatic Workload Repository statistics.	The data to use for analysis.
TIME_LIST	UNLIMITED	UNLIMITED	The time limit for which the Advisor should run. Specified in seconds.
RECOMMEND_ALL	TRUE	If set to TRUE, generate recommendations on all segments specified by the user. If set to FALSE, recommendations for only those objects that are eligible for shrink.	Whether to generate recommendations for all segments.

Examples

```

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
        'SH.%,SCOTT.EMP');
END;
/

```

Undo Advisor Task Parameters

Table 12–35 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 12–35 Undo Advisor Task Parameters

Parameter	Default Value	Possible Values	Description
TARGET_OBJECTS	none	UNDO_TBS	The target object is the undo tablespace of the system.
START_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository.
END_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	none	Any positive integer.	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC.
END_TIME_SEC	none	Any positive integer.	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC.

Examples

```

DECLARE
    tname VARCHAR2(30);
    oid NUMBER;
BEGIN
    DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
    DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
    DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 12–36 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure.

Table 12–36 ADDM Task Parameters

Parameter	Default	Possible Values	Description
START_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository.
END_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository.
DB_ID	The current database ID.	Not applicable.	The database for START_SNAPSHOT and END_SNAPSHOT.
INSTANCE	The current instance ID.	Not applicable.	The instance for START_SNAPSHOT and END_SNAPSHOT.
DBIO_EXPECTED	10 milliseconds	System dependent.	The average time to read the database block in microseconds.

Examples

```

DECLARE
    tid      NUMBER;
BEGIN
    DBMS_ADVISOR.CREATE_TASK('ADDM', tid, 'ADDM_TEST', 'my test');
    DBMS_ADVISOR.SET_TASK_PARAMETER('ADDM_TEST', 'START_SNAPSHOT', '19',
                                     - 'END_SNAPSHOT', '26',
                                     - 'DB_ID', '155789304',
                                     - 'INSTANCE', '1');

    DBMS_ADVISOR.EXECUTE_TASK('ADDM_TEST');
END;
/

```

SQL Tuning Advisor Task Parameters

See the [DBMS_SQLTUNE](#) package on page 101-1 and *Oracle Database Performance Tuning Guide* for more information.

TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
    task_name IN OUT VARCHAR2,
    mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 12–37 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

See Also: *Oracle Database Performance Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

Table 12–38 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: <ul style="list-style-type: none"> ▪ CREATE MATERIALIZED VIEW LOG ▪ ALTER MATERIALIZED VIEW LOG FORCE ▪ [CREATE DROP] MATERIALIZED VIEW

Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS '/myscript_dir' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_
task'), -
'/homes/tune', 'my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.

UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
  task_name      IN VARCHAR2
  object_id      IN NUMBER,
  attr1         IN VARCHAR2 := NULL,
  attr2         IN VARCHAR2 := NULL,
  attr3         IN VARCHAR2 := NULL,
  attr4         IN CLOB := NULL,
  attr5         IN VARCHAR2 := NULL);
```

Parameters

Table 12–39 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
```

```
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                              'SELECT * FROM SH.SALES', obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id, NULL, NULL, NULL,
                              'SELECT count(*) FROM SH.SALES');

END;
/
```

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
  task_name          IN VARCHAR2
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name     IN VARCHAR2,
  value              IN VARCHAR2);
```

Parameters

Table 12–40 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Name of the attribute to be changed. The valid values are: <ul style="list-style-type: none"> ▪ owner The new owner of the object. ▪ name The new name of the object. ▪ tablespace The new tablespace for the object.
value	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  attribute := 'SH';
```

```
    DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);  
END;  
/
```

UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  new_name           IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  read_only         IN VARCHAR2 := NULL,
  is_template        IN VARCHAR2 := NULL,
  how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 12–41 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

UPDATE_SQLWKLD_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  sql_id             IN NUMBER,
  application        IN VARCHAR2 := NULL,
  action            IN VARCHAR2 := NULL,
  priority          IN NUMBER := NULL,
  username          IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  search            IN VARCHAR2,
  updated          OUT NUMBER,
  application        IN VARCHAR2 := NULL,
  action            IN VARCHAR2 := NULL,
  priority          IN NUMBER := NULL,
  username          IN VARCHAR2 := NULL);
```

Parameters

Table 12–42 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>DBMS_ADVISOR.ADVISOR_ALL</code> .
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository. Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user <code>SCOTT</code> is the executing user, then you must provide the user identifier <code>SCOTT</code> in all uppercase letters. It will not recognize the user <code>scott</code> as a match for <code>SCOTT</code> .
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
  task_name      IN VARCHAR2
  new_name       IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL,
  read_only     IN VARCHAR2 := NULL,
  is_template    IN VARCHAR2 := NULL,
  how_created   IN VARCHAR2 := NULL);
```

Parameters

Table 12-43 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name, 'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name', NULL, 'New description');
END;
/
```

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- [Using DBMS_ALERT](#)
 - Overview
 - Security Model
 - Constants
 - Restrictions
 - Exceptions
 - Operational Notes
 - Examples
- [Summary of DBMS_ALERT Subprograms](#)

Using DBMS_ALERT

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

Constants

The DBMS_ALERT package uses the constants shown in [Table 13-1](#):

Table 13-1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. [Table 13-2](#) shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

See Also: [Chapter 70, "DBMS_PIPE"](#)

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
 - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
 - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 13–2 *DBMS_ALERT Error Messages*

Error Message	Procedure
ORU-10001 lock request error, status: N	SIGNAL
ORU-10015 error: N waiting for pipe status	WAITANY
ORU-10016 error: N sending on pipe 'X'	SIGNAL
ORU-10017 error: N receiving on pipe 'X'	SIGNAL
ORU-10019 error: N on lock request	WAIT
ORU-10020 error: N on lock request	WAITANY

Table 13-2 (Cont.) DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
  <<readagain>>:
  /* ... read the emp table and graph it */
  DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
  if status = 0 then goto <<readagain>>; else
  /* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
  BEGIN
    DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
  END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

Summary of DBMS_ALERT Subprograms

Table 13-3 *DBMS_ALERT Package Subprograms*

Subprogram	Description
REGISTER Procedure on page 13-12	Receives messages from an alert
REMOVE Procedure on page 13-13	Disables notification from an alert
REMOVEALL Procedure on page 13-14	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure on page 13-15	Sets the polling interval
SIGNAL Procedure on page 13-16	Signals an alert (send message to registered sessions)
WAITANY Procedure on page 13-17	Waits <code>timeout</code> seconds to receive alert message from an alert registered for session
WAITONE Procedure on page 13-18	Waits <code>timeout</code> seconds to receive message from named alert

REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (  
    name IN VARCHAR2);
```

Parameters

Table 13–4 REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested.

Caution: Alert names beginning with 'ORA\$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (  
    name IN VARCHAR2);
```

Parameters

Table 13–5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

SET_DEFAULTS Procedure

In case a polling loop is required, use the `SET_DEFAULTS` procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (  
    sensitivity IN NUMBER);
```

Parameters

Table 13–6 *SET_DEFAULTS Procedure Parameters*

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
    name      IN VARCHAR2,
    message   IN VARCHAR2);
```

Parameters

Table 13–7 *SIGNAL Procedure Parameters*

Parameter	Description
name	Name of the alert to signal.
message	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
  name      OUT  VARCHAR2,
  message   OUT  VARCHAR2,
  status    OUT  INTEGER,
  timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 13–8 WAITANY Procedure Parameters

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

-20000, ORU-10024: there are no alerts registered.

WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit `COMMIT` is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
    name      IN   VARCHAR2,
    message   OUT  VARCHAR2,
    status    OUT  INTEGER,
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 13–9 WAITONE Procedure Parameters

Parameter	Description
name	Name of the alert to wait for.
message	Returns the message associated with the alert. This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITONE</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If the named alert does not occurs before <code>timeout</code> seconds, this returns a status of 1.

DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- [Using DBMS_APPLICATION_INFO](#)
 - Overview
 - Security Model
 - Operational Notes
- [Summary of DBMS_APPLICATION_INFO Subprograms](#)

Using DBMS_APPLICATION_INFO

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V\$SESSION and V\$SQLAREA views.

Security Model

Note: The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The `DBMSAPIN.SQL` script is already run by `catproc`.

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the *SYS* version of the package. The public synonym for *DBMS_APPLICATION_INFO* can then be changed to point to the *DBA*'s version of the package.

Summary of DBMS_APPLICATION_INFO Subprograms

Table 14–1 *DBMS_APPLICATION_INFO Package Subprograms*

Subprogram	Description
READ_CLIENT_INFO Procedure on page 14-7	Reads the value of the <code>client_info</code> field of the current session
READ_MODULE Procedure on page 14-8	Reads the values of the module and action fields of the current session
SET_ACTION Procedure on page 14-9	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure on page 14-10	Sets the <code>client_info</code> field of the session
SET_MODULE Procedure on page 14-11	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure on page 14-12	Sets a row in the <code>V\$SESSION_LONGOPS</code> table

READ_CLIENT_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (  
    client_info OUT VARCHAR2);
```

Parameters

Table 14–2 *READ_CLIENT_INFO Procedure Parameters*

Parameter	Description
<code>client_info</code>	Last client information value supplied to the <code>SET_CLIENT_INFO</code> procedure.

READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
    module_name OUT VARCHAR2,
    action_name OUT VARCHAR2);
```

Parameters

Table 14-3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V\$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V\$SESSION view, or by calling the [READ_CLIENT_INFO Procedure](#).

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V\$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
-----
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
    action_name IN VARCHAR2);
```

Parameters

Table 14–4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
        WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
        WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (  
    client_info IN VARCHAR2);
```

Parameters

Table 14–5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
client_info	Supplies any additional information about the client application. This information is stored in the V\$SESSION view. Information exceeding 64 bytes is truncated.

Note: CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
  module_name IN VARCHAR2,
  action_name IN VARCHAR2);
```

Parameters

Table 14–6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
  VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
    commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

SET_SESSION_LONGOPS Procedure

This procedure sets a row in the `V$SESSION_LONGOPS` view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
  rindex      IN OUT BINARY_INTEGER,
  slno        IN OUT BINARY_INTEGER,
  op_name     IN      VARCHAR2         DEFAULT NULL,
  target      IN      BINARY_INTEGER  DEFAULT 0,
  context     IN      BINARY_INTEGER  DEFAULT 0,
  sofar       IN      NUMBER           DEFAULT 0,
  totalwork   IN      NUMBER           DEFAULT 0,
  target_desc IN      VARCHAR2         DEFAULT 'unknown target',
  units       IN      VARCHAR2         DEFAULT NULL)
```

```
set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 14–7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
<code>rindex</code>	A token which represents the <code>v\$session_longops</code> row to update. Set this to <code>set_session_longops_nohint</code> to start a new row. Use the returned value from the prior call to reuse a row.
<code>slno</code>	Saves information across calls to <code>set_session_longops</code> : It is for internal use and should not be modified by the caller.
<code>op_name</code>	Specifies the name of the long running task. It appears as the <code>OPNAME</code> column of <code>v\$session_longops</code> . The maximum length is 64 bytes.
<code>target</code>	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the <code>TARGET</code> column of <code>v\$session_longops</code> .
<code>context</code>	Any number the client wants to store. It appears in the <code>CONTEXT</code> column of <code>v\$session_longops</code> .
<code>sofar</code>	Any number the client wants to store. It appears in the <code>SOFAR</code> column of <code>v\$session_longops</code> . This is typically the amount of work which has been done so far.
<code>totalwork</code>	Any number the client wants to store. It appears in the <code>TOTALWORK</code> column of <code>v\$session_longops</code> . This is typically an estimate of the total amount of work needed to be done in this long running operation.

Table 14–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the <code>target</code> parameter. This value appears in the <code>TARGET_DESC</code> field of <code>v\$session_longops</code> . The maximum length is 32 bytes.
units	Specifies the units in which <code>sofar</code> and <code>totalwork</code> are being represented. It appears as the <code>UNITS</code> field of <code>v\$session_longops</code> . The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates `V$SESSION_LONGOPS` on the procedure's progress.

```

DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;

BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
        -- perform task on object target

        sofar := sofar + 1;
        dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
    END LOOP;
END;
```

DBMS_APPLY_ADM

The DBMS_APPLY_ADM package, one of a set of Streams packages, provides subprograms to start, stop, and configure an apply process. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes

This chapter contains the following topic:

- [Summary of DBMS_APPLY_ADM Subprograms](#)

Summary of DBMS_APPLY_ADM Subprograms

Table 15–1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ALTER_APPLY Procedure on page 15-4	Alters an apply process
COMPARE_OLD_VALUES Procedure on page 15-9	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure on page 15-11	Creates an apply process
CREATE_OBJECT_DEPENDENCY Procedure on page 15-18	Creates an object dependency
DELETE_ALL_ERRORS Procedure on page 15-19	Deletes all the error transactions for the specified apply process
DELETE_ERROR Procedure on page 15-20	Deletes the specified error transaction
DROP_APPLY Procedure on page 15-21	Drops an apply process
DROP_OBJECT_DEPENDENCY on page 15-22	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure on page 15-23	Reexecutes the error transactions for the specified apply process.
EXECUTE_ERROR Procedure on page 15-24	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function on page 15-27	Returns the message payload from the error queue for the specified message number and transaction identifier
SET_DML_HANDLER Procedure on page 15-28	Alters operation options for a specified object with a specified apply process
SET_ENQUEUE_DESTINATION Procedure on page 15-33	Sets the queue where the apply process automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure on page 15-35	Specifies whether a message that satisfies the specified rule is executed by an apply process
SET_GLOBAL_INSTANTIATION_SCN Procedure on page 15-37	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures on page 15-39	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure on page 15-41	Sets an apply parameter to the specified value
SET_SCHEMA_INSTANTIATION_SCN Procedure on page 15-46	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database

Table 15–1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_TABLE_INSTANTIATION_SCN Procedure on page 15-48	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure on page 15-50	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure on page 15-53	Sets or removes a value dependency
START_APPLY Procedure on page 15-54	Directs the apply process to start applying messages
STOP_APPLY Procedure on page 15-55	Stops the apply process from applying any messages and rolls back any unfinished transactions being applied

Note: All procedures commit unless specified otherwise. However, the GET_ERROR_MESSAGE function does not commit.

ALTER_APPLY Procedure

This procedure alters an apply process.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY (
  apply_name          IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set     IN  BOOLEAN   DEFAULT FALSE,
  message_handler     IN  VARCHAR2  DEFAULT NULL,
  remove_message_handler IN  BOOLEAN  DEFAULT FALSE,
  ddl_handler         IN  VARCHAR2  DEFAULT NULL,
  remove_ddl_handler  IN  BOOLEAN   DEFAULT FALSE,
  apply_user          IN  VARCHAR2  DEFAULT NULL,
  apply_tag           IN  RAW        DEFAULT NULL,
  remove_apply_tag    IN  BOOLEAN   DEFAULT FALSE,
  precommit_handler  IN  VARCHAR2  DEFAULT NULL,
  remove_precommit_handler IN  BOOLEAN  DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 15–2 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being altered. You must specify an existing apply process name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages.</p> <p>If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</p> <p>If you specify NULL and the <code>remove_rule_set</code> parameter is set to FALSE, then this procedure retains any existing positive rule set. If you specify NULL and the <code>remove_rule_set</code> parameter is set to TRUE, then this procedure removes any existing positive rule set.</p>

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
<code>remove_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified apply process. If you remove the positive rule set for an apply process, and the apply process does not have a negative rule set, then the apply process dequeues all messages in its queue.</p> <p>If you remove the positive rule set for an apply process, and a negative rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified apply process.</p> <p>If the <code>rule_set_name</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p>
<code>message_handler</code>	<p>A user-defined procedure that processes non-LCR messages in the queue for the apply process.</p> <p>See "Usage Notes" on page 15-16 in the CREATE_APPLY Procedure for more information about a message handler procedure.</p>
<code>remove_message_handler</code>	<p>If <code>TRUE</code>, then the procedure removes the message handler for the specified apply process.</p> <p>If <code>FALSE</code>, then the procedure retains any message handler for the specified apply process.</p> <p>If the <code>message_handler</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p>
<code>ddl_handler</code>	<p>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply process.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the <code>EXECUTE</code> member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" on page 15-16 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.</p>
<code>remove_ddl_handler</code>	<p>If <code>TRUE</code>, then the procedure removes the DDL handler for the specified apply process.</p> <p>If <code>FALSE</code>, then the procedure retains any DDL handler for the specified apply process.</p> <p>If the <code>ddl_handler</code> parameter is non-NULL, then this parameter should be set to <code>FALSE</code>.</p>

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	<p>The user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. If NULL, then the apply user is not changed.</p> <p>If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted DBA role. Only the SYS user can set the apply_user to SYS.</p> <p>If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process <p>These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>By default, this parameter is set to the user who created the apply process by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the apply_user for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.</p>
apply_tag	<p>A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter.</p> <p>If NULL, the default, then the apply tag for the apply process is not changed.</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW ('17')</pre> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	<p>If TRUE, then the procedure sets the apply tag for the specified apply process to NULL, and the apply process generates redo entries with NULL tags.</p> <p>If FALSE, then the procedure retains any apply tag for the specified apply process.</p> <p>If the <code>apply_tag</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
precommit_handler	<p>A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> ■ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ■ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. <p>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user-enqueued message, the commit SCN is generated by the apply process.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> ■ Any work that commits must be an autonomous transaction. ■ Any rollback must be to a named savepoint created in the procedure. <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" on page 15-16 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.</p>
remove_precommit_handler	<p>If TRUE, then the procedure removes the precommit handler for the specified apply process.</p> <p>If FALSE, then the procedure retains any precommit handler for the specified apply process.</p> <p>If the <code>precommit_handler</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages.</p> <p>If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified apply process. If you remove the negative rule set for an apply process, and the apply process does not have a positive rule set, then the apply process dequeues all messages in its queue.</p> <p>If you remove the negative rule set for an apply process, and a positive rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified apply process.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

Usage Notes

An apply process is stopped and restarted automatically when you change the value of one or more of the following `ALTER_APPLY` procedure parameters:

- `message_handler`
- `ddl_handler`
- `apply_user`
- `apply_tag`
- `precommit_handler`

COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in a Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES (
  object_name      IN VARCHAR2,
  column_list      IN VARCHAR2,
  operation        IN VARCHAR2 DEFAULT 'UPDATE',
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES (
  object_name      IN VARCHAR2,
  column_table     IN DBMS_UTILITY.LNAME_ARRAY,
  operation        IN VARCHAR2 DEFAULT 'UPDATE',
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 15-3 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
<code>object_name</code>	The name of the source table specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>column_list</code>	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify <code>*</code> to include all nonkey columns.
<code>column_table</code>	A PL/SQL index-by table of type <code>DBMS_UTILITY.LNAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.
<code>operation</code>	The name of the operation, which can be specified as: <ul style="list-style-type: none"> ■ <code>UPDATE</code> for UPDATE operations ■ <code>DELETE</code> for DELETE operations ■ <code>*</code> for both UPDATE and DELETE operations
<code>compare</code>	If <code>compare</code> is <code>TRUE</code> , the old values of the specified columns are compared during apply. If <code>compare</code> is <code>FALSE</code> , the old values of the specified columns are not compared during apply.

Table 15-3 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

By default, an apply process uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you use a time column for conflict detection, then an apply process does not need to check old values for non-key and nontime columns.

Note: An apply process always compares old values for key columns when they are present in a row LCR. This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

CREATE_APPLY Procedure

This procedure creates an apply process.

Note: The user who invokes this procedure must be granted DBA role.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY (
  queue_name          IN  VARCHAR2,
  apply_name          IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2  DEFAULT NULL,
  message_handler     IN  VARCHAR2  DEFAULT NULL,
  ddl_handler         IN  VARCHAR2  DEFAULT NULL,
  apply_user          IN  VARCHAR2  DEFAULT NULL,
  apply_database_link IN  VARCHAR2  DEFAULT NULL,
  apply_tag           IN  RAW        DEFAULT '00',
  apply_captured      IN  BOOLEAN   DEFAULT FALSE,
  precommit_handler  IN  VARCHAR2  DEFAULT NULL,
  negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
  source_database     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–4 CREATE_APPLY Procedure Parameters

Parameter	Description
queue_name	The name of the queue from which the apply process dequeues messages. You must specify an existing queue in the form [<i>schema_name</i> .] <i>queue_name</i> . For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. Note: The queue_name setting cannot be altered after the apply process is created.
apply_name	The name of the apply process being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply process or messaging client. Note: The apply_name setting cannot be altered after the apply process is created.

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages.</p> <p>If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify NULL, and no negative rule set is specified, then the apply process applies either all captured messages or all user-enqueued messages in the queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p>
message_handler	<p>A user-defined procedure that processes non-LCR messages in the queue for the apply process.</p> <p>See "Usage Notes" on page 15-16 for more information about a message handler procedure.</p>
ddl_handler	<p>A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply process.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the <code>EXECUTE</code> member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" on page 15-16 for more information about a DDL handler procedure.</p>

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_user	<p>The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.</p> <p>Only a user who is granted DBA role can set an apply user. Only the SYS user can set the apply_user to SYS.</p> <p>The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> ▪ The necessary privileges to perform DML and DDL changes on the apply objects ▪ EXECUTE privilege on the rule sets used by the apply process ▪ EXECUTE privilege on all rule-based transformation functions used in the rule set ▪ EXECUTE privilege on all apply handler procedures ▪ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process <p>These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the apply_user setting for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.</p>
apply_database_link	<p>The database at which the apply process applies messages. This parameter is used by an apply process when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply process applies messages at the local database.</p> <p>Note: The apply_database_link setting cannot be altered after the apply process is created.</p>

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_tag	<p>A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter.</p> <p>By default, the tag for an apply process is the hexadecimal equivalent of '00' (double zero).</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW('17')</pre> <p>If NULL, then the apply process generates redo entries with NULL tags.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
apply_captured	<p>Either TRUE or FALSE.</p> <p>If TRUE, then the apply process applies only the messages in a queue that were captured by a Streams capture process.</p> <p>If FALSE, then the apply process applies only the user-enqueued messages in a queue. These messages are user messages that were not captured by a Streams capture process. These messages might or might not contain a user-created LCR.</p> <p>To apply both captured and user-enqueued messages in a queue, you must create at least two apply processes.</p> <p>Note: The apply_captured setting cannot be altered after the apply process is created.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about processing captured or user-enqueued messages with an apply process</p>

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
<code>precommit_handler</code>	<p>A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. When a user or application enqueues messages and then issues a <code>COMMIT</code> statement, the commit directive is enqueued automatically. <p>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user-enqueued message, the commit SCN is generated by the apply process.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> Any work that commits must be an autonomous transaction. Any rollback must be to a named savepoint created in the procedure. <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" on page 15-16 for more information about a precommit handler procedure.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages.</p> <p>If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the apply process applies either all captured messages or all user-enqueued messages in the queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.</p>

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>If NULL, then the source database name of the first LCR received by the apply process is used for the source database.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1 .NET automatically.</p> <p>The rules in the apply process rule sets determine which messages are dequeued by the apply process. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.</p>

Usage Notes

The following sections describe usage notes for this procedure:

Handler Procedure Names

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

The user who invokes the `CREATE_APPLY` procedure must have `EXECUTE` privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the `CREATE_APPLY` procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
    parameter_name IN ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a `ANYDATA` encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a `ANYDATA` encapsulation of a DDL LCR.

See Also: [Chapter 189, "Logical Change Record TYPES"](#) for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (  
    parameter_name IN NUMBER);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply process schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply process uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply process does not use column values in the LCRs to detect dependencies.

Note: An error is raised if NULL is specified for either of the procedure parameters.

- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY (
  object_name          IN  VARCHAR2,
  parent_object_name  IN  VARCHAR2);
```

Parameters

Table 15–5 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
object_name	The name of the child database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
parent_object_name	The name of the parent database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.departments. If the schema is not specified, then the current user is the default.

DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply process.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS (  
    apply_name IN VARCHAR2 DEFAULT NULL);
```

Parameter

Table 15–6 *DELETE_ALL_ERRORS Procedure Parameter*

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are deleted.

DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(  
    local_transaction_id IN VARCHAR2);
```

Parameter

Table 15–7 *DELETE_ERROR Procedure Parameter*

Parameter	Description
local_transaction_id	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

DROP_APPLY Procedure

This procedure drops an apply process.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 15–8 *DROP_APPLY Procedure Parameters*

Parameter	Description
apply_name	The name of the apply process being dropped. You must specify an existing apply process name. Do not specify an owner.
drop_unused_rule_sets	<p>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply process if these rule sets are not used by any other Streams client. Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.</p> <p>If FALSE, then the procedure does not drop the rule sets used by the specified apply process, and the rule sets retain their rules.</p>

Usage Notes

When you use this procedure to drop an apply process, information about rules created for the apply process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply process. The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Streams data dictionary views

DROP_OBJECT_DEPENDENCY

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
 - An error is raised if NULL is specified for either of the procedure parameters.
-
-

See Also:

- ["CREATE_OBJECT_DEPENDENCY Procedure"](#) on page 15-18
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(  
    object_name          IN  VARCHAR2,  
    parent_object_name  IN  VARCHAR2);
```

Parameters

Table 15–9 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
object_name	The name of the child database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
parent_object_name	The name of the parent database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.departments. If the schema is not specified, then the current user is the default.

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply process.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

See Also: *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS (
  apply_name      IN  VARCHAR2  DEFAULT NULL,
  execute_as_user IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–10 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are reexecuted.
execute_as_user	If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.

EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

See Also: *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
    local_transaction_id IN VARCHAR2,
    execute_as_user      IN BOOLEAN   DEFAULT FALSE,
    user_procedure       IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–11 EXECUTE_ERROR Procedure Parameters

Parameter	Description
<code>local_transaction_id</code>	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
<code>execute_as_user</code>	<p>If TRUE, then the procedure reexecutes the transaction in the security context of the current user.</p> <p>If FALSE, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The <code>DBA_APPLY_ERROR</code> data dictionary view lists the original receiver for each error transaction.</p> <p>The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.</p>
<code>user_procedure</code>	<p>A user-defined procedure that modifies the error transaction so that it can be successfully executed.</p> <p>Specify NULL to execute the error transaction without running a user procedure.</p> <p>See Also: "Usage Notes" on page 15-24 for more information about the user procedure</p>

Usage Notes

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the `schema_name`.

- `fix_errors` is the *package_name*.
- `fix_hr_errors` is the *procedure_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    in_anydata          IN      ANYDATA,
    error_record        IN      DBA_APPLY_ERROR%ROWTYPE,
    error_message_number IN      NUMBER,
    messaging_default_processing IN OUT BOOLEAN,
    out_anydata         OUT     ANYDATA);
```

The user procedure has the following parameters:

- `in_anydata`: The ANYDATA encapsulation of a message that the apply process passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- `error_record`: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- `error_message_number`: The message number of the ANYDATA object in the `in_anydata` parameter, starting at 1
- `messaging_default_processing`: If TRUE, then the apply process continues processing the message in the `in_anydata` parameter, which can include executing DML or DDL statements and invoking apply handlers.
If FALSE, then the apply process skips processing the message in the `in_anydata` parameter and moves on to the next message in the `in_anydata` parameter.
- `out_anydata`: The ANYDATA object processed by the user procedure and used by the apply process if `messaging_default_processing` is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the `messaging_default_processing` parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the `in_anydata` parameter is a row LCR, then the `out_anydata` parameter must be row LCR if the `messaging_default_processing` parameter is set to TRUE.

- If the ANYDATA object in the `in_anydata` parameter is a DDL LCR, then the `out_anydata` parameter must be DDL LCR if the `messaging_default_processing` parameter is set to `TRUE`.
- The user who runs the user procedure must have `SELECT` privilege on the `DBA_APPLY_ERROR` data dictionary view.

Note: LCRs containing transactional directives, such as `COMMIT` and `ROLLBACK`, are not passed to the user procedure.

GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether or not the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

See Also:

- ["SET_ENQUEUE_DESTINATION Procedure"](#) on page 15-33
- ["SET_EXECUTE Procedure"](#) on page 15-35

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
  message_number      IN   NUMBER,
  local_transaction_id IN  VARCHAR2,
  destination_queue_name OUT VARCHAR2,
  execute             OUT  BOOLEAN)
RETURN ANYDATA;
```

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
  message_number      IN   NUMBER,
  local_transaction_id IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 15–12 *GET_ERROR_MESSAGE Function Parameters*

Parameter	Description
<code>message_number</code>	The identification number of the message. This number identifies the position of the message in the transaction. Query the <code>DBA_APPLY_ERROR</code> data dictionary view to view the message number of each apply error.
<code>local_transaction_id</code>	Identifier of the error transaction for which to return a message
<code>destination_queue_name</code>	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains <code>NULL</code> .
<code>execute</code>	Contains <code>TRUE</code> if the message should be executed Contains <code>FALSE</code> if the message should not be executed

SET_DML_HANDLER Procedure

This procedure sets a user procedure as a DML handler for a specified operation on a specified object. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER (
  object_name      IN  VARCHAR2,
  object_type      IN  VARCHAR2,
  operation_name   IN  VARCHAR2,
  error_handler    IN  BOOLEAN   DEFAULT FALSE,
  user_procedure   IN  VARCHAR2,
  apply_database_link IN VARCHAR2 DEFAULT NULL,
  apply_name       IN  VARCHAR2 DEFAULT NULL,
  assemble_lob     IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–13 SET_DML_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, <code>TABLE</code> is the only possible source object type.
operation_name	The name of the operation, which can be specified as: <ul style="list-style-type: none"> ▪ <code>INSERT</code> ▪ <code>UPDATE</code> ▪ <code>DELETE</code> ▪ <code>LOB_UPDATE</code> <p>For example, suppose you run this procedure twice for the <code>hr.employees</code> table. In one call, you set <code>operation_name</code> to <code>UPDATE</code> and <code>user_procedure</code> to <code>employees_update</code>. In another call, you set <code>operation_name</code> to <code>INSERT</code> and <code>user_procedure</code> to <code>employees_insert</code>. Both times, you set <code>error_handler</code> to <code>FALSE</code>. In this case, the <code>employees_update</code> procedure is run for <code>UPDATE</code> operations on the <code>hr.employees</code> table, and the <code>employees_insert</code> procedure is run for <code>INSERT</code> operations on the <code>hr.employees</code> table.</p>
error_handler	If <code>TRUE</code> , then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply process error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. <p>If <code>FALSE</code>, then the handler being set is run for all row LCRs involving the specified operation on the specified object.</p>

Table 15–13 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
<code>user_procedure</code>	<p>A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when the apply process encounters an error.</p> <p>Specify <code>NULL</code> to unset a DML handler that is set for the specified operation on the specified object.</p>
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
<code>apply_name</code>	<p>The name of the apply process that uses the DML handler or error handler.</p> <p>If <code>NULL</code>, then the procedure sets the DML handler or error handler as a general handler for all apply processes in the database.</p> <p>If the <code>user_procedure</code> parameter is set to <code>NULL</code> to unset a handler, and the handler being unset is set for a specific apply process, then use the <code>apply_name</code> parameter to specify the apply process to unset the handler.</p>
<code>assemble_lob</code>	<p>If <code>TRUE</code>, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly.</p> <p>If <code>FALSE</code>, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</p>

Usage Notes

Run this procedure at the destination database. The `SET_DML_HANDLER` procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

If the `error_handler` parameter is set to `TRUE`, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply process error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the `error_handler` parameter is set to `FALSE`, then the user procedure is a DML handler, not an error handler, and a DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a DML handler or an error handler for a particular operation on an object. It cannot set both a DML handler and an error handler for the same object and operation.

If the `apply_name` parameter is non-`NULL`, then the DML handler or error handler is set for the specified apply process. In this case, this handler is not invoked for other apply processes at the local destination database. If the `apply_name` parameter is `NULL`, the default, then the handler is set as a general handler for all apply processes at the destination database. When a handler is set for a specific apply process, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A DML handler named `handler_hr` is specified for an apply process named `apply_hr` for UPDATE operations on the `hr.employees` table.
- A general DML handler named `handler_gen` also exists for UPDATE operations on the `hr.employees` table.

In this case, the `apply_hr` apply process uses the `handler_hr` DML handler for UPDATE operations on the `hr.employees` table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Attention: Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with DML handlers, error handlers, or custom rule-based transformation functions. DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

Note: Currently, setting an error handler for an apply process that is applying changes to a non-Oracle database is not supported.

The `SET_DML_HANDLER` procedure can be used to set either a DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the `SET_DML_HANDLER` procedure must have EXECUTE privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `SET_DML_HANDLER` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `hr` is the `schema_name`.
- `apply_pkg` is the `package_name`.
- `employees_default` is the `procedure_name`.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.

- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

See Also: *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding DML handlers and LOB, LONG, and LONG RAW datatypes

Signature of a DML Handler Procedure

The procedure specified in the `user_procedure` parameter must have the following signature:

```
PROCEDURE user_procedure (
    parameter_name IN ANYDATA);
```

Here, `user_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

See Also: [Chapter 189, "Logical Change Record TYPES"](#) for more information about LCRs

Signature of an Error Handler Procedure

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    message           IN ANYDATA,
    error_stack_depth IN NUMBER,
    error_numbers     IN DBMS_UTILITY.NUMBER_ARRAY,
    error_messages    IN emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
 - The `emsg_array` value must be a user-defined array that is a table of type VARCHAR2 with at least 76 characters.
-
-

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply process.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply process automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is a Streams apply process. The information in an action context is an object of type SYS.RE\$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY\$_ENQUEUE.
- The value is a ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name           IN VARCHAR2,
    destination_queue_name IN VARCHAR2);
```

Parameters

Table 15–14 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [<i>schema_name.</i>] <i>rule_name</i> . For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue into which the apply process should enqueue the message. Specify the queue in the form [<i>schema_name.</i>] <i>queue_name</i> . Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY\$_ENQUEUE is removed. If no name-value pair exists with the name APPLY\$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair already exists for the rule with the name APPLY\$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

If an apply handler, such as a DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply process tries to enqueue a message into it.
- Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply processes using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply process. If the rule is in the negative rule set for an apply process, then the apply process does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply process rule sets.

SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply process.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is a Streams apply process. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_EXECUTE`.
- The value is a `ANYDATA` instance that contains `NO` as a `VARCHAR2`. When the value is `NO`, then an apply process does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name IN VARCHAR2,
  execute   IN BOOLEAN);
```

Parameters

Table 15–15 SET_EXECUTE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.]rule_name</code> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>execute</code>	<p>If <code>TRUE</code>, then the procedure removes the name-value pair with the name <code>APPLY\$_EXECUTE</code> for the specified rule. Removing the name-value pair means that the apply process executes messages that satisfy the rule. If no name-value pair with name <code>APPLY\$_EXECUTE</code> exists for the rule, then no action is taken.</p> <p>If <code>FALSE</code>, then the procedure adds a name-value pair to the rule's action context. The name is <code>APPLY\$_EXECUTE</code> and the value is <code>NO</code>. An apply process does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair already exists for the rule with the name <code>APPLY\$_EXECUTE</code>, then it is removed, and a new one with the value <code>NO</code> is added.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>

Usage Notes

If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

Note:

- Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
 - The specified rule must be in the positive rule set for an apply process for the apply process to follow the execution directive. If the rule is in the negative rule set for an apply process, then the apply process ignores the execution directive for the rule.
-
-

SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
    source_database_name IN VARCHAR2,
    instantiation_scn    IN NUMBER,
    apply_database_link  IN VARCHAR2 DEFAULT NULL,
    recursive            IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 15–16 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables. Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Note:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
 - The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS (
  object_name          IN  VARCHAR2,
  column_list          IN  VARCHAR2,
  apply_database_link IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS (
  object_name          IN  VARCHAR2,
  column_table         IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–17 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
<code>object_name</code>	The name of the table specified as [<i>schema_name.</i>] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. If the apply process is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
<code>column_list</code>	A comma-delimited list of the columns in the table that you want to use as the substitute primary key, with no spaces between the column names. If the <code>column_list</code> parameter is empty or <code>NULL</code> , then the current set of key columns is removed.
<code>column_table</code>	A PL/SQL index-by table of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table that you want to use as the substitute primary key. The index for <code>column_table</code> must be 1-based, increasing, dense, and terminated by a <code>NULL</code> . If the <code>column_table</code> parameter is empty or <code>NULL</code> , then the current set of key columns is removed.
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

When not empty, this set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object already has primary key columns and you want to use those primary key columns as the key.

Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

Note:

- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
 - You should not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
 - If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
-

SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
    apply_name IN VARCHAR2,
    parameter  IN VARCHAR2,
    value      IN VARCHAR2);
```

Parameters

Table 15–18 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply process name. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Apply Process Parameters" on page 15-41 for a list of these parameters.
value	The value to which the parameter is set

Apply Process Parameters

The following table lists the parameters for the apply process.

Table 15–19 Apply Process Parameters

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	<p>If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply process only updates or deletes one of the rows.</p> <p>If N, then the apply process raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table.</p> <p>Note: Regardless of the setting for this parameter, apply processes do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns.</p> <p>See Also: "Duplicate Rows and Substitute Primary Key Columns" on page 15-44</p>
commit_serialization	full or none	full	<p>The order in which applied transactions are committed.</p> <p>If full, then the apply process commits applied transactions in the order in which they were committed at the source database.</p> <p>If none, then the apply process can commit transactions in any order. Performance is best if you specify none.</p> <p>Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.</p> <p>Logical standby environments typically specify full.</p>
disable_on_error	Y or N	Y	<p>If Y, then the apply process is disabled on the first unresolved error, even if the error is not fatal.</p> <p>If N, then the apply process continues regardless of unresolved errors.</p>

Table 15–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the apply process is disabled if the apply process terminates because it reached a value specified by the <code>time_limit</code> parameter or <code>transaction_limit</code> parameter. If N, then the apply process is restarted immediately after stopping because it reached a limit.
maximum_scn	A valid SCN or infinite	infinite	The apply process is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If <code>infinite</code> , then the apply process runs regardless of the SCN value.
parallelism	A positive integer	1	The number of transactions that can be concurrently applied. Setting the parallelism parameter to a number higher than the number of available parallel execution servers can disable the apply process. Make sure the <code>PROCESSES</code> and <code>PARALLEL_MAX_SERVERS</code> initialization parameters are set appropriately when you set the parallelism apply process parameter. Note: When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.
startup_seconds	0, a positive integer, or infinite	0	The maximum number of seconds to wait for another instantiation of the same apply process to finish. If the other instantiation of the same apply process does not finish within this time, then the apply process does not start. If <code>infinite</code> , then an apply process does not start until another instantiation of the same apply process finishes.
time_limit	A positive integer or infinite	infinite	The apply process stops as soon as possible after the specified number of seconds since it started. If <code>infinite</code> , then the apply process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
transaction_limit	A positive integer or infinite	infinite	The apply process stops after applying the specified number of transactions. If <code>infinite</code> , then the apply process continues to run regardless of the number of transactions applied.

Table 15–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or infinite	10000	<p>The apply process begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less.</p> <p>If the reader server of an apply process has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:</p> <ol style="list-style-type: none"> 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory <p>The apply process applies the first 10,100 messages from the hard disk and the last 100 messages from memory.</p> <p>When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.</p> <p>Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply process is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.</p> <p>If <i>infinite</i>, then the apply process does not spill messages to the hard disk.</p> <p>Query the <code>DBA_APPLY_SPILL_TXN</code> data dictionary view for information about transactions spilled by an apply process.</p> <p>Note: When the value of this parameter is changed for a running apply process, the new setting does not take effect until the apply process is restarted.</p>
write_alert_log	Y or N	Y	<p>If <i>Y</i>, then the apply process writes a message to the alert log on exit.</p> <p>If <i>N</i>, then the apply process does not write a message to the alert log on exit.</p> <p>The message specifies the reason why the apply process stopped.</p>

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `infinite` for larger values.
 - For parameters that require an SCN setting, any valid SCN value can be specified.
-

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when the all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that updates at the source database always update at least one of the columns specified as a substitute key column at the destination database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

If a table does not have a primary key, a unique index that has at least one NOT NULL column, or a substitute key, then the key consists of all non LOB, non LONG, and non LONG RAW columns. When there is no key for a table and the `allow_duplicate_rows` apply process parameter is set to `Y`, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can

update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply process ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply process determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply process always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply process does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply process raises an error regardless of the setting for the `allow_duplicate_rows` apply process parameter.

See Also: ["SET_KEY_COLUMNS Procedures"](#) on page 15-39

SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name  IN  VARCHAR2,
  source_database_name IN  VARCHAR2,
  instantiation_scn   IN  NUMBER,
  apply_database_link IN  VARCHAR2  DEFAULT NULL,
  recursive           IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–20 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-NULL `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

Note: Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

See Also:

- ["SET_GLOBAL_INSTANTIATION_SCN Procedure"](#) on page 15-37
- ["SET_TABLE_INSTANTIATION_SCN Procedure"](#) on page 15-48

- *Oracle Streams Replication Administrator's Guide*

SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–21 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.

Usage Notes

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply process at the destination database disregards the LCR. Otherwise, the apply process applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL *base_table_owner* and *base_table_name* specified, except for DDL LCRs with a *command_type* of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a *command_type* of ALTER TABLE or CREATE TRIGGER.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
  object_name      IN  VARCHAR2,
  method_name      IN  VARCHAR2,
  resolution_column IN  VARCHAR2,
  column_list      IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 15–22 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
object_name	<p>The schema and name of the table, specified as [<i>schema_name</i>.] <i>object_name</i>, for which an update conflict handler is being added, modified, or removed.</p> <p>For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>
method_name	<p>Type of update conflict handler to create.</p> <p>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</p> <ul style="list-style-type: none"> ■ MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. ■ MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. ■ OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. ■ DISCARD: Retains the column list from the destination database, discarding the column list from the source database. <p>If <code>NULL</code>, then the procedure removes any existing update conflict handler with the same <code>object_name</code>, <code>resolution_column</code>, and <code>column_list</code>. If non-<code>NULL</code>, then the procedure replaces any existing update conflict handler with the same <code>object_name</code> and <code>resolution_column</code>.</p>

Table 15–22 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
resolution_column	<p>Name of the column used to uniquely identify an update conflict handler. For the <code>MAXIMUM</code> and <code>MINIMUM</code> prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the <code>column_list</code> parameter.</p> <p><code>NULL</code> is not allowed for this parameter. For the <code>OVERWRITE</code> and <code>DISCARD</code> prebuilt methods, you can specify any column in the column list.</p>
column_list	<p>List of columns for which the conflict handler is called.</p> <p>If a conflict occurs for one or more of the columns in the list when an apply process tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list.</p> <p>Note: Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, and user-defined type columns. Therefore, you should not include these types of columns in the <code>column_list</code> parameter.</p>
apply_database_link	<p>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</p> <p>Note: Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</p>

Usage Notes

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply process, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

Note: Currently, setting an update conflict handler for an apply process that is applying to a non-Oracle database is not supported.

See Also:

- ["Signature of an Error Handler Procedure"](#) on page 15-31 for information about setting an error handler
- ["SET_DML_HANDLER Procedure"](#) on page 15-28
- *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name      => 'hr.employees',
    method_name      => 'MAXIMUM',
    resolution_column => 'salary',
    column_list      => cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply process uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY (
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_list  IN VARCHAR2);
```

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY (
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 15–23 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
<code>dependency_name</code>	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If NULL, an error is raised.
<code>object_name</code>	The name of the table, specified as [<i>schema_name</i> .] <i>table_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised. If NULL, then <code>attribute_list</code> and <code>attribute_table</code> also must be NULL.
<code>attribute_list</code>	A comma-delimited list of column names in the table. There must be no spaces between entries.
<code>attribute_table</code>	A PL/SQL index-by table of type <code>DBMS_UTILITY.NAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.

START_APPLY Procedure

This procedure directs the apply process to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(  
    apply_name IN VARCHAR2);
```

Parameter

Table 15–24 *START_APPLY Procedure Parameter*

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is `ENABLED`, then the apply process is started upon database instance startup. An apply process (*an_{nn}*) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply process.

STOP_APPLY Procedure

This procedure stops the apply process from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY (
  apply_name IN VARCHAR2,
  force      IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 15–25 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply process as soon as possible. If FALSE, then the procedure stops the apply process after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply process depends on the setting specified for the <code>force</code> parameter and the setting specified for the <code>commit_serialization</code> apply process parameter. See " Usage Notes " for more information.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the apply process is not started upon database instance startup.

The `enqueue` and `dequeue` state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the `STOP` status of an apply process.

The following table describes apply process behavior for each setting of the `force` parameter in the `STOP_APPLY` procedure and the `commit_serialization` apply process parameter. In all cases, the apply process rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Process Behavior
TRUE	full	The apply process stops immediately and does not apply any unfinished transactions.
TRUE	none	When the apply process stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	full	The apply process stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	none	Before stopping, the apply process applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the `commit_serialization` apply process parameter is set to `none` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply process has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply process stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply process stops.

A different scenario would result if the `commit_serialization` apply process parameter is set to `full`. For example, assume that the `commit_serialization` apply process parameter is set to `full` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply process has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply process stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply process stops, and transaction C is rolled back.

See Also: ["SET_PARAMETER Procedure"](#) on page 15-41 for more information about the `commit_serialization` apply process parameter

The `DBMS_AQ` package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- *Oracle Streams Advanced Queuing User's Guide and Reference*
- [Oracle Streams AQ TYPES](#) for information about TYPES to use with `DBMS_AQ`.

This chapter contains the following topics:

- [Using DBMS_AQ](#)
 - Constants
 - Data Structures
 - Operational Notes
- [Summary of DBMS_AQ Subprograms](#)

Using DBMS_AQ

- [Constants](#)
- [Data Structures](#)
- [Operational Notes](#)

Constants

When using enumerated constants such as `BROWSE`, `LOCKED`, or `REMOVE`, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with `DBMS_AQ`. For example: `DBMS_AQ.BROWSE`. [Table 16–1](#) lists the PL/SQL enumerated constants that require the prefix, `DBMS_AQ`.

Table 16–1 Enumerated Constants

Parameter	Options
<code>visibility</code>	<code>IMMEDIATE</code> , <code>ON_COMMIT</code>
<code>dequeue mode</code>	<code>BROWSE</code> , <code>LOCKED</code> , <code>REMOVE</code> , <code>REMOVE_NODATA</code>
<code>navigation</code>	<code>FIRST_MESSAGE</code> , <code>NEXT_MESSAGE</code> , <code>NEXT_TRANSACTION</code>
<code>state</code>	<code>WAITING</code> , <code>READY</code> , <code>PROCESSED</code> , <code>EXPIRED</code>
<code>sequence_deviation</code>	<code>BEFORE</code> , <code>TOP</code> . Note: The <code>sequence_deviation</code> attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if <code>message_grouping</code> is set to <code>TRANSACTIONAL</code> . The <code>sequence_deviation</code> feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).
<code>wait</code>	<code>FOREVER</code> , <code>NO_WAIT</code>
<code>delay</code>	<code>NO_DELAY</code>
<code>expiration</code>	<code>NEVER</code>
<code>namespace</code>	<code>NAMESPACE_AQ</code> , <code>NAMESPACE_ANONYMOUS</code>

Data Structures

Table 16–2 DBMS_AQ Data Structures

Data Structures	Description
Object Name on page 16-4	Names database objects
Type Name on page 16-4	Defines queue types
Oracle Streams AQ PL/SQL Callback on page 16-5	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 16–3 Type Name Attributes

Attribute	Description
<code>object_type</code>	Maximum number of attributes in the object type is limited to 900.

Table 16–3 (Cont.) Type Name Attributes

Attribute	Description
"RAW"	<p>To store payload of type RAW, Oracle Streams AQ creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Streams AQ. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases.</p> <p>Because LOB columns are used for storing RAW payload, the Oracle Streams AQ administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the <code>storage_clause</code> parameter during queue table creation time.</p>

Oracle Streams AQ PL/SQL Callback

The `plsqcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
  payload IN RAW,
  payload1 IN NUMBER);
```

Attributes

Table 16–4 Oracle Streams AQ PL/SQL Callback Attributes

Attribute	Description
<code>context</code>	Specifies the context for the callback function that was passed by <code>dbms_aq.register</code> . See AQ\$_REG_INFO Type on page 185-11.
<code>reginfo</code>	See AQ\$_REG_INFO Type on page 185-11.
<code>descr</code>	See AQ\$_DESCRIPTOR Type on page 185-5
<code>payload</code>	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
<code>payload1</code>	Specifies the length of <code>payload</code> . If <code>payload</code> is null, <code>payload1 = 0</code> .

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
```

```
payload IN VARCHAR2,  
payload1 IN NUMBER);
```

Operational Notes

- [DBMS_AQ and DBMS_AQADM Java Classes](#)

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for DBMS_AQ and DBMS_AQADM. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have EXECUTE privileges on the DBMS_AQIN package to use these interfaces.

Summary of DBMS_AQ Subprograms

Table 16–5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure on page 16-9	Creates an entry for an Oracle Streams AQ agent in the LDAP directory
DEQUEUE Procedure on page 16-10	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function on page 16-13	Dequeues an array of messages from the specified queue
ENQUEUE Procedure on page 16-15	Adds a message to the specified queue
ENQUEUE_ARRAY Function on page 16-17	Adds an array of messages to the specified queue
LISTEN Procedures on page 16-18	Listen to one or more queues on behalf of a list of agents
POST Procedure on page 16-20	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure on page 16-21	Registers for message notifications
UNBIND_AGENT Procedure on page 16-22	Removes an entry for an Oracle Streams AQ agent from the LDAP directory
UNREGISTER Procedure on page 16-23	Unregisters a subscription which turns off notification

Note: DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.

BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT (
  agent          IN SYS.AQ$_AGENT,
  certificate    IN VARCHAR2 default NULL);
```

Parameters

Table 16–6 *BIND_AGENT Procedure Parameters*

Parameter	Description
agent	Agent that is to be registered in LDAP server.
certificate	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute <code>usercertificate</code>) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a <code>OrganizationalPerson</code> OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
  queue_name          IN      VARCHAR2,
  dequeue_options     IN      dequeue_options_t,
  message_properties  OUT     message_properties_t,
  payload             OUT     "<ADT_1>"
  msgid              OUT     RAW);
```

Parameters

Table 16–7 DEQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue.
dequeue_options	See DEQUEUE_OPTIONS_T Type on page 185-15.
message_properties	See MESSAGE_PROPERTIES_T Type on page 185-22.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of <i>type_name</i> refer to Type Name on page 16-4.
msgid	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless `msgid` is specified.
- `correlation`

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.
- `deq_condition`

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note: It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See [DEQUEUE_OPTIONS_T Type](#) on page 185-15 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE_AQ_AGENT Procedure](#) on page 17-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE_DB_ACCESS Procedure](#) on page 17-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
  queue_name           IN   VARCHAR2,
  dequeue_options     IN   dequeue_options_t,
  array_size          IN   pls_integer,
  message_properties_array OUT message_properties_array_t,
  payload_array       OUT   "<COLLECTION_1>",
  msgid_array         OUT   msgid_array_t,
  error_array         OUT   error_array_t)
RETURN pls_integer;
```

Parameters

Table 16–8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 185-26.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 185-27.
error_array	Currently not implemented

Usage Notes

A nonzero wait time, as specified in `dequeue_options`, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the `DEQUEUE_ARRAY` function will dequeue up to `array_size` messages and return immediately.

Dequeue by `message_id` is not supported. See [DEQUEUE Procedure](#) on page 16-10 for more information on the `navigation` parameter. Existing `NAVIGATION` modes are supported. In addition, two new `NAVIGATION` modes are supported for queues enabled for message grouping:

- `FIRST_MESSAGE_MULTI_GROUP`
- `NEXT_MESSAGE_MULTI_GROUP`

See Also: [ENQUEUE_OPTIONS_T Type](#) on page 185-18

For transaction grouped queues and `ONE_GROUP` navigation, messages are dequeued from a single transaction group only, subject to the `array_size` limit. In `MULTI_GROUP` navigation, messages are dequeued across multiple transaction groups, still subject to the `array_size` limit. `ORA-25235` is returned to indicate the end of a transaction group.

`DEQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
  queue_name          IN      VARCHAR2,
  enqueue_options    IN      enqueue_options_t,
  message_properties IN      message_properties_t,
  payload             IN      "<ADT_1>",
  msgid              OUT     RAW);
```

Parameters

Table 16–9 ENQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 185-18.
message_properties	See MESSAGE_PROPERTIES_T Type on page 185-22.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of <i>type_name</i> refer to Type Name on page 16-4.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

Note: The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See [MESSAGE_PROPERTIES_T Type](#) on page 185-22 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE_AQ_AGENT Procedure](#) on page 17-22.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE_DB_ACCESS Procedure](#) on page 17-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
    queue_name          IN   VARCHAR2,
    enqueue_options    IN   enqueue_options_t,
    array_size          IN   pls_integer,
    message_properties_array IN message_properties_array_t,
    payload_array       IN   "<COLLECTION_1>",
    msgid_array         OUT  msgid_array_t,
    error_array         OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 16–10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 185-18.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate <code>array_size</code> elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 185-26.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, <code>VARRAY</code> , or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 185-27.
error_array	Currently not implemented

Usage Notes

`ENQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
  agent_list      IN    AQ$_AGENT_LIST_T,
  wait            IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
  agent           OUT   SYS.AQ$_AGENT);
```

```
DBMS_AQ.LISTEN (
  agent_list      IN    AQ$_AGENT_LIST_T,
  wait            IN    BINARY_INTEGER DEFAULT FOREVER,
  listen_delivery_mode IN PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
  agent           OUT   SYS.AQ$_AGENT,
  message_delivery_mode OUT PLS_INTEGER);
```

```
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 16–11 LISTEN Procedure Parameters

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the `LISTEN` call is only an indication that there is a message for one of the listed agents in one of the specified queues. The interested agent must still dequeue the relevant message.

Note: You cannot call `LISTEN` on nonpersistent queues.

POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (  
  post_list      IN SYS.AQ$_POST_INFO_LIST,  
  post_count     IN NUMBER);
```

Parameters

Table 16–12 *POST Procedure Parameters*

Parameter	Description
post_list	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ\$_POST_INFO_LIST Type.
post_count	Specifies the number of entries in the post_list.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
  reg_list      IN SYS.AQ$_REG_INFO_LIST,
  count         IN NUMBER);
```

Parameters

Table 16–13 REGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ\$_REG_INFO Type .
count	Specifies the number of entries in the reg_list.

Usage Notes

This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.

If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also: [Chapter 18, "DBMS_AQELM"](#) for more information on e-mail and HTTP notifications

UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT (  
    agent      IN SYS.AQ$AGENT);
```

Parameters

Table 16–14 *UNBIND_AGENT Procedure Parameters*

Parameter	Description
agent	Agent that is to be removed from the LDAP server

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (  
  reg_list      IN  SYS.AQ$_REG_INFO_LIST,  
  reg_count     IN  NUMBER);
```

Parameters

Table 16–15 UNREGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ\$_REG_INFO Type .
reg_count	Specifies the number of entries in the reg_list.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

Using DBMS_AQADM

This section contains the following topics.

- [Constants](#)

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 17-1 *Enumerated Types in the Administrative Interface*

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the [DBMS_AQ](#) package.

Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

- [Queue Table Subprograms](#) on page 17-5
- [Privilege Subprograms](#) on page 17-6
- [Queue Subprograms](#) on page 17-7
- [Subscriber Subprograms](#) on page 17-8
- [Notification Subprograms](#) on page 17-9
- [Propagation Subprograms](#) on page 17-10
- [Oracle Streams AQ Agent Subprograms](#) on page 17-11
- [Alias Subprograms](#) on page 17-12

Queue Table Subprograms

Table 17–2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure on page 17-20	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure on page 17-26	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure on page 17-34	Drops an existing queue table
ENABLE_JMS_TYPES Procedure on page 17-36	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure on page 17-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 17-42	Purges messages from queue tables

Privilege Subprograms

Table 17–3 Privilege Subprograms

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure on page 17-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 17-40	Grants Oracle Streams AQ system privileges to users and roles
REVOKE_QUEUE_PRIVILEGE Procedure on page 17-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 17-47	Revokes Oracle Streams AQ system privileges from users and roles

Queue Subprograms

Table 17–4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure on page 17-19	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure on page 17-23	Creates a nonpersistent RAW queue
CREATE_QUEUE Procedure on page 17-24	Creates a queue in the specified queue table
DROP_QUEUE Procedure on page 17-33	Drops an existing queue
QUEUE_SUBSCRIBERS Function on page 17-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type <code>DBMS_AQADM.AQ\$_subscriber_list_t</code>
START_QUEUE Procedure on page 17-51	Enables the specified queue for enqueueing or dequeuing
STOP_QUEUE Procedure on page 17-52	Disables enqueueing or dequeuing on the specified queue

Subscriber Subprograms

Table 17–5 *Subscriber Subprograms*

Subprograms	Description
ADD_SUBSCRIBER Procedure on page 17-16	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure on page 17-21	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure on page 17-45	Removes a default subscriber from a queue

Notification Subprograms

Table 17–6 Notification Subprograms

Subprograms	Description
GET_WATERMARK Procedure on page 17-38	Retrieves the value of watermark set by the SET_WATERMARK Procedure
SET_WATERMARK Procedure on page 17-50	Used for Oracle Streams AQ notification to specify and limit memory use

Propagation Subprograms

Table 17–7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure on page 17-18	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure on page 17-31	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 17-37	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure on page 17-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure on page 17-53	Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 17-54	Verifies that the source and destination queues have identical types

Oracle Streams AQ Agent Subprograms

Table 17–8 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure on page 17-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
CREATE_AQ_AGENT Procedure on page 17-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
DISABLE_DB_ACCESS Procedure on page 17-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DROP_AQ_AGENT Procedure on page 17-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
ENABLE_DB_ACCESS Procedure on page 17-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user

Alias Subprograms

Table 17–9 *Alias Subprograms*

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 17-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure on page 17-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

Summary of DBMS_AQADM Subprograms

Table 17–10 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 17-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure on page 17-16	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure on page 17-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
ALTER_PROPAGATION_SCHEDULE Procedure on page 17-18	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure on page 17-19	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure on page 17-20	Alters the existing properties of a queue table
ALTER_SUBSCRIBER Procedure on page 17-21	Alters existing properties of a subscriber to a specified queue
CREATE_AQ_AGENT Procedure on page 17-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
CREATE_NP_QUEUE Procedure on page 17-23	Creates a nonpersistent RAW queue
CREATE_QUEUE Procedure on page 17-24	Creates a queue in the specified queue table
CREATE_QUEUE_TABLE Procedure on page 17-26	Creates a queue table for messages of a predefined type
DEL_ALIAS_FROM_LDAP Procedure on page 17-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure on page 17-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DISABLE_PROPAGATION_SCHEDULE Procedure on page 17-31	Disables a propagation schedule
DROP_AQ_AGENT Procedure on page 17-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
DROP_QUEUE Procedure on page 17-33	Drops an existing queue
DROP_QUEUE_TABLE Procedure on page 17-34	Drops an existing queue table
ENABLE_DB_ACCESS Procedure on page 17-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user
ENABLE_JMS_TYPES Procedure on page 17-36	A precondition for the enqueue of JMS types and XML types

Table 17-10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
ENABLE_PROPAGATION_SCHEDULE Procedure on page 17-37	Enables a previously disabled propagation schedule
GET_WATERMARK Procedure on page 17-38	Retrieves the value of watermark set by the SET_WATERMARK Procedure
GRANT_QUEUE_PRIVILEGE Procedure on page 17-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 17-40	Grants Oracle Streams AQ system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure on page 17-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 17-42	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function on page 17-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type <code>DBMS_AQADM.AQ\$_subscriber_list_t</code>
REMOVE_SUBSCRIBER Procedure on page 17-45	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure on page 17-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 17-47	Revokes Oracle Streams AQ system privileges from users and roles
SCHEDULE_PROPAGATION Procedure on page 17-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_WATERMARK Procedure on page 17-50	Used for Oracle Streams AQ notification to specify and limit memory use
START_QUEUE Procedure on page 17-51	Enables the specified queue for enqueueing or dequeuing
STOP_QUEUE Procedure on page 17-52	Disables enqueueing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure on page 17-53	Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 17-54	Verifies that the source and destination queues have identical types

ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(  
    alias          IN VARCHAR2,  
    obj_location  IN VARCHAR2);
```

Parameters

Table 17–11 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
alias	Name of the alias. Example: west_shipping.
obj_location	The distinguished name of the object (queue, agent or connection factory) to which alias refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.

ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
  queue_name      IN   VARCHAR2,
  subscriber      IN   sys.aq$_agent,
  rule            IN   VARCHAR2 DEFAULT NULL,
  transformation  IN   VARCHAR2 DEFAULT NULL,
  queue_to_queue  IN   BOOLEAN DEFAULT FALSE,
  delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 17–12 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are <code>priority</code> and <code>corrid</code> . To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of <code>DBMS_AQADM.PERSISTENT</code> , <code>DBMS_AQADM.BUFFERED</code> , or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by <code>ALTER_SUBSCRIBER</code> .

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule => 'PRIORITY <= 3 AND CORRID = ''FROM JAPAN'''
```

Note that these are all single quotation marks.

ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name           IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http         IN BOOLEAN DEFAULT FALSE,
  enable_smtp         IN BOOLEAN DEFAULT FALSE,
  enable_anyp         IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 17–13 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
  queue_name          IN    VARCHAR2,
  destination         IN    VARCHAR2 DEFAULT NULL,
  duration            IN    NUMBER  DEFAULT NULL,
  next_time           IN    VARCHAR2 DEFAULT NULL,
  latency             IN    NUMBER  DEFAULT 60,
  destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–14 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
    queue_name      IN      VARCHAR2,
    max_retries     IN      NUMBER   DEFAULT NULL,
    retry_delay     IN      NUMBER   DEFAULT NULL,
    retention_time  IN      NUMBER   DEFAULT NULL,
    auto_commit     IN      BOOLEAN  DEFAULT TRUE,
    comment         IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–15 ALTER_QUEUE Procedure Parameters

Parameter	Description
<code>queue_name</code>	Name of the queue that is to be altered
<code>max_retries</code>	Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31}-1$. A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code> . <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then <code>RETRY_COUNT</code> is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
<code>retry_delay</code>	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
<code>retention_time</code>	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.
<code>auto_commit</code>	TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
<code>comment</code>	User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.

ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
  queue_table      IN  VARCHAR2,
  comment          IN  VARCHAR2      DEFAULT NULL,
  primary_instance IN  BINARY_INTEGER DEFAULT NULL,
  secondary_instance IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 17–16 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
  queue_name      IN      VARCHAR2,
  subscriber      IN      sys.aq$_agent,
  rule            IN      VARCHAR2
  transformation  IN      VARCHAR2);
```

Parameters

Table 17-17 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being altered. See " AQ\$_AGENT Type " on page 185-3.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the `schema.AQ$queue_table_R` and `schema.AQ$queue_table_S` views.

CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name          IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http        IN BOOLEAN DEFAULT FALSE,
  enable_smtp        IN BOOLEAN DEFAULT FALSE,
  enable_anyp        IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 17–18 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

Usage Notes

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents.

CREATE_NP_QUEUE Procedure

Note: nonpersistent queues are deprecated in Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
  queue_name          IN          VARCHAR2,
  multiple_consumers IN          BOOLEAN DEFAULT FALSE,
  comment             IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–19 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Reference</i> .
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
comment	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ\$_MEM_SC or AQ\$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the `LISTEN` call on a nonpersistent queue.

CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
  queue_name      IN      VARCHAR2,
  queue_table     IN      VARCHAR2,
  queue_type      IN      BINARY_INTEGER DEFAULT NORMAL_QUEUE,
  max_retries     IN      NUMBER          DEFAULT NULL,
  retry_delay     IN      NUMBER          DEFAULT 0,
  retention_time  IN      NUMBER          DEFAULT 0,
  dependency_tracking IN    BOOLEAN        DEFAULT FALSE,
  comment         IN      VARCHAR2        DEFAULT NULL,
  auto_commit     IN      BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 17-20 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Reference</i> with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. <code>NORMAL_QUEUE</code> means the queue is a normal queue. This is the default. <code>EXCEPTION_QUEUE</code> means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the <code>REMOVE</code> mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31} - 1$. A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code> . <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if <code>max_retries</code> is set to 0. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. <code>INFINITE</code> means the message is retained forever. <code>NUMBER</code> is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 17-20 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
  queue_table           IN      VARCHAR2,
  queue_payload_type   IN      VARCHAR2,
  [storage_clause      IN      VARCHAR2          DEFAULT NULL, ]
  sort_list            IN      VARCHAR2          DEFAULT NULL,
  multiple_consumers   IN      BOOLEAN          DEFAULT FALSE,
  message_grouping     IN      BINARY_INTEGER   DEFAULT NONE,
  comment              IN      VARCHAR2          DEFAULT NULL,
  auto_commit          IN      BOOLEAN          DEFAULT TRUE,
  primary_instance     IN      BINARY_INTEGER   DEFAULT 0,
  secondary_instance   IN      BINARY_INTEGER   DEFAULT 0,
  compatible           IN      VARCHAR2          DEFAULT NULL,
  secure               IN      BOOLEAN          DEFAULT FALSE);
```

Parameters

Table 17–21 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name on page 16-4 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITTRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See <i>Oracle Database SQL Reference</i> for the usage of these parameters.

Table 17-21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
sort_list	<p>The columns to be used as the sort key in ascending order. This parameter has the following format:</p> <p><i>'sort_column_1, sort_column_2'</i></p> <p>The allowed column names are <i>priority</i> and <i>enq_time</i>. If both columns are specified, then <i>sort_column_1</i> defines the most significant order.</p> <p>After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.</p> <p>If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.</p> <p>Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its <i>msgid</i> or <i>correlation.msgid</i>, <i>correlation</i>, and <i>sequence_deviation</i> take precedence over the default dequeuing order, if they are specified.</p>
multiple_consumers	<p>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</p>
message_grouping	<p>Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</p>
comment	<p>User-specified description of the queue table. This user comment is added to the queue catalog.</p>
auto_commit	<p>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.</p> <p>Note: This parameter has been deprecated.</p>
primary_instance	<p>The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance.</p> <p>The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.</p>
secondary_instance	<p>The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.</p>
compatible	<p>The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.</p>

Table 17-21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
<code>secure</code>	This parameter must be set to <code>TRUE</code> if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$queue_table_name`, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- `aq$_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$_queue_table_name_s`, a table for storing information about the subscribers
- `aq$_queue_table_name_r`, a table for storing information about rules on subscriptions

`aq$_queue_table_name_h`, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8i release 8.1.5 or later. See the *Oracle Streams Advanced Queuing User's Guide and Reference* for more information.

The default value of the `compatible` parameter depends on the database compatibility mode in the `init.ora`. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(  
    alias IN VARCHAR2);
```

Parameters

Table 17–22 DEL_ALIAS_FROM_LDAP Procedure Parameters

Parameter	Description
alias	The alias to be removed.

DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (  
  agent_name          IN VARCHAR2,  
  db_username         IN VARCHAR2)
```

Parameters

Table 17–23 *DISABLE_DB_ACCESS Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the [ENABLE_DB_ACCESS Procedure](#).

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
    queue_name          IN  VARCHAR2,
    destination         IN  VARCHAR2 DEFAULT NULL,
    destination_queue   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17-24 *DISABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code>

DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
    agent_name          IN VARCHAR2)
```

Parameters

Table 17–25 *DROP_AQ_AGENT Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent

DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
  queue_name      IN    VARCHAR2,
  auto_commit     IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17–26 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueueing and dequeuing. All the queue data is deleted as part of the drop operation.

DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
  queue_table      IN   VARCHAR2,
  force            IN   BOOLEAN DEFAULT FALSE,
  auto_commit      IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17-27 DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name          IN VARCHAR2,
  db_username         IN VARCHAR2)
```

Parameters

Table 17–28 *ENABLE_DB_ACCESS Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the [CREATE_AQ_AGENT Procedure](#).

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.

ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams Sys.Anydata queues unless you call this procedure after DBMS_STREAMS_ADM.SET_UP_QUEUE. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (  
    queue_table IN VARCHAR2);
```

Parameters

Table 17–29 *ENABLE_JMS_TYPES Procedure Parameters*

Parameter	Description
queue_table	Specifies name of the queue table to be enabled for JMS and XML types.

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
    queue_name          IN   VARCHAR2,
    destination         IN   VARCHAR2 DEFAULT NULL,
    destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 17-30 *ENABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

Syntax

```
DBMS_AQADM.GET_WATERMARK (  
    wmvalue    OUT    NUMBER);
```

Parameters

Table 17–31 GET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
  privilege      IN   VARCHAR2,
  queue_name     IN   VARCHAR2,
  grantee        IN   VARCHAR2,
  grant_option   IN   BOOLEAN := FALSE);
```

Parameters

Table 17–32 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are `ENQUEUE_ANY`, `DEQUEUE_ANY`, and `MANAGE_ANY`. Initially, only `SYS` and `SYSTEM` can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
  privilege      IN   VARCHAR2,
  grantee        IN   VARCHAR2,
  admin_option   IN   BOOLEAN := FALSE);
```

Parameters

Table 17-33 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
<code>privilege</code>	The Oracle Streams AQ system privilege to grant. The options are <code>ENQUEUE_ANY</code> , <code>DEQUEUE_ANY</code> , and <code>MANAGE_ANY</code> . <code>ENQUEUE_ANY</code> means users granted this privilege are allowed to enqueue messages to any queues in the database. <code>DEQUEUE_ANY</code> means users granted this privilege are allowed to dequeue messages from any queues in the database. <code>MANAGE_ANY</code> means users granted this privilege are allowed to run <code>DBMS_AQADM</code> calls on any schemas in the database.
<code>grantee</code>	Grantee(s). The grantee(s) can be a user, a role, or the <code>PUBLIC</code> role.
<code>admin_option</code>	Specifies if the system privilege is granted with the <code>ADMIN</code> option or not. If the privilege is granted with the <code>ADMIN</code> option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is <code>FALSE</code> .

MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
    queue_table IN VARCHAR2,  
    compatible  IN VARCHAR2);
```

Parameters

Table 17–34 *MIGRATE_QUEUE_TABLE Procedure Parameters*

Parameter	Description
queue_table	Specifies name of the queue table to be migrated.
compatible	Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.

PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE (
  queue_table      IN  VARCHAR2,
  purge_condition  IN  VARCHAR2,
  purge_options    IN  aq$_purge_options_t);
```

where type `aq$_purge_options_t` is described in [Chapter 185, "Oracle Streams AQ TYPES"](#).

Parameters

Table 17–35 *PURGE_QUEUE_TABLE Procedure Parameters*

Parameter	Description
<code>queue_table</code>	Specifies the name of the queue table to be purged.
<code>purge_condition</code>	<p>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL <code>WHERE</code> clause, and it is case-sensitive. The condition is based on the columns of <code>aq\$queue_table_name</code> view.</p> <p>When specifying the <code>purge_condition</code>, qualify the column names in <code>aq\$queue_table_name</code> view with <code>qtview</code>.</p> <p>To purge all queues in a queue table, set <code>purge_condition</code> to either <code>NULL</code> (a bare null word, no quotes) or <code>' '</code> (two single quotes).</p>
<code>purge_options</code>	<p>Type <code>aq\$_purge_options_t</code> contains a <code>block</code> parameter and a <code>delivery_mode</code> parameter.</p> <ul style="list-style-type: none"> ■ If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>. The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. ■ <code>delivery_mode</code> is used to specify whether <code>DBMS_AQADM.PERSISTENT</code>, <code>DBMS_AQADM.BUFFERED</code> or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You can purge selected messages from the queue table by specifying a `purge_condition`. [Table 17–35](#) describes these parameters. Messages can be enqueued and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$queue_table_name_S` view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
    queue_name          IN          VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 17–36 *QUEUE_SUBSCRIBERS Function Parameters*

Parameter	Description
queue_name	Specifies the queue whose subscribers are to be printed.

REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (  
    queue_name      IN      VARCHAR2,  
    subscriber      IN      sys.aq$_agent);
```

Parameters

Table 17-37 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ\$_AGENT Type on page 185-3.

REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (  
  privilege      IN      VARCHAR2,  
  queue_name     IN      VARCHAR2,  
  grantee        IN      VARCHAR2);
```

Parameters

Table 17-38 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
  privilege      IN  VARCHAR2,
  grantee        IN  VARCHAR2);
```

Parameters

Table 17–39 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
  queue_name          IN   VARCHAR2,
  destination         IN   VARCHAR2 DEFAULT NULL,
  start_time         IN   DATE      DEFAULT SYSDATE,
  duration            IN   NUMBER   DEFAULT NULL,
  next_time          IN   VARCHAR2 DEFAULT NULL,
  latency            IN   NUMBER   DEFAULT 60,
  destination_queue  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–40 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

SET_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (  
    wmvalue      IN      NUMBER);
```

Parameters

Table 17–41 *SET_WATERMARK Procedure Parameter*

Parameter	Description
wmvalue	Watermark value in megabytes.

START_QUEUE Procedure

This procedure enables the specified queue for enqueueing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
  queue_name      IN      VARCHAR2,
  enqueue         IN      BOOLEAN DEFAULT TRUE,
  dequeue         IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17-42 *START_QUEUE Procedure Parameters*

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use `START_QUEUE` to enable the queue. The default is to enable it for both `ENQUEUE` and `DEQUEUE`. Only `dequeue` operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

STOP_QUEUE Procedure

This procedure disables enqueueing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
  queue_name      IN   VARCHAR2,
  enqueue         IN   BOOLEAN DEFAULT TRUE,
  dequeue         IN   BOOLEAN DEFAULT TRUE,
  wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17–43 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
  queue_name      IN  VARCHAR2,
  destination     IN  VARCHAR2 DEFAULT NULL
  destination_queue IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–44 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
    src_queue_name    IN    VARCHAR2,
    dest_queue_name   IN    VARCHAR2,
    destination       IN    VARCHAR2 DEFAULT NULL,
    rc                OUT   BINARY_INTEGER);
```

Parameters

Table 17-45 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
<code>src_queue_name</code>	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
<code>dest_queue_name</code>	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
<code>destination</code>	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
<code>rc</code>	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in <code>rc</code> .

The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

See Also: *Oracle Streams Advanced Queuing User's Guide and Reference* for detailed information about DBMS_AQELM

This chapter contains the following topic:

- [Summary of DBMS_AQELM Subprograms](#)

Summary of DBMS_AQELM Subprograms

Table 18–1 *DBMS_ALERT Package Subprograms*

Subprogram	Description
SET_MAILHOST Procedure on page 18-3	Sets the host name for the SMTP server that the database will use to send out e-mail notifications
SET_MAILPORT Procedure on page 18-4	Sets the port number for the SMTP server
SET_SENDFROM Procedure on page 18-5	Sets the sent-from e-mail address

SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (  
    mailhost IN VARCHAR2);
```

Parameters

Table 18–2 *SET_MAILHOST Procedure Parameters*

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (  
    mailport IN NUMBER);
```

Parameters

Table 18–3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (  
    sendfrom IN VARCHAR2);
```

Parameters

Table 18–4 *SET_SENDFROM Procedure Parameters*

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

See Also: *Oracle Streams Advanced Queuing User's Guide and Reference* for detailed information about DBMS_AQIN

This chapter contains the following topic:

- [Using DBMS_AQIN](#)
 - Over view

Using DBMS_AQIN

This section contains topics which relate to using the DBMS_AQIN package.

- [Overview](#)

Overview

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINISTRATOR_ROLE.

DBMS_CAPTURE_ADM

The DBMS_CAPTURE_ADM package, one of a set of Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topic:

- [Summary of DBMS_CAPTURE_ADM Subprograms](#)

Summary of DBMS_CAPTURE_ADM Subprograms

Table 20–1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure on page 20-3	Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SCHEMA_INSTANTIATION Procedure on page 20-4	Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures
ABORT_TABLE_INSTANTIATION Procedure on page 20-5	Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure
ALTER_CAPTURE Procedure on page 20-6	Alters a capture process
BUILD Procedure on page 20-11	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure on page 20-12	Creates a capture process
DROP_CAPTURE Procedure on page 20-17	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure on page 20-19	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process
PREPARE_GLOBAL_INSTANTIATION Procedure on page 20-21	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure on page 20-22	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_TABLE_INSTANTIATION Procedure on page 20-23	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure on page 20-24	Sets a capture process parameter to the specified value
START_CAPTURE Procedure on page 20-26	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure on page 20-27	Stops the capture process from mining redo logs

Note: All subprograms commit unless specified otherwise.

ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION();
```

ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SCHEMA_INSTANTIATION` procedure. It also reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the `PREPARE_SCHEMA_INSTANTIATION` procedure
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(  
    schema_name IN VARCHAR2);
```

Parameter

Table 20–2 *ABORT_SCHEMA_INSTANTIATION Procedure Parameter*

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation

ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(  
    table_name IN VARCHAR2);
```

Parameter

Table 20–3 *ABORT_TABLE_INSTANTIATION Procedure Parameter*

Parameter	Description
table_name	The name of the table for which to abort the effects of preparing instantiation, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.

ALTER_CAPTURE Procedure

This procedure alters a capture process.

See Also: *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE (
  capture_name          IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  start_scn             IN  NUMBER    DEFAULT NULL,
  use_database_link    IN  BOOLEAN   DEFAULT NULL,
  first_scn             IN  NUMBER    DEFAULT NULL,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE,
  capture_user         IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN NUMBER  DEFAULT NULL);
```

Parameters

Table 20–4 ALTER_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [<i>schema_name</i>.] <i>rule_set_name</i>. For example, to specify a positive rule set in the HR schema named <i>job_capture_rules</i>, enter <i>hr.job_capture_rules</i>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <i>DBMS_STREAMS_ADM</i> package or the <i>DBMS_RULE_ADM</i> package.</p> <p>If you specify NULL and the <i>remove_rule_set</i> parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the <i>remove_rule_set</i> parameter is set to TRUE, then the procedure removes any existing positive rule set.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a capture process</p>

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_rule_set	<p>If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.</p> <p>If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.</p> <p>If FALSE, then the procedure retains the positive rule set for the specified capture process.</p> <p>If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</p>
start_scn	<p>A valid SCN for the database from which the capture process should start capturing changes. The SCN value specified must be greater than or equal to the first SCN for the capture process. An error is returned if an invalid SCN is specified.</p>
use_database_link	<p>If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.</p> <p>If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.</p> <p>If NULL, then the current value of this parameter for the capture process is not changed.</p>

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
<code>first_scn</code>	<p>Specifies the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:</p> <ul style="list-style-type: none"> ■ It must be greater than the current first SCN for the capture process. ■ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. ■ It must be less than or equal to the required checkpoint SCN for the capture process. <p>An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 20-10 for information about determining an SCN value that meets all of these conditions.</p> <p>When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN.</p> <p>Also, if the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [<i>schema_name.</i>] <i>rule_set_name</i>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p>

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
<code>remove_negative_rule_set</code>	<p>If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.</p> <p>If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>If FALSE, then the procedure retains the negative rule set for the specified capture process.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
<code>capture_user</code>	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted DBA role. Only the SYS user can set the <code>capture_user</code> to SYS.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, make sure the capture user has the following privileges:</p> <ul style="list-style-type: none"> ■ EXECUTE privilege on the rule sets used by the capture process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process <p>These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>By default, this parameter is set to the user who created the capture process by running either the CREATE_CAPTURE procedure in this package or one of the following procedures in the DBMS_STREAMS_ADM package with the <code>streams_type</code> parameter set to capture:</p> <pre>ADD_GLOBAL_RULES ADD_SCHEMA_RULES ADD_TABLE_RULES ADD_SUBSET_RULES</pre> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the <code>capture_user</code> setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.</p>

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
<code>checkpoint_retention_time</code>	<p>Either the number of days that a capture process should retain checkpoints before purging them automatically, or <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically. If <code>NULL</code>, then the checkpoint retention time is not changed.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about checkpoint retention time</p>

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the `first_scn` parameter. The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```

Also, a capture process is stopped and restarted automatically when you change the value of one or more of the following `ALTER_CAPTURE` procedure parameters:

- `start_scn`
- `capture_user`

BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the OUT parameter `first_scn`, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(  
    first_scn OUT NUMBER);
```

```
DBMS_CAPTURE_ADM.BUILD();
```

Parameters

Table 20–5 *BUILD Procedure Parameter*

Parameter	Description
<code>first_scn</code>	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

You can run this procedure multiple times at a source database.

If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.

After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Concepts and Administration* for more information about creating a capture process
- [Chapter 92, "DBMS_RULE_ADM"](#) for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
  queue_name          IN  VARCHAR2,
  capture_name       IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2  DEFAULT NULL,
  start_scn          IN  NUMBER    DEFAULT NULL,
  source_database    IN  VARCHAR2  DEFAULT NULL,
  use_database_link  IN  BOOLEAN   DEFAULT FALSE,
  first_scn          IN  NUMBER    DEFAULT NULL,
  logfile_assignment IN  VARCHAR2  DEFAULT 'implicit',
  negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
  capture_user       IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN NUMBER    DEFAULT 60);
```

Parameters

Table 20–6 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [<i>schema_name</i> .] <i>queue_name</i> . For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. Note: The queue_name setting cannot be altered after the capture process is created.
capture_name	The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. Note: The capture_name setting cannot be altered after the capture process is created.

Table 20–6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the hr schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a capture process</p>
start_scn	<p>A valid SCN for the database from which the capture process should start capturing changes. If the specified value is lower than the current SCN of the source database, then either the <code>first_scn</code> should be specified, or the SCN value specified for <code>start_scn</code> must be greater than or equal to the first SCN of an existing capture process which has taken at least one checkpoint.</p> <p>If <code>start_scn</code> is <code>NULL</code> and no value is specified for the <code>first_scn</code> parameter, then the current SCN of the database is used as start SCN. If <code>start_scn</code> is <code>NULL</code> and a non-<code>NULL</code> value is specified for the <code>first_scn</code> parameter, then the <code>first_scn</code> value is used.</p> <p>If a value is specified for both <code>start_scn</code> and <code>first_scn</code>, then the <code>start_scn</code> value must be greater than or equal to the <code>first_scn</code> value.</p> <p>An error is returned if an invalid SCN is specified.</p>
source_database	<p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>If <code>NULL</code>, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for <code>use_database_link</code> and <code>first_scn</code> can be specified.</p>

Table 20–6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
use_database_link	<p>If <code>TRUE</code>, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. The capture process uses the database link to prepare database objects for instantiation at the source database and run the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure at the source database, if necessary.</p> <p>If <code>FALSE</code>, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:</p> <ul style="list-style-type: none"> ■ Run the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. ■ Prepare source database objects for instantiation.
first_scn	<p>Specifies the lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure has been run at least once at the source database.</p> <p>You can query the <code>FIRST_CHANGE#</code> column of the <code>V\$ARCHIVED_LOG</code> dynamic performance view where the <code>DICTIONARY_BEGIN</code> column is <code>YES</code> to determine whether the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure has been run on a source database. Any of the values returned by such a query can be used as a <code>first_scn</code> value if the redo log containing that SCN value is still available.</p>
logfile_assignment	<p>If <code>implicit</code>, the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database.</p> <p>If <code>explicit</code>, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the <code>FOR logminer_session_name</code> clause when the redo log file is added manually to the downstream database. If <code>explicit</code>, then redo transport services cannot be used to add redo log files to the capture process being created.</p> <p>If you specify <code>explicit</code> for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log.</p> <p>See Also: "Usage Notes" on page 20-16 for information about adding redo log files manually</p>

Table 20–6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
negative_rule_set_name	<p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p>
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the user who runs the <code>CREATE_CAPTURE</code> procedure is used.</p> <p>Only a user who is granted <code>DBA</code> role can set a capture user. Only the <code>SYS</code> user can set the <code>capture_user</code> to <code>SYS</code>.</p> <p>Note: If the specified user is dropped using <code>DROP USER . . . CASCADE</code>, then the <code>capture_user</code> setting for the capture process is set to <code>NULL</code> automatically. You must specify a capture user before the capture process can run.</p>
checkpoint_retention_time	<p>Either the number of days that a capture process should retain checkpoints before purging them automatically, or <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the <code>SCN</code> value corresponding to the first change in the next archived redo log file.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about checkpoint retention time</p>

Usage Notes

The user who invokes this procedure must be granted DBA role.

The `capture_user` parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, make sure the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process

These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, make sure you consider security implications when you configure a capture process.
 - Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.
-
-

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
    file_name FOR capture_process;
```

Here, `file_name` is the name of the redo log file being added and `capture_process` is the name of the capture process that will use the redo log file at the downstream database. The `capture_process` is equivalent to the `logminer_session_name` and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the `DBMS_FILE_TRANSFER` package, FTP, or some other transfer method.

See Also: *Oracle Database SQL Reference* for more information about the `ALTER DATABASE` statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

DROP_CAPTURE Procedure

This procedure drops a capture process.

Note: A capture process must be stopped before it can be dropped.

See Also: "[STOP_CAPTURE Procedure](#)" on page 20-27

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20-7 DROP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Streams client. Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES

- DBA_STREAMS_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Streams data dictionary views

INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE (
  capture_name    IN  VARCHAR2,
  attribute_name  IN  VARCHAR2,
  include         IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 20–8 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Specify an existing capture process name. Do not specify an owner.
attribute_name	<p>The name of the attribute to be included in or excluded from LCRs captured by the capture process. The following names are valid settings:</p> <ul style="list-style-type: none"> ▪ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. ▪ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ▪ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ▪ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in a Real Application Clusters environment. The type is NUMBER. ▪ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ▪ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	<p>If TRUE, then the specified attribute is included in LCRs captured by the capture process</p> <p>If FALSE, then the specified attribute is excluded from LCRs captured by the capture process</p>

Usage Notes

The redo log contains information about each change made to a database, and some of this information is not captured by a capture process unless you use this procedure to instruct a capture process to capture it. This procedure enables you to specify extra

information in the redo log that a capture process should capture. If you want to exclude an extra attribute that is being captured by a capture process, then specify the attribute and specify `FALSE` for the `include` parameter.

PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
    supplemental_logging IN VARCHAR2 DEFAULT 'keys');
```

Parameter

Table 20–9 *PREPARE_GLOBAL_INSTANTIATION Procedure Parameter*

Parameter	Description
supplemental_logging	<p>Either none, keys, or all.</p> <p>If none is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If keys is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying keys does not enable supplemental logging of bitmap join index columns.</p> <p>If all is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, and user-defined type.</p>

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
  schema_name          IN VARCHAR2,
  supplemental_logging IN VARCHAR2 DEFAULT 'keys');
```

Parameters

Table 20–10 *PREPARE_SCHEMA_INSTANTIATION Procedure Parameters*

Parameter	Description
schema_name	The name of the schema. For example, hr.
supplemental_logging	<p>Either none, keys, or all.</p> <p>If none is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If keys is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying keys does not enable supplemental logging of bitmap join index columns.</p> <p>If all is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, and user-defined type.</p>

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table.

This procedure records the lowest SCN of the table for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name          IN  VARCHAR2,
    supplemental_logging IN  VARCHAR2 DEFAULT 'keys');
```

Parameters

Table 20–11 *PREPARE_TABLE_INSTANTIATION Procedure Parameters*

Parameter	Description
table_name	The name of the table specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.
supplemental_logging	<p>Either <i>none</i>, <i>keys</i>, or <i>all</i>.</p> <p>If <i>none</i> is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.</p> <p>If <i>keys</i> is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying <i>keys</i> does not enable supplemental logging of bitmap join index columns.</p> <p>If <i>all</i> is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, and user-defined type.</p>

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER (
  capture_name IN VARCHAR2,
  parameter    IN VARCHAR2,
  value        IN VARCHAR2);
```

Parameters

Table 20–12 SET_PARAMETER Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner.
parameter	The name of the parameter you are setting. See " Capture Process Parameters " on page 20-24 for a list of these parameters.
value	The value to which the parameter is set

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 20–13 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the capture process is disabled because it reached a value specified by the <code>time_limit</code> parameter or <code>message_limit</code> parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit.
downstream_real_time_mine	Y or N	Y for local capture processes N for downstream capture processes	If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement <code>ALTER SYSTEM ARCHIVE LOG CURRENT</code> to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See <i>Oracle Streams Concepts and Administration</i> for information about creating a real-time downstream capture process. If N, then the capture process is an archived-log downstream capture process. This parameter is ignored for local capture processes.
maximum_scn	A valid SCN or infinite	infinite	The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If <code>infinite</code> , then the capture process runs regardless of the SCN value.

Table 20–13 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
message_limit	A positive integer or infinite	infinite	The capture process stops after capturing the specified number of messages. If <i>infinite</i> , then the capture process continues to run regardless of the number of messages captured.
parallelism	A positive integer	1	The number of parallel execution servers that can concurrently mine the redo log Setting the <i>parallelism</i> parameter to a number higher than the number of available parallel execution servers might disable the capture process. Make sure the <i>PROCESSES</i> and <i>PARALLEL_MAX_SERVERS</i> initialization parameters are set appropriately when you set the <i>parallelism</i> capture process parameter. Note: When you change the value of this parameter, the capture process is stopped and restarted automatically.
startup_seconds	0, a positive integer, or infinite	0	The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If <i>infinite</i> , then the capture process does not start until another instantiation of the same capture process finishes.
time_limit	A positive integer or infinite	infinite	The capture process stops as soon as possible after the specified number of seconds since it started. If <i>infinite</i> , then the capture process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
write_alert_log	Y or N	Y	If <i>Y</i> , then the capture process writes a message to the alert log on exit. If <i>N</i> , then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify *infinite* for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by `c`.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of a capture process.

See Also: [Chapter 106, "DBMS_STREAMS_ADM"](#)

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(  
    capture_name IN VARCHAR2);
```

Parameters

Table 20–14 *START_CAPTURE Procedure Parameter*

Parameter	Description
<code>capture_name</code>	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A <code>NULL</code> setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup. A capture process (`cnnn`) is an Oracle background process.

STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

The stop status is persistently recorded. Hence, if the status is `DISABLED`, then the capture process is not started upon database instance startup.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the stop status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
  capture_name IN VARCHAR2,
  force        IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 20–15 STOP_CAPTURE Procedure Parameters

Parameter	Description
<code>capture_name</code>	The name of the capture process. A <code>NULL</code> setting is not allowed. Do not specify an owner.
<code>force</code>	This parameter is reserved for future use. Currently, valid <code>BOOLEAN</code> settings are ignored.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the capture process is not started upon database instance startup. A capture process (*cnnn*) is an Oracle background process.

DBMS_CDC_PUBLISH

The `DBMS_CDC_PUBLISH` package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one **publisher** who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the `DBMS_CDC_SUBSCRIBE` package.

Note: In previous releases, this package was named `DBMS_LOGMNR_CDC_PUBLISH`. Beginning with Oracle Database 10g, the `LOGMNR` string has been removed from the name, resulting in the name `DBMS_CDC_PUBLISH`. Although both variants of the name are still supported, the variant with the `LOGMNR` string has been deprecated and may not be supported in a future release.

See Also: *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture

This chapter contains the following topics:

- [Using DBMS_CDC_PUBLISH](#)
 - Overview
 - Deprecated Subprograms
 - Security Model
 - Views
- [Summary of DBMS_CDC_PUBLISH Subprograms](#)

Using DBMS_CDC_PUBLISH

This section contains the following topics, which relate to using the DBMS_CDC_PUBLISH package:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Views](#)

Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

See Also: [Chapter 22, "DBMS_CDC_SUBSCRIBE"](#) for information on the package used to subscribe to published change data

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10g:

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION` with a subscription handle
When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.
- `DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW`
Dropping a subscriber view is now performed automatically by Change Data Capture.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_CDC_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in *Oracle Database Data Warehousing Guide* for details.

Views

The `DBMS_CDC_PUBLISH` package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_PUBLISH Subprograms

Table 21–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

Table 21–1 DBMS_CDC_PUBLISH Package Subprograms

Subprogram	Mode	Description
ALTER_AUTOLOG_CHANGE_SOURCE Procedure on page 21-8	Asynchronous AutoLog	Changes one or more properties of an existing AutoLog change source
ALTER_CHANGE_SET Procedure on page 21-10	All	Changes one or more of the properties of an existing change set
ALTER_CHANGE_TABLE Procedure on page 21-13	All	Adds or drops columns for an existing change table, or changes the properties of an existing change table
ALTER_HOTLOG_CHANGE_SOURCE Procedure on page 21-15	Asynchronous Distributed HotLog	Changes one or more properties of an existing Distributed HotLog change source
CREATE_AUTOLOG_CHANGE_SOURCE Procedure on page 21-17	Asynchronous AutoLog	Creates an AutoLog change source
CREATE_CHANGE_SET Procedure on page 21-19	All	Creates a change set
CREATE_CHANGE_TABLE Procedure on page 21-22	All	Creates a change table in a specified schema
CREATE_HOTLOG_CHANGE_SOURCE Procedure on page 21-26	Asynchronous Distributed HotLog	Creates a Distributed HotLog change source
DROP_CHANGE_SET Procedure on page 21-28	All	Drops an existing change set
DROP_CHANGE_SOURCE Procedure on page 21-29	Asynchronous Autolog and Asynchronous Distributed Hotlog	Drops an existing AutoLog or Distributed HotLog change source
DROP_CHANGE_TABLE Procedure on page 21-30	All	Drops an existing change table
DROP_SUBSCRIPTION Procedure on page 21-31	All	Allows a publisher to drop a subscription that was created by a subscriber
PURGE Procedure on page 21-32	All	Removes unneeded rows from all change tables in the staging database
PURGE_CHANGE_SET Procedure on page 21-33	All	Removes unneeded rows from all change tables in a specified change set
PURGE_CHANGE_TABLE Procedure on page 21-34	All	Removes unneeded rows from a specified change table

ALTER_AUTOLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description IN CHAR DEFAULT 'N',
    first_scn          IN NUMBER DEFAULT NULL);
```

Parameters

Table 21–2 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
first_scn	New first SCN.

Exceptions

Table 21–3 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31455	Nothing to ALTER
ORA-31497	Invalid value specified for first_scn
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31501	Specified change source is not an AutoLog change source
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

See Also: The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

ALTER_CHANGE_SET Procedure

This procedure changes the properties of an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_SET (
  change_set_name      IN VARCHAR2,
  description           IN VARCHAR2 DEFAULT NULL,
  remove_description   IN CHAR DEFAULT 'N',
  enable_capture       IN CHAR DEFAULT NULL,
  recover_after_error  IN CHAR DEFAULT NULL,
  remove_ddl           IN CHAR DEFAULT NULL,
  stop_on_ddl         IN CHAR DEFAULT NULL);
```

Parameters

Table 21–4 ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
description	New description of the change set. Specify using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_capture	A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled and cannot be disabled. Asynchronous change sets are created with change data capture disabled.
recover_after_error	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.
remove_ddl	A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.

Table 21–4 (Cont.) ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
stop_on_ddl	<p>A value of 'Y' or 'N'.</p> <p>If the value is 'Y', then Change Data Capture stops when a DDL event is detected.</p> <p>If the value is 'N', then Change Data Capture continues when a DDL event is detected.</p> <p>See the Usage Notes for additional information about this parameter.</p>

Exceptions

Table 21–5 ALTER_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31455	Invalid lock handle while acquiring lock
ORA-31468	Cannot process DDL change record
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31485	Invalid database link
ORA-31498	The <code>description</code> and <code>remove_description</code> parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, `SYNC_SET`, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: `enable_capture`, `recover_after_error`, `remove_ddl`, and `stop_on_ddl`.
- Properties supplied to this procedure with a `NULL` value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the `stop_on_ddl` parameter is as follows:
 - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity

to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

- * ANALYZE TABLE
- * LOCK TABLE
- * GRANT privileges to access a table
- * REVOKE privileges to access a table
- * COMMENT on a table
- * COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying 'Y' for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:
 - The `stop_on_ddl` parameter is set to 'Y' and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify 'Y' for the `remove_ddl` parameter.
 - The `stop_on_ddl` parameter is set to 'N' and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
 - A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table *string.string* partition *string* by *string* in tablespace *string*).

See Also: *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.

ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE (
    owner                IN VARCHAR2,
    change_table_name    IN VARCHAR2,
    operation            IN VARCHAR2,
    column_list         IN VARCHAR2,
    rs_id               IN CHAR,
    row_id              IN CHAR,
    user_id             IN CHAR,
    timestamp           IN CHAR,
    object_id           IN CHAR,
    source_colmap       IN CHAR,
    target_colmap       IN CHAR);
```

Parameters

Table 21–6 ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	The schema that owns the change table.
change_table_name	The change table that is being altered. Change table names follow the Oracle schema object naming rules.
operation	Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.
column_list	User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.
rs_id	Each listed parameter specifies a particular control column, as follows: <ul style="list-style-type: none"> ■ The rs_id parameter specifies the RSID\$ control column. ■ The row_id parameter specifies the ROW_ID\$ control column. ■ The user_id parameter specifies the USERNAME\$ control column. ■ The timestamp parameter specifies the TIMESTAMP\$ control column. ■ The object_id parameter specifies the SYS_NC_OID\$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP\$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP\$ control column.
row_id	
user_id	
timestamp	
object_id	
source_colmap	
target_colmap	
	Each parameter must have a value of either 'Y' or 'N', where: <ul style="list-style-type: none"> ■ 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter. ■ 'N': Neither adds the specified control column, nor drops it from the change table.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns.

Exceptions

Table 21–7 ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31403	Specified change table already contains the specified column
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column <i>control-column-name</i>
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31423	Specified change table does not contain the specified column
ORA-31454	Invalid value specified for operation parameter, expecting ADD or DROP
ORA-31455	Nothing to alter
ORA-31456	Error executing a procedure in the DBMS_CDC_UTILITY package
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER_CHANGE_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

See Also: *Oracle Database Data Warehousing Guide* for information about the impact on subscriptions when a publisher adds a column to a change table.

ALTER_HOTLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE (
    change_source_name  IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description  IN CHAR DEFAULT 'N',
    enable_source       IN CHAR DEFAULT NULL);
```

Parameters

Table 21–8 ALTER_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_source	A value of 'Y' or 'N'. If the value is 'Y', then the change source is enabled. If the value is 'N', then the change source is disabled.

Exceptions

Table 21–9 ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Change source is not an existing change source
ORA-31455	Nothing to ALTER
ORA-31480	Staging database and source database cannot be the same
ORA-31481	Change source is not a HotLog change source
ORA-31482	Invalid option for non-distributed HotLog change source
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Parameter value longer than maximum length
ORA-31532	Cannot enable change source

Table 21–9 (Cont.) ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, `HOTLOG_SOURCE`, which cannot be altered.

CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    source_database    IN VARCHAR2,
    first_scn          IN NUMBER,
    online_log         IN CHAR DEFAULT 'N');
```

Parameters

Table 21–10 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source. Change source names follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	Global name of the change source's source database instance.
first_scn	The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.
online_log	A value of 'Y' or 'N'. If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with <code>online_log='Y'</code> on a given staging database. If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with <code>online_log='N'</code> on a given staging database.

Exceptions

Table 21–11 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source specified
ORA-31497	Invalid value specified for <code>first_scn</code>
ORA-31499	Null value specified for required parameter
ORA-31507	Specified parameter value is longer than the maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31535	Cannot support change source in this configuration

Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the `source_database` parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the `GLOBAL_NAME` column in the `GLOBAL_NAME` view at the source database for the `source_database` parameter value.
- The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The `CREATE_AUTOLOG_CHANGE_SOURCE first_scn` parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the `first_scn` parameter using either of the following methods:

- Direct `DBMS_CAPTURE_ADM.BUILD` to return the value when the dictionary is built:

```
SET SERVEROUTPUT ON
VARIABLE FSCN NUMBER;
BEGIN
  :FSCN := 0;
  DBMS_CAPTURE_ADM.BUILD(:FSCN);
  DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
END;
/
The first_scn value is 207722
```

- Make the following query on the source database. If this query returns multiple distinct values for `first_change#`, then the data dictionary has been extracted more than once and the publisher should choose the `first_change#` value that is the most appropriate to the change source.

```
SELECT DISTINCT FIRST_CHANGE#, NAME
FROM V$ARCHIVED_LOG
WHERE DICTIONARY_BEGIN = 'YES';
```

See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

See Also: *Oracle Database Data Warehousing Guide* for information about supplemental logging.

CREATE_CHANGE_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET (
    change_set_name      IN VARCHAR2,
    description          IN VARCHAR2 DEFAULT NULL,
    change_source_name  IN VARCHAR2,
    stop_on_ddl         IN CHAR DEFAULT 'N',
    begin_date          IN DATE DEFAULT NULL,
    end_date            IN DATE DEFAULT NULL);
```

Parameters

Table 21–12 CREATE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set. Change set names follow the Oracle schema object naming rules.
description	Description of the change set. Specify using 255 or fewer characters.
change_source_name	Name of the existing change source to contain this change set.
stop_on_ddl	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.
begin_date	Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.
end_date	Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.

Exceptions

Table 21–13 CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31407	The end_date must be greater than the begin_date
ORA-31408	Invalid value specified for begin_scn or end_scn
ORA-31437	Duplicate change set specified
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31483	Cannot have spaces in the parameter
ORA-31485	Invalid database link

Table 21–13 (Cont.) CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31487	Cannot support begin dates or end dates in this configuration
ORA-31488	Cannot support change set in this configuration
ORA-31499	Null value specified for required parameter
ORA-31503	Invalid date supplied for <code>begin_date</code> or <code>end_date</code>
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: `begin_date`, `end_date`, and `stop_on_ddl`. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: `begin_date` and `end_date`.
- When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the `CHANGE_PROPAGATION` and `CHANGE_PROPAGATION_SETS` views on the staging database.
- An AutoLog online change source (created with `online_log='Y'`) can only contain one change set.
- The `begin_date` and `end_date` parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
 - When a `begin_date` is specified, changes from transactions that begin on or after that date are captured.
 - When a `begin_date` is not specified, capture starts with the earliest available change data.
 - When an `end_date` is specified, changes from transactions that are committed on or before that date are captured.
 - When an `end_date` is not specified, Change Data Capture continues indefinitely.
- The effect of the `stop_on_ddl` parameter is as follows:
 - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

 - * ANALYZE TABLE
 - * LOCK TABLE
 - * GRANT privileges to access a table

- * REVOKE privileges to access a table
- * COMMENT on a table
- * COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

Note: Oracle recommends that the publisher be certain that the source table that will be referenced in a `CREATE_CHANGE_TABLE` procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the `stop_on_ddl` parameter set to 'Y'.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE (
  owner                IN VARCHAR2,
  change_table_name   IN VARCHAR2,
  change_set_name     IN VARCHAR2,
  source_schema       IN VARCHAR2,
  source_table        IN VARCHAR2,
  column_type_list    IN VARCHAR2,
  capture_values      IN VARCHAR2,
  rs_id               IN CHAR,
  row_id              IN CHAR,
  user_id             IN CHAR,
  timestamp           IN CHAR,
  object_id           IN CHAR,
  source_colmap       IN CHAR,
  target_colmap       IN CHAR,
  options_string      IN VARCHAR2);
```

Parameters

Table 21–14 *CREATE_CHANGE_TABLE Procedure Parameters*

Parameter	Description
<code>owner</code>	Name of the schema that owns the change table.
<code>change_table_name</code>	Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.
<code>change_set_name</code>	Name of the change set in which this change table resides.
<code>source_schema</code>	The schema where the source table is located.
<code>source_table</code>	The source table from which the change records are captured.
<code>column_type_list</code>	The user columns and datatypes that are being tracked. Specify using a comma-delimited list.
<code>capture_values</code>	One of the following capture values for update operations: <ul style="list-style-type: none"> ▪ <code>OLD</code>: Captures the original values from the source table. ▪ <code>NEW</code>: Captures the changed values from the source table. ▪ <code>BOTH</code>: Captures the original and changed values from the source table.

Table 21–14 (Cont.) CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description	
rs_id	<p>Each listed parameter specifies a particular control column as follows:</p> <ul style="list-style-type: none"> ■ The rs_id parameter specifies the RSID\$ control column. ■ The row_id parameter specifies the ROW_ID\$ control column. ■ The user_id parameter specifies the USERNAME\$ control column. ■ The timestamp parameter specifies the TIMESTAMP\$ control column. ■ The object_id parameter specifies the SYS_NC_OID\$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP\$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP\$ control column. <p>Each parameter can have a value of 'Y' or 'N', where:</p> <ul style="list-style-type: none"> ■ 'Y': Adds the specified control column to the change table. ■ 'N': Does not add the specified control column to the change table. 	
row_id		
user_id		
timestamp		
object_id		
source_colmap		
target_colmap		
options_string		The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns

Exceptions

Table 21–15 CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31402	Unrecognized parameter specified
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column <i>control-column-name</i>
ORA-31418	Specified source schema does not exist
ORA-31419	Specified source table does not exist
ORA-31420	Unable to submit the purge job
ORA-31421	Change table does not exist
ORA-31422	Owner schema does not exist
ORA-31438	Duplicate change table
ORA-31447	Cannot create change tables in the SYS schema
ORA-31450	Invalid value for change_table_name

Table 21–15 (Cont.) CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31451	Invalid value for <code>capture_values</code> , expecting: OLD, NEW, or BOTH
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31467	No column found in the source table
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
- A change table is a database table that contains two types of columns:
 - User columns, which are copies of actual columns of source tables that reside in the change table.
 - Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.
- If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher's Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher's database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.
- The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.
- When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the `source_colmap` and `object_id` parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify 'N' for the `row_id` and `username` parameters when the change source is 9.2 or 10.1.
- When the publisher specifies the `rs_id` parameter, the `RSID$` column is added to the change table. The `RSID$` column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the `RSID$` column value by itself to order committed operations across transactions; it must be used in conjunction with the `CSCN$` column value.
- The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the `options_string` parameter. With the

`options_string` parameter, the publisher can set any option that is valid for the `CREATE TABLE` DDL statement (except for partitioning properties).

Note: How the publisher defines the `options_string` parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses `NOT NULL` constraints and a particular column is not changed in an incoming change row, then the constraint can cause the `INSERT` operation to fail and the transaction that contains the `INSERT` operation to be rolled back.

- Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system tablespace or if the publisher specifies a tablespace in the `options_string` parameter. If a tablespace is not specified by the publisher, and the publisher's default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

See Also: *Oracle Database Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.

CREATE_HOTLOG_CHANGE_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE (
    change_source_name    IN VARCHAR2,
    description           IN VARCHAR2 DEFAULT NULL,
    source_database       IN VARCHAR2);
```

Parameters

Table 21–16 CREATE_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameters	Description
change_source_name	Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	The name of the database link defined from the staging database to the source database, where the source database is Oracle9i Database, Database 10g Release 1, or Oracle Database 10gRelease 2. See <i>Oracle Database Data Warehousing Guide</i> for information on creating database links for the Distributed HotLog mode of Change Data Capture.

Exceptions

Table 21–17 CREATE_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source
ORA-31480	Staging database and source database cannot be the same
ORA-31483	Cannot have spaces in the parameter
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31507	Parameter value longer than the maximum length
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the predefined change source, `HOTLOG_SOURCE`, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.
- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.
- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
 - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
 - Inserts a row into the CHANGE_SOURCES view on the staging database where the SOURCE_TYPE column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.
- Note that the database link indicated by the `source_database` parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.

DROP_CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SET (
    change_set_name    IN VARCHAR2);
```

Parameters

Table 21–18 DROP_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 21–19 DROP_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31411	Specified change set is referenced by a change table
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value is longer than maximum length

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.

DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE_HOTLOG_CHANGE_SOURCE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE (
    change_source_name    IN VARCHAR2);
```

Parameters

Table 21–20 DROP_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.

Exceptions

Table 21–21 DROP_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31406	Specified change source is referenced by a change set
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.

DROP_CHANGE_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE (
    owner          IN VARCHAR2,
    change_table_name IN VARCHAR2,
    force_flag     IN CHAR);
```

Parameters

Table 21–22 DROP_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.
force_flag	Drops the change table, depending on whether or not there are subscriptions to it, as follows: <ul style="list-style-type: none"> ▪ 'Y': Drops the change table even if there are subscriptions to it. ▪ 'N': Drops the change table only if there are no subscriptions to it.

Exceptions

Table 21–23 DROP_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31424	Change table has active subscriptions
ORA-31441	Table is not a change table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP_CHANGE_TABLE procedure using the force_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.

DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the `DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION` procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
    subscription_name IN VARCHAR2);
```

Parameters

Table 21–24 *DROP_SUBSCRIPTION Procedure Parameters*

Parameter	Description
subscription_name	Name of the subscription that was specified by a previous call to the <code>DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION</code> procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 21–25 *DROP_SUBSCRIPTION Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31432	Invalid source table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure and the publisher need not use the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure.

PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

Syntax

```
DBMS_CDC_PUBLISH.PURGE;
```

Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
 - The publisher can run this procedure manually from the command line to purge data from change tables.
 - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET (
  change_set_name IN VARCHAR2);
```

Parameters

Table 21–26 *PURGE_CHANGE_SET Procedure Parameters*

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 21–27 *PURGE_CHANGE_SET Procedure Exceptions*

Exception	Description
ORA-31410	Change set is not an existing change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE (
    owner          IN VARCHAR2,
    change_table_name IN VARCHAR2);
```

Parameters

Table 21–28 PURGE_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the named change table.
change_table_name	Name of an existing change table. Change table names follow the Oracle schema object naming rules.

Exceptions

Table 21–29 PURGE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

DBMS_CDC_SUBSCRIBE

The DBMS_CDC_SUBSCRIBE package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The **subscribers** (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

Note: In previous releases, this package was named DBMS_LOGMNR_CDC_SUBSCRIBE. Beginning with Oracle Database 10g, the LOGMNR string has been removed from the name, resulting in the name DBMS_CDC_SUBSCRIBE. Although both variants of the name are still supported, the variant with the LOGMNR string has been deprecated and may not be supported in a future release.

See Also: *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

- [Using DBMS_CDC_SUBSCRIBE](#)
 - Overview
 - Deprecated Subprograms
 - Security Model
 - Views
- [Summary of DBMS_CDC_SUBSCRIBE Subprograms](#)

Using DBMS_CDC_SUBSCRIBE

This section contains the following topics, which relate to using the DBMS_CDC_SUBSCRIBE package:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Views](#)

Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

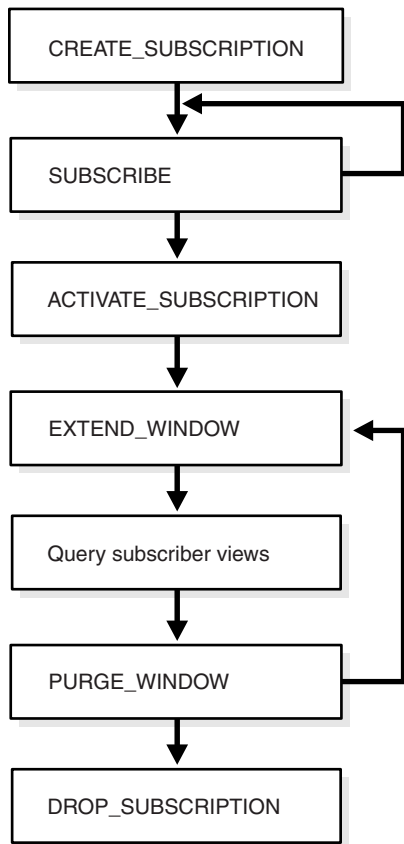

1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL `SELECT` statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 22-1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS_CDC_SUBSCRIBE package (which are listed in Table 22-1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

Note: If a subscriber uses the `PURGE_WINDOW` procedure immediately after using an `EXTEND_WINDOW` procedure, then change data may be lost without ever being processed.

See Also: [Chapter 21, "DBMS_CDC_PUBLISH"](#) for information on the package for publishing change data.

Figure 22-1 Subscription Flow

Deprecated Subprograms

Note: Oracle Corporation recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10g:

- `DROP_SUBSCRIBER_VIEW`
Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.
- `GET_SUBSCRIPTION_HANDLE`
Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.
- `PREPARE_SUBSCRIBER_VIEW`
Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

Changes in Behavior

If an existing application uses these deprecated `DBMS_CDC_SUBSCRIBE` subprograms with Oracle Database 10g, note the following changes in behavior:

- Subscriber views are persistent for the life of the subscription.
- Some error conditions, particularly with regard to subscriber view management, no longer occur.
- If a publisher alters a publication such that it contains different control columns, the subscriber must call `DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW` to see the new column structure.

Deprecated Parameters

The use of the `subscription_handle` parameter with the following `DBMS_CDC_SUBSCRIBE` procedures has been deprecated beginning with Oracle Database 10g:

- `SUBSCRIBE`
- `ACTIVATE_SUBSCRIPTION`
- `EXTEND_WINDOW`
- `PURGE_WINDOW`
- `DROP_SUBSCRIPTION`

Security Model

Change Data Capture grants EXECUTE privileges to PUBLIC on the DBMS_CDC_
SUBSCRIBE package.

Views

The DBMS_CDC_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_SUBSCRIBE Subprograms

Table 22–1 DBMS_CDC_SUBSCRIBE Package Subprograms

Subprogram	Description
ACTIVATE_SUBSCRIPTION Procedure on page 22-9	Indicates that a subscription is ready to start accessing change data
CREATE_SUBSCRIPTION Procedure on page 22-10	Creates a subscription and associates it with one change set
DROP_SUBSCRIPTION Procedure on page 22-12	Drops a subscription that was created with a prior call to the <code>CREATE_SUBSCRIPTION</code> procedure
EXTEND_WINDOW Procedure on page 22-13	Sets a subscription window high boundary so that new change data can be seen
PURGE_WINDOW Procedure on page 22-14	Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data
SUBSCRIBE Procedure on page 22-15	Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table

ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
    subscription_name IN VARCHAR2);
```

Parameters

Table 22–2 *ACTIVATE_SUBSCRIPTION Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–3 *ACTIVATE_SUBSCRIPTION Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
 - No additional source tables can be added to the subscription.
 - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
 - The subscriber must use the EXTEND_WINDOW procedure to see the initial set of change data.
 - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end_date parameter value.

CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated `GET_SUBSCRIPTION_HANDLE` procedure.

Syntax

```
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (
    change_set_name      IN  VARCHAR2,
    description          IN  VARCHAR2,
    subscription_name    IN  VARCHAR2);
```

Parameters

Table 22–4 CREATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
<code>change_set_name</code>	The name of an existing change set to which the subscriber subscribes
<code>description</code>	A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.
<code>subscription_name</code>	A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of <code>CDC\$</code> . Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–5 CREATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31449	Invalid value for <code>change_set_name</code>
ORA-31457	Maximum length of description field exceeded
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31506	Duplicate subscription name specified
ORA-31510	Name uses reserved prefix <code>CDC\$</code>
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The `CREATE_SUBSCRIPTION` procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.

- Subscriptions cannot be created if the underlying change set has reached its end_date parameter value.

DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (  
    subscription_name IN VARCHAR2);
```

Parameters

Table 22–6 *DROP_SUBSCRIPTION Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–7 *DROP_SUBSCRIPTION Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.

EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (
    subscription_name IN VARCHAR2);
```

Parameters

Table 22–8 *EXTEND_WINDOW Procedure Parameters*

Parameter	Description
subscription_name	The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–9 *EXTEND_WINDOW Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31509	Publication does not exist
ORA-31514	Change set disabled due to capture error

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
 - The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
 - Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.
- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the EXTEND_WINDOW procedure will not raise the high boundary.

PURGE_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
    subscription_name IN VARCHAR2);
```

Parameters

Table 22–10 *PURGE_WINDOW Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–11 *PURGE_WINDOW Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
 - Informs Change Data Capture that the subscriber is finished with the current set of change data.
 - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.

- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the PURGE_WINDOW procedure will not move the low boundary.

SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table

When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified `source_table` and `column_list`. If such a publication cannot be found, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
    subscription_name    IN VARCHAR2,
    source_schema        IN VARCHAR2,
    source_table         IN VARCHAR2,
    column_list          IN VARCHAR2,
    subscriber_view      IN VARCHAR2);
```

- Using publication IDs

When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the `column_list` parameter are not in the identified change table, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
    subscription_name    IN VARCHAR2,
    publication_id       IN NUMBER,
    column_list          IN VARCHAR2,
    subscriber_view      IN VARCHAR2);
```

Parameters

Table 22–12 SUBSCRIBE Procedure Parameters

Parameter	Description
<code>subscription_name</code>	The name of a subscription that was specified for, or returned by, a previous call to the <code>CREATE_SUBSCRIPTION</code> procedure. Subscription names follow the Oracle schema object naming rules.
<code>source_schema</code>	The name of the schema where the source table resides
<code>source_table</code>	The name of a published source table
<code>column_list</code>	A comma-delimited list of columns from the published source table or publication
<code>subscriber_view</code>	Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of <code>CDC\$</code> . Subscriber view names follow the Oracle schema object naming rules.
<code>publication_id</code>	A valid <code>publication_id</code> , which the subscriber can obtain from the <code>ALL_PUBLISHED_COLUMNS</code> view.

Exceptions

Table 22–13 *SUBSCRIBE Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31427	Specified source table already subscribed
ORA-31428	No publication contains all the specified columns
ORA-31432	Invalid source table
ORA-31466	No publications found
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31510	Name uses reserved prefix CDC\$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The `SUBSCRIBE` procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the `SUBSCRIBE` procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the `SUBSCRIBE` procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the `SUBSCRIBE` procedure using the `source_schema` and `source_table` parameters or using the `publication_id` parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the `SUBSCRIBE` procedure using the `publication_id` parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the `ALL_PUBLISHED_COLUMNS` view.
- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the `SUBSCRIBE` procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the `SUBSCRIBE` procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.

DBMS_CHANGE_NOTIFICATION

The `DBMS_CHANGE_NOTIFICATION` package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

See Also: *Oracle Database Application Developer's Guide - Fundamentals* regarding implementing database change notification.

This chapter contains the following topics:

- [Using DBMS_CHANGE_NOTIFICATION](#)
 - Overview
 - Security Model
 - Constants
 - Operational Notes
 - Examples
- [Data Structures](#)
 - OBJECT Types
- [Summary of DBMS_CHANGE_NOTIFICATION Subprograms](#)

Using DBMS_CHANGE_NOTIFICATION

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Examples](#)

Overview

The `DBMS_CHANGE_NOTIFICATION` package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. When a transaction changes any of the objects associated with the registered queries and `COMMITs`, this invokes the PL/SQL callback specified during registration. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a `BEGIN-END` block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the `BEGIN` phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by `ENDING` the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

Security Model

The `DBMS_CHANGE_NOTIFICATION` package requires that the user have the `CHANGE_NOTIFICATION` system privilege in order to receive notifications, and be granted `EXECUTE` privilege on the `DBMS_CHANGE_NOTIFICATION` package.

In addition the user is required to have `SELECT` privileges on all objects to be registered. Note that if the `SELECT` privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

Constants

The DBMS_CHANGE_NOTIFICATION package uses the constants shown in [Table 23–1](#). The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CHANGE_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDS describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 23–1 DBMS_CHANGE_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running RAC
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows

Operational Notes

- The notifications are published by the database when a transaction changes the registered objects and `COMMITs`.
- All objects referenced in the queries executed inside the registration block starting from the previous `NEW_REG_START` or `ENABLE_REG` to `REG_END` are considered interesting objects and added to the registration.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the `job_queue_processes` parameter set to a non-zero value? This parameter needs to be configured to a non-zero value in order to receive PL/SQL notifications via the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you `COMMITting` the transaction? Please note that the notifications are transactional and will be generated when the transaction `COMMITs`.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the `JOBQ` process that attempts to execute the procedure. The trace file would be usually named `<ORACLE_SID>_j*_<PID>.trc.`

For example, if the `ORACLE_SID` is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.

Suppose a registration is created with 'chnf_callback' as the notification handler and with `registration_id` 100. Let us suppose the user forgets to define the `chnf_callback` procedure. Then the `JOBQ` trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
Error in PLSQL notification of msgid:
Queue :
Consumer Name :
PLSQL function :chnf_callback
Exception Occured, Error msg:
ORA-00604: error occurred at recursive SQL level 2
ORA-06550: line 1, column 7:
PLS-00201: identifier 'CHNF_CALLBACK' must be declared
ORA-06550: line 1, column 7:
PL/SQL: Statement ignored
```

Examples

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CHANGE_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT / AS SYSDBA;
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CHANGE_NOTIFICATION TO hr;
```

```
Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;
```

```
CONNECT hr/hr;
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);
```

```
Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                             table_operation number);
```

```
Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                            row_id varchar2(30));
```

```
Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
    regid          NUMBER;
    tbname         VARCHAR2(60);
    event_type     NUMBER;
    numtables      NUMBER;
    operation_type NUMBER;
    numrows        NUMBER;
    row_id         VARCHAR2(20);
BEGIN
    regid          := ntfnds.registration_id;
    numtables      := ntfnds.numtables;
    event_type     := ntfnds.event_type;

    INSERT INTO nfevents VALUES(regid, event_type);
    IF (event_type = DBMS_CHANGE_NOTIFICATION.EVENT_OBJCHANGE) THEN
        FOR i IN 1..numtables LOOP
            tbname          := ntfnds.table_desc_array(i).table_name;
            operation_type := ntfnds.table_desc_array(i).Opflags;
            INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
            /* Send the table name and operation_type to client side listener using UTL_
HTTP */
            /* If interested in the rowids, obtain them as follows */
```

```

IF (bitand(operation_type, DBMS_CHANGE_NOTIFICATION.ALL_ROWS) = 0) THEN
    numRows := ntfnds.table_desc_array(i).numrows;
ELSE
    numRows :=0; /* ROWID INFO NOT AVAILABLE */
END IF;

/* The body of the loop is not executed when numRows is ZERO */
FOR j IN 1..numRows LOOP
    Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
    INSERT INTO nfrowchanges VALUES(regid, tname, Row_id);
    /* optionally Send out row_ids to client side listener using UTL_HTTP; */
END LOOP;

END LOOP;
END IF;
COMMIT;
END;
/

```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (`chnf_callback`) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```

Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
    REGDS      SYS.CHNF$_REG_INFO;
    regid      NUMBER;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    qosflags   NUMBER;
BEGIN
    qosflags := DBMS_CHANGE_NOTIFICATION.QOS_RELIABLE +
                DBMS_CHANGE_NOTIFICATION.QOS_ROWIDS;
    REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
    regid := DBMS_CHANGE_NOTIFICATION.NEW_REG_START (REGDS);
    SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
    DBMS_CHANGE_NOTIFICATION.REG_END;
END;
/

```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITTED changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

```

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;

```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nfrowchanges` tables.

```
SQL> SELECT * FROM nfevents;
```

REGID	EVENT_TYPE
20045	6

```
SQL> SELECT * FROM nftablechanges;
```

REGID	TABLE_NAME	TABLE_OPERATION
-------	------------	-----------------

```
-----
20045      HR.EMPLOYEES      4
```

```
SQL> select * from nfrowchanges;
```

```

REGID      TABLE_NAME      ROW_ID
-----
20045      HR.EMPLOYEES      AAAKB/AABAAAJ8zAAF

```

Notes

1. In the above example, a registration was created on the `EMPLOYEES` table with `'chnf_callback'` as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (`QOS_RELIABLE`) and rowid notifications (`QOS_ROWIDS`).
2. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of `EVENT_OBJCHANGE`. In all other cases (e.g. `EVENT_DEREG`, `EVENT_SHUTDOWN`), the table descriptor array should not be accessed.
3. The handler accesses the row descriptor array from the table notification descriptor only if the `ALL_ROWS` bit is not set in the table operation flag. If the `ALL_ROWS` bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like `TRUNCATE` that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a `FULL` table invalidation.

This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1 % of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using `UTL_HTTP`. The listener could then refresh its cache by querying from the back-end database.

Data Structures

The DBMS_CHANGE_NOTIFICATION package uses the following OBJECT types.

OBJECT Types

- [SYS.CHNF\\$_DESC](#) Object Type
- [SYS.CHNF\\$_TDESC](#) Object Type
- [SYS.CHNF\\$_TDESC_ARRAY](#) Object (Array) Type
- [SYS.CHNF\\$_RDESC](#) Object Type
- [SYS.CHNF\\$_RDESC_ARRAY](#) Object (Array) Type
- [SYS.CHNF\\$_REG_INFO](#) Object Type

SYS.CHNF\$_DESC Object Type

This is the top level change notification descriptor type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
  registration_id  NUMBER,
  transaction_id   RAW(8),
  dbname           VARCHAR2(30),
  event_type       NUMBER,
  numtables        NUMBER,
  table_desc_array CHNF$_TDESC_ARRAY)
```

Attributes

Table 23–2 *SYS.CHNF\$_DESC Object Type*

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.

SYS.CHNF\$_TDESC Object Type

This object type is the table descriptor that contains an array of row descriptors.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT OF (
  opflags          NUMBER,
  table_name       VARCHAR2(64),
  numrows          NUMBER,
  row_desc_array   CHNF$_RDESC_ARRAY);
```

Attributes

Table 23–3 TYPE SYS.CHNF\$_TDESC Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) which describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEDOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

SYS.CHNF\$_TDESC_ARRAY Object (Array) Type

This object is the table descriptor type that describes the operations that occurred on a registered table.

Syntax

```
TYPE SYS.CHNF$_TDESC_ARRAY IS VARRAY (1024) OF CHNF$_TDESC;
```

SYS.CHNF\$_RDESC Object Type

This object type is the notification descriptor received as an argument of the server side PL/SQL procedure which contains the details of the invalidation. This object type describes modifications to an individual row within a changed table.

An array of CHNF\$_RDESC is embedded inside a CHNF\$_TDESC (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT OF (  
    opflags      NUMBER,  
    row_id       VARCHAR2(2000));
```

Attributes

Table 23-4 TYPE SYS.CHNF\$_RDESC Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

SYS.CHNF\$_RDESC_ARRAY Object (Array) Type

This object type corresponds to an array of row change notification descriptors and is embedded inside the table change descriptor (CHNF\$_TDESC) if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the `opflags` field of the table change descriptor.

Syntax

```
TYPE SYS.CHNF$_RDESC_ARRAY IS VARRAY (1024) OF CHNF$_RDESC;
```

SYS.CHNF\$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                VARCHAR2(20) ,
  qosflags                NUMBER,
  timeout                 NUMBER,
  operations_filter       NUMBER,
  transaction_lag         NUMBER);
```

Attributes

Table 23–5 TYPE SYS.CHNF\$_REG_INFO Object Type

Attribute	Description
callback	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is <call_backname> (ntfnds IN SYS.chnf\$_desc)
qosflags	Quality of service flags. Can be set to an OR of QOS_RELIABLE / QOS_DEREG_NFY / QOS_ROWIDS: <ul style="list-style-type: none"> ▪ 0x1 (QOS_RELIABLE): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in a RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. ▪ 0x2 (QOS_DEREG_NFY): The registration will be expunged on the first notification ▪ 0x4 (QOS_ROWIDS): The notification needs to include information about the rowids that were modified
timeout	If set to a non-zero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the <code>timeout</code> option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.

Table 23–5 (Cont.) TYPE SYS.CHNF\$_REG_INFO Object Type

Attribute	Description
operations_filter	<p>if non-zero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:</p> <ul style="list-style-type: none"> ■ 0: Notify on all operations (DBMS_CHANGE_NOTIFICATION.ALL_OPERATIONS) ■ 0x2: Notify on every INSERT (DBMS_CHANGE_NOTIFICATION.INSERTOP) ■ 0x4: Notify on every UPDATE (DBMS_CHANGE_NOTIFICATION.UPDATEOP) ■ 0x8: Notify on every DELETE (DBMS_CHANGE_NOTIFICATION.DELETEOP) <p>A combination of operations can be specified by using a bitwise OR.</p>
transaction_lag	<p>Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated</p>

Usage Notes

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

CHNF\$_DESC describes the change notification descriptor.

- The `init.ora` parameter `job_queue_processes` must be set to a non-zero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

Summary of DBMS_CHANGE_NOTIFICATION Subprograms

Table 23–6 *DBMS_CHANGE_NOTIFICATION Package Subprograms*

Subprogram	Description
DEREGISTER Procedure on page 23-19	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure on page 23-20	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function on page 23-21	Begins a new registration block
REG_END Procedure on page 23-22	Ends the registration boundary

DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CHANGE_NOTIFICATION.DEREGISTER (  
    regid IN NUMBER);
```

Parameters

Table 23–7 *DEREGISTER Procedure Parameters*

Parameter	Description
regid	Client registration ID

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.

ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). This subprogram is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the [REG_END Procedure](#).

Syntax

```
DBMS_CHANGE_NOTIFICATION.ENABLE_REG (  
    regid IN NUMBER);
```

Parameters

Table 23–8 *ENABLE_REG Procedure Parameters*

Parameter	Description
<code>regid</code>	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

```
DBMS_CHANGE_NOTIFICATION.NEW_REG_START (
    regds IN sys.chnf$_reg_info)
RETURN NUMBER;
```

Parameters

Table 23–9 NEW_REG_START Function Parameters

Parameter	Description
sys.chnf\$_reg_info	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE_NOTIFICATION system privilege and SELECT privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CHANGE_NOTIFICATION.REG_END;
```

DBMS_CRYPT provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also: *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

Using the DBMS_CRYPTO Subprograms

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Algorithms](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)

Overview

DBMS_CRYPT0 contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPT0 package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPT0. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 24–1 lists the DBMS_CRYPT0 package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLKIT.

Table 24–1 DBMS_CRYPT0 and DBMS_OBFUSCATION_TOOLKIT Feature Comparison

Package Feature	DBMS_CRYPT0	DBMS_OBFUSCATION_TOOLKIT
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY	DES, 3DES
Padding forms	PKCS5, zeroes	none supported
Block cipher chaining modes	CBC, CFB, ECB, OFB	CBC
Cryptographic hash algorithms	MD5, SHA-1, MD4	MD5
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1	none supported
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER	RAW, VARCHAR2
Database types	RAW, CLOB, BLOB	RAW, VARCHAR2

DBMS_CRYPT0 is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

Types

Parameters for the DBMS_CRYPT0 subprograms use these datatypes:

Table 24–2 *DBMS_CRYPT0 Datatypes*

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

Table 24–3 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA). Produces a 160-bit hash.

Table 24–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5 ¹	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1 ¹	Same as SHA hash function, except it requires a secret key to verify the hash value.

¹ Complies with IETF RFC 2104 standard

Table 24–5 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

Table 24–6 DBMS_CRYPTO Block Cipher Suites

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES ¹ + CHAIN_CBC ² + PAD_PKCS5 ³
DES3_CBC_PKCS5	ENCRYPT_3DES ¹ + CHAIN_CBC ² + PAD_PKCS5 ³

¹ See Table 24–5, "DBMS_CRYPTO Encryption Algorithms"

² See Table 24–7, "DBMS_CRYPTO Block Cipher Chaining Modifiers"

³ See Table 24–8, "DBMS_CRYPTO Block Cipher Padding Modifiers"

Table 24–7 DBMS_CRYPT0 Block Cipher Chaining Modifiers

Name	Description
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that <i>n</i> bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

Table 24–8 DBMS_CRYPT0 Block Cipher Padding Modifiers

Name	Description
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes.

Restrictions

The `VARCHAR2` datatype is not directly supported by `DBMS_CRYPTO`. Before you can perform cryptographic operations on data of the type `VARCHAR2`, you must convert it to the uniform database character set `AL32UTF8`, and then convert it to the `RAW` datatype. After performing these conversions, you can then encrypt it with the `DBMS_CRYPTO` package.

See Also: ["Conversion Rules"](#) on page 24-11 for information about converting datatypes.

Exceptions

Table 24–9 lists exceptions that have been defined for DBMS_CRYPT0.

Table 24–9 DBMS_CRYPT0 Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

Operational Notes

- [When to Use Encrypt and Decrypt Procedures or Functions](#)
- [When to Use Hash or Message Authentication Code \(MAC\) Functions](#)
- [About Generating and Storing Encryption Keys](#)
- [Conversion Rules](#)

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt RAW datatypes. Data of type `VARCHAR2` must be converted to RAW before you can use `DBMS_CRYPTO` functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. When she retrieves the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS_OBFUSCATION_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:

- *Oracle Database Advanced Security Administrator's Guide* for information about configuring network encryption and SSL.
- ["Key Management"](#) on page 62-5 for a full discussion about securely storing encryption keys
- ["RANDOMBYTES Function"](#) on page 24-20

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:
 1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
 2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

Syntax example:

```
UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:
 1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
 2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

Syntax example:

```
UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
```

See Also: [Chapter 170, "UTL_I18N"](#) for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```

DECLARE
    input_string      VARCHAR2 (200) := 'Secret Message';
    output_string     VARCHAR2 (200);
    encrypted_raw     RAW (2000);           -- stores encrypted binary text
    decrypted_raw     RAW (2000);         -- stores decrypted binary text
    num_key_bytes     NUMBER := 256/8;    -- key length 256 bits (32 bytes)
    key_bytes_raw     RAW (32);          -- stores 256-bit encryption key
    encryption_type   PLS_INTEGER :=      -- total encryption type
        DBMS_CRYPTO.ENCRYPT_AES256
        + DBMS_CRYPTO.CHAIN_CBC
        + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
    DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
    key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
    encrypted_raw := DBMS_CRYPTO.ENCRYPT
    (
        src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
        typ => encryption_type,
        key => key_bytes_raw
    );
    -- The encrypted value "encrypted_raw" can be used here

    decrypted_raw := DBMS_CRYPTO.DECRYPT
    (
        src => encrypted_raw,
        typ => encryption_type,
        key => key_bytes_raw
    );
    output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

    DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

Summary of DBMS_CRYPTO Subprograms

Table 24–10 DBMS_CRYPTO Package Subprograms

Subprogram	Description
DECRYPT Function on page 24-14	Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures on page 24-15	Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Function on page 24-16	Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures on page 24-17	Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV
HASH Function on page 24-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data
MAC Function on page 24-19	Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection
RANDOMBYTES Function on page 24-20	Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function on page 24-21	Returns a random BINARY_INTEGER
RANDOMNUMBER Function on page 24-22	Returns a random 128-bit integer of the NUMBER datatype

DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT (
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (decrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24–11 DECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

See Also: ["Usage Notes"](#) for the ENCRYPT function on page 24-16 for additional information about the ciphers and modifiers available with this package.
- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

See Also: ["Conversion Rules"](#) on page 24-11 for a discussion of the VARCHAR2 to RAW conversion process.

DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPT0.DECRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN          RAW          DEFAULT NULL);
```

```
DBMS_CRYPT.DECRYPT (
  dst IN OUT NOCOPY CLOB          CHARACTER SET ANY_CS,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN          RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (decrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24–12 DECRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT (
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (encrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24–13 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See [Table 24–7](#) and [Table 24–8](#) on page 24-7 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

```
DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
```

See [Table 24–6](#) on page 24-6 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

See Also: ["Conversion Rules"](#) on page 24-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPT0.ENCRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN          RAW          DEFAULT NULL);
```

```
DBMS_CRYPT0.ENCRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          CLOB          CHARACTER SET ANY_CS,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN          RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (encrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24–14 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

See "[Conversion Rules](#)" on page 24-11 for usage notes about using the ENCRYPT procedure.

HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to ["When to Use Hash or Message Authentication Code \(MAC\) Functions"](#) on page 24-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in [Table 24–3](#) on page 24-6.

Syntax

```
DBMS_CRYPTO.Hash (
    src IN RAW,
    typ IN PLS_INTEGER)
RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN BLOB,
    typ IN PLS_INTEGER)
RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (hash, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24–15 HASH Function Parameters

Parameter Name	Description
src	The source data to be hashed.
typ	The hash algorithm to be used.

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, `HASH_SH1`, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "[HASH Function](#)" on page 24-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "[When to Use Hash or Message Authentication Code \(MAC\) Functions](#)" on page 24-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See [Table 24-4](#) on page 24-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPT0.MAC (
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW)
RETURN RAW;

DBMS_CRYPT0.MAC (
    src IN BLOB,
    typ IN PLS_INTEGER
    key IN RAW)
RETURN RAW;

DBMS_CRYPT0.MAC (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER
    key IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (mac, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24-16 MAC Function Parameters

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator), and it draws its entropy (seed) from the `sqlnet.ora` file parameter `SQLNET.CRYPTO_SEED`.

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
    number_bytes IN POSITIVE)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (randombytes, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 24–17 RANDOMBYTES Function Parameter

Parameter Name	Description
<code>number_bytes</code>	The number of pseudo-random bytes to be generated.

Usage Note

- The `number_bytes` value should not exceed the maximum length of a RAW variable.
- The `SQLNET.CRYPTO_SEED` parameter can be set by entering 10 to 70 random characters with the following syntax in the `sqlnet.ora` file:

```
SQLNET.CRYPTO_SEED = <10 to 70 random characters>
```

See Also: *Oracle Database Advanced Security Administrator's Guide* for more information about the `SQLNET.CRYPTO_SEED` parameter and its use.

RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

Syntax

```
DBMS_CRYPT0.RANDOMINTEGER  
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references (randominteger, WNDS, RNDS, WNPS, RNPS);
```

RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of $[0..2^{128}-1]$.

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER  
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references (randomnumber, WNDS, RNDS, WNPS, RNPS);
```

DBMS_DATA_MINING

Oracle Data Mining (ODM) is designed for programmers, systems analysts, project managers, and others who develop data mining applications. Data mining discovers hidden patterns within the data and uses that knowledge to make predictions and summaries.

The `DBMS_DATA_MINING` package is an interface to ODM. With `DBMS_DATA_MINING`, you can build a mining model, test the model, and apply the model to your data.

See Also:

- [Chapter 26, "DBMS_DATA_MINING_TRANSFORM"](#). This package supports data pre-processing for data mining.
- [Chapter 72, "DBMS_PREDICTIVE_ANALYTICS"](#). This package automates the entire process of predictive data mining, from data preprocessing through model building to scoring new data.
- *Oracle Database SQL Reference* for information about the SQL scoring functions for data mining.
- *Oracle Data Mining Administrator's Guide* for information about sample data mining programs.
- *Oracle Data Mining Application Developer's Guide* for information about developing data mining applications in SQL and Java.

This chapter contains the following topics:

Using DBMS_DATA_MINING

This section contains topics which relate to using the DBMS_DATA_MINING package.

- [Overview](#)
- [New Functionality](#)
- [Model Names](#)
- [Constants](#)
- [Data Types](#)
- [Exceptions](#)
- [User Views](#)

Overview

Oracle Data Mining (ODM) embeds data mining functionality in the Oracle Database. The data never leaves the database — the data, its preparation, model building, and model scoring (applying) all remain in the database. This enables Oracle to provide an infrastructure for data analysts and application developers to integrate data mining seamlessly with database applications.

Oracle Data Mining Concepts

ODM supports both predictive and descriptive data mining. Predictive data mining uses an historical model to predict a target value. Descriptive data mining identifies natural groupings within a given data set.

Predictive data mining functions include:

- Classification
- Regression
- Attribute Importance

Descriptive data mining functions include:

- Clustering
- Association
- Feature Extraction

The steps you use to build and score a model depend on the data mining function and the algorithm being used. To learn more about ODM functions and algorithms, refer to *Oracle Data Mining Concepts*.

Oracle Data Mining APIs

ODM provides a graphical user interface (Oracle Data Miner), as well as application programming interfaces for SQL and Java. The SQL interface consists of PL/SQL packages and SQL functions. The Java interface is an Oracle implementation of the JDM 1.0 standard for data mining. The SQL and Java APIs are fully interoperable.

The SQL functions for data mining, new in 10g Release 2 (10.2), return the results of model scoring. These functions apply pre-existing models within the context of a SQL statement. The ODM scoring functions include: CLUSTER_ID, CLUSTER_PROBABILITY, CLUSTER_SET, FEATURE_ID, FEATURE_SET, FEATURE_VALUE, PREDICTION, PREDICTION_COST, PREDICTION_DETAILS, PREDICTION_PROBABILITY, PREDICTION_SET. The ODM scoring functions are documented in *Oracle Database SQL Reference*.

The DBMS_DATA_MINING package supports the process of building, testing, and scoring models for all ODM mining functions. Most mining data requires preprocessing before mining activities can begin. For this, you can use the DBMS_DATA_MINING_TRANSFORM package or third-party utilities. To automate the entire process of predictive data mining, use the DBMS_PREDICTIVE_ANALYTICS package.

See Also: Sample data mining programs are available with Oracle Data Mining. Instructions for using the sample programs are provided in the *Oracle Data Mining Administrator's Guide*. Additional information about the Oracle Data Mining interfaces is available in the *Oracle Data Mining Application Developer's Guide*.

New Functionality

In Oracle Database 10g Release 2, the `DBMS_DATA_MINING` package includes the following new functionality:

- Decision Tree algorithm for classification
- Orthogonal Partitioning Clustering (O-Cluster) algorithm for clustering
- One-Class Support Vector Machine, which supports Anomaly Detection
- Active learning for Support Vector Machine

For detailed information about new features in Oracle Data Mining, see *Oracle Data Mining Concepts* and *Oracle Database New Features*

Model Names

The names of ODM models must be valid schema object names. However, the naming rules for models are more restrictive than the naming rules for schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign (\$), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in *Oracle Database SQL Reference*.

Constants

Oracle Data Mining uses constants to specify the mining function, its algorithm, and other details about a model. The function, or type, of a model is specified when the model is created. Non-default characteristics of the model are specified in a settings table associated with the model.

The settings table is a user-created table with the following columns:

```
(setting_name      VARCHAR2(30),
 setting_value     VARCHAR2(128))
```

Each setting in the `setting_name` column is a constant, and many of the values that can be specified in the `setting_value` column are also constants. Numeric values are implicitly converted to `VARCHAR2`. To explicitly convert them, use the `TOCHAR` function.

See Also: *Oracle Data Mining Application Developer's Guide* for information about creating a settings table, and for default setting values and ranges.

Constants that Specify the Mining Function

Oracle Data Mining supports a number of predictive and descriptive mining functions. The mining function is specified as a parameter to the `CREATE_MODEL` procedure. See "[CREATE_MODEL Procedure](#)" on page 25-30 for more information.

The `mining_function` parameter has a `VARCHAR2(30)` data type; it can have the values listed in [Table 25-1](#).

Table 25-1 Mining Functions

Constant	Description
<code>association</code>	Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set.
<code>attribute_importance</code>	Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome.
<code>classification</code>	Classification is a predictive mining function. A classification model uses historical data to predict new discrete or categorical data. The <code>classification</code> function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).
<code>clustering</code>	Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set.
<code>feature_extraction</code>	Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model.
<code>regression</code>	Regression is a predictive mining function. A regression model uses historical data to predict new continuous, numerical data.

Constants that Specify Information About Mining Functions

Every model is based on one of the mining functions described in [Table 25–1](#). You can configure the mining function with the settings described in [Table 25–2](#).

Table 25–2 Mining Function Settings

Constant	Description
<code>algo_name</code>	Setting that specifies the algorithm used by the model. The following constants can be values for this setting:
<code>algo_adaptive_bayes_network</code>	Adaptive Bayes Network (ABN), the default algorithm for classification.
<code>algo_ai_md1</code>	Minimum Description Length (MDL) algorithm for attribute importance.
<code>algo_apriori_association_rules</code>	Apriori algorithm for association.
<code>algo_decision_tree</code>	Decision Tree (DT) algorithm for classification.
<code>algo_kmeans</code>	<i>k</i> -Means (KM), the default algorithm for clustering.
<code>algo_naive_bayes</code>	Naive Bayes (NB) algorithm for classification.
<code>algo_nonnegative_matrix_factor</code>	Non-Negative Matrix Factorization (NMF) algorithm for feature selection.
<code>algo_o_cluster</code>	O-Cluster (OC) algorithm for clustering.
<code>algo_support_vector_machines</code>	Support Vector Machine (SVM) algorithm for classification or regression. One-Class SVM, used for anomaly detection, is SVM classification with a null target.
<code>asso_max_rule_length</code>	Setting that specifies the maximum length of a rule used by an association model.
<code>asso_min_confidence</code>	Setting that specifies the minimum confidence for an association model.
<code>asso_min_support</code>	Setting that specifies the minimum support for an association model.
<code>clas_cost_table_name</code>	Setting that specifies the name of the cost matrix table for a classification model.
<code>clas_priors_table_name</code>	Setting that specifies the name of the prior probability table for NB and ABN models. Decision Tree is the only classification algorithm that does not use priors. For SVM classification models, this setting specifies the name of a table of weights.
<code>clus_num_clusters</code>	Setting that specifies the number of clusters for a clustering model.
<code>feat_num_features</code>	Setting that specifies the number of features for a feature selection model.

Constants that Specify Information About Algorithms

The algorithm used by a model is specified by the `algo_name` setting (described in [Table 25–2](#)). You can configure the algorithm with the settings described in [Table 25–3](#).

Table 25–3 Algorithm Settings

Algorithm	Constant	Description
ABN	<code>abns_max_build_minutes</code>	Setting that specifies the maximum time threshold to complete an ABN model build.
	<code>abns_max_nb_predictors</code>	Setting that specifies the maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type <code>abns_naive_bayes</code> .
	<code>abns_max_predictors</code>	Setting that specifies the maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type <code>abns_single_feature</code> or <code>abns_multi_feature</code> .
	<code>abns_model_type</code>	Setting that specifies the ABN model type. The following constants can be values for this setting:
	<code>abns_multi_feature</code>	Multifeature ABN model.
	<code>abns_naive_bayes</code>	Naive Bayes ABN model.
<code>abns_single_feature</code>	Single feature ABN model.	
DT	<code>tree_impurity_metric</code>	Setting that specifies the tree impurity metric for Decision Tree. The following constants can be values for this setting:
	<code>tree_impurity_entropy</code>	Entropy.
	<code>tree_impurity_gini</code>	Gini.
	<code>tree_term_max_depth</code>	Setting that specifies the maximum tree depth termination criteria for Decision Tree.
	<code>tree_term_minpct_node</code>	Setting name that specifies the minimum percent of records in a parent node termination criteria for Decision Tree.
	<code>tree_term_minpct_split</code>	Setting name that specifies the minimum percent of records in a parent node splitting criteria for Decision Tree.
	<code>tree_term_minrec_node</code>	Setting name that specifies the minimum number of records in a parent node termination criteria for Decision Tree.
<code>tree_term_minrec_split</code>	Setting that specifies the minimum number of records in a parent node splitting criteria for Decision Tree.	
KM	<code>kmns_block_growth</code>	Setting that specifies the growth factor for memory allocated to hold cluster data for <i>k</i> -Means.
	<code>kmns_conv_tolerance</code>	Setting that specifies the convergence tolerance for <i>k</i> -Means.
	<code>kmns_distance</code>	Setting that specifies the distance function for <i>k</i> -Means. The following constants can be values for this setting:
	<code>kmns_cosine</code>	Cosine distance function.
	<code>kmns_euclidean</code>	Euclidean distance function.
	<code>kmns_fast_cosine</code>	Fast cosine distance function.
	<code>kmns_iterations</code>	Setting that specifies the number of iterations for <i>k</i> -Means.
	<code>kmns_min_pct_attr_support</code>	Setting that specifies the minimum percentage support required for attributes in rules for <i>k</i> -Means clusters.
	<code>kmns_num_bins</code>	Setting that specifies the number of histogram bins <i>k</i> -Means.

Table 25-3 (Cont.) Algorithm Settings

Algorithm	Constant	Description
	kmns_split_criterion	Setting that specifies the split criterion for <i>k</i> -Means. The following constants can be values for this setting:
	kmns_size	Size as the split criterion.
	kmns_variance	Variance as the split criterion.
NB	nabs_pairwise_threshold	Setting that specifies pair-wise threshold for Naive Bayes.
	nabs_singleton_threshold	Setting that specifies singleton threshold for Naive Bayes.
NMF	nmfs_conv_tolerance	Setting that specifies convergence tolerance for NMF.
	nmfs_num_iterations	Setting that specifies the number of iterations for NMF.
	nmfs_random_seed	Setting that specifies the random seed for NMF.
OC	oclt_max_buffer	Setting that specifies buffer size for O-Cluster.
	oclt_sensitivity	Setting that specifies sensitivity for O-Cluster.
SVM	svms_active_learning	Setting that specifies whether active learning is enabled or disabled. The following constants can be values for this setting:
	svms_al_disable	Active learning is disabled.
	svms_al_enable	Active learning is enabled.
	svms_complexity_factor	Setting that specifies the complexity factor for SVM.
	svms_conv_tolerance	Setting that specifies tolerance for SVM.
	svms_epsilon	Setting that specifies epsilon for SVM Regression.
	svms_kernel_cache_size	Setting that specifies the Gaussian kernel cache size for SVM.
	svms_kernel_function	Setting that specifies the kernel function for SVM. The following constants can be values for this setting:
	svms_gaussian	Gaussian kernel.
	svms_linear	Linear kernel.
	svms_outlier_rate	Setting that specifies the desired rate of outliers in the training data. Valid for One-Class SVM models only.
	svms_std_dev	Setting that specifies standard deviation for SVM Gaussian kernel.

Data Types

The `DBMS_DATA_MINING` package includes a number of table functions that return algorithm-specific information about models. These functions take a model name as input and return the requested information as a collection of rows. The table functions are named `GET_n`, where `n` identifies the type of information to return. For a list of the ODM GET functions, see "[Summary of DBMS_DATA_MINING Subprograms](#)" on page 25-15.

All the GET functions use **pipelining**, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL User's Guide and Reference*.

The virtual table returned by the GET functions is an object data type. Another object data type defines the rows. Some of the columns have object data types that define nested tables.

ODM also uses object data types for handling wide data. These types, `DM_NESTED_NUMERICALS` and `DM_NESTED_CATEGORICALS` define nested tables that can be used for storing a set of mining attributes in a single column. For more information on wide data, see the *Oracle Data Mining Application Developer's Guide*.

The ODM object data types are described in [Table 25-4](#).

Table 25-4 DBMS_DATA_MINING Summary of Data Types

Data Type	Purpose
<code>DM_ABN_DETAIL</code>	Represents information about an ABN model.
<code>DM_ABN_DETAILS</code>	Represents a collection of <code>DM_ABN_DETAIL</code> . It is returned by <code>GET_MODEL_DETAILS_ABN</code> .
<code>DM_CENTROID</code>	Represents the centroid of a cluster.
<code>DM_CENTROIDS</code>	Represents a collection of <code>DM_CENTROID</code> . It is returned by <code>GET_MODEL_DETAILS_KM</code> and <code>GET_MODEL_DETAILS_OC</code> .
<code>DM_CHILD</code>	Represents a child node of a cluster.
<code>DM_CHILDREN</code>	Represents a collection of <code>DM_CHILD</code> .
<code>DM_CLUSTER</code>	Represents a cluster.
<code>DM_CLUSTERS</code>	Represents a collection of <code>DM_CLUSTER</code> . It is returned by <code>GET_MODEL_DETAILS_KM</code> and <code>GET_MODEL_DETAILS_OC</code> .
<code>DM_CONDITIONAL</code>	Represents a conditional probability associated with a mining attribute used in an NB or ABN model.
<code>DM_CONDITIONALS</code>	Represents a collection of <code>DM_CONDITIONAL</code> . It is returned by <code>GET_MODEL_DETAILS_NB</code> and <code>GET_MODEL_DETAILS_ABN</code> .
<code>DM_HISTOGRAM_BIN</code>	Represents a histogram associated with a cluster identifier.
<code>DM_HISTOGRAMS</code>	Represents a collection of <code>DM_HISTOGRAM_BIN</code> . It is returned by <code>GET_MODEL_DETAILS_KM</code> .
<code>DM_ITEMS</code>	Represents items.
<code>DM_ITEMSET</code>	Represents a collection of <code>DM_ITEMS</code> .
<code>DM_ITEMSETS</code>	Represents a collection of <code>DM_ITEMSET</code> . These are frequent sets of items in Association models.

Table 25–4 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Purpose
DM_MODEL_SETTING	Represents a setting/value combination from the settings table for the model.
DM_MODEL_SETTINGS	Represents a collection of DM_MODEL_SETTING. It is returned by GET_MODEL_SETTINGS.
DM_MODEL_SIGNATURE_ATTRIBUTE	Represents an attribute of the model signature.
DM_MODEL_SIGNATURE	Represents a collection of DM_MODEL_SIGNATURE_ATTRIBUTE. It is returned by GET_MODEL_SIGNATURE.
DM_NB_DETAIL	Represents information about an NB model.
DM_NB_DETAILS	Represents a collection of DM_NB_DETAIL. It is returned by GET_MODEL_DETAILS_NB.
DM_NESTED_CATEGORICAL	Represents a nested table of categorical attributes.
DM_NESTED_CATEGORICALS	Represents a collection of DM_NESTED_CATEGORICAL. It is used for representing wide data.
DM_NESTED_NUMERICAL	Represents a nested table of numerical attributes.
DM_NESTED_NUMERICALS	Represents a collection of DM_NESTED_NUMERICAL. It is used for representing wide data.
DM_NMF_ATTRIBUTE	Represents a mining attribute for an NMF model.
DM_NMF_ATTRIBUTE_SET	Represents a collection of DM_NMF_ATTRIBUTE. It is returned by GET_MODEL_DETAILS_NMF.
DM_NMF_FEATURE	Represents a feature in an NMF model.
DM_NMF_FEATURE_SET	Represents a collection of DM_NMF_FEATURE. It is returned by GET_MODEL_DETAILS_NMF.
DM_PREDICATE	Represents either the antecedent or the consequent of a rule.
DM_PREDICATES	Represents a collection of DM_PREDICATE.
DM_RANKED_ATTRIBUTE	Represents an entry in the set of attributes ranked by the attribute's importance.
DM_RANKED_ATTRIBUTES	Represents a collection of DM_RANKED_ATTRIBUTE. It is returned by GET_MODEL_DETAILS_AI.
DM_RULE	Represents a model rule.
DM_RULES	Represents a collection of DM_RULE. It is returned by GET_ASSOCIATION_RULES for <i>k</i> -means models, by GET_MODEL_DETAILS_KM, and by GET_MODEL_DETAILS_OC.
DM_SVM_ATTRIBUTE	Represents an attribute for an SVM model.
DM_SVM_ATTRIBUTE_SET	Represents a collection of DM_SVM_ATTRIBUTE. It is returned by GET_MODEL_DETAILS_SVM for a linear model.
DM_SVM_LINEAR_COEFF	Represents an SVM linear coefficient.
DM_SVM_LINEAR_COEFF_SET	Represents a collection of DM_SVM_LINEAR_COEFF. It is returned by GET_MODEL_DETAILS_SVM for an SVM model built using the linear kernel.

Exceptions

The following table lists the exceptions raised by DBMS_DATA_MINING.

Table 25–5 Exceptions raised by DBMS_DATA_MINING

Oracle Error	Description
ORA-40201	Invalid input parameter %s
ORA-40202	Column %s does not exist in the input table %s
ORA-40203	Model %s does not exist
ORA-40204	Model %s already exists
ORA-40205	Invalid setting name %s
ORA-40206	Invalid setting value for setting name %s
ORA-40207	Duplicate or multiple function settings
ORA-40208	Duplicate or multiple algorithm settings for function %s
ORA-40209	Setting % is invalid for % function
ORA-40211	Algorithm name %s is invalid
ORA-40212	Invalid target data type in input data for %s function
ORA-40213	Contradictory values for settings: %s, %s
ORA-40214	Duplicate setting: %s
ORA-40215	Model %s is incompatible with current operation
ORA-40216	Feature not supported
ORA-40217	Priors table mismatched with training data
ORA-40219	Apply result table %s is incompatible with current operation
ORA-40220	Maximum number of attributes exceeded
ORA-40221	Maximum target cardinality exceeded
ORA-40222	Data mining model export failed, job name=%s, error=%s
ORA-40223	Data mining model import failed, job name=%s, error=%s
ORA-40225	Model is currently in use by another process
ORA-40226	Model upgrade/downgrade must be performed by SYS
ORA-40251	No support vectors were found
ORA-40252	No target values were found
ORA-40253	No target counter examples were found
ORA-40254	Priors cannot be specified for one-class models
ORA-40261	Input data for model build contains negative values
ORA-40262	NMF: number of features not between [1, %s]
ORA-40271	No statistically significant features were found
ORA-40272	Apply rules prohibited for this model mode
ORA-40273	Invalid model type %s for Adaptive Bayes network algorithm
ORA-40281	Invalid model name
ORA-40282	Invalid cost matrix

Table 25-5 (Cont.) Exceptions raised by DBMS_DATA_MINING

Oracle Error	Description
ORA-40283	Missing cost matrix
ORA-40284	Model does not exist
ORA-40285	Label not in the model
ORA-40286	Remote operations not permitted on mining models
ORA-40287	Invalid data for model -- cosine distance out of bounds
ORA-40289	Duplicate attributes provided for data mining function
ORA-40290	Model incompatible with data mining function
ORA-40291	Model cost not available
ORA-40301	Invalid cost matrix specification
ORA-40302	Invalid classname %s in cost matrix specification
ORA-40303	Invalid prior probability specification
ORA-40304	Invalid classname %s in prior probability specification
ORA-40305	Invalid impurity metric specified
ORA-40306	Wide data not supported for decision tree model create
ORA-40321	Invalid bin number, is zero or negative value
ORA-40322	Bin number too large

User Views

[Table 25–6](#) describes the `DM_USER_MODELS` view, which provides information about the models in the user's schema.

Table 25–6 *DM_USER_MODELS*

Column	Data Type	NULL	Description
<code>name</code>	<code>VARCHAR2 (25)</code>	NOT NULL	Name of the model
<code>function_name</code>	<code>VARCHAR2 (30)</code>		The model function. See Table 25–1 .
<code>algorithm_name</code>	<code>VARCHAR2 (30)</code>		The algorithm used by the model. See Table 25–2 .
<code>creation_date</code>	<code>DATE</code>		The date on which the model was created
<code>build_duration</code>	<code>NUMBER</code>		The duration of the model build process
<code>target_attribute</code>	<code>VARCHAR2 (30)</code>		The attribute designated as the target of a classification model
<code>model_size</code>	<code>NUMBER</code>		The size of the model in megabytes

Summary of DBMS_DATA_MINING Subprograms

Table 25–7 summarizes the subprograms included in the DBMS_DATA_MINING package.

Table 25–7 DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
APPLY Procedure on page 25-17	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure on page 25-20	Computes the confusion matrix from the <code>APPLY</code> results on test data for a classification model; also provides the accuracy of the model
COMPUTE_LIFT Procedure on page 25-23	Computes lift for a given positive target value from the <code>APPLY</code> results on test data for a classification model
COMPUTE_ROC Procedure on page 25-26	Computes Receiver Operating Characteristic (ROC) for a classification model
CREATE_MODEL Procedure on page 25-30	Creates (builds) a mining model
DROP_MODEL Procedure on page 25-33	Drops a model
EXPORT_MODEL Procedure on page 25-34	Exports a model into a dump file
GET_ASSOCIATION_RULES Function on page 25-37	Returns the rules from an Association model
GET_DEFAULT_SETTINGS Function on page 25-40	Returns all the default settings for all mining functions and algorithms
GET_FREQUENT_ITEMSETS Function on page 25-41	Returns the frequent itemsets from an Association model
GET_MODEL_DETAILS_ABN Function on page 25-43	Returns the details of an Adaptive Bayes Network model
GET_MODEL_DETAILS_AI Function on page 25-45	Returns the details of an Attribute Importance model
GET_MODEL_DETAILS_KM Function on page 25-46	Returns the details of a <i>k</i> -Means model
GET_MODEL_DETAILS_NB Function on page 25-49	Returns the details of a Naive Bayes model
GET_MODEL_DETAILS_NMF Function on page 25-51	Returns the details of an NMF model
GET_MODEL_DETAILS_OC Function on page 25-52	Returns the details of an O-Cluster model
GET_MODEL_DETAILS_SVM Function on page 25-55	Returns the details of a SVM model with a linear kernel
GET_MODEL_DETAILS_XML Function on page 25-57	Returns the details of a decision tree model
GET_MODEL_SETTINGS Function on page 25-58	Returns the settings used to build a model
GET_MODEL_SIGNATURE Function on page 25-59	Returns the signature of a model

Table 25–7 (Cont.) DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
IMPORT_MODEL Procedure on page 25-60	Imports a specified model into a user schema
RANK_APPLY Procedure on page 25-63	Ranks the predictions from the APPLY results for a classification model
RENAME_MODEL Procedure on page 25-66	Renames a model

APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the APPLY results in a table. The APPLY operation is also referred to as **scoring**.

For predictive mining functions, the APPLY operation generates predictions in a target column. For descriptive mining functions such as clustering, the APPLY operation assigns each case to a cluster with a probability.

The APPLY operation is not applicable to association models and attribute importance models.

Note: You can use the ODM scoring functions as an alternative to the DBMS_DATA_MINING.APPLY procedure. These SQL functions are documented in the *Oracle Database SQL Reference*. Additional information and code samples are provided in the *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.APPLY (
    model_name           IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–8 APPLY Procedure Parameters

Parameter	Description
model_name	Name of the model
data_table_name	Name of table or view representing data to be scored
case_id_column_name	Name of the case identifier column
result_table_name	Name of the table to store apply results
data_schema_name	Name of the schema containing the data to be scored

Usage Notes

The data provided for APPLY should match the data provided to CREATE_MODEL in terms of the schema definition and relevant content. The GET_MODEL_SIGNATURE function provides this information. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must be pre-processed in the same way. The case identifier is not considered to be a mining attribute during APPLY.

You must provide the name of the table in which the results of the apply operation are to be stored. APPLY creates a table with an algorithm-specific fixed schema in the user schema that owns the model.

The behavior of an APPLY operation is analogous to a SQL query operation, even though it is packaged as a procedure. It does not update the model contents and does not have any contention with CREATE_MODEL, DROP_MODEL, or RENAME_MODEL operations. The corollary is that if you potentially drop or rename a model while a

model is being applied to scoring data, the APPLY operation may discontinue with partial or unpredictable results.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The `case_id` column will match the case identifier column name provided by you. The type of incoming `case_id` column is preserved in APPLY output.

Classification Algorithms

The table containing the APPLY results for all classification models has the same definition. For numerical targets, the results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
prediction    NUMBER
probability   NUMBER
```

For categorical targets, the results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
prediction    VARCHAR2
probability   NUMBER
```

One-Class SVM (Anomaly Detection)

The results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
prediction    NUMBER
probability   NUMBER
```

Values in the `prediction` column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression using SVM

The results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
prediction    NUMBER
```

Clustering using *k*-Means and O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
cluster_id    NUMBER
probability   NUMBER
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table will have the following columns

```
case_id      VARCHAR2/NUMBER
feature_id    NUMBER
match_quality NUMBER
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if build data was pre-processed in any manner,
 * perform the same pre-processing steps on the
 * scoring data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.APPLY(
  model_name          => 'census_model',
  data_table_name     => 'census_2d_apply',
  case_id_column_name => 'person_id',
  result_table_name   => 'census_apply_result');
END;
/

-- View Apply Results
SELECT case_id, prediction, probability
       FROM census_apply_result;
```

COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes the confusion matrix for a classification model and also provides the accuracy of the model. See *Oracle Data Mining Concepts* for a description of confusion matrix.

Before executing a COMPUTE_CONFUSION_MATRIX procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy                OUT NUMBER,
    apply_result_table_name IN VARCHAR2,
    target_table_name       IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    confusion_matrix_table_name IN VARCHAR2,
    score_column_name       IN VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
    cost_matrix_table_name  IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name IN VARCHAR2 DEFAULT NULL,
    target_schema_name      IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–9 COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
accuracy	Accuracy of the model
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing only the case identifier column and target column values (see Usage Notes)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the target table and the apply results table.
target_column_name	Name of the target column in the target table
confusion_matrix_table_name	Name of the table into which the confusion matrix is to be generated
score_column_name	Name of the column representing the score from the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.
score_criterion_column_name	Name of the column representing the ranking factor for the score from the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.

Table 25–9 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
cost_matrix_table_name	Name of the fixed-schema cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can also provide a cost matrix as an optional input in order to have the cost of predictions reflected in the results.

It is important to note that the inputs to `COMPUTE_CONFUSION_MATRIX` do not always have to be generated using `APPLY`. As long as the definition of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can produce the confusion matrix and accuracy. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to `CREATE_MODEL` in schema and relevant content. If the data provided as input to `CREATE_MODEL` has been pre-processed, then the data input to `APPLY` must also be pre-processed using the statistics from the `CREATE_MODEL` data pre-processing.

Before you use the `COMPUTE_CONFUSION_MATRIX` procedure, you must prepare two data input streams from your test data.

First, you must `APPLY` the model on your test data. Use the result table name from `APPLY` as `apply_result_table_name` in the `COMPUTE_CONFUSION_MATRIX` procedure.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. Use the name of this second table as `target_table_name`.

The definition for the second view or table name for a numerical target attribute is:

```
(case_identifier_column_name VARCHAR2/NUMBER,
target_column_name          NUMBER)
```

The definition for the second view or table name for a categorical target attribute is:

```
(case_identifier_column_name VARCHAR2/NUMBER,
target_column_name          NUMBER)
```

You must provide the name of the table in which the confusion matrix is to be generated. The resulting fixed schema table will always be created in the schema owning the model.

For numerical target attributes, the confusion matrix table will have the definition:

```
(actual_target_value    NUMBER,
predicted_target_value  NUMBER,
value                   NUMBER)
```

For categorical target attributes, the confusion matrix table will have the definition:

```
(actual_target_value    VARCHAR2,
```

```
predicted_target_value  VARCHAR2,  
value                   NUMBER)
```

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE  
  v_sql_stmt VARCHAR2(4000);  
  v_accuracy NUMBER;  
BEGIN  
  
  /* apply the model census_model on test data */  
  DBMS_DATA_MINING.APPLY(  
    model_name           => 'census_model',  
    data_table_name     => 'census_2d_test',  
    case_id_column_name => 'person_id',  
    result_table_name   => 'census_test_result');  
  CREATE VIEW census_2d_test_view as select person_id, class from census_2d_test;  
  
  /* now compute the confusion matrix from the two  
  * data streams, also providing a cost matrix as input.  
  */  
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (  
    accuracy              => v_accuracy,  
    apply_result_table_name => 'census_test_result',  
    target_table_name     => 'census_2d_test_view',  
    case_id_column_name   => 'person_id',  
    target_column_name    => 'class',  
    confusion_matrix_table_name => 'census_confusion_matrix',  
    cost_matrix_table_name => 'census_cost_matrix');  
  DBMS_OUTPUT.PUT_LINE('Accuracy of the model: ' || v_accuracy);  
END;  
  
/  
  
-- View the confusion matrix using Oracle SQL  
SELECT actual_target_value, predicted_target_value, value  
FROM census_confusion_matrix;
```

COMPUTE_LIFT Procedure

This procedure computes a lift table for a given positive target for a classification model. See *Oracle Data Mining Concepts* for a description of lift.

Before executing a COMPUTE_LIFT procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_LIFT (
    apply_result_table_name      IN VARCHAR2,
    target_table_name           IN VARCHAR2,
    case_id_column_name         IN VARCHAR2,
    target_column_name          IN VARCHAR2,
    lift_table_name             IN VARCHAR2,
    positive_target_value       IN VARCHAR2,
    score_column_name           IN VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
    num_quantiles               IN NUMBER DEFAULT 10,
    cost_matrix_table_name      IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name    IN VARCHAR2 DEFAULT NULL,
    target_schema_name          IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–10 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing only the case identifier column and target column values (see Usage Notes)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.
target_column_name	Name of the target column
lift_table_name	Name of the table into which the lift table is to be generated
positive_target_value	Value of the positive target. If the target column is of NUMBER type, use TO_CHAR () operator to provide the value as a string.
score_column_name	Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.

Table 25–10 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
score_criterion_column_name	Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. This column must be a numerical type.
num_quantiles	Number of quantiles required in the lift table
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can also provide a cost matrix as an optional input to have the cost of predictions reflected in the results.

It is important to note that the data inputs to COMPUTE_LIFT do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the lift table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the same binning table used in build pre-processing.

Before you use the COMPUTE_LIFT procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. The parameter `apply_result_table_name` in the COMPUTE_LIFT procedure represents the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. The parameter `target_table_name` reflects this input. The definition for this view or table name for a numerical target attribute is:

```
(case_identifier_column_name VARCHAR2/NUMBER,
target_column_name          NUMBER)
```

The definition for this view or table name for a categorical target attribute is:

```
(case_identifier_column_name VARCHAR2/NUMBER,
target_column_name          NUMBER)
```

You must provide the name of the table in which the lift table is to be generated. The resulting fixed schema table is always created in the schema that owns the model.

The resulting lift table will have the following definition:

```
(quantile_number           NUMBER,
probability_threshold      NUMBER,
gain_cumulative           NUMBER,
quantile_total_count      NUMBER,
quantile_target_count     NUMBER,
percent_records_cumulative NUMBER,
```

lift_cumulative	NUMBER,
target_density_cumulative	NUMBER,
targets_cumulative	NUMBER,
non_targets_cumulative	NUMBER,
lift_quantile	NUMBER,
target_density	NUMBER)

When a cost matrix is passed to the `COMPUTE_LIFT` procedure, the cost threshold is returned in the `probability_threshold` column.

The output columns are explained in *Oracle Data Mining Concepts*.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```

DECLARE
  v_sql_stmt VARCHAR2(4000);
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name          => 'census_model',
  data_table_name     => 'census_2d_test',
  case_id_column_name => 'person_id',
  result_table_name   => 'census_test_result');

/* next create a view from test data that projects
 * only the case identifier and target column
 */

/* now compute lift with the default 10 quantiles
 * from the two data streams
 */
DBMS_DATA_MINING.COMPUTE_LIFT (
  apply_result_table_name => 'census_test_result',
  target_table_name       => 'census_2d_test_view',
  case_id_column_name     => 'person_id',
  target_column_name      => 'class',
  lift_table_name         => 'census_lift',
  positive_target_value   => '1',
  cost_matrix_table_name  => 'census_cost_matrix');
END;
/

-- View the lift table contents using SQL
SELECT *
  FROM census_lift;

```

COMPUTE_ROC Procedure

This procedure computes the receiver operating characteristic (ROC) for a binary classification model. See *Oracle Data Mining Concepts* for a description of receiver operating characteristic.

Before executing a COMPUTE_ROC procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
    roc_area_under_curve          OUT NUMBER,
    apply_result_table_name      IN  VARCHAR2,
    target_table_name            IN  VARCHAR2,
    case_id_column_name          IN  VARCHAR2,
    target_column_name           IN  VARCHAR2,
    roc_table_name               IN  VARCHAR2,
    positive_target_value        IN  VARCHAR2,
    score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
    apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
    target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–11 COMPUTE_ROC Procedure Parameters

Parameter	Description
roc_area_under_the_curve	A measure of model accuracy, specifically, the probability that the model will correctly rank a randomly chosen pair of rows of opposite classes.
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing the case identifiers and target values from the test data. (See the Usage Notes.)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.
target_column_name	Name of the target column
roc_table_name	Name of the table into which ROC results are to be generated. See Table 25–12, "COMPUTE_ROC Output" .
positive_target_value	Value of the positive target. If the target column is of NUMBER type, use TO_CHAR() operator to provide the value as a string.

Table 25–11 (Cont.) COMPUTE_ROC Procedure Parameters

Parameter	Description
score_column_name	Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.
score_criterion_column_name	Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table

Usage Notes

It is important to note that the data inputs to COMPUTE_ROC do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the ROC table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

Before you use the COMPUTE_ROC procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. The parameter `apply_result_table_name` in the COMPUTE_ROC procedure identifies the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifiers and target values from the test data. The parameter `target_table_name` identifies this table. For a numerical target attribute, the columns of this table are:

```
case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name          NUMBER
```

For a categorical target attribute, the columns of this table are:

```
case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name          VARCHAR2
```

You must provide the name of the table in which the ROC table is to be generated. The resulting table will always be created in the schema that owns the model, and it will always have the following columns.

```
(probability          NUMBER,
 true_positives       NUMBER,
 false_negatives      NUMBER,
 false_positives      NUMBER,
 true_negatives       NUMBER,
 true_positive_fraction NUMBER,
 false_positive_fraction NUMBER)
```

The output columns are explained in [Table 25–12](#).

Table 25–12 *COMPUTE_ROC Output*

Output Column	Description
<code>probability</code>	Minimum predicted positive class probability resulting in a positive class prediction. Thus, different threshold values result in different hit rates and <code>false_alarm_rates</code> .
<code>true_negatives</code>	Negative cases in the test data with predicted probabilities below the <code>probability_threshold</code> (correctly predicted)
<code>true_positives</code>	Positive cases in the test data with predicted probabilities above the <code>probability_threshold</code> (correctly predicted)
<code>false_negatives</code>	Positive cases in the test data with predicted probabilities below the <code>probability_threshold</code> (incorrectly predicted)
<code>false_positives</code>	Negative cases in the test data with predicted probabilities above the <code>probability_threshold</code> (incorrectly predicted)
<code>true_positive_fraction</code>	<code>true_positives / (true_positives + false_negatives)</code>
<code>false_positive_fraction</code>	<code>false_positives / (false_positives + true_negatives)</code>

The typical use scenario is to examine the `true_positive_fraction` and `false_positive_fraction` to determine the most desirable `probability_threshold`. This threshold is then used to predict class values in subsequent apply operations. For example, to identify positively predicted cases in probability rank order from an apply result table, given a `probability_threshold`:

```
select case_id_column_name from apply_result_table_name where probability >
probability_threshold order by probability DESC;
```

There are two procedures one might use to identify the most desirable `probability_threshold`. One procedure applies when the relative cost of positive class versus negative class prediction errors are known to the user. The other applies when such costs are not well known to the user. In the first instance, one can apply the relative costs to the ROC table to compute the minimum cost `probability_threshold`. Suppose the relative cost ratio, Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like:

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false_positives cost
  FROM ROC_table
  GROUP BY probability_threshold),
minCost AS (
  SELECT min(cost) minCost
  FROM cost)
SELECT max(probability_threshold)probability_threshold
FROM cost, minCost
WHERE cost = minCost;
```

If relative costs are not well known, the user simply scans the values in the table (in sorted order) and makes a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable:

```
select * from ROC_table order by probability_threshold
```

Examples

Assume that you have built a classification model `census_model` using the SVM algorithm, and you have been provided the test data in a table called `census_2d_`

test, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
  v_accuracy NUMBER;
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name          => 'census_model',
  data_table_name     => 'census_2d_test',
  case_id_column_name => 'person_id',
  result_table_name   => 'census_test_result');

/* next create a view from test data that projects
 * only the case identifier and target column
 */
v_sql_stmt :=
'CREATE VIEW census_2d_test_view AS ' ||
'SELECT person_id, class FROM census_2d_test';
EXECUTE IMMEDIATE v_sql_stmt;

/* now compute the receiver operating characteristics from
 * the two data streams, also providing a cost matrix
 * as input.
 */
DBMS_DATA_MINING.COMPUTE_ROC (
  accuracy              => v_accuracy,
  apply_result_table_name => 'census_test_result',
  target_table_name     => 'census_2d_test_view',
  case_id_column_name   => 'person_id',
  target_column_name    => 'class',
  roc_table_name        => 'census_roc',
  cost_matrix_table_name => 'census_cost_matrix');
END;
/

-- View the ROC results using Oracle SQL
SELECT *
  FROM census_roc;
```

CREATE_MODEL Procedure

This procedure creates a mining model for a given mining function

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
    model_name           IN VARCHAR2,
    mining_function      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    target_column_name   IN VARCHAR2 DEFAULT NULL,
    settings_table_name  IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    settings_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–13 CREATE_MODEL Procedure Parameters

Parameter	Description
model_name	Name of the model. (See "Model Names" on page 25-5)
mining_function	Constant representing the mining function. See "Constants that Specify the Mining Function" on page 25-6
data_table_name	Name of the table or view containing the training data
case_id_column_name	Name of the case identifier column
target_column_name	Name of the target column — NULL for descriptive models and for One-Class SVM models
settings_table_name	Name of the table or view containing mining function settings and algorithm settings
data_schema_name	Name of the schema hosting the training data
settings_schema_name	Name of the schema hosting the settings table/view

Usage Notes

The data provided to all subsequent operations such as APPLY must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to subsequent operations such as APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing. The case identifier column is not considered to be a mining attribute during CREATE_MODEL.

You can view the default settings for each algorithm through GET_DEFAULT_SETTINGS. You can override the defaults by providing a settings table specifying your choice of mining algorithm and relevant overriding algorithm settings.

Once a model has been built, information about the attributes used for model build can be obtained from GET_MODEL_SIGNATURE. To inspect or review model contents, you can use any of the algorithm-specific GET_MODEL_DETAILS functions.

The behavior of the CREATE_MODEL is analogous to a SQL DDL CREATE operation. It contends with RENAME_MODEL and DROP_MODEL operations.

Note: The CREATE_MODEL operation creates a set of tables in the owner's schema to store the patterns and information that constitute a mining model for a particular algorithm. The names of these tables have the prefix DM\$. The number, schema, and content of these tables is Oracle proprietary and may change from release to release. You must not direct any queries or updates against these system tables.

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```

/* prepare a settings table to override default
 * settings (Naive Bayes is the default classifier)
 */
CREATE TABLE census_settings (
    setting_name VARCHAR2(30),
    setting_value VARCHAR2(128));

BEGIN
/* indicate that SVM is the chosen classifier */
INSERT INTO census_settings VALUES (
DBMS_DATA_MINING.ALGO_NAME, DBMS_DATA_MINING.ALGO_SUPPORT_VECTOR_MACHINES);

/* override the default value for complexity factor */
INSERT INTO census_settings (setting_name, setting_value)
VALUES (dbms_data_mining.svms_complexity_factor, TO_CHAR(0.081));
COMMIT;

/* build a model with name census_model */
DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'census_model',
    mining_function     => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name    => 'census_2d_build',
    case_id_column_name => 'person_id',
    target_column_name => 'class',
    settings_table_name => 'census_settings');
END;
/

```

You use similar code to build a One-Class SVM model. The main difference is that the target column is empty.

```

/* prepare a settings table to override default
 * settings (Naive Bayes is the default classifier)
 */
CREATE TABLE census_settings (
    setting_name VARCHAR2(30),
    setting_value VARCHAR2(128));

BEGIN
/* indicate that SVM is the chosen classifier */
INSERT INTO census_settings VALUES (
DBMS_DATA_MINING.ALGO_NAME, DBMS_DATA_MINING.ALGO_SUPPORT_VECTOR_MACHINES);

/* override the default value for outlier rate */
INSERT INTO census_settings (setting_name, setting_value)
VALUES (dbms_data_mining.svms_outlier_rate, TO_CHAR(0.05));
COMMIT;

```

```
/* build a model with name census_model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name          => 'census_model',
  mining_function     => DBMS_DATA_MINING.CLASSIFICATION,
  data_table_name     => 'census_2d_build',
  case_id_column_name => 'person_id',
  target_column_name  => NULL,
  settings_table_name => 'census_settings');
END;
/
```

DROP_MODEL Procedure

This procedure drops an existing mining model from the user's schema.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2);
```

Parameters

Table 25–14 DROP_MODEL Procedure Parameters

Parameter	Description
model_name	Name of the model

Usage Notes

You can use `DROP_MODEL` to drop an existing mining model.

The behavior of the `DROP_MODEL` is similar to a SQL DDL `DROP` operation. It blocks `RENAME_MODEL` and `CREATE_MODEL` operations. It does not block or block on `APPLY`, which is a SQL query-like operation that does not update any model data.

If an `APPLY` operation is using a model, and you attempt to drop the model during that time, the `DROP` will succeed and `APPLY` will return indeterminate results. This is in line with the conventional behavior in the RDBMS, where DDL operations do not block on query operations.

Examples

Assume the existence of a model `census_model`. The following example shows how to drop this model.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'census_model');
END;
/
```

EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. You can import from the dump file set using the `IMPORT_MODEL` procedure. Both `EXPORT_MODEL` and `IMPORT_MODEL` use Oracle Data Pump technology.

See Also: *Oracle Data Mining Administrator's Guide* for more information on model export and import.

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
    filename          IN VARCHAR2,
    directory         IN VARCHAR2,
    model_filter      IN VARCHAR2 DEFAULT NULL,
    filesize          IN VARCHAR2 DEFAULT NULL,
    operation         IN VARCHAR2 DEFAULT NULL,
    remote_link       IN VARCHAR2 DEFAULT NULL,
    jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–15 EXPORT_MODEL Procedure Parameters

Parameter	Description
<code>filename</code>	<p>Name of the dump file set to which the models should be exported. The name must be unique within the schema.</p> <p>The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the <code>filesize</code> parameter, or you can use the <code>operation</code> parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created.</p> <p>When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</p>
<code>directory</code>	<p>Name of a pre-defined directory object that specifies where the dump file set should be created.</p> <p>You must have read/write privileges on the directory object and on the file system directory that it identifies.</p>
<code>model_filter</code>	<p>Optional parameter that specifies which model or models to export. If you do not specify a value for <code>model_filter</code>, all models in the schema are exported. You can also specify <code>NULL</code> (the default) or <code>'ALL'</code> to export all models.</p> <p>You can export individual models by name and groups of models that share a given characteristic. For instance, you could export all Naive Bayes models or all models that use the same target attribute. See the Usage Notes for more information. Examples are provided in Table 25–16.</p>
<code>filesize</code>	<p>Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB.</p> <p>If the size of the models to export is larger than <code>filesize</code>, one or more additional files are created within the dump set. See the description of the <code>filename</code> parameter for more information.</p>

Table 25–15 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the <code>filesize</code> parameter determines the size of the files. You can specify either of the following values for <code>operation</code> : <ul style="list-style-type: none"> ■ 'EXPORT' — Export all or the specified models. (Default) ■ 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter not used in this release. Set to NULL.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form <code>username_exp_nnnn</code> , where <code>nnnn</code> is a number. For example, a job name in the SCOTT schema might be <code>SCOTT_exp_134</code> . If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named <code>jobname.log</code> , is created in the same directory as the dump file set.

Usage Notes

The `model_filter` parameter specifies which models to export. You can list the models by name, or you can identify a group of models that share a given characteristic. To specify models by name, provide a single model name or a comma-delimited list of model names. To specify a group of models that share a characteristic, use a conditional expression that completes the `WHERE` clause of a query against the `DM_USER_MODELS` view. `DM_USER_MODELS` lists the models in the current schema. It has the following columns.

Name	Null?	Type
NAME	NOT NULL	VARCHAR2 (25)
FUNCTION_NAME		VARCHAR2 (30)
ALGORITHM_NAME		VARCHAR2 (30)
CREATION_DATE		DATE
BUILD_DURATION		NUMBER
TARGET_ATTRIBUTE		VARCHAR2 (30)
MODEL_SIZE		NUMBER

For descriptions of the columns in `DM_USER_MODELS`, see ["User Views"](#) on page 25-14.

To construct a conditional expression for `model_filter`, specify a column name, a supported conditional operator, and a value. The supported conditional operators are: `<`, `<=`, `=`, `=>`, `>`, `LIKE`, `IN`. For information on conditional operators and `WHERE` clauses, see *Oracle Database SQL Reference*.

Examples of model filters are provided in [Table 25–16](#).

Table 25–16 Sample Values for the Model Filter Parameter

Sample Value	Meaning
'mymodel'	Export the model named <code>mymodel</code>
'mymodel2, mymodel3'	Export the models named <code>mymodel2</code> and <code>mymodel3</code>
'name= 'mymodel''	Export the model named <code>mymodel</code>
'name IN ('mymodel2', 'mymodel3')'	Export the models named <code>mymodel2</code> and <code>mymodel3</code>

Table 25–16 (Cont.) Sample Values for the Model Filter Parameter

Sample Value	Meaning
'name LIKE 'AI%''	Export all models that have names starting with AI
'ALGORITHM_NAME = 'NAIVE_BAYES''	Export all Naive Bayes models. See Table 25–2 for a list of algorithm names.
'FUNCTION_NAME = 'CLASSIFICATION''	Export all classification models. See Table 25–1 for a list of mining functions.

Examples

The following statement exports all the models in the DMUSER3 schema to a dump file set called `models_out` in the directory `$ORACLE_HOME/rdbms/log`. This directory is mapped to a directory object called `DATA_PUMP_DIR`. The DMUSER3 user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL*Plus and list the resulting dump file and log file.

```
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

The following example uses the same directory object and is executed by the same user. It exports the models called `NMF_SH_SAMPLE` and `SVMR_SH_REGR_SAMPLE` to a different dump file set in the same directory.

```
SQL>execute dbms_data_mining.export_model ('models2_out', 'DATA_PUMP_DIR',
      'name in ('NMF_SH_SAMPLE', 'SVMR_SH_REGR_SAMPLE)');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
  DMUSER3_exp_924.log  models2_out01.dmp
```

Using the same directory object and schema, this example exports all models whose target is `AFFINITY_CARD`.

```
SQL>execute dbms_data_mining.export_model ('models050402_out',
      'DATA_PUMP_DIR', 'target_attribute = 'AFFINITY_CARD'',
      '1M', 'EXPORT', NULL, 'models050402_job');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
  DMUSER3_exp_924.log  models2_out01.dmp
  models050402_job.log  models050402_out01.dmp  models050402_out02.dmp
```

GET_ASSOCIATION_RULES Function

This table function returns the rules from an Association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the `topn` parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
  model_name          IN VARCHAR2,
  topn                IN NUMBER DEFAULT NULL,
  rule_id             IN INTEGER DEFAULT NULL,
  min_confidence      IN NUMBER DEFAULT NULL,
  min_support         IN NUMBER DEFAULT NULL,
  max_rule_length     IN INTEGER DEFAULT NULL,
  min_rule_length     IN INTEGER DEFAULT NULL,
  sort_order          IN DMSYS.ORA_MINING_VARCHAR2_NT DEFAULT NULL,
  antecedent_items   IN DYSYS.ORA_MINING_VARCHAR2_NT DEFAULT NULL,
  consequent_items    IN DYSYS.ORA_MINING_VARCHAR2_NT DEFAULT NULL)
RETURN DM_RULES PIPELINED;
```

Parameters

Table 25–17 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
<code>model_name</code>	Name of the model. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
<code>topn</code>	Return the <i>n</i> top rules ordered by confidence and then support, both descending. If you specify a sort order, the top <i>n</i> rules are derived after the sort is performed. If <code>topn</code> is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are <code>RULE_CONFIDENCE</code> and <code>RULE_SUPPORT</code> . If <code>topn</code> is specified and a maximum or minimum rule length is specified, then <code>RULE_CONFIDENCE</code> , <code>RULE_SUPPORT</code> , and <code>NUMBER_OF_ITEMS</code> are allowed in the sort order.
<code>rule_id</code>	Identifier of the rule to return. If you specify a value for <code>rule_id</code> , do not specify values for the other filtering parameters.
<code>min_confidence</code>	Return the rules with confidence greater than or equal to this number
<code>min_support</code>	Return the rules with support greater than or equal to this number
<code>max_rule_length</code>	Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See <code>NUMBER_OF_ITEMS</code> in Table 25–18). For example, in the rule <code>A=>B</code> (if A, then B), the number of items is 2. If <code>max_rule_length</code> is specified, then the <code>NUMBER_OF_ITEMS</code> column is permitted in the sort order.

Table 25–17 (Cont.) GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify: DMSYS.ORA_MINING_VARCHAR2_NT ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by confidence in descending order, then by support in descending order. See the examples.
antecedent_items	Return the rules with these items in the antecedent. See the examples.
consequent_items	Return the rules with this item in the consequent. See the examples.

Return Values

Table 25–18 GET_ASSOCIATION_RULES Function Return Values

Return Value	Description																												
DM_RULES	Represents a set of rows of type DM_RULE. The rows have the following columns: <table border="0"> <tr> <td>(rule_id</td> <td>INTEGER,</td> </tr> <tr> <td>antecedent</td> <td>DM_PREDICATES,</td> </tr> <tr> <td>consequent</td> <td>DM_PREDICATES,</td> </tr> <tr> <td>rule_support</td> <td>NUMBER,</td> </tr> <tr> <td>rule_confidence</td> <td>NUMBER,</td> </tr> <tr> <td>antecedent_support</td> <td>NUMBER,</td> </tr> <tr> <td>consequent_support</td> <td>NUMBER,</td> </tr> <tr> <td>number_of_items</td> <td>INTEGER)</td> </tr> </table> <p>The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</p> <table border="0"> <tr> <td>(attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>conditional_operator</td> <td>CHAR(2)/*=,<>,<,>,<=,>=*/,</td> </tr> <tr> <td>attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_support</td> <td>NUMBER,</td> </tr> <tr> <td>attribute_confidence</td> <td>NUMBER)</td> </tr> </table>	(rule_id	INTEGER,	antecedent	DM_PREDICATES,	consequent	DM_PREDICATES,	rule_support	NUMBER,	rule_confidence	NUMBER,	antecedent_support	NUMBER,	consequent_support	NUMBER,	number_of_items	INTEGER)	(attribute_name	VARCHAR2(30),	conditional_operator	CHAR(2)/*=,<>,<,>,<=,>=*/,	attribute_num_value	NUMBER,	attribute_str_value	VARCHAR2(4000),	attribute_support	NUMBER,	attribute_confidence	NUMBER)
(rule_id	INTEGER,																												
antecedent	DM_PREDICATES,																												
consequent	DM_PREDICATES,																												
rule_support	NUMBER,																												
rule_confidence	NUMBER,																												
antecedent_support	NUMBER,																												
consequent_support	NUMBER,																												
number_of_items	INTEGER)																												
(attribute_name	VARCHAR2(30),																												
conditional_operator	CHAR(2)/*=,<>,<,>,<=,>=*/,																												
attribute_num_value	NUMBER,																												
attribute_str_value	VARCHAR2(4000),																												
attribute_support	NUMBER,																												
attribute_confidence	NUMBER)																												

Usage Notes

This table function pipes out rows of type DM_RULES. For information on ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

The DMSYS.ORA_MINING_VARCHAR2_NT type is defined as a table of VARCHAR2(4000).

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
  SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following example returns all the rules which have 'AQUATIC' or 'EGGS' in the antecedent, and has 'VENOMOUS' as the consequent. The rules are sorted first by NUMBER_OF_ITEMS in descending order, then by RULE_CONFIDENCE in descending order, and finally by RULE_SUPPORT in descending order.

```
SELECT * FROM TABLE
(
  DBMS_DATA_MINING.GET_ASSOCIATION_RULES
    ('AR_Model_31', 120, NULL, 1, .51, 7,
     DMSYS.ORA_MINING_VARCHAR2_NT
       ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
     DMSYS.ORA_MINING_VARCHAR2_NT('AQUATIC', 'EGGS'),
     DMSYS.ORA_MINING_VARCHAR2_NT('VENOMOUS')));
```

GET_DEFAULT_SETTINGS Function

This table function returns the default settings for all mining functions and algorithms supported in the DBMS_DATA_MINING package.

Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
RETURN DM_MODEL_SETTINGS PIPELINED;
```

Return Values

Table 25–19 GET_DEFAULT_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

This table function pipes out rows of type DM_MODEL_SETTING. For information on ODM data types and ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

Examples

For example, if you want to override some or all of *k*-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
  CREATE TABLE mysettings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
  WHERE setting_name LIKE 'KMNS%';
  -- now update individual settings as required
  UPDATE mysettings
     SET setting_value = 0.02
     WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
  model_name          IN VARCHAR2,
  topn                IN NUMBER DEFAULT NULL)
RETURN DM_ITEMSETS PIPELINED;
```

Parameters

Table 25–20 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
model_name	Name of the model
topn	When not NULL, return the top <i>n</i> rows ordered by support in descending order

Return Values

Table 25–21 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description								
DM_ITEMSETS	Represents a set of rows of type DM_ITEMSET. The rows have the following columns: <div style="margin-left: 20px;"> <table> <tr> <td>itemsets_id</td> <td>NUMBER,</td> </tr> <tr> <td>items</td> <td>DM_ITEMS,</td> </tr> <tr> <td>support</td> <td>NUMBER,</td> </tr> <tr> <td>number_of_items</td> <td>NUMBER)</td> </tr> </table> <p>The <code>items</code> column returns a nested table of type <code>DM_ITEMS</code>. The table has one column of type <code>VARCHAR2 (4000)</code>, which contains individual item names.</p> </div>	itemsets_id	NUMBER,	items	DM_ITEMS,	support	NUMBER,	number_of_items	NUMBER)
itemsets_id	NUMBER,								
items	DM_ITEMS,								
support	NUMBER,								
number_of_items	NUMBER)								

Usage Notes

This table function pipes out rows of type `DM_ITEMSETS`. For information on ODM data types and piped output from table functions, see "[Data Types](#)" on page 25-10.

Examples

The following example demonstrates an Association model build followed by an invocation of `GET_FREQUENT_ITEMSETS` table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
  WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
  SET setting_value = TO_CHAR(0.081)
  WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
```

```
/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name          => 'market_model',
  function            => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name    => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

GET_MODEL_DETAILS_ABN Function

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (
    model_name          IN VARCHAR2)
RETURN DM_ABN_DETAILS PIPELINED;
```

Parameters

Table 25–22 GET_MODEL_DETAILS_ABN Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–23 GET_MODEL_DETAILS_ABN Function Return Values

Return Value	Description
DM_ABN_DETAILS	<p>Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns:</p> <pre>(rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER)</pre> <p>The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</p> <pre>(attribute_name VARCHAR2(30), conditional_operator CHAR(2), /*=, <>, <, >, <=, >= */ attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)</pre>

Usage Notes

This table function pipes out rows of type DM_ABN_DETAIL. For information on ODM data types and piped output from table functions, see "[Data Types](#)" on page 25-10.

This function returns details only for a single feature ABN model.

Examples

The following example demonstrates an ABN model build followed by an invocation of GET_MODEL_DETAILS_ABN table function from Oracle SQL.

```
BEGIN
  -- prepare a settings table to override default algorithm and model type
  CREATE TABLE abn_settings (setting_name VARCHAR2(30),
    setting_value
    VARCHAR2(128));
  INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
```

```
        DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
INSERT INTO abn_settings VALUES
    (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
     DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
COMMIT;
-- create a model
DBMS_DATA_MINING.CREATE_MODEL (
    model_name          => 'abn_model',
    function             => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name     => 'abn_build',
    case_id_column_name => 'id',
    target_column_name  => NULL,
    settings_table_name => 'abn_settings');
END;
/
-- View the (unformatted) results from SQL*Plus
SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
```

GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
  model_name          IN VARCHAR2)
RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

Table 25–24 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–25 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description						
DM_RANKED_ATTRIBUTES	Represents a set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: <table data-bbox="743 989 1214 1083" style="margin-left: 20px;"> <tbody> <tr> <td>attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>importance_value</td> <td>NUMBER,</td> </tr> <tr> <td>rank</td> <td>NUMBER(38)</td> </tr> </tbody> </table>	attribute_name	VARCHAR2(30),	importance_value	NUMBER,	rank	NUMBER(38)
attribute_name	VARCHAR2(30),						
importance_value	NUMBER,						
rank	NUMBER(38)						

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to `GET_MODEL_DETAILS_KM` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_KM` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
    model_name          VARCHAR2,
    cluster_id         NUMBER   DEFAULT NULL,
    attribute           VARCHAR2 DEFAULT NULL,
    centroid            NUMBER   DEFAULT 1,
    histogram           NUMBER   DEFAULT 1,
    rules               NUMBER   DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 25–26 *GET_MODEL_DETAILS_KM Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model
<code>cluster_id</code>	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
<code>attribute</code>	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
<code>centroid</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
<code>histogram</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
<code>rules</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 25–27 GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description																				
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: <table> <tr><td>id</td><td>INTEGER,</td></tr> <tr><td>record_count</td><td>NUMBER,</td></tr> <tr><td>parent</td><td>NUMBER,</td></tr> <tr><td>tree_level</td><td>NUMBER,</td></tr> <tr><td>dispersion</td><td>NUMBER,</td></tr> <tr><td>split_predicate</td><td>DM_PREDICATES,</td></tr> <tr><td>child</td><td>DM_CHILDREN,</td></tr> <tr><td>centroid</td><td>DM_CENTROIDS,</td></tr> <tr><td>histogram</td><td>DM_HISTOGRAMS,</td></tr> <tr><td>rule</td><td>DM_RULE)</td></tr> </table>	id	INTEGER,	record_count	NUMBER,	parent	NUMBER,	tree_level	NUMBER,	dispersion	NUMBER,	split_predicate	DM_PREDICATES,	child	DM_CHILDREN,	centroid	DM_CENTROIDS,	histogram	DM_HISTOGRAMS,	rule	DM_RULE)
id	INTEGER,																				
record_count	NUMBER,																				
parent	NUMBER,																				
tree_level	NUMBER,																				
dispersion	NUMBER,																				
split_predicate	DM_PREDICATES,																				
child	DM_CHILDREN,																				
centroid	DM_CENTROIDS,																				
histogram	DM_HISTOGRAMS,																				
rule	DM_RULE)																				

The `split_predicate` column of `DM_CLUSTER` returns a nested table of type `DM_PREDICATES`. Each row, of type `DM_PREDICATE`, has the following columns:

attribute_name	VARCHAR2(30),
conditional_operator	CHAR(2) /*=, <>, <, >, <=, >=*/,
attribute_num_value	NUMBER,
attribute_str_value	VARCHAR2(4000),
attribute_support	NUMBER,
attribute_confidence	NUMBER)

The `child` column of `DM_CLUSTER` returns a nested table of type `DM_CHILDREN`. The rows, of type `DM_CHILD`, have a single column of type `NUMBER`, which contains the identifiers of each child.

The `centroid` column of `DM_CLUSTER` returns a nested table of type `DM_CENTROIDS`. The rows, of type `DM_CENTROID`, have the following columns:

attribute_name	VARCHAR2(30),
mean	NUMBER,
mode_value	VARCHAR2(4000),
variance	NUMBER)

The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:

attribute_name	VARCHAR2(30),
bin_id	NUMBER,
lower_bound	NUMBER,
upper_bound	NUMBER,
label	VARCHAR2(4000),
count	NUMBER)

The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:

rule_id	INTEGER,
antecedent	DM_PREDICATES,
consequent	DM_PREDICATES,
rule_support	NUMBER,
rule_confidence	NUMBER)

Table 25–27 (Cont.) GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description
	The antecedent and consequent columns of DM_RULE each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	(attribute_name VARCHAR2(30),
	conditional_operator CHAR(2)/*=, <>, <, >, <=, >=*/,
	attribute_num_value NUMBER,
	attribute_str_value VARCHAR2(4000),
	attribute_support NUMBER,
	attribute_confidence NUMBER)

Usage Notes

The table function pipes out rows of type DM_CLUSTERS. For information on ODM data types and piped output from table functions, see "[Data Types](#)" on page 25-10.

Examples

The following example demonstrates a *k*-Means clustering model build followed by an invocation of GET_MODEL_DETAILS_KM table function from Oracle SQL.

```
BEGIN
-- create a settings table
UPDATE cluster_settings
   SET setting_value = 3
  WHERE setting_name = DBMS_DATA_MINING.KMEANS_BLOCK_GROWTH;

/* build a k-Means clustering model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name          => 'eight_clouds',
  function            => DBMS_DATA_MINING.CLUSTERING,
  data_table_name     => 'eight_clouds_build',
  case_id_column_name => 'id',
  target_column_name  => NULL,
  settings_table_name => 'cluster_settings');
END;
/

-- View the (unformatted) rules from SQL*Plus
SELECT id, record_count, parent, tree_level, dispersion,
       child, centroid, histogram, rule
  FROM TABLE(DBMS_DATA_MINING_GET_MODEL_DETAILS_KM('eight_clouds'));
```

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
    model_name      IN      VARCHAR2)
RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

Table 25–28 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–29 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description																		
DM_NB_DETAILS	<p>Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns:</p> <table> <tbody> <tr> <td>target_attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>target_attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>target_attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>prior_probability</td> <td>NUMBER,</td> </tr> <tr> <td>conditionals</td> <td>DM_CONDITIONALS)</td> </tr> </tbody> </table> <p>The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns:</p> <table> <tbody> <tr> <td>attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>conditional_probability</td> <td>NUMBER)</td> </tr> </tbody> </table>	target_attribute_name	VARCHAR2(30),	target_attribute_str_value	VARCHAR2(4000),	target_attribute_num_value	NUMBER,	prior_probability	NUMBER,	conditionals	DM_CONDITIONALS)	attribute_name	VARCHAR2(30),	attribute_str_value	VARCHAR2(4000),	attribute_num_value	NUMBER,	conditional_probability	NUMBER)
target_attribute_name	VARCHAR2(30),																		
target_attribute_str_value	VARCHAR2(4000),																		
target_attribute_num_value	NUMBER,																		
prior_probability	NUMBER,																		
conditionals	DM_CONDITIONALS)																		
attribute_name	VARCHAR2(30),																		
attribute_str_value	VARCHAR2(4000),																		
attribute_num_value	NUMBER,																		
conditional_probability	NUMBER)																		

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details as shown in this example.

```
-- You can view the Naive Bayes model details in many ways
-- Consult the Oracle Application Developer's Guide -
-- Object-Relational Features for different ways of
-- accessing Oracle Objects.

-- View the (unformatted) details from SQL*Plus
SELECT attribute_name, attribute_num_value, attribute_str_value,
       prior_probability, conditionals,
```

```
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('census_model');
```

See `nbdemo.sql` for generation of formatted rules.

GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
  model_name      IN      VARCHAR2)
RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

Table 25–30 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–31 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description
DM_NMF_FEATURE_SET	Represents a set of rows of DM_NMF_FEATURE. The rows have the following columns: (feature_id NUMBER, attribute_set DM_NMF_ATTRIBUTE_SET) The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns: (attribute_name VARCHAR2(30) , attribute_value VARCHAR2(4000) , coefficient NUMBER)

Usage Notes

The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

Examples

Assume you have built an NMF model called my_nmf_model. You can retrieve model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT feature_id, attribute_set
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF(
  'my_nmf_model'));
```

GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to `GET_MODEL_DETAILS_OC` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_OC` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
    model_name          VARCHAR2,
    cluster_id         NUMBER   DEFAULT NULL,
    attribute           VARCHAR2 DEFAULT NULL,
    centroid            NUMBER   DEFAULT 1,
    histogram           NUMBER   DEFAULT 1,
    rules               NUMBER   DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 25–32 *GET_MODEL_DETAILS_OC Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model
<code>cluster_id</code>	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
<code>attribute</code>	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
<code>centroid</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
<code>histogram</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
<code>rules</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 25–33 GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: <pre>(id INTEGER, record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE)</pre>

The `split_predicate` column of `DM_CLUSTER` returns a nested table of type `DM_PREDICATES`. Each row, of type `DM_PREDICATE`, has the following columns:

```
(attribute_name  VARCHAR2(30),
 conditional_operator CHAR(2) /*=, <>, <, >, <=, >=*/,
 attribute_num_value NUMBER,
 attribute_str_value VARCHAR2(4000),
 attribute_support NUMBER,
 attribute_confidence NUMBER)
```

The `child` column of `DM_CLUSTER` returns a nested table of type `DM_CHILDREN`. The rows, of type `DM_CHILD`, have a single column of type `NUMBER`, which contains the identifiers of each child.

The `centroid` column of `DM_CLUSTER` returns a nested table of type `DM_CENTROIDS`. The rows, of type `DM_CENTROID`, have the following columns:

```
(attribute_name  VARCHAR2(30)
 mean            NUMBER,
 mode_value      VARCHAR2(4000),
 variance        NUMBER)
```

The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:

```
(attribute_name  VARCHAR2(30),
 bin_id          NUMBER,
 lower_bound     NUMBER,
 upper_bound     NUMBER,
 label           VARCHAR2(4000),
 count           NUMBER)
```

The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:

```
(rule_id        INTEGER,
 antecedent     DM_PREDICATES,
 consequent     DM_PREDICATES,
 rule_support   NUMBER,
 rule_confidence NUMBER)
```

Table 25-33 (Cont.) GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
	The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	(attribute_name VARCHAR2(30),
	conditional_operator CHAR(2)/*=, <>, <, >, <=, >=*/,
	attribute_num_value NUMBER,
	attribute_str_value VARCHAR2(4000),
	attribute_support NUMBER,
	attribute_confidence NUMBER)

Usage Notes

The table function pipes out rows of type DM_CLUSTER. For information about ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

Examples

Assume you have built an OC model called `my_oc_model`. You can retrieve information from the model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT T.id                    clu_id,
       T.record_count        rec_cnt,
       T.parent              parent,
       T.tree_level         tree_level
FROM (SELECT *
      FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                  'my_oc_model'))
      ORDER BY id) T
WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a Support Vector Machine model. This is applicable only for classification or regression models built using a linear kernel. For any other kernel, the table function returns ORA-40215.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
  model_name      IN      VARCHAR2)
RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

Table 25–34 GET_MODEL_DETAILS_SVM Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–35 GET_MODEL_DETAILS_SVM Function Return Values

Return Value	Description
DM_SVM_LINEAR_COEFF_SET	<p>Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:</p> <pre>(class VARCHAR2(4000), attribute_set DM_SVM_ATTRIBUTE_SET)</pre> <p>The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:</p> <pre>(attribute_name VARCHAR2(30), attribute_value VARCHAR2(4000), coefficient NUMBER)</pre> <p>See Usage Notes.</p>

Usage Notes

The table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

The class column of DM_SVM_LINEAR_COEFF represents classification target values. For regression targets, class is NULL. For each classification target value for classification models, a set of coefficients is returned. For binary classification, one-class classifier, and regression models, only a single set of coefficients is returned.

The attribute_value column in the nested table DM_SVM_ATTRIBUTE_SET is used for categorical attributes. The coefficient column is the linear coefficient value.

Examples

The following example demonstrates an SVM model build followed by an invocation of GET_MODEL_DETAILS_SVM table function from Oracle SQL:

```
-- Create SVM model
```

```
BEGIN
  dbms_data_mining.create_model(
    model_name          => 'SVM_Clas_sample',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'svmc_sample_build_prepared',
    case_id_column_name => 'id',
    target_column_name  => 'affinity_card',
    settings_table_name => 'svmc_sample_settings');
END;
/
-- Display model details
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVM_Clas_sample'))
 ORDER BY class;
```

GET_MODEL_DETAILS_XML Function

This table function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
  model_name      IN      VARCHAR2)
RETURN XMLTYPE;
```

Parameters

Table 25–36 GET_MODEL_DETAILS_XML Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–37 GET_MODEL_DETAILS_XML Function Return Value

Return Value	Description
XMLTYPE	The PMML 2.1 XML definition for the decision tree model.

Usage Notes

The function returns the XML representing the decision tree; the definition is the one specified in the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at <http://www.dmg.org>.

GET_MODEL_SETTINGS Function

This table function returns the list of settings that were used to build the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SETTINGS (
    model_name          IN VARCHAR2)
RETURN DM_MODEL_SETTINGS PIPELINED;
```

Parameters

Table 25–38 GET_MODEL_SETTINGS Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–39 GET_MODEL_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

The table function pipes out rows of type DM_MODEL_SETTING. For information about ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```
SELECT setting_name, setting_value
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```

GET_MODEL_SIGNATURE Function

This table function returns the model signature, which is a set of rows that provide the name and type of each attribute required as input to the APPLY operation.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SIGNATURE (
    model_name          IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

Parameters

Table 25–40 GET_MODEL_SIGNATURE Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–41 GET_MODEL_SIGNATURE Function Return Values

Return Value	Description				
DM_MODEL_SIGNATURE	Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns: <table border="0" style="margin-left: 20px;"> <tr> <td>attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>attribute_type</td> <td>VARCHAR2(106)</td> </tr> </table>	attribute_name	VARCHAR2(30),	attribute_type	VARCHAR2(106)
attribute_name	VARCHAR2(30),				
attribute_type	VARCHAR2(106)				

Usage Notes

This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on ODM data types and piped output from table functions, see ["Data Types"](#) on page 25-10.

You can use this table function to get the list of attributes used for building the model. This is particularly helpful to describe a model when an APPLY operation on test or scoring data is done a significant time period after the model is built, or after it is imported into another definition.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```
SELECT attribute_name, attribute_type
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model'));
```

IMPORT_MODEL Procedure

This procedure imports the specified data mining models from a dump file set that was created with EXPORT_MODEL or with the expdp export utility. Both IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology.

See Also: *Oracle Data Mining Administrator's Guide* for more information on model export and import.

Syntax

```
DBMS_DATA_MINING.IMPORT_MODEL (
  filename          IN  VARCHAR2,
  directory         IN  VARCHAR2,
  model_filter      IN  VARCHAR2 DEFAULT NULL,
  operation         IN  VARCHAR2 DEFAULT NULL,
  remote_link      IN  VARCHAR2 DEFAULT NULL,
  jobname          IN  VARCHAR2 DEFAULT NULL,
  schema_remap     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–42 *IMPORT_MODEL Procedure Parameters*

Parameter	Description
filename	<p>Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump.</p> <p>The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 25-34 for details.) If the dump file set contains multiple files, you can specify '<i>filename%U</i>' instead of listing them. For example, if your dump file set contains 3 files, <i>archive01.dmp</i>, <i>archive02.dmp</i>, and <i>archive03.dmp</i>, you can import them by specifying '<i>archive%U</i>'.</p>
directory	<p>Name of a pre-defined directory object that specifies where the dump file set is located.</p> <p>You must have read/write privileges on the directory object and on the file system directory that it identifies.</p>
model_filter	<p>Optional parameter that specifies which model or models to import. If you do not specify a value for <i>model_filter</i>, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models.</p> <p>You can import individual models by name and groups of models that share a given characteristic. For instance, you could import all Naive Bayes models or all models that use the same target attribute. See the Usage Notes for more information. Examples are provided in Table 25–43.</p>
operation	<p>Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported.</p> <p>You can specify either of the following values for <i>operation</i>:</p> <ul style="list-style-type: none"> ▪ 'IMPORT' — Import the models (Default) ▪ 'SQL_FILE' — Write the SQL DDL for creating the models to a text file. The text file is named <i>job_name.sql</i> and is located in the dump set directory.
remote_link	Optional parameter not used in this release. Set to NULL

Table 25–42 (Cont.) IMPORT_MODEL Procedure Parameters

Parameter	Description
jobname	<p>Optional parameter that specifies the name of the import job. By default, the name has the form <code>username_imp_nnnn</code>, where <code>nnnn</code> is a number. For example, a job name in the <code>SCOTT</code> schema might be <code>SCOTT_imp_134</code>.</p> <p>If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters.</p> <p>A log file for the import job, named <code>jobname.log</code>, is created in the same directory as the dump file set.</p>
schema_remap	<p>Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema.</p> <p>If the dump file set belongs to a different schema, you must specify a schema mapping in the form <code>export_user:import_user</code>. For example, you would specify <code>'SCOTT:MARY'</code> to import a model exported by <code>SCOTT</code> into the <code>MARY</code> schema.</p> <p>NOTE: In some cases, you may need to have the <code>IMPORT_FULL_DATABASE</code> privilege or the <code>SYS</code> role to import a model from a different schema.</p>

Usage Notes

The `model_filter` parameter specifies which models to import. You can list the models by name, or you can identify a group of models that share a given characteristic. To specify models by name, provide a single model name or a comma-delimited list of model names. To specify a group of models that share a characteristic, use a conditional expression that completes the `WHERE` clause of a query against the `DM_USER_MODELS` view. `DM_USER_MODELS` lists the models in the current schema. It has the following columns.

Name	Null?	Type
NAME	NOT NULL	VARCHAR2 (25)
FUNCTION_NAME		VARCHAR2 (30)
ALGORITHM_NAME		VARCHAR2 (30)
CREATION_DATE		DATE
BUILD_DURATION		NUMBER
TARGET_ATTRIBUTE		VARCHAR2 (30)
MODEL_SIZE		NUMBER

For descriptions of the columns in `DM_USER_MODELS`, see ["User Views"](#) on page 25-14.

To construct a conditional expression for `model_filter`, specify a column name, a supported conditional operator, and a value. The supported conditional operators are: `<`, `<=`, `=`, `=>`, `>`, `LIKE`, `IN`. For information on conditional operators and `WHERE` clauses, see *Oracle Database SQL Reference*.

Examples of model filters are provided in [Table 25–43](#).

Table 25–43 Sample Values for the Model Filter Parameter

Sample Value	Meaning
<code>'mymodel'</code>	Import the model named <code>mymodel</code> .
<code>'mymodel2, mymodel3'</code>	Import the models named <code>mymodel2</code> and <code>mymodel3</code> .
<code>'name= 'mymodel'''</code>	Import the model named <code>mymodel</code> .
<code>'name IN ('mymodel2', 'mymodel3')'</code>	Import the models named <code>mymodel2</code> and <code>mymodel3</code> .

Table 25–43 (Cont.) Sample Values for the Model Filter Parameter

Sample Value	Meaning
'name LIKE 'AI%''	Import all models that have names starting with AI.
'ALGORITHM_NAME = 'NAIVE_BAYES'''	Import all Naive Bayes models. See Table 25–2 for a list of algorithm names.
'FUNCTION_NAME = 'CLASSIFICATION'''	Import all classification models. See Table 25–1 for a list of mining functions.

Examples

This example shows a model being exported and imported within the schema `dmuser2`. Then the same model is imported into the `dmuser3` schema. The `dmuser3` user has the `IMPORT_FULL_DATABASE` privilege.

```
SQL>CONNECT dmuser2/dmuser2_psw
SQL>SELECT name FROM dm_user_models;
NAME
-----
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out', 'DATA_PUMP_DIR',
                                           'name = 'NMF_SH_SAMPLE''');
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                                           'DATA_PUMP_DIR', 'name = 'NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL>CONNECT dmuser3/dmuser3_psw
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                                           'DATA_PUMP_DIR', 'name = 'NMF_SH_SAMPLE'',
                                           'IMPORT', NULL, 'nmf_imp_job', 'dmuser2:dmuser3');
```

The following example shows user `MARY` importing all models from a dump file, `model_exp_001.dmp`, which was created by user `SCOTT`. The dump file is located in the file system directory mapped to a directory object called `DM_DUMP`. If user `MARY` does not have `IMPORT_FULL_DATABASE` privileges, `IMPORT_MODEL` will raise an error.

```
-- import all models
DECLARE
  file_name      VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
    filename=>file_name,
    directory=>'DM_DUMP',
    schema_remap=>'SCOTT:MARY');
  DBMS_OUTPUT.PUT_LINE(
'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

RANK_APPLY Procedure

This procedure ranks the results of an `APPLY` operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
    apply_result_table_name      IN VARCHAR2,
    case_id_column_name         IN VARCHAR2,
    score_column_name           IN VARCHAR2,
    score_criterion_column_name IN VARCHAR2,
    ranked_apply_result_tab_name IN VARCHAR2,
    top_N                       IN INTEGER DEFAULT 1,
    cost_matrix_table_name      IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name    IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–44 RANK_APPLY Procedure Parameters

Parameter	Description
<code>apply_result_table_name</code>	Name of the table or view containing the results of an <code>APPLY</code> operation on the test dataset (see Usage Notes)
<code>case_id_column_name</code>	Name of the case identifier column. This must be the same as the one used for generating <code>APPLY</code> results.
<code>score_column_name</code>	Name of the prediction column in the apply results table
<code>score_criterion_column_name</code>	Name of the probability column in the apply results table
<code>ranked_apply_result_tab_name</code>	Name of the table containing the ranked apply results
<code>top_N</code>	Top N predictions to be considered from the <code>APPLY</code> results for precision recall computation
<code>cost_matrix_table_name</code>	Name of the cost matrix table
<code>apply_result_schema_name</code>	Name of the schema hosting the <code>APPLY</code> results table
<code>cost_matrix_schema_name</code>	Name of the schema hosting the cost matrix table

Usage Notes

You can use `RANK_APPLY` to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of `RANK_APPLY` is similar to that of `APPLY` with respect to other DDL-like operations such as `CREATE_MODEL`, `DROP_MODEL`, and `RENAME_MODEL`. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from `APPLY`.

The main intended use of `RANK_APPLY` is for the generation of the final `APPLY` results against the scoring data in a production setting. You can apply the model against test

data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The `case_id` column will be the same case identifier column as that of the apply results.

Classification Models — NB, ABN, SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id      VARCHAR2/NUMBER,
prediction    NUMBER,
probability   NUMBER,
cost         NUMBER,
rank         INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id      VARCHAR2/NUMBER,
prediction    VARCHAR2,
probability   NUMBER,
cost         NUMBER,
rank         INTEGER)
```

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id      VARCHAR2/NUMBER,
cluster_id    NUMBER,
probability   NUMBER,
rank         INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id      VARCHAR2/NUMBER,
feature_id    NUMBER,
match_quality NUMBER,
rank         INTEGER)
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if build data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
*/

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name      => 'census_apply_result',
  case_id_column_name          => 'person_id',
  score_column_name            => 'prediction',
  score_criterion_column_name  => 'probability',
  ranked_apply_result_tab_name => 'census_ranked_apply_result',
  top_N                         => 3,
  cost_matrix_table_name       => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

RENAME_MODEL Procedure

This procedure renames a mining model to a specified new name.

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
    model_name          IN VARCHAR2,
    new_model_name     IN VARCHAR2);
```

Parameters

Table 25–45 *RENAME_MODEL Procedure Parameters*

Parameter	Description
model_name	Old name of the model
new_model_name	New name of the model (See "Model Names" on page 25-5)

Usage Notes

You can use `RENAME_MODEL` to rename an existing mining model.

The behavior of the `RENAME_MODEL` is similar to a SQL DDL `RENAME` operation. It blocks `DROP_MODEL` and `CREATE_MODEL` operations. It does not block `APPLY`, which is a SQL query-like operation that does not update any model data.

If an `APPLY` operation is using a model, and you attempt to rename the model during that time, the `RENAME` will succeed and `APPLY` will return indeterminate results. This is in line with the conventional behavior in the RDBMS, where DDL operations do not block on query operations.

Examples

Assume the existence of a model `census_model`. The following example shows how to rename this model.

```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name      => 'census_model',
    new_model_name => 'census_new_model');
END;
/
```

DBMS_DATA_MINING_TRANSFORM

The `DBMS_DATA_MINING_TRANSFORM` package contains a set of data transformation utilities that prepare data for data mining. Once you have prepared the data, you can use it to build and score models using the `DBMS_DATA_MINING` package or the Oracle Data Mining (ODM) Java API. You can also score models using the SQL scoring functions for data mining.

`DBMS_DATA_MINING_TRANSFORM` is an open-source PL/SQL package. You can use the routines in this package to prepare your data for data mining, or you can develop your own routines based on the public source code.

The source code, interface definitions, and inline documentation are available in `$ORACLE_HOME/rdbms/admin/dbmsdmxf.sql`.

See Also:

- [Chapter 25, "DBMS_DATA_MINING"](#). This package provides routines for building, scoring, exporting, and importing models. It also provides functions that return information about models.

 - Types
 - Transformation Methods
 - Steps in Defining a Transformation
 - Sample Transformation
- [Summary of DBMS_DATA_MINING_TRANSFORM Subprograms](#)

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics which relate to using the DBMS_DATA_MINING_TRANSFORM package.

- [Overview](#)
- [Types](#)
- [Transformation Methods](#)
- [Steps in Defining a Transformation](#)
- [Sample Transformation](#)

Overview

The DBMS_DATA_MINING_TRANSFORM package serves two purposes:

- It is a basic utility package for preprocessing data for data mining.
- It is an open-source learning tool that shows how to use SQL to perform common data transformations for data mining. The inputs and outputs for routines in this package are simple views and tables that are not Oracle proprietary. You can study the source code to help you create data transforms that are specific to your own application data. The source code for this package is in `dbmsdmxf.sql` in the `rdbms/admin` directory under `$ORACLE_HOME`.

Note: Use of the DBMS_DATA_MINING_TRANSFORM package is not required by Oracle Data Mining. You can develop your own preprocessing utilities or use third-party tools customized for your application.

The main principle behind the design of DBMS_DATA_MINING_TRANSFORM is the fact that SQL has enough power to perform most of the common mining transforms efficiently. For example, binning can be done using CASE expressions or DECODE functions, and linear normalization is a simple algebraic expression of the form $(x - \text{shift})/\text{scale}$ where x is the data value that is being transformed.

However, the queries that perform the transforms can be rather lengthy. So it is desirable to have some convenience routines that will help in generating queries. Thus, the goal of this package is to provide query generation services for the most common mining transforms, as well as to provide a framework that can be easily extended for implementing other transforms.

Note on Notation: This chapter uses standard interval notation for number sets:

- **[a,b]** is the set of all real numbers greater than or equal to **a** and less than or equal to **b**
- **[a,b)** is the set of all real numbers greater than or equal to **a** and less than **b**.

(**b** is in the set **[a,b]**; **b** is not in the set **[a,b)**.)

Subscripts do not conform to standard notation; instead "X_N" is used for "X_N."

See Also: Sample data mining programs are available with Oracle Data Mining. These programs include sample data transformations using DBMS_DATA_MINING_TRANSFORM. Instructions for using the sample programs are provided in the *Oracle Data Mining Administrator's Guide*.

Types

Table 26–1 Summary of Data Types

Data Type	Purpose
Column_List	List of column names representing mining attributes, defined to be <code>VARRAY(1000) of VARCHAR2(32)</code> .

Transformation Methods

The DBMS_DATA_MINING_TRANSFORM package supports binning, normalization, winsorizing and clipping, and missing value transformations.

Binning

Binning involves mapping both continuous and discrete values to discrete values of reduced cardinality. For example, the age of persons can be binned into discrete numeric bins: 1-20 to 1, 21-40 to 2, and so on. Popular car manufacturers such as Ford, Chrysler, BMW, Volkswagen can be binned into discrete categorical bins: {Ford, Chrysler} to US_Car_Makers, and {BMW, Volkswagen} to European_Car_Makers.

DBMS_DATA_MINING_TRANSFORM supports binning for both categorical and numerical attributes. Categorical attributes have VARCHAR2/CHAR data types; numerical attributes have NUMBER data types.

Top-N Frequency Categorical Binning

The bin definition for each attribute is computed based on the occurrence frequency of values that are computed from the data. The user specifies a particular number of bins, say N. Each of the bins bin₁,..., bin_N corresponds to the values with top frequencies. The bin bin_{N+1} corresponds to all remaining values.

Equi-Width Numerical Binning

The bin definition for each attribute is computed based on the minimum and maximum values that are computed from the data. The user specifies a particular number of bins, say N. Each of the bins bin₁,..., bin_N span ranges of equal width of size $inc = (max - min)/N$, bin₀ spans (-inf, min) and bin_(N+1) spans (max, + inf). When N is not specified, it can be estimated from the data.

Quantile Numerical Binning

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin₁,..., bin_N span the following ranges: bin₁ spans [min₁,min₂]; bin₂,..., bin_i,..., bin_{N-1} span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Normalization

Normalization involves scaling continuous values down to a specific range, such as [-1.0,1.0] or [0.0,1.0] such that $x_{new} = (x_{old} - shift) / scale$. Normalization applies only to numerical attributes.

Min-Max Normalization

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are $shift = min$, and $scale = (max - min)$ respectively.

Scale Normalization

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are $shift = 0$ and $scale = \max\{abs(max), abs(min)\}$.

Z-Score Normalization

The normalization definition for each attribute is computed based on the values for mean and standard deviation that are computed from the data. The values for shift

and `scale` are computed to be `shift = mean`, and `scale = standard deviation` respectively.

Winsorizing and Trimming (Clipping)

Some computations on attribute values can be significantly affected by extreme values. One approach to achieving a more robust computation is to either Winsorize or trim the data as a preprocessing step.

Winsorizing involves setting the tail values of a particular attribute to some specified value. For example, for a 90% Winsorization, the bottom 5% are set equal to the minimum value in the 6th percentile, while the upper 5% are set equal to the value corresponding to the maximum value in the 95th percentile.

Trimming "removes" the tails in the sense that trimmed values are ignored in further values. This is achieved by setting the tails to `NULL`.

Missing Value Treatment

Missing Value treatment involves replacing `NULL` values in the data. Missing Value treatment is recommended when the fraction of missing values is high compared to the overall attribute value set. If the data contains relatively few missing values, you might choose to simply delete those records for the purpose of data mining.

If you want to replace missing values and you know or suspect what the values should be, you can use that knowledge to replace the `NULLs`. If you suspect that the `NULLs` may be random omissions, you can determine a meaningful value for them.

`DBMS_DATA_MINING_TRANSFORM INSERT` routines handle missing values by replacing `NULLs` in numerical attributes with the mean attribute value, and by replacing `NULLs` in categorical attributes with the mode.

Steps in Defining a Transformation

DBMS_DATA_MINING_TRANSFORM provides routines that define CREATE, INSERT, and XFORM operations. To define a data transformation, perform the following steps:

1. Use a CREATE routine to create a transformation definition table with a pre-defined set of columns.
2. Use an INSERT routine to populate the table with transformation definitions for selected attributes.
3. Use an XFORM routine to create a view of the transformation definition table.

Creating a Transformation Definition Table

Use the following procedures to create transformation definition tables:

- CREATE_BIN_NUM and CREATE_BIN_CAT to create bin definition tables.
- CREATE_NORM_LIN to create a normalization definition table.
- CREATE_CLIP to create a clipping definition table.
- CREATE_MISS_NUM and CREATE_MISS_CAT to create missing value treatment definition tables.

Usually, the consistency and integrity of transform definition tables is guaranteed by the creation process. Alternatively, it can be achieved by leveraging an integrity constraints mechanism. This can be done either by altering the tables created with CREATE routines, or by creating the tables manually with the necessary integrity constraints.

Defining a Transformation

The most common way of defining a transformation (populating the transformation definition tables) for each attribute is based on data inspection using some predefined methods (also known as automatic transform definition). Some of the most popular methods have been captured by the INSERT routines in DBMS_DATA_MINING_TRANSFORM. For example, the z-score normalization method estimates mean and standard deviation from the data to be used as a shift and scale parameters of the linear normalization transform.

Use the following procedures to populate the transformation definition tables:

- INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, and INSERT_AUTOBIN_NUM_EQWIDTH for binning numerical attributes, and INSERT_BIN_CAT_FREQ for binning categorical attributes.
- INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, or INSERT_NORM_LIN_ZSCORE for normalizing numerical attributes.
- INSERT_CLIP_WINZOR_TAIL for winsorizing numerical attributes or INSERT_CLIP_TRIM_TAIL for clipping numerical attributes.
- INSERT_MISS_NUM_MEAN for missing value treatment of numerical attributes, and INSERT_MISS_CAT_MODE for missing value treatment of categorical attributes.

You can invoke these routines several times to transform all relevant attributes from various data sources until the definition table fully represents all mining attributes for a given problem.

After performing automatic transform definitions, some or all of the definitions can be adjusted by issuing SQL DML statements against the transform definition tables, thus providing virtually infinite flexibility in defining custom transforms.

The `INSERT` routines enable flexible transformation definitions in several ways:

- The data provided to the `INSERT` routines does not necessarily have to be the data used for a particular model creation. It can be any data that contains adequate representation of the mining attributes.
- The `INSERT` routines can be called any number of times against the same or different dataset until all the attributes have their transformations defined. You can selectively exclude one or more attributes for a particular iteration of the `INSERT`. In the most extreme case, each individual attribute can potentially have a unique transformation definition.
- You do not have to separately feed in numerical and categorical attributes, since categorical binning automatically skips over `NUMBER` columns in your table, and numerical binning, normalization, and clipping routines skip over `VARCHAR2` / `CHAR` columns in your input data.

Generating the Query for a Transform

Query generation is driven by the simple transform-specific definition tables with predefined columns. Query generation routines should be viewed as macros, and transformation definition tables as parameters used in macro expansions. Similar to using `#define` macros in the C language, the invoker is responsible for ensuring the correctness of the expanded macro, that is, that the result is a valid SQL query.

You can generate the views representing the transformation queries with the following procedures:

- `XFORM_BIN_NUM`, and `XFORM_BIN_CAT` for binning
- `XFORM_NORM_LIN` for normalization
- `XFORM_CLIP` for clipping
- `XFORM_MISS_NUM` and `XFORM_MISS_CAT` for missing value treatment

If your data contains a combination of numerical and categorical attributes, you must essentially feed the results of one transformation step to the next step. For example, the results of `XFORM_BIN_CAT` can be fed to `XFORM_BIN_NUM` or vice versa. The order is irrelevant since numerical and categorical transforms work on disjoint sets of attributes.

Sample Transformation

Given a dataset for a particular mining problem, any preprocessing and transformations on the mining data must be uniform across all mining operations. In other words, if the build data is preprocessed according to a particular transformation definition, then it follows that the test data and the scoring data must be preprocessed using the same definition.

The general usage of routines in this package can be explained using this example. Assume that your input table contains both numerical and categorical data that requires binning. A possible sequence of operations will be:

1. Invoke `CREATE_BIN_NUM` to generate an empty numerical bin definition table.
2. Invoke `INSERT_BIN_NUM_EQWIDTH` to define the transformations for all numerical attributes in the build data input. (For the sake of simplicity, let us assume that all numerical values are to be binned into 10 bins.) If you are binning for an O-Cluster model, use `INSERT_AUTOBIN_NUM_EQWIDTH`.
3. Next invoke `XFORM_BIN_NUM` with the numerical bin table and the build data table as inputs. The resulting object is a view that represents a SQL query against the build data table that performs numerical binning. Assume that you have named this result object `build_bin_num_view`.
4. Since you still have the categorical attributes to be binned, invoke `CREATE_BIN_CAT` to create a categorical bin definition table.
5. Next, invoke `INSERT_BIN_CAT_FREQ` to define the transforms for all categorical attributes. (For the sake of simplicity, let us assume that all categorical attributes are to be binned into 10 bins.)
6. As the final step, invoke `XFORM_BIN_CAT` with the categorical bin table and the view name provided by `XFORM_BIN_NUM`, namely `build_bin_num_view`, as the inputs. This essentially amounts to combining the transformations from both stages.
7. The object resulting from this operation is a view that represents a SQL query against your build data table, influenced by the contents of the bin definition tables. Provide this view name as the data input to the `CREATE_MODEL` procedure in the `DBMS_DATA_MINING` package.

If this happens to be a classification model, and you want to `APPLY` this model to scoring data, you must prepare the scoring data similar to the build data. You can achieve this in two simple steps:

1. First, call `XFORM_BIN_NUM` with the scoring data table and the numerical bin boundary table as inputs. The resulting object is a view that represents an SQL query against your scoring data table, influenced by the contents of the numerical bin boundary table. Assume that you have named this result object `apply_bin_num_view`.
2. As the next and final step, invoke `XFORM_BIN_CAT` with the categorical bin table and the view name provided by `XFORM_BIN_NUM`, namely `apply_bin_num_view`, as the inputs.
3. The object resulting from this operation is now a view that represents a SQL query against your scoring data table, influenced by the contents of the bin definition tables. Provide this view name as the data input to the `APPLY` procedure in the `DBMS_DATA_MINING` package.

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 26–2 DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
CREATE_BIN_CAT Procedure on page 26-12	Creates a categorical bin definition table
CREATE_BIN_NUM Procedure on page 26-13	Creates a numerical bin definition table
CREATE_CLIP Procedure on page 26-14	Creates a clipping definition table
CREATE_MISS_CAT Procedure on page 26-15	Creates a categorical missing value treatment definition table
CREATE_MISS_NUM Procedure on page 26-16	Creates a numerical missing value treatment definition table
CREATE_NORM_LIN Procedure on page 26-17	Creates a normalization definition table
INSERT_AUTOBIN_NUM_EQWIDTH Procedure on page 26-18	Populates the numerical bin definition table, using the number of bins estimated from the data
INSERT_BIN_CAT_FREQ Procedure on page 26-20	Populates the categorical bin definition table, applying frequency-based binning to the categorical input data
INSERT_BIN_NUM_EQWIDTH Procedure on page 26-22	Populates the numerical bin definition table, applying equi-width binning to the numerical input data
INSERT_BIN_NUM_QTILE Procedure on page 26-24	Populates the numerical bin definition table, applying quantile binning to the numerical input data
INSERT_CLIP_TRIM_TAIL Procedure on page 26-26	Populates the clipping definition table, applying trimming based on tail fraction to the numerical input data
INSERT_CLIP_WINSOR_TAIL Procedure on page 26-28	Populates the clipping definition table, applying Winsorizing based on tail fraction to the numerical input data
INSERT_MISS_CAT_MODE Procedure on page 26-30	Populates the categorical missing value treatment definition table, applying the mode to each missing value
INSERT_MISS_NUM_MEAN Procedure on page 26-31	Populates the numerical missing value treatment definition table, applying the mean to each missing value
INSERT_NORM_LIN_MINMAX Procedure on page 26-32	Populates the normalization definition table, applying min-max normalization to the numerical input data
INSERT_NORM_LIN_SCALE Procedure on page 26-33	Populates the normalization definition table, applying scale normalization to the numerical input data
INSERT_NORM_LIN_ZSCORE Procedure on page 26-34	Populates the normalization definition table applying z-score normalization to the numerical input data
XFORM_BIN_CAT Procedure on page 26-35	Creates the view representing the transformed output with binned categorical data
XFORM_BIN_NUM Procedure on page 26-37	Creates the view representing the transformed output with binned numerical data
XFORM_CLIP Procedure on page 26-40	Creates the view representing the transformed output with clipped numerical data

Table 26-2 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
XFORM_MISS_CAT Procedure on page 26-42	Creates the view representing the transformed output with categorical missing value treatment
XFORM_MISS_NUM Procedure on page 26-43	Creates the view representing the transformed output with numerical missing value treatment
XFORM_NORM_LIN Procedure on page 26-44	Creates the view representing the transformed output with normalized numerical data

CREATE_BIN_CAT Procedure

This procedure creates a categorical binning definition table. This table is used as input to the `INSERT_BIN_CAT_FREQ` and `XFORM_BIN_CAT` procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (  
    bin_table_name     IN VARCHAR2,  
    bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–3 CREATE_BIN_CAT Procedure Parameters

Parameter	Description
<code>bin_table_name</code>	Name of the bin definition table
<code>bin_schema_name</code>	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
<code>col</code>	<code>VARCHAR2(30)</code>
<code>val</code>	<code>VARCHAR2(4000)</code>
<code>bin</code>	<code>VARCHAR2(4000)</code>

Examples

```
BEGIN  
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('build_bin_cat_table');  
END;
```

CREATE_BIN_NUM Procedure

This procedure creates a numerical binning definition table. This table is used as input to the INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, INSERT_AUTOBIN_NUM_EQWIDTH, and XFORM_BIN_NUM procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
    bin_table_name    IN VARCHAR2,
    bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–4 CREATE_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
bin_schema_name	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2 (30)
val	NUMBER
bin	VARCHAR2 (4000)

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('build_bin_num_table');
END;
```

CREATE_CLIP Procedure

This procedure creates a clipping definition table. This table is used as input to the INSERT_CLIP_WINSOR_TAIL, INSERT_CLIP_TRIM_TAIL, and XFORM_CLIP procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
    clip_table_name    IN VARCHAR2,
    clip_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–5 CREATE_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table
clip_schema_name	Name of the schema hosting the clipping definition table

Usage Notes

The generated clipping definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
lcut	NUMBER
lval	NUMBER
rcut	NUMBER
rval	NUMBER

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('build_clip_table');
END;
```

CREATE_MISS_CAT Procedure

This procedure creates a categorical missing value treatment definition table. This table is used as input to the INSERT_MISS_CAT_MODE procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
    miss_table_name      IN VARCHAR2,
    miss_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–6 CREATE_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table

Usage Notes

The generated categorical missing value treatment definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2 (30)
val	VARCHAR2 (4000)

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('build_miss_cat_table');
END;
```

CREATE_MISS_NUM Procedure

This procedure creates a numerical missing value treatment definition table. This table is used as input to the `INSERT_MISS_NUM_MEAN` procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–7 CREATE_MISS_NUM Procedure Parameters

Parameter	Description
<code>miss_table_name</code>	Name of the numeric missing value treatment definition table
<code>miss_schema_name</code>	Name of the schema hosting the numeric missing value treatment definition table

Usage Notes

The generated numeric missing value definition table will have the following columns.

Column Name	Data Type
<code>col</code>	<code>VARCHAR2 (30)</code>
<code>val</code>	<code>NUMBER</code>

Example

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('build_miss_num_table');
END;
```

CREATE_NORM_LIN Procedure

This procedure creates a linear normalization definition table. This table is used as input to the INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, INSERT_NORM_LIN_ZSCORE, and XFORM_NORM_LIN procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–8 CREATE_NORMALIZE_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table
norm_schema_name	Name of the schema hosting the normalization definition table

Usage Notes

The generated linear normalization definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
shift	NUMBER
scale	NUMBER

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('build_norm_table');
END;
```

INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every numerical column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using `CREATE_BIN_NUM`. Based on the statistical information it collects on the input data, this procedure calculates the number of bins.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table.

N , the number of bins, is computed for each column separately and is based on the number of non-NULL values (`cnt`), the maximum (`max`), the minimum (`min`), the standard deviation (`dev`) and the constant $C=3.49/0.9$ as follows:

$$N = \text{floor}(\text{power}(\text{cnt}, 1/3) * (\text{max} - \text{min}) / (\text{c} * \text{dev}))$$

Each of the `bin_num` ($= N$) bins `bin_1, ..., bin_N` span ranges of equal width $\text{inc} = (\text{max} - \text{min}) / N$ where `bin_I = I` when $N > 0$ or `bin_I = N+1-I` when $N < 0$, and `bin_0 = bin_(N+1) = NULL`. The values of the `val` column are rounded to `round_num` significant digits prior to scoring them in the definition table.

The parameter `bin_num` is used to adjust N to be at least `bin_num`. No adjustment is done when `bin_num` is NULL or 0. The parameter `max_bin_num` is used to adjust N to be at most `max_bin_num`. No adjustment is done when `bin_num` is NULL or 0. For columns with all integer values (discrete columns), N is adjusted to be at most the maximum number of distinct values in the observed range $\text{max} - \text{min} + 1$.

The parameter `sample_size` is used to adjust `cnt` to be at most `sample_size`. No adjustment is done when `sample_size` is NULL or 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 3,
  max_bin_num        IN PLS_INTEGER DEFAULT 100,
  exclude_list       IN Column_List DEFAULT NULL,
  round_num          IN PLS_INTEGER DEFAULT 6,
  sample_size        IN PLS_INTEGER DEFAULT 50000,
  bin_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–9 INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

Parameter	Description
<code>bin_table_name</code>	Name of the categorical bin table generated using <code>CREATE_BIN_NUM</code> procedure
<code>data_table_name</code>	Name of the table containing the data
<code>bin_num</code>	Minimum number of bins; default number is 3
<code>max_bin_num</code>	Maximum number of bins that sets the upper limit for estimates of bin numbers; default is 100

Table 26–9 (Cont.) INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
<code>exclude_list</code>	List of columns (attributes) to be excluded from this iteration of the binning process; categorical attributes are automatically excluded
<code>round_num</code>	Number of significant digits; default is 6
<code>sample_size</code>	Size of the data sample; default is 50,000
<code>bin_schema_name</code>	Name of the schema hosting the bin definition table; default is user schema
<code>data_schema_name</code>	Name of the schema hosting the table with data; default is user schema

Usage Notes

For a given input table, you can call this routine several times with different specifications for number of bins for a given input table. For each call, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. The sign of `bin_num`, `max_bin_num`, and `sample_size` have no effect on the result; absolute values are used. The value adjustment of N is done in the following order: First `bin_num`, next, `max_bin_num`, and, finally, discrete column adjustment.

Examples

The simplest invocation of this routine populates bin definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQUIWIDTH(
    'num_bin_table', 'build_data_table');
END;
/
```

INSERT_BIN_CAT_FREQ Procedure

This procedure finds the categorical binning definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the categorical binning definition table created using CREATE_BIN_CAT.

Definition for each relevant column is computed based on the occurrence frequency of column values that are computed from the data table. Each of the bin_num(N) bins bin_1, ..., bin_N corresponds to the values with top frequencies when $N > 0$ or bottom frequencies when $N < 0$, and bin_(N+1) to all remaining values, where bin_I = I. Ordering ties among identical frequencies are broken by ordering on column values (ASC for $N > 0$ or DESC for $N < 0$). When the number of distinct values $C < N$ only C+1 bins will be created.

The parameter default_num (D) is used for pruning based on the number of values that fall into the default bin. When $D > 0$ only columns that have at least D defaults are kept while others are ignored. When $D < 0$ only columns that have at most D values are kept. No pruning is done when D is NULL or $D = 0$. Parameter bin_support (SUP) is used for restricting bins to frequent ($SUP > 0$) values $frq \geq SUP * tot$, or infrequent ($SUP < 0$) ones $frq \leq -SUP * tot$, where frq is a given value count and tot is a sum of all counts as computed from the data. No support filtering is done when SUP is NULL or when $SUP = 0$.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    bin_num             IN PLS_INTEGER DEFAULT 9,
    exclude_list       IN Column_List DEFAULT NULL,
    default_num        IN PLS_INTEGER DEFAULT 2,
    bin_support         NUMBER DEFAULT NULL,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–10 INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
default_num	Number of default values
bin_support	Bin support as a fraction
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all NULLs are ignored. No bin definitions are populated when `bin_num = 0`, or `bin_num`, is NULL.

Examples

The simplest invocation of this routine populates bin definitions in the `cat_bin_table` for all the categorical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
    'cat_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table. Each of the bin_num (= N) bins bin₁, ..., bin_N span ranges of equal width $inc = (max - min) / N$ where bin_I = I when N > 0 or bin_I = N+1-I when N < 0, and bin₀ = bin_(N+1) = NULL.

The values of the val column in the bin definition table are rounded to round_num significant digits. For more information, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    bin_num             IN PLS_INTEGER DEFAULT 10,
    exclude_list       IN Column_List DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–11 INSERT_BIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
round_num	Number of significant digits. See Usage Notes.
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. No bin definitions are populated when bin_num = 0, or bin_num is NULL.

For example, when N=2, col='mycol', min=10, and max = 21, the following three rows are inserted into the definition table (inc = 5.5):

```
COL      VAL  BIN
-----
mycol    10  NULL
```

```
mycol 15.5 1
mycol  21  2
```

The `round_num` parameter specifies how to round the number in the `VAL` column of the definition table. When `round_num` is positive, it specifies the most significant digits to retain. When `round_num` is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. When `round_num` is 0, the value is unchanged.

For example, a value of 308.162 would be rounded as follows.

```
For a value of 308.162:
  when round_num = 1      result is 300
  when round_num = 2      result is 310
  when round_num = 3      result is 308
  when round_num = 0      result is 308.162
  when round_num = -1     result is 308.16
  when round_num = -2     result is 308.2
  when round_num = NULL   result is NULL
```

Examples

The simplest invocation of this routine populates bin definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
    'num_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_QTILE Procedure

This procedure finds a numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the binning definition table that was created using CREATE_BIN_NUM.

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin_1,..., bin_N span the following ranges: bin_1 spans [min_1,min_2]; bin_2,..., bin_i,..., bin_N-1 span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 10,
  exclude_list       IN Column_List DEFAULT NULL,
  bin_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–12 INSERT_BIN_NUM_QTILE Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using the CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
bin_schema_name	Name of the schema hosting the numerical binning definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for bin_num for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When N = 4, col='mycol', and data is {1,2,2,2,2,3,4}, the following three rows are inserted into the definition table:

```
COL      VAL      BIN
-----
mycol    1      NULL
mycol    2         1
mycol    4         2
```

Here quantities are {1,2}, {2,2}, {2,3}, {4} and min(1) = 1, min(2) = 2, min(3) = 2, min(4) = 4, max(4) = 4, and ranges are [1,2], (2,2], (2,4], (4,4]. After collapsing [1,2] and (2,4].

Examples

The simplest invocation of this routine populates numerical binning definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
    'num_bin_table', 'build_table');
END;
```

INSERT_CLIP_TRIM_TAIL Procedure

This procedure finds the trimming definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

The definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that $val(1) < val(2) < \dots < val(N)$, where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = NULL
rcut = val(N-floor(*N*q))
rval = NULL
```

where $q = ABS(NVL(tail_frac,0))$. Nothing is done when $q \geq 0.5$.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  tail_frac            IN NUMBER DEFAULT 0.025,
  exclude_list         IN Column_List DEFAULT NULL,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–13 INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using the CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification.

Example 1. When $q = 0.2$, $col='mycol'$, and data is $\{1,2,2,2,3,4,4\}$, the following row is inserted into the definition table:

```
COL      LCUT   LVAL   RCUT   RVAL
-----
mycol    2      NULL   4      NULL
```

Here $1 + \text{floor}(N*q) = 1 + \text{floor}(7*0.2) = 2$, $lcut = val(2) = 2$.

$N - \text{floor}(N*q) = 7 - \text{floor}(7*0.2) = 6$, $\text{rcut} = \text{val}(6) = 4$.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL(
    'clip_table', 'build_table');
END;
```

INSERT_CLIP_WINSOR_TAIL Procedure

This procedure finds the Winsorizing definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

Definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that $val(1) < val(2) < \dots < val(N)$, where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = lcut
rcut = val(N-floor(N*q))
rval = rcut
```

where $q = ABS(NVL(tail_frac,0))$. Nothing is done when $q \geq 0.5$.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  tail_frac            IN NUMBER DEFAULT 0.025,
  exclude_list         IN Column_List DEFAULT NULL,
  clip_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–14 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attribute (that is, column names using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When $q = 0.2$, $col='mycol'$, and data is $\{1,2,2,2,3,4,4\}$, the following row is inserted into the definition table:

```
COL      LCUT   LVAL   RCUT   RVAL
-----
mycol    2       2      4      4
```

Here $1 + \text{floor}(N*q) = 1 + \text{floor}(7*0.2) = 2$, $lcut = val(2) = 2$.

$N - \text{floor}(N*q) = 7 - \text{floor}(7*0.2) = 6$, $\text{rcut} = \text{val}(6) = 4$.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL(
    'clip_table', 'build_table');
END;
```

INSERT_MISS_CAT_MODE Procedure

This procedure finds the categorical missing value treatment definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_CAT.

The definition for each selected column is computed based on the mode value that is computed from the data table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–15 INSERT_MISS_CAT_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the missing value treatment. See Table 26–1, "Summary of Data Types" for the definition of COLUMN_LIST.
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the categorical attributes that will receive missing value treatment by using the `exclude_list` parameter. NULL values in all the selected attributes will be replaced with the mode (the most commonly occurring value) for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in `miss_table` for all categorical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
        'miss_table', 'build_table');
END;
```

INSERT_MISS_NUM_MEAN Procedure

This procedure finds the numerical missing value treatment definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_NUM.

The definition for each selected column is computed based on the mean value that is computed from the data table. The value of mean is rounded to round_num significant digits prior to storing it in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–16 INSERT_MISS_NUM_MEAN Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the miss value treatment. See Table 26–1, "Summary of Data Types" for the definition of COLUMN_LIST.
round_num	The number of significant digits
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the numerical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mean (average) value for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN(
        'miss_table', 'build_table');
END;
```

INSERT_NORM_LIN_MINMAX Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the mean and standard deviation that are computed from the data table, such that $\text{shift} = \text{mean}$ and $\text{scale} = \text{standard deviation}$. The values of shift and scale are rounded to `round_num` significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
    norm_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN Column_List DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–17 INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description
<code>norm_table_name</code>	Name of the normalization table generated using CREATE_NORM_LIN procedure
<code>data_table_name</code>	Name of the table containing the data
<code>exclude_list</code>	List of columns (attributes) to be excluded from this iteration of the normalization process
<code>round_num</code>	Number of significant digits
<code>norm_schema_name</code>	Name of the schema hosting the normalization definition table
<code>data_schema_name</code>	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the `exclude_list` parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the `norm_minmax_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
        'norm_minmax_table', 'build_table');
END;
```

INSERT_NORM_LIN_SCALE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for `shift` and `scale` are `shift = 0` and `scale = max{abs(max), abs(min)}`.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
    norm_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN Column_List DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–18 INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description
<code>norm_table_name</code>	Name of the normalization table generated using CREATE_NORM_LIN procedure
<code>data_table_name</code>	Name of the table containing the data
<code>exclude_list</code>	List of columns (attributes) to be excluded from this iteration of the normalization process
<code>round_num</code>	Number of significant digits
<code>norm_schema_name</code>	Name of the schema hosting the normalization definition table
<code>data_schema_name</code>	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the `exclude_list` parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the `norm_minmax_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE(
        'norm_scale_table', 'build_table');
END;
```

INSERT_NORM_LIN_ZSCORE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on z-score normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table, such that $\text{shift} = \text{min}$ and $\text{scale} = \text{max} - \text{min}$. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    exclude_list         IN Column_List DEFAULT NULL,
    round_num            IN PLS_INTEGER DEFAULT 6,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–19 INSERT_BIN_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_zscore_table for all the numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
        'norm_zscore_table', 'build_table');
END;
/
```

XFORM_BIN_CAT Procedure

This procedure creates the view that performs categorical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–20 XFORM_BIN_CAT Procedure Parameters

Parameter	Description
<code>bin_table_name</code>	Name of the categorized binning definition table generated using <code>CREATE_BIN_CAT</code> procedure
<code>data_table_name</code>	Name of the table containing the data
<code>xform_view_name</code>	View representing the transformed output
<code>literal_flag</code>	Literal flag
<code>bin_schema_name</code>	Name of the schema hosting the bin definition table
<code>data_schema_name</code>	Name of the schema hosting the data table
<code>xform_schema_name</code>	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by `CREATE_BIN_CAT` and populated with bin definitions by `INSERT_BIN_CAT_FREQ` is used to guide the query generation process to construct categorical binning expressions of the following form:

```
DECODE("col", val_1, bin_1,
        ...
        val_N, bin_N,
        NULL, NULL,
        bin_(N+1)) "col"
```

This expression maps values `val_1, ..., val_N` into `N` bins `bin_1, ..., bin_N`, and other values into `bin_(N+1)`, while `NULL` values remain unchanged. `bin_(N+1)` is optional. If not specified, it defaults to `NULL`. To specify `bin_(N+1)` provide a row with `val` set to `NULL`.

The `literal_flag` parameter indicates whether the values in bin are valid SQL literals. When the flag is set to `TRUE`, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to `FALSE`. One example of when it can be set to `TRUE` is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Set `literal_flag` to `TRUE` when the data is binned for an O-Cluster model build.

The `col` parameter is case-sensitive since it generates quoted identifiers. In cases when there are multiple entries with the same `col, val` combination with different `bin`, the behavior is undefined — any one of the `bin` values might be used.

Examples

Example 1. `bin_cat` contains four rows with `col = 'mycol'`:

```
{col = 'mycol', val = 'Waltham',      bin = 'MA'}
{col = 'mycol', val = 'Burlington',   bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
{col = 'mycol', val = NULL,           bin = 'OTHER'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',      'MA',
              'Burlington',    'MA',
              'Redwood Shores', 'CA',
              NULL,             NULL,
              'OTHER') "mycol"
```

Example 2. `bin_cat` contains three rows with `col = 'mycol'`:

```
{col = 'mycol', val = 'Waltham',      bin = 'MA'}
{col = 'mycol', val = 'Burlington',   bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',      'MA',
              'Burlington',    'MA',
              'Redwood Shores', 'CA') "mycol"
```

Example 3. For the definition:

```
COL  VAL          BIN
-----
mycol Waltham      1
mycol Burlington  1
mycol Redwood Shores 2
```

the following expression is generated when the `literal` flag is set to `FALSE`:

```
DECODE ("mycol", 'Waltham',      '1',
              'Burlington'      '1',
              'Redwood Shores', '2') "mycol"
```

and when the flag is set to `TRUE`:

```
DECODE("mycol", 'Waltham',      1,
              'Burlington',    1,
              'Redwood Shores', 2) "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on bin definitions in the `cat_bin_table`.

```
BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT(
'cat_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_BIN_NUM Procedure

This procedure creates the view that performs numerical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–21 XFORM_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_NUM and populated with bin definitions by INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE is used to guide the query generation process to construct numerical binning expressions of the following form:

```
CASE WHEN "col" < val_0 THEN 'bin0_0'
      WHEN "col" <= val_1 THEN 'bin_1'
      ...
      WHEN "col" <= val_N THEN 'bin_N'
      WHEN "col" IS NOT NULL THEN 'bin_(N+1)'
END "col"
```

This expression maps values in the range [val_0;val_N] into N bins bin_1,..., bin_N, values outside of this range into bin_0 or bin_(N+1), such that

```
(-inf; val_0) -> bin_0
[val_0; val_1) -> bin_1
...
(val_(N-1); val_N] -> bin_N
(val_N; +inf) -> bin_(N+1)
```

NULL values remain unchanged. bin_(N+1) is optional. If it is not specified, the values ("col" > val_N) are mapped to NULL. To specify bin_(N+1), provide a row with val set to NULL. The order of the WHEN... THEN pairs is based on the ascending order of val for a given col.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that col is case-sensitive since it generates quoted identifiers. In cases where there are multiple entries with the same col,val combination with different bin, the behavior is undefined — any one of the bin values might be used.

Examples

Example 1. bin_num contains four rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = 'small'}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
{col = 'mycol', val = NULL, bin = 'huge'}
```

the following expression is generated:

```
CASE WHEN "mycol" < 10      THEN 'tiny'
      WHEN "mycol" <= 15.5 THEN 'small'
      WHEN "mycol" <= 20   THEN 'large'
      WHEN "mycol" IS NOT NULL THEN 'huge'
END "mycol"
```

Example 2. bin_num contains three rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = NULL}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
```

the following expression is generated:

```
CASE WHEN "mycol" < 10      THEN NULL
      WHEN "mycol" <= 15.5 THEN 'small'
      WHEN "mycol" <= 20   THEN 'large'
END "mycol"
```

Example 3. For the definition:

```
COL  VAL  BIN
----  ---  ---
mycol 10  NULL
mycol 15.5 1
mycol 21  2
```

the following expression is generated when the literal flag is set to FALSE:

```
CASE WHEN "mycol" < 10      THEN NULL
      WHEN "mycol" <= 15.5 THEN '1'
      WHEN "mycol" <= 20   THEN '2'
END "mycol"
```

and when the flag is set to TRUE:

```
CASE WHEN "mycol" < 10 THEN NULL
      WHEN "mycol" <= 15.5 THEN 1
      WHEN "mycol" <= 20 THEN 2
      END "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on transform definitions in bin definitions in the `num_bin_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM(
    'num_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2,DEFAULT NULL,
  xform_schema_name    IN VARCHAR2,DEFAULT NULL;
```

Parameters

Table 26–22 XFORM_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```
CASE WHEN "col" < lcut THEN lval
      WHEN "col" > rcut THEN rval
      ELSE "col"
END "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

Example 1 (Winsorizing). When col = 'my_col', lcut = -1.5, lval = -1.5, and rcut = 4.5 and rval = 4.5, the following expression is generated:

```
CASE WHEN "my_col" < -1.5 THEN -1.5
      WHEN "my_col" > 4.5 THEN 4.5
      ELSE "my_col"
END "my_col"
```

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in clipping definitions in the `clip_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP(
    'clip_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_CAT Procedure

This procedure creates a view that performs categorical missing value treatment. Only the columns that are specified in the xform definition are treated; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    miss_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 26–23 XFORM_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The data type of the transformed columns is preserved by putting a CAST expression around the NVL function. For example, when col = 'state', val = 'MA' the data type is CHAR(2) the following expression is generated:

```
CAST (NVL("state", 'MA') AS CHAR(2)) "state"
```

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT(
        'miss_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_NUM Procedure

This procedure creates a view that performs numerical missing value treatment of the data table. Only the columns that are specified in the xform definition are treated, the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
  miss_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  miss_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 26–24 XFORM_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table generated using CREATE_MISS_NUM
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in missing value definitions in `miss_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM(
    'miss_table', 'build_table', 'build_view');
END;
```

XFORM_NORM_LIN Procedure

This procedure creates the view that performs linear normalization. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
  norm_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  norm_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–25 XFORM_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The normalization table created by CREATE_NORM_LIN is populated with definitions by either INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX is used to guide the query generation process to construct normalization expressions of the following form:

```
("col" - shift)/scale "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

For example, when col = 'my_col', shift = -1.5, and scale = 20. The following expression is generated:

```
("my_col" - (-1.5))/20 "my_col"
```

Examples

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on normalization definitions in the norm_minmax_table.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN(
    'norm_minmax_table', 'build_table', 'build_view');
END;
```

DBMS_DATAPUMP

The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

See Also: *Oracle Database Utilities* for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- [Using DBMS_DATAPUMP](#)
 - Overview
 - Security Model
 - Constants
- [Data Structures](#)
 - Data Structures - Object Types
- [Summary of DBMS_DATAPUMP Subprograms](#)

Using DBMS_DATAPUMP

This section contains topics that relate to using the DBMS_DATAPUMP package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)

Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and datatypes existing in Oracle Database 10g are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The existing EXP_FULL_DATABASE and IMP_FULL_DATABASE roles will be used to allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

EXP_FULL_DATABASE

The EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the EXP_FULL_DATABASE role will also grant access to the SYS schema.

IMP_FULL_DATABASE

The IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the IMP_FULL_DATABASE role will also grant access to the SYS schema.

Constants

There are several public constants defined for use with the `DBMS_DATAPUMP.GET_STATUS` procedure. All such constants are defined as part of the `DBMS_DATAPUMP` package. Any references to these constants must be prefixed by `DBMS_DATAPUMP.` and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_STATUS_WIP` `CONSTANT BINARY_INTEGER := 1;`
- `KU$_STATUS_JOB_DESC` `CONSTANT BINARY_INTEGER := 2;`
- `KU$_STATUS_JOB_STATUS` `CONSTANT BINARY_INTEGER := 4;`
- `KU$_STATUS_JOB_ERROR` `CONSTANT BINARY_INTEGER := 8;`

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_DUMPFILE_TYPE_DISK` `CONSTANT BINARY_INTEGER := 0;`
- `KU$_DUMPFILE_TYPE_TEMPLATE` `CONSTANT BINARY_INTEGER := 3;`

Data Structures

The `DBMS_DATAPUMP` package defines `OBJECT` types. The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10g, release 1 (10.1), there is a `sys.ku$_Status1010` type, and in the next Oracle Database release, there could be a `sys.ku$_Status1110` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `ku$_Status1010` is defined for the `sys.ku$_Status1010` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10g, release 1, the generic synonym `ku$_Status` is defined as `ku$_Status1010`. In a future release, there might be a `ku$_Status1110` synonym for `sys.ku$Status1110`. Because the `ku$_Status` generic synonym always points to the latest definition, it would now point to `ku$_Status1110` rather than to `ku$_Status1010`.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

Note: Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

See Also: [GET_STATUS Procedure](#) on page 27-23 for additional information about how types are used

Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- [Worker Status Types](#)
- [Log Entry and Error Types](#)
- [Job Status Types](#)
- [Job Description Types](#)
- [Status Types](#)

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The `percent_done` refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$WorkerStatus1010 AS OBJECT (
    worker_number    NUMBER,
    process_name     VARCHAR2(30),
    state            VARCHAR2(30),
    schema           VARCHAR2(30),
    name             VARCHAR2(4000),
    object_type      VARCHAR2(200),
    partition        VARCHAR2(30),
    completed_objects NUMBER,
    total_objects    NUMBER,
    completed_rows   NUMBER,
    completed_bytes  NUMBER,
    percent_done     NUMBER)

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1010
FOR sys.ku$WorkerStatus1010;

CREATE TYPE sys.ku$WorkerStatus1020 AS OBJECT (
    worker_number    NUMBER,          -- Worker process identifier
    process_name     VARCHAR2(30),    -- Worker process name
    state            VARCHAR2(30),    -- Worker process state
    schema           VARCHAR2(30),    -- Schema name
    name             VARCHAR2(4000),  -- Object name
    object_type      VARCHAR2(200),  -- Object type
    partition        VARCHAR2(30),    -- Partition name
    completed_objects NUMBER,        -- Completed number of objects
    total_objects    NUMBER,        -- Total number of objects
    completed_rows   NUMBER,        -- Number of rows completed
    completed_bytes  NUMBER,        -- Number of bytes completed
    percent_done     NUMBER,        -- Percent done current object
    degree           NUMBER          -- Degree of parallelism)

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1020
FOR sys.ku$WorkerStatus1020;
```

```

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1020;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010

CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
  FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
  FOR sys.ku$_WorkerStatusList1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
  FOR ku$_WorkerStatusList1020;

```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```

CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
    logLineNumber    NUMBER,
    errorNumber      NUMBER,
    LogText          VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;

```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```

CREATE TYPE sys.ku$_DumpFile1010 IS OBJECT (
    file_name        VARCHAR2(4000), -- Fully-qualified name
    file_type        NUMBER,         -- 0=Disk, 1=Pipe, etc.
    file_size        NUMBER,         -- Its length in bytes
    file_bytes_written NUMBER        -- Bytes written so far)

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile FOR ku$_DumpFile1010;

CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1010 FOR
  sys.ku$_DumpFileSet1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1020 FOR

```

```

sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
    job_name          VARCHAR2(30),
    operation         VARCHAR2(30),
    job_mode          VARCHAR2(30),
    bytes_processed   NUMBER,
    percent_done      NUMBER,
    degree            NUMBER,
    error_count       NUMBER,
    state             VARCHAR2(30),
    phase             NUMBER,
    restart_count     NUMBER,
    worker_status_list ku$_WorkerStatusList1010,
    files             ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR
    sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (
    job_name          VARCHAR2(30),           -- Name of the job
    operation         VARCHAR2(30),           -- Current operation
    job_mode          VARCHAR2(30),           -- Current mode
    bytes_processed   NUMBER,                -- Bytes so far
    total_bytes       NUMBER,                -- Total bytes for job
    percent_done      NUMBER,                -- Percent done
    degree            NUMBER,                -- Of job parallelism
    error_count       NUMBER,                -- #errors so far
    state             VARCHAR2(30),           -- Current job state
    phase             NUMBER,                -- Job phase
    restart_count     NUMBER,                -- #Job restarts
    worker_status_list ku$_WorkerStatusList1020, -- job worker processes
    files             ku$_DumpFileSet1010    -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR    sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;

```

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```

CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (
    param_name      VARCHAR2(30),
    param_op        VARCHAR2(30),
    param_type      VARCHAR2(30),
    param_length    NUMBER,
    param_value_n   NUMBER,
    param_value_t   VARCHAR2(4000));

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1010 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1020 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue FOR ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;

```

```

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1010 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1020 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues FOR ku$_ParamValues1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT (
  job_name      VARCHAR2(30),
  guid          RAW(16),
  operation     VARCHAR2(30),
  job_mode      VARCHAR2(30),
  remote_link   VARCHAR2(4000),
  owner         VARCHAR2(30),
  instance     VARCHAR2(16),
  db_version    VARCHAR2(30),
  creator_privs VARCHAR2(30),
  start_time    DATE,
  max_degree    NUMBER,
  log_file      VARCHAR2(4000),
  sql_file      VARCHAR2(4000),
  params        ku$_ParamValues1010)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT (
  job_name      VARCHAR2(30),      -- The job name
  guid          RAW(16),          -- The job GUID
  operation     VARCHAR2(30),      -- Current operation
  job_mode      VARCHAR2(30),      -- Current mode
  remote_link   VARCHAR2(4000),    -- DB link, if any
  owner         VARCHAR2(30),      -- Job owner
  platform     VARCHAR2(101),     -- Current job platform
  exp_platform  VARCHAR2(101),     -- Export platform
  global_name   VARCHAR2(4000),    -- Global name of DB
  exp_global_name VARCHAR2(4000),  -- Export global name
  instance     VARCHAR2(16),      -- The instance name
  db_version    VARCHAR2(30),      -- Version of objects
  exp_db_version VARCHAR2(30),     -- Export version
  scn          NUMBER,            -- Job SCN
  creator_privs VARCHAR2(30),      -- Privs of job
  start_time    DATE,             -- This job start time
  exp_start_time DATE,            -- Export start time
  term_reason   NUMBER,           -- Job termination code
  max_degree    NUMBER,           -- Max. parallelism
  log_file      VARCHAR2(4000),    -- Log file name
  sql_file      VARCHAR2(4000),    -- SQL file name
  params        ku$_ParamValues1010 -- Parameter list)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_JobDesc1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;

```

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the GET_STATUS call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the `ku$_LogEntry` that is returned has already had its log lines ordered for proper output. That is, the original `ku$_LogEntry` objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
  mask NUMBER,          /* Indicates which status types are present*/
  wip ku$_LogEntry1010, /* Work-In-Progress: std. exp/imp msgs */
  job_description ku$_JobDesc1010, /* Complete job description */
  job_status ku$_JobStatus1010, /* Detailed job status + per-worker sts */
  error ku$_LogEntry1010 /* Multi-level contextual errors */
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
(
  mask NUMBER,          -- Status types present
  wip ku$_LogEntry1010, -- Work in progress
  job_description ku$_JobDesc1020, -- Complete job description
  job_status ku$_JobStatus1020, -- Detailed job status
  error ku$_LogEntry1010 -- Multi-level context errors
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```

Summary of DBMS_DATAPUMP Subprograms

Table 27–1 DBMS_DATAPUMP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 27-13	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure
ATTACH Function on page 27-16	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
DATA_FILTER Procedures on page 27-18	Specifies restrictions on the rows that are to be retrieved
DETACH Procedure on page 27-20	Specifies that the user has no further interest in using the handle
GET_DUMPFILE_INFO Procedure on page 27-21	Monitors the status of a job or waits for the completion of a job.
GET_STATUS Procedure on page 27-23	Monitors the status of a job or waits for the completion of a job or for more details on API errors
LOG_ENTRY Procedure on page 27-26	Inserts a message into the log file
METADATA_FILTER Procedure on page 27-27	Provides filters that allow you to restrict the items that are included in a job
METADATA_REMAP Procedure on page 27-30	Specifies a remapping to be applied to objects as they are processed in the specified job
METADATA_TRANSFORM Procedure on page 27-32	Specifies transformations to be applied to objects as they are processed in the specified job
OPEN Function on page 27-35	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures except ATTACH
SET_PARALLEL Procedure on page 27-38	Adjusts the degree of parallelism within a job
SET_PARAMETER Procedures on page 27-40	Specifies job-processing options
START_JOB Procedure on page 27-44	Begins or resumes execution of a job
STOP_JOB Procedure on page 27-46	Terminates a job, but optionally, preserves the state of the job
WAIT_FOR_JOB Procedure on page 27-48	Runs a job until it either completes normally or stops for some other reason.

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
    handle      IN NUMBER,
    filename    IN VARCHAR2,
    directory   IN VARCHAR2,
    filesize    IN VARCHAR2 DEFAULT NULL,
    filetype    IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE);
```

Parameters

Table 27–2 ADD_FILE Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
filename	The name of the file being added. <code>filename</code> must be a simple filename without any directory path information. For dump files, the <code>filename</code> can include a substitution variable, %U, which indicates that multiple files may be generated with the specified <code>filename</code> as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of <code>export%U</code> would cause <code>export01</code> , <code>export02</code> , <code>export03</code> , and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.
directory	The name of a directory object within the database that is used to locate <code>filename</code> . A <code>directory</code> must be specified. See the Data Pump Export chapter in <i>Oracle Database Utilities</i> for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, <code>filesize</code> will default to an unlimited size. For Import and SQL_FILE operations, <code>filesize</code> is ignored. The minimum value for <code>filesize</code> is ten times the default Data Pump block size, which is 4 kilobytes. <code>filesize</code> may only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP. : <ul style="list-style-type: none"> ■ KU\$_FILE_TYPE_DUMP_FILE (dump file for a job) ■ KU\$_FILE_TYPE_LOG_FILE (log file for a job) ■ KU\$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.

- `INVALID_ARGVAL`. An invalid value was supplied for an input parameter.
- `INVALID_STATE`. The job is completing, or the job is past the defining state for an import or `SQL_FILE` job or is past the defining state for LOG and SQL files.
- `FILE_ERROR`. Oracle does not have the requested operating system access to the specified file or the file has already been specified for the current operation.
- `INVALID_OPERATION`. A dump file was specified for a Network Import or `ESTIMATE_ONLY` export operation.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a `SQL_FILE` operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and `SQL_FILE` operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the `SET_PARALLEL` procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (`%U`) is included in a filename, multiple dump files may be specified through a single call to `ADD_FILE`. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current `SET_PARALLEL` value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple `ADD_FILES` with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if `expa%U`, `expb%U` and `expc%U` were all specified for a job having a parallelism of 6, the initial dump files created would look like: `expa01`, `expb01`, `expc01`, `expa02`, `expb02`, and `expc02`.
- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, an Import or `SQL_FILE` operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of

the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

ATTACH Function

This function gains access to a previously-created job.

Syntax

```
DBMS_DATAPUMP.ATTACH(
  job_name      IN VARCHAR2 DEFAULT NULL,
  job_owner     IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 27–3 *ATTACH Function Parameters*

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the EXP_FULL_DATABASE role (for export operations) or the IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU\$_STATUS_WIP and KU\$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the `ATTACH` fails, use a null handle in a subsequent call to `GET_STATUS` for more information about the failure.

DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN VARCHAR2,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–4 DATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle that is returned from the OPEN procedure.
name	The name of the filter.
value	The value of the filter.
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

Exceptions

- **INVALID_ARGVAL.** There can be several reasons for this message:
 - A bad filter name is specified
 - The mode is TRANSPORTABLE, which does not support data filters
 - The specified table does not exist
 - The filter has already been set for the specified values of schema_name and table_name
- **INVALID_STATE.** The user called DATA_FILTER when the job was not in the Defining state.
- **INCONSISTENT_ARGS.** The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- **PRIVILEGE_ERROR.** A schema name was supplied, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.

- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in [Table 27-5](#).

Table 27-5 Data Filters

Name	Datatype	Operations that Support Filter	Description
INCLUDE_ROWS	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
PARTITION_EXPR PARTITION_LIST	text	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed.
SAMPLE	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.
SUBQUERY	text	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(  
    handle IN NUMBER);
```

Parameters

Table 27–6 *DETACH Procedure Parameters*

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call.

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a `STOP_JOB` that was applied to the job referenced by the handle. All previously allocated `DBMS_DATAPUMP` handles are released when an instance is restarted.

GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
  filename   IN VARCHAR2,
  directory  IN VARCHAR2,
  info_table OUT ku$_dumpfile_info,
  filetype   OUT NUMBER);
```

Parameters

Table 27-7 GET_DUMPFILE_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information.
directory	A directory object that specifies where the file can be found.
info_table	A PL/SQL table for storing information about the dump file.
filetype	The type of file (Data Pump dump file, original Export dump file, or unknown).

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of zero will be returned and the dump file info_table will remain empty.

A filetype value of one indicates a Data Pump dump file. A file type value of two indicates an original Export dump file. In both cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
  item_code   NUMBER,           -- Identifies header item
  value       VARCHAR2(2048)    -- Text string value)
/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as follows (prepended with the package name, DBMS_DATAPUMP.):

KU\$ DFHDR_FILE_VERSION	CONSTANT NUMBER := 1;
KU\$ DFHDR_MASTER_PRESENT	CONSTANT NUMBER := 2;
KU\$ DFHDR_GUID	CONSTANT NUMBER := 3;
KU\$ DFHDR_FILE_NUMBER	CONSTANT NUMBER := 4;
KU\$ DFHDR_CHARSET_ID	CONSTANT NUMBER := 5;
KU\$ DFHDR_CREATION_DATE	CONSTANT NUMBER := 6;
KU\$ DFHDR_FLAGS	CONSTANT NUMBER := 7;
KU\$ DFHDR_JOB_NAME	CONSTANT NUMBER := 8;
KU\$ DFHDR_PLATFORM	CONSTANT NUMBER := 9;
KU\$ DFHDR_INSTANCE	CONSTANT NUMBER := 10;
KU\$ DFHDR_LANGUAGE	CONSTANT NUMBER := 11;
KU\$ DFHDR_BLOCKSIZE	CONSTANT NUMBER := 12;
KU\$ DFHDR_DIRPATH	CONSTANT NUMBER := 13;
KU\$ DFHDR_METADATA_COMPRESSED	CONSTANT NUMBER := 14;
KU\$ DFHDR_DB_VERSION	CONSTANT NUMBER := 15;
KU\$ DFHDR_MAX_ITEM_CODE	CONSTANT NUMBER := 15;

GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS (
  handle     IN NUMBER,
  mask       IN BINARY_INTEGER,
  timeout    IN NUMBER DEFAULT NULL,
  job_state  OUT VARCHAR2,
  status     OUT ku$_Status1010);
```

Parameters

Table 27–8 GET_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. A null handle can be used to retrieve error information after OPEN and ATTACH failures.
mask	A bit mask that indicates which of four types of information to return: <ul style="list-style-type: none"> ■ KU\$_STATUS_WIP ■ KU\$_STATUS_JOB_DESC ■ KU\$_STATUS_JOB_STATUS ■ KU\$_STATUS_JOB_ERROR Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 27-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU\$_STATUS_WIP or KU\$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku\$_Status structure.
status	A ku\$_Status is returned. The ku\$_Status mask indicates what kind of information is included. This could be none if only KU\$_STATUS_WIP or KU\$_STATUS_JOB_ERROR information is requested and the timeout period expires. This can be a ku\$_Status1010 or ku\$_Status1020 object type.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The `GET_STATUS` procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The `KU$_STATUS_JOB_DESC` and `KU$_STATUS_JOB_STATUS` values are classified as synchronous information because the information resides in the master table. The `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the `job_state` returned by `GET_STATUS` does not indicate a terminating job, it is possible that the job could still terminate before the next call to `GET_STATUS`. This would result in an `INVALID_HANDLE` exception. Alternatively, the job could terminate during the call to `GET_STATUS`, which would result in a `NO_SUCH_JOB` exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the `GET_STATUS` procedure:

- Errors resulting from other procedure calls: For example, the `SET_PARAMETER` procedure may produce an `INCONSISTENT_ARGS` exception. The client should immediately call `GET_STATUS` with `mask=8` (errors) and `timeout=0`. The returned `ku$_Status.error` will contain a `ku$_LogEntry` that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be `Table already exists` when trying to create a table. The `ku$_Status.error` will contain a `ku$_LogEntry` with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to `GET_STATUS` with an infinite timeout (-1) "listening" for `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` messages. If status was requested, then `JOB_STATUS` information will also be in the request.

When the `ku$_Status` is interpreted, the following guidelines should be used:

- `ku$_Status.ku$_JobStatus.percent_done` refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
 - `EXPORT` or `network IMPORT`-- $(\text{bytes_processed} / \text{estimated_bytes}) * 100$
 - `IMPORT`-- $(\text{bytes_processed} / \text{total_expected_bytes}) * 100$
 - `SQL_FILE` or `estimate-only EXPORT`-- 0.00 if not done or 100.00 if done

The effects of the `QUERY` and `PARTITION_EXPR` data filters are not considered in computing `percent_done`.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

$$((\text{SYSDATE} - \text{start time}) / \text{ku_Status.ku_JobStatus.percent_done}) * 100$$

- The caller should not use `ku_Status.ku_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY (
  handle          IN NUMBER,
  message         IN VARCHAR2
  log_file_only   IN NUMBER DEFAULT 0);
```

Parameters

Table 27–9 LOG_ENTRY Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
message	A text line to be added to the log file.
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU\$STATUS_WIP) messages.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If `log_file_only` is zero (the default), the message is also broadcast as a `KU$STATUS_WIP` message through the `GET_STATUS` procedure to all users attached to the job.

The `LOG_ENTRY` procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports `INCLUDE` and `EXCLUDE` parameters defined by the user. Identifying these values as calls to the underlying `METADATA_FILTER` procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the `INCLUDE` and `EXCLUDE` parameters.

Lines entered in the log stream from `LOG_ENTRY` are prefixed by the string, " ; ; ; "

METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–10 METADATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from the OPEN procedure.
name	The name of the filter. See Table 27–11 for descriptions of the available filters.
value	The value of the filter.
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

[Table 27–11](#) describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 27–11 Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
NAME_EXPR NAME_LIST	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN ('SCOTT')'). For Schema mode, identifies which users are to be processed.

Table 27–11 (Cont.) Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
TABLESPACE_ EXPR	TABLE, CLUSTER,	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression.
TABLESPACE_ LIST	INDEX, ROLLBACK_ SEGMENT	For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_ PATH_EXPR	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.
INCLUDE_ PATH_LIST		
EXCLUDE_ PATH_EXPR		
EXCLUDE_ PATH_LIST		

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
 - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
 - The specified object_path is not supported for the current mode.
 - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.
- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:

- NAME_EXPR
- SCHEMA_EXPR
- TABLESPACE_EXPR
- INCLUDE_PATH_EXPR
- EXCLUDE_PATH_EXPR

The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:

- NAME_LIST
- SCHEMA_LIST
- TABLESPACE_LIST
- INCLUDE_PATH_LIST
- EXCLUDE_PATH_LIST

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying NAME_EXPR as '!='EMP'' and NAME_EXPR as '!='DEPT'' on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.

METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  old_value   IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–12 METADATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the remap. See Table 27–13 for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value.
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

[Table 27–13](#) describes the remaps provided by the METADATA_REMAP procedure.

Table 27–13 Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	Text	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE 's objects to SCOTT, but SCOTT cannot remap SCOTT 's objects to BLAKE.

Table 27–13 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_ TABLESPACE	Text	TABLE, INDEX, ROLLBACK_ SEGMENT, MATERIALIZED_ VIEW, MATERIALIZED_ VIEW_ LOG, TABLE_ SPACE	Any storage segment in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> tablespace will be relocated to the <code>value</code> tablespace.
REMAP_ DATAFILE	Text	LIBRARY, TABLESPACE, DIRECTORY	Any datafile reference in the job that matches the <code>object_type</code> parameter and referenced the <code>old_value</code> datafile will be redefined to use the <code>value</code> datafile.

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. This message can indicate any of the following:
 - The job's mode does not include the specified `object_type`.
 - The remap has already been specified for the specified `old_value` and `object_type`.
- `INVALID_OPERATION`. Remaps are only supported for `SQL_FILE` and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- `INVALID_STATE`. The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).
- `INCONSISTENT_ARGS`. There was no `value` supplied or it was of the wrong datatype for the remap.
- `PRIVILEGE_ERROR`. A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user's schema or a `REMAP_DATAFILE`.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `METADATA_REMAP` procedure is only supported for Import and `SQL_FILE` operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary `SQL_FILE` operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.
- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according to its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER,
  object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–14 METADATA_TRANSFORM Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the transformation. See Table 27–15 for descriptions of the available transforms.
value	The value of the parameter for the transform.
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

[Table 27–15](#) describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 27–15 Transforms Provided by the METADATA_TRANSFORM Procedure

Name	Datatype	Object Type	Meaning
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.
SEGMENT_ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters. Defaults to 1.

Table 27–15 (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

Name	Datatype	Object Type	Meaning
STORAGE	NUMBER	TABLE	If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).
OID	NUMBER	TYPE TABLE	If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
 - The mode is transportable, which doesn't support transforms.
 - The job's mode does not include the specified object_type.
 - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique

according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures except ATTACH.

Syntax

```
DBMS_DATAPUMP.OPEN (
  operation      IN VARCHAR2,
  mode           IN VARCHAR2,
  remote_link    IN VARCHAR2 DEFAULT NULL,
  job_name       IN VARCHAR2 DEFAULT NULL,
  version        IN VARCHAR2 DEFAULT 'COMPATIBLE'
  compression    IN NUMBER DEFAULT KU$_COMPRESS_METADATA)
RETURN NUMBER;
```

Parameters

Table 27–16 OPEN Function Parameters

Parameter	Meaning
operation	The type of operation to be performed. Table 27–17 contains descriptions of valid operation types.
mode	The scope of the operation to be performed. Table 27–18 contains descriptions of valid modes. Specifying NULL generates an error.
remote_link	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
job_name	<p>The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN procedure and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name).</p> <p>The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N".</p> <p>The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.</p>
version	<p>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <ul style="list-style-type: none"> ▪ COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. ▪ LATEST - the version of the metadata corresponds to the database version. ▪ A specific database version, for example, '10.0.0'. In Oracle Database10g, this value cannot be lower than 10.0.0.

Table 27–16 (Cont.) OPEN Function Parameters

Parameter	Meaning
<code>compression</code>	The type of compression to use for an export job. The supported compression types are <code>ku\$_compress_metadata</code> (which is the default) and <code>ku\$_compress_none</code> .

Table 27–17 describes the valid operation types for the OPEN Function.

Table 27–17 Valid Operation Types for the OPEN Function

Operation	Description
<code>EXPORT</code>	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
<code>IMPORT</code>	Restores data and metadata from a dump file set or across a database link.
<code>SQL_FILE</code>	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the <code>ADD_FILE</code> procedure.

Table 27–18 describes the valid modes for the OPEN procedure.

Table 27–18 Valid Modes for the OPEN Function

Mode	Description
<code>FULL</code>	Operates on the full database or full dump file set except for the <code>SYS</code> , <code>XDB</code> , <code>ORDSYS</code> , <code>MDSYS</code> , <code>CTXSYS</code> , <code>ORDPLUGINS</code> , and <code>LBACSYS</code> schemas.
<code>SCHEMA</code>	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify <code>SYS</code> , <code>XDB</code> , <code>ORDSYS</code> , <code>MDSYS</code> , <code>CTXSYS</code> , <code>ORDPLUGINS</code> , or <code>LBACSYS</code> schemas for this mode.
<code>TABLE</code>	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.
<code>TABLESPACE</code>	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
<code>TRANSPORTABLE</code>	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: `ADD_FILE`, `DATA_FILTER`, `DETACH`, `GET_STATUS`, `LOG_ENTRY`, `METADATA_FILTER`, `METADATA_REMAP`, `METADATA_TRANSFORM`, `SET_PARALLEL`, `SET_PARAMETER`, `START_JOB`, `STOP_JOB`, and `WAIT_FOR_JOB`

Exceptions

- `INVALID_ARGVAL`. An invalid operation or mode was specified. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- `JOB_EXISTS`. A table already exists with the specified job name.
- `PRIVILEGE_ERROR`. The user does not have the necessary privileges or roles to use the specified mode.
- `INTERNAL_ERROR`. The job was created under the wrong schema or the master table was of the wrong format.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the `ATTACH` procedure.
- If the `OPEN` fails, call `GET_STATUS` with a null handle to retrieve additional information about the failure.

SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(  
  handle      IN NUMBER,  
  degree      IN NUMBER);
```

Parameters

Table 27–19 SET_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of *n*, the user should supply *n* files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- `SQL_FILE` operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2);
```

```
DBMS_DATAPUMP.SET_PARAMETER (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER);
```

Parameters

Table 27–20 SET_PARAMETER Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN call.
name	The name of the parameter. Table 27–21 describes the valid parameter names.
value	The value for the specified parameter.

[Table 27–21](#) describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 27–21 Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_COMMAND	Text	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
ESTIMATE	Text	Export and Import	Specifies that the estimate method for the size of the tables should be performed before starting the job. If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables. If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS. The ESTIMATE parameter cannot be used in Transportable Tablespace mode. Default=BLOCKS.
ESTIMATE_ONLY	Number	Export	Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.

Table 27-21 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
FLASHBACK_SCN	NUMBER	Export and network Import	System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.
FLASHBACK_TIME	Text	Export and network Import	<p>Either the date and time used to determine a consistent point for reading user data or a string of the form TO_TIMESTAMP (. . .).</p> <p>If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions.</p> <p>FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.</p>
INCLUDE_METADATA	NUMBER	Export and Import	<p>If nonzero, metadata for objects will be moved in addition to user table data.</p> <p>If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data.</p> <p>INCLUDE_METADATA is not supported in Transportable mode.</p> <p>Default=1.</p>
REUSE_DATAFILES	NUMBER	Import	<p>If nonzero, tablespace data files can be created using preexisting data files for tablespace creations. REUSE_DATAFILES is only supported in Full mode.</p> <p>Default=0</p>
SKIP_UNUSABLE_INDEXES	NUMBER	Import	<p>If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode.</p> <p>Default=1</p>

Table 27–21 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TABLE_EXISTS_ACTION	Text	Import	<p>Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP.</p> <p>If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported.</p> <p>If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import.</p> <p>Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE.</p> <p>If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped.</p> <p>If APPEND, new rows are added to the existing rows in the table.</p> <p>If SKIP, the preexisting table is left unchanged.</p> <p>TABLE_EXISTS_ACTION is not supported in Transportable mode.</p> <p>The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.</p>
TABLESPACE_DATAFILE	Text	Import	<p>Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports.</p> <p>TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.</p>
TTS_FULL_CHECK	NUMBER	Export	<p>If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports.</p> <p>Default=0.</p>
USER_METADATA	NUMBER	Export and network Import	<p>For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter.</p> <p>The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode.</p> <p>Default=1 if user has EXP_FULL_DATABASE role; 0 otherwise.</p>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
 - An invalid name was supplied for an input parameter
 - The wrong datatype was used for value
 - A value was not supplied
 - The supplied value was not allowed for the specified parameter name

- A flashback parameter had been established after a different flashback parameter had already been established
- A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.
- INVALID_STATE. The specified job is not in the Defining state.
- INCONSISTENT_ARGS. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- PRIVILEGE_ERROR. The user does not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role required for the specified parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARAMETER procedure is used to specify optional features for the current job. See [Table 27-21](#) for a list of supported options.

START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
  handle          IN NUMBER,
  skip_current    IN NUMBER DEFAULT 0);
```

Parameters

Table 27–22 *START_JOB Procedure Parameters*

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through either the OPEN or ATTACH procedure.
skip_ current	<p>If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index.</p> <p>A description of the actions skipped is entered into the log file. skip_ current is ignored for the initial START_JOB in a job.</p> <p>If zero, no data or metadata is lost upon a restart.</p>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
 - No files have been defined for an Export, non-network Import, or SQL_FILE job
 - An ADD_FILE procedure has not been called to define the output for a SQL_FILE job
 - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
 - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
 - The dump file set on an Import of SQL_FILE job was either incomplete or missing a master table specification
- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the `SET_PARALLEL` procedure was not called prior to the `START_JOB` procedure, the initial level of parallelism used in the job will be 1. If `SET_PARALLEL` was called prior to the job starting, the degree specified by the last `SET_PARALLEL` call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another `SET_PARALLEL` call.
- To restart a stopped job, an `ATTACH` must be performed prior to executing the `START_JOB` procedure.

STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
    handle      IN NUMBER,
    immediate   IN NUMBER DEFAULT 0,
    keep_master IN NUMBER DEFAULT NULL,
    delay       IN NUMBER DEFAULT 0);
```

Parameters

Table 27–23 STOP_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (  
  handle      IN  NUMBER,  
  job_state   OUT VARCHAR2);
```

Parameters

Table 27–24 WAIT_FOR_JOB Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing. This will be either Stopped or Completed.

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be Completed. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be Stopped.

DBMS_DB_VERSION

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

See Also: *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- [Using DBMS_DB_VERSION](#)
 - Overview
 - Constants
 - Examples

Using DBMS_DB_VERSION

- [Overview](#)
- [Constants](#)

Overview

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 10g Release 2 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
  VERSION CONSTANT PLS_INTEGER := 10; -- RDBMS version number
  RELEASE CONSTANT PLS_INTEGER := 2; -- RDBMS release number
  ver_le_9_1    CONSTANT BOOLEAN := FALSE;
  ver_le_9_2    CONSTANT BOOLEAN := FALSE;
  ver_le_9      CONSTANT BOOLEAN := FALSE;
  ver_le_10_1   CONSTANT BOOLEAN := FALSE;
  ver_le_10_2   CONSTANT BOOLEAN := TRUE;
  ver_le_10     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER_LE_9_1 represents version <= 9 and release <= 1
- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
  version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
  version 11 code
$ELSE
  version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS_DB_VERSION.VER_LE_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER_LE_11 is not defined in version 10 database because conditional compilation protects the \$ELSIF from evaluation if DBMS_DB_VERSION.VER_LE_10 is TRUE.

Constants

The `DBMS_DB_VERSION` package contains different constants for different Oracle Database releases. The Oracle Database 10g Release 2 version of the `DBMS_DB_VERSION` package uses the constants shown in [Table 28-1](#).

Table 28-1 *DBMS_DB_VERSION Constants*

Name	Type	Value	Description
<code>VERSION</code>	<code>PLS_INTEGER</code>	10	Current version
<code>RELEASE</code>	<code>PLS_INTEGER</code>	2	Current release
<code>VER_LE_9</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9
<code>VER_LE_9_1</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9 and release <= 1
<code>VER_LE_9_2</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9 and release <= 2
<code>VER_LE_10</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <= 10
<code>VER_LE_10_1</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 10 and release <= 1
<code>VER_LE_10_2</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <=10 and release <= 2

Examples

This example uses conditional compilation to guard new features.

```

CREATE OR REPLACE PROCEDURE whetstone IS

  -- Notice that conditional compilation constructs
  -- can interrupt a regular PL/SQL statement.
  -- You can locate a conditional compilation directive anywhere
  -- there is whitespace in the regular statement.

  SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                $ELSE BINARY_DOUBLE
    $END;

  t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                $ELSE 0.499975d
    $END;

  t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                $ELSE 2.0d
    $END;

  x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                $ELSE 1.0d
    $END;

  y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                $ELSE 1.0d
    $END;

  z  MY_REAL;

  PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
    x1 my_real;
    y1 my_real;
  BEGIN
    x1 := x;
    y1 := y;
    x1 := t * (x1 + y1);
    y1 := t * (x1 + y1);
    z := (x1 + y1)/t2;
  END P;
BEGIN
  P(x, y, z);
  DBMS_OUTPUT.PUT_LINE ('z = ' || z);
END whetstone;
/

```

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- [Using DBMS_DDL](#)
 - Deprecated Subprograms
 - Security Model
 - Operational Notes
- [Summary of DBMS_DDL Subprograms](#)

Using DBMS_DDL

This section contains topics which relate to using the DBMS_DDL package.

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Release 10gR2:

- [ALTER_COMPILE Procedure](#)

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

Summary of DBMS_DDL Subprograms

Table 29–1 DBMS_DDL Package Subprograms

Subprogram	Description
ALTER_COMPILE Procedure on page 29-7	Compiles the PL/SQL object
ALTER_TABLE_NOT_REFERENCEABLE Procedure on page 29-8	Reorganizes object tables
ALTER_TABLE_REFERENCEABLE Procedure on page 29-9	Reorganizes object tables
CREATE_WRAPPED Procedures on page 29-10	Takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement
IS_TRIGGER_FIRE_ONCE Function on page 29-12	Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE
SET_TRIGGER_FIRING_PROPERTY Procedure on page 29-13	Sets the specified DML or DDL trigger's firing property
WRAP Functions on page 29-14	Takes as input a CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated

ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

Note: This procedure is deprecated in Release 10gR2. While the procedure remains available in the package, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
    type          VARCHAR2,
    schema        VARCHAR2,
    name          VARCHAR2
    reuse_settings BOOLEAN := FALSE);
```

Parameters

Table 29–2 ALTER_COMPILE Procedure Parameters

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 29–3 ALTER_COMPILE Procedure Exceptions

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
    table_name      IN          VARCHAR2,
    table_schema    IN  DEFAULT NULL,
    affected_schema IN  DEFAULT NULL);
```

Parameters

Table 29–4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

Parameter	Description
<code>table_name</code>	The name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
<code>table_schema</code>	The name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
<code>affected_schema</code>	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is., it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.<table_name>] REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
  table_name      IN  VARCHAR2,
  table_schema    IN  DEFAULT NULL,
  affected_schema IN  DEFAULT NULL);
```

Parameters

Table 29–5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

Parameter	Description
<code>table_name</code>	The name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
<code>table_schema</code>	The name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
<code>affected_schema</code>	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same EOID; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it will make the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also: [WRAP Functions](#) on page 29-14

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual [WRAP Functions](#) and DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(*cursor*, SYS.DBMS_DDL.WRAP (*input*, *lb*, *ub*)):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    DBMS_SQL.VARCHAR2A,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(*cursor*, SYS.DBMS_DDL.WRAP (*input*, *lb*, *ub*)):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    DBMS_SQL.VARCHAR2S,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Parameters

Table 29–6 CREATE_WRAPPED Procedure Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name

DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus `"/` termination character), both the [CREATE_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

IS_TRIGGER_FIRE_ONCE Function

This function returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, it returns `FALSE`.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package

Note: Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: ["SET_TRIGGER FIRING_PROPERTY Procedure"](#) on page 29-13

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
  trig_owner      IN VARCHAR2,
  trig_name       IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 29–7 IS_TRIGGER_FIRE_ONCE Function Parameters

Parameter	Description
<code>trig_owner</code>	Schema of trigger
<code>trig_name</code>	Name of trigger

SET_TRIGGER_FIRING_PROPERTY Procedure

This procedure sets the specified DML or DDL trigger's firing property. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package.

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY
  trig_owner      IN  VARCHAR2,
  trig_name       IN  VARCHAR2,
  fire_once       IN  BOOLEAN);
```

Parameters

Table 29–8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

Parameter	Description
trig_owner	Schema of the trigger to set
trig_name	Name of the trigger to set
fire_once	If TRUE, the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers. If FALSE, the trigger is set to always fire.

Usage Notes

You can specify one of the following settings for a trigger's firing property:

- If the fire_once parameter is set to TRUE for a trigger, then the trigger does not fire for these types of changes.
- If the fire_once parameter is set to FALSE for a trigger, then the trigger fires for these types of changes.

Regardless of the firing property set by this procedure, a trigger continues to fire when changes are made by means other than the apply process or apply error execution. For example, if a user session or an application makes a change, then the trigger continues to fire, regardless of the firing property.

Note:

- If you dequeue an error transaction from the error queue and execute it without using the DBMS_APPLY_ADM package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
 - Only DML and DDL triggers can be fire once. All other types of triggers always fire.
-

See Also: *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

See Also: [CREATE_WRAPPED Procedures](#) on page 29-10

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP (
    ddl      VARCHAR2)
RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the [PARSE Procedure](#) in the [DBMS_SQL](#) package and its argument list follows the convention of DBMS_SQL.PARSE:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2S,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the [PARSE Procedure](#) in the [DBMS_SQL](#) package:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2A,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 29–9 WRAP Function Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name `SYS.DBMS_DDL` to avoid the possibility that the name `DBMS_DDL` is captured by a locally-defined unit or by redefining the `DBMS_DDL` public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus `"/` termination character), both the [CREATE_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

Exceptions

ORA-24230: If the input is not a `CREATE OR REPLACE` statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

Note: The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

- [Using DBMS_DEBUG](#)
 - Overview
 - Constants
 - Variables
 - Exceptions
 - Operational Notes
- [Data Structures](#)
 - RECORD Types
 - TABLE Types
- [Summary of DBMS_DEBUG Subprograms](#)

Using DBMS_DEBUG

- [Overview](#)
- [Constants](#)
- [Variables](#)
- [Exceptions](#)
- [Operational Notes](#)

Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with `DBMS_DEBUG`. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using `DBMS_DEBUG`: This tells it which target session to supervise. The debug session may then call entry points in `DBMS_DEBUG` to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- [SYNCHRONIZE Function](#)
- [DEBUG_ON Procedure](#)
- [DEBUG_OFF Procedure](#)

`DBMS_DEBUG` does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

Variables

The DBMS_DEBUG uses the variables shown in [Table 30-1](#).

Table 30-1 *DBMS_DEBUG Variables*

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination.

Statuses returned by GET_VALUE and SET_VALUE:

Status	Description
error_bogus_frame	No such entypoint on the stack.
error_no_debug_info	Program was compiled without debug symbols.
error_no_such_object	No such variable or parameter.
error_unknown_type	Debug information is unreadable.
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided.
error_illegal_index	No such element exists in the collection.
error_nullcollection	Table is atomically null.
error_nullvalue	Value is null.

Statuses returned by SET_VALUE:

Status	Description
error_illegal_value	Constraint violation.
error_illegal_null	Constraint violation.
error_value_malformed	Unable to decipher the given value.
error_other	Some other error.
error_name_incomplete	Name did not resolve to a scalar.

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint.
error_idle_breakpt	Cannot enable or disable an unused breakpoint.
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation).

General error codes (returned by many of the DBMS_DEBUG subprograms):

Status	Description
error_unimplemented	Functionality is not yet implemented.
error_deferred	No program running; operation deferred.
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server.
error_communication	Some error other than a timeout occurred.
error_timeout	Timeout occurred.

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE.

The following exceptions are raised by procedure SELF_CHECK:

Exception	Description
pipe_creation_failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;  
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 30-1 and Figure 30-2 illustrate the flow of operations in the session to be debugged and in the debugging session.

Figure 30-1 Target Session

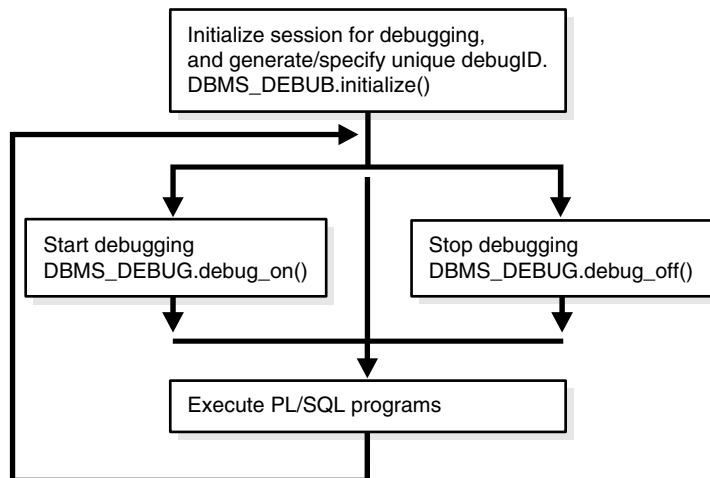

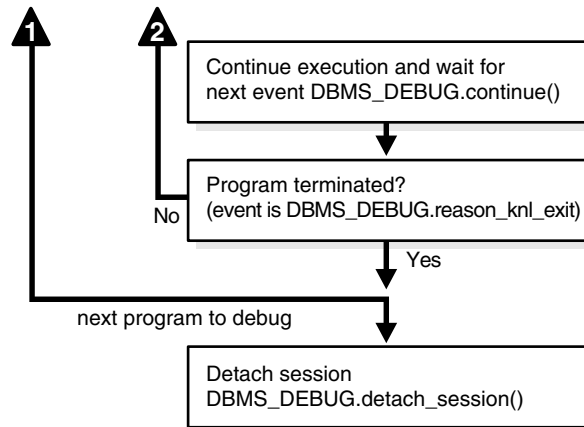

Figure 30-2 Debug Session

Figure 30–3 Debug Session (Cont.)

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common and Debug Session Sections

- [Common Section](#)

- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function
- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function

- [GET_RUNTIME_INFO Function](#)
- [GET_INDEXES Function](#)
- [EXECUTE Procedure](#)

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init`'d to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
 - Package specifications.
 - Procedures and functions that are not nested inside other packages, procedures, or functions.
 - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
<code>break_next_line</code>	Break at next source line (step over calls).

Value	Description
break_any_call	Break at next source line (step into calls).
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine).
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised.
break_handler	Break when an exception handler is executed.
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

Information Flags

These are flags which may be passed as the `info_requested` parameter to `SYNCHRONIZE`, `CONTINUE`, and `GET_RUNTIME_INFO`.

Flag	Description
info_getStackDepth	Get the current depth of the stack.
info_getBreakpoint	Get the breakpoint number.
info_getLineinfo	Get program unit information.

Reasons for Suspension

After `CONTINUE` is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-
reason_interpreter_starting	Interpreter is starting.
reason_breakpoint	Hit a breakpoint.
reason_enter	Procedure entry.
reason_return	Procedure is about to return.
reason_finish	Procedure is finished.
reason_line	Reached a new line.
reason_interrupt	An interrupt occurred.
reason_exception	An exception was raised.
reason_exit	Interpreter is exiting (old form).
reason_knl_exit	Kernel is exiting.
reason_handler	Start exception-handler.
reason_timeout	A timeout occurred.
reason_instantiate	Instantiation block.
reason_abort	Interpreter is aborting.

Data Structures

The DBMS_DEBUG package defines RECORD types and TABLE types.

RECORD Types

- [BREAKPOINT_INFO Record Type](#)
- [PROGRAM_INFO Record Type](#)
- [RUNTIME_INFO Record Type](#)

TABLE Types

- [BACKTRACE_TABLE Table Type](#)
- [BREAKPOINT_TABLE Table Type](#)
- [INDEX_TABLE Table Type](#)
- [VC2_TABLE Table Type](#)

BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
  name          VARCHAR2(30),
  owner         VARCHAR2(30),
  dblink        VARCHAR2(30),
  line#         BINARY_INTEGER,
  libunittype  BINARY_INTEGER,
  status        BINARY_INTEGER);
```

Fields

Table 30-2 *RUNTIME_INFO* Fields

Field	Description
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	NULL, unless this is a nested procedure or function
status	See Constants on page 30-4 for values of breakpoint_status_*

PROGRAM_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
  -- The following fields are used when setting a breakpoint
  namespace      BINARY_INTEGER,
  name           VARCHAR2(30),
  owner          VARCHAR2(30),
  dblink         VARCHAR2(30),
  line#          BINARY_INTEGER,
  -- Read-only fields (set by Probe when doing a stack backtrace)
  libunittype    BINARY_INTEGER,
  entrypointname VARCHAR2(30));
```

Fields

Table 30–3 PROGRAM_INFO Fields

Field	Description
namespace	See Namespaces on page 30-12
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	A read-only field, NULL, unless this is a nested procedure or function
entrypointname	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the Libunit Types on page 30-12 for more information.

RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
  line#           BINARY_INTEGER,
  terminated      binary_integer,
  breakpoint      binary_integer,
  stackdepth     BINARY_INTEGER,
  interpreterdepth BINARY_INTEGER,
  reason         BINARY_INTEGER,
  program        program_info);
```

Fields

Table 30–4 *RUNTIME_INFO Fields*

Field	Description
line#	Duplicate of program.line#
terminated	Whether the program has terminated
breakpoint	Breakpoint number
stackdepth	Number of frames on the stack
interpreterdepth	[A reserved field]
reason	Reason for suspension
program	Source location

BACKTRACE_TABLE Table Type

This type is used by `PRINT_BACKTRACE`.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Table Type

This type is used by `GET_INDEXES` to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_DEBUG Subprograms

Table 30–5 DBMS_DEBUG Package Subprograms

Subprogram	Description
ATTACH_SESSION Procedure on page 30-24	Notifies the debug session about the target debugID
CONTINUE Function on page 30-25	Continues execution of the target program
DEBUG_OFF Procedure on page 26	Turns debug-mode off
DEBUG_ON Procedure on page 30-27	Turns debug-mode on
DELETE_BREAKPOINT Function on page 30-28	Deletes a breakpoint
DELETE_OER_BREAKPOINT Function on page 30-29	Deletes an OER breakpoint
DETACH_SESSION Procedure on page 30-30	Stops debugging the target program
DISABLE_BREAKPOINT Function on page 30-31	Disables a breakpoint
ENABLE_BREAKPOINT Function on page 30-32	Activates an existing breakpoint
EXECUTE Procedure on page 30-33	Executes SQL or PL/SQL in the target session
GET_INDEXES Function on page 30-35	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure on page 30-36	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function on page 30-37	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function on page 30-38	Returns information about the current program
GET_TIMEOUT_BEHAVIOUR Function on page 30-39	Returns the current timeout behavior
GET_VALUE Function on page 30-40	Gets a value from the currently-running program
INITIALIZE Function on page 30-42	Sets debugID in target session
PING Procedure on page 30-44	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure on page 30-45	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure on page 30-46	Prints a stack backtrace
PROBE_VERSION Procedure on page 30-47	Returns the version number of DBMS_DEBUG on the server

Table 30-5 (Cont.) DBMS_DEBUG Package Subprograms

Subprogram	Description
SELF_CHECK Procedure on page 30-48	Performs an internal consistency check
SET_BREAKPOINT Function on page 30-49	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function on page 30-50	Sets an OER breakpoint
SET_TIMEOUT Function on page 30-51	Sets the timeout value
SET_TIMEOUT_BEHAVIOUR Procedure on page 30-52	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function on page 30-53	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures on page 30-55	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure on page 30-56	Fetches the frame source
SHOW_SOURCE Procedures on page 30-57	Fetches program source
SYNCHRONIZE Function on page 30-59	Waits for program to start running
TARGET_PROGRAM_RUNNING Procedure on page 30-60	Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not

ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (  
    debug_session_id IN VARCHAR2,  
    diagnostics      IN BINARY_INTEGER := 0);
```

Parameters

Table 30–6 *ATTACH_SESSION Procedure Parameters*

Parameter	Description
debug_session_id	Debug ID from a call to INITIALIZE in target session.
diagnostics	Generate diagnostic output if nonzero.

CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not NULL, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
    run_info      IN OUT runtime_info,
    breakflags    IN      BINARY_INTEGER,
    info_requested IN      BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–7 CONTINUE Function Parameters

Parameter	Description
<code>run_info</code>	Information about the state of the program.
<code>breakflags</code>	Mask of events that are of interest. See " Breakflags " on page 30-12.
<code>info_requested</code>	Which information should be returned in <code>run_info</code> when the program stops. See " Information Flags " on page 30-13.

Return Values

Table 30–8 CONTINUE Function Return Values

Return	Description
<code>success</code>	
<code>error_timeout</code>	Timed out before the program started running.
<code>error_communication</code>	Other communication error.

DEBUG_OFF Procedure

Caution: There must be a debug session waiting if immediate is TRUE.

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (  
    no_client_side_plsql_engine BOOLEAN := TRUE,  
    immediate                   BOOLEAN := FALSE);
```

Parameters

Table 30–9 *DEBUG_ON Procedure Parameters*

Parameter	Description
no_client_side_plsql_engine	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine.
immediate	If this is TRUE, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

Table 30–10 *DELETE_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 30–11 *DELETE_BREAKPOINT Function Return Values*

Return	Description
success	
error_no_such_breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot delete an unused breakpoint.
error_stale_breakpt	The program unit was redefined since the breakpoint was set.

DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (  
    oer IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 30–12 *DELETE_OER_BREAKPOINT Function Parameters*

Parameter	Description
oer	The OER (positive 4-byte number) to delete.

DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–13 *DISABLE_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 30–14 *DISABLE_BREAKPOINT Function Return Values*

Returns	Description
success	
error_no_such_breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot disable an unused breakpoint.

ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

Table 30–15 *ENABLE_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 30–16 *ENABLE_BREAKPOINT Function Return Values*

Return	Description
success	Success.
error_no_such_ breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot enable an unused breakpoint.

EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to `DBMS_DEBUG.EXECUTE` occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
  what          IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  bind_results  IN BINARY_INTEGER,
  results       IN OUT NOCOPY dbms_debug_vc2coll,
  errm          IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 30–17 EXECUTE Procedure Parameters

Parameter	Description
<code>what</code>	SQL or PL/SQL source to execute.
<code>frame#</code>	The context in which to execute the code. Only -1 (global context) is supported at this time.
<code>bind_results</code>	Whether the source wants to bind to <code>results</code> in order to return values from the target session. 0 = No 1 = Yes
<code>results</code>	Collection in which to place results, if <code>bind_results</code> is not 0.
<code>errm</code>	Error message, if an error occurred; otherwise, NULL.

Examples

Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
  coll sys.dbms_debug_vc2coll; -- results (unused)
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                    'values(''LJE'', 1, 1)',
                    -1, 0, coll, errm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
```

```

dbms_debug.execute(
  'DECLARE PRAGMA autonomous_transaction; ' ||
  'BEGIN ' ||
  '  insert into emp(ename, empno, deptno) ' ||
  '  values(''LJE'', 1, 1); ' ||
  ' COMMIT; ' ||
  'END;',
  -1, 0, coll, errm);
END;

```

Example 3

This example executes a PL/SQL block, and it returns some results.

```

DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute(
    'DECLARE ' ||
    '  pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
    '  x PLS_INTEGER; ' ||
    '  i PLS_INTEGER := 1; ' ||
    'BEGIN ' ||
    '  SELECT COUNT(*) INTO x FROM emp; ' ||
    '  pp.EXTEND(x * 6); ' ||
    '  FOR c IN (SELECT * FROM emp) LOOP ' ||
    '    pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
    '    pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
    '    pp(i) := ''Job: '' || c.job; i := i+1; ' ||
    '    pp(i) := ''Mgr: '' || c.mgr; i := i+1; ' ||
    '    pp(i) := ''Sal: '' || c.sal; i := i+1; ' ||
    '    pp(i) := null; i := i+1; ' ||
    '  END LOOP; ' ||
    '  :1 := pp; ' ||
    'END;',
    -1, 1, coll, errm);
  each := coll.FIRST;
  WHILE (each IS NOT NULL) LOOP
    dosomething(coll(each));
    each := coll.NEXT(each);
  END LOOP;
END;

```

GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES (
    varname   IN  VARCHAR2,
    frame#    IN  BINARY_INTEGER,
    handle    IN  program_info,
    entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–18 *GET_INDEXES Function Parameters*

Parameter	Description
varname	Name of the variable to get index information about.
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable.
handle	Package description, if object is a package variable.
entries	1-based table of the indexes. If non-NULL, then <code>entries(1)</code> contains the first index of the table, <code>entries(2)</code> contains the second index, and so on.

Return Values

Table 30–19 *GET_INDEXES Function Return Values*

Return	Description
<code>error_no_such_object</code>	Either: <ul style="list-style-type: none"> - The package does not exist. - The package is not instantiated. - The user does not have privileges to debug the package. - The object does not exist in the package.

GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the [SHOW_SOURCE Procedures](#) which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (  
    buffer          IN OUT VARCHAR2,  
    buflen         IN BINARY_INTEGER,  
    piece#         IN BINARY_INTEGER);
```

Parameters

Table 30–20 GET_MORE_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer.
buflen	The length of the buffer.
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures .

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
  program          IN  program_info,
  maxline          OUT BINARY_INTEGER,
  number_of_entry_points OUT BINARY_INTEGER,
  linemap          OUT  RAW)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–21 GET_LINE_MAP Function Parameters

Parameter	Description
program	A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.
maxline	The largest source code line number in 'program'.
number_of_entry_points	The number of subprograms in 'program'
linemap	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.

Return Values

Table 30–22 GET_LINE_MAP Function Return Values

Return	Description
success	A successful completion.
error_no_debug_info	The program unit exists, but has no debug info.
error_bad_handle	No such program unit exists.

GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to 0.

Note: This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (  
    info_requested IN BINARY_INTEGER,  
    run_info      OUT runtime_info)  
RETURN BINARY_INTEGER;
```

Parameters

Table 30–23 *GET_RUNTIME_INFO Function Parameters*

Parameter	Description
<code>info_requested</code>	Which information should be returned in <code>run_info</code> when the program stops. See " Information Flags " on page 30-13.
<code>run_info</code>	Information about the state of the program.

GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

Parameters

Table 30–24 GET_TIMEOUT_BEHAVIOUR Function Parameters

Parameter	Description
oer	The OER (a 4-byte positive number).

Return Values

Table 30–25 GET_TIMEOUT_BEHAVIOUR Function Return Values

Return	Description
success	A successful completion.

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  frame#       IN BINARY_INTEGER,
  scalar_value OUT VARCHAR2,
  format      IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–26 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter.
frame#	Frame in which it lives; 0 means the current procedure.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 30–27 GET_VALUE Function Return Values

Return	Description
success	A successful completion.
error_bogus_frame	Frame does not exist.
error_no_debug_info	Entrypoint has no debug information.
error_no_such_object	variable_name does not exist in frame#.
error_unknown_type	The type information in the debug information is illegible.
error_nullvalue	Value is NULL.
error_indexed_table	The object is a table, but no index was provided.

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
  variable_name IN VARCHAR2,
  handle       IN program_info,
  scalar_value OUT VARCHAR2,
  format      IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–28 *GET_VALUE Function Parameters*

Parameter	Description
variable_name	Name of the variable or parameter.
handle	Description of the package containing the variable.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 30–29 *GET_VALUE Function Return Values*

Return	Description
error_no_such_object	Either: <ul style="list-style-type: none"> - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.
error_indexed_table	The object is a table, but no index was provided.

Examples

This example illustrates how to get the value with a given package `PACK` in schema `SCOTT`, containing variable `VAR`:

```

DECLARE
    handle    dbms_debug.program_info;
    resultbuf VARCHAR2(500);
    retval    BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;

```

INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
  debug_session_id IN VARCHAR2      := NULL,
  diagnostics      IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```

Parameters

Table 30–30 INITIALIZE Function Parameters

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile. 0 = (default) no diagnostics 1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`.

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call `debug_off`) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
- `abort_on_timeout` - Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;
```

```
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;
```

```
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;
```

```
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    listing IN OUT VARCHAR2);  
  
DBMS_DEBUG.PRINT_BACKTRACE (  
    backtrace OUT backtrace_table);
```

Parameters

Table 30–31 PRINT_BACKTRACE Procedure Parameters

Parameter	Description
listing	A formatted character buffer with embedded newlines.
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
  pkgs  IN OUT NOCOPY backtrace_table,
  flags IN BINARY_INTEGER);
```

Parameters

Table 30–32 PRINT_INSTANTIATIONS Procedure Parameters

Parameter	Description
pkgs	The instantiated packages
flags	Bitmask of options: <ul style="list-style-type: none"> ■ 1 - show specs ■ 2 - show bodies ■ 4 - show local instantiations ■ 8 - show remote instantiations (NYI) ■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.

Exceptions

`no_target_program` - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: `Namespace`, `Name`, `Owner`, and `LibunitType`.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (  
    major out BINARY_INTEGER,  
    minor out BINARY_INTEGER);
```

Parameters

Table 30–33 *PROBE_VERSION Procedure Parameters*

Parameter	Description
major	Major version number.
minor	Minor version number: increments as functionality is added.

SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pblload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
    timeout IN binary_integer := 60);
```

Parameters

Table 30–34 SELF_CHECK Procedure Parameters

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

Exceptions

Table 30–35 SELF_CHECK Procedure Exceptions

Exception	Description
OER-6516	Probe version is inconsistent.
pipe_creation_failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
  program      IN program_info,
  line#        IN BINARY_INTEGER,
  breakpoint#  OUT BINARY_INTEGER,
  fuzzy        IN BINARY_INTEGER := 0,
  iterations   IN BINARY_INTEGER := 0)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–36 SET_BREAKPOINT Function Parameters

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set.
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint.
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return <code>error_illegal_line</code> . 1 means search forward for an adjacent line at which to place the breakpoint. -1 means search backward for an adjacent line at which to place the breakpoint.
iterations	Number of times to wait before signalling this breakpoint.

Return Values

Note: The `fuzzy` and `iterations` parameters are not yet implemented.

Table 30–37 SET_BREAKPOINT Function Return Values

Return	Description
success	A successful completion.
error_illegal_line	Cannot set a breakpoint at that line.
error_bad_handle	No such program unit exists.

SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (  
    oer IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 30–38 SET_OER_BREAKPOINT Function Parameters

Parameter	Description
oer	The OER (positive 4-byte number) to delete.

Return Values

Table 30–39 SET_OER_BREAKPOINT Function Return Values

Return	Description
success	A successful completion.
error_no_such_ breakpt	No such OER breakpoint exists.

SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (  
    timeout BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

Table 30–40 *SET_TIMEOUT Function Parameters*

Parameter	Description
timeout	The timeout to use for communication between the target and debug sessions.

SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
    behaviour IN PLS_INTEGER);
```

Parameters

Table 30–41 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

Parameter	Description
behaviour	One of the following:
retry_on_timeout	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
continue_on_timeout	Continue execution, using same event flags.
nodebug_on_timeout	Turn debug-mode OFF (in other words, call <code>debug_off</code>) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling <code>debug_on</code> .
abort_on_timeout	Continue execution, using the <code>abort_execution</code> flag, which should cause the program to terminate immediately. The session remains in debug-mode.

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
    frame#           IN binary_integer,
    assignment_statement IN varchar2)
RETURN BINARY_INTEGER;
```

```
DBMS_DEBUG.SET_VALUE (
    handle           IN program_info,
    assignment_statement IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 30-42 SET_VALUE Function Parameters

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable.
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

Return Values

Table 30-43 SET_VALUE Function Return Values

Return	Description
success	-
error_illegal_value	Not possible to set it to that value.
error_illegal_null	Cannot set to NULL because object type specifies it as 'not null'.
error_value_malformed	Value is not a scalar.
error_name_incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	Either: <ul style="list-style-type: none"> - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that

modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
    handle dbms_debug.program_info;
    retval BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval            := dbms_debug.set_value(handle, 'var := 6;');
END;
```

SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
    code_breakpoints  OUT breakpoint_table,
    oer_breakpoints   OUT oer_table);
```

Parameters

Table 30-44 SHOW_BREAKPOINTS Procedure Parameters

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints. Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number.
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER.

SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
    first_line IN          BINARY_INTEGER,
    last_line  IN          BINARY_INTEGER,
    source     IN OUT NOCOPY vc2_table,
    frame_num  IN          BINARY_INTEGER);
```

Parameters

Table 30–45 *SHOW_FRAME_SOURCE Procedure Parameters*

Parameter	Description
first_line	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#.
frame_num	1-based frame number.

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the [Usage Notes](#) to [SHOW_SOURCE Procedures](#).

SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
  first_line IN BINARY_INTEGER,
  last_line  IN BINARY_INTEGER,
  source     OUT vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
  first_line IN BINARY_INTEGER,
  last_line  IN BINARY_INTEGER,
  window     IN BINARY_INTEGER,
  print_arrow IN BINARY_INTEGER,
  buffer     IN OUT VARCHAR2,
  buflen     IN BINARY_INTEGER,
  pieces     OUT BINARY_INTEGER);
```

Parameters

Table 30–46 SHOW_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#.
window	'Window' of lines (the number of lines around the current source line).
print_arrow	Nonzero means to print an arrow before the current line.
buffer	Buffer in which to place the source listing.
buflen	Length of buffer.
pieces	Set to nonzero if not all the source could be placed into the given buffer.

Return Values

An indexed table of source-lines. The source lines are stored starting at first_line. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
  info DBMS_DEBUG.runtime_info;
BEGIN
  -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
  -- or GET_RUNTIME_INFO to fill in 'info'
  SELECT text INTO <buffer> FROM all_source
```

```
WHERE owner = info.Program.Owner
      AND name = info.Program.Name
      AND line = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in `bufferlength` (`bufLen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not NULL, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
    run_info          OUT runtime_info,
    info_requested IN  BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–47 SYNCHRONIZE Function Parameters

Parameter	Description
<code>run_info</code>	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
<code>info_requested</code>	Optional bit-field in which to request information other than the default (which is <code>info_getStackDepth + info_getLineInfo</code>). 0 means that no information is requested at all. See " Information Flags " on page 30-13.

Return Values

Table 30–48 SYNCHRONIZE Function Return Values

Return	Description
<code>success</code>	A successful completion.
<code>error_timeout</code>	Timed out before the program started execution.
<code>error_communication</code>	Other communication error.

TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING  
RETURN BOOLEAN;
```

DBMS_DEFER

DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

- [Documentation of DBMS_DEFER](#)

Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see DBMS_DEFER in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_DEFER_QUERY

DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- [Documentation of DBMS_DEFER_QUERY](#)

Documentation of DBMS_DEFER_QUERY

For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_DEFER_SYS

DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

- [Documentation of DBMS_DEFER_SYS](#)

Documentation of DBMS_DEFER_SYS

For a complete description of this package within the context of Replication, see DBMS_DEFER_SYS in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_DESCRIBE

You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- [Using DBMS_DESCRIBE](#)
 - Overview
 - Security Model
 - Types
 - Exceptions
 - Examples
- [Summary of DBMS_DESCRIBE Subprograms](#)

Using DBMS_DESCRIBE

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Examples](#)

Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also: *Oracle Call Interface Programmer's Guide*

Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;
```

```
TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 34-1 *DBMS_DESCRIBE Errors*

Error	Description
ORA-20000	ORU-10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person (person_id number(4), person_nm varchar2(10))

FUNCTION ACCOUNT_UPDATE (account_no  NUMBER,
                        person        person%rowtype,
                        amounts       DBMS_DESCRIBE.NUMBER_TABLE,
                        trans_date    DATE)
                        return        account.balance%type;

FUNCTION ACCOUNT_UPDATE (account_no  NUMBER,
                        person        person%rowtype,
                        amounts       DBMS_DESCRIBE.NUMBER_TABLE,
                        trans_no      NUMBER)
                        return        account.balance%type;
```

This procedure might look similar to the following output:

overload	position	argument	level	datatype	length	prec	scale	rad
1	0		0		2	22	7	2 10
1	1	ACCOUNT	0		2	0	0	0 0
1	2	PERSON	0		250	0	0	0 0
1	1	PERSON_ID	1		2	22	4	0 10
1	2	PERSON_NM	1		1	10	0	0 0
1	3	AMOUNTS	0		251	0	0	0 0
1	1		1		2	22	0	0 0
1	4	TRANS_DATE	0		12	0	0	0 0
2	0		0		2	22	7	2 10
2	1	ACCOUNT_NO	0		2	22	0	0 0
2	2	PERSON	0		2	22	4	0 10
2	3	AMOUNTS	0		251	22	4	0 10
2	1		1		2	0	0	0 0
2	4	TRANS_NO	0		2	0	0	0 0

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
  pvc2    IN    VARCHAR2,
  pvc     OUT   VARCHAR,
  pstr    IN OUT STRING,
  plong   IN    LONG,
  prowid  IN    ROWID,
  pchara  IN    CHARACTER,
  pchar   IN    CHAR,
  praw   IN    RAW,
  plraw   IN    LONG RAW,
  pbinnt  IN    BINARY_INTEGER,
  pplsint IN    PLS_INTEGER,
  pbool   IN    BOOLEAN,
  pnat    IN    NATURAL,
  ppos    IN    POSITIVE,
  pposn   IN    POSITIVEN,
```

```

    pnatn  IN    NATURALN,
    pnum   IN    NUMBER,
    pintgr IN    INTEGER,
    pint   IN    INT,
    psmall IN    SMALLINT,
    pdec   IN    DECIMAL,
    preal  IN    REAL,
    pfloat IN    FLOAT,
    pnumer IN    NUMERIC,
    pdp    IN    DOUBLE PRECISION,
    pdate  IN    DATE,
    pmls   IN    MLSLABEL) AS

```

```

BEGIN
    NULL;
END;

```

If you describe this procedure using the following:

```

CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

    PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
        n INTEGER;
    BEGIN
        n := isize - LENGTHB(val);
        IF n < 0 THEN
            n := 0;
        END IF;
        DBMS_OUTPUT.PUT(val);
        FOR i in 1..n LOOP
            DBMS_OUTPUT.PUT(' ');
        END LOOP;
    END prt_value;

    PROCEDURE desc_proc (name VARCHAR2) IS

        overload    DBMS_DESCRIBE.NUMBER_TABLE;
        position     DBMS_DESCRIBE.NUMBER_TABLE;
        c_level      DBMS_DESCRIBE.NUMBER_TABLE;
        arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
        dtv          DBMS_DESCRIBE.NUMBER_TABLE;
        def_val      DBMS_DESCRIBE.NUMBER_TABLE;
        p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
        length       DBMS_DESCRIBE.NUMBER_TABLE;
        precision    DBMS_DESCRIBE.NUMBER_TABLE;
        scale        DBMS_DESCRIBE.NUMBER_TABLE;
        radix        DBMS_DESCRIBE.NUMBER_TABLE;
        spare        DBMS_DESCRIBE.NUMBER_TABLE;
        idx          INTEGER := 0;

    BEGIN
        DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
            name,
            null,
            null,

```

```

        overload,
        position,
        c_level,
        arg_name,
        dty,
        def_val,
        p_mode,
        length,
        precision,
        scale,
        radix,
        spare);

DBMS_OUTPUT.PUT_LINE('Position      Name          DTY  Mode');
LOOP
    idx := idx + 1;
    prt_value(TO_CHAR(position(idx)), 12);
    prt_value(arg_name(idx), 12);
    prt_value(TO_CHAR(dty(idx)), 5);
    prt_value(TO_CHAR(p_mode(idx)), 5);
    DBMS_OUTPUT.NEW_LINE;
END LOOP;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.NEW_LINE;

END desc_proc;
END describe_it;
```

Then the results list all the numeric codes for the PL/SQL datatypes:

Position	Name	Datatype_Code	Mode
1	PVC2	1	0
2	PVC	1	1
3	PSTR	1	2
4	PLONG	8	0
5	PROWID	11	0
6	PCHARA	96	0
7	PCHAR	96	0
8	PRAW	23	0
9	PLRAW	24	0
10	PBININT	3	0
11	PPLSINT	3	0
12	PBOOL	252	0
13	PNAT	3	0
14	PPOS	3	0
15	PPOSN	3	0
16	PNATN	3	0

Summary of DBMS_DESCRIBE Subprograms

Table 34–2 DBMS_DESCRIBE Package Subprograms

Subprogram	Description
DESCRIBE_PROCEDURE Procedure on page 34-11	Provides a brief description of a PL/SQL stored procedure

DESCRIBE_PROCEDURE Procedure

The procedure `DESCRIBE_PROCEDURE` provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE (
  object_name          IN  VARCHAR2,
  reserved1            IN  VARCHAR2,
  reserved2            IN  VARCHAR2,
  overload             OUT NUMBER_TABLE,
  position             OUT NUMBER_TABLE,
  level                OUT NUMBER_TABLE,
  argument_name        OUT VARCHAR2_TABLE,
  datatype             OUT NUMBER_TABLE,
  default_value        OUT NUMBER_TABLE,
  in_out               OUT NUMBER_TABLE,
  length               OUT NUMBER_TABLE,
  precision            OUT NUMBER_TABLE,
  scale                OUT NUMBER_TABLE,
  radix                OUT NUMBER_TABLE,
  spare                OUT NUMBER_TABLE,
  include_string_constraints OUT BOOLEAN DEFAULT FALSE);
```

Parameters

Table 34-3 *DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters*

Parameter	Description
<code>object_name</code>	<p>Name of the procedure being described.</p> <p>The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified <code>OBJECT_NAME</code> can result in one of the following exceptions:</p> <p>ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function.</p> <p>ORA-20001 - The procedure or function that you specified does not exist within the given package.</p> <p>ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects.</p> <p>ORA-20003 - The object that you specified is invalid and cannot be described.</p> <p>ORA-20004 - The object was specified with a syntax error.</p>
<code>reserved1</code> <code>reserved2</code>	Reserved for future use -- must be set to <code>NULL</code> or the empty string.
<code>overload</code>	<p>A unique number assigned to the procedure's signature.</p> <p>If a procedure is overloaded, then this field holds a different value for each version of the procedure.</p>
<code>position</code>	<p>Position of the argument in the parameter list.</p> <p>Position 0 returns the values for the return type of a function.</p>

Table 34-3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
level	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the <i>Oracle Call Interface Programmer's Guide</i> for a description of the ODESSP call for an example.
argument_name	Name of the argument associated with the procedure that you are describing.
datatype	Oracle datatype of the argument being described. The datatypes and their numeric type codes are: 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR2, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE_TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	Describes the mode of the parameter: 0 IN 1 OUT 2 IN OUT
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned. If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_string_constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96

Return Values

All values from DESCRIBE_PROCEDURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

See Also: *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- [Using DBMS_DIMENSION](#)
 - Security Model
- [Summary of DBMS_DIMENSION Subprograms](#)

Using DBMS_DIMENSION

This section contains topics which relate to using the DBMS_DIMENSION package.

- [Security Model](#)

Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

Summary of DBMS_DIMENSION Subprograms

Table 35–1 *DBMS_DIMENSION Package Subprograms*

Subprogram	Description
DESCRIBE_DIMENSION Procedure on page 35-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
VALIDATE_DIMENSION Procedure on page 35-6	Verifies that the relationships specified in a dimension are correct

DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (  
    dimension IN VARCHAR2);
```

Parameters

Table 35–2 DESCRIBE_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table `DIMENSION_EXCEPTIONS` in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
    dimension          IN VARCHAR2,
    incremental        IN BOOLEAN := TRUE,
    check_nulls        IN BOOLEAN := FALSE,
    statement_id       IN VARCHAR2 := NULL );
```

Parameters

Table 35–3 *VALIDATE_DIMENSION Procedure Parameters*

Parameter	Description
<code>dimension</code>	The owner and name of the dimension in the format of <code>owner.name</code> .
<code>incremental</code>	If <code>TRUE</code> , check only the new rows for tables of this dimension. If <code>FALSE</code> , check all the rows.
<code>check_nulls</code>	If <code>TRUE</code> , then all level columns are verified to be non-null. If <code>FALSE</code> , this check is omitted. Specify <code>FALSE</code> when non-NULLness is guaranteed by other means, such as <code>NOT NULL</code> constraints.
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- [Using DBMS_DISTRIBUTED_TRUST_ADMIN](#)
 - Overview
 - Security Model
 - Examples
- [Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms](#)

Using DBMS_DISTRIBUTED_TRUST_ADMIN

- [Overview](#)
- [Security Model](#)
- [Examples](#)

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute `DBMS_DISTRIBUTED_TRUST_ADMIN`, the `EXECUTE_CATALOG_ROLE` role must be granted to the DBA. To select from the view `TRUSTED_SERVERS`, the `SELECT_CATALOG_ROLE` role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the `ALLOW_SERVER` procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the `DENY_SERVER` procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures `DENY_ALL` and `ALLOW_ALL` delete all entries (in other words, server names) that are explicitly allowed or denied using the `ALLOW_SERVER` procedure or `DENY_SERVER` procedure respectively.

Examples

If you have not yet used the package `DBMS_DISTRIBUTED_TRUST_ADMIN` to change the trust listing, by default you trust all databases in the same enterprise domain if that domain is listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Trusted    All
```

Because all servers are currently trusted, you can execute the [DENY_SERVER Procedure](#) and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Untrusted  SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the [DENY_ALL Procedure](#), you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

```
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
-----
Untrusted  All
```

The [ALLOW_SERVER Procedure](#) can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Trusted    SALES.US.AMERICAS.ACME_AUTO.COM
```

Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Table 36–1 *DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms*

Subprogram	Description
ALLOW_ALL Procedure on page 36-7	Empties the list and inserts a row indicating that all servers should be trusted
ALLOW_SERVER Procedure on page 36-8	Enables a specific server to be allowed access even though deny all is indicated in the list
DENY_ALL Procedure on page 36-9	Empties the list and inserts a row indicating that all servers should be untrusted
DENY_SERVER Procedure on page 36-10	Enables a specific server to be denied access even though allow all is indicated in the list

ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view `TRUSTED_SERVERS` will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

`ALLOW_ALL` only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (  
    server IN VARCHAR2);
```

Parameters

Table 36–2 ALLOW_SERVER Procedure Parameters

Parameter	Description
server	Unique, fully-qualified name of the server to be trusted.

Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.

DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view `TRUSTED_SERVERS` will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (  
    server IN VARCHAR2);
```

Parameters

Table 36–3 *DENY_SERVER Procedure Parameters*

Parameter	Description
<code>server</code>	Unique, fully-qualified name of the server to be untrusted.

Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry `"deny all"`, and if there is no `"allow DBx"` entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry `"deny all"`, and if there is an `"allow DBx"` entry, then this procedure causes that entry to be deleted.

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- [Using DBMS_EPG](#)
 - Overview
 - Security Model
 - Exceptions
- [Data Structures](#)
 - [VARCHAR2_TABLE](#) Table Type
- [Subprogram Groups](#)
 - Configuration Subprograms
 - Authorization Subprograms
- [Summary of DBMS_EPG Subprograms](#)

Using DBMS_EPG

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)

Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of `mod_plsql` in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser via HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

Security Model

The XDBADMIN role is required to invoke the configuration interface. It may be invoked by the database user "XDB".

The authorization interface can be invoked by any user.

Exceptions

The following table lists the exceptions raised by the DBMS_EPG package.

Table 37-1 DBMS_EPG Exceptions

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Subprogram Groups

The DBMS_EPG consists of two interfaces:

- [Configuration Subprograms](#)
- [Authorization Subprograms](#)

Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 37-2 Configuration Subprogram Group

Subprogram	Description
CREATE_DAD Procedure on page 37-12	Creates a new DAD
DELETE_DAD_ATTRIBUTE Procedure on page 37-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 37-15	Deletes a global attribute
DROP_DAD Procedure on page 37-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 37-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 37-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 37-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 37-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 37-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 37-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 37-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 37-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 37-27	Sets the value of a global attribute
UNMAP_DAD Procedure on page 37-28	Unmaps a DAD from the specified virtual path

Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 37-3 Authorization Subprogram Group

Subprogram	Description
AUTHORIZE_DAD Procedure on page 37-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
DEAUTHORIZE_DAD Procedure on page 37-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

Summary of DBMS_EPG Subprograms

Table 37–4 DBMS_ALERT Package Subprograms

Subprogram	Description
AUTHORIZE_DAD Procedure on page 37-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
CREATE_DAD Procedure on page 37-12	Creates a new DAD
DEAUTHORIZE_DAD Procedure on page 37-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
DELETE_DAD_ATTRIBUTE Procedure on page 37-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 37-15	Deletes a global attribute
DROP_DAD Procedure on page 37-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 37-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 37-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 37-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 37-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 37-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 37-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 37-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 37-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 37-27	Sets the value of a global attribute
UNMAP_DAD Procedure on page 37-28	Unmaps a DAD from the specified virtual path

AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

See Also: [Authorization Subprograms](#) on page 37-9 for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37-5 *AUTHORIZE_DAD Procedure Parameters*

Parameter	Description
dad_name	The name of the DAD to create
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

CREATE_DAD Procedure

This procedure creates a new DAD.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37-6 CREATE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

See Also: [Authorization Subprograms](#) on page 37-9 for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
    dad_name IN VARCHAR2,
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37-7 DEAUTHORIZE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2);
```

Parameters

Table 37–8 *DELETE_DAD_ATTRIBUTE Procedure Parameters*

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

Exceptions

Raises an error if DAD does not exist

DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (  
    attr_name      IN VARCHAR2);
```

Parameters

Table 37-9 *DELETE_GLOBAL_ATTRIBUTE Procedure Parameters*

Parameter	Description
attr_name	The global attribute to delete

DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (  
    dadname IN VARCHAR2);
```

Parameters

Table 37–10 *DROP_DAD Procedure Parameters*

Parameter	Description
dad_name	The DAD to drop

Exceptions

Raises an error if the DAD does not exist.

GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
  dad_name      IN          VARCHAR2,
  attr_names    OUT NOCOPY VARCHAR2_TABLE,
  attr_values   OUT NOCOPY VARCHAR2_TABLE);
```

Parameters

Table 37-11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (  
    dad_name      IN          VARCHAR2,  
    paths         OUT NOCOPY VARCHAR2_TABLE);
```

Parameters

Table 37-12 GET_ALL_DAD_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which the DAD is mapped

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, `paths` will be set to empty arrays.

GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
  attr_names      OUT  NOCOPY  VARCHAR2_TABLE,
  attr_values     OUT  NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 37-13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.

GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 37-14 *GET_DAD_ATTRIBUTE Procedure Parameters*

Parameter	Description
dad_names	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (  
    dad_names      OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 37-15 *GET_DAD_LIST Procedure Parameters*

Parameter	Description
dad_names	The list of all DADs

Usage Notes

If no DADs exist then dad_names will be set to an empty array.

GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (  
    attr_name IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 37-16 GET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2);
```

Parameters

Table 37–17 MAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

Exceptions

Raises an error if the DAD does not exist.

SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
    dad_name     IN  VARCHAR2,
    attr_name    IN  VARCHAR2,
    attr_value   IN  VARCHAR2);
```

Parameters

Table 37–18 SET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

Table 37–19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

Table 37–19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInputFilterEnable	input-filter-enable	No	Enumeration of On, Off
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. `mod_plsql` users should note the following
 - The `PlsqlDatabasePassword` attribute is not needed.
 - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRAApp.home');
```

SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
  attr_name     IN VARCHAR2,
  attr_value    IN VARCHAR2);
```

Parameters

Table 37–20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

Table 37–21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

See Also: [Configuration Subprograms](#) on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (  
    dad_name IN VARCHAR2,  
    path      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37-22 UNMAP_DAD Procedure Parameters

Parameter	Description
<code>dad_name</code>	The name of the DAD to unmap
<code>path</code>	The virtual path to unmap

Usage Notes

Raises an error if the DAD does not exist.

DBMS_ERRLOG

The DBMS_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

See Also: *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS_ERRLOG and *Oracle Database SQL Reference* for `error_logging_clause` syntax

This chapter contains the following topics:

- [Using DBMS_ERRLOG](#)
 - Security Model
- [Summary of DBMS_ERRLOG Subprograms](#)

Using DBMS_ERRLOG

This section contains topics which relate to using the DBMS_ERRLOG package.

- [Security Model](#)

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

Summary of DBMS_ERRLOG Subprograms

Table 38–1 *DBMS_ERRLOG Package Subprograms*

Subprogram	Description
CREATE_ERROR_LOG Procedure on page 38-5	Creates the error logging table used in DML error logging

CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
  dml_table_name          IN VARCHAR2,
  err_log_table_name      IN VARCHAR2 := NULL,
  err_log_table_owner     IN VARCHAR2 := NULL,
  err_log_table_space     IN VARCHAR2 := NULL,
  skip_unsupported       IN BOOLEAN := FALSE);
```

Parameters

Table 38–2 CREATE_ERROR_LOG Procedure Parameters

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR\$_'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR\$_EMP' dml_table_name: '"Emp2"', err_log_table_name: 'ERR\$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                               Null?      Type
-----
CHANNEL_ID                          NOT NULL   CHAR(1)
```

CHANNEL_DESC	NOT NULL	VARCHAR2 (20)
CHANNEL_CLASS		VARCHAR2 (20)

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                               Null?    Type
-----
ORA_ERR_NUMBER$                   NUMBER
ORA_ERR_MSG$                       VARCHAR2 (2000)
ORA_ERR_ROWID$                     ROWID
ORA_ERR_OPTYP$                     VARCHAR2 (2)
ORA_ERR_TAG$                       VARCHAR2 (2000)
CHANNEL_ID                         VARCHAR2 (4000)
CHANNEL_DESC                       VARCHAR2 (4000)
CHANNEL_CLASS                      VARCHAR2 (4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

The `DBMS_EXPFIL` package contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.

See Also: *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.

This chapter contains the following topics:

- [Summary of Expression Filter Subprograms](#)

Summary of Expression Filter Subprograms

Table 39–1 describes the subprograms in the `DBMS_EXPFIL` package.

All the values and names passed to the procedures defined in the `DBMS_EXPFIL` package are not case sensitive, unless otherwise mentioned. To preserve the case, you use double quotation marks around the values.

Table 39–1 *DBMS_EXPFIL Package Subprograms*

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the attribute set
ADD_FUNCTIONS Procedure	Adds a function, type, or package to the approved list of functions with an attribute set
ASSIGN_ATTRIBUTE_SET Procedure	Assigns an attribute set to a column storing expressions
BUILD_EXCEPTIONS_TABLE Procedure	Creates an exception table to hold references to invalid expressions
CLEAR_EXPRSET_STATS Procedure	Clears the predicate statistics for an expression set
COPY_ATTRIBUTE_SET Procedure	Makes a copy of the attribute set
CREATE_ATTRIBUTE_SET Procedure	Creates an attribute set
DEFAULT_INDEX_PARAMETERS Procedure	Assigns default index parameters to an attribute set
DEFAULT_XINDEX_PARAMETERS Procedure	Assigns default XPath index parameters to an attribute set
DEFRAG_INDEX Procedure	Rebuilds the bitmap indexes online to reduce fragmentation
DROP_ATTRIBUTE_SET Procedure	Drops an unused attribute set
GET_EXPRSET_STATS Procedure	Collects predicate statistics for an expression set
GRANT_PRIVILEGE Procedure	Grants an expression DML privilege to a user
INDEX_PARAMETERS Procedure	Assigns index parameters to an expression set
MODIFY_OPERATOR_LIST Procedure	Modifies the list of common operators used in predicates with a certain attribute
REVOKE_PRIVILEGE Procedure	Revokes an expression DML privilege from a user
UNASSIGN_ATTRIBUTE_SET Procedure	Breaks the association between a column storing expressions and the attribute set
VALIDATE_EXPRESSIONS Procedure	Validates expression metadata and the expressions stored in a column
XINDEX_PARAMETERS Procedure	Assigns XPath index parameters to an expression set

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to the attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_type  IN   VARCHAR2,
  attr_defv1 IN   VARCHAR2 DEFAULT NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  tab_alias  IN   exf$table_alias);
```

Parameters

Table 39–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defv1	Default value for the elementary attribute
tab_alias	The type that identifies the database table to which the attribute is aliased

Usage Notes

- This procedure adds an elementary attribute to an attribute set. If the attribute set was originally created from an existing object type, then additional attributes cannot be added.
- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter*.
- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- The default value specification for an attribute is similar to a default value specification for a table column. The resulting default values should agree with the

datatype of the attribute. For example, valid default values for an attribute of DATE datatype are SYSDATE and `to_date('01-01-2004', 'DD-MM-YYYY')`.

- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'HRAttrSet',
    attr_name => 'HRREP',
    attr_type => 'VARCHAR2(30)',
    attr_defv1 => 'Betty Smith');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'HRAttrSet',
    attr_name => 'DEPT',
    tab_alias => exf$table_alias('DEPT'));
END;
```

The following commands define a CreationTime elementary attribute that takes the database time as the default value.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'PurchaseOrder',
    attr_name => 'CreationTime',
    attr_type => 'DATE',
    attr_defv1 => 'SYSDATE');
END;
```

Alternately, the following commands initialize the CreationTime attribute to a specific value when it is not explicitly specified in the data item passed to the EVALUATE operator.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'PurchaseOrder',
    attr_name => 'CreationTime',
    attr_type => 'DATE',
    attr_defv1 => 'to_date(''01-01-2004'', ''DD-MM-YYYY'')');
END;
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the attribute set.

Syntax

```
DBMS_EXPFIL.ADD_FUNCTIONS (
    attr_set   IN   VARCHAR2,
    funcs_name IN   VARCHAR2);
```

Parameters

Table 39-3 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use by the expression set. If the expression set refers to a user-defined function, the function must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list. The function added to the attribute set, and thus used in the stored expressions, should not perform any DML or DDL (database state changing) operations. Any violations to this rule will only be caught at run-time while evaluating the expressions (this implies that this will not be checked during the ADD_FUNCTIONS procedure call).
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the expression set are considered valid. The expressions in a set can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
    DBMS_EXPFIL.ADD_FUNCTIONS (
        attr_set   => 'Car4Sale',
        funcs_name => 'HorsePower');
    DBMS_EXPFIL.ADD_FUNCTIONS (
        attr_set   => 'Car4Sale',
```

```
    funcs_name => 'Scott.CrashTestRating');  
END;
```

ASSIGN_ATTRIBUTE_SET Procedure

This procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column.

Syntax

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (
  attr_set IN VARCHAR2,
  expr_tab IN VARCHAR2,
  expr_col IN VARCHAR2,
  force IN VARCHAR2 DEFAULT 'FALSE');
```

Parameters

Table 39–4 *ASSIGN_ATTRIBUTE_SET Procedure Parameters*

Parameter	Description
attr_set	The name of the attribute set
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
force	Argument used to trust the existing expressions in a table (and skip validation)

Usage Notes

- The ASSIGN_ATTRIBUTE_SET procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column. The attribute set contains the elementary attribute names and their datatypes and any functions used in the expressions. The attribute set is used by the Expression column to validate changes and additions to the expression set.
- An attribute set can be assigned only to a table column in the same schema as the attribute set. An attribute set can be assigned to one or more table columns. Assigning an attribute set to a column storing expressions implicitly creates methods for the associated object type. For this operation to succeed, the object type cannot have any dependent objects before the attribute set is assigned.
- By default, the column should not have any expressions at the time of association. However, if the values in the column are known to be valid expressions, you can use a value of 'TRUE' for the force argument to assign the attribute set to a column containing expressions.
- See "Defining Expression Columns" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following command assigns the attribute set to a column storing expressions. The expression set should be empty at the time of association.

```
BEGIN
  DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (attr_set => 'Car4Sale',
```

```
                expr_tab => 'Consumer',  
                expr_col => 'Interest');  
  
END;
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates the exception table, used in validation, in the current schema.

Syntax

```
DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
    exception_tab IN VARCHAR2);
```

Parameters

Table 39–5 *BUILD_EXCEPTIONS_TABLE Procedure Parameter*

Parameter	Description
exception_tab	The name of the exception table

Usage Notes

- The expressions stored in a table column can be validated using the `VALIDATE_EXPRESSIONS` procedure. During expression validation, you can optionally provide the name of the exception table in which the references to the invalid expressions are stored. The `BUILD_EXCEPTIONS_TABLE` procedure creates the exception table in the current schema.
- See "Evaluation Semantics" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and [VALIDATE_EXPRESSIONS Procedure](#) in this chapter for more information.
- Related view: `USER_TABLES`

Examples

The following command creates the exception table, `InterestExceptions`, in the current schema:

```
BEGIN
    DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
        exception_tab => 'InterestExceptions');
END;
```

CLEAR_EXPRSET_STATS Procedure

This procedure clears the predicate statistics for the expression set stored in a table column.

Syntax

```
DBMS_EXPFIL.CLEAR_EXPRSET_STATS (  
    expr_tab IN VARCHAR2,  
    expr_col IN VARCHAR2);
```

Parameters

Table 39–6 CLEAR_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions

Usage Notes

- This procedure clears the predicate statistics for the expression set stored in a table column. See also [GET_EXPRSET_STATS Procedure](#) in this chapter for information about gathering the statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS

Examples

The following command clears the predicate statistics for the expression set stored in Interest column of the Consumer table:

```
BEGIN  
    DBMS_EXPFIL.CLEAR_EXPRSET_STATS (expr_tab => 'Consumer',  
                                     expr_col => 'Interest');  
END;
```

COPY_ATTRIBUTE_SET Procedure

This procedure copies an attribute set along with its user-defined function list and default index parameters to another set.

Syntax

```
DBMS_EXPFIL.COPY_ATTRIBUTE_SET (
  from_set  IN  VARCHAR2,
  to_set    IN  VARCHAR2);
```

Parameters

Table 39-7 COPY_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
from_set	Name of an existing attribute set to be copied
to_set	Name of the new attribute set

Usage Notes

- A schema-extended name can be used for the `from_set` argument to copy an attribute set across schemas. The user issuing the command must have `EXECUTE` privileges for the object type associated with the original attribute set. The user must ensure that any references to schema objects (user-defined functions, tables, and embedded objects) are valid in the new schema.
- The default index parameters and the user-defined function list of the new set can be changed independent of the original set.
- Related views: `ALL_EXPFIL_ATTRIBUTE_SETS` and `ALL_EXPFIL_ATTRIBUTES`.

Examples

The following command makes a copy of the Car4Sale attribute set:

```
BEGIN
  DBMS_EXPFIL.COPY_ATTRIBUTE_SET (from_set => 'Car4Sale',
                                to_set    => 'Vehicle');
END;
```

CREATE_ATTRIBUTE_SET Procedure

This procedure creates an empty attribute set or an attribute set with a complete set of elementary attributes derived from an object type with a matching name.

Syntax

```
DBMS_EXPFIL.CREATE_ATTRIBUTE_SET (
    attr_set    IN    VARCHAR2,
    from_type  IN    VARCHAR2 DEFAULT 'NO');
```

Parameters

Table 39–8 CREATE_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set to be created
from_type	YES, if the attributes for the attribute set should be derived from an existing object type

Usage Notes

- The object type used for an attribute set cannot contain any user methods, and it should not be an evolved type (with the use of `ALTER TYPE` command). This object type should not have any dependent objects at the time of the attribute set creation. If the attribute set is not derived from an existing object type, this procedure creates an object type with a matching name.
- An attribute set with one or more table alias attributes cannot be derived from an object type. For this purpose, create an empty attribute set and add one elementary attribute at a time using the `DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE` procedure. (See Appendix A in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.)
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and [ADD_ELEMENTARY_ATTRIBUTE Procedures](#) in this chapter for more information.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.

Examples

The following commands create an attribute set with all the required elementary attributes derived from the `Car4Sale` type:

```
CREATE OR REPLACE TYPE Car4Sale AS OBJECT
    (Model    VARCHAR2(20) ,
     Year     NUMBER,
     Price    NUMBER,
     Mileage  NUMBER);

BEGIN
    DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale',
                                   from_type => 'YES');
END;
```

Assuming that the `Car4Sale` type does not exist, the attribute set can be created from scratch as shown in the following example:

```
BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Model',
    attr_type => 'VARCHAR2(20)');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Year',
    attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Price',
    attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Mileage',
    attr_type => 'NUMBER');
END;
```

DEFAULT_INDEX_PARAMETERS Procedure

This procedure assigns default index parameters to an attribute set. It also adds or drops a partial list of stored and indexed attributes to or from the default list associated with the attribute list.

Syntax

```
DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
  attr_set   IN   VARCHAR2,
  attr_list  IN   EXF$ATTRIBUTE_LIST,
  operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–9 DEFAULT_INDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set
attr_list	An instance of EXF\$ATTRIBUTE_LIST with a partial list of (default) stored and indexed attributes for an Expression Filter index
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- Existing Expression Filter indexes are not modified when the default parameters for the corresponding attribute set are changed. The new index defaults are used when a new Expression Filter index is created and when an existing index is rebuilt. (See "Alter Index Rebuild" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about rebuilding indexes.)
- See "Creating an Index from Default Parameters" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about assigning default index parameters to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command adds the specified stored and indexed attributes to the attribute set's default index parameters list:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
    attr_set => 'Car4Sale',
    attr_list => exf$attribute_list (
      exf$attribute (attr_name => 'Model',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'Price',
                    attr_oper => exf$indexoper('all'),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'HorsePower(Model, Year)',
                    attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
                    attr_indexed => 'FALSE'),
      exf$attribute (attr_name => 'CrashTestRating(Model, Year)',
```

```
        attr_oper => exf$indexoper('=' , '<' , '>' , '>=' , '<='),
        attr_indexed => 'FALSE')),
    operation => 'ADD');
END;
```

The following command drops the `CrashTestRating(Model, Year)` attribute (stored or indexed) from the previous list.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    attr_list => exf$attribute_list (
      exf$attribute (attr_name => 'CrashTestRating(Model, Year)'),
    operation => 'DROP');
END;
```

DEFAULT_XPINDEX_PARAMETERS Procedure

This procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set.

Syntax

```
DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS (
  attr_set    IN    VARCHAR2,
  xmlt_attr   IN    VARCHAR2,
  xptag_list  IN    EXF$XPATH_TAGS,
  operation   IN    VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–10 DEFAULT_XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set
xmlt_attr	The name of the attribute with the XMLType datatype
xptag_list	An instance of EXF\$XPATH_TAGS type with a partial list of XML elements and attributes to be configured for the Expression Filter index
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- The attribute set used for an expression set may have one or more XML type attributes (defined with XMLType datatype) and the corresponding expressions may contain XPath predicates on these attributes. The Expression Filter index created for the expression set can be tuned to process these XPath predicates efficiently by using some XPath-specific index parameters (in addition to some non-XPath index parameters).
- The DEFAULT_XPINDEX_PARAMETERS procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set. The XPath parameters are assigned to a specific XMLType attribute in the attribute set and this information can be viewed using the USER_EXPFIL_DEF_INDEX_PARAMS view. The DEFAULT_INDEX_PARAMETERS procedure and the DEFAULT_XPINDEX_PARAMETERS procedure can be used independent of each other. They maintain a common list of default index parameters for the attribute set.
- See "Index Tuning for XPath Predicates" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about XPath parameters to the default index parameters of an attribute set. See also [DEFAULT_INDEX_PARAMETERS Procedure](#) in this chapter for more information about default index parameters.
- Related views: USER_EXPFIL_ATTRIBUTES and USER_EXPFIL_DEF_INDEX_PARAMS.

Note: The values assigned to the tag_name argument of exf\$xpath_tag type are case sensitive.

Examples

The following command adds the specified XML tags to the default index parameters list along with their preferences such as positional or value filter and indexed or stored predicate group:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    xmlt_attr => 'Details',
    xptag_list =>
      --- XPath tag list
      exf$xpath_tags(
        exf$xpath_tag(tag_name => 'stereo@make', --- XML attribute
                      tag_indexed => 'TRUE',
                      tag_type => 'VARCHAR(15)'), --- value filter
        exf$xpath_tag(tag_name => 'stereo', --- XML element
                      tag_indexed => 'FALSE',
                      tag_type => null), --- positional filter
        exf$xpath_tag(tag_name => 'memory', --- XML element
                      tag_indexed => 'TRUE',
                      tag_type => 'VARCHAR(10)'), --- value filter
        exf$xpath_tag(tag_name => 'GPS',
                      tag_indexed => 'TRUE',
                      tag_type => null)
      )
    );
END;
```

The following command drops the `stereo@make` tag from the default index parameters:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    xmlt_attr => 'Details',
    xptag_list =>
      --- XPath tag list
      exf$xpath_tags(
        exf$xpath_tag(tag_name => 'stereo@make')
      ),
    operation => 'DROP'
  );
END;
```

DEFRAG_INDEX Procedure

This procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.

Syntax

```
DBMS_EXPFIL.DEFRAG_INDEX (  
    idx_name IN VARCHAR2);
```

Parameters

Table 39–11 DEFRAG_INDEX Procedure Parameter

Parameter	Description
idx_name	The name of the Expression Filter index

Usage Notes

- The bitmap indexes defined for the indexed attributes of an Expression Filter index become fragmented as additions and updates are made to the expression set. The DEFRAG_INDEX procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.
- Indexes can be defragmented when the expression set is being modified. However, you should schedule defragmentation when the workload is relatively light.
- See "Index Storage and Maintenance" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about rebuilding indexes.
- Related views: USER_EXPFIL_INDEXES and USER_INDEXES.

Examples

The following command is issued to defragment the bitmap indexes associated with the Expression Filter index:

```
BEGIN  
    DBMS_EXPFIL.DEFRAG_INDEX (idx_name => 'InterestIndex');  
END;
```

DROP_ATTRIBUTE_SET Procedure

This procedure drops an attribute set not being used for any expression set.

Syntax

```
DBMS_EXPFIL.DROP_ATTRIBUTE_SET (
  attr_set IN VARCHAR2);
```

Parameters

Table 39–12 *DROP_ATTRIBUTE_SET Procedure Parameter*

Parameter	Description
attr_set	The name of the attribute set to be dropped

Usage Notes

- The `DROP_ATTRIBUTE_SET` procedure drops an attribute set not being used for any expression set. If the attribute set was initially created from an existing object type, the object type remains after dropping the attribute set. Otherwise, the object type is dropped with the attribute set.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_EXPRESSION_SETS`.

Examples

Assuming that the attribute set is not used by an Expression column, the following command drops the attribute set:

```
BEGIN
  DBMS_EXPFIL.DROP_ATTRIBUTE_SET(attr_set => 'Car4Sale');
END;
```

GET_EXPRSET_STATS Procedure

This procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.

Syntax

```
DBMS_EXPFIL.GET_EXPRSET_STATS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

Parameters

Table 39–13 GET_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions

Usage Notes

- When a representative set of expressions are stored in a table column, you can use predicate statistics for those expressions to configure the corresponding Expression Filter index (using the TOP parameters clause). The GET_EXPRSET_STATS procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.
- See "Creating an Index from Statistics" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about using predicate statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS.

Examples

The following command computes the predicate statistics for the expressions stored in the Interest column of the Consumer table:

```
BEGIN
  DBMS_EXPFIL.GET_EXPRSET_STATS (expr_tab => 'Consumer',
                                expr_col => 'Interest');
END;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on one or more Expression columns to other users.

Syntax

```
DBMS_EXPFIL.GRANT_PRIVILEGE (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2,
  priv_type IN  VARCHAR2,
  to_user   IN  VARCHAR2);
```

Parameters

Table 39–14 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
priv_type	Type of the privilege to be granted. Valid values: INSERT EXPRESSION, UPDATE EXPRESSION, ALL.
to_user	The user to whom the privilege is to be granted

Usage Notes

- The SQL EVALUATE operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have INSERT and UPDATE privileges for the table and INSERT EXPRESSION and UPDATE EXPRESSION privilege for a specific Expression column in the table.
- Using the GRANT_PRIVILEGE procedure, the owner of the table can grant INSERT EXPRESSION or UPDATE EXPRESSION privileges on one or more Expression columns to other users. Both the privileges can be granted to a user by specifying ALL for the privilege type.
- See [REVOKE_PRIVILEGE Procedure](#) in this chapter and "Granting and Revoking Privileges" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The owner of Consumer table can grant INSERT EXPRESSION privileges to user SCOTT with the following command. User SCOTT should also have INSERT privileges on the table so that he can add new expressions to the set.

```
BEGIN
  DBMS_EXPFIL.GRANT_PRIVILEGE (expr_tab => 'Consumer',
                               expr_col => 'Interest',
                               priv_type => 'INSERT EXPRESSION',
                               to_user   => 'SCOTT');
END;
```

INDEX_PARAMETERS Procedure

This procedure fine-tunes the index parameters for each expression set before index creation.

Syntax

```
DBMS_EXPFIL.INDEX_PARAMETERS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2,
  attr_list IN  EXF$ATTRIBUTE_LIST,
  operation IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–15 INDEX_PARAMETERS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions.
attr_list	An instance of EXF\$ATTRIBUTE_LIST with a partial list of stored and indexed attributes
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- An attribute set can be used by multiple expression sets stored in different columns of user tables. By default, the index parameters associated with the attribute set are used to define an Expression Filter index on an expression set. If you need to fine-tune the index for each expression set, you can specify a small list of the index parameters in the PARAMETERS clause of the CREATE INDEX statement. However, when an Expression Filter index uses a large number of index parameters or if the index is configured for XPath predicates, fine-tuning the parameters with the CREATE INDEX statement is not possible.
- The INDEX_PARAMETERS procedure fine-tunes the index parameters for each expression set before index creation. This procedure can be used to copy the defaults from the corresponding attribute set and selectively add (or drop) additional index parameters for the expression set. (You use the XPINDEX_PARAMETERS procedure to add and drop XPath index parameters.) The Expression Filter index defined for an expression set with a non-empty list of index parameters always uses these parameters. The INDEX_PARAMETERS procedure cannot be used when the Expression Filter index is already defined for the column storing expressions.
- The operations allowed with this procedure include:
 - Deriving the current list of default index parameters (including any XPath-specific parameters) from the corresponding attribute set and assigning them to the specified expression set (a value of DEFAULT for the operation argument).
 - Adding (or dropping) one or more attributes to (or from) the current list of parameters assigned to the expression set (values of ADD or DROP for the operation argument).

- Clearing the index parameters assigned to the expression set. This enables the user to start using default parameters or tune the parameters from scratch (a value of `CLEAR` for the operation argument).

Note: This procedure is useful only when an attribute set is shared across multiple expression sets. In all other cases, the defaults assigned to the attribute set can be tuned for the expression set using it.

- See "Creating an Index from Exact Parameters" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and [XPINDEX_PARAMETERS Procedure](#) in this chapter for more information.
- Related views: `USER_EXPFIL_EXPRESSION_SETS`, `USER_EXPFIL_DEF_INDEX_PARAMS` and `USER_EXPFIL_INDEX_PARAMS`.

Examples

The following command synchronizes the expression set's index parameters with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                              expr_col => 'Interest',
                              attr_list => null,
                              operation => 'DEFAULT');
END;
```

The following command adds a stored attribute to the expression set's index parameters.

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                              expr_col => 'Interest',
                              attr_list =>
                                exf$attribute_list (
                                  exf$attribute (
                                    attr_name => 'CrashTestRating(Model, Year)',
                                    attr_oper => exf$indexoper('all'),
                                    attr_indexed => 'FALSE')),
                              operation => 'ADD');
END;
```

The following command clears the index parameters associated with the expression set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                              expr_col => 'Interest',
                              attr_list => null,
                              operation => 'CLEAR');
END;
```

A subsequent index creation will use the default index parameters assigned to the corresponding attribute set.

MODIFY_OPERATOR_LIST Procedure

This procedure modifies the list of common operators associated with a certain attribute in the attribute set.

Syntax

```
DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_oper  IN   EXF$INDEXOPER);
```

Parameters

Table 39–16 *MODIFY_OPERATOR_LIST Procedure Parameters*

Parameter	Description
attr_set	The name of the attribute set
attr_name	The name of the stored or indexed attribute being modified
attr_oper	The new list of operators that are frequently used in the predicates with the attribute

Usage Notes

- The `MODIFY_OPERATOR_LIST` procedure modifies the operator list for the stored and indexed attributes defined in the attribute set's default index parameters. Existing Expression Filter indexes are not affected when an attribute's operator list is modified. The updated index defaults are used when a new Expression Filter index is created or when an existing index is rebuilt.
- Related views: `USER_EXPFIL_DEF_INDEX_PARAMS`

Examples

The following command modifies the operator list associated with the `HorsePower (Model, Year)` attribute defined in the `Car4Sale` attribute set.

```
BEGIN
  DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
    attr_set => 'Car4Sale',
    attr_name => 'HorsePower (Model, Year)',
    attr_oper => exf$indexoper('=', '<', '>', 'between'));
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes an expression privilege previously granted by the owner.

Syntax

```
DBMS_EXPFIL.REVOKE_PRIVILEGE (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2,
  priv_type IN  VARCHAR2,
  from_user IN  VARCHAR2);
```

Parameters

Table 39–17 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
priv_type	Type of privilege to be revoked
from_user	The user from whom the privilege is to be revoked

Usage Notes

- The REVOKE_PRIVILEGE procedure revokes an expression privilege previously granted by the owner.
- See [GRANT_PRIVILEGE Procedure](#) in this chapter and "Granting and Revoking Privileges" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The following command revokes the INSERT EXPRESSION privilege on the Interest column of the Consumer table from user SCOTT:

```
BEGIN
  DBMS_EXPFIL.REVOKE_PRIVILEGE (expr_tab => 'Consumer',
                                expr_col => 'Interest',
                                priv_type => 'INSERT EXPRESSION',
                                from_user => 'SCOTT');
END;
```

UNASSIGN_ATTRIBUTE_SET Procedure

This procedure unassigns an attribute set from a column storing expressions.

Syntax

```
DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

Parameters

Table 39–18 UNASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions

Usage Notes

- A column of an expression datatype can be converted back to a VARCHAR2 type by unassigning the attribute set. You can unassign an attribute set from a column storing expressions if an Expression Filter index is not defined on the column.
- See [ASSIGN_ATTRIBUTE_SET Procedure](#) in this chapter for information about assigning attribute sets.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_INDEXES.

Examples

The following command unassigns the attribute set previously assigned to the Interest column of the Consumer table. (See "Bulk Loading of Expression Data" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter*.)

```
BEGIN
  DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (expr_tab => 'Consumer',
                                     expr_col => 'Interest');
END;
```

VALIDATE_EXPRESSIONS Procedure

This procedure validates all the expressions in a set.

Syntax

```
DBMS_EXPFIL.VALIDATE_EXPRESSIONS (
  expr_tab      IN  VARCHAR2,
  expr_col      IN  VARCHAR2,
  exception_tab IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–19 VALIDATE_EXPRESSIONS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
exception_tab	The name of the exception table. This table is created using the BUILD_EXCEPTIONS_TABLE procedure.

Usage Notes

- The expressions stored in a table may have references to schema objects like user-defined functions and tables. When these schema objects are dropped or modified, the expressions could become invalid and the subsequent evaluation (query with EVALUATE operator) could fail.
- The VALIDATE_EXPRESSIONS procedure validates all the expressions in a set. By default, the expression validation utility fails on the first expression that is invalid. Optionally, the caller can pass an exception table to store references to all the invalid expressions. In addition to validating expressions in the set, this procedure validates the parameters (stored and indexed attributes) of the associated index and the approved list of user-defined functions. Any errors in the index parameters or the user-defined function list are immediately reported to the caller.
- See "Evaluation Semantics" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and [BUILD_EXCEPTIONS_TABLE Procedure](#) in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_ASET_FUNCTIONS, and USER_EXPFIL_PREDTAB_ATTRIBUTES.

Examples

The following command validates the expressions stored in the Interest column of the Consumer table.

```
BEGIN
  DBMS_EXPFIL.VALIDATE_EXPRESSIONS (expr_tab => 'Consumer',
                                     expr_col => 'Interest');
END;
```

XPINDEX_PARAMETERS Procedure

This procedure is used in conjunction with the `INDEX_PARAMETERS` procedure to fine-tune the XPath-specific index parameters for each expression set.

Syntax

```
DBMS_EXPFIL.XPINDEX_PARAMETERS (
    expr_tab    IN    VARCHAR2,
    expr_col    IN    VARCHAR2,
    xmlt_attr   IN    VARCHAR2,
    xptag_list  IN    EXF$XPATH_TAGS,
    operation   IN    VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–20 *XPINDEX_PARAMETERS Procedure Parameters*

Parameter	Description
<code>exp_tab</code>	The table storing the expression set
<code>expr_col</code>	The column in the table that stores the expressions
<code>xmlt_attr</code>	The name of the attribute with the XMLType datatype
<code>xptag_list</code>	An instance of EXF\$XPATH_TAGS type with a partial list of XML elements and attributes
<code>operation</code>	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- When an attribute set is shared by multiple expression sets, the `INDEX_PARAMETERS` procedure can be used to tune the simple (non-XPath) index parameters for each expression set. The `XPINDEX_PARAMETERS` procedure is used in conjunction with the `INDEX_PARAMETERS` procedure to fine-tune the XPath-specific index parameters for each expression set.
- See also [INDEX_PARAMETERS Procedure](#) in this chapter and "Index Tuning for XPath Predicates" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.
- Related views: `USER_EXPFIL_ATTRIBUTES`, `USER_EXPFIL_DEF_INDEX_PARAMS`, and `USER_EXPFIL_INDEX_PARAMS`.

Note: The values assigned to the `tag_name` argument of `exf$xpath_tag` type are case-sensitive.

Examples

The following command synchronizes the expression set's index parameters (XPath and non-XPath) with the defaults associated with the corresponding attribute set:

```
BEGIN
    DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                                expr_col => 'Interest',
                                attr_list => null,
                                operation => 'DEFAULT');
```

```
END;
```

The following command adds an XPath-specific index parameter to the expression set:

```
BEGIN
  DBMS_EXPFIL.XPINDEX_PARAMETERS(expr_tab => 'Consumer',
    expr_col => 'Interest',
    xmlt_attr => 'Details',
    xptag_list =>
      exf$xpath_tags(
        exf$xpath_tag(tag_name => 'GPS',
          tag_indexed => 'TRUE',
          tag_type => NULL)),
    operation => 'ADD');
END;
```

The DBMS_FGA package provides fine-grained security functions.

This chapter contains the following topics:

- [Using DBMS_FGA](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_FGA Subprograms](#)

Using DBMS_FGA

- [Security Model](#)
- [Operational Notes](#)

Security Model

Execute privilege on DBMS_FGA is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to `DBA_FGA_AUDIT_TRAIL` to analyze the SQL text and corresponding bind variables that are issued.

Summary of DBMS_FGA Subprograms

Table 40–1 *DBMS_FGA Package Subprograms*

Subprogram	Description
ADD_POLICY Procedure on page 40-6	Creates an audit policy using the supplied predicate as the audit condition
DISABLE_POLICY Procedure on page 40-11	Disables an audit policy
DROP_POLICY Procedure on page 40-12	Drops an audit policy
ENABLE_POLICY Procedure on page 40-13	Enables an audit policy

ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

Syntax

```
DBMS_FGA.ADD_POLICY (
    object_schema    VARCHAR2,
    object_name      VARCHAR2,
    policy_name      VARCHAR2,
    audit_condition  VARCHAR2,
    audit_column     VARCHAR2,
    handler_schema   VARCHAR2,
    handler_module   VARCHAR2,
    enable           BOOLEAN,
    statement_types  VARCHAR2,
    audit_trail      BINARY_INTEGER IN DEFAULT,
    audit_column_opts BINARY_INTEGER IN DEFAULT);
```

Parameters

Table 40–2 ADD_POLICY Procedure Parameters

Parameter	Description	Default Value
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)	NULL
object_name	The name of the object to be audited.	-
policy_name	The unique name of the policy.	-
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.	NULL
audit_column	The columns to be checked for access. These can include hidden columns. The default, NULL, causes audit if any column is accessed or affected.	NULL
handler_schema	The schema that contains the event handler. The default, NULL, causes the current schema to be used.	NULL
handler_module	The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.	NULL
enable	Enables the policy if TRUE, which is the default.	TRUE
statement_types	The SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only.	SELECT
audit_trail	Destination (DB or XML) of fine grained audit records. Also specifies whether to populate LSQLTEXT and LSQLBIND in fga_log\$.	DB+EXTENDED
audit_column_opts	Establishes whether a statement is audited when the query references <i>any</i> column specified in the audit_column parameter or only when <i>all</i> such columns are referenced.	ANY_COLUMNS

Usage Notes

- If `object_schema` is not specified, the current log-on user schema is assumed.

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. This condition can be NULL (or omitted), which is interpreted as TRUE, but it cannot contain the following elements:
 - Subqueries or sequences
 - Any direct use of `SYSDATE`, `UID`, `USER` or `USERENV` functions. However, a user-defined function and other SQL functions can use these functions to return the desired information.
 - Any use of the pseudo columns `LEVEL`, `PRIOR`, or `ROWNUM`.

Specifying an audit condition of "1=1" to force auditing of all specified statements ("`statement_types`") affecting the specified column ("`audit_column`") is no longer needed to achieve this purpose. NULL will cause audit even if no rows were processed, so that all actions on a table with this policy are audited.

- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

```
PROCEDURE <fname> ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
VARCHAR2 ) AS ...
```

where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.

- The `audit_trail` parameter specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
 - If `audit_trail` includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\%DB_UNIQUE_NAME\adump` on Windows systems.)
 - If `audit_trail` includes DB instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database.
 - If `audit_trail` includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
 - For example:

- * Setting `audit_trail` to `DBMS_FGA.DB` sends the audit trail to the `SYS.FGA_LOG$` table in the database and omits SQL Text and SQL Bind.
- * Setting `audit_trail` to `DBMS_FGA.DB + DBMS_FGA.EXTENDED` sends the audit trail to the `SYS.FGA_LOG$` table in the database and includes SQL Text and SQL Bind.
- * Setting `audit_trail` to `DBMS_FGA.XML` writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
- * Setting `audit_trail` to `DBMS_FGA.XML + DBMS_FGA.EXTENDED` writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

The `audit_trail` parameter appears in the `ALL_AUDIT_POLICIES` view.

- You can change the operating system destination using the following command:

```
ALTER SYSTEM SET AUDIT_FILE_DEST = '<New Directory>' DEFERRED
```
- On many platforms, XML audit files are named `<process_name>_<processId>.xml`, for example, `ora_2111.xml`, or `s002_11.xml`. On Windows, the XML audit files are named `<process_name>_<ThreadId>.xml` (or `<process_name>_ProcessId.xml` if the process is not running as a thread).
- The `audit_column_opts` parameter establishes whether a statement is audited
 - when the query references *any* column specified in the `audit_column` parameter (`audit_column_opts = DBMS_FGA.ANY_COLUMNS`), or
 - only when *all* such columns are referenced (`audit_column_opts = DBMS_FGA.ALL_COLUMNS`).

The default is `DBMS_FGA.ANY_COLUMNS`.

The `ALL_AUDIT_POLICIES` view also shows `audit_column_opts`.

- When `audit_column_opts` is set to `DBMS_FGA.ALL_COLUMNS`, a SQL statement is audited only when all the columns mentioned in `audit_column` have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

Also, all these columns must refer to a single table/view or alias.

Thus, if a SQL statement selects the columns from different table aliases, the statement will not be audited.

V\$XML_AUDIT_TRAIL View

The new values for the `audit_trail` parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

A new dynamic view, `V$XML_AUDIT_TRAIL`, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Since the audit XML files are stored in files with extension .xml on all platforms, the dynamic view presents audit information similarly on all platforms, using the following schema:

Table 40–3 Elements in the V\$XML_AUDIT_TRAIL Dynamic View

Element	Type
AUDIT_TYPE	VARCHAR2 (18)
SESSION_ID	NUMBER
PROXY_SESSIONID	NUMBER
STATEMENTID	NUMBER
ENTRYID	NUMBER
EXTENDED_TIMESTAMP	TIMESTAMP (6) WITH TIME ZONE
GLOBAL_UID	VARCHAR2 (32)
DB_USER	VARCHAR2 (30)
CLIENT_ID	VARCHAR2 (64)
EXT_NAME	VARCHAR2 (4000)
OS_USER	VARCHAR2 (255)
USERHOST	VARCHAR2 (128)
OS_PROCESS	VARCHAR2 (16)
TERMINAL	VARCHAR2 (255)
INSTANCE_NUMBER	NUMBER
OBJECT_SCHEMA	VARCHAR2 (30)
OBJECT_NAME	VARCHAR2 (128)
POLICY_NAME	VARCHAR2 (30)
STATEMENT_TYPE	VARCHAR2 (28)
TRANSACTIONID	RAW (8)
SCN	NUMBER
COMMENT_TEXT	VARCHAR2 (4000)
SQL_BIND	VARCHAR2 (4000)
SQL_TEXT	VARCHAR2 (4000)

Usage Notes

- Every XML audit record contains the elements AUDIT_TYPE and EXTENDED_TIMESTAMP, with the latter printed in UTC zone (with no timezone information). Values retrieved using V\$XML_AUDIT_TRAIL view are converted to session timezone and printed.
- For SQL_TEXT and SQL_BIND element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such SQL_TEXT and SQL_BIND values.
- For large numbers of XML audit files, querying V\$XML_AUDIT_TRAIL is faster when they are loaded into a database table using SQL*Loader or a similar tool. XML audit files are larger than the equivalent written to OS files when AUDIT_TRAIL=OS.

- Error handling is the same as when `AUDIT_TRAIL=OS`. If any error occurs in writing an audit record to disk, including the directory identified by `AUDIT_FILE_DEST` being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.

Examples

```
DBMS_FGA.ADD_POLICY (  
  object_schema => 'scott',  
  object_name   => 'emp',  
  policy_name   => 'mypolicy1',  
  audit_condition => 'sal < 100',  
  audit_column  => 'comm,sal',  
  handler_schema => NULL,  
  handler_module => NULL,  
  enable        => TRUE,  
  statement_types => 'INSERT, UPDATE',  
  audit_trail   => DBMS_FGA.XML + DBMS_FGA.EXTENDED,  
  audit_column_opts => DBMS_FGA.ANY_COLUMNS);
```

DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2 );
```

Parameters

Table 40–4 *DISABLE_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

The default value for `object_schema` is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DISABLE_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1');
```

DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    policy_name    VARCHAR2 );
```

Parameters

Table 40–5 *DROP_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If <code>NULL</code> , the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

Usage Notes

The `DBMS_FGA` procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the `DBMS_FGA` procedures are part of the DDL transaction. The default value for `object_schema` is `NULL`. (If `NULL`, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DROP_POLICY (  
    object_schema => 'scott',  
    object_name   => 'emp',  
    policy_name   => 'mypolicy1');
```

ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2,
  enable         BOOLEAN);
```

Parameters

Table 40–6 *ENABLE_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If <code>NULL</code> , the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.
enable	Defaults to <code>TRUE</code> to enable the policy.

Examples

```
DBMS_FGA.ENABLE_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1',
  enable        => TRUE);
```

DBMS_FILE_GROUP

The `DBMS_FILE_GROUP` package, one of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. This package can be used to create and manage file group repositories.

See Also: *Oracle Streams Concepts and Administration*

This chapter contains the following topics:

- [Using DBMS_FILE_GROUP](#)
 - Overview
 - Constants
- [Summary of DBMS_FILE_GROUP Subprograms](#)

Using DBMS_FILE_GROUP

This section contains topics which relate to using the DBMS_FILE_GROUP package.

- [Overview](#)
- [Constants](#)

Overview

The following terms pertain to the DBMS_FILE_GROUP package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is `expdat.dmp`.
- The directory object that contains the file is `db_files`.
- The file type is `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

Version

A **version** is a collection of related files. For example, a version might consist of a set of datafiles and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can be used to logically group a set of versions. For example, a file group named `financial_quarters` can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as `Q1FY04`, `Q2FY04`, and so on.

Constants

The `DBMS_FILE_GROUP` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, specify `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` for an export dump file.

Table 41-1 DBMS_FILE_GROUP Parameters with Enumerated Constants

Parameter	Enumerated Constant	Type	Description
file_type	<ul style="list-style-type: none"> ■ DATAFILE 	VARCHAR2 (30)	DATAFILE is a data file for a database. This constant can be specified as 'DATAFILE'.
new_file_type	<ul style="list-style-type: none"> ■ EXPORT_DUMP_FILE ■ DATAPUMP_LOG_FILE 		<p>EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'.</p> <p>DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.</p>
max_versions	<ul style="list-style-type: none"> ■ INFINITE 	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
retention_days			
privilege	<p>System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure:</p> <ul style="list-style-type: none"> ■ READ_ANY_FILE_GROUP ■ MANAGE_ANY_FILE_GROUP ■ MANAGE_FILE_GROUP <p>Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure:</p> <ul style="list-style-type: none"> ■ READ_ON_FILE_GROUP ■ MANAGE_ON_FILE_GROUP 	BINARY_INTEGER	<p>READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary.</p> <p>MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema.</p> <p>MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema.</p> <p>READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary.</p> <p>MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.</p>

Summary of DBMS_FILE_GROUP Subprograms

Table 41–2 DBMS_FILE_GROUP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 41-6	Adds a file to a version of a file group
ALTER_FILE Procedure on page 41-8	Alters a file in a version of a file group
ALTER_FILE_GROUP Procedure on page 41-10	Alters a file group
ALTER_VERSION Procedure on page 41-12	Alters a version of a file group
CREATE_FILE_GROUP Procedure on page 41-14	Creates a file group
CREATE_VERSION Procedure on page 41-16	Creates a version of a file group
DROP_FILE_GROUP Procedure on page 41-17	Drops a file group
DROP_VERSION Procedure on page 41-18	Drops a version of a file group
GRANT_OBJECT_PRIVILEGE Procedure on page 41-19	Grants object privileges on a file group to a user
GRANT_SYSTEM_PRIVILEGE Procedure on page 41-20	Grants system privileges for file group operations to a user
PURGE_FILE_GROUP Procedure on page 41-21	Purges a file group using the file group's retention policy
REMOVE_FILE Procedure on page 41-22	Removes a file from a version of a file group
REVOKE_OBJECT_PRIVILEGE Procedure on page 41-23	Revokes object privileges on a file group from a user
REVOKE_SYSTEM_PRIVILEGE Procedure on page 41-24	Revokes system privileges for file group operations from a user

Note: All subprograms commit unless specified otherwise.

ADD_FILE Procedure

This procedure adds a file to a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  file_type       IN VARCHAR2 DEFAULT NULL,
  file_directory  IN VARCHAR2 DEFAULT NULL,
  version_name    IN VARCHAR2 DEFAULT NULL,
  comments        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 41–3 ADD_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
file_name	The name of the file being added to the version. Each file name in a version must be unique.
file_type	The file type. The following are reserved file types: <ul style="list-style-type: none"> ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' Data Pump metadata is populated when a Data Pump export dump file is imported. ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify NULL to omit a file type description. See " Constants " on page 41-4 for more information about the reserved file types.
file_directory	The name of the directory object that corresponds to the directory containing the file. If NULL, then the procedure uses the default directory object for the version. If NULL and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.

Table 41-3 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
<code>version_name</code>	<p>The name of the version to which the file is added.</p> <p>If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group.</p> <p>If NULL, then the procedure uses the version with the latest creation time for the file group.</p>
<code>comments</code>	Comments about the file being added

Usage Notes

To run this procedure with either `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

See Also: *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name    IN  VARCHAR2,
  file_name          IN  VARCHAR2,
  version_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_name      IN  VARCHAR2  DEFAULT NULL,
  new_file_directory IN  VARCHAR2  DEFAULT NULL,
  new_file_type      IN  VARCHAR2  DEFAULT NULL,
  remove_file_type   IN  VARCHAR2  DEFAULT 'N',
  new_comments       IN  VARCHAR2  DEFAULT NULL,
  remove_comments    IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 41–4 ALTER_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. Note: When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name. Note: When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

Table 41–4 (Cont.) ALTER_FILE Procedure Parameters

Parameter	Description
<code>new_file_type</code>	<p>The file type. The following are reserved file types:</p> <ul style="list-style-type: none"> ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' <p>If the file type is not one of the reserved file types, then enter a text description of the file type.</p> <p>If NULL, then the procedure does not change the file type.</p> <p>See Also: "Constants" on page 41-4 for more information about the reserved file types.</p>
<code>remove_file_type</code>	<p>If Y, then the procedure removes the file type. If Y and the <code>new_file_type</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not remove the file type.</p>
<code>new_comments</code>	<p>New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments.</p> <p>If NULL, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If Y, then the procedure removes the comments for the file. If Y and the <code>new_comments</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not change the existing comments.</p>

Usage Notes

If the file type is changed to `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `new_file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

See Also: *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP (
  file_group_name      IN  VARCHAR2,
  keep_files           IN  VARCHAR2  DEFAULT NULL,
  min_versions         IN  NUMBER    DEFAULT NULL,
  max_versions         IN  NUMBER    DEFAULT NULL,
  retention_days       IN  NUMBER    DEFAULT NULL,
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN  VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 41-5 ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being altered, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	<p>If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If NULL, then this parameter is not changed.</p> <p>Note: If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.</p>
min_versions	<p>The minimum number of versions to retain. The specified value must be greater than or equal to 1.</p> <p>If NULL, then the procedure does not change the <i>min_versions</i> setting for the file group.</p>
max_versions	<p>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i>. When the number of versions exceeds the specified <i>max_versions</i>, the oldest version is purged.</p> <p>Specify <i>DBMS_FILE_GROUP.INFINITE</i> for no limit to the number of versions.</p> <p>If NULL, then the procedure does not change the <i>max_versions</i> setting for the file group.</p>

Table 41–5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
<code>retention_days</code>	<p>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <code>retention_days</code> and there are more versions than the number specified in <code>min_versions</code>, the version is purged. The age of a version is calculated by subtracting the creation time from the current time.</p> <p>A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours.</p> <p>Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of days a version can exist.</p> <p>If <code>NULL</code>, then the procedure does not change the <code>retention_days</code> setting for the file group.</p>
<code>new_default_directory</code>	<p>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.</p> <p>If <code>NULL</code>, then the procedure does not change the default directory.</p>
<code>remove_default_directory</code>	<p>If <code>Y</code>, then the procedure removes the default directory for the file group. If <code>Y</code> and the <code>new_default_directory</code> parameter is set to a non-<code>NULL</code> value, then the procedure raises an error.</p> <p>If <code>N</code>, then the procedure does not remove the default directory for the file group.</p>
<code>new_comments</code>	<p>Comments about the file group. If non-<code>NULL</code>, then the new comments replace the existing comments for the file group.</p> <p>If <code>NULL</code>, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If <code>Y</code>, then the comments for the file group are removed. If <code>Y</code> and the <code>new_comments</code> parameter is set to a non-<code>NULL</code> value, then the procedure raises an error.</p> <p>If <code>N</code>, then the procedure does not change the comments for the file group.</p>

Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name      IN  VARCHAR2,
  version_name         IN  VARCHAR2  DEFAULT NULL,
  new_version_name     IN  VARCHAR2  DEFAULT NULL,
  remove_version_name  IN  VARCHAR2  DEFAULT 'N',
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 41-6 ALTER_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.

Table 41-6 (Cont.) ALTER_VERSION Procedure Parameters

Parameter	Description
<code>new_comments</code>	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
<code>remove_comments</code>	If Y, then the procedure removes the comments for the version. If Y and the <code>new_comments</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

CREATE_FILE_GROUP Procedure

This procedure creates a file group.

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP (
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER     DEFAULT 2,
  max_versions       IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 41–7 CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If Y , then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N , then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. Note: If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i> . When the number of versions exceeds the specified <i>max_versions</i> , the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <i>retention_days</i> and there are more versions than the number specified in <i>min_versions</i> , the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, <i>1.25</i> specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the `PURGE_FILE_GROUP` procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the `OUT` parameter `version_out`, and the other does not.

See Also: ["PURGE_FILE_GROUP Procedure"](#) on page 41-21

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments        IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments        IN  VARCHAR2 DEFAULT NULL,
  version_out     OUT  VARCHAR2);
```

Parameters

Table 41–8 CREATE_VERSION Procedure Parameters

Parameter	Description
<code>file_group_name</code>	The name of the file group to which the new version is added, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>version_name</code>	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk (<code>'*'</code>).
<code>default_directory</code>	The default directory object used when files are added to a version if no directory is specified when the files are added.
<code>comments</code>	Comments about the version being created
<code>version_out</code>	If the <code>version_name</code> parameter is set to a non-NULL value, then this parameter contains the specified version name. If the <code>version_name</code> parameter is set to NULL, then this parameter contains the generated version number.

DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name IN VARCHAR2,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 41–9 DROP_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being dropped, specified as [<i>schema_name.</i>] <i>file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If <i>Y</i> , then the procedure retains the files in the file group on hard disk. If <i>N</i> , then the procedure deletes the files in the file group from hard disk. If <i>NULL</i> , then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have *WRITE* privilege on the directory object that contains the files.

DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 41–10 DROP_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If <code>NULL</code> , then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions.
keep_files	If <code>Y</code> , then the procedure retains the files in the version on hard disk. If <code>N</code> , then the procedure deletes the files in the version from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  grantee      IN  VARCHAR2,
  grant_option IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 41–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
object_name	The name of the file group on which the privilege is granted, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See " Constants " on page 41-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

Note: When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS. Set the O7_DICTIONARY_ACCESSIBILITY initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 41–12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The constant that specifies the privilege. See " Constants " on page 41-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group except when purging a version will cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
    file_group_name IN VARCHAR2);
```

Parameter

Table 41–13 *PURGE_FILE_GROUP Procedure Parameter*

Parameter	Description
<code>file_group_name</code>	The name of the file group, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. If <code>NULL</code> and this procedure is run by <code>SYS</code> user, then the procedure purges all file groups.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_file       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 41–14 REMOVE_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being removed from the version
version_name	The name of the version from which the file is removed. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is removed from version 1 of the file group. If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group. If '*', then the procedure removes the file from all versions.
keep_file	If <code>Y</code> , then the procedure retains the file on hard disk. If <code>N</code> , then the procedure deletes the file from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name IN VARCHAR2,
  privilege   IN BINARY_INTEGER,
  revokee     IN VARCHAR2);
```

Parameters

Table 41–15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
object_name	The name of the file group on which the privilege is revoked, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See " Constants " on page 41-4 for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(  
  privilege IN BINARY_INTEGER,  
  revokee   IN VARCHAR2);
```

Parameters

Table 41–16 *REVOKE_SYSTEM_PRIVILEGE Procedure Parameters*

Parameter	Description
privilege	The constant that specifies the privilege. See " Constants " on page 41-4 for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

DBMS_FILE_TRANSFER

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- *Oracle Database Concepts* for conceptual information about file transfer
- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

- [Using DBMS_FILE_TRANSFER](#)
 - Operating Notes
- [Summary of DBMS_FILE_TRANSFER Subprograms](#)

Using DBMS_FILE_TRANSFER

- [Operating Notes](#)

Operating Notes

Caution: DBMS_FILE_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

Summary of DBMS_FILE_TRANSFER Subprograms

Table 42–1 DBMS_FILE_TRANSFER Package Subprograms

Subprogram	Description
COPY_FILE Procedure on page 42-5	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
GET_FILE Procedure on page 42-7	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
PUT_FILE Procedure on page 42-9	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE (
  source_directory_object  IN  VARCHAR2,
  source_file_name         IN  VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_file_name    IN  VARCHAR2);
```

Parameters

Table 42–2 COPY_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the <code>CREATE DIRECTORY</code> command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, <code>+diskgroup1</code>) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: <code>+diskgroup1/dbs/control</code>).
destination_file_name	<p>The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM:</p> <ul style="list-style-type: none"> ■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) ■ The file type tag assigned to the file is <code>COPY_FILE</code> ■ The value of the <code>destination_file_name</code> argument becomes the file's alias name in the designated destination directory <p>The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.</p>

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- READ privilege on the directory object specified in the `source_directory_object` parameter
- WRITE privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

See Also: *Oracle Database Administrator's Guide* for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';
```

```
Directory created.
```

```
SQL> BEGIN
  2   DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR', 't_xdbtmp.f', 'DGROUP',
                                't_xdbtmp.f');
  3 END;
  4 /
```

```
PL/SQL procedure successfully completed.
```

```
SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
  source_directory_object    IN VARCHAR2,
  source_file_name          IN VARCHAR2,
  source_database           IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_file_name     IN VARCHAR2);
```

Parameters

Table 42–3 GET_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V\$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS '^t_work^';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- assumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
  source_directory_object      IN  VARCHAR2,
  source_file_name            IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name       IN  VARCHAR2,
  destination_database        IN  VARCHAR2);
```

Parameters

Table 42–4 PUT_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V\$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user/password@inst1

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
  DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                                'dbs2' ) ;
END ;
```

DBMS_FLASHBACK

Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)

See Also: For detailed information about DBMS_FLASHBACK:

- *Oracle Database Application Developer's Guide - Fundamentals*
- *Oracle Database SQL Reference* .

This chapter contains the following topics:

- [Using DBMS_FLASHBACK](#)
 - Overview
 - Security Model
 - Exceptions
 - Operational Notes
 - Examples
- [Summary of DBMS_FLASHBACK Subprograms](#)

Using DBMS_FLASHBACK

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

Overview

When DBMS_FLASHBACK is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use DBMS_FLASHBACK for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to restore deleted e-mail by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

Security Model

To use this package, a database administrator must grant `EXECUTE` privileges for `DBMS_FLASHBACK`.

Exceptions

Table 43–1 *DBMS_FLASHBACK Error Messages*

Error	Description
ORA-08180	Time specified is too old.
ORA-08181	Invalid system change number specified.
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode.
ORA-08183	User cannot enable Flashback within an uncommitted transaction.
ORA-08184	User cannot enable Flashback within another Flashback session.
ORA-08185	SYS cannot enable Flashback mode.

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need.

If you need to perform a Flashback over a 24-hour period, the DBA should set the `undo_retention` parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the `RETENTION GUARANTEE` clause for the undo tablespace to ensure that unexpired undo is not discarded. `UNDO_RETENTION` is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, `RETENTION GUARANTEE` prevents this. For more information, see the *Oracle Database Administrator's Guide*

In a Flashback-enabled session, `SYSDATE` will not be affected; it will continue to provide the current time.

DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```

DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
  employee_no  number(5) PRIMARY KEY,
  employee_name varchar2(20),
  employee_mgr  number(5)
  CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
  salary       number,
  hiredate     date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20 seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;

```

```
REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr

    /*
        Note that all the DML operations inside the loop are performed
        with Flashback disabled
    */
    IF (c1_rec.employee_mgr = scotts_emp) then
        INSERT INTO employee VALUES (c1_rec.employee_no,
            c1_rec.employee_name,
            scotts_mgr,
            c1_rec.salary,
            c1_rec.hiredate);
    ELSE
        IF (c1_rec.employee_no != scotts_emp) THEN
            INSERT INTO employee VALUES (c1_rec.employee_no,
                c1_rec.employee_name,
```

```
        cl_rec.employee_mgr,  
        cl_rec.salary,  
        cl_rec.hiredate);  
    END IF;  
END IF;  
END LOOP;  
END;  
/  
  
REM -- Show the restored organization.  
select lpad(' ', 2*(level-1)) || employee_name Name  
FROM employee  
CONNECT BY PRIOR employee_no = employee_mgr  
START WITH employee_no = 1  
ORDER BY LEVEL;
```

Summary of DBMS_FLASHBACK Subprograms

Table 43–2 DBMS_FLASHBACK Package Subprograms

Subprogram	Description
DISABLE Procedure on page 43-11	Disables the Flashback mode for the entire session
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure on page 43-12	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries will return data consistent as of the specified wall-clock time or SCN
ENABLE_AT_TIME Procedure on page 43-13	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in <code>query_time</code>
GET_SYSTEM_CHANGE_NUMBER Function on page 43-14	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
SCN_TO_TIMESTAMP Function on page 43-15	Takes the current SCN as an Oracle number datatype and returns a <code>TIMESTAMP</code> .
TIMESTAMP_TO_SCN Function on page 43-16	Takes a <code>TIMESTAMP</code> as input and returns the current SCN as an Oracle number datatype

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');  
SELECT salary FROM emp where name = 'Joe'  
EXECUTE dbms_flashback.disable;
```

ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (  
    query_scn IN NUMBER);
```

Parameters

Table 43–3 *ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters*

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
    query_time    IN TIMESTAMP);
```

Parameters

Table 43–4 *ENABLE_AT_TIME Procedure Parameters*

Parameter	Description
<code>query_time</code>	<p>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</p> <ul style="list-style-type: none"> ■ Using the <code>TIMESTAMP</code> constructor <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TIMESTAMP '2001-01-09 12:31:00');</pre> <p>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</p> ■ Using the <code>TO_TIMESTAMP</code> function: <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TO_ TIMESTAMP ('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</pre> <p>You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</p> ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER  
RETURN NUMBER;
```

SCN_TO_TIMESTAMP Function

This function takes the SCN as an Oracle number datatype and returns the corresponding `TIMESTAMP`.

Syntax

```
DBMS_FLASHBACK.SCN_TO_TIMESTAMP  
  (query_scn IN NUMBER)  
RETURN TIMESTAMP;
```

Parameters

Table 43–5 *SCN_TO_TIMESTAMP Procedure Parameters*

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

TIMESTAMP_TO_SCN Function

This function takes a `TIMESTAMP` as input and returns the corresponding SCN as an Oracle number datatype.

Syntax

```
DBMS_FLASHBACK.TIMESTAMP_TO_SCN
  query_time    IN          TIMESTAMP
RETURN NUMBER);
```

Parameters

Table 43–6 *TIMESTAMP_TO_SCN Procedure Parameters*

Parameter	Description
<code>query_time</code>	<p>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</p> <ul style="list-style-type: none"> ■ Using the <code>TIMESTAMP</code> constructor <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TIMESTAMP '2001-01-09 12:31:00')</pre> <p>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</p> ■ Using the <code>TO_TIMESTAMP</code> function: <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TO_ TIMESTAMP ('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</pre> <p>You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</p> ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- [Summary of DBMS_FREQUENT_ITEMSET Subprograms](#)

Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 44–1 *DBMS_FREQUENT_ITEMSET Package Subprograms*

Subprogram	Description
FI_HORIZONTAL Function on page 44-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
FI_TRANSACTIONAL Function on page 44-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL (
  tranx_cursor      IN      SYSREFCURSOR,
  support_threshold IN      NUMBER,
  itemset_length_min IN     NUMBER,
  itemset_length_max IN     NUMBER,
  including_items   IN      SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN      SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

Parameters

Table 44–2 FI_HORIZONTAL Procedure Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned. The default is NULL.

Return Values

Table 44–3 *FI_HORIZONTAL Procedure Parameters*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

Example

Suppose you have a table `horiz_table_in`.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in `horiz_table_in` looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
            FROM horiz_table_in),
    0.3,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                              ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
  tranx_cursor      IN   SYSREFCURSOR,
  support_threshold IN   NUMBER,
  itemset_length_min IN  NUMBER,
  itemset_length_max IN  NUMBER,
  including_items   IN   SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN   SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

Parameters

Table 44–4 *FI_TRANSACTIONAL Procedure Parameters*

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

Return Values

Table 44–5 *FI_TRANSACTIONAL Procedure Parameters*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table `tranx_table_in` looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of `VARCHAR2(30)`, you must create a nested table of `VARCHAR2(30)`:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in),
        0.6,
        2,
        5,
        NULL,
        NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```

0.6,
2,
5,
CURSOR(SELECT * FROM table(FI_VARCHAR_NT
('apple', 'banana', 'orange'))),
CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));

```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```

SELECT
  bt.setid, nt.*
FROM
  (SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
   FROM table(
     DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
       CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
       NULL, NULL)) bt,
   table(bt.itemset) nt);

```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the NESTED_TABLE_FAST_INSERT hint for performance:

```

CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */ INTO fq_nt
  SELECT cast(itemset as FI_VARCHAR_NT)
  FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));

```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```

CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP

```

```
        FETCH freqC INTO coll_nt;
        EXIT WHEN freqC%NOTFOUND;
        num_rows := num_rows + 1;
        num_itms := num_itms + coll_nt.count;
    END LOOP;
    CLOSE freqC;
    DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
```

```
END;
/
```

DBMS_HS_PASSTHROUGH

The pass-through SQL feature allows an application developer to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows for operations in statements for which there is no equivalent in Oracle.

You can run these statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is run in the same transaction as regular "transparent" SQL statements.

This chapter discusses the following topic:

- [Summary of DBMS_HS_PASSTHROUGH Subprograms](#)

Summary of DBMS_HS_PASSTHROUGH Subprograms

Table 45–1 DBMS_HS_PASSTHROUGH Package Subprograms

Subprogram	Description
BIND_INOUT_VARIABLE Procedure on page 45-3	Binds IN OUT bind variables
BIND_INOUT_VARIABLE_RAW Procedure on page 45-4	Binds IN OUT bind variables of datatype RAW
BIND_OUT_VARIABLE Procedure on page 45-5	Binds an OUT variable with a PL/SQL program variable
BIND_OUT_VARIABLE_RAW Procedure on page 45-6	Binds an OUT variable of datatype RAW with a PL/SQL program variable
BIND_VARIABLE Procedure on page 45-7	Binds an IN variable positionally with a PL/SQL program variable
BIND_VARIABLE_RAW Procedure on page 45-8	Binds IN variables of type RAW
CLOSE_CURSOR Procedure on page 45-9	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
EXECUTE_IMMEDIATE Procedure on page 45-10	Runs a (non-SELECT) SQL statement immediately, without bind variables
EXECUTE_NON_QUERY Function on page 45-11	Runs a (non-SELECT) SQL statement
FETCH_ROW Function on page 45-12	Fetches rows from a query
GET_VALUE Procedure on page 45-13	Retrieves column value from SELECT statement, or retrieves OUT bind parameters
GET_VALUE_RAW Procedure on page 45-14	Similar to GET_VALUE, but for datatype RAW
OPEN_CURSOR Function on page 45-15	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
PARSE Procedure on page 45-16	Parses SQL statement at non-Oracle system

BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  <dt>,
  n      IN      VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also: For binding IN OUT variables of datatype RAW see [BIND_INOUT_VARIABLE_RAW Procedure](#) on page 45-4.

Parameters

Table 45–2 BIND_INOUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–3 BIND_INOUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of datatype RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  RAW,
  n      IN      VARCHAR2);
```

Parameters

Table 45-4 BIND_INOUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable. For example, in <code>SELECT * FROM emp WHERE ename = :ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45-5 BIND_INOUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also: For binding OUT variables of datatype RAW, see [BIND_OUT_VARIABLE_RAW Procedure](#) on page 45-6.

Parameters

Table 45-6 BIND_OUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename = :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45-7 BIND_OUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of datatype RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NOT NULL,
  v      OUT RAW,
  n      IN  VARCHAR2);
```

Parameters

Table 45–8 BIND_OUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–9 BIND_OUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      IN <dt>,
  n      IN VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also: To bind RAW variables use [BIND_VARIABLE_RAW Procedure](#) on page 45-8.

Parameters

Table 45–10 *BIND_VARIABLE Procedure Parameters*

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–11 *BIND_VARIABLE Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined: WNDS, RNDS

BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
  c   IN BINARY_INTEGER NOT NULL,
  p   IN BINARY_INTEGER NOT NULL,
  v   IN RAW,
  n   IN VARCHAR2);
```

Parameters

Table 45–12 BIND_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in <code>SELECT * FROM emp WHERE ename= :ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–13 BIND_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
  c IN BINARY_INTEGER NOT NULL);
```

Parameters

Table 45–14 *CLOSE_CURSOR Procedure Parameters*

Parameter	Description
c	Cursor to be released.

Exceptions

Table 45–15 *CLOSE_CURSOR Procedure Exceptions*

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN_CURSOR, PARSE, EXECUTE_NON_QUERY, CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
    s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 45–16 EXECUTE_IMMEDIATE Procedure Parameters

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

Table 45–17 EXECUTE_IMMEDIATE Procedure Exceptions

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a `SELECT` statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
  c IN BINARY_INTEGER NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 45–18 EXECUTE_NON_QUERY Function Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 45–19 EXECUTE_NON_QUERY Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	<code>BIND_VARIABLE</code> procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

FETCH_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL `SELECT` statement. When there are no more rows to be fetched, the exception `NO_DATA_FOUND` is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
    c    IN BINARY_INTEGER NOT NULL,
    f    IN BOOLEAN)
RETURN BINARY_INTEGER;
```

Parameters

Table 45–20 *FETCH_ROW Function Parameters*

Parameter	Description
<code>c</code>	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
<code>first</code>	(Optional) Reexecutes <code>SELECT</code> statement. Possible values: <ul style="list-style-type: none"> - <code>TRUE</code>: reexecute <code>SELECT</code> statement. - <code>FALSE</code>: fetch the next row, or if run for the first time, then execute and fetch rows (default).

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 45–21 *FETCH_ROW Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

Pragmas

Purity level defined : `WNDS`

GET_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of `SELECT` statements, after a row has been fetched.
- It retrieves the `OUT` bind values, after the `SQL` statement has been run.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      OUT <dt>);
```

<dt> is either `DATE`, `NUMBER`, or `VARCHAR2`.

See Also: For retrieving values of datatype `RAW`, see [GET_VALUE_RAW Procedure](#) on page 45-14.

Parameters

Table 45–22 *GET_VALUE Procedure Parameters*

Parameter	Description
c	Cursor associated with the pass-through <code>SQL</code> statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable or select list item in the <code>SQL</code> statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

Exceptions

Table 45–23 *GET_VALUE Procedure Exceptions*

Exception	Description
ORA-1403	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the <code>SQL</code> statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

Pragmas

Purity level defined : `WNDS`

GET_VALUE_RAW Procedure

This procedure is similar to `GET_VALUE`, but for datatype `RAW`.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
  c    IN  BINARY_INTEGER NOT NULL,
  p    IN  BINARY_INTEGER NOT NULL,
  v    OUT RAW);
```

Parameters

Table 45–24 GET_VALUE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

Exceptions

Table 45–25 GET_VALUE_RAW Procedure Exceptions

Exception	Description
ORA-1403	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

Pragmas

Purity level defined : `WNDS`

OPEN_CURSOR Function

This function opens a cursor for running a pass-through SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
RETURN BINARY_INTEGER;
```

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 45–26 OPEN_CURSOR Function Exceptions

Exception	Description
ORA-28554	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' OPEN_CURSORS initialization parameter.

Pragmas

Purity level defined : WNDS, RNDS

PARSE Procedure

This procedure parses SQL statement at non-Oracle system.

Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
  c          IN  BINARY_INTEGER NOT NULL,
  stmt      IN  VARCHAR2 NOT NULL);
```

Parameters

Table 45–27 *PARSE Procedure Parameters*

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened using function OPEN_CURSOR.
stmt	Statement to be parsed.

Exceptions

Table 45–28 *PARSE Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

The `DBMS_IOT` package creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command. `DBMS_IOT` can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the `enable_constraint` operation.

`DBMS_IOT` is not loaded during database installation. To install `DBMS_IOT`, run `dbmsiotc.sql`, available in the `ADMIN` directory.

This chapter contains the following topics:

- [Summary of DBMS_IOT Subprograms](#)

Note: With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

Summary of DBMS_IOT Subprograms

Table 46–1 *DBMS_IOT Package Subprograms*

Subprogram	Description
BUILD_CHAIN_ROWS_TABLE Procedure on page 46-3	Creates a table into which references to the chained rows for an index-organized table can be placed using the <code>ANALYZE</code> command
BUILD_EXCEPTIONS_TABLE Procedure on page 46-4	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

Table 46-2 BUILD_CHAIN_ROWS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS', 'L', 'LC');
```

A chained-row table is created with the following columns:

Column Name	Null?	Type
OWNER_NAME		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CLUSTER_NAME		VARCHAR2(30)
PARTITION_NAME		VARCHAR2(30)
SUBPARTITION_NAME		VARCHAR2(30)
HEAD_ROWID		ROWID
TIMESTAMP		DATE
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

Parameters

Table 46-3 BUILD_EXCEPTIONS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS', 'L', 'LE');
```

An exception table for the preceding index-organized table with the following columns:

Column Name	Null?	Type
ROW_ID		VARCHAR2(30)
OWNER		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CONSTRAINT		VARCHAR2(30)
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- [Documentation of DBMS_JAVA](#)

Documentation of DBMS_JAVA

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer's Guide*.

The DBMS_JOB package schedules and manages jobs in the job queue.

Note: The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS_JOB by revoking the package execution privilege for users.

For more information, see [Chapter 93, "DBMS_SCHEDULER"](#) and "Moving from DBMS_JOB to DBMS_SCHEDULER" in *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS_JOB](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_JOB Subprograms](#)

Using DBMS_JOB

- [Security Model](#)
- [Operational Notes](#)

Security Model

No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

Operational Notes

- [Working with Real Application Clusters](#)
- [Stopping a Job](#)

Working with Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the [DBMS_SCHEDULER](#) package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

DBMS_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(  
  job      OUT      BINARY_INTEGER,  
  what     IN       VARCHAR2, NEXT_DATE IN DATE DEFAULTSYSDATE,  
  interval IN       VARCHAR2 DEFAULT 'NULL',  
  no_parse IN       BOOLEAN DEFAULT FALSE,  
  instance IN       BINARY_INTEGER DEFAULT ANY_INSTANCE,  
  force    IN       BOOLEAN DEFAULT FALSE);
```

Use the parameters `instance` and `force` to control job and instance affinity. The default value of `instance` is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the `instance` value. Oracle displays error ORA-23319 if the `instance` value is a negative number or NULL.

The `force` parameter defaults to `false`. If `force` is TRUE, any positive integer is acceptable as the job instance. If `force` is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

DBMS_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE( JOB IN BINARY_INTEGER,  
  instance          IN BINARY_INTEGER,  
  force             IN BOOLEAN DEFAULT FALSE);
```

The `FORCE` parameter in this example defaults to `FALSE`. If the `instance` value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of `force`. If the `INSTANCE` value is positive and the `FORCE` parameter is `FALSE`, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the `force` parameter is `TRUE`, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the `instance` value is negative or NULL.

DBMS_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE( JOB IN BINARY_INTEGER,
```

```

        what                IN VARCHAR2 DEFAULT NULL,
next_date                IN DATE DEFAULT NULL,
interval                IN VARCHAR2 DEFAULT NULL,
instance                IN BINARY_INTEGER DEFAULT NULL,
force                    IN BOOLEAN DEFAULT FALSE );

```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the instance number is negative.

DBMS_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If `force` is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if `force` is `FALSE` and the connected instance is the incorrect instance.

```

DBMS_JOB.RUN(
    job    IN BINARY_INTEGER,
    force  IN BOOLEAN DEFAULT FALSE);

```

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

Summary of DBMS_JOB Subprograms

Table 48–1 *DBMS_JOB Package Subprograms*

Subprogram	Description
BROKEN Procedure on page 48-7	Disables job execution
CHANGE Procedure on page 48-8	Alters any of the user-definable parameters associated with a job
INSTANCE Procedure on page 48-9	Assigns a job to be run by a instance
INTERVAL Procedure on page 48-10	Alters the interval between executions for a specified job
NEXT_DATE Procedure on page 48-11	Alters the next execution time for a specified job
REMOVE Procedure on page 48-12	Removes specified job from the job queue
RUN Procedure on page 48-13	Forces a specified job to run
SUBMIT Procedure on page 48-14	Submits a new job to the job queue
USER_EXPORT Procedures on page 48-16	Re-creates a given job for export, or re-creates a given job for export with instance affinity
WHAT Procedure on page 48-17	Alters the job description for a specified job

BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```
DBMS_JOB.BROKEN (  
  job      IN  BINARY_INTEGER,  
  broken   IN  BOOLEAN,  
  next_date IN DATE DEFAULT SYSDATE);
```

Parameters

Table 48–2 *BROKEN Procedure Parameters*

Parameter	Description
job	Number of the job being run.
broken	Job broken: IN value is FALSE.
next_data	Date of the next refresh.

Note: If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```
DBMS_JOB.CHANGE (
  job      IN  BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN  DATE,
  interval IN  VARCHAR2,
  instance IN  BINARY_INTEGER DEFAULT NULL,
  force    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–3 *CHANGE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.
next_date	Date of the next refresh.
interval	Date function; evaluated immediately before the job starts running.
instance	When a job is submitted, specifies which instance can run the job. This defaults to <code>NULL</code> , which indicates that instance affinity is not changed.
force	If this is <code>FALSE</code> , then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are `NULL`, then leave that value as it is.

Example

```
BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;
```

INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```
DBMS_JOB.INSTANCE (
  job          IN BINARY_INTEGER,
  instance     IN BINARY_INTEGER,
  force        IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–4 *INSTANCE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

You must issue a `COMMIT` statement immediately after the statement.

INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```
DBMS_JOB.INTERVAL (
  job      IN  BINARY_INTEGER,
  interval IN  VARCHAR2);
```

Parameters

Table 48–5 *INTERVAL Procedure Parameters*

Parameter	Description
job	Number of the job being run.
interval	Date function, evaluated immediately before the job starts running.

Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement `select interval into next_date from dual`;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
'sysdate + 7'	Run once a week.
'next_day(sysdate, ''TUESDAY'')'	Run once every Tuesday.
'null'	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- You must issue a `COMMIT` statement immediately after the statement.

NEXT_DATE Procedure

This procedure changes when an existing job next runs.

Syntax

```
DBMS_JOB.NEXT_DATE (  
    job          IN BINARY_INTEGER,  
    next_date IN DATE);
```

Parameters

Table 48–6 NEXT_DATE Procedure Parameters

Parameter	Description
job	Number of the job being run.
next_date	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```
DBMS_JOB.REMOVE (  
    job          IN BINARY_INTEGER );
```

Parameters

Table 48–7 REMOVE Procedure Parameters

Parameter	Description
job	Number of the job being run.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

Example

```
BEGIN  
    DBMS_JOB.REMOVE(14144);  
    COMMIT;  
END;
```

RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See view `user_jobs`.

Syntax

```
DBMS_JOB.RUN (
  job      IN BINARY_INTEGER,
  force    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–8 *RUN Procedure Parameters*

Parameter	Description
<code>job</code>	Number of the job being run.
<code>force</code>	If this is <code>TRUE</code> , then instance affinity is irrelevant for running jobs in the foreground process. If this is <code>FALSE</code> , then the job can be run in the foreground only in the specified instance.

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

Caution: This re-initializes the current session's packages.

Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```
DBMS_JOB.SUBMIT (
  job      OUT BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN  DATE DEFAULT sysdate,
  interval IN  VARCHAR2 DEFAULT 'null',
  no_parse IN  BOOLEAN DEFAULT FALSE,
  instance IN  BINARY_INTEGER DEFAULT any_instance,
  force    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–9 SUBMIT Procedure Parameters

Parameter	Description
<code>job</code>	Number of the job being run.
<code>what</code>	PL/SQL procedure to run.
<code>next_date</code>	Next date when the job will be run.
<code>interval</code>	Date function that calculates the next time to run the job. The default is <code>NULL</code> . This must evaluate to either a future point in time or <code>NULL</code> .
<code>no_parse</code>	A flag. The default is <code>FALSE</code> . If this is set to <code>FALSE</code> , then Oracle parses the procedure associated with the job. If this is set to <code>TRUE</code> , then Oracle parses the procedure associated with the job the first time that the job is run. For example, if you want to submit a job before you have created the tables associated with the job, then set this to <code>TRUE</code> .
<code>instance</code>	When a job is submitted, specifies which instance can run the job.
<code>force</code>	If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
```

```
DBMS_JOB.SUBMIT(:jobno,  
  'dbms_ddl.analyze_object(''TABLE'',  
  'DQUON', 'ACCOUNTS',  
  'ESTIMATE', NULL, 50);'  
  SYSDATE, 'SYSDATE + 1');  
COMMIT;  
END;  
/  
Statement processed.  
print jobno  
JOBNO  
-----  
14144
```

USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (*8i* and after) and preserves the compatibility.

Syntax

```
DBMS_JOB.USER_EXPORT (  
  job      IN      BINARY_INTEGER,  
  mycall  IN OUT  VARCHAR2);
```

```
DBMS_JOB.USER_EXPORT (  
  job      IN      BINARY_INTEGER,  
  mycall  IN OUT  VARCHAR2,  
  myinst  IN OUT  VARCHAR2);
```

Parameters

Table 48–10 *USER_EXPORT Procedure Parameter*

Parameter	Description
job	Number of the job being run.
mycall	Text of a call to re-create the given job.
myinst	Text of a call to alter instance affinity.

WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```
DBMS_JOB.WHAT (  
  job      IN  BINARY_INTEGER,  
  what     IN  VARCHAR2);
```

Parameters

Table 48–11 WHAT Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.

Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- Some legal values of what (assuming the routines exist) are:
 - 'myproc(''10-JAN-82'', next_date, broken);'
 - 'scott.emppackage.give_raise(''JENKINS'', 30000.00);'
 - 'dbms_job.remove(job);'

The DBMS_LDAP package lets you access data from LDAP servers.

- [Documentation of DBMS_LDAP](#)

Documentation of DBMS_LDAP

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP` in the *Oracle Internet Directory Application Developer's Guide*.

DBMS_LDAP_UTL

The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

Documentation of DBMS_LDAP_UTL

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP_UTL` in the *Oracle Internet Directory Application Developer's Guide*.

DBMS_LIBCACHE

The `DBMS_LIBCACHE` package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- [Using DBMS_LIBCACHE](#)
 - Overview
 - Security Model
- [Summary of DBMS_LIBCACHE Subprograms](#)

Using DBMS_LIBCACHE

- [Overview](#)
- [Security Model](#)

Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements. The open and parse functions are executed in advance for `PL/SQL` and `DML`. For `PL/SQL`, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

Security Model

To execute `DBMS_LIBCACHE` you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, `DBMS_LIBCACHE` should be called for each.

Alternatively, `DBMS_LIBCACHE` may be called with the generic user `PARSER`. However, this user cannot parse the SQL that uses objects with access granted through roles. This is a standard PL/SQL security limitation.

Summary of DBMS_LIBCACHE Subprograms

Table 51–1 DBMS_LIBCACHE Package Subprograms

Subprogram	Description
COMPILE_FROM_REMOTE Procedure on page 51-6	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
  p_db_link           IN      dbms_libcache$def.db_link%type,
  p_username          IN      VARCHAR2 default null,
  p_threshold_executions IN    NATURAL default 3,
  p_threshold_sharable_mem IN  NATURAL default 1000,
  p_parallel_degree   IN      NATURAL default 1);
```

Parameters

Table 51–2 *COMPILE_FROM_REMOTE Procedure Parameters*

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role <code>SELECT_ON_CATALOG</code> at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with <code>dbms_libcache\$def.ACCESS_METHOD = DB_LINK_METHOD</code>
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single <code>user_id</code> , for example <code>APPS</code> , <code>APPS</code> is the parsing <code>user_id</code> that is recorded in the shared pool. To select only SQL statements parsed by <code>APPS</code> , enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example <code>GL</code> . If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

Table 51-2 (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
<code>p_threshold_sharable_mem</code>	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
<code>p_parallel_degree</code>	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulation specific parts of a LOB or complete LOBs.

Using DBMS_LOB

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Rules and Limits](#)
- [Operational Notes](#)

Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

Security Model

This package must be created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

Any `DBMS_LOB` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_LOB` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the `AUTHID` to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE proc1 authid definer ...
```

or

```
CREATE PROCEDURE proc1 authid current_user ...
```

See Also: For more information on `AUTHID` and privileges, see *Oracle Database PL/SQL User's Guide and Reference*

You can provide secure access to `BFILES` using the `DIRECTORY` feature discussed in `BFILENAME` function in the *Oracle Database Application Developer's Guide - Large Objects* and the *Oracle Database SQL Reference*.

For information about the security model pertaining to temporary LOBs, see [Operational Notes](#).

Constants

DBMS_LOB defines the following constants:

```
file_readonly CONSTANT BINARY_INTEGER := 0;
lob_readonly  CONSTANT BINARY_INTEGER := 0;
lob_readwrite CONSTANT BINARY_INTEGER := 1;
lobmaxsize    CONSTANT INTEGER        := 18446744073709551615;
call          CONSTANT PLS_INTEGER    := 12;
session       CONSTANT PLS_INTEGER    := 10;
```

Datatypes

The DBMS_LOB package uses the datatypes shown in [Table 52–1](#).

Table 52–1 Datatypes Used by DBMS_LOB

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause `ANY_CS` in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

Rules and Limits

- [General Rules and Limits](#)
- [Rules and Limits Specific to External Files \(BFILES\)](#)
- [Maximum LOB Size](#)
- [Maximum Buffer Size](#)

General Rules and Limits

- The following rules apply in the specification of subprograms in this package:
 - `length`, `offset`, and `amount` parameters for subprograms operating on BLOBs and BFILES must be specified in terms of *bytes*.
 - `length`, `offset`, and `amount` parameters for subprograms operating on CLOBs must be specified in terms of *characters*.
- A subprogram raises an `INVALID_ARGVAL` exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
 1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
 2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
 3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize` (4GB-1) in any DBMS_LOB subprogram.
 4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed $(lobmaxsize/character_width_in_bytes)$ characters.

For example, if the CLOB consists of 2-byte characters, such as:

```
JA16SJISFIXED
```

Then, the maximum `amount` value should not exceed:

```
4294967295/2 = 2147483647 characters.
```

- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for `RAW` and `VARCHAR2` parameters used in DBMS_LOB subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for DBMS_LOB subprograms for CLOBs and NCLOBs.

- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

For example, in DBMS_LOB subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. If the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR`

data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of `amount` plus the `offset` exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as `READ`, `COMPARE`, `INSTR`, and `SUBSTR`, read until `End of Lob/File` is reached. For example, for a `READ` operation on a `BLOB` or `BFILE`, if the user specifies `offset` value of 3 GB and an `amount` value of 2 GB, then `READ` reads only $((4\text{GB}-1) - 3\text{GB})$ bytes.

- Functions with `NULL` or invalid input values for parameters return a `NULL`. Procedures with `NULL` values for destination LOB parameters raise exceptions.
- Operations involving patterns as parameters, such as `COMPARE`, `INSTR`, and `SUBSTR` do not support regular expressions or special matching characters (such as `%` in the `LIKE` operator in SQL) in the `pattern` parameter or substrings.
- The `End Of LOB` condition is indicated by the `READ` procedure using a `NO_DATA_FOUND` exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The `READ` buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an `offset` parameter is 1, which indicates the first byte in the `BLOB` or `BFILE` data, and the first character in the `CLOB` or `NCLOB` value. No default values are specified for the `amount` parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as `APPEND`, `COPY`, `ERASE`, `TRIM`, or `WRITE`. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILES)

- The subprograms `COMPARE`, `INSTR`, `READ`, `SUBSTR`, `FILECLOSE`, `FILECLOSEALL` and `LOADFROMFILE` operate only on an *opened* `BFILE` locator; that is, a successful `FILEOPEN` call must precede a call to any of these subprograms.
- For the functions `FILEEXISTS`, `FILEGETNAME` and `GETLENGTH`, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the `DIRECTORY` object and the file.
- `DBMS_LOB` does not support any concurrency control mechanism for `BFILE` operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the `FILECLOSEALL` subprogram to close all files opened in the session and resume file operations from the beginning.
- If you are the creator of a `DIRECTORY`, or if you have system privileges, then use the `CREATE OR REPLACE`, `DROP`, and `REVOKE` statements in SQL with extreme caution.

If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to

invoke a program or anonymous block that calls `FILECLOSEALL`, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the `BFILE`.

In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than `SESSION_MAX_OPEN_FILES`.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the `BFILE` variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open `BFILEs` are lost. The result is a larger open file count which may or may not exceed the `SESSION_MAX_OPEN_FILES` value.

For example, consider a `READ` operation past the end of the `BFILE` value, which generates a `NO_DATA_FOUND` exception:

```
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;
```

```
ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

After the exception has occurred, the `BFILE` locator variable `file` goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
    exception
    WHEN no_data_found
```

```
        THEN
        BEGIN
            dbms_output.put_line('End of File reached. Closing file');
            dbms_lob.fileclose(fil);
            -- or dbms_lob.filecloseall if appropriate
        END;
    END;
/
```

```
Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

Maximum LOB Size

The maximum size of a LOB supported by the database is equal to the value of the `db_block_size` initialization parameter times the value 4294967295. This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

Maximum Buffer Size

The maximum buffer size, 32767 bytes, is represented by `maxbufsize`.

Operational Notes

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system. See also Chapter 1 of *Oracle Database Application Developer's Guide - Large Objects*.

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- [Internal LOBs](#)
- [External LOBs](#)
- [Temporary LOBs](#)

Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a DIRECTORY object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the DIRECTORY object and the filename of the external LOB you are adding to the BFILENAME function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the given LOB locator.

After the LOBs are defined and created, you can then SELECT from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to DBMS_LOB for access to the LOB value.

For details on the different ways to do this, you must refer to the section of the *Oracle Database Application Developer's Guide - Large Objects* that describes "Accessing External LOBs (BFILES)."

Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as `CACHE/ NOCACHE`. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL `DBMS_LOB` package, PRO*C, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the `EMPTY_BLOB` or `EMPTY_CLOB` functions that are supported for permanent LOBs. The `EMPTY_BLOB` function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the `DBMS_LOB` package by using the appropriate `FREETEMPORARY` or `OCIDurationEnd` statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and `DBMS_LOB` statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or `DBMS_LOB COPY` command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a `v$` view called `V$TEMPORARY_LOBS`, which contains information about how many temporary LOBs exist for each session. `V$` views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using `V$TEMPORARY_LOBS` in conjunction with `DBA_SEGMENTS`, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in `DBMS_LOB` return `NULL` if any of the input parameters are `NULL`. All procedures in `DBMS_LOB` raise an exception if the `LOB` locator is input as `NULL`.
2. Operations based on `CLOBs` do not verify if the character set IDs of the parameters (`CLOB` parameters, `VARCHAR2` buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.
4. Temporary LOBs still adhere to value semantics in order to be consistent with permanent LOBs and to try to conform to the ANSI standard for LOBs. As a result, each time a user does an `OCILobLocatorAssign`, or the equivalent assignment in `PL/SQL`, the database makes a copy of the temporary `LOB`.

Each locator points to its own `LOB` value. If one locator is used to create a temporary `LOB`, and then is assigned to another `LOB` locator using `OCILobLocatorAssign` in `OCI` or through an assignment operation in `PL/SQL`, then the database copies the original temporary `LOB` and causes the second locator to point to the copy.

In order for users to modify the same `LOB`, they must go through the same locator. In `OCI`, this can be accomplished fairly easily by using pointers to locators and assigning the pointers to point to the same locator. In `PL/SQL`, the same `LOB` variable must be used to update the `LOB` to get this effect.

The following example shows a place where a user incurs a copy, or at least an extra round-trip to the server.

```
DECLARE
  a blob;
  b blob;
BEGIN
  dbms_lob.createtemporary(b, TRUE);
  -- the following assignment results in a deep copy
  a := b;
END;
```

The `PL/SQL` compiler makes temporary copies of actual arguments bound to `OUT` or `IN OUT` parameters. If the actual parameter is a temporary `LOB`, then the temporary copy is a deep (value) copy.

The following `PL/SQL` block illustrates the case where the user incurs a deep copy by passing a temporary `LOB` as an `IN OUT` parameter.

```
DECLARE
  a blob;
  procedure foo(parm IN OUT blob) is
  BEGIN
    ...
  END;
```

```
BEGIN
  dbms_lob.createtemporary(a, TRUE);
  -- the following call results in a deep copy of the blob a
  foo(a);
END;
```

To minimize deep copies on PL/SQL parameter passing, use the `NOCOPY` compiler hint where possible.

The duration parameter passed to `dbms_lob.createtemporary()` is a hint. The duration of the new temp LOB is the same as the duration of the locator variable in PL/SQL. For example, in the preceding program block, the program variable `a` has the duration of the residing frame. Therefore at the end of the block, memory of `a` will be freed at the end of the function.

If a PL/SQL package variable is used to create a temp LOB, it will have the duration of the package variable, which has a duration of `SESSION`.

```
BEGIN
  y clob;
END;
/
BEGIN
  dbms_lob.createtemporary(package.y, TRUE);
END;
```

See Also: *Oracle Database PL/SQL User's Guide and Reference* for more information on `NOCOPY` syntax

Exceptions

Table 52–2 DBMS_LOB Exceptions

Exception	Code	Description
INVALID_ARGVAL	21560	The argument is expecting a nonNULL, valid value but the argument value passed in is NULL, invalid, or out of range.
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
NOEXIST_DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
INVALID_DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
OPERATION_FAILED	22288	The operation attempted on the file failed.
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
NO_DATA_FOUND		EndofLob indicator for looping read operations. This is not a hard error.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

Summary of DBMS_LOB Subprograms

Table 52–3 DBMS_LOB Package Subprograms

Subprogram	Description
APPEND Procedures on page 52-18	Appends the contents of the source LOB to the destination LOB
CLOSE Procedure on page 52-19	Closes a previously opened internal or external LOB
COMPARE Functions on page 52-20	Compares two entire LOBs or parts of two LOBs
CONVERTTOBLOB Procedure on page 52-22	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
CONVERTTOCLOB Procedure on page 52-25	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
COPY Procedures on page 52-28	Copies all, or part, of the source LOB to the destination LOB
CREATETEMPORARY Procedures on page 52-30	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
ERASE Procedures on page 52-31	Erases all or part of a LOB
FILECLOSE Procedure on page 52-33	Closes the file
FILECLOSEALL Procedure on page 52-34	Closes all previously opened files
FILEEXISTS Function on page 52-35	Checks if the file exists on the server
FILEGETNAME Procedure on page 52-36	Gets the directory object name and file name
FILEISOPEN Function on page 52-37	Checks if the file was opened using the input BFILE locators
FILEOPEN Procedure on page 52-38	Opens a file
FREETEMPORARY Procedures on page 52-39	Frees the temporary BLOB or CLOB in the user's default temporary tablespace
GETCHUNKSIZE Functions on page 52-41	Returns the amount of space used in the LOB chunk to store the LOB value
GETLENGTH Functions on page 52-42	Gets the length of the LOB value
GET_STORAGE_LIMIT on page 52-40	Returns the storage limit for LOBs in your database configuration
INSTR Functions on page 52-43	Returns the matching position of the <i>n</i> th occurrence of the pattern in the LOB
ISOPEN Functions on page 52-45	Checks to see if the LOB was already opened using the input locator

Table 52-3 (Cont.) DBMS_LOB Package Subprograms

Subprogram	Description
ISTEMPORARY Functions on page 52-46	Checks if the locator is pointing to a temporary LOB
LOADBLOBFROMFILE Procedure on page 52-47	Loads BFILE data into an internal BLOB
LOADCLOBFROMFILE Procedure on page 52-49	Loads BFILE data into an internal CLOB
LOADFROMFILE Procedure on page 52-52	Loads BFILE data into an internal LOB
OPEN Procedures on page 52-54	Opens a LOB (internal, external, or temporary) in the indicated mode
READ Procedures on page 52-56	Reads data from the LOB starting at the specified offset
SUBSTR Functions on page 52-58	Returns part of the LOB value starting at the specified offset
TRIM Procedures on page 52-60	Trims the LOB value to the specified shorter length
WRITE Procedures on page 52-62	Writes data to the LOB from a specified offset
WRITEAPPEND Procedures on page 52-64	Writes a buffer to the end of a LOB

APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

There are two overloaded APPEND procedures.

Syntax

```
DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY BLOB,
  src_lob  IN          BLOB);

DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob  IN          CLOB CHARACTER SET dest_lob%CHARSET);
```

Parameters

Table 52–4 APPEND Procedure Parameters

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

Exceptions

Table 52–5 APPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```
DBMS_LOB.CLOSE (
  lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
  lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
  file_loc   IN OUT NOCOPY BFILE);
```

Parameters

Table 52–6 *CLOSE Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILES), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close APIs. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

```
DBMS_LOB.COMPARE (
  lob_1          IN BLOB,
  lob_2          IN BLOB,
  amount         IN INTEGER := 4294967295,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.COMPARE (
  lob_1          IN CLOB CHARACTER SET ANY_CS,
  lob_2          IN CLOB CHARACTER SET lob_1%CHARSET,
  amount         IN INTEGER := 4294967295,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.COMPARE (
  lob_1          IN BFILE,
  lob_2          IN BFILE,
  amount         IN INTEGER,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–7 COMPARE Function Parameters

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.

Return Values

- INTEGER: Zero if the comparison succeeds, nonzero if not.
- NULL, if
 - amount < 1
 - amount > LOBMAXSIZE
 - offset_1 or offset_2 < 1

* `offset_1` or `offset_2` > LOBMAXSIZE

Usage Notes

You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

COMPARE returns zero if the data exactly matches over the range specified by the `offset` and `amount` parameters. Otherwise, a nonzero INTEGER is returned.

For fixed-width n -byte CLOBs, if the input amount for COMPARE is specified to be greater than $(4294967295/n)$, then COMPARE matches characters in a range of size $(4294967295/n)$, or $\text{Max}(\text{length}(\text{clob1}), \text{length}(\text{clob2}))$, whichever is lesser.

Exceptions

Table 52–8 COMPARE Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB (
  dest_lob      IN OUT      NOCOPY BLOB,
  src_clob      IN          CLOB CHARACTER SET ANY_CS,
  amount       IN          INTEGER,
  dest_offset   IN OUT      INTEGER,
  src_offset    IN OUT      INTEGER,
  blob_csid    IN          NUMBER,
  lang_context  IN OUT      INTEGER,
  warning      OUT          INTEGER);
```

Parameters

Table 52–9 *CONVERTTOBLOB Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant <code>DBMS_LOB.LOBMAXSIZE</code> . If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.
src_offset	(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 52–9 (Cont.) CONVERTTOBLOB Procedure Parameters

Parameter	Description
warning	<p>(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message.</p> <p>Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.</p>

Usage Notes

Preconditions

Before calling the `CONVERTTOBLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 52–10](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 52–10 DBMS_LOB.CONVERTTOBLOB Typical Values

Parameter	Value	Description
amount	<code>LOBMAXSIZE</code> (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	<code>DEFAULT_CSID</code> (IN)	default CSID, use same CSID as source LOB
lang_context	<code>DEFAULT_LANG_CTX</code> (IN)	default language context
warning	<code>NO_WARNING</code> (OUT)	no warning message, success
	<code>WARN_INCONVERTIBLE_CHAR</code> (OUT)	character in source cannot be properly converted

General Notes

You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the source LOB character set, and performs a binary copy of the data—no character set conversion is performed.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source LOB. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.

Exceptions

Table 52–11 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 52–11 *CONVERTTOBLOB Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: <ul style="list-style-type: none">- <code>src_offset</code> or <code>dest_offset</code> < 1.- <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code>.- <code>amount</code> < 1.- <code>amount</code> > <code>LOBMAXSIZE</code>.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for more information on using LOBs in application development

CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB (
  dest_lob      IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
  src_blob      IN              BLOB,
  amount        IN              INTEGER,
  dest_offset   IN OUT         INTEGER,
  src_offset    IN OUT         INTEGER,
  blob_csid     IN              NUMBER,
  lang_context  IN OUT         INTEGER,
  warning       OUT             INTEGER);
```

Parameters

Table 52–12 *CONVERTTOCLOB Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant DBMS_LOB.LOBBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	(IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	(IN) Offset in bytes in the source LOB for the start of the read. (OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 52–12 (Cont.) CONVERTTOCLOB Procedure Parameters

Parameter	Description
warning	<p>Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message.</p> <p>Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.</p>

Usage Notes

Preconditions

Before calling the `CONVERTTOCLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the `CONVERTTOCLOB` procedure. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 52–13](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 52–13 DBMS_LOB.CONVERTTOCLOB Typical Values

Parameter	Value	Description
amount	<code>LOBMAXSIZE</code> (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	<code>DEFAULT_CSID</code> (IN)	default CSID, use destination CSID
lang_context	<code>DEFAULT_LANG_CTX</code> (IN)	default language context
warning	<code>NO_WARNING</code> (OUT)	no warning message, success
	<code>WARN_INCONVERTIBLE_CHAR</code> (OUT)	character in source cannot be properly converted

General Notes

You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the BLOB contains character data in the same character set as the destination CLOB, and performs a binary copy of the data to the destination LOB, no character set conversion being performed.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BLOB. The amount and `src_offset` values are in bytes and the `dest_offset` is in characters. To convert the entire BLOB, you can specify `LOBMAXSIZE` for the amount parameter.

Exceptions

Table 52–14 *CONVERTTOCLOB Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: <ul style="list-style-type: none"> - <code>src_offset</code> or <code>dest_offset</code> < 1. - <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code>. - <code>amount</code> < 1. - <code>amount</code> > <code>LOBMAXSIZE</code>.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for more information on using LOBs in application development

COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY BLOB,
  src_lob    IN           BLOB,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);

DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob    IN           CLOB CHARACTER SET dest_lob%CHARSET,
  amount     IN           INTEGER,
  dest_offset IN           INTEGER := 1,
  src_offset IN           INTEGER := 1);
```

Parameters

Table 52–15 COPY Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

Exceptions

Table 52–16 COPY Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - src_offset or dest_offset < 1 - src_offset or dest_offset > LOBMAXSIZE - amount < 1 - amount > LOBMAXSIZE

Usage Notes

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the `src_offset` to the end of the source LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := 10);

DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := 10);
```

Parameters

Table 52–17 CREATETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 2 predefined duration values (SESSION or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session or call. If dur is omitted, then the session duration is used.

See Also:

- *Oracle Database Application Developer’s Guide - Large Objects* for additional details on usage of this procedure
- *Oracle Database PL/SQL User’s Guide and Reference* for more information about NOCOPY and passing temporary lob as parameters

ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```
DBMS_LOB.ERASE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN OUT NOCOPY INTEGER,
  offset       IN              INTEGER := 1);

DBMS_LOB.ERASE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN OUT NOCOPY INTEGER,
  offset       IN              INTEGER := 1);
```

Parameters

Table 52–18 ERASE Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be erased. For more information, see Operational Notes .
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

Usage Notes

Note: The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "[TRIM Procedures](#)" on page 52-60.

When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.

The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.

Exceptions

Table 52–19 ERASE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - amount < 1 or amount > LOBMAXSIZE - offset < 1 or offset > LOBMAXSIZE

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- ["TRIM Procedures"](#) on page 52-60
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

Note: The database has only read-only access to BFILES. This means that BFILES cannot be written through the database.

Syntax

```
DBMS_LOB.FILECLOSE (
    file_loc IN OUT NOCOPY BFILE);
```

Parameters

Table 52–20 FILECLOSE Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE to be closed.

Exceptions

Table 52–21 FILECLOSE Procedure Exceptions

Exception	Description
VALUE_ERROR	NULL input value for file_loc.
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- ["FILEOPEN Procedure"](#) on page 52-38
- ["FILECLOSEALL Procedure"](#) on page 52-34
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILECLOSEALL Procedure

This procedure closes all BFILEs opened in the session.

Syntax

```
DBMS_LOB.FILECLOSEALL;
```

Exceptions

Table 52–22 FILECLOSEALL Procedure Exception

Exception	Description
UNOPENED_FILE	No file has been opened in the session.

See Also:

- ["FILEOPEN Procedure"](#) on page 52-38
- ["FILECLOSE Procedure"](#) on page 52-33
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEEXISTS Function

This function finds out if a given BFILE locator points to a file that actually exists on the server's file system.

Syntax

```
DBMS_LOB.FILEEXISTS (
    file_loc    IN    BFILE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–23 FILEEXISTS Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

Table 52–24 FILEEXISTS Function Return Values

Return	Description
0	Physical file does not exist.
1	Physical file exists.

Exceptions

Table 52–25 FILEEXISTS Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- ["FILEISOPEN Function"](#) on page 52-37.
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the `dir_alias` buffer is 30, and for the entire path name, it is 2000.

Syntax

```
DBMS_LOB.FILEGETNAME (  
    file_loc  IN    BFILE,  
    dir_alias OUT  VARCHAR2,  
    filename  OUT  VARCHAR2);
```

Parameters

Table 52–26 FILEGETNAME Procedure Parameters

Parameter	Description
<code>file_loc</code>	Locator for the BFILE
<code>dir_alias</code>	Directory object name
<code>filename</code>	Name of the BFILE

Exceptions

Table 52–27 FILEGETNAME Procedure Exceptions

Exception	Description
<code>VALUE_ERROR</code>	Any of the input parameters are NULL or INVALID.
<code>INVALID_ARGVAL</code>	<code>dir_alias</code> or <code>filename</code> are NULL.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEISOPEN Function

This function finds out whether a BFILE was opened with the given FILE locator.

Syntax

```
DBMS_LOB.FILEISOPEN (
    file_loc IN BFILE)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–28 FILEISOPEN Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

INTEGER: 0 = file is not open, 1 = file is open

Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 52–29 FILEISOPEN Function Exceptions

Exception	Description
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- ["FILEEXISTS Function"](#) on page 52-35
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```
DBMS_LOB.FILEOPEN (
    file_loc  IN OUT NOCOPY  BFILE,
    open_mode IN              BINARY_INTEGER := file_readonly);
```

Parameters

Table 52–30 FILEOPEN Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

Exceptions

Table 52–31 FILEOPEN Procedure Exceptions

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- ["FILECLOSE Procedure"](#) on page 52-33
- ["FILECLOSEALL Procedure"](#) on page 52-34
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in your default temporary tablespace.

Syntax

```
DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB);
```

```
DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 52–32 *FREETEMPORARY Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Usage Notes

After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.

If an invalid LOB locator is assigned to another LOB locator using OCILobLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

GET_STORAGE_LIMIT

The `DBMS_LOB.GET_STORAGE_LIMIT` function returns the LOB storage limit for your database configuration. The `DBMS_LOB` package supports LOB instances up to this storage limit in size.

Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT  
RETURN INTEGER;
```

Return Value

The value returned from this function is the maximum allowable size for LOB instances for your database configuration. The return value depends on your `DB_BLOCK_SIZE` initialization parameter setting and is calculated as (4 gigabytes minus 1) times the value of the `DB_BLOCK_SIZE` initialization parameter.

Usage

Note that BLOB instances are sized in bytes while CLOB and NCLOB instances are sized in characters.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for details on LOB storage limits

GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, which can be a multiple of database blocks. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```
DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksizes, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–33 GETCHUNKSIZE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Return Values

The value returned for BLOBs is in terms of bytes. The value returned for CLOBs is in terms of characters.

Usage Notes

Performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN BLOB)
RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (
  file_loc  IN BFILE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–34 GETLENGTH Function Parameter

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILEs:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

INSTR Functions

This function returns the matching position of the *nth* occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (
  lob_loc    IN    BLOB,
  pattern    IN    RAW,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  lob_loc    IN    CLOB      CHARACTER SET ANY_CS,
  pattern    IN    VARCHAR2  CHARACTER SET lob_loc%CHARSET,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.INSTR (
  file_loc   IN    BFILE,
  pattern    IN    RAW,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–35 INSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes .
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

Return Values

Table 52–36 INSTR Function Return Values

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.

Table 52–36 (Cont.) INSTR Function Return Values

Return	Description
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

Usage Notes

The form of the VARCHAR2 buffer (the `pattern` parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILES, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 52–37 INSTR Function Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- ["SUBSTR Functions"](#) on page 52-58
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
  lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
  lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
  file_loc IN BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–38 ISOPEN Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
file_loc	File locator.

Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILES), ISOPEN also requires a round-trip, because that's where the state is kept.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

Syntax

```
DBMS_LOB.ISTEMPORARY (  
    lob_loc IN BLOB)  
    RETURN INTEGER;  
  
DBMS_LOB.ISTEMPORARY (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
    RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–39 *ISTEMPORARY Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Return Values

This function returns TRUE in temporary if the locator is pointing to a temporary LOB. It returns FALSE otherwise.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
  dest_lob    IN OUT NOCOPY BLOB,
  src_bfile   IN          BFILE,
  amount      IN          INTEGER,
  dest_offset IN OUT     INTEGER,
  src_offset  IN OUT     INTEGER);
```

Parameters

Table 52–40 *LOADBLOBFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in bytes for BLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect

performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

Table 52–41 Suggested Values of the Parameter

Parameter	Default Value	Description
amount	DBMSLOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize          CONSTANT INTEGER          := 4294967295;
```

Exceptions

Table 52–42 LOADBLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
  dest_lob      IN OUT NOCOPY  BLOB,
  src_bfile     IN              BFILE,
  amount        IN              INTEGER,
  dest_offset   IN OUT         INTEGER,
  src_offset    IN OUT         INTEGER,
  bfile_csids  IN              NUMBER,
  lang_context  IN OUT         INTEGER,
  warning       OUT             INTEGER);
```

Parameters

Table 52-43 *LOADCLOBFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	CLOB/NCLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. Use DBMS_LOB.LOBBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
bfile_csids	Character set id of the source (BFILE) file.
lang_context	(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call

Table 52–43 (Cont.) LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined as warn_inconvertible_char in DBMSLOB.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- `csid=0` indicates the default behavior that uses database `csid` for CLOB and national `csid` for NCLOB in the place of source `csid`. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Constants

Here is a summary of the constants and the suggested values that can be used.

Table 52–44 Suggested Values of the Parameter

Parameter	Suggested Value	Description
amount	DBMSLOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Table 52–44 (Cont.) Suggested Values of the Parameter

Parameter	Suggested Value	Description
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

lobmaxsize	CONSTANT INTEGER	:= 18446744073709551615;
warn_inconvertible_char	CONSTANT INTEGER	:= 1;
default_csid	CONSTANT INTEGER	:= 0;
default_lang_ctx	CONSTANT INTEGER	:= 0;
no_warning	CONSTANT INTEGER	:= 0;

Exceptions

Table 52–45 LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Syntax

```
DBMS_LOB.LOADFROMFILE (
  dest_lob    IN OUT NOCOPY BLOB,
  src_file    IN          BFILE,
  amount      IN          INTEGER,
  dest_offset IN          INTEGER := 1,
  src_offset  IN          INTEGER := 1);
```

Parameters

Table 52–46 *LOADFROMFILE Procedure Parameters*

Parameter	Description
<code>dest_lob</code>	LOB locator of the target for the load.
<code>src_file</code>	BFILE locator of the source for the load.
<code>amount</code>	Number of bytes to load from the BFILE.
<code>dest_offset</code>	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
<code>src_offset</code>	Offset in bytes in the source BFILE (origin: 1) for the start of the load.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is either in bytes or characters for BLOBs and CLOBs respectively.

Note: The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

Note: If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using `DBMS_LOB.LOADFROMFILE`, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use `sql*loader` instead of `LOADFROMFILE` to load data into a CLOB or NCLOB because `sql*loader` will provide the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Exceptions

Table 52–47 *LOADFROMFILE Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - <code>src_offset</code> or <code>dest_offset</code> < 1. - <code>src_offset</code> or <code>dest_offset</code> > LOBMAXSIZE. - <code>amount</code> < 1. - <code>amount</code> > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```
DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY BLOB,
  open_mode IN           BINARY_INTEGER);

DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  open_mode IN           BINARY_INTEGER);

DBMS_LOB.OPEN (
  file_loc IN OUT NOCOPY BFILE,
  open_mode IN           BINARY_INTEGER := file_readonly);
```

Parameters

Table 52–48 OPEN Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

Usage Notes

Note: If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILES), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close APIs. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and nonLOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input `offset` points past the End of LOB, then amount is set to 0, and a `NO_DATA_FOUND` exception is raised.

Syntax

```
DBMS_LOB.READ (
  lob_loc   IN          BLOB,
  amount    IN OUT NOCOPY BINARY_INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          RAW);
```

```
DBMS_LOB.READ (
  lob_loc   IN          CLOB CHARACTER SET ANY_CS,
  amount    IN OUT NOCOPY BINARY_INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

```
DBMS_LOB.READ (
  file_loc  IN          BFILE,
  amount    IN OUT NOCOPY BINARY_INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          RAW);
```

Parameters

Table 52–49 READ Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be read. For more information, see Operational Notes .
<code>file_loc</code>	The file locator for the LOB to be examined.
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
<code>buffer</code>	Output buffer for the read operation.

Exceptions

[Table 52–50](#) lists exceptions that apply to any LOB instance. [Table 52–51](#) lists exceptions that apply only to BFILEs.

Table 52–50 READ Procedure Exceptions

Exception	Description
<code>VALUE_ERROR</code>	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL.

Table 52–50 (Cont.) READ Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE - amount is greater, in bytes or characters, than the capacity of buffer.
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.

Table 52–51 READ Procedure Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than $(32767/n)$, then SUBSTR returns a character buffer of length $(32767/n)$, or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, n is the maximum byte-width used for characters in the CLOB.

Syntax

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      BLOB,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;

DBMS_LOB.SUBSTR (
  lob_loc      IN      CLOB CHARACTER SET ANY_CS,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR (
  file_loc     IN      BFILE,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–52 SUBSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes .
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

Return Values

Table 52–53 SUBSTR Function Return Values

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.

Table 52–53 (Cont.) SUBSTR Function Return Values

Return	Description
NULL	Either: <ul style="list-style-type: none"> - any input parameter is NULL - amount < 1 - amount > 32767 - offset < 1 - offset > LOBMAXSIZE

Exceptions

Table 52–54 SUBSTR Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the `newlen` parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

Note: The TRIM procedure decreases the length of the LOB to the value specified in the `newlen` parameter.

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in `newlen` is greater than the size of the LOB, then an exception is raised.

Syntax

```
DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY BLOB,
  newlen       IN          INTEGER);

DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  newlen       IN          INTEGER);
```

Parameters

Table 52–55 TRIM Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes .
<code>newlen</code>	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

Exceptions

Table 52–56 TRIM Procedure Exceptions

Exception	Description
VALUE_ERROR	<code>lob_loc</code> is NULL.
INVALID_ARGVAL	Either: - <code>new_len</code> < 0 - <code>new_len</code> > LOBMAXSIZE

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- ["ERASE Procedures"](#) on page 52-31
- ["WRITEAPPEND Procedures"](#) on page 52-64
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the `buffer` parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY BLOB,
  amount   IN             BINARY_INTEGER,
  offset   IN             INTEGER,
  buffer   IN             RAW);

DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY CLOB  CHARACTER SET ANY_CS,
  amount   IN             BINARY_INTEGER,
  offset   IN             INTEGER,
  buffer   IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 52–57 WRITE Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see Operational Notes .
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write, or number that were written.
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
<code>buffer</code>	Input buffer for the write.

Exceptions

Table 52–58 WRITE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - <code>amount</code> < 1 - <code>amount</code> > MAXBUFSIZE - <code>offset</code> < 1 - <code>offset</code> > LOBMAXSIZE

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data

currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITE from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- ["COPY Procedures"](#) on page 52-28
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the `buffer` parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY BLOB,
  amount  IN           BINARY_INTEGER,
  buffer  IN           RAW);

DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount  IN           BINARY_INTEGER,
  buffer  IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 52–59 *WRITEAPPEND Procedure Parameters*

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see Operational Notes .
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write, or number that were written.
<code>buffer</code>	Input buffer for the write.

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 52–60 *WRITEAPPEND Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - <code>amount</code> < 1 - <code>amount</code> > MAXBUFSIZE

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITEAPPEND from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set.

The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

The `DBMS_LOCK` package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

See Also: For more information, and an example of how to use the `DBMS_LOCK` package, see "About User Locks" in *Oracle Database Application Developer's Guide - Fundamentals*

This chapter contains the following topics:

- [Using DBMS_LOCK](#)
 - Overview
 - Security Model
 - Constants
 - Rules and Limits
 - Operational Notes
- [Summary of DBMS_LOCK Subprograms](#)

Using DBMS_LOCK

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Rules and Limits](#)
- [Operational Notes](#)

Overview

Some uses of user locks:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

Constants

The DBMS_LOCK package uses the constants shown in [Table 53-1](#).

Table 53-1 DBMS_LOCK Constants

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuLl	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	<ul style="list-style-type: none"> ■ Sub eXclusive ■ Row Exclusive Mode 	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	<ul style="list-style-type: none"> ■ Shared ■ Row Exclusive Mode ■ Intended Exclusive 	INTEGER	4	ULRSX	-
SSX_MODE	<ul style="list-style-type: none"> ■ Shared Sub eXclusive ■ Share Row Exclusive Mode 	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

Table 53–2 Lock Compatibility

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait constant integer := 32767;
```

The constant `maxwait` waits forever.

Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

DBMS_LOCK is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

Summary of DBMS_LOCK Subprograms

Table 53–3 *DBMS_LOCK Package Subprograms*

Subprogram	Description
ALLOCATE_UNIQUE Procedure on page 53-9	Allocates a unique lock ID to a named lock.
CONVERT Function on page 53-11	Converts a lock from one mode to another.
RELEASE Function on page 53-12	Releases a lock.
REQUEST Function on page 53-13	Requests a lock of a specific mode.
SLEEP Procedure on page 53-14	Puts a procedure to sleep for a specific time.

ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) given a lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
    lockname          IN  VARCHAR2,
    lockhandle        OUT VARCHAR2,
    expiration_secs   IN  INTEGER   DEFAULT 864000);
```

Parameters

Table 53–4 *ALLOCATE_UNIQUE Procedure Parameters*

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA\$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by <code>ALLOCATE_UNIQUE</code> . You can use this handle in subsequent calls to <code>REQUEST</code> , <code>CONVERT</code> , and <code>RELEASE</code> . A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by <code>ALLOCATE_UNIQUE</code> with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_secs	Number of seconds to wait after the last <code>ALLOCATE_UNIQUE</code> has been performed on a given lock, before permitting that lock to be deleted from the <code>DBMS_LOCK_ALLOCATED</code> table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to <code>ALLOCATE_UNIQUE</code> may delete expired locks to recover space.

Usage Notes

If you choose to identify locks by name, you can use `ALLOCATE_UNIQUE` to generate a unique lock identification number for these named locks.

The first session to call `ALLOCATE_UNIQUE` with a new lock name causes a unique lock ID to be generated and stored in the `dbms_lock_allocated` table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least `expiration_secs` (defaults to 10 days) past the last call to `ALLOCATE_UNIQUE` with the given lock name. After this time, the row in the `dbms_lock_allocated` table for this lock name may be deleted in order to recover space. `ALLOCATE_UNIQUE` performs a commit.

Note: Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a given name.

Exceptions

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog dbms_lock_allocated.

CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.CONVERT(
  id          IN INTEGER ||
  lockhandle  IN VARCHAR2,
  lockmode   IN INTEGER,
  timeout     IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;
```

Parameters

Table 53–5 CONVERT Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	New mode that you want to assign to the given lock. For the available modes and their associated integer identifiers, see Constants on page 53-5.
timeout	Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

Return Values

Table 53–6 CONVERT Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

RELEASE Function

This function explicitly releases a lock previously acquired using the `REQUEST` function. Locks are automatically released at the end of a session. `RELEASE` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

Syntax

```
DBMS_LOCK.RELEASE (  
    id          IN INTEGER)  
RETURN INTEGER;
```

```
DBMS_LOCK.RELEASE (  
    lockhandle IN VARCHAR2)  
RETURN INTEGER;
```

Parameters

Table 53–7 *RELEASE Function Parameter*

Parameter	Description
<code>id</code> or <code>lockhandle</code>	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change.

Return Values

Table 53–8 *RELEASE Function Return Values*

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by <code>id</code> or <code>lockhandle</code>
5	Illegal lock handle

REQUEST Function

This function requests a lock with a given mode. REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.REQUEST(
  id                IN  INTEGER ||
  lockhandle        IN  VARCHAR2,
  lockmode          IN  INTEGER DEFAULT X_MODE,
  timeout           IN  INTEGER DEFAULT MAXWAIT,
  release_on_commit IN  BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

The current default values, such as X_MODE and MAXWAIT, are defined in the DBMS_LOCK package specification.

Parameters

Table 53–9 REQUEST Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see Constants on page 53-5.
timeout	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).
release_on_commit	Set this parameter to TRUE to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

Return Values

Table 53–10 REQUEST Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by id or lockhandle
5	Illegal lock handle

SLEEP Procedure

This procedure suspends the session for a given period of time.

Syntax

```
DBMS_LOCK.SLEEP (  
    seconds IN NUMBER);
```

Parameters

Table 53–11 *SLEEP Procedure Parameters*

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

The DBMS_LOGMNR package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

Using DBMS_LOGMNR

This section contains the following topics, which relate to using the DBMS_LOGMNR package:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

See Also: [Chapter 55, "DBMS_LOGMNR_D"](#) for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR package.

Constants

The DBMS_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGMNR.NEW.

Table 54–1 describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 54–1 Constants for ADD_LOGFILE Options Flag

Constant	Description
NEW	Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
ADDFILE	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.

Table 54–2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

Table 54–2 Constants for START_LOGMNR Options Flag

Constant	Description
COMMITTED_DATA_ONLY	<p>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on).</p> <p>If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</p>
SKIP_CORRUPTION	<p>Directs a select operation on the V\$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V\$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.</p>
DDL_DICT_TRACKING	<p>If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open.</p> <p>This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.</p>

Table 54–2 (Cont.) Constants for START_LOGMNR Options Flag

Constant	Description
DICT_FROM_ONLINE_CATALOG	<p>Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed.</p> <p>This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files.</p> <p>Expect to see a value of 2 in the STATUS column of the V\$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.</p>
DICT_FROM_REDO_LOGS	<p>If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.</p>
NO_SQL_DELIMITER	<p>If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.</p>
NO_ROWID_IN_STMT	<p>If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled.</p> <p>When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.</p>
PRINT_PRETTY_SQL	<p>If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.</p>
CONTINUOUS_MINE	<p>Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled.</p> <p>Beginning with Oracle Database release 10.1, the CONTINUOUS_MINE options is supported for use in an Oracle Real Application Clusters environment.</p>

Views

The DBMS_LOGMNR package uses the views listed in the section on Accessing LogMiner Operational Information in Views in *Oracle Database Utilities*.

Operational Notes

A **LogMiner session** begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue `SQL SELECT` statements against the `V$logmnr_contents` view to retrieve the data of interest.

Summary of DBMS_LOGMNR Subprograms

Table 54–3 DBMS_LOGMNR Package Subprograms

Subprogram	Description
ADD_LOGFILE Procedure on page 54-10	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
COLUMN_PRESENT Function on page 54-12	Call this function for any row returned from the V\$LOGMNR_CONTENTS view to determine if undo or redo column values exist for the column specified by the <code>column_name</code> input parameter to this function
END_LOGMNR Procedure on page 54-14	Finishes a LogMiner session
MINE_VALUE Function on page 54-15	Call this function for any row returned from the V\$LOGMNR_CONTENTS view to retrieve the undo or redo column value of the column specified by the <code>column_name</code> input parameter to this function
REMOVE_LOGFILE Procedure on page 54-17	Removes a redo log file from the list of redo log files for LogMiner to process
START_LOGMNR Procedure on page 54-18	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to <code>DBMS_LOGMNR.ADD_LOGFILE</code>)

ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
  LogFileName      IN VARCHAR2,
  options          IN BINARY_INTEGER default ADDFILE );
```

Parameters

Table 54–4 ADD_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: <ul style="list-style-type: none"> ■ Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW) ■ Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE) See Table 54–1, "Constants for ADD_LOGFILE Options Flag" .

Exceptions

Table 54–5 ADD_LOGFILE Procedure Exceptions

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

Usage Notes

- Before querying the V\$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

COLUMN_PRESENT Function

This function is designed to be used in conjunction with the `MINE_VALUE` function.

If the `MINE_VALUE` function returns a `NULL` value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a `NULL` value.

To distinguish between these two cases, use the `COLUMN_PRESENT` function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN NUMBER;
```

Parameters

Table 54–6 *COLUMN_PRESENT Function Parameters*

Parameter	Description
<code>sql_redo_undo</code>	Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$logmnr_contents</code> view from which to extract data values. See the Usage Notes for more information.
<code>column_name</code>	Specifies the fully qualified name (<code>schema.table.column</code>) of the column for which this function will return information.

Return Values

[Table 54–7](#) describes the return values for the `COLUMN_PRESENT` function. The `COLUMN_PRESENT` function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of `NULL` values returned by the `DBMS_LOGMNR.MINE_VALUE` function.

Table 54–7 *Return Values for COLUMN_PRESENT Function*

Return	Description
0	Specified column is not present in this row of <code>V\$logmnr_contents</code> .
1	Column is present in this row of <code>V\$logmnr_contents</code> .

Exceptions

Table 54–8 *COLUMN_PRESENT Function Exceptions*

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the <code>column_name</code> parameter is not a fully qualified column name.

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V\$logmnr_contents view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
 - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
 - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
 - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be NULL).
 - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be NULL).

END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

Table 54–9 *END_LOGMNR Procedure Exception*

Exception	Description
ORA-01307	No LogMiner session is currently active. The <code>END_LOGMNR</code> procedure was called without adding any log files or before the <code>START_LOGMNR</code> procedure was called

MINE_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```
DBMS_LOGMNR.MINE_VALUE (
    sql_redo_undo    IN RAW,
    column_name      IN VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

Table 54–10 MINE_VALUE Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V\$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 54–11 Return Values for MINE_VALUE Function

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

Exceptions

Table 54–12 MINE_VALUE Function Exceptions

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
- The MINE_VALUE function must be invoked in the context of a select operation from the V\$LOGMNR_CONTENTS view.

- The MINE_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:
 - If an update operation was performed and you want to know what the value was prior to the update operation, specify `UNDO_VALUE`.
 - If an update operation was performed and you want to know what the value is after the update operation, specify `REDO_VALUE`.
 - If an insert operation was performed, typically you would specify `REDO_VALUE` (because the value of a column prior to an insert operation will always be null).
 - If a delete operation was performed, typically you would specify `UNDO_VALUE` (because the value of a column after a delete operation will always be null).

REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

Note: This procedure replaces the REMOVEFILE constant that was an option on the ADD_LOGFILE procedure prior to Oracle Database 10g.

Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
    LogFileName      IN VARCHAR2);
```

Parameters

Table 54–13 REMOVE_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

Exceptions

Table 54–14 REMOVE_LOGFILE Procedure Exception

Exception	Description
ORA-01290	Cannot remove unlisted log file

Usage Notes

- Before querying the V\$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
  startScn          IN NUMBER default 0,
  endScn            IN NUMBER default 0,
  startTime         IN DATE default '01-jan-1988',
  endTime          IN DATE default '31-dec-2110',
  DictFileName     IN VARCHAR2 default '',
  Options          IN BINARY_INTEGER default 0 );
```

Parameters

Table 54–15 START_LOGMNR Procedure Parameters

Parameter	Description
startScn	Directs LogMiner to return only redo records with an SCN greater than or equal to the <code>startScn</code> specified. This fails if there is no redo log file containing the specified <code>startScn</code> value. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
endScn	Directs LogMiner to return only redo records with an SCN less than or equal to the <code>endScn</code> specified. If you specify an <code>endScn</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endScn</code> value in the redo log file that contains the most recent changes. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
startTime	Directs LogMiner to return only redo records with a timestamp greater than or equal to the <code>startTime</code> specified. This fails if there is no redo log file containing the specified <code>startTime</code> value. (You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>startScn</code> is specified. See the Usage Notes for additional information.
endTime	Directs LogMiner to return only redo records with a timestamp less than or equal to the <code>endTime</code> specified. If you specify an <code>endTime</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endTime</code> in the redo log file that contains the most recent changes. You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>endScn</code> is specified. See the Usage Notes for additional information.

Table 54–15 (Cont.) START_LOGMNR Procedure Parameters

Parameter	Description
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct SQL_REDO and SQL_UNDO columns in V\$LOGMNR_CONTENTS, as well as to fully translate SEG_NAME, SEG_OWNER, SEG_TYPE_NAME, TABLE_NAME, and TABLE_SPACE columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither DICT_FROM_REDO_LOGS nor DICT_FROM_ONLINE_CATALOG is specified.
options	See Table 54–2, "Constants for START_LOGMNR Options Flag" .

Exceptions

Table 54–16 START_LOGMNR Procedure Exceptions

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.
ORA-01282	value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See *Oracle Database Utilities* and

Chapter 55, "DBMS_LOGMNR_D" in this manual for more information about the LogMiner dictionary.

- After executing the `START_LOGMNR` procedure, you can query the following views:
 - `V$LOGMNR_CONTENTS` - contains history of information in redo log files
 - `V$LOGMNR_DICTIONARY` - contains current information about the LogMiner dictionary file extracted to a flat file
 - `V$LOGMNR_PARAMETERS` - contains information about the LogMiner session(You can query the `V$LOGMNR_LOGS` view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to `DBMS_LOGMNR.START_LOGMNR`. You must specify all desired parameters and options (including SCN and time ranges) each time you call `DBMS_LOGMNR.START_LOGMNR`
- Be aware that specifying redo log files using a timestamp is not precise.
- The `CONTINUOUS_MINE` option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the `CONTINUOUS_MINE` option:
 - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the `V$ARCHIVED_LOGS` view to determine which redo log file entries will be found by LogMiner.

Even if an entry is listed in the database control file (and the `V$ARCHIVED_LOGS` view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be available.
 - If you specify the `CONTINUOUS_MINE` option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the `V$LOGMNR_CONTENTS` view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.
 - LogMiner can mine online redo logs. However, if the `CONTINUOUS_MINE` option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:

- If you specify neither a `startTime` nor a `startScn` parameter, LogMiner will set the `startScn` parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
- If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
- If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
- If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` without the `CONTINUOUS_MINE` option, and you specify:
 - * 0 for the `startTime` or `startScn` value, then the lowest SCN in the LogMiner redo log file list will be used as the `startScn`
 - * A nonzero number for the `startTime` or `startScn` value, then an error is returned
 - * 0 or a nonzero number for the `endTime` or `endScn` value, then the highest SCN in the LogMiner redo log file list will be used as the `endScn`
- If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` with the `CONTINUOUS_MINE` option, and you specify:
 - * 0 for the `startTime` or `startScn` value, then an error is returned.
 - * A `startTime` or `startScn` value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the `V$LOGMNR_CONTENTS` view.
 - * An `endTime` or `endScn` parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
 - * 0 for the `endTime` or `endScn` parameter value, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until you enter `CTL+C` or you terminate the PL/SQL cursor.

DBMS_LOGMNR_D

The DBMS_LOGMNR_D package, one of a set of LogMiner packages, contains two subprograms:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- [Using DBMS_LOGMNR_D](#)
 - Overview
 - Security Model
- [Summary of DBMS_LOGMNR_D Subprograms](#)

Using DBMS_LOGMNR_D

This section contains the following topics, which relate to using the DBMS_LOGMNR_D package:

- [Overview](#)
- [Security Model](#)

Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you. LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

See Also: [DBMS_LOGMNR](#) for information on the package subprograms used in running a LogMiner session.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR_D package.

Summary of DBMS_LOGMNR_D Subprograms

Table 55-1 DBMS_LOGMNR_D Package Subprograms

Subprogram	Description
BUILD Procedure on page 55-6	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
SET_TABLESPACE Procedure on page 55-9	Re-creates all LogMiner tables in an alternate tablespace

BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

Syntax

```
DBMS_LOGMNR_D.BUILD (
    dictionary_filename IN VARCHAR2,
    dictionary_location IN VARCHAR2,
    options              IN NUMBER);
```

Parameters

Table 55–2 BUILD Procedure Parameters

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the path to the LogMiner dictionary file directory.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

Exceptions

Table 55–3 BUILD Procedure Exceptions

Exception	Description
ora-01302	Dictionary build options are missing or incorrect. This error is returned under the following conditions: <ul style="list-style-type: none"> ■ If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified ■ If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified ■ If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified
ora-01308	Initialization parameter UTL_FILE_DIR is not set.
ora-01336	Specified dictionary file cannot be opened. This error is returned under the following conditions: <ul style="list-style-type: none"> ■ The specified value for the dictionary_location does not exist. ■ The UTL_FILE_DIR initialization parameter is not set to have access to the dictionary_location ■ The dictionary file is read-only.

Usage Notes

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the `STORE_IN_REDO_LOGS` option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the `STORE_IN_FLAT_FILE` option, the LogMiner dictionary is extracted to a flat file with the specified name.
- If you do not specify a filename and location, but do specify the `STORE_IN_REDO_LOGS` option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the `STORE_IN_REDO_LOGS` option, an error is returned.
- If you do not specify a filename and location, but do specify the `STORE_IN_FLAT_FILE` option, an error is returned.
- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9i release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- Do not run the `DBMS_LOGMNR_D.BUILD` procedure if there are any ongoing DDL operations.
- The database must be open when you run the `DBMS_LOGMNR_D.BUILD` procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:
 - You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter `UTL_FILE_DIR` in the initialization parameter file. For example:

```
UTL_FILE_DIR = /oracle/dictionary
```

After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.
 - You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

Be aware that the `DDL_DICT_TRACKING` option to the `DBMS_LOGMNR.START_LOGMNR` procedure is not supported for flat file dictionaries created prior to Oracle9i. If you attempt to use the `DDL_DICT_TRACKING` option with a LogMiner database extracted to a flat file prior to Oracle9i, the ORA-01330 error (problem loading a required build table) is returned.

- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The `DBMS_LOGMNR_D.BUILD` procedure must be run on a system that is running Oracle9i or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The `COMPATIBLE` parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers. See *Oracle Database Utilities* for information about using supplemental logging with LogMiner.

Examples

Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named `dictionary.ora` in a specified path (`/oracle/database`).

```
SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', -  
    '/oracle/database/', -  
    options => dbms_logmnr_d.store_in_flat_file);
```

Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -  
    options => dbms_logmnr_d.store_in_redo_logs);
```

SET_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYS_AUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (
    new_tablespace      IN VARCHAR2);
```

Parameters

Table 55–4 SET_TABLESPACE Parameter

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET_TABLESPACE procedure to move the tables to the SYS_AUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

See Also: *Oracle Database Concepts* and *Oracle Database SQL Reference* for information about tablespaces and how to create them

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS_LOGMNR_D.SET_TABLESPACE procedure.

```
SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
      SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

DBMS_LOGSTDBY

The DBMS_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

See Also: *Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

This chapter contains the following topics:

- [Using DBMS_LOGSTDBY](#)
 - Overview
 - Operational Notes
 - Deprecated Subprograms
- [Summary of DBMS_LOGSTDBY Subprograms](#)

Using DBMS_LOGSTDBY

This section contains topics which relate to using the DBMS_LOGSTDBY package.

- [Overview](#)
- [Operational Notes](#)
- [Deprecated Subprograms](#)

Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The subprograms in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.
For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

Operational Notes

Case Sensitivity

Ensure you use the correct case when supplying schema and table names to the DBMS_LOGSTDBY package. For example, the following statements show incorrect and correct syntax for a SKIP procedure that skips changes to OE.TEST.

Incorrect statement:

```
EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'DML', schema_name => 'oe', -  
    object_name => 'test', proc_name => null);
```

Because the names are specified with lowercase characters, the transactions that update these columns will still be applied to the logical standby database.

Correct statement:

```
EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'DML', schema_name => 'OE', -  
    object_name => 'TEST', proc_name => null);
```

Privileges and Security

A prototype role, LOGSTDBY_ADMINISTRATOR, is created by default with RESOURCE, and EXECUTE on DBMS_LOGSTDBY privileges. If you choose to use this role, consider granting ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard. Oracle recommends using an account with DBA privileges to perform administration tasks on logical standby databases.

The six procedures associated with skipping transactions (SKIP and UNSKIP, SKIP_ERROR and UNSKIP_ERROR, and SKIP_TRANSACTION and UNSKIP_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

Deprecated Subprograms

The `transaction_consistency` parameter of the [APPLY_SET Procedure](#) is being deprecated with this release of the Oracle Database. The `transaction_consistency` parameter is being replaced by the `preserve_commit_order` parameter.

Summary of DBMS_LOGSTDBY Subprograms

Table 56–1 DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
APPLY_SET Procedure on page 56-7	Sets the values of various parameters that configure and maintain SQL Apply
APPLY_UNSET Procedure on page 56-9	Restores the default values of various parameters that configure and maintain SQL Apply
BUILD Procedure on page 56-10	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary
INSTANTIATE_TABLE Procedure on page 56-11	Creates and populates a table in the standby database from a corresponding table in the primary database
PREPARE_FOR_NEW_PRIMARY Procedure on page 56-12	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
PURGE_SESSION Procedure on page 56-14	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
REBUILD Procedure on page 56-15	Records relevant metadata (including the LogMiner Multiversioned Data Dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
SET_TABLESPACE Procedure on page 56-16	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the SYS_AUX tablespace.
SKIP Procedure on page 56-17	Specifies rules that control database operations that should not be applied to the logical standby database
SKIP_ERROR Procedure on page 56-24	Specifies rules regarding what action to take upon encountering errors
SKIP_TRANSACTION Procedure on page 56-28	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
UNSKIP Procedure on page 56-30	Deletes rules specified by the SKIP procedure
UNSKIP_ERROR Procedure on page 56-32	Deletes rules specified by the SKIP_ERROR procedure
UNSKIP_TRANSACTION Procedure on page 56-34	Deletes rules specified by the SKIP_TRANSACTION procedure

APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. SQL Apply cannot be running when you use this procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
    parameter    IN VARCHAR,
    value        IN VARCHAR);
```

Parameters

Table 56–2 APPLY_SET Procedure Parameters

Parameter	Description
LOG_AUTO_DELETE	Automatically deletes archived redo log files once they have been applied on the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files, and FALSE to disable automatic deletion. The default value is TRUE.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower.
MAX_SERVERS	Number of parallel query servers that SQL Apply uses to read and apply redo. It defaults to the value of the PARALLEL_MAX_SERVERS initialization parameter or 9, whichever is lower.
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value.
PRESERVE_COMMIT_ORDER	TRUE: Transaction are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting. FALSE: Transactions are applied out of order from how they were committed on the primary database, and no attempt is made to provide read-consistent results. Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened in the primary database. See the Usage Notes for details and recommendations.
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. Specify one of the following values: TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.

Table 56–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
RECORD_SKIP_DDL	Controls whether skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. Specify one of the following values: TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_APPLIED_DDL	Controls whether DDL statements that have been applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. Specify one of the following values: TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.
APPLY_SERVERS	Controls the number of APPLIER processes (parallel execution servers) used to apply changes
PREPARE_SERVERS	Controls the number of PREPARER processes (parallel execution servers) used to prepare changes

Exceptions

Table 56–3 APPLY_SET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- SQL Apply must be stopped before calling the APPLY_SET procedure.
- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

Examples

To record DDLs in the DBA_LOGSTDBY_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

APPLY_UNSET Procedure

Use the `APPLY_UNSET` procedure to restore the default values of the parameters that you changed with the `APPLY_SET` procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
    parameter          IN VARCHAR);
```

Parameters

The parameter information for the `APPLY_UNSET` procedure is the same as that described for the `APPLY_SET` procedure. See [Table 56–2](#) for complete parameter information.

Exceptions

Table 56–4 *APPLY_UNSET Procedure Exceptions*

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- SQL Apply must be stopped before calling the `APPLY_UNSET` procedure.
- Use the `APPLY_SET` procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the `DBA_LOGSTDBY_EVENTS` view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use `DBMS_LOGSTDBY.BUILD` for each RAC instance.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    dblink           IN VARCHAR2);
```

Parameters

Table 56–5 INSTANTIATE_TABLE Procedure Parameters

Parameter	Description
<code>schema_name</code>	Name of the schema
<code>table_name</code>	Name of the table to be created or re-created in the standby database
<code>dblink</code>	Name of the database link account that has privileges to read and lock the table in the primary database

Exceptions

Table 56–6 INSTANTIATE_TABLE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until the redo log that was current on the primary database at the time of execution is applied to the standby database.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
    SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
    DBLINK => 'INSTANTIATE_TBL_LINK');
```

PREPARE_FOR_NEW_PRIMARY Procedure

The `PREPARE_FOR_NEW_PRIMARY` procedure must be invoked at a logical standby database following a failover if that standby database was not the target of the failover operation. Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the `alert.log`. These logs must be copied to the logical standby and registered using the `ALTER DATABASE REGISTER LOGICAL LOGFILE` statement.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
    FORMER_STANDBY_TYPE    IN VARCHAR2,
    DBLINK                 IN VARCHAR2);
```

Parameters

Table 56–7 *PREPARE_FOR_NEW_PRIMARY Procedure Parameters*

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

Exceptions

Table 56–8 *PREPARE_FOR_NEW_PRIMARY Procedure Exceptions*

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

Usage Notes

- This routine is intended only for logical standby systems.
- This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully.
- Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally.
- Upon manual registration of the terminal logs, users should complete the process by calling either `START LOGICAL STANDBY APPLY` if the new primary database was formerly a physical standby database or `START LOGICAL STANDBY APPLY NEW PRIMARY` if the new primary database was formerly a logical standby database.
- See the alert log for more details regarding the reasons for any exception.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY ( -  
        FORMER_STANDBY_TYPE => 'LOGICAL',      -  
        DBLINK => 'dblink_to_newprimary');
```

PURGE_SESSION Procedure

Identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply. Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

Exceptions

Table 56–9 PURGE_SESSION Procedure Exceptions

Exception	Description
ORA-01309	Invalid session

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the `DBA_LOGMNR_PURGED_LOG` view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10g Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the `LOG_AUTO_DELETE` parameter described in the `DBMS_LOGSTDBY.APPLY_SET` procedure described on page 56-7.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the `DBA_LOGMNR_PURGED_LOG` view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;
```

```
FILE_NAME
-----
/boston/arc_dest/arc_1_40_509538672.log
/boston/arc_dest/arc_1_41_509538672.log
/boston/arc_dest/arc_1_42_509538672.log
/boston/arc_dest/arc_1_43_509538672.log
/boston/arc_dest/arc_1_44_509538672.log
/boston/arc_dest/arc_1_45_509538672.log
/boston/arc_dest/arc_1_46_509538672.log
/boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner Multiversioned Data Dictionary) in the redo stream required for other logical standby databases.

Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

Usage Notes

- LogMiner Multiversioned Data Dictionary information is logged in the redo log files.
- The standby redo log files (if present) are archived.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

SET_TABLESPACE Procedure

Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the SYSAUX tablespace.

Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(  
    NEW_TABLESPACE IN VARCHAR2)
```

Parameters

Table 56–10 SET_TABLESPACE Procedure Parameters

Parameter	Description
NEW_TABLESPACE	Name of the new tablespace where metadata tables will reside.

Exceptions

Table 56–11 SET_TABLESPACE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress

Examples

To move metadata tables to a new tablespace named LOGSTDBY_TBS, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

SKIP Procedure

The `SKIP` procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database. For example, the `SKIP` procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Syntax

```
DBMS_LOGSTDBY.SKIP (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL,
    proc_name           IN VARCHAR2 DEFAULT NULL,
    use_like             IN BOOLEAN DEFAULT TRUE,
    esc                 IN CHAR1 DEFAULT NULL);
```

Parameters

Table 56–12 SKIP Procedure Parameters

Parameter	Description
<code>stmt</code>	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 56–13 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
<code>schema_name</code>	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> .
<code>object_name</code>	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> .

Table 56–12 (Cont.) SKIP Procedure Parameters

Parameter	Description
proc_name	<p>Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' "schema" . "package" . "procedure" '</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> ■ IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter ■ IN STATEMENT_TYPE VARCHAR2 -- The <code>stmt</code> of the filter ■ IN SCHEMA VARCHAR2 -- The <code>schema_name</code> of the filter, if applicable ■ IN NAME VARCHAR2 -- The <code>object_name</code> of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid values are: <ul style="list-style-type: none"> SKIP_ACTION_APPLY -- Execute the statement SKIP_ACTION_SKIP -- Skip the statement SKIP_ACTION_REPLACE -- Execute the replacement statement supplied in the <code>NEW_STATEMENT</code> output parameter
use_like	<p>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <i>Oracle Database SQL Reference</i>.</p>
esc	<p>Identifies an escape character (such as the character <code>/</code>) that you can use for pattern matching. If the escape character appears in the pattern before the character <code>"%"</code> or <code>"_"</code> then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Reference</i> for more information about pattern matching.</p>

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104:

```
invalid Logical Standby option requested error:
```

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
  stmt => 'DML', -
  schema_name => 'HR', -
  object_name => 'EMPLOYEES', -
  proc_name => 'DML_HANDLER');
```

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the `SCHEMA_DDL` event for the `HR.EMPLOYEES` table, and a rule for the `ALTER TABLE` event for the `HR.EMPLOYEES` table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'SCHEMA DDL', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'TABLE_ALTER_HANDLER');
```

On encountering an `ALTER TABLE` statement, the `schema_ddl_handler` procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement.

Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the `empddl_handler` procedure being invoked upon encountering the `ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER` statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMP%', -
      proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the `SKIP` procedure with caution, particularly when skipping DDL statements. If a `CREATE TABLE` statement is skipped, for example, you must also specify other DDL statements that refer to that table in the `SKIP` procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the `SKIP` procedure, SQL Apply must be halted. Do this by issuing an `ALTER DATABASE STOP LOGICAL STANDBY APPLY` statement. Once all desired filters have been specified, issue an `ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE` statement to start SQL Apply using the new filter settings.
- See the `UNSKIP` procedure on page 56-30 for information about reversing (undoing) the settings of the `SKIP` procedure.
- For `USER` statements, the `SCHEMA_NAME` parameter will be the user and specify '%' for the `OBJECT_NAME` parameter.
- If the `PROC_NAME` parameter is supplied, it must already exist in `DBA_PROCEDURES` and it must execute with `DEFINER` rights. If the procedure is declared with `INVOKER` rights, the `ORA-1031: insufficient privileges` message will be returned.

- If the procedure returns a REPLACEMENT statement, the REPLACEMENT statement will be executed using the SYSTEM and OBJECT privileges of the owner of the procedure.
- The PL/SQL block of a SKIP procedure cannot contain transaction control statements (for example, COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction.

Skip Statement Options

Table 56–13 lists the supported values for the `stmt` parameter of the SKIP procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. Any of the SQL statements in the right column, however, are also valid values. Note that keywords are generally defined by database object.

Table 56–13 Supported Values for the `stmt` Parameter

Keyword	Associated SQL Statements
NON_SCHEMA_DDL	<i>All DDL that does not pertain to a particular schema</i> Note: SCHEMA_NAME and OBJECT_NAME must be null
SCHEMA_DDL	<i>All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)</i> Note: SCHEMA_NAME and OBJECT_NAME must <i>not</i> be null
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY	CREATE DIRECTORY DROP DIRECTORY
INDEX	ALTER INDEX CREATE INDEX DROP INDEX

Table 56–13 (Cont.) Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
PROCEDURE ¹	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
TABLE	ALTER TABLE CREATE TABLE DROP TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE TRUNCATE TABLESPACE
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY

Table 56–13 (Cont.) Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW

¹ Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 56–14 DBMS_LOGSTDBY.SKIP Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret SKIP procedure return values." Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view.
ORA-16236	Logical standby metadata operation in progress.

Examples

Example 1 Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA DDL', -
    schema_name => 'HR', -
    table_name => '%', -
    proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
    schema_name => 'HR', -
    table_name => '%', -
    proc_name => null);
```

Example 2 Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a SKIP procedure to handle DDL statements with file specifications transparently.

The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the SKIP procedure to handle tablespace DDL statements:

```
CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl (
```

```
old_stmt IN VARCHAR2,
stmt_typ IN VARCHAR2,
schema   IN VARCHAR2,
name     IN VARCHAR2,
xidusn   IN NUMBER,
xidslt   IN NUMBER,
xidsqn   IN NUMBER,
action   OUT NUMBER,
new_stmt OUT VARCHAR2
) AS
BEGIN

-- All primary file specification that contains a directory
-- /usr/orcl/primary/dbs
-- should go to /usr/orcl/stdby directory specification

new_stmt = replace(old_stmt,
                   '/usr/orcl/primary/dbs',
                   '/usr/orcl/stdby');

action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;

EXCEPTION
  WHEN OTHERS THEN
    action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
    new_stmt := NULL;
END handle_tbs_ddl;
```

2. Register the SKIP procedure with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
                                proc_name => 'SYS.HANDLE_TBS_DDL');
```

SKIP_ERROR Procedure

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine if the error should cause SQL Apply to stop. All errors to be skipped are stored in system tables that describe how exceptions should be handled.

Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
    stmt          IN VARCHAR2,
    schema_name   IN VARCHAR2,
    object_name   IN VARCHAR2,
    proc_name     IN VARCHAR2,
    use_like      IN BOOLEAN,
    esc           IN CHAR1);
```

Parameters

Table 56–15 SKIP_ERROR Procedure Parameters

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 56–13 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.

Table 56–15 (Cont.) SKIP_ERROR Procedure Parameters

Parameter	Description
proc_name	<p>Name of a stored procedure to call when SQL Apply determines a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' "schema" . "package" . "procedure" '</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> ■ IN STATEMENT VARCHAR(4000) -- The first 4K of the statement ■ IN STATEMENT_TYPE VARCHAR2 -- The <code>stmt</code> of the filter ■ IN SCHEMA VARCHAR2 -- The <code>schema_name</code> of the filter, if applicable ■ IN NAME VARCHAR2 -- The <code>object_name</code> of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ IN ERROR VARCHAR(4000) -- Text of error to be recorded (optional) ■ OUT NEW_ERROR VARCHAR(4000) -- Null or modified error text
use_like	<p>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <i>Oracle Database SQL Reference</i>.</p>
esc	<p>Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Reference</i> for more information about pattern matching.</p>

Usage Notes

- A stored procedure provided to the `SKIP_ERROR` procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the `STATUS` column of the `DBA_LOGSTDBY_EVENTS` table. The `STATUS_CODE` column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the `NEW_ERROR` is written to the events table. To truly have no effect, set `NEW_ERROR` to `ERROR` in the procedure.
- If the stored procedure requires that a shutdown be avoided, then you must set `NEW_ERROR` to `NULL`.
- This procedure requires DBA privileges to execute.

- For USER statements, the SCHEMA_NAME parameter will be the user and you should specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is specified, it must already exist in DBA_PROCEDURES and it must execute with DEFINERS rights. If the procedure is declared with INVOKERS rights, the ORA-1031: insufficient privileges message will be returned.
- The PL/SQL block of a SKIP_ERROR procedure cannot contain transaction control statements (for example: COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

Exceptions

Table 56–16 SKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Examples

To skip errors on GRANT statements on SYS or HR schemas, define a procedure `handle_error_ddl` and register it. In the following example, assume that `handle_error_ddl` is a free-standing procedure in the SYS schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl (
  old_stmt   IN  VARCHAR2,
  stmt_type  IN  VARCHAR2,
  schema     IN  VARCHAR2,
  name       IN  VARCHAR2,
  xidusn     IN  NUMBER,
  xidslt     IN  NUMBER,
  xidsqn     IN  NUMBER,
  error      IN  VARCHAR2,
  new_stmt   OUT VARCHAR2
) AS

BEGIN
  -- Default to what we already have
  new_stmt := old_stmt;

  -- Ignore any GRANT errors on SYS or HR schemas
  IF INSTR(UPPER(old_stmt), 'GRANT') > 0
  THEN
    IF schema IS NULL
    OR (schema IS NOT NULL AND
       (UPPER(schema) = 'SYS' OR UPPER(schema) = 'HR' )
    THEN

```

```
        new_stmt := NULL;
        -- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
        -- code not shown here
    END IF;
END IF;

END handle_error_ddl;
/
```

2. Register the error handler with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
    statement => 'NON_SCHEMA_DDL', -
    schema_name => NULL, -
    object_name => NULL, -
    proc_name => 'SYS.HANDLE_ERROR_DDL');
```

SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
    XIDUSN          IN NUMBER,
    XIDSLT NUMBER   IN NUMBER,
    XIDSQN NUMBER   IN NUMBER);
```

Parameters

Table 56–17 SKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

CAUTION: **SKIP_TRANSACTION** is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the **V\$LOGMNR_CONTENTS** view and have taken compensating actions at the logical standby database. **SKIP_TRANSACTION** is not the appropriate procedure to invoke to skip DML changes to a table.

To skip a DML failure, use a **SKIP** procedure, such as **SKIP('DML', 'MySchema', 'MyFailed Table')**. Using the **SKIP_TRANSACTION** procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

- This procedure requires DBA privileges to execute.
- Use the **DBA_LOGSTDBY_SKIP_TRANSACTION** view to list the transactions that are going to be skipped by SQL Apply.
- Also, see the **ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION** statement in *Oracle Database SQL Reference*.

Exceptions

Table 56–18 *SKIP_TRANSACTION Procedure Exceptions*

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-  
      XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure. The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2,
    object_name         IN VARCHAR2);
```

Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See [Table 56–12](#) on page 56-17 for complete parameter information.

Exceptions

Table 56–19 UNSKIP Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

CAUTION: If DML changes for a table have been skipped and not compensated for, you must follow the call to the UNSKIP procedure with a call to the **INSTANTIATE_TABLE** procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the UNSKIP procedure, and you will need a distinct UNSKIP procedure call to delete each rule that was previously specified.

For example, assume you have specified the following two rules to skip applying DML statements to the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => null);
```

In the following example, the wildcard in the `TABLE_NAME` parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML', -  
    SCHEMA_NAME => 'HR', -  
    OBJECT_NAME => 'EMP%');
```

In fact, this `UNSKIP` procedure matches neither of the rules, because the wildcard character in the `TABLE_NAME` parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding `SKIP` rule.

UNSKIP_ERROR Procedure

Use the UNSKIP_ERROR procedure to delete rules specified earlier with the SKIP_ERROR procedure. The parameters specified in the UNSKIP_ERROR procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
    stmt           IN VARCHAR2,
    schema_name    IN VARCHAR2,
    object_name    IN VARCHAR2);
```

Parameters

The parameter information for the UNSKIP_ERROR procedure is the same as that described for the SKIP_ERROR procedure. See [Table 56–15](#) for complete parameter information.

Exceptions

Table 56–20 UNSKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP_ERROR procedure, and you need a distinct UNSKIP_ERROR procedure call to delete each rule that you previously specified.

For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => 'hr_tempemp_handler');
```

In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT_NAME parameter will not be expanded.

Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -  
    statement => 'NON_SCHEMA_DDL', -  
    schema_name => NULL, -  
    object_name => NULL);
```

UNSKIP_TRANSACTION Procedure

Use the UNSKIP_TRANSACTION procedure to delete rules specified earlier with the SKIP_TRANSACTION procedure. The parameters specified in the UNSKIP_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
    XIDUSN          NUMBER,
    XIDSLT          NUMBER,
    XIDSQN          NUMBER);
```

Parameters

Table 56–21 UNSKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

Exceptions

Table 56–22 UNSKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

DBMS_METADATA

The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

See Also: *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- [Using DBMS_METADATA](#)
 - Overview
 - Security Model
 - Rules and Limits
- [Data Structures - Object and Table Types](#)
- [Subprogram Groupings](#)
 - Subprograms for Retrieving Multiple Objects From the Database
 - Subprograms for Submitting XML to the Database
- [Summary of All DBMS_METADATA Subprograms](#)

Using DBMS_METADATA

This section contains topics which relate to using the DBMS_METADATA package.

- [Overview](#)
- [Security Model](#)
- [Rules and Limits](#)

Overview

You can use the DBMS_METADATA package to retrieve metadata and also to submit XML.

- [Retrieving Metadata](#)
- [Submitting XML](#)

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET_XML and GET_DDL return metadata for a single named object. The GET_DEPENDENT_XML, GET_DEPENDENT_DDL, GET_GRANTED_XML, and GET_GRANTED_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, SET_PARSE_ITEM, CONVERT, PUT, and CLOSE.

Security Model

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- SYS and users with `SELECT_CATALOG_ROLE` can see all objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program `invokers-rights`.

Rules and Limits

In an Oracle Shared Server (OSS) environment, the `DBMS_METADATA` package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the `MAX_SHARED_SERVERS` initialization parameter.

Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the following OBJECT and TABLE types.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (  
    item          VARCHAR2(30),  
    value         VARCHAR2(4000),  
    object_row    NUMBER )  
/  
  
CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;  
  
CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item  
/  
  
CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;  
  
CREATE TYPE sys.ku$_ddl AS OBJECT (  
    ddlText      CLOB,  
    parsedItem   sys.ku$_parsed_items )  
/  
  
CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;  
  
CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl  
/  
  
CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;  
  
CREATE TYPE sys.ku$_multi_ddl AS OBJECT (  
    object_row    NUMBER,  
    ddls         sys.ku$_ddls )  
/  
  
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;  
  
CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;  
/  
  
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR  
    sys.ku$_multi_ddls;  
  
CREATE TYPE sys.ku$_ErrorLine IS OBJECT (  
    errorNumber   NUMBER,  
    errorText     VARCHAR2(2000) )  
/  
  
CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;  
  
CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine  
/  
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;  
  
CREATE TYPE sys.ku$_SubmitResult AS OBJECT (  
    ddl          sys.ku$_ddl,  
    errorLines   sys.ku$_ErrorLines );  
/  

```

```
CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult  
/  
  
CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;
```

Subprogram Groupings

The `DBMS_METADATA` subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- [Table 57-1](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to retrieve multiple objects from a database.
- [Table 57-2](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to submit XML metadata to a database.

Subprograms for Retrieving Multiple Objects From the Database

Table 57-1 lists the subprograms used for retrieving multiple objects from the database.

Table 57-1 DBMS_METADATA Subprograms for Retrieving Multiple Objects

Subprogram	Description
ADD_TRANSFORM Function on page 57-12	Specifies a transform that <code>FETCH_XXX</code> applies to the XML representation of the retrieved objects
CLOSE Procedure on page 57-15	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
FETCH_XXX Functions and Procedures on page 57-18	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
GET_QUERY Function on page 57-25	Returns the text of the queries that are used by <code>FETCH_XXX</code>
GET_XXX Functions on page 57-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
OPEN Function on page 57-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
SET_COUNT Procedure on page 57-36	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_XXX</code> call
SET_FILTER Procedure on page 57-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 57-47	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 57-50	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

Subprograms for Submitting XML to the Database

Table 57–2 lists the subprograms used for submitting XML to the database.

Table 57–2 DBMS_METADATA Subprograms for Submitting XML

Subprogram	Description
ADD_TRANSFORM Function on page 57-12	Specifies a transform for the XML documents
CLOSE Procedure on page 57-15	Closes the context opened with <code>OPENW</code>
CONVERT Functions and Procedures on page 57-16	Converts an XML document to DDL
OPENW Function on page 57-33	Opens a write context
PUT Function on page 57-34	Submits an XML document to the database
SET_PARSE_ITEM Procedure on page 57-47	Specifies an object attribute to be parsed
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 57-50	<code>SET_TRANSFORM_PARAM</code> specifies a parameter to a transform <code>SET_REMAP_PARAM</code> specifies a remapping for a transform

Summary of All DBMS_METADATA Subprograms

Table 57-3 DBMS_METADATA Package Subprograms

Subprogram	Description
ADD_TRANSFORM Function on page 57-12	Specifies a transform that <code>FETCH_XXX</code> applies to the XML representation of the retrieved objects
CLOSE Procedure on page 57-15	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
CONVERT Functions and Procedures on page 57-16	Converts an XML document to DDL.
FETCH_XXX Functions and Procedures on page 57-18	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
GET_XXX Functions on page 57-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
GET_QUERY Function on page 57-25	Returns the text of the queries that are used by <code>FETCH_XXX</code>
OPEN Function on page 57-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
OPENW Function on page 57-33	Opens a write context
PUT Function on page 57-34	Submits an XML document to the database
SET_COUNT Procedure on page 57-36	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_XXX</code> call
SET_FILTER Procedure on page 57-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 57-47	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 57-50	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

ADD_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects.
- When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9
- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    encoding    IN VARCHAR2 DEFAULT NULL,
    object_type IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 57–4 ADD_TRANSFORM Function Parameters

Parameters	Description
handle	The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata.
name	The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See <i>Oracle XML DB Developer's Guide</i> . Otherwise, name designates a transform implemented by this project. The following transforms are defined: <ul style="list-style-type: none"> ■ <code>DDL</code> - the document is transformed to DDL that creates the object. The output of this transform is <i>not</i> an XML document. ■ <code>MODIFY</code> - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.
encoding	The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left <code>NULL</code> and the URL is external to the database, UTF-8 encoding is assumed. If left <code>NULL</code> and the URL is internal to the database (that is, it begins with <code>/oradb/</code>), then the encoding is assumed to be the database character set.

Table 57–4 (Cont.) ADD_TRANSFORM Function Parameters

Parameters	Description
object_type	<p>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</p> <ol style="list-style-type: none"> When you use ADD_TRANSFORM to retrieve objects, the following definition of object_type applies: <p>Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur:</p> <ul style="list-style-type: none"> if object_type is omitted, the transform applies to all object types within the heterogeneous collection if object_type is specified, the transform only applies to that specific object type within the collection <p>If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.</p> When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of the DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_XXX for the OPEN context. After the first call to FETCH_XXX is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:

- `encoding` is specified even though `name` is not a URL
- `object_type` is not part of the collection designated by `handle`

CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by `OPEN` (or `OPENW`) and cleans up the associated state.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9
- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

```
DBMS_METADATA.CLOSE (
    handle IN NUMBER);
```

Parameters

Table 57-5 *CLOSE Procedure Parameters*

Parameter	Description
handle	The handle returned from <code>OPEN</code> (or <code>OPENW</code>).

Usage Notes

Note: The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by `OPEN` or (`OPENW`).

- If a call to `FETCH_XXX` returns `NULL`, indicating no more objects, a call to `CLOSE` is made transparently. In this case, you can still call `CLOSE` on the handle and not get an exception. (The call to `CLOSE` is not required.)
- If you know that only one specific object will be returned, you should explicitly call `CLOSE` after the single `FETCH_XXX` call to free resources held by the handle.

Exceptions

- `INVALID_ARGVAL`. The value for the `handle` parameter is `NULL` or invalid.

CONVERT Functions and Procedures

The `CONVERT` functions and procedures transform input XML documents. The `CONVERT` functions return creation DDL. The `CONVERT` procedures return either XML or DDL, depending on the specified transforms.

See Also: For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

The `CONVERT` functions are as follows:

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN sys.XMLType)
RETURN sys.ku$_multi_ddls;
```

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN CLOB)
RETURN sys.ku$_multi_ddls;
```

The `CONVERT` procedures are as follows:

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN sys.XMLType,
    result IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN CLOB,
    result IN OUT NOCOPY CLOB);
```

Parameters

Table 57–6 *CONVERT Subprogram Parameters*

Parameter	Description
<code>handle</code>	The handle returned from <code>OPENW</code> .
<code>document</code>	The XML document containing object metadata of the type of the <code>OPENW</code> handle.
<code>result</code>	The converted document.

Return Values

DDL to create the object(s).

Usage Notes

You can think of `CONVERT` as the second half of `FETCH_XXX`, either `FETCH_DDL` (for the function variants) or `FETCH_CLOB` (for the procedure variants). There are two differences:

- `FETCH_xxx` gets its XML document from the database, but `CONVERT` gets its XML document from the caller
- `FETCH_DDL` returns its results in a `sys.ku$_ddls` nested table, but `CONVERT` returns a `sys.ku$_multi_ddls` nested table

The transforms specified with `ADD_TRANSFORM` are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the `parsedItems` column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in `OPENW`.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. No transform was specified. The DDL transform was not specified (function variants only).
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. See "Usage Notes" on page 57-19 for the variants.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9

Syntax

The FETCH functions are as follows:

```
DBMS_METADATA.FETCH_XML (
    handle IN NUMBER)
RETURN sys.XMLType;
```

See Also: *Oracle XML DB Developer's Guide* for a description of XMLType

```
DBMS_METADATA.FETCH_DDL (
    handle IN NUMBER)
RETURN sys.ku$_ddls;
```

```
DBMS_METADATA.FETCH_CLOB (
    handle          IN NUMBER,
    cache_lob       IN BOOLEAN DEFAULT TRUE,
    lob_duration    IN PLS_INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.FETCH_XML_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB,
    parsed_items OUT sys.ku$_parsed_items,
    object_type_path OUT VARCHAR2);
```

Parameters

Table 57–7 *FETCH_xxx Function Parameters*

Parameters	Description
handle	The handle returned from OPEN.
cache_lob	TRUE=read LOB into buffer cache
lob_duration	The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.
doc	The metadata for the objects, or NULL if all objects have been returned.

Table 57-7 (Cont.) FETCH_xxx Function Parameters

Parameters	Description
<code>parsed_items</code>	A nested table containing the items specified by <code>SET_PARSE_ITEM</code> . If <code>SET_PARSE_ITEM</code> was not called, a NULL is returned.
<code>object_type_path</code>	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to <code>FETCH_XXX</code> . If <code>handle</code> designates a homogeneous object type, a NULL is returned.

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to `OPEN` that returned the handle, and subsequent calls to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on. Each call to `FETCH_XXX` returns the number of objects specified by `SET_COUNT` (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to `FETCH_XXX` return NULL and cause the stream created by `OPEN` to be transparently closed.

There are several different `FETCH_XXX` functions and procedures:

- The `FETCH_XML` function returns the XML metadata for an object as an `XMLType`. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The `FETCH_DDL` function returns the DDL (to create the object) in a `sys.ku$_ddl$` nested table. It assumes that the DDL transform has been specified. Each row of the `sys.ku$_ddl$` nested table contains a single DDL statement in the `ddlText` column; if requested, parsed items for the DDL statement will be returned in the `parsedItems` column. Multiple DDL statements may be returned under the following circumstances:
 - When you call `SET_COUNT` to specify a count greater than 1
 - When an object is transformed into multiple DDL statements. For example, A `TYPE` object that has a DDL transform applied to it can be transformed into both `CREATE TYPE` and `CREATE TYPE BODY` statements. A `TABLE` object can be transformed into a `CREATE TABLE`, and one or more `ALTER TABLE` statements
- The `FETCH_CLOB` function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the `cache_lob` and `lob_duration` parameters.
- The `FETCH_CLOB` procedure returns the objects by reference in an `IN OUT NOCOPY` parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The `FETCH_XML_CLOB` procedure returns the XML metadata for the objects as a CLOB in an `IN OUT NOCOPY` parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by `FETCH_xxx` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.
- If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object's metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_ddl`s nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:
 - `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
 - `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
 - `object_row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_xxx`, (because `SET_COUNT` specified a count greater than 1) then `object_row=1` for all items for the first object, 2 for the second, and so on.
- The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be `NULL`.
- If `SET_PARSE_ITEM` was not called, `NULL` is returned as the value of the parsed items nested table.
- It is expected that the same variant of `FETCH_xxx` will be called for all objects selected by `OPEN`. That is, programs will not intermix calls to `FETCH_XML`, `FETCH_DDL`, `FETCH_CLOB`, and so on using the same `OPEN` handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the `FETCH_xxx` calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. Either `FETCH_XML` was called when the DDL transform had been specified, or `FETCH_DDL` was called when the DDL transform had *not* been specified.

GET_xxx Functions

The following GET_xxx functions let you fetch metadata for objects with a single call:

- GET_XML
- GET_DDL
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9

Syntax

```
DBMS_METADATA.GET_XML (
object_type      IN VARCHAR2,
name            IN VARCHAR2,
schema         IN VARCHAR2 DEFAULT NULL,
version        IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform      IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA.GET_DDL (
object_type      IN VARCHAR2,
name            IN VARCHAR2,
schema         IN VARCHAR2 DEFAULT NULL,
version        IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform      IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;
```

```
DBMS_METADATA.GET_DEPENDENT_XML (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version        IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform      IN VARCHAR2 DEFAULT NULL,
object_count   IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

```
DBMS_METADATA.GET_DEPENDENT_DDL (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version        IN VARCHAR2 DEFAULT 'COMPATIBLE',
model          IN VARCHAR2 DEFAULT 'ORACLE',
transform      IN VARCHAR2 DEFAULT 'DDL',
object_count   IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

```
DBMS_METADATA.GET_GRANTED_XML (
```

```

object_type      IN VARCHAR2,
grantee          IN VARCHAR2 DEFAULT NULL,
version          IN VARCHAR2 DEFAULT 'COMPATIBLE',
model            IN VARCHAR2 DEFAULT 'ORACLE',
transform        IN VARCHAR2 DEFAULT NULL,
object_count     IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

```

DBMS_METADATA.GET_GRANTED_DDL (
object_type      IN VARCHAR2,
grantee          IN VARCHAR2 DEFAULT NULL,
version          IN VARCHAR2 DEFAULT 'COMPATIBLE',
model            IN VARCHAR2 DEFAULT 'ORACLE',
transform        IN VARCHAR2 DEFAULT 'DDL',
object_count     IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

Parameters

Table 57–8 GET_xxx Function Parameters

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See Table 57–17 for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See SET_COUNT Procedure on page 57-36.

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML or DDL.
 - GET_XXX is used to fetch named objects, especially schema objects (tables, views).
 - GET_DEPENDENT_XXX is used to fetch dependent objects (audits, object grants).
 - GET_GRANTED_XXX is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET_XXX to fetch an index by name, or GET_DEPENDENT_XXX to fetch the same index by specifying the table on which it is defined.
- GET_XXX only returns a single named object.
- For GET_DEPENDENT_XXX and GET_GRANTED_XXX, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)
- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE', 'EMP', 'SCOTT')
FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET_TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
```

```
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM, 'STORAGE', false);
SELECT DBMS_METADATA.GET_DDL('TABLE', u.table_name)
      FROM USER_ALL_TABLES u
      WHERE u.nested='NO'
      AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM, 'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
      'EMPLOYEES', 'HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT', 'SCOTT')
      FROM DUAL;
```

GET_QUERY Function

This function returns the text of the queries that are used by `FETCH_XXX`. This function assists in debugging.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9

Syntax

```
DBMS_METADATA.GET_QUERY (
    handle IN NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 57-9 GET_QUERY Function Parameters

Parameter	Description
handle	The handle returned from <code>OPEN</code> . It cannot be the handle for a heterogeneous object type.

Return Values

The text of the queries that will be used by `FETCH_XXX`.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for the `handle` parameter.

OPEN Function

This function specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9

Syntax

```
DBMS_METADATA.OPEN (
  object_type IN VARCHAR2,
  version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model      IN VARCHAR2 DEFAULT 'ORACLE',
  network_link IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 57–10 Open Function Parameters

Parameter	Description
object_type	<p>The type of object to be retrieved. Table 57–11 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see model in this table).</p> <p>The Attributes column in Table 57–11 specifies some object type attributes:</p> <ul style="list-style-type: none"> ▪ Schema objects, such as tables, belong to schemas. ▪ Named objects have unique names (if they are schema objects, the name is unique to the schema). ▪ Dependent objects, such as indexes, are defined with reference to a base schema object. ▪ Granted objects are granted or assigned to a user or role and therefore have a named grantee. ▪ Heterogeneous object types denote a collection of related objects of different types. See Table 57–12 for a listing of object types returned for the heterogeneous object type. <p>These attributes are relevant when choosing object selection criteria. See "SET_FILTER Procedure" on page 57-37 for more information.</p>
version	<p>The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <p>COMPATIBLE (default)—the version of the metadata corresponds to the database compatibility level.</p> <p>LATEST—the version of the metadata corresponds to the database version.</p> <p>A specific database version, for example, 9.2.0. As of Oracle Database 10g, this value cannot be lower than 9.2.0.</p>

Table 57–10 (Cont.) Open Function Parameters

Parameter	Description
model	Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported as of Oracle Database 10g.
network_link	Reserved.

Table 57–11 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

Table 57–11 DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: <ul style="list-style-type: none"> ■ primary key constraint for IOT ■ column NOT NULL constraints ■ certain REF SCOPE and WITH ROWID constraints for tables with REF columns
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.
FUNCTION	stored functions	SN	None

Table 57–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None
MATERIALIZED_VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
OUTLINE	stored outlines	N	This type is being deprecated.
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See " SET_FILTER Procedure " on page 57-37.
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INITIAL_CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None

Table 57–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in CREATE PUBLIC SYNONYM FOO FOR BAR, the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table (<i>not</i> the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See " SET_FILTER Procedure " on page 57-37.
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.

Table 57–12 lists the types of objects returned for the major heterogeneous object types. For SCHEMA_EXPORT, certain object types are only returned if the INCLUDE_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE_USER.

Table 57–12 Object Types Returned for the Heterogeneous Object Type

Object Type	DATABASE_EXPORT	SCHEMA_EXPORT	TABLE_EXPORT	TRANSPORTABLE_EXPORT

TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

Return Values

An opaque handle to the class of objects. This handle is used as input to SET_FILTER, SET_COUNT, ADD_TRANSFORM, GET_QUERY, SET_PARSE_ITEM, FETCH_xxx, and CLOSE.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `version` or `model` parameter was not valid for the `object_type`.

OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

See Also: For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

```
DBMS_METADATA.OPENW
(object_type IN VARCHAR2,
version      IN VARCHAR2 DEFAULT 'COMPATIBLE',
model       IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

Parameters

Table 57–13 OPENW Function Parameters

Parameter	Description
object_type	The type of object to be submitted. Valid types names and their meanings are listed in Table 57–11 . The type cannot be a heterogeneous object type.
version	The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: <ul style="list-style-type: none"> ▪ COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher. ▪ LATEST - The version of the DDL corresponds to the database version. ▪ A specific database version. As of Oracle Database 10g, this value cannot be lower than 9.2.0.
model	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.

Return Values

An opaque handle to write context. This handle is used as input to the ADD_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The model parameter was not valid for the object_type.

PUT Function

This function submits an XML document containing object metadata to the database to create the object.

See Also: For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document    IN          sys.XMLType,
    flags       IN          NUMBER,
    results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

```
DBMS_METADATA.PUT (
    handle      IN          NUMBER,
    document    IN          CLOB,
    flags       IN          NUMBER,
    results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

Parameters

Table 57–14 PUT Function Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata for the type of the OPENW handle.
flags	Reserved for future use
results	Detailed results of the operation.

Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the `sys.ku$_SubmitResults` nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. The DDL transform was not specified.
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single `FETCH_XXX` call. By default, each call to `FETCH_XXX` returns one object. You can use the `SET_COUNT` procedure to override this default. If `FETCH_XXX` is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single `FETCH_XXX` operation only returns objects of a single object type.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9

Syntax

```
DBMS_METADATA.SET_COUNT (
    handle          IN NUMBER,
    value           IN NUMBER,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57–15 SET_COUNT Procedure Parameters

Parameter	Description
handle	The handle returned from <code>OPEN</code> .
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> ▪ if <code>object_type_path</code> is omitted, the count applies to all object types within the heterogeneous collection ▪ if <code>object_type_path</code> is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_COUNT` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first call to `FETCH_XXX` is made, no further calls to `SET_COUNT` for the current `OPEN` context are permitted.
- `INCONSISTENT_ARGS`. `object_type` parameter is not consistent with handle.

SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9

Syntax

```
DBMS_METADATA.SET_FILTER (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  value           IN VARCHAR2,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  value           IN BOOLEAN DEFAULT TRUE,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  value           IN NUMBER,
  object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57–16 SET_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
name	<p>The name of the filter. For each filter, Table 57–17 lists the <code>object_type</code> it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any).</p> <p>The Datatype column of Table 57–17 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (<i>not</i> a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows:</p> <pre>' IN ('DEPT' , 'EMP')'</pre> <p>The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.</p>
value	The value of the filter. Text, Boolean, and Numeric filters are supported.

Table 57–16 (Cont.) SET_FILTER Procedure Parameters

Parameter	Description
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 57–18 for a listing of some of the values for this parameter.

[Table 57–17](#) describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

Table 57–17 SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Named objects	NAME	text	Objects with this exact name are selected.
Named objects	NAME_EXPR	text expression	The filter value is combined with the object attribute corresponding to the object name to produce a WHERE condition in the query that fetches the objects. By default, all named objects of object_type are selected.
Named objects	EXCLUDE_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched. By default, all named objects of the object type are selected.
Schema objects	SCHEMA	text	Objects in this schema are selected. If the object type is SYNONYM, specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	text	Objects in this tablespace (or having a partition in this tablespace) are selected.

Table 57-17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in obj\$ is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in obj\$ is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_NAME	text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.
Dependent Objects	BASE_OBJECT_SCHEMA	text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BASE_OBJECT_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT_SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT_TYPE	text	The object type of the base object.
Dependent Objects	BASE_OBJECT_TYPE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT_TABLESPACE	text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT_TABLESPACE_EXPR	text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_GENERATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.

Table 57–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Granted Objects	PRIVNAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the privilege or role name. By default, all privileges/roles are returned.
Granted Objects	GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_ GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	text	Object grants are selected that are granted by this user.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME	text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME_EXPR	text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	text	<p>The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used.</p> <p>The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.</p>
SCHEMA_EXPORT	SCHEMA	text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	text expression	<p>The filter value is either:</p> <ul style="list-style-type: none"> combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects. <p>By default the current user's objects are selected.</p>
SCHEMA_EXPORT	INCLUDE_USER	Boolean	<p>If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA.</p> <p>Defaults to FALSE.</p>
TABLE_EXPORT	SCHEMA	text	Objects (tables and their dependent objects) in this schema are selected.
TABLE_EXPORT	SCHEMA_EXPR	text expression	<p>The filter value is either:</p> <ul style="list-style-type: none"> combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects. <p>By default the current user's objects are selected.</p>

Table 57–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	NAME	text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.
Heterogeneous objects	INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR	text expression	For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 57–18 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.

Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle, 'SCHEMA', 'SCOTT');
SET_FILTER(handle, 'NAME', 'EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle, 'NAME_EXPR', '>=' 'FELIX'');
```

```
SET_FILTER(handle, 'NAME_EXPR', '<=' 'OSCAR'');
```

- With `SET_FILTER`, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is `SYS` or has `SELECT_CATALOG_ROLE`, then any object can be retrieved; otherwise, only the following can be retrieved:
 - Schema objects owned by the current user
 - Public synonyms
 - System privileges granted to the current user or to `PUBLIC`
 - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as `PUBLIC`).
 - `SCHEMA_EXPORT` where the name is the current user
 - `TABLE_EXPORT` where `SCHEMA` is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program `invokers-rights`.

- For heterogeneous object types, the `BEGIN_WITH` and `BEGIN_AFTER` filters allow restart on an object type boundary. Appropriate filter values are returned by the `FETCH_XML_CLOB` procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for `SCHEMA_EXPORT` the `NAME` filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a `NAME_EXPR` filter explicitly for the `TABLE` object type path. [Table 57–18](#) lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: `DATABASE_EXPORT_OBJECTS`, `SCHEMA_EXPORT_OBJECTS`, and `TABLE_EXPORT_OBJECTS`.) See [Table 57–17](#) for filters defined for each path name. These path names are valid in the `INCLUDE_PATH_EXPR` and `EXCLUDE_PATH_EXPR` filters. Path names marked with an asterisk (*) are *only* valid in those filters; they cannot be used as values of the `SET_FILTER object_type_path` parameter.

Table 57–18 Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION.** SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.
- **INCONSISTENT_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
 - filter name not valid for the object type associated with the OPEN context
 - filter name not valid for the object_type_path
 - object_type_path not part of the collection designated by handle
 - filter value is the wrong datatype

SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9
- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
  handle      IN NUMBER,
  name        IN VARCHAR2);
```

Parameters

Table 57–19 SET_PARSE_ITEM Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).
name	The name of the object attribute to be parsed and returned. See Table 57–20 for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> ▪ if object_type is omitted, the parse item applies to all object types within the heterogeneous collection ▪ if object_type is specified, the parse item only applies to that specific object type within the collection This parameter only applies when SET_PARSE_ITEM is used for object retrieval.

[Table 57–20](#) describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Table 57–20 SET_PARSE_ITEM: Parse Items

Object Type	Name	Meaning
All objects	VERB	If <code>FETCH_XML_CLOB</code> is called, no value is returned. If <code>FETCH_DDL</code> is called, then for every row in the <code>sys.ku\$_ddl</code> s nested table returned by <code>FETCH_DDL</code> the verb in the corresponding <code>ddlText</code> is returned. If the <code>ddlText</code> is a SQL DDL statement, then the SQL verb (for example, <code>CREATE</code> , <code>GRANT</code> , <code>AUDIT</code>) is returned. If the <code>ddlText</code> is a procedure call (for example, <code>DBMS_AQADM.CREATE_QUEUE_TABLE()</code>) then the <code>package.procedure-name</code> is returned.
All objects	OBJECT_TYPE	If <code>FETCH_XML_CLOB</code> is called, an object type name from Table 57–11 is returned. If <code>FETCH_DDL</code> is called and the <code>ddlText</code> is a SQL DDL statement whose verb is <code>CREATE</code> or <code>ALTER</code> , the object type as used in the DDL statement is returned (for example, <code>TABLE</code> , <code>PACKAGE_BODY</code> , and so on). Otherwise, an object type name from Table 57–11 is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a <code>TABLE_DATA</code> object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, <code>ENABLE</code> is returned. If the trigger is disabled, <code>DISABLE</code> is returned.
OBJECT_ GRANT, TABLESPACE_ QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

Usage Notes

These notes apply when using `SET_PARSE_ITEM` to retrieve objects.

By default, the `FETCH_xxx` routines return an object's metadata as XML or creation DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

You can call `SET_PARSE_ITEM` multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For `TABLE_DATA` objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table (<i>not</i> the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the `BASE_OBJECT_NAME`, `BASE_OBJECT_SCHEMA` and `BASE_OBJECT_TYPE` parse items for secondary `TABLE` objects return the name, schema, and type of the domain index.

See Also:

- ["FETCH_xxx Functions and Procedures"](#) on page 57-18
- *Oracle Database Utilities* for information about using the Metadata API

By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- `INCONSISTENT_ARGS`. The attribute name is not valid for the object type associated with the `OPEN` context.

SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. SET_TRANSFORM_PARAM and SET_REMAP_PARAM specify parameters to the XSLT stylesheet identified by transform_handle. Use them to modify or customize the output of the transform.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 57-9
- [Subprograms for Submitting XML to the Database](#) on page 57-10

Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    value               IN VARCHAR2,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    value               IN BOOLEAN DEFAULT TRUE,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    value               IN NUMBER,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_REMAP_PARAM (
    transform_handle    IN NUMBER,
    name                IN VARCHAR2,
    old_value           IN VARCHAR2,
    new_value           IN VARCHAR2,
    object_type         IN VARCHAR2 DEFAULT NULL);
```

Parameters

[Table 57-21](#) describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.

Table 57-21 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
transform_handle	<p>Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session.</p> <p>Note that the handle returned by OPEN is not a valid transform handle.</p> <p>For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.</p>

Table 57–21 (Cont.) SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
name	The name of the parameter. Table 57–22 lists the transform parameters defined for the DDL transform, specifying the <code>object_type</code> it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive. Table 57–23 describes the parameters for the MODIFY transform in the <code>SET_TRANSFORM_PARAM</code> procedure. Table 57–24 describes the parameters for the MODIFY transform in the <code>SET_REMAP_PARAM</code> procedure.
value	The value of the transform. This parameter is valid only for <code>SET_TRANSFORM_PARAM</code> .
old_value	The old value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> .
new_value	The new value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> .
object_type	Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply: <ul style="list-style-type: none"> ▪ If <code>object_type</code> is omitted, the parameter applies to all applicable object types within the heterogeneous collection. ▪ If <code>object_type</code> is specified, the parameter only applies to that object type. <p>This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.</p>

Table 57–22 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the `SET_TRANSFORM_PARAM` procedure.

Table 57–22 SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
TABLE	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is FALSE.) Defaults to TRUE.
TABLE	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is FALSE.) Defaults to TRUE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, emit all non-referential table constraints. Defaults to TRUE.
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, emit all referential constraints (foreign keys). Defaults to TRUE.

Table 57–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, emit table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE	OID	BOOLEAN	If TRUE, emit the OID clause for object tables. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, emit the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE	SPECIFICATION	BOOLEAN	If TRUE, emit the type specification. Defaults to TRUE.
TYPE	BODY	BOOLEAN	If TRUE, emit the type body. Defaults to TRUE.
TYPE	OID	BOOLEAN	If TRUE, emit the OID clause. Defaults to FALSE.
PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, emit the package specification. Defaults to TRUE.
PACKAGE	BODY	BOOLEAN	If TRUE, emit the package body. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, emit the INSERT statements into the OL\$ dictionary tables that will create the outline and its hints. If FALSE, emit a CREATE OUTLINE statement. Defaults to FALSE. Note: This object type is being deprecated.
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.

Table 57–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.
ROLE	REVOKE_FROM	Text	The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is emitted after the CREATE ROLE. Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant. Defaults to null string.
TABLESPACE	REUSE	BOOLEAN	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. Defaults to FALSE.
CLUSTER, INDEX, ROLLBACK_ SEGMENT, TABLE, TABLESPACE	PCTSPACE	NUMBER	A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundredths of the current allocation. For example, 100 means 100%. If the object type is TABLESPACE, the following size values are affected: - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE For other object types, INITIAL and NEXT are affected.

Table 57–23 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure.

Table 57–23 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document. This parameter is additive. By default, all objects are copied to the output document.

Table 57–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

Table 57–24 SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	<p>Objects in the document will have their filespecs renamed as follows: any filespec matching <code>old_value</code> will be changed to <code>new_value</code>. Filespecs should <i>not</i> be enclosed in quotes.</p> <p>This parameter is additive.</p> <p>By default, filespecs are not renamed.</p>
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	<p>Any schema object in the document whose name matches <code>old_value</code> will have its schema name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object schema name matches <code>old_value</code> will have its base object schema name changed to <code>new_value</code>.</p> <p>Any granted object whose grantee name matches <code>old_value</code> will have its grantee name changed to <code>new_value</code>.</p> <p>Any user whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, schemas are not remapped.</p>
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_ SEGMENT, MATERIALIZED_ VIEW, MATERIALIZED_ VIEW_LOG, TABLESPACE_ QUOTA	REMAP_TABLESPACE	Text	<p>Objects in the document will have their tablespaces renamed as follows: any tablespace name matching <code>old_value</code> will be changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, tablespaces are not remapped.</p>

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. Either `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` was called after the first call to `FETCH_xxx` for the OPEN context. After the first call to `FETCH_xxx` is made, no further calls to `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` are permitted.
- `INCONSISTENT_ARGS`. The arguments are inconsistent. This can mean the following:
 - The transform parameter name is not valid for the object type associated with the OPEN context or for the transform associated with the transform handle.
 - The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', false);
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the `MODIFY` transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 5);
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces `TBS1` and `TBS3` are changed to `TBS2` and `TBS4`, respectively.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS3', 'TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS2', 'TBS3');
```

Note: The number of remap parameters that can be specified for a `MODIFY` transform is limited to ten. That is, you can specify up to ten `REMAP_DATAFILE` parameters, up to ten `REMAP_SCHEMA` parameters and so on. Additional instances are ignored. To work around this, you can perform another `DBMS_METADATA.ADD_TRANSFORM` and specify additional remap parameters.

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM` using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` inherit these parameters when they invoke the DDL transform.

Note: The enumerated constant must be prefixed with the package name `DBMS_METADATA.SESSION_TRANSFORM`.

DBMS_MGWADM

DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note: You must run the `catmgw.sql` script to load the Messaging Gateway packages and types into the database.

- [DBMS_MGWADM Constants—Shutdown Modes](#) on page 58-5
- [DBMS_MGWADM Constants—WebSphere MQ Interface Types](#) on page 58-5

Table 58–1 DBMS_MGWADM Constants—Cleanup Actions

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_REC	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

Table 58–2 DBMS_MGWADM Constants—Force Values

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

Table 58–3 DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

Table 58–4 DBMS_MGWADM Constants—Named Property Constants

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP\$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE_ALL) for the reserved property name used to remove all properties

Table 58–5 DBMS_MGWADM Constants—Other Constants

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.

Table 58–6 DBMS_MGWADM Constants—Propagation Types

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Streams AQ propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Streams AQ queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Streams AQ to non-Oracle propagation. The propagation source is a local Oracle Streams AQ queue and the destination is a queue in a foreign (non-Oracle) messaging system.

Table 58–7 DBMS_MGWADM Constants—Queue Domain Types

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

Table 58–8 DBMS_MGWADM Constants—Shutdown Modes

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

Table 58–9 DBMS_MGWADM Constants—WebSphere MQ Interface Types

Name	Type	Description
MQSERIES_BASE_JAVA_INTERFACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

Views

The views listed in [Table 58–10](#) provide Messaging Gateway configuration, status, and statistical information. Unless otherwise indicated, the `SELECT` privilege is granted to `MGW_ADMINISTRATOR_ROLE` so that only Messaging Gateway administrators have access to the views. All views are owned by `SYS`.

Table 58–10 Database Views

Name	Description
MGW_GATEWAY View	Configuration and status information for Messaging Gateway
MGW_LINKS View	Names and types of messaging system links currently created
MGW_MQSERIES_LINKS View	Messaging system properties for WebSphere MQ links
MGW_TIBRV_LINKS View	Messaging system properties for TIB/Rendezvous links
MGW_FOREIGN_QUEUEUES View	Queue properties of registered queues
MGW_SUBSCRIBERS View	Subscriber properties, status, and statistical information
MGW_SCHEDULES View	Schedule properties and status

MGW_GATEWAY View

This view lists configuration and status information for Messaging Gateway, as shown in [Table 58–11](#).

Table 58–11 MGW_GATEWAY View Properties

Name	Type	Description
<code>AGENT_DATABASE</code>	<code>VARCHAR2</code>	The database connect string used by the Messaging Gateway agent. <code>NULL</code> indicates that a local connection is used.
<code>AGENT_INSTANCE</code>	<code>NUMBER</code>	The database instance on which the Messaging Gateway agent is currently running. This should be <code>NULL</code> if the agent is not running.
<code>AGENT_JOB</code>	<code>NUMBER</code>	Job number of the queued job used to start the Messaging Gateway agent process. The job number is set when Messaging Gateway is started and cleared when it shuts down.
<code>AGENT_PING</code>	<code>VARCHAR2</code>	Gateway agent ping status. Values: <ul style="list-style-type: none"> ▪ <code>NULL</code> means no ping attempt was made. ▪ <code>REACHABLE</code> means ping attempt was successful. ▪ <code>UNREACHABLE</code> means ping attempt failed. <p><code>AGENT_PING</code> attempts to contact the Messaging Gateway agent. There is a short delay (up to 5 seconds) if the ping attempt fails. No ping is attempted if the <code>AGENT_STATUS</code> is <code>NOT_STARTED</code> or <code>START_SCHEDULED</code>.</p>
<code>AGENT_START_TIME</code>	<code>TIMESTAMP</code>	The time when the Messaging Gateway agent job currently running was started. This should be <code>NULL</code> if the agent is not running.

Table 58–11 (Cont.) MGW_GATEWAY View Properties

Name	Type	Description
AGENT_STATUS	VARCHAR2	Status of the Messaging Gateway agent. Values: <ul style="list-style-type: none"> ▪ NOT_STARTED means the Messaging Gateway agent has not been started ▪ START_SCHEDULED means Messaging Gateway agent has been scheduled to start. That is, Messaging Gateway has been started using DBMS_MGWADM.STARTUP, but the queued job used to start the Messaging Gateway agent has not yet run. ▪ STARTING means Messaging Gateway agent is starting. That is, Messaging Gateway has been started using DBMS_MGWADM.STARTUP, the queued job has run, and the Messaging Gateway agent is starting up. ▪ INITIALIZING means the Messaging Gateway agent has started and is initializing ▪ RUNNING means the Messaging Gateway agent is running ▪ SHUTTING_DOWN means the Messaging Gateway agent is shutting down ▪ BROKEN means an unexpected condition has been encountered that prevents the Messaging Gateway agent from starting. DBMS_MGWADM.CLEANUP_GATEWAY must be called before the agent can be started.
AGENT_USER	VARCHAR2	Database username used by the Messaging Gateway agent to connect to the database
LAST_ERROR_DATE	DATE	Date of last Messaging Gateway agent error. The last error information is cleared when Messaging Gateway is started. It is set if the Messaging Gateway agent fails to start or terminates due to an abnormal condition.
LAST_ERROR_MSG	VARCHAR2	Message for last Messaging Gateway agent error
LAST_ERROR_TIME	VARCHAR2	Time of last Messaging Gateway agent error
MAX_CONNECTIONS	NUMBER	Maximum number of messaging connections to Oracle Database
MAX_MEMORY	NUMBER	Maximum heap size used by the Messaging Gateway agent (in MB)
MAX_THREADS	NUMBER	Maximum number of messaging threads created by the Messaging Gateway agent

MGW_LINKS View

This view lists the names and types of messaging system links currently defined. [Table 58–12](#) lists the MGW_LINKS view properties.

Table 58–12 MGW_LINKS View Properties

Name	Type	Description
LINK_COMMENT	VARCHAR2	User comment for the link
LINK_NAME	VARCHAR2	Name of the messaging system link
LINK_TYPE	VARCHAR2	Type of messaging system link. Values <ul style="list-style-type: none"> ▪ MQSERIES is for WebSphere MQ links. ▪ TIBRV is for TIB/Rendezvous links.

MGW_MQSERIES_LINKS View

This view lists information for the WebSphere MQ messaging system links. The view includes most of the messaging system properties specified when the link is created. [Table 58–13](#) lists the MGW_MQSERIES_LINKS view properties.

Table 58–13 MGW_MQSERIES_LINKS View Properties

Name	Type	Description
CHANNEL	VARCHAR2	Connection channel
HOSTNAME	VARCHAR2	Name of the WebSphere MQ host
INBOUND_LOG_QUEUE	VARCHAR2	Inbound propagation log queue
INTERFACE_TYPE	VARCHAR2	Messaging interface type. Values: <ul style="list-style-type: none"> ■ BASE_JAVA is for WebSphere MQ Base Java interface ■ JMS_CONNECTION is for WebSphere MQ JMS unified, domain-independent connections ■ JMS_QUEUE_CONNECTION is for WebSphere MQ JMS queue connections ■ JMS_TOPIC_CONNECTION is for WebSphere MQ JMS topic connections
LINK_COMMENT	VARCHAR2	User comment for the link
LINK_NAME	VARCHAR2	Name of the messaging system link
MAX_CONNECTIONS	NUMBER	Maximum number of messaging connections
OPTIONS	SYS.MGW_PROPERTIES	Link options
OUTBOUND_LOG_QUEUE	VARCHAR2	Outbound propagation log queue
PORT	NUMBER	Port number
QUEUE_MANAGER	VARCHAR2	Name of the WebSphere MQ queue manager

MGW_TIBRV_LINKS View

This view lists information for TIB/Rendezvous messaging system links. The view includes most of the messaging system properties specified when the link was created. [Table 58–14](#) lists the MGW_TIBRV_LINKS view properties.

Table 58–14 MGW_TIBRV_LINKS View Properties

Property Name	Type	Description
CM_LEDGER	VARCHAR2	TIB/Rendezvous CM ledger file name
CM_NAME	VARCHAR2	TIB/Rendezvous CM correspondent name
DAEMON	VARCHAR2	TIB/Rendezvous daemon parameter for rvd transport
LINK_COMMENT	VARCHAR2	User comment for the link
LINK_NAME	VARCHAR2	Name of the messaging system link
NETWORK	VARCHAR2	TIB/Rendezvous network parameter for rvd transport
OPTIONS	SYS.MGW_PROPERTIES	Link options
SERVICE	VARCHAR2	TIB/Rendezvous service parameter for rvd transport

MGW_FOREIGN_QUEUES View

This view lists information for foreign queues. The view includes most of the queue properties specified when the queue is registered. [Table 58–15](#) lists the MGW_FOREIGN_QUEUES view properties.

Table 58–15 MGW_FOREIGN_QUEUES View Properties

Name	Type	Description
DOMAIN	VARCHAR2	Queue domain type. Values: <ul style="list-style-type: none"> ▪ NULL means the queue domain type is automatically determined by the messaging system ▪ QUEUE is for a queue (point-to-point) model ▪ TOPIC is for a topic (publish-subscribe) model
LINK_NAME	VARCHAR2	Name of the messaging system link
NAME	VARCHAR2	Name of the registered queue
OPTIONS	SYS.MGW_PROPERTIES	Optional queue properties
PROVIDER_QUEUE	VARCHAR2	Message provider (native) queue name
QUEUE_COMMENT	VARCHAR2	User comment for the foreign queue

MGW_SUBSCRIBERS View

This view lists configuration and status information for Messaging Gateway subscribers. The view includes most of the subscriber properties specified when the subscriber is added, as well as other status and statistical information. [Table 58–16](#) lists the MGW_SUBSCRIBERS view properties.

Table 58–16 MGW_SUBSCRIBERS View Properties

Name	Type	Description
DESTINATION	VARCHAR2	Destination queue to which messages are propagated
EXCEPTIONQ_MSGS	NUMBER	Number of messages moved to the propagation exception queue since the last time the agent was started
EXCEPTION_QUEUE	VARCHAR2	Exception queue used for logging purposes
FAILURES	NUMBER	Number of propagation failures
LAST_ERROR_DATE	DATE	Date of last propagation error
LAST_ERROR_MSG	VARCHAR2	Message for last propagation error
LAST_ERROR_TIME	VARCHAR2	Time of last propagation error
OPTIONS	SYS.MGW_PROPERTIES	Subscriber options
PROP_STYLE	VARCHAR2	Message propagation style. Values: <ul style="list-style-type: none"> ▪ NATIVE is for native message propagation ▪ JMS is for JMS message propagation
PROPAGATED_MSGS	NUMBER	Number of messages propagated to the destination queue since the last time the agent was started

Table 58–16 (Cont.) MGW_SUBSCRIBERS View Properties

Name	Type	Description
PROPAGATION_TYPE	VARCHAR2	Propagation type. Values: <ul style="list-style-type: none"> ▪ OUTBOUND is for Oracle Streams AQ to non-Oracle propagation ▪ INBOUND is for non-Oracle to Oracle Streams AQ propagation
QUEUE_NAME	VARCHAR2	Subscriber source queue
RULE	VARCHAR2	Subscription rule
STATUS	VARCHAR2	Subscriber status. Values: <ul style="list-style-type: none"> ▪ ENABLED means the subscriber is enabled ▪ DELETE_PENDING means subscriber removal is pending, usually because DBMS_MGWADM.REMOVE_SUBSCRIBER has been called but certain cleanup tasks pertaining to this subscriber are still outstanding
SUBSCRIBER_ID	VARCHAR2	Propagation subscriber identifier
TRANSFORMATION	VARCHAR2	Transformation used for message conversion

MGW_SCHEDULES View

This view lists configuration and status information for Messaging Gateway schedules. The view includes most of the schedule properties specified when the schedule is created, as well as other status information. [Table 58–17](#) lists the MGW_SCHEDULES view properties.

Table 58–17 MGW_SCHEDULES View Properties

Name	Type	Description
DESTINATION	VARCHAR2	Propagation destination
LATENCY	NUMBER	Propagation window latency (in seconds)
NEXT_TIME	VARCHAR2	Reserved for future use
PROPAGATION_TYPE	VARCHAR2	Propagation type. Values: <ul style="list-style-type: none"> ▪ OUTBOUND is for Oracle Streams AQ to non-Oracle propagation ▪ INBOUND is for non-Oracle to Oracle Streams AQ propagation
PROPAGATION_WINDOW	NUMBER	Reserved for future use
SCHEDULE_DISABLED	VARCHAR2	Indicates whether the schedule is disabled. Y means the schedule is disabled. N means the schedule is enabled.
SCHEDULE_ID	VARCHAR2	Propagation schedule identifier
SOURCE	VARCHAR2	Propagation source
START_DATE	DATE	Reserved for future use
START_TIME	VARCHAR2	Reserved for future use

Data Structures

The DBMS_MGWADM package defines the following OBJECT types.

Object Types

- [SYS.MGW_MQSERIES_PROPERTIES](#) Object Type
- [SYS.MGW_PROPERTIES](#) Object Type
- [SYS.MGW_PROPERTY](#) Object Type
- [SYS.MGW_TIBRV_PROPERTIES](#) Object Type

SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```

TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
    queue_manager      VARCHAR2(64),
    hostname           VARCHAR2(64),
    port               INTEGER,
    channel            VARCHAR2(64),
    interface_type     INTEGER,
    max_connections    INTEGER,
    username           VARCHAR2(64),
    password           VARCHAR2(64),
    inbound_log_queue  VARCHAR2(64),
    outbound_log_queue VARCHAR2(64),

    -- Methods
    STATIC FUNCTION construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES,

    STATIC FUNCTION alter_construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES );

```

Attributes

Table 58–18 SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not NULL.
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.
interface_type	The type of messaging interface to use. Values: <ul style="list-style-type: none"> ■ DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used. ■ DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner. ■ DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues ■ DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system

Table 58–18 (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source:</p> <ul style="list-style-type: none"> ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.
outbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:</p> <ul style="list-style-type: none"> ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.

Methods

Table 58–19 SYS.MGW_MQSERIES_PROPERTIES Methods

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types are assigned a value of NULL.

SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes

Table 58–20 SYS.MGW_PROPERTIES Attributes

Attribute	Description
name	Property name
value	Property value

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the MGWPROP\$_ prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

```
MGW_PROPERTY.NAME = property_name
MGW_PROPERTY.VALUE = property_value
```

If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
MGW_PROPERTY.VALUE = name_of_property_to_remove
```

No action is taken if the property name does not exist in the original list.

- Remove all properties

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
MGW_PROPERTY.VALUE = not used
```

See Also: "The DBMS_MGWADM package defines constants to represent the reserved property names on [Table 58-4](#), "DBMS_MGWADM Constants—Named Property Constants"

SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
  name  VARCHAR2(500),
  value VARCHAR2(4000),

  -- Methods
  STATIC FUNCTION construct  --- (1)
  RETURN SYS.MGW_PROPERTY,

  STATIC FUNCTION construct(  --- (2)
    p_name  IN VARCHAR2,
    p_value IN VARCHAR2)
  RETURN SYS.MGW_PROPERTY );
```

Attributes

Table 58–21 SYS.MGW_PROPERTY Attributes

Attribute	Description
name	Property name
value	Property value

Methods

Table 58–22 SYS.MGW_PROPERTY Methods

Method	Description
construct --- (1)	Constructs a new MGW_PROPERTY instance. All attributes are assigned a value of NULL
construct --- (2)	Constructs a new MGW_PROPERTY instance initialized using the given parameters

SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

Syntax

```
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
  service  VARCHAR2(128),
  daemon   VARCHAR2(128),
  network  VARCHAR2(256),
  cm_name  VARCHAR2(256),
  cm_ledger VARCHAR2(256),

  -- Methods
  STATIC FUNCTION construct
  RETURN SYS.MGW_TIBRV_PROPERTIES,

  STATIC FUNCTION alter_construct
  RETURN SYS.MGW_TIBRV_PROPERTIES );
```

Attributes

Table 58–23 *SYS.MGW_TIBRV_PROPERTIES Attributes*

Attribute	Description
<code>service</code>	The service parameter for the rvd transport
<code>daemon</code>	The daemon parameter for the rvd transport
<code>network</code>	The network parameter for the rvd transport
<code>cm_name</code>	The CM correspondent name. Reserved for future use.
<code>cm_ledger</code>	The CM ledger file name. Reserved for future use.

Methods

Table 58–24 *SYS.MGW_TIBRV_PROPERTIES Methods*

Method	Description
<code>construct</code>	Constructs a new <code>SYS.MGW_TIBRV_PROPERTIES</code> instance. All attributes will be assigned a value of <code>NULL</code> .
<code>alter_construct</code>	Constructs a new <code>SYS.MGW_TIBRV_PROPERTIES</code> instance. This function is useful for altering the properties of an existing messaging link. All attributes having a <code>VARCHAR2</code> data type will be assigned a value of <code>DBMS_MGWADM.NO_CHANGE</code> . Attributes of other data types will be assigned a value of <code>NULL</code> .

Summary of DBMS_MGWADM Subprograms

Table 58–25 DBMS_MGWADM Package Subprograms

Subprogram	Description
ADD_SUBSCRIBER Procedure on page 58-20	Adds a subscriber used to consume messages from a source queue for propagation to a destination
ALTER_AGENT Procedure on page 58-23	Alters Messaging Gateway agent parameters
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 58-24	Alters the properties of a TIB/Rendezvous messaging system link
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 58-25	Alters the properties of a WebSphere MQ messaging system link
ALTER_PROPAGATION_SCHEDULE Procedure on page 58-26	Alters a propagation schedule
ALTER_SUBSCRIBER Procedure on page 58-27	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
CLEANUP_GATEWAY Procedure on page 58-29	Cleans up Messaging Gateway
CREATE_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 58-32	Creates a messaging system link to a TIB/Rendezvous messaging system
CREATE_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 58-33	Creates a messaging system link to a WebSphere MQ messaging system
DB_CONNECT_INFO Procedure on page 58-34	Configures connection information used by the Messaging Gateway agent for connections to Oracle Database
DISABLE_PROPAGATION_SCHEDULE Procedure on page 58-35	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 58-36	Enables a propagation schedule
REGISTER_FOREIGN_QUEUE Procedure on page 58-37	Registers a non-Oracle queue entity in Messaging Gateway
REMOVE_MSGSYSTEM_LINK Procedure on page 58-38	Removes a messaging system link for a non-Oracle messaging system
REMOVE_SUBSCRIBER Procedure on page 58-39	Removes a subscriber used to consume messages from a source queue for propagation to a destination
RESET_SUBSCRIBER Procedure on page 58-40	Resets the propagation error state for a subscriber
SCHEDULE_PROPAGATION Procedure on page 58-41	Schedules message propagation from a source to a destination
SET_LOG_LEVEL Procedure on page 58-43	Dynamically alters the Messaging Gateway agent logging level

Table 58–25 (Cont.) DBMS_MGWADM Package Subprograms

Subprogram	Description
SHUTDOWN Procedure on page 58-44	Shuts down the Messaging Gateway agent
STARTUP Procedure on page 58-45	Starts the Messaging Gateway agent
UNREGISTER_FOREIGN_QUEUE Procedure on page 58-46	Removes a non-Oracle queue entity in Messaging Gateway
UNSCHEDULE_PROPAGATION Procedure on page 58-47	Removes a propagation schedule

ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER (
  subscriber_id      IN VARCHAR2,
  propagation_type  IN BINARY_INTEGER,
  queue_name        IN VARCHAR2,
  destination       IN VARCHAR2,
  rule              IN VARCHAR2 DEFAULT NULL,
  transformation     IN VARCHAR2 DEFAULT NULL,
  exception_queue   IN VARCHAR2 DEFAULT NULL,
  options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

Table 58–26 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If NULL, then the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.

Usage Notes

See Also: "Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `NULL`.

See Also: For additional information regarding subscriber options

- "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference*
- "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference*

OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- `queue_name` specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

ALTER_AGENT Procedure

This procedure configures Messaging Gateway agent parameters.

Syntax

```
DBMS_MGWADM.ALTER_AGENT (
    max_connections IN BINARY_INTEGER DEFAULT NULL,
    max_memory      IN BINARY_INTEGER DEFAULT NULL,
    max_threads     IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 58–27 ALTER_AGENT Procedure Parameters

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is <code>NULL</code> , then the current value is unchanged.
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is <code>NULL</code> , then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is <code>NULL</code> , then the current value is unchanged.

Usage Notes

Default values for these configuration parameters are set when the Messaging Gateway agent is installed.

Changes to the `max_memory` and `max_threads` parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.

ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 58–28 ALTER_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed.
options	Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	A user-specified description, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value will not be changed.

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: [SYS.MGW_PROPERTIES Object Type](#) on page 58-14

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname IN VARCHAR2,
  properties IN SYS.MGW_MQSERIES_PROPERTIES,
  options IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

Parameters

Table 58–29 ALTER_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a WebSphere MQ messaging system link. If it is NULL, then no link properties are changed.
options	Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed.

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: [SYS.MGW_PROPERTIES Object Type](#) on page 58-14

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
    schedule_id IN VARCHAR2,
    duration    IN NUMBER DEFAULT NULL,
    next_time   IN VARCHAR2 DEFAULT NULL,
    latency     IN NUMBER DEFAULT NULL);
```

Parameters

Table 58–30 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be altered
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
  subscriber_id   IN VARCHAR2,
  rule            IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  options        IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 58–31 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ

interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

CLEANUP_GATEWAY Procedure

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The `MGW_GATEWAY` view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY (
  action IN BINARY_INTEGER,
  sarg   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–32 CLEANUP_GATEWAY Procedure Parameters

Parameter	Description
<code>action</code>	The cleanup action to be performed. Values: <ul style="list-style-type: none"> ▪ <code>DBMS_MGWADM.CLEAN_STARTUP_STATE</code> for Messaging Gateway start up state recovery. ▪ <code>DBMS_MGWADM.CLEAN_LOG_QUEUES</code> for log queue cleanup. ▪ <code>DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC</code> for subscriber recovery due to missing log record. ▪ <code>DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE</code> for subscriber recovery due to missing message.
<code>sarg</code>	Optional argument whose meaning depends on the value specified for <code>action</code> . This should be <code>NULL</code> if it is not used for the specified action.

Usage Notes

CLEAN_STARTUP_STATE

`sarg` is not used and must be `NULL`.

The `CLEAN_STARTUP_STATE` action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The `CLEAN_STARTUP_STATE` action may be needed when the `MGW_GATEWAY` view shows that the `AGENT_STATUS` value is something other than `NOT_STARTED` or `START_SCHEDULED`, and the `AGENT_PING` value is `UNREACHABLE` for an extended period of time.

If the `AGENT_STATUS` value is `BROKEN`, then the Messaging Gateway agent cannot be started until the problem has been resolved and the `CLEAN_STARTUP_STATE` action used to reset the agent status. A `BROKEN` status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the queued job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to `NOT_STARTED`.

Execution of this command fails if:

- The agent status is `NOT_STARTED` or `START_SCHEDULED`.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is `STARTING`.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

Note: Terminate any Messaging Gateway agent process that may still be running after a `CLEAN_STARTUP_STATE` action has been successfully performed. This should be done before calling `DBMS_MGWADM.STARTUP` to start Messaging Gateway. The process is usually named `extprocmgwextproc`.

CLEAN_LOG_QUEUES

`sarg` is not used and must be `NULL`.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

Note: For Oracle Database 10g, the `CLEAN_LOG_QUEUES` action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC

`sarg` specifies a Messaging Gateway subscriber ID to be reset. It must be not `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

Caution: If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE

`sarg` specifies a Messaging Gateway subscriber ID to be reset. It must be not `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that subscriber. The procedure will fail if the Messaging Gateway agent is not running.

CREATE_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT NULL );
```

Parameters

Table 58–33 CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameter	Description
linkname	A user-defined name to identify this messaging system link
properties	Basic properties of a TIB/Rendezvous messaging system link.
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system
comment	A user-specified description. NULL if one is not desired.

Usage Notes

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

CREATE_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname      IN VARCHAR2,
  properties    IN SYS.MGW_MQSERIES_PROPERTIES,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–34 CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameter	Description
linkname	A user-defined name to identify the messaging system link
properties	Basic properties of a WebSphere MQ messaging system link
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.
comment	A user-specified description. NULL if one is not desired

Usage Notes

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

DB_CONNECT_INFO Procedure

This procedure configures connection information used by the Messaging Gateway agent for connections to Oracle Database.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (  
    username      IN VARCHAR2,  
    password      IN VARCHAR2,  
    database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–35 DB_CONNECT_INFO Procedure Parameters

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from <code>tnsnames.ora</code> .

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role `MGW_AGENT_ROLE`, and then call this procedure to configure Messaging Gateway. Role `MGW_AGENT_ROLE` is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2 );
```

Parameters

Table 58–36 *DISABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a propagation schedule.

Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2 );
```

Parameters

Table 58–37 *ENABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE (
  name          IN VARCHAR2,
  linkname      IN VARCHAR2,
  provider_queue IN VARCHAR2 DEFAULT NULL,
  domain        IN INTEGER DEFAULT NULL,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–38 REGISTER_FOREIGN_QUEUE Procedure Parameters

Parameters	Description
name	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
linkname	The link name for the messaging system on which this queue exists
provider_queue	The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.
domain	The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model)
options	Optional queue properties
comment	A user-specified description. Can be NULL.

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

See Also: For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference*.

REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(  
    linkname IN VARCHAR2);
```

Parameters

Table 58–39 REMOVE_MSGSYSTEM_LINK Procedure Parameters

Parameters	Description
linkname	The messaging system link name

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (
  subscriber_id IN VARCHAR2,
  force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

Parameters

Table 58–40 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	<p>Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. <code>DBMS_MGWADM.NO_FORCE</code> (0) means the subscriber is not removed if Messaging Gateway is unable to clean up successfully. <code>DBMS_MGWADM.FORCE</code> (1) means the subscriber is removed, even though all cleanup actions may not be done.</p> <p>The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.</p>

Usage Notes

For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.

RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (  
    subscriber_id IN VARCHAR2 );
```

Parameters

Table 58–41 RESET_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber

SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
  schedule_id      IN VARCHAR2,
  propagation_type IN BINARY_INTEGER,
  source           IN VARCHAR2,
  destination      IN VARCHAR2,
  start_time       IN DATE DEFAULT SYSDATE,
  duration         IN NUMBER DEFAULT NULL,
  next_time        IN VARCHAR2 DEFAULT NULL,
  latency          IN NUMBER DEFAULT NULL);
```

Parameters

Table 58–42 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
<code>schedule_id</code>	Specifies a user-defined name that identifies the schedule
<code>propagation_type</code>	Specifies the type of message propagation. <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> is for Oracle Streams AQ to non-Oracle propagation. <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> is for non-Oracle to Oracle Streams AQ propagation.
<code>source</code>	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
<code>destination</code>	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
<code>start_time</code>	Reserved for future use
<code>duration</code>	Reserved for future use
<code>next_time</code>	Reserved for future use
<code>latency</code>	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If <code>latency</code> is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of `schema.queue`.

- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

SET_LOG_LEVEL Procedure

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (  
    log_level IN BINARY_INTEGER);
```

Parameters

Table 58–43 SET_LOG_LEVEL Procedure Parameters

Parameter	Description
log_level	Level at which the Messaging Gateway agent logs information. DBMS_MGWADM.BASIC_LOGGING generates the least information while DBMS_MGWADM.TRACE_DEBUG_LOGGING generates the most information.

See Also: [Table 58–3, "DBMS_MGWADM Constants—Logging Levels"](#) on page 58-3 for details on the log_level parameter

SHUTDOWN Procedure

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (  
    smode IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

Parameters

Table 58–44 SHUTDOWN Procedure Parameters

Parameter	Description
<code>smode</code>	The shutdown mode. The only value currently supported is <code>DBMS_MGWADM.SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.

STARTUP Procedure

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP (
  instance IN BINARY_INTEGER DEFAULT 0,
  force    IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

Parameters

Table 58–45 STARTUP Procedure Parameters

Parameter	Description
instance	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance.
force	If this is <code>DBMS_MGWADM.FORCE</code> , then any positive integer is acceptable as the job instance. If this is <code>DBMS_MGWADM.NO_FORCE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

The Messaging Gateway agent cannot be started until an agent user has been configured using `DBMS_MGWADM.DB_CONNECT_INFO`.

This procedure submits a job queue job, which starts the Messaging Gateway agent when it runs. The `instance` and `force` parameters are used for job queue affinity, which you use to indicate whether a particular instance or any instance can run a submitted job.

UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE (  
    name          IN VARCHAR2,  
    linkname      IN VARCHAR2);
```

Parameters

Table 58–46 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

Parameter	Description
name	The queue name
linkname	The link name for the messaging system on which the queue exists

Usage Notes

This procedure does not remove the physical queue in the non-Oracle messaging system.

All subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a subscriber or propagation schedule references the non-Oracle queue.

UNSCHEDULE_PROPAGATION Procedure

This procedure removes a propagation schedule.

Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (  
    schedule_id    IN VARCHAR2 );
```

Parameters

Table 58–47 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

DBMS_MGWMSG

DBMS_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

See Also: [Chapter 58, "DBMS_MGWADM"](#) which describes the Messaging Gateway administrative interface, `DBMS_MGWADM`

This chapter contains the following topics:

- [Using DBMS_MGWMSG](#)
 - Security Model
 - Constants
 - Types
- [Summary of DBMS_MGWMSG Subprograms](#)

Using DBMS_MGWMSG

- [Security Model](#)
- [Constants](#)
- [Types](#)

Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by SYS.

Note: You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User's Guide and Reference* for information on loading database objects and using DBMS_MGWMSG.

Constants

Table 59–1 DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5
INTEGER_VALUE	CONSTANT BINARY_INTEGER := 6
LONG_VALUE	CONSTANT BINARY_INTEGER := 7
FLOAT_VALUE	CONSTANT BINARY_INTEGER := 8
DOUBLE_VALUE	CONSTANT BINARY_INTEGER := 9
DATE_VALUE	CONSTANT BINARY_INTEGER := 10

Table 59–2 DBMS_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value

Value	Constant
BOOLEAN_FALSE	CONSTANT BINARY_INTEGER := 0
BOOLEAN_TRUE	CONSTANT BINARY_INTEGER := 1

Table 59–3 DBMS_MGWMSG Constants: Case Comparisons

Value	Constant
CASE_SENSITIVE	CONSTANT BINARY_INTEGER := 0
CASE_INSENSITIVE	CONSTANT BINARY_INTEGER := 1

Table 59–4 Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_BOOL	CONSTANT INTEGER := 1
TIBRVMSG_F32	CONSTANT INTEGER := 2
TIBRVMSG_F64	CONSTANT INTEGER := 3
TIBRVMSG_I8	CONSTANT INTEGER := 4
TIBRVMSG_I16	CONSTANT INTEGER := 5
TIBRVMSG_I32	CONSTANT INTEGER := 6
TIBRVMSG_I64	CONSTANT INTEGER := 7
TIBRVMSG_IPADDR32	CONSTANT INTEGER := 8
TIBRVMSG_IPPORT16	CONSTANT INTEGER := 9
TIBRVMSG_DATETIME	CONSTANT INTEGER := 10
TIBRVMSG_F32ARRAY	CONSTANT INTEGER := 11

Table 59-4 (Cont.) Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_F64ARRAY	CONSTANT INTEGER := 12
TIBRVMSG_I8ARRAY	CONSTANT INTEGER := 13
TIBRVMSG_I16ARRAY	CONSTANT INTEGER := 14
TIBRVMSG_I32ARRAY	CONSTANT INTEGER := 15
TIBRVMSG_I64ARRAY	CONSTANT INTEGER := 16
TIBRVMSG_OPAQUE	CONSTANT INTEGER := 17
TIBRVMSG_STRING	CONSTANT INTEGER := 18
TIBRVMSG_XML	CONSTANT INTEGER := 19

Types

- [SYS.MGW_TEXT_VALUE_T Type](#)
- [SYS.MGW_RAW_VALUE_T Type](#)
- [SYS.MGW_BASIC_MSG_T Type](#)
- [SYS.MGW_NUMBER_ARRAY_T Type](#)
- [SYS.MGW_TIBRV_FIELD_T Type](#)
- [SYS.MGW_TIBRV_MSG_T Type](#)

SYS.MGW_NAME_VALUE_T Type

This type specifies a named value. The name attribute, type attribute, and one of the <>_value attributes are typically not NULL.

Syntax

```

TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
    name          VARCHAR2(250),
    type          INTEGER,
    integer_value INTEGER,
    number_value  NUMBER,
    text_value    VARCHAR2(4000),
    raw_value     RAW(2000),
    date_value    DATE,

    -- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_BOOLEAN (
        name  IN VARCHAR2,
        value IN INTEGER )
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_BYTE (
        name  IN VARCHAR2,
        value IN INTEGER )
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_SHORT (
        name  IN VARCHAR2,
        value IN INTEGER )
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_INTEGER (
        name  IN VARCHAR2,
        value IN INTEGER )
    RETURN SYS.MGW_NAME_VALUE_T,

    STATIC FUNCTION CONSTRUCT_LONG (
        name  IN VARCHAR2,

```

```

        value IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
    name   IN VARCHAR2,
    value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
    name   IN VARCHAR2,
    value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
    name   IN VARCHAR2,
    value  IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
    name   IN VARCHAR2,
    value  IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
    name   IN VARCHAR2,
    value  IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );

```

Attributes

Table 59–5 *SYS.MGW_NAME_VALUE_T Attributes*

Attribute	Description
name	Name associated with the value
type	Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in Table 59–1 . This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
integer_value	Stores a numeric integer value
number_value	Stores a numeric float or large integer value
text_value	Stores a text value
raw_value	Stores a RAW (bytes) value
date_value	Stores a date value

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

[Table 59–6](#) shows the mapping between the value type and the attribute used to store the value.

Table 59–6 *SYS.MGW_NAME_VALUE_T Type Attribute Mapping*

Type	Value Stored in Attribute
DBMS_MGWMSG.TEXT_VALUE	text_value
DBMS_MGWMSG.RAW_VALUE	raw_value
DBMS_MGWMSG.BOOLEAN_VALUE	integer_value

Table 59–6 (Cont.) SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_TYPE Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in [Table 59–6](#).

Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
    name    IN VARCHAR2,
    value   IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

SYS.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_value attributes should be set.

Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
    small_value VARCHAR2(4000),
```

```

    large_value CLOB,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);

```

Attributes

Table 59-7 SYS.MGW_TEXT_VALUE_T Attributes

Attribute	Description
small_value	Small TEXT value. Used for values <= 4000.
large_value	Large TEXT value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_TEXT_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;

```

SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_value attributes.

Syntax

```

TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
    small_value RAW(2000),
    large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);

```

Attributes

Table 59-8 SYS.MGW_RAW_VALUE_T Attributes

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```

STATIC FUNCTION CONSTRUCT

```

```
RETURN SYS.MGW_RAW_VALUE_T;
```

SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
  header      SYS.MGW_NAME_VALUE_ARRAY_T,
  text_body   SYS.MGW_TEXT_VALUE_T,
  raw_body    SYS.MGW_RAW_VALUE_T,

  --Methods
  STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_BASIC_MSG_T);
```

Attributes

Table 59–9 SYS.MGW_BASIC_MSG_T Attributes

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

SYS.MGW_TIBRV_FIELD_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name   VARCHAR2(256),
  field_id     INTEGER,
  field_type   INTEGER,
  number_value NUMBER,
  number_array_value SYS.MGW_NUMBER_ARRAY_T,
```

```

text_value      VARCHAR2 (4000) ,
raw_value       RAW(2000) ,
date_value      DATE,
clob_value      CLOB,
blob_value      BLOB);

```

Attributes

Table 59–10 SYS.MGW_TIBRV_FIELD_T Attributes

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Table 59–11 describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

Table 59–11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value

Table 59–11 (Cont.) SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

SYS.MGW_TIBRV_MSG_T Type

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```

TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
    send_subject    VARCHAR2(256),
    reply_subject   VARCHAR2(256),
    cm_time_limit   NUMBER,
    cm_sender_name  VARCHAR2(256),
    cm_sequence_num NUMBER,
    fields          SYS.MGW_TIBRV_IFIELDS_T,
    clob_data1      CLOB,
    clob_data2      CLOB,
    clob_data3      CLOB,
    blob_data1      BLOB,
    blob_data2      BLOB,
    blob_data3      BLOB,

    STATIC FUNCTION construct
    RETURN SYS.MGW_TIBRV_MSG_T,

    MEMBER PROCEDURE add_bool (
        name IN  VARCHAR2,
        id   IN  INTEGER,
        value IN INTEGER ),

    MEMBER PROCEDURE add_f32 (
        name IN  VARCHAR2,
        id   IN  INTEGER,
        value IN  FLOAT ),

RETURN INTEGER
);

```

Attributes

Table 59–12 *SYS.MGW_TIBRV_MSG_T* Type Attributes

Attribute	Description
send_subject	Send subject name
reply_subject	Reply subject name
cm_time_limit	Time limit for a certified message
cm_sender_name	Sender name of a certified message
cm_sequence_num	Sequence number of a certified message
fields	Collection of message fields
clob_data1	Used to store a large text value
clob_data2	Used to store a large text value
clob_data3	Used to store a large text value
blob_data1	Used to store a large raw value
blob_data2	Used to store a large raw value
blob_data3	Used to store a large raw value

Construct Method

Constructs a new `SYS.MGW_TIBRV_MSG_T` instance. All attributes are set to `NULL`.

Syntax

```

STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;

```

ADD_<> Procedures

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> (
    name IN VARCHAR2,
    id   IN INTEGER,
    value IN datatype );
```

Parameters

Table 59–13 *SYS.MGW_TIBRV_MSG_T ADD_<> Method Parameters*

Parameter	Description
name	Field name
id	Field identifier
value	Field data

Table 59–14 shows, for each add method, the field type that will be assigned and valid values for the field data.

Table 59–14 *MGW_TIBRV_MSG_T Add Method Field Types*

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a
add_f64	TIBRVMSG_F64	n/a
add_i8	TIBRVMSG_I8	Valid range: -128...127
add_i16	TIBRVMSG_I16	Valid range: -32768...32767
add_i32	TIBRVMSG_I32	Valid range: -2147483648...2147483647
add_i64	TIBRVMSG_I64	n/a
add_ipaddr32	TIBRVMSG_IPADDR32	n/a
add_ipport16	TIBRVMSG_IPPORT16	n/a
add_datetime	TIBRVMSG_DATETIME	n/a
add_f32array	TIBRVMSG_F32ARRAY	n/a
add_f64array	TIBRVMSG_F64ARRAY	n/a
add_i8array	TIBRVMSG_I8ARRAY	Valid range: -128...127
add_i16array	TIBRVMSG_I16ARRAY	Valid range: -32768...32767
add_i32array	TIBRVMSG_I32ARRAY	Valid range: -2147483648...2147483647
add_i64array	TIBRVMSG_I64ARRAY	n/a
add_opaque	TIBRVMSG_OPAQUE	Value stored as RAW if size < 2000; otherwise value stored in BLOB
add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

Table 59–14 (Cont.) MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

SET_<> Methods

Accessor methods to set an instance attribute to a specific value.

Syntax

```
MEMBER PROCEDURE SET_<> (
    value IN datatype );
```

Parameters**Table 59–15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters**

Parameter	Description
value	Value to be assigned

GET_<> Methods

Accessor methods to retrieve the value for an instance attribute.

Syntax

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Procedure

Gets the number of message fields.

Syntax

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Procedure

Retrieves field information for the field having a given field collection index. This method should only be called if the GET_FIELD_COUNT Procedure returns a

nonzero value and `idx` must specify a valid collection index; that is, $1 \leq idx \leq get_field_count()$.

Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 59–16 *SYS.MGW_TIBRV_MSG_T GET_FIELD Procedure Parameters*

Parameter	Description
<code>idx</code>	Specifies the 1-based field collection index of the field to retrieve

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Procedure

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

```
MEMBER PROCEDURE get_field_by_name (
    name IN    VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 59–17 *SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Procedure Parameters*

Parameter	Description
<code>name</code>	Specifies the field name to search for. This can be <code>NULL</code> to find the first field that does not have a field name.

Return Values

Returns the field information, or `NULL` if no match was found.

GET_FIELD_BY_ID Procedure

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or `NULL`, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

```
MEMBER PROCEDURE get_field_by_id (
    id    IN    INTEGER )
```

```
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 59–18 *SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Procedure Parameters*

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Procedure

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

```
MEMBER PROCEDURE find_field_name (
    name      IN  VARCHAR2,
    start_idx IN  INTEGER )
RETURN INTEGER;
```

Parameters

Table 59–19 *SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Procedure Parameters*

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Procedure

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

```
MEMBER PROCEDURE find_field_id (
    id      IN  INTEGER,
    start_idx IN INTEGER )
RETURN    INTEGER;
```

Parameters

Table 59–20 *SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Procedure Parameters*

Parameter	Description
<code>id</code>	Specifies the field identifier to search for. This can be zero (0) or <code>NULL</code> to find a field that does not have an identifier.
<code>start_idx</code>	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

Summary of DBMS_MGWMSG Subprograms

Table 59–21 DBMS_MGWMSG Package Subprograms

Subprogram	Description
LCR_TO_XML Function on page 59-22	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD) to a SYS.XMLTYPE object
NVARRAY_ADD Procedure on page 59-23	Appends a name-value element to the end of a name-value array
NVARRAY_FIND_NAME Function on page 59-24	Searches a name-value array for the element with the name you specify in p_name
NVARRAY_FIND_NAME_TYPE Function on page 59-25	Searches a name-value array for an element with the name and value type you specify
NVARRAY_GET Function on page 59-26	Gets the name-value element of the name you specify in p_name from a name-value array
NVARRAY_GET_BOOLEAN Function on page 59-27	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
NVARRAY_GET_BYTE Function on page 59-28	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
NVARRAY_GET_DATE Function on page 59-29	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type
NVARRAY_GET_DOUBLE Function on page 59-30	Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type
NVARRAY_GET_FLOAT Function on page 59-31	Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type
NVARRAY_GET_INTEGER Function on page 59-32	Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type
NVARRAY_GET_LONG Function on page 59-33	Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type
NVARRAY_GET_RAW Function on page 59-34	Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type
NVARRAY_GET_SHORT Function on page 59-35	Gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type
NVARRAY_GET_TEXT Function on page 59-36	Gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type
XML_TO_LCR Function on page 59-37	Converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD)

LCR_TO_XML Function

This function converts a `SYS.ANYDATA` object encapsulating a row LCR (Logical Change Record, in this case a `LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`) to a `SYS.XMLTYPE` object.

See Also: [XML_TO_LCR Function](#) on page 59-37

Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
  p_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

Parameters

Table 59-22 LCR_TO_XML Function Parameters

Parameter	Description
<code>p_anydata</code>	An <code>ANYDATA</code> object to be converted

Return Values

Returns a `SYS.XMLTYPE` object.

Usage Notes

An exception is raised if the encapsulated type `p_anydata` is not an LCR.

NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (  
    p_array IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_value IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

Table 59–23 NVARRAY_ADD Procedure Parameters

Parameter	Description
p_array	On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.
p_value	The value to add. If NULL, then p_array is not changed.

NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN BINARY_INTEGER;
```

Parameters

Table 59–24 NVARRAY_FIND_NAME Function Parameters

Parameters	Description
<code>p_array</code>	The name-value array to search
<code>p_name</code>	The name to find
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.

NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_type     IN BINARY_INTEGER
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 59–25 NVARRAY_FIND_NAME_TYPE Function Parameters

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in Table 59–1 on page 59-4.
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

NVARARRAY_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

Syntax

```
DBMS_MGWMSG.NVARARRAY_GET (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 59–26 *NVARARRAY_GET Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the matching element, or `NULL` if the specified name is not found.

NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `BOOLEAN_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
  p_array      IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name       IN VARCHAR2,
  p_compare    IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–27 NVARRAY_GET_BOOLEAN Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `BYTE_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN INTEGER;
```

Parameters

Table 59–28 NVARRAY_GET_BYTE Function

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DATE_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

Parameters

Table 59–29 NVARRAY_GET_DATE Function Parameters

Parameters	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DOUBLE_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARARRAY_GET_DOUBLE (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 59–30 *NVARARRAY_GET_DOUBLE Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `FLOAT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 59–31 NVARRAY_GET_FLOAT Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_INTEGER Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `INTEGER_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–32 *NVARRAY_GET_INTEGER Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `LONG_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 59–33 NVARRAY_GET_LONG Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `RAW_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 59–34 NVARRAY_GET_RAW Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `SHORT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–35 NVARRAY_GET_SHORT Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `TEXT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;
```

Parameters

Table 59–36 NVARRAY_GET_TEXT Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

XML_TO_LCR Function

This function converts a `SYS.XMLTYPE` object to a `SYS.ANYDATA` object encapsulating a row LCR (`LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`).

See Also: [LCR_TO_XML Function](#) on page 59-22

Syntax

```
DBMS_MGWMSG.XML_TO_LCR (  
    p_xmldata IN SYS.XMLTYPE )  
    RETURN SYS.ANYDATA;
```

Parameters

Table 59-37 XML_TO_LCR Function Parameters

Parameter	Description
<code>p_xmldata</code>	An <code>XMLTYPE</code> object representing an LCR

Return Values

Returns a `SYS.ANYDATA` object.

Usage Notes

An exception is raised if `p_xmldata` cannot be converted to an LCR.

DBMS_MONITOR

The DBMS_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- [Summary of DBMS_MONITOR Subprograms](#)

Summary of DBMS_MONITOR Subprograms

Table 60–1 DBMS_MONITOR Package Subprograms

Subprogram	Description
CLIENT_ID_STAT_DISABLE Procedure on page 60-3	Disables statistic gathering previously enabled for a given Client Identifier
CLIENT_ID_STAT_ENABLE Procedure on page 60-4	Enables statistic gathering for a given Client Identifier
CLIENT_ID_TRACE_DISABLE Procedure on page 60-5	Disables the trace previously enabled for a given Client Identifier globally for the database
CLIENT_ID_TRACE_ENABLE Procedure on page 60-6	Enables the trace for a given Client Identifier globally for the database
DATABASE_TRACE_DISABLE Procedure on page 60-7	Disables SQL trace for the whole database or a specific instance
DATABASE_TRACE_ENABLE Procedure on page 60-8	Enables SQL trace for the whole database or a specific instance
SERV_MOD_ACT_STAT_DISABLE Procedure on page 60-9	Disables statistic gathering enabled for a given combination of Service Name, MODULE and ACTION
SERV_MOD_ACT_STAT_ENABLE Procedure on page 60-10	Enables statistic gathering for a given combination of Service Name, MODULE and ACTION
SERV_MOD_ACT_TRACE_DISABLE Procedure on page 60-12	Disables the trace for ALL enabled instances for a or a given combination of Service Name, MODULE and ACTION name globally
SERV_MOD_ACT_TRACE_ENABLE Procedure on page 60-13	Enables SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified
SESSION_TRACE_DISABLE Procedure on page 60-15	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
SESSION_TRACE_ENABLE Procedure on page 60-16	Enables the trace for a given database session identifier (SID) on the local instance

CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V\$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(  
    client_id          IN  VARCHAR2);
```

Parameters

Table 60–2 CLIENT_ID_STAT_DISABLE Procedure Parameters

Parameter	Description
client_id	The Client Identifier for which statistic aggregation is disabled.

Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V\$CLIENT_STATS views.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(  
    client_id          IN  VARCHAR2);
```

Parameters

Table 60–3 CLIENT_ID_STAT_ENABLE Procedure Parameters

Parameter	Description
client_id	The Client Identifier for which statistic aggregation is enabled.

Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(  
  client_id          IN  VARCHAR2);
```

Parameters

Table 60–4 CLIENT_ID_TRACE_DISABLE Procedure Parameters

Parameter	Description
client_id	The Client Identifier for which SQL tracing is disabled.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(  
  client_id  IN  VARCHAR2,  
  waits      IN  BOOLEAN DEFAULT TRUE,  
  binds      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 60–5 CLIENT_ID_TRACE_ENABLE Procedure Parameters

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled.
waits	If TRUE, wait information is present in the trace.
binds	If TRUE, bind information is present in the trace.

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,  
FALSE);
```

DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(  
    instance_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–6 DATABASE_TRACE_DISABLE Procedure Parameters

Parameter	Description
instance_name	Disables tracing for the named instance

DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(  
    waits          IN BOOLEAN DEFAULT TRUE,  
    binds          IN BOOLEAN DEFAULT FALSE,  
    instance_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–7 DATABASE_TRACE_ENABLE Procedure Parameters

Parameter	Description
waits	If TRUE, wait information will be present in the trace
binds	If TRUE, bind information will be present in the trace
instance_name	If set, restricts tracing to the named instance

SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V\$SERV_MOD_ACT_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2,
  action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 60–8 *SERV_MOD_ACT_STAT_DISABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which statistic aggregation is disabled.
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V\$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE (
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 60–9 *SERV_MOD_ACT_STAT_ENABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled.
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for a module specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'PAYROLL' );
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'GLEDGER', 'DEBIT_ENTRY' );
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.

- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.

SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2,
  action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS,
  instance_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–10 *SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name.

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
  DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
  FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
  DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1', 'PAYROLL');
```

SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an `instance_name` is specified.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2 DEFAULT ANY_MODULE,
  action_name   IN VARCHAR2 DEFAULT ANY_ACTION,
  waits         IN BOOLEAN DEFAULT TRUE,
  binds         IN BOOLEAN DEFAULT FALSE,
  instance_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–11 *SERV_MOD_ACT_TRACE_ENABLE Procedure Parameters*

Parameter	Description
<code>service_name</code>	Name of the service for which tracing is enabled.
<code>module_name</code>	Name of the MODULE. An optional additional qualifier for the service.
<code>action_name</code>	Name of the ACTION. An optional additional qualifier for the Service and MODULE name.
<code>waits</code>	If TRUE, wait information is present in the trace.
<code>binds</code>	If TRUE, bind information is present in the trace.
<code>instance_name</code>	If set, this restricts tracing to the named <code>instance_name</code> .

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The `instance_name` parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the `trcsess` tool to collect it into a single file.
- Specifying NULL for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
  DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
```

```
FALSE, NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',  
DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
  session_id      IN      BINARY_INTEGER DEFAULT NULL,
  serial_num      IN      BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 60–12 *SESSION_TRACE_DISABLE Procedure Parameters*

Parameter	Description
session_id	Name of the service for which SQL trace is disabled.
serial_num	Serial number for this session.

Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE (
    session_id  IN  BINARY_INTEGER DEFAULT NULL,
    serial_num  IN  BINARY_INTEGER DEFAULT NULL,
    waits       IN  BOOLEAN DEFAULT TRUE,
    binds       IN  BOOLEAN DEFAULT FALSE)
```

Parameters

Table 60–13 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
session_id	Database Session Identifier for which SQL tracing is enabled. Specifying NULL means that my current session should be traced.
serial_num	Serial number for this session. Specifying NULL means that any session which matches session_id (irrespective of serial number) should be traced.
waits	If TRUE, wait information is present in the trace.
binds	If TRUE, bind information is present in the trace.

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If serial_num is NULL but session_id is specified, a session with a given session_id is traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

DBMS_MVIEW

DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

Note: DBMS_SNAPSHOT is a synonym for DBMS_MVIEW.

- [Summary of DBMS_MVIEW Subprograms](#)

Using DBMS_MVIEW

This section contains topics which relate to using the DBMS_MVIEW package.

- [Operational Notes](#)
- [Rules and Limits](#)

Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN . . END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

Rules and Limits

The `EXPLAIN_REWRITE` procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the `EXPLAIN_MVIEW` procedure.

Summary of DBMS_MVIEW Subprograms

Table 61-1 DBMS_MVIEW Package Subprograms

Subprogram	Description
BEGIN_TABLE_REORGANIZATION Procedure on page 61-6	Performs a process to preserve materialized view data needed for refresh
END_TABLE_REORGANIZATION Procedure on page 61-7	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
ESTIMATE_MVIEW_SIZE Procedure on page 61-8	Estimates the size of a materialized view that you might create, in bytes and rows
EXPLAIN_MVIEW Procedure on page 61-9	Explains what is possible with a materialized view or potential materialized view
EXPLAIN_REWRITE Procedure on page 61-10	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
I_AM_A_REFRESH Function on page 61-12	Returns the value of the I_AM_REFRESH package state
PMARKER Function on page 61-13	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
PURGE_DIRECT_LOAD_LOG Procedure on page 61-14	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
PURGE_LOG Procedure on page 61-15	Purges rows from the materialized view log
PURGE_MVIEW_FROM_LOG Procedure on page 61-16	Purges rows from the materialized view log
REFRESH Procedures on page 61-17	Refreshes one or more materialized views that are not members of the same refresh group
REFRESH_ALL_MVIEWS Procedure on page 61-19	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
REFRESH_DEPENDENT Procedures on page 61-20	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
REGISTER_MVIEW Procedure on page 61-22	Enables the administration of individual materialized views
UNREGISTER_MVIEW Procedure on page 61-24	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (  
    tabowner    IN    VARCHAR2,  
    tabname     IN    VARCHAR2);
```

Parameters

Table 61-2 *BEGIN_TABLE_REORGANIZATION Procedure Parameters*

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (  
    tabowner    IN    VARCHAR2,  
    tabname     IN    VARCHAR2);
```

Parameters

Table 61-3 *END_TABLE_REORGANIZATION Procedure Parameters*

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW. ESTIMATE_MVIEW_SIZE (  
    stmt_id      IN VARCHAR2,  
    select_clause IN VARCHAR2,  
    num_rows     OUT NUMBER,  
    num_bytes    OUT NUMBER);
```

Parameters

Table 61–4 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
stmt_id	Arbitrary string used to identify the statement in an EXPLAIN PLAN
select_clause	The SELECT statement to be analyzed
num_rows	Estimated cardinality
num_bytes	Estimated number of bytes

EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call `DBMS_MVIEW.EXPLAIN_MVIEW`, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the `SELECT` string or `CREATE MATERIALIZED VIEW` statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called `MV_CAPABILITIES_TABLE`, which is the default, or to an array called `MSG_ARRAY`.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to `MV_CAPABILITIES_TABLE`.
- The second version is for explaining an existing or potential materialized view with output to a `VARRAY`.

Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
  mv          IN VARCHAR2,
  statement_id IN VARCHAR2:= NULL);
```

```
DBMS_MVIEW.EXPLAIN_MVIEW (
  mv          IN VARCHAR2,
  msg_array   OUT SYS.ExplainMVArrayType);
```

Parameters

Table 61–5 *EXPLAIN_MVIEW Procedure Parameters*

Parameter	Description
<code>mv</code>	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a <code>SELECT</code> statement or a <code>CREATE MATERIALIZED VIEW</code> statement for a potential materialized view.
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of <code>EXPLAIN_MVIEW</code>
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_MVIEW</code> 's output to a PL/SQL <code>VARRAY</code> rather than <code>MV_CAPABILITIES_TABLE</code> .

Usage Notes

You must run the `utlxmv.sql` script to create `MV_CAPABILITIES_TABLE` in the current schema prior to calling `EXPLAIN_MVIEW` except when you direct output to a `VARRAY`. The script is found in the `ADMIN` directory.

EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

A demo file, `xrwutl.sql`, is available to help format the output from EXPLAIN_REWRITE.

Syntax

You can obtain the output from `DBMS_MVIEW.EXPLAIN_REWRITE` in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
  query          VARCHAR2,
  mv             VARCHAR2(30),
  statement_id   VARCHAR2(30));
```

You can create an output table called `REWRITE_TABLE` by executing the `utl_xrw.sql` script.

The `query` parameter is a text string representing the SQL query. The parameter, `mv`, is a fully qualified materialized view name in the form of `schema.mv`. This is an optional parameter. When it is not specified, `EXPLAIN_REWRITE` returns any relevant messages regarding all the materialized views considered for rewriting the given query. When `schema` is omitted and only `mv` is specified, `EXPLAIN_REWRITE` looks for the materialized view in the current schema.

If you want to direct the output of `EXPLAIN_REWRITE` to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
  query          [VARCHAR2 | CLOB],
  mv             VARCHAR2(30),
  output_array   SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, `EXPLAIN_REWRITE` can be easily invoked with the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN . . . END` block, as shown in the examples in `/rdbms/demo/smxrw*`.

You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

Parameters

Table 61–6 *EXPLAIN_REWRITE Procedure Parameters*

Parameter	Description
<code>query</code>	SQL <code>SELECT</code> statement to be explained
<code>mv</code>	The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code> . For multiple materialized views, you can provide a comma-delimited list of names.
<code>statement_id</code>	A client-supplied unique identifier to distinguish output messages
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code> 's output to a PL/SQL <code>VARRAY</code> .

Usage Notes

To obtain the output into a table, you must run the `utl_xrw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

I_AM_A_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH  
RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(  
    rid IN ROWID)  
RETURN NUMBER;
```

Parameters

Table 61-7 *PMARKER Procedure Parameters*

Parameter	Description
rid	The rowid of a row entry in a master table

PURGE_DIRECT_LOAD_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

See Also: *Oracle Database Data Warehousing Guide* for more information

Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG ( ) ;
```

PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

```
DBMS_MVIEW.PURGE_LOG (
  master      IN   VARCHAR2,
  num         IN   BINARY_INTEGER := 1,
  flag        IN   VARCHAR2      := 'NOP');
```

Parameters

Table 61–8 *PURGE_LOG Procedure Parameters*

Parameter	Description
master	Name of the master table or master materialized view.
num	<p>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 2);</pre> <p>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</pre> <p>This statement completely purges the materialized view log that corresponds to <code>master_table</code> if fewer than 9999 materialized views are based on <code>master_table</code>. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</p>
flag	<p>Specify <code>delete</code> to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter <code>num</code>. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');</pre>

PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its `mview_id` or the combination of the `mviewowner`, `mviewname`, and the `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
  mview_id      IN   BINARY_INTEGER |
  mviewowner    IN   VARCHAR2,
  mviewname     IN   VARCHAR2,
  mviewsite     IN   VARCHAR2);
```

Note: This procedure is overloaded. The `mview_id` parameter is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

Parameters

Table 61–9 *PURGE_MVIEW_FROM_LOG Procedure Parameters*

Parameter	Description
<code>mview_id</code>	<p>If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the <code>mview_id</code> parameter. Query the <code>DBA_BASE_TABLE_MVIEWS</code> view at the materialized view log site for a listing of materialized view IDs.</p> <p>Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (<code>DBA_REGISTERED_MVIEWS</code>).</p>
<code>mviewowner</code>	<p>If you do not specify an <code>mview_id</code>, enter the owner of the target materialized view using the <code>mviewowner</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view owners.</p>
<code>mviewname</code>	<p>If you do not specify an <code>mview_id</code>, enter the name of the target materialized view using the <code>mviewname</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view names.</p>
<code>mviewsite</code>	<p>If you do not specify an <code>mview_id</code>, enter the site of the target materialized view using the <code>mviewsite</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view sites.</p>

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```
DBMS_MVIEW.REFRESH (
  { list          IN    VARCHAR2,
  | tab          IN    DBMS_UTILITY.UNCL_ARRAY, }
  method        IN    VARCHAR2      := NULL,
  rollback_seg  IN    VARCHAR2      := NULL,
  push_deferred_rpc IN    BOOLEAN    := true,
  refresh_after_errors IN    BOOLEAN  := false,
  purge_option  IN    BINARY_INTEGER := 1,
  parallelism   IN    BINARY_INTEGER := 0,
  heap_size     IN    BINARY_INTEGER := 0,
  atomic_refresh IN    BOOLEAN      := true,
  nested        IN    BOOLEAN      := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 61–10 REFRESH Procedure Parameters

Parameter	Description
<code>list</code> <code>tab</code>	<p>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</p>
<code>method</code>	<p>A string of refresh methods indicating how to refresh the listed materialized views. An <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH ('countries_mv,regions_mv,hr.employees_mv','cf');</pre> <p>This statement performs a complete refresh of the <code>countries_mv</code> materialized view, a fast refresh of the <code>regions_mv</code> materialized view, and a default refresh of the <code>hr.employees</code> materialized view.</p>
<code>rollback_seg</code>	<p>Name of the materialized view site rollback segment to use while refreshing materialized views</p>

Table 61–10 (Cont.) REFRESH Procedure Parameters

Parameter	Description
<code>push_deferred_rpc</code>	Used by updatable materialized views only. Set this parameter to <code>true</code> if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
<code>refresh_after_errors</code>	If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
<code>purge_option</code>	If you are using the parallel propagation mechanism (in other words, <code>parallelism</code> is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set <code>purge</code> to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute <code>PUSH</code> with this parameter set to 2 to reduce the queue.
<code>parallelism</code>	0 specifies serial propagation. $n > 1$ specifies parallel propagation with n parallel processes. 1 specifies parallel propagation using only one parallel process.
<code>heap_size</code>	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. Note: Do not set this parameter unless directed to do so by Oracle Support Services.
<code>atomic_refresh</code>	If this parameter is set to <code>true</code> , then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to <code>false</code> , then each of the materialized views is refreshed in a separate transaction.
<code>nested</code>	If <code>true</code> , then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
  number_of_failures  OUT  BINARY_INTEGER,
  method              IN   VARCHAR2         := NULL,
  rollback_seg        IN   VARCHAR2         := NULL,
  refresh_after_errors IN  BOOLEAN          := false,
  atomic_refresh      IN   BOOLEAN          := true);
```

Parameters

Table 61–11 REFRESH_ALL_MVIEWS Procedure Parameters

Parameter	Description
number_of_failures	Returns the number of failures that occurred during processing
method	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.

REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
  number_of_failures    OUT    BINARY_INTEGER,
  { list                IN     VARCHAR2,
  | tab                 IN     DBMS_UTILITY.UNCL_ARRAY, }
  method                IN     VARCHAR2      := NULL,
  rollback_seg          IN     VARCHAR2      := NULL,
  refresh_after_errors  IN     BOOLEAN       := false,
  atomic_refresh        IN     BOOLEAN       := true,
  nested                IN     BOOLEAN       := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 61–12 REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
<code>number_of_failures</code>	Returns the number of failures that occurred during processing
<code>list</code> <code>tab</code>	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a table.

Table 61–12 (Cont.) REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
method	<p>A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH_DEPENDENT ('employees,departments,hr.regions','cf');</pre> <p>performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.</p>
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	<p>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.</p> <p>If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.</p>
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
  mviewowner  IN   VARCHAR2,
  mviewname   IN   VARCHAR2,
  mviewsite   IN   VARCHAR2,
  mview_id    IN   DATE | BINARY_INTEGER,
  flag        IN   BINARY_INTEGER,
  qry_txt     IN   VARCHAR2,
  rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 61–13 REGISTER_MVIEW Procedure Parameters

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	<p>A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following:</p> <p>DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view</p> <p>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view</p> <p>DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view</p> <p>DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed</p> <p>DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable</p> <p>A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter:</p> <p>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW</p> <p>You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.</p>
qry_txt	The first 32,000 bytes of the materialized view definition query.

Table 61–13 (Cont.) REGISTER_MVIEW Procedure Parameters

Parameter	Description
rep_type	<p>Version of the materialized view. Valid constants that can be assigned include the following:</p> <p>DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site</p> <ul style="list-style-type: none"> ■ DBMS_MVIEW.REG_V8_SNAPSHOT <p>reg_repapi_snapshot if the materialized view is at an Oracle database version 8.x or higher site</p> <p>DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site</p>

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same `mviewowner`, `mviewname`, and `mviewsite`, then the most recent values for `mview_id`, `flag`, and `qry_txt` are stored. If a query exceeds the maximum VARCHAR2 size, then `qry_txt` contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of `mview_id` must be looked up in the materialized view data dictionary views by the person who calls the procedure.

UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (  
    mviewowner      IN   VARCHAR2,  
    mviewname       IN   VARCHAR2,  
    mviewsite       IN   VARCHAR2);
```

Parameters

Table 61–14 UNREGISTER_MVIEW Procedure Parameters

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

DBMS_OBFUSCATION_TOOLKIT

DBMS_OBFUSCATION_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

This chapter contains the following topics:

- [Using DBMS_OBFUSCATION_TOOLKIT](#)
 - Overview
 - Security Model

- [Summary of DBMS_OBFUSCATION Subprograms](#)

Using DBMS_OBFUSCATION_TOOLKIT

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search: 2^{112} or 2^{168} attempts instead of 2^{56} attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

Security Model

Oracle installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed. The package also grants access to the `PUBLIC` role so no explicit grant needs to be done.

Operational Notes

- [Key Management](#)
- [Storing the Key in the Database](#)
- [Storing the Key in the Operating System](#)
- [User-Supplied Keys](#)

Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The DBMS_OBFUSCATION_TOOLKIT package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package.

Furthermore, the encryption and decryption done by the DBMS_OBFUSCATION_TOOLKIT takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See *Oracle Database Advanced Security Administrator's Guide* for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.

The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

Storing the Key in the Database

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the DBMS_OBFUSCATION_TOOLKIT package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with SELECT access to EMP from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the EMP table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).

Storing the Key in the Operating System

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

User-Supplied Keys

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.

Summary of DBMS_OBFUSCATION Subprograms

Table 62–1 DBMS_OBFUSCATION Package Subprograms

Subprogram	Description
DES3DECRYPT Procedures and Functions on page 62-8	Generates the decrypted form of the input data
DES3ENCRYPT Procedures and Functions on page 62-10	Generates the encrypted form of the input data by passing it through the Triple DES encryption algorithm
DES3GETKEY Procedures and Functions on page 62-8	Takes a random value and uses it to generate an encryption key, using Triple DES
DESDECRYPT Procedures and Functions on page 62-13	Generates the decrypted form of the input data
DESENCRYPT Procedures and Functions on page 62-15	Generates the encrypted form of the input data
DESGETKEY Procedures and Functions on page 62-17	Takes a random value and uses it to generate an encryption key
MD5 Procedures and Functions on page 62-18	Generates MD5 hashes of data

DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "[DES3ENCRYPT Procedures and Functions](#)" on page 62-10.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input          IN   RAW,
  key            IN   RAW,
  decrypted_data OUT  RAW,
  which         IN   PLS_INTEGER DEFAULT TwoKeyMode
  iv           IN   RAW          DEFAULT NULL);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input_string   IN   VARCHAR2,
  key_string     IN   VARCHAR2,
  decrypted_string OUT VARCHAR2,
  which         IN   PLS_INTEGER DEFAULT TwoKeyMode
  iv_string     IN   VARCHAR2   DEFAULT NULL);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input          IN RAW,
  key            IN RAW,
  which         IN PLS_INTEGER DEFAULT TwoKeyMode
  iv           IN RAW          DEFAULT NULL)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input_string IN VARCHAR2,
  key_string   IN VARCHAR2,
  which       IN PLS_INTEGER DEFAULT TwoKeyMode
  iv_string   IN VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 62–2 *DES3DECRYPT Parameters for Raw Data*

Parameter	Description
input	Data to be decrypted
key	Decryption key
decrypted_data	Decrypted data
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector
input_string	String to be decrypted
key_string	Decryption key string
decrypted_string	Decrypted string
iv_string	Initialization vector

Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3ENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

Syntax

```

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input          IN    RAW,
  key            IN    RAW,
  encrypted_data OUT   RAW,
  which          IN    PLS_INTEGER DEFAULT TwoKeyMode
  iv            IN    RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input_string   IN    VARCHAR2,
  key_string     IN    VARCHAR2,
  encrypted_string OUT VARCHAR2,
  which          IN    PLS_INTEGER DEFAULT TwoKeyMode
  iv_string      IN    VARCHAR2   DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input          IN RAW,
  key            IN RAW,
  which          IN PLS_INTEGER DEFAULT TwoKeyMode
  iv            IN RAW          DEFAULT NULL)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input_string IN VARCHAR2,
  key_string   IN VARCHAR2,
  which        IN PLS_INTEGER DEFAULT TwoKeyMode
  iv_string    IN VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 62–3 *DES3ENCRYPT Parameters Procedure and Function*

Parameter	Description
input	Data to be encrypted.
key	Encryption key.
encrypted_data	Encrypted data.
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector.
input_string	String to be encrypted.
key_string	Encryption key string.
encrypted_string	Encrypted string.
iv_string	Initialization vector.

Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the `DES3ENCRYPT` procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The `DES3ENCRYPT` procedure uses the 2-key implementation by default.

You also have the option of providing an *initialization vector* (IV) with the `DES3ENCRYPT` procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL `DES3ENCRYPT` procedure is empty, then the procedure raises the error `ORA-28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the `DES3ENCRYPT` procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double encrypt data using the `DES3ENCRYPT` procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the `which` parameter, `ORA-28236 "Invalid Triple DES mode"` is generated. Only the values 0 (`TwoKeyMode`) and 1 (`ThreeKeyMode`) are valid.

Restrictions

The `DES3ENCRYPT` procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the `DES3ENCRYPT` function itself more than once to encrypt the same data using 3DES.)

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed       IN   RAW,
  key        OUT  RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed_string IN  VARCHAR2,
  key        OUT  VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which IN PLS_INTEGER DEFAULT TwoKeyMode,
  seed  IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed_string IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 62–4 *DES3GETKEY Procedure and Function Parameters*

Parameter	Description
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
seed	A value at least 80 characters long.
key	Encryption key.
seed_string	A value at least 80 characters long.
key	Encryption key.

DESDECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input          IN  RAW,
  key            IN  RAW,
  decrypted_data OUT RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input_string   IN  VARCHAR2,
  key_string     IN  VARCHAR2,
  decrypted_string OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input          IN  RAW,
  key            IN  RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input_string   IN  VARCHAR2,
  key_string     IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 62–5 *DESDECRYPT Procedure and Function Parameters*

Parameter	Description
input	Data to be decrypted.
key	Decryption key.
decrypted_data	Decrypted data.
input_string	String to be decrypted.
key_string	Decryption key string.
decrypted_string	Decrypted string.

Usage Notes

If the input data or key given to the PL/SQL DESDECRYPT function is empty, then Oracle raises ORA error 28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DESDECRYPT function is not a multiple of 8 bytes, Oracle raises ORA error 28232 "Invalid input size for Obfuscation toolkit."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Note: ORA-28233 is not applicable to the DESDECRYPT function.

Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

Note: The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.

DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input          IN   RAW,
  key            IN   RAW,
  encrypted_data OUT  RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input_string   IN   VARCHAR2,
  key_string     IN   VARCHAR2,
  encrypted_string OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input          IN RAW,
  key            IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input_string IN VARCHAR2,
  key_string  IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 62–6 *DESENCRYPT Procedure and Function Parameters*

Parameter	Description
input	Data to be encrypted.
key	Encryption key.
encrypted_data	Encrypted data.
input_string	String to be encrypted.
key_string	Encryption key string.
encrypted_string	Encrypted string.

Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the DESENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit."

If you try to double-encrypt data using the DESENCRYPT procedure, then the procedure raises the error ORA-28233 "Double encryption not supported."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Restrictions

The DESENCRYPT procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DESGETKEY Procedures and Functions

These subprograms take a random value and use it to generate an encryption key.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed      IN  RAW,
  key       OUT RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed_string IN VARCHAR2,
  key         OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed_string IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 62–7 *DESGETKEY Procedure and Function Parameters*

Parameter	Description
seed	A value at least 80 characters long.
key	Encryption key.
seed_string	A value at least 80 characters long.
key	Encryption key.

MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input          IN  RAW,
  checksum       OUT raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input_string   IN  VARCHAR2,
  checksum_string OUT varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input          IN RAW)
RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input_string IN VARCHAR2)
RETURN varchar2_checksum;
```

Parameters

Table 62–8 MD5 Procedure and Function Parameters

Parameter Name	Description
input	Data to be hashed
checksum	128-bit cryptographic message digest
input_string	Data to be hashed
checksum_string	128-bit cryptographic message digest

DBMS_ODCI package contains a single user function related to the use of Data Cartridges.

- *Oracle Database Data Cartridge Developer's Guide*

This chapter contains the following topic:

- [Summary of DBMS_ODCI Subprograms](#)

Summary of DBMS_ODCI Subprograms

Table 63–1 *DBMS_ODCI Package Subprograms*

Subprogram	Description
ESTIMATE_CPU_UNITS Function on page 63-3	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, `ESTIMATE_CPU_UNITS` considers the speed of a single processor.

Syntax

```
DBMS_ODCI.ESTIMATE_CPU_UNITS (  
    elapsed_time    NUMBER)  
RETURN NUMBER;
```

Parameters

Parameter	Description
<code>elapsed_time</code>	The elapsed time in seconds that it takes to execute a function.

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.

DBMS_OFFLINE_OG

The DBMS_OFFLINE_OG package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

- [Documentation of DBMS_OFFLINE_OG](#)

Documentation of DBMS_OFFLINE_OG

For a complete description of this package within the context of Replication, see DBMS_OFFLINE_OG in the *Oracle Database Advanced Replication Management API Reference*.

Note: With Oracle Database 10g, the DBMS_OLAP package has been replaced with improved technology. While Oracle recommends you not begin development using DBMS_OLAP, Oracle continues to support DBMS_OLAP, and your existing applications using DBMS_OLAP will continue to work.

- If you are developing new or substantially modified applications and had previously used the Summary Advisor in DBMS_OLAP, you should now use the SQL Access Advisor described in [Chapter 12, "DBMS_ADVISOR"](#).
 - If you had previously used DBMS_OLAP.VALIDATE_DIMENSION, you should now use DBMS_DIMENSION.VALIDATE_DIMENSION described in [Chapter 35, "DBMS_DIMENSION"](#).
 - If you had previously used DBMS_OLAP.ESTIMATE_MVIEW_SIZE, you should now use DBMS_MVIEW.ESTIMATE_MVIEW_SIZE described in [Chapter 61, "DBMS_MVIEW"](#).
-
-

The DBMS_OLAP package, presented here for reasons of backward compatibility, provides a collection of materialized view analysis and advisory functions that are callable from any PL/SQL program. Some of the functions generate output tables.

See Also: *Oracle Database Data Warehousing Guide* for more information.

This chapter contains the following topics:

- [Using DBMS_OLAP](#)

 - Views
 - Deprecated Subprograms
- [Summary of DBMS_OLAP Subprograms](#)

Using DBMS_OLAP

This section contains topics which relate to using the DBMS_OLAP package.

- [Overview](#)
- [Views](#)
- [Deprecated Subprograms](#)

Overview

DBMS_OLAP performs seven major functions, which include materialized view strategy recommendation, materialized view strategy evaluation, reporting and script generation, repository management, workload management, filter management, and dimension validation.

To perform materialized view strategy recommendation and evaluation functions, the workload information can either be provided by the user or synthesized by the Advisor engine. In the former case, cardinality information of all tables and materialized views referenced in the workload are required. In the latter case, dimension objects must be present and cardinality information for all dimension tables, fact tables, and materialized views are required. Cardinality information should be gathered with the `DBMS_STATS.GATHER_TABLE_STATS` procedure. Once these functions are completed, the analysis results can be presented with the reporting and script generation function.

The workload management function handles three types of workload, which are user-specified workload, SQL cache workload, and Oracle Trace workload. To process the user-specified workload, a user-defined workload table must be present in the user's schema. To process Oracle Trace workload, the Oracle Trace formatter must be run to preprocess collected workload statistics into default V-tables in the user's schema.

Views

Several views are created when using DBMS_OLAP. All are in the SYSTEM schema. To access these views, you must have a DBA role.

SYSTEM.MVIEW_EVALUATIONS

Table 65–1 SYSTEM.MVIEW_EVALUATIONS

Column	NULL?	Datatype	Description
RUNID	NOT NULL	NUMBER	Run ID identifying a unique Advisor call.
MVIEW_OWNER	-	VARCHAR2 (30)	Owner of materialized view.
MVIEW_NAME	-	VARCHAR2 (30)	Name of an exiting materialized view in this database.
RANK	NOT NULL	NUMBER	Rank of this materialized view in descending order of BENEFIT_TO_CSOT_RATIO.
STORAGE_IN_BYTES	-	NUMBER	Size of the materialized view in bytes.
FREQUENCY	-	NUMBER	Number of times this materialized view appears in the workload.
CUMULATIVE_BENEFIT	-	NUMBER	The cumulative benefit of the materialized view.
BENEFIT_TO_COST_RATIO	NOT NULL	NUMBER	The ratio of CUMULATIVE_BENEFIT to STORAGE_IN_BYTES.

SYSTEM.MVIEW_EXCEPTIONS

Table 65–2 SYSTEM.MVIEW_EXCEPTIONS

Column	NULL?	Datatype	Description
RUNID	-	NUMBER	Run ID identifying a unique Advisor call.
OWNER	-	VARCHAR2 (30)	Owner name.
TABLE_NAME	-	VARCHAR2 (30)	Table name.
DIMENSION_NAME	-	VARCHAR2 (30)	Dimension name.
RELATIONSHIP	-	VARCHAR2 (11)	Violated relation name.
BAD_ROWID	-	ROWID	Location of offending entry.

SYSTEM.MVIEW_FILTER

Table 65–3 SYSTEM.MVIEW_FILTER

Column	NULL?	Datatype	Description
FILTERID	NOT NULL	NUMBER	Unique number used to identify the operation that used this filter.
SUBFILTERNUM	NOT NULL	NUMBER	A unique ID number that groups all filter items together. A corresponding filter header record can be found in the MVIEW_LOG table.
SUBFILTERTYPE	-	VARCHAR2 (12)	Filter item number.

Table 65–3 (Cont.) SYSTEM.MVIEW_FILTER

Column	NULL?	Datatype	Description
STR_VALUE	-	VARCHAR2 (1028)	String attribute for items that require strings.
NUM_VALUE1	-	NUMBER	Numeric low for items that require numbers.
NUM_VALUE2	-	NUMBER	Numeric high for items that require numbers.
DATE_VALUE1	-	DATE	Date low for items that require dates.
DATE_VALUE2	-	DATE	Date high for items that require dates.

SYSTEM.MVIEW_FILTERINSTANCE**Table 65–4 SYSTEM.MVIEW_FILTERINSTANCE**

Column	NULL?	Datatype	Description
RUNID	NOT NULL	NUMBER	Unique number used to identify the operation that used this filter.
FILTERID	-	NUMBER	A unique ID number that groups all filter items together. A corresponding filter header record can be found in the MVIEW_LOG table.
SUBFILTERNUM	-	NUMBER	Filter item number.
SUBFILTERTYPE	-	VARCHAR2 (12)	Filter item type.
STR_VALUE	-	VARCHAR2 (1028)	String attribute for items that require strings.
NUM_VALUE1	-	NUMBER	Numeric low for items that require numbers.
NUM_VALUE2	-	NUMBER	Numeric high for items that require numbers.
DATE_VALUE1	-	DATE	Date low for items that require dates.
DATE_VALUE2	-	DATE	Date high for items that require dates.

SYSTEM.MVIEW_LOG**Table 65–5 SYSTEM.MVIEW_LOG**

Column	NULL?	Datatype	Description
ID	NOT NULL	NUMBER	Unique number used to identify the table entry. The number must be created using the CREATE_ID routine.
FILTERID	-	NUMBER	Optional filter ID. Zero indicates no user-supplied filter has been applied to the operation.
RUN_BEGIN	-	DATE	Date at which the operation began.
RUN_END	-	DATE	Date at which the operation ended.
TYPE	-	VARCHAR2 (11)	A name that identifies the type of operation.
STATUS	-	VARCHAR2 (11)	The current operational status.
MESSAGE	-	VARCHAR2 (2000)	Informational message indicating current operation or condition.
COMPLETED	-	NUMBER	Number of steps completed by operation.
TOTAL	-	NUMBER	Total number steps to be performed.
ERROR_CODE	-	VARCHAR2 (20)	Oracle error code in the event of an error.

SYSTEM.MVIEW_RECOMMENDATIONS

Table 65–6 SYSTEM.MVIEW_RECOMMENDATIONS

Column	NULL?	Datatype	Description
RUNID	-	NUMBER	Run ID identifying a unique Advisor call.
ALL_TABLES	-	VARCHAR2 (2000)	A comma-delimited list of fully qualified table names for structured recommendations.
FACT_TABLES	-	VARCHAR2 (1000)	A comma-delimited list of grouping levels, if any, for structured recommendation.
GROUPING_LEVELS	-	VARCHAR2 (2000)	-
QUERY_TEXT	-	LONG	Query text of materialized view if RECOMMENDED_ACTION is CREATE; null otherwise.
RECOMMENDATION_NUMBER	NOT NULL	NUMBER	Unique identifier for this recommendation.
RECOMMENDED_ACTION	-	VARCHAR2 (6)	CREATE, RETAIN, or DROP.
MVIEW_OWNER	-	VARCHAR2 (30)	Owner of the materialized view if RECOMMENDED_ACTION is RETAIN or DROP; null otherwise.
MVIEW_NAME	-	VARCHAR2 (30)	Name of the materialized view if RECOMMENDED_ACTION is RETAIN or DROP; null otherwise.
STORAGE_IN_BYTES	-	NUMBER	Actual or estimated storage in bytes.
PCT_PERFORMANCE_GAIN	-	NUMBER	The expected incremental improvement in performance obtained by accepting this recommendation relative to the initial condition, assuming that all previous recommendations have been accepted, or NULL if unknown.
BENEFIT_TO_COST_RATIO	NOT NULL	NUMBER	Ratio of the incremental improvement in performance to the size of the materialized view in bytes, or NULL if unknown.

SYSTEM.MVIEW_WORKLOAD

Table 65–7 SYSTEM.MVIEW_WORKLOAD

Column	NULL?	Datatype	Description
APPLICATION	-	VARCHAR2 (30)	Optional application name for the query.
CARDINALITY	-	NUMBER	Total cardinality of all of tables in query.
WORKLOADID	-	NUMBER	Workload ID identifying a unique sampling.
FREQUENCY	-	NUMBER	Number of times query executed.
IMPORT_TIME	-	DATE	Date at which item was collected.
LASTUSE	-	DATE	Last date of execution.
OWNER	-	VARCHAR2 (30)	User who last executed query.
PRIORITY	-	NUMBER	User-supplied ranking of query.
QUERY	-	LONG	Query text.

Table 65-7 (Cont.) SYSTEM.MVIEW_WORKLOAD

Column	NULL?	Datatype	Description
QUERYID	-	NUMBER	Id number identifying a unique query.
RESPONSETIME	-	NUMBER	Execution time in seconds.
RESULTSIZE	-	NUMBER	Total bytes selected by the query.

Deprecated Subprograms

The DBMS_OLAP subprograms have been replaced with improved technology: see [Chapter 12, "DBMS_ADVISOR"](#), [Chapter 35, "DBMS_DIMENSION"](#) and [Chapter 61, "DBMS_MVIEW"](#). All DBMS_OLAP subprograms are obsolete with Oracle Database 10g, and while Oracle will continue to support them, they are documented only for reasons of backward compatibility.

Summary of DBMS_OLAP Subprograms

Note: The DBMS_OLAP subprograms have been replaced with improved technology:

- If you are developing new or substantially modified applications and had previously used the Summary Advisor in DBMS_OLAP, you should now use the SQL Access Advisor described in [Chapter 12, "DBMS_ADVISOR"](#).
- If you had previously used DBMS_OLAP.VALIDATE_DIMENSION, you should now use DBMS_DIMENSION.VALIDATE_DIMENSION described in [Chapter 35, "DBMS_DIMENSION"](#).
- If you had previously used DBMS_OLAP.ESTIMATE_MVIEW_SIZE, you should now use DBMS_MVIEW.ESTIMATE_MVIEW_SIZE described in [Chapter 61, "DBMS_MVIEW"](#)

Table 65–8 DBMS_OLAP Package Subprograms

Subprogram	Description
ADD_FILTER_ITEM Procedure on page 65-11	Filters the contents being used during the recommendation process [see Deprecated Subprograms on page 65-8]
CREATE_ID Procedure on page 65-13	Generates an internal ID used by a new workload collection, a new filter, or a new Advisor run [see Deprecated Subprograms on page 65-8]
ESTIMATE_MVIEW_SIZE Procedure on page 65-14	Estimates the size of a materialized view that you might create, in bytes and rows [see Deprecated Subprograms on page 65-8]
EVALUATE_MVIEW_STRATEGY Procedure on page 65-15	Measures the utilization of each existing materialized view [see Deprecated Subprograms on page 65-8]
GENERATE_MVIEW_REPORT Procedure on page 65-16	Generates an HTML-based report on the given Advisor run [see Deprecated Subprograms on page 65-8]
GENERATE_MVIEW_SCRIPT Procedure on page 65-17	Generates a simple script containing the SQL commands to implement Summary Advisor recommendations [see Deprecated Subprograms on page 65-8]
LOAD_WORKLOAD_CACHE Procedure on page 65-18	Obtains a SQL cache workload [see Deprecated Subprograms on page 65-8]
LOAD_WORKLOAD_TRACE Procedure on page 65-19	Loads a workload collected by Oracle Trace [see Deprecated Subprograms on page 65-8]
LOAD_WORKLOAD_USER Procedure on page 65-20	Loads a user-defined workload [see Deprecated Subprograms on page 65-8]
PURGE_FILTER Procedure on page 65-21	Deletes a specific filter or all filters [see Deprecated Subprograms on page 65-8]
PURGE_RESULTS Procedure on page 65-22	Removes all results or those for a specific run [see Deprecated Subprograms on page 65-8]
PURGE_WORKLOAD Procedure on page 65-23	Deletes all workloads or a specific collection [see Deprecated Subprograms on page 65-8]

Table 65–8 (Cont.) DBMS_OLAP Package Subprograms

Subprogram	Description
RECOMMEND_MVIEW_STRATEGY Procedure on page 65-24	Generates a set of recommendations about which materialized views should be created, retained, or dropped [see Deprecated Subprograms on page 65-8]
SET_CANCELLED Procedure on page 65-26	Stops the Advisor if it takes too long returning results [see Deprecated Subprograms on page 65-8]
VALIDATE_DIMENSION Procedure on page 65-27	Verifies that the relationships specified in a <code>dimension</code> are correct [see Deprecated Subprograms on page 65-8]
VALIDATE_WORKLOAD_CACHE Procedure on page 65-28	Validates the SQL Cache workload before performing load operations [see Deprecated Subprograms on page 65-8]
VALIDATE_WORKLOAD_TRACE Procedure on page 65-29	Validates the Oracle Trace workload before performing load operations [see Deprecated Subprograms on page 65-8]
VALIDATE_WORKLOAD_USER Procedure on page 65-30	Validates the user-supplied workload before performing load operations [see Deprecated Subprograms on page 65-8]

ADD_FILTER_ITEM Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure adds a new filter item to an existing filter to make it more restrictive. It also creates a filter to restrict what is analyzed for the workload.

Syntax

```
ADD_FILTER_ITEM (
  filter_id      IN NUMBER,
  filter_name    IN VARCHAR2,
  string_list    IN VARCHAR2,
  number_min     IN NUMBER,
  number_max     IN NUMBER,
  date_min       IN VARCHAR2,
  date_max       IN VARCHAR2);
```

Parameters

Table 65–9 ADD_FILTER_ITEM Procedure Parameters

Parameter	Description
filter_id	An ID that uniquely describes the filter. It is generated by the DBMS_OLAP.CREATE_ID procedure
filter_name	<ul style="list-style-type: none"> ▪ APPLICATION: String-workloads application column. An example of how to load a SQL Cache workload follows. ▪ BASETABLE: String-based tables referenced by workload queries. Name must be fully qualified including owner and table name (for example, SH.SALES). ▪ CARDINALITY: Numerical-sum of cardinality of the referenced base tables. ▪ FREQUENCY: Numerical-workloads frequency column. ▪ LASTUSE: Date-workloads lastuse column. Not used by SQL Cache workload. ▪ OWNER: String-workloads owner column. Expected in uppercase unless owner defined explicitly to be not all in uppercase. ▪ PRIORITY: Numerical-workloads priority column. Not used by SQL Cache workload. ▪ RESPONSETIME: Numerical-workloads response time column. Not used by SQL Cache workload. ▪ SCHEMA: String-based schema referenced by workload filter. ▪ TRACENAME: String-list of oracle trace collection names. Only used by a Trace Workload.
string_list	A comma-delimited list of strings. This parameter is only used by the filter items of the string type.
number_min	The lower bound of a numerical range. NULL represents the lowest possible value. This parameter is only used by the parameters of the numerical type.
number_max	The upper bound of a numerical range, NULL for no upper bound. NULL represents the highest possible value. This parameter is only used by the parameters of the numerical type.

Table 65–9 (Cont.) ADD_FILTER_ITEM Procedure Parameters

Parameter	Description
date_min	The lower bound of a date range. NULL represents the lowest possible date value. This parameter is only used by the parameters of the date type.
date_max	The upper bound of a date range. NULL represents the highest possible date value. This parameter is only used by the parameters of the date type.

CREATE_ID Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure creates a unique identifier, which is used to identify a filter, a workload or results of an Advisor or dimension validation run.

Syntax

```
CALL DBMS_OLAP.CREATE_ID (  
    id          OUT NUMBER);
```

Parameters

Table 65–10 *CREATE_ID Procedure Parameters*

Parameter	Description
id	The unique identifier that can be used to identify a filter, a workload, or an Advisor run

ESTIMATE_MVIEW_SIZE Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_OLAP. ESTIMATE_MVIEW_SIZE (  
    stmt_id      IN VARCHAR2,  
    select_clause IN VARCHAR2,  
    num_rows     OUT NUMBER,  
    num_bytes    OUT NUMBER);
```

Parameters

Table 65–11 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
stmt_id	Arbitrary string used to identify the statement in an EXPLAIN PLAN
select_clause	The SELECT statement to be analyzed
num_rows	Estimated cardinality
num_bytes	Estimated number of bytes

EVALUATE_MVIEW_STRATEGY Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure measures the utilization of each existing materialized view based on the materialized view usage statistics collected from the workload. The `workload_id` is optional. If not provided, `EVALUATE_MVIEW_STRATEGY` uses a hypothetical workload.

Syntax

```
DBMS_OLAP.EVALUATE_MVIEW_STRATEGY (
  run_id          IN NUMBER,
  workload_id    IN NUMBER,
  filter_id      IN NUMBER);
```

Parameters

Table 65–12 *EVALUATE_MVIEW_STRATEGY Procedure Parameters*

Parameter	Description
<code>run_id</code>	An ID generated by the <code>DBMS_OLAP.CREATE_ID</code> procedure to identify results of a run
<code>workload_id</code>	An optional workload ID that maps to a workload in the current repository. Use the parameter <code>DBMS_OLAP.WORKLOAD_ALL</code> to choose all workloads.
<code>filter_id</code>	Specify filter for the workload to be used. The value <code>DBMS_OLAP.FILTER_NONE</code> indicates no filtering.

Usage Notes

Periodically, the unused results can be purged from the system by calling the `DBMS_OLAP.PURGE_RESULTS` procedure.

GENERATE_MVIEW_REPORT Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure generates an HTML-based report on the given Advisor run.

Syntax

```
DBMS_OLAP.GENERATE_MVIEW_REPORT (
    filename    IN VARCHAR2,
    id          IN NUMBER,
    flags       IN NUMBER);
```

Parameters

Table 65–13 *GENERATE_MVIEW_REPORT Procedure Parameters*

Parameter	Description
filename	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permissions.
id	An ID that identifies an Advisor run. Or use the parameter <code>DBMS_OLAP.RUNID_ALL</code> to indicate all Advisor runs should be reported.
flags	Bit masked flags indicating what sections should be reported <ul style="list-style-type: none"> ▪ <code>DBMS_OLAP.RPT_ACTIVITY</code> -- Overall activities ▪ <code>DBMS_OLAP.RPT_JOURNAL</code> -- Runtime journals ▪ <code>DBMS_OLAP.RPT_WORKLOAD_FILTER</code> -- Filters ▪ <code>DBMS_OLAP.RPT_WORKLOAD_DETAIL</code> -- Workload information ▪ <code>DBMS_OLAP.RPT_WORKLOAD_QUERY</code> -- Workload query information ▪ <code>DBMS_OLAP.RPT_RECOMMENDATION</code> -- Recommendations ▪ <code>DBMS_OLAP.RPT_USAGE</code> -- Materialized view usage ▪ <code>DBMS_OLAP.RPT_ALL</code> -- All sections

GENERATE_MVIEW_SCRIPT Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure generates a simple script containing the SQL commands to implement Summary Advisor recommendations.

Syntax

```
DBMS_OLAP.GENERATE_MVIEW_SCRIPT(
  filename      IN VARCHAR2,
  id            IN NUMBER,
  tspace       IN VARCHAR2);
```

Parameters

Table 65–14 *GENERATE_MVIEW_SCRIPT Procedure Parameters*

Parameter	Description
filename	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permissions.
id	An ID that identifies an Advisor run. The parameter <code>DBMS_OLAP.RUNID_ALL</code> indicates all Advisor runs should be reported.
tspace	Optional tablespace name to use when creating materialized views.

LOAD_WORKLOAD_CACHE Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure loads a SQL cache workload.

Syntax

```
DBMS_OLAP.LOAD_WORKLOAD_CACHE (
    workload_id IN NUMBER,
    flags       IN NUMBER,
    filter_id   IN NUMBER,
    application IN VARCHAR2,
    priority    IN NUMBER);
```

Parameters

Table 65–15 *LOAD_WORKLOAD_CACHE Procedure Parameters*

Parameter	Description
workload_id	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permission.
flags	<ul style="list-style-type: none"> ▪ <code>DBMS_OLAP.WORKLOAD_OVERWRITE</code>: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID. ▪ <code>DBMS_OLAP.WORKLOAD_APPEND</code>: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload. ▪ <code>DBMS_OLAP.WORKLOAD_NEW</code>: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error. <p>Note: the flags have the same behavior irrespective of the <code>LOAD_WORKLOAD</code> operation.</p>
filter_id	Specify filter for the workload to be loaded
application	The default business application name. This value will be used for a query if one is not found in the target workload.
priority	The default business priority to be assigned to every query in the target workload

LOAD_WORKLOAD_TRACE Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure loads an Oracle Trace workload.

Syntax

```
DBMS_OLAP.LOAD_WORKLOAD_TRACE (
  workload_id  IN NUMBER,
  flags        IN NUMBER,
  filter_id    IN NUMBER,
  application  IN VARCHAR2,
  priority     IN NUMBER,
  owner_name   IN VARCHAR2);
```

Parameters

Table 65–16 *LOAD_WORKLOAD_TRACE Procedure Parameters*

Parameter	Description
collectionid	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permission.
flags	<ul style="list-style-type: none"> ▪ <code>DBMS_OLAP.WORKLOAD_OVERWRITE</code>: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID. ▪ <code>DBMS_OLAP.WORKLOAD_APPEND</code>: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload. ▪ <code>DBMS_OLAP.WORKLOAD_NEW</code>: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error. <p>Note: the flags have the same behavior irrespective of the <code>LOAD_WORKLOAD</code> operation.</p>
filter_id	Specify filter for the workload to be loaded
application	The default business application name. This value will be used for a query if one is not found in the target workload.
priority	The default business priority to be assigned to every query in the target workload
owner_name	The schema that contains the Oracle Trace data. If omitted, the current user will be used

LOAD_WORKLOAD_USER Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure loads a user-defined workload.

Syntax

```
DBMS_OLAP.LOAD_WORKLOAD_USER (
  workload_id  IN    NUMBER,
  flags        IN    NUMBER,
  filter_id    IN    NUMBER,
  owner_name   IN    VARCHAR2,
  table_name   IN    VARCHAR2);
```

Parameters

Table 65–17 *LOAD_WORKLOAD_USER Procedure Parameters*

Parameter	Description
<code>workload_id</code>	The required id that was returned by the <code>DBMS_OLAP.CREATE_ID</code> call
<code>flags</code>	<ul style="list-style-type: none"> ■ <code>DBMS_OLAP.WORKLOAD_OVERWRITE</code>: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID ■ <code>DBMS_OLAP.WORKLOAD_APPEND</code>: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload ■ <code>DBMS_OLAP.WORKLOAD_NEW</code>: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error <p>Note: the flags have the same behavior irrespective of the <code>LOAD_WORKLOAD</code> operation.</p>
<code>filter_id</code>	Specify filter for the workload to be loaded
<code>owner_name</code>	The schema that contains the user supplied table or view
<code>table_name</code>	The table or view name containing valid workload data

PURGE_FILTER Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure removes a filter at any time. You can delete a specific filter or all filters.

Syntax

```
DBMS_OLAP.PURGE_FILTER (  
    filter_id    IN    NUMBER);
```

Parameters

Table 65–18 *PURGE_FILTER Procedure Parameters*

Parameter	Description
filter_id	The parameter DBMS_OLAP.FILTER_ALL indicates all filters should be removed.

PURGE_RESULTS Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

Many procedures in the DBMS_OLAP package generate output in system tables, such as recommendation results for RECOMMEND_MVIEW_STRATEGY and evaluation results for EVALUATE_MVIEW_STRATEGY, and dimension validation results for VALIDATE_DIMENSION. When these outputs are no longer required, they should be removed using the procedure PURGE_RESULTS. You can remove all results or those for a specific run.

Syntax

```
DBMS_OLAP.PURGE_RESULTS (
    run_id    IN    NUMBER);
```

Parameters

Table 65–19 PURGE_RESULTS Procedure Parameters

Parameter	Description
run_id	An ID generated with the DBMS_OLAP.CREATE_ID procedure. The ID should be associated with a RECOMMEND_MVIEW_STRATEGY or a EVALUATE_MVIEW_STRATEGY or a VALIDATE_DIMENSION run. Use the value DBMS_OLAP.RUNID_ALL to specify all such runs.

PURGE_WORKLOAD Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure removes workloads when they are no longer needed. You can delete all workloads or a specific collection.

Syntax

```
DBMS_OLAP.PURGE_WORKLOAD (  
    workload_id IN NUMBER);
```

Parameters

Table 65–20 *PURGE_WORKLOAD Procedure Parameters*

Parameter	Description
workload_id	An ID number originally assigned by the <code>create_id</code> call. If the value of <code>workload_id</code> is set to <code>DBMS_OLAP.WORKLOAD_ALL</code> , then all workloads for the current user will be deleted.

RECOMMEND_MVIEW_STRATEGY Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure generates a set of recommendations about which materialized views should be created, retained, or dropped, based on information in the workload (gathered by Oracle Trace, the user workload, or the SQL cache), and an analysis of table and column cardinality statistics gathered by the `DBMS_STATS.GATHER_TABLE_STATS` procedure.

`RECOMMEND_MVIEW_STRATEGY` requires that you have run the `GATHER_TABLE_STATS` procedure to gather table and column cardinality statistics and have collected and formatted the workload statistics.

The workload is aggregated to determine the count of each request in the workload, and this count is used as a weighting factor during the optimization process. If the `workload_id` is not provided, then `RECOMMEND_MVIEW_STRATEGY` uses a hypothetical workload based on dimension definitions and other embedded statistics.

The space of all dimensional materialized views that include the specified fact tables identifies the set of materialized views that optimize performance across the workload. The recommendation results are stored in system tables, which can be accessed through the view `SYSTEM.MVIEW_RECOMMENDATIONS`.

Syntax

```
DBMS_OLAP.RECOMMEND_MVIEW_STRATEGY (
  run_id           IN NUMBER,
  workload_id     IN NUMBER,
  filter_id       IN NUMBER,
  storage_in_bytes IN NUMBER,
  retention_pct   IN NUMBER,
  retention_list  IN VARCHAR2,
  fact_table_filter IN VARCHAR2);
```

Parameters

Table 65–21 *RECOMMEND_MVIEW_STRATEGY Procedure Parameters*

Parameter	Description
<code>run_id</code>	An ID generated by the <code>DBMS_OLAP.CREATE_ID</code> procedure to uniquely identify results of a run
<code>workload_id</code>	An optional workload ID that maps to a workload in the current repository. Use the parameter <code>DBMS_OLAP.WORKLOAD_ALL</code> to choose all workloads. If the <code>workload_id</code> is set to <code>NULL</code> , the call will use a hypothetical workload.
<code>filter_id</code>	An optional filter ID that maps to a set of user-supplied filter items. Use the parameter <code>DBMS_OLAP.FILTER_NONE</code> to avoid filtering.
<code>storage_in_bytes</code>	Maximum storage, in bytes, that can be used for storing materialized views. This number must be nonnegative.

Table 65–21 (Cont.) RECOMMEND_MVIEW_STRATEGY Procedure Parameters

Parameter	Description
retention_pct	Number between 0 and 100 that specifies the percent of existing materialized view storage that must be retained, based on utilization on the actual or hypothetical workload. A materialized view is retained if the cumulative space, ranked by utilization, is within the retention threshold specified (or if it is explicitly listed in <code>retention_list</code>). Materialized views that have a NULL utilization (for example, nondimensional materialized views) are always retained.
retention_list	A comma-delimited list of materialized view table names. A drop recommendation is not made for any materialized view that appears in this list.
fact_table_filter	Optional list of fact tables used to filter real or ideal workload

Usage Notes

Periodically, the unused results can be purged from the system by calling the `PURGE_RESULTS` procedure.

SET_CANCELLED Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

If the Summary Advisor takes too long to make its recommendations using the procedures RECOMMEND_MVIEW_STRATEGY, you can stop it by calling the procedure SET_CANCELLED and passing in the `run_id` for this recommendation process.

Syntax

```
DBMS_OLAP.SET_CANCELLED (  
    run_id      IN NUMBER);
```

Parameters

Table 65–22 SET_CANCELLED Procedure Parameters

Parameter	Description
<code>run_id</code>	ID that uniquely identifies an Advisor analysis operation. This call can be used to cancel a long running workload collection as well as an Advisor analysis session

VALIDATE_DIMENSION Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure verifies that the hierarchical and attribute relationships, and join relationships, specified in an existing dimension object are correct. This provides a fast way to ensure that referential integrity is maintained.

The validation results are stored in system tables, which can be accessed through the view `SYSTEM.MVIEW_EXCEPTIONS`.

Syntax

```
DBMS_OLAP.VALIDATE_DIMENSION (
  dimension_name  IN VARCHAR2,
  dimension_owner IN VARCHAR2,
  incremental     IN BOOLEAN,
  check_nulls    IN BOOLEAN,
  run_id         IN NUMBER);
```

Parameters

Table 65–23 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
<code>dimension_name</code>	Name of the dimension to analyze
<code>dimension_owner</code>	Name of the dimension owner
<code>incremental</code>	If TRUE, then tests are performed only for the rows specified in the <code>sumdelta\$</code> table for tables of this dimension; otherwise, check all rows.
<code>check_nulls</code>	<ul style="list-style-type: none"> ▪ If TRUE, then all level columns are verified to be non-NULL; otherwise, this check is omitted. ▪ Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
<code>run_id</code>	An ID generated by the <code>DBMS_OLAP.CREATE_ID</code> procedure to identify a run

Usage Notes

Periodically, the unused results can be purged from the system by calling the `PURGE_RESULTS` procedure.

VALIDATE_WORKLOAD_CACHE Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure validates the SQL Cache workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_CACHE (  
    valid          OUT NUMBER,  
    error         OUT VARCHAR2);
```

Parameters

Table 65–24 VALIDATE_WORKLOAD_USER Procedure Parameters

Parameter	Description
valid	Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID. Indicates whether a workload is valid
error	VARCHAR2, return error set

VALIDATE_WORKLOAD_TRACE Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure validates the Oracle Trace workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_TRACE (  
    owner_name      IN  VARCHAR2,  
    valid           OUT NUMBER,  
    error           OUT VARCHAR2);
```

Parameters

Table 65–25 VALIDATE_WORKLOAD_TRACE Procedure Parameters

Parameter	Description
owner_name	Owner of the trace workload table
valid	Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID. Indicates whether a workload is valid.
error	VARCHAR2, return error text

VALIDATE_WORKLOAD_USER Procedure

Note: See [Deprecated Subprograms](#) on page 65-8.

This procedure validates the user-supplied workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_USER (
  owner_name      IN VARCHAR2,
  table_name      IN VARCHAR2,
  valid           OUT NUMBER,
  error           OUT VARCHAR2);
```

Parameters

Table 65–26 VALIDATE_WORKLOAD_USER Procedure Parameters

Parameter	Description
owner_name	Owner of the user workload table
table_name	User workload table name
valid	Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID Indicate whether a workload is valid.
error	VARCHAR2, return error set

DBMS_OUTLN

The `DBMS_OUTLN` package, synonymous with `OUTLN_PKG`, contains the functional interface for subprograms associated with the management of stored outlines.

See Also: For more information about using the `DBMS_OUTLN` package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

This chapter contains the following topics:

- [Using DBMS_OUTLN](#)
 - Overview
 - Security Model
- [Summary of DBMS_OUTLN Subprograms](#)

Using DBMS_OUTLN

- [Overview](#)
- [Security Model](#)

Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

Summary of DBMS_OUTLN Subprograms

Table 66–1 DBMS_OUTLN Package Subprograms

Subprogram	Description
CLEAR_USED Procedure on page 66-6	Clears the outline 'used' flag
CREATE_OUTLINE Procedure on page 66-7	Generates outlines from the shared cursor identified by hash value and child number
DROP_BY_CAT Procedure on page 66-8	Drops outlines that belong to a specified category
DROP_UNUSED Procedure on page 66-9	Drops outlines that have never been applied in the compilation of a SQL statement
EXACT_TEXT_SIGNATURES Procedure on page 66-10	Updates outline signatures to those that compute based on exact text matching
UPDATE_BY_CAT Procedure on page 66-11	Changes the category of outlines in one category to a new category
UPDATE_SIGNATURES Procedure on page 66-12	Updates outline signatures to the current version's signature

CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (  
    name      IN      VARCHAR2);
```

Parameters

Table 66–2 *CLEAR_USED Procedure Parameters*

Parameter	Description
name	Name of the outline.

CREATE_OUTLINE Procedure

This procedure generates an outline from the shared cursor identified by hash value and child number.

Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (  
    hash_value    IN NUMBER,  
    child_number  IN NUMBER,  
    category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

Parameters

Table 66-3 CREATE_OUTLINE Procedure Parameters

Parameter	Description
hash_value	Hash value identifying the target shared cursor.
child_number	Child number of the target shared cursor.
category	Category in which to create outline (optional).

DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the `DEFAULT` category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

```
DBMS_OUTLN.DROP_BY_CAT (  
    cat VARCHAR2);
```

Parameters

Table 66–4 *DROP_BY_CAT Procedure Parameters*

Parameter	Description
cat	Category of outlines to drop.

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the `DEFAULT` category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

```
DBMS. OUTLN. EXACT_TEXT_SIGNATURES ;
```

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

```
DBMS.OUTLN.UPDATE_BY_CAT (  
  oldcat  VARCHAR2 default 'DEFAULT',  
  newcat  VARCHAR2 default 'DEFAULT');
```

Parameters

Table 66-5 *UPDATE_BY_CAT Procedure Parameters*

Parameter	Description
oldcat	The current category of outlines.
newcat	The new category of outlines.

UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

```
DBMS . OUTLN . UPDATE_SIGNATURES ;
```

Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

DBMS_OUTLN_EDIT

The DBMS_OUTLN_EDIT package is an invoker's rights package.

See Also: For more information about using the DBMS_OUTLN_EDIT package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

This chapter contains the following topic:

- [Summary of DBMS_OUTLN_EDIT Subprograms](#)

Summary of DBMS_OUTLN_EDIT Subprograms

Table 67–1 DBMS_OUTLN_EDIT Package Subprograms

Subprogram	Description
CHANGE_JOIN_POS Procedure on page 67-3	Changes the join position for the hint identified by outline name and hint number to the position specified by newpos
CREATE_EDIT_TABLES Procedure on page 67-4	Creates outline editing tables in calling a user's schema
DROP_EDIT_TABLES Procedure on page 67-5	Drops outline editing tables in calling the user's schema
GENERATE_SIGNATURE Procedure on page 67-6	Generates a signature for the specified SQL text
REFRESH_PRIVATE_OUTLINE Procedure on page 67-7	Refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints

CHANGE_JOIN_POS Procedure

This function changes the join position for the hint identified by outline name and hint number to the position specified by `newpos`.

Syntax

```
DBMS_OUTLN_EDIT.CHANGE_JOIN_POS (  
    name      VARCHAR2  
    hintno    NUMBER  
    newpos    NUMBER);
```

Parameters

Table 67-2 *CHANGE_JOIN_POS Procedure Parameters*

Parameter	Description
<code>name</code>	Name of the private outline to be modified.
<code>hintno</code>	Hint number to be modified.
<code>newpos</code>	New join position for the target hint.

CREATE_EDIT_TABLES Procedure

This procedure creates outline editing tables in calling a user's schema.

Syntax

```
DBMS_OUTLN_EDIT.CREATE_EDIT_TABLES;
```

Usage Notes

Beginning with Oracle Database 10g Release 1 (10.1) you will not need to use this statement because the outline editing tables will already exist as temporary tables in the `SYSTEM` schema.

DROP_EDIT_TABLES Procedure

This procedure drops outline editing tables in calling the user's schema.

Syntax

```
DBMS_OUTLN_EDIT.DROP_EDIT_TABLES;
```

GENERATE_SIGNATURE Procedure

This procedure generates a signature for the specified SQL text.

Syntax

```
DBMS_OUTLN.GENERATE_SIGNATURE (  
    sqltxt      IN  VARCHAR2,  
    signature   OUT RAW);
```

Parameters

Table 67–3 *GENERATE_SIGNATURE Procedure Parameters*

Parameter	Description
sqltxt	The specified SQL.
signature	The signature to be generated.

REFRESH_PRIVATE_OUTLINE Procedure

This procedure refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints.

Syntax

```
DBMS_OUTLN_EDIT.REFRESH_PRIVATE_OUTLINE (  
    name IN VARCHAR2);
```

Parameters

Table 67–4 REFRESH_PRIVATE_OUTLINE Procedure Parameters

Parameter	Description
name	Name of the private outline to be refreshed.

The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- [Using DBMS_OUTPUT](#)
 - Overview
 - Security Model
 - Operational Notes
 - Exceptions
 - Rules and Limits
 - Examples
- [Data Structures](#)
 - TABLE Types
 - OBJECT Types
- [Summary of DBMS_OUTPUT Subprograms](#)

Using DBMS_OUTPUT

This section contains topics which relate to using the DBMS_OUTPUT package.

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command DESCRIBE to procedures).

The [PUT Procedure](#) and [PUT_LINE Procedure](#) in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the [GET_LINE Procedure](#) and [GET_LINES Procedure](#).

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

Operational Notes

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.
- SQL*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking `DBMS_OUTPUT.ENABLE (buffer_size => NULL);`
with no limit on the output.
- You should generally avoid having application code invoke either the [DISABLE Procedure](#) or [ENABLE Procedure](#) because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

Note: Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

Exceptions

DBMS_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

Table 68-1 DBMS_OUTPUT Errors

Error	Description
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

Rules and Limits

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

Examples

Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here: '||:new.col||' is the new value');
```

If you have enabled the DBMS_OUTPUT package, then the text produced by this PUT_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
  DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to [GET_LINES Procedure](#) which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in ["Example 3: Retrieving Information About an Object"](#) on page 68-9.

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages  NUMBER(11, 2) := 0;
  counter      NUMBER(10) := 1;
BEGIN

  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal
      + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
      ' ; Wages = ' || TO_CHAR(total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
    TO_CHAR(total_wages));
  RETURN total_wages;

END dept_salary;
```

Assume the EMP table contains the following rows:

EMPNO	SAL	COMM	DEPT
1002	1500	500	20
1203	1000		30
1289	1000		10

```
1347          1000      250      20
```

Assume the user executes the following statements in SQL*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250
```

PL/SQL procedure successfully executed.

Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```

/*****
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                */
*****/
CREATE OR REPLACE PROCEDURE explain_out
(statement_id IN VARCHAR2) AS

-- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

CURSOR explain_rows IS
SELECT level, id, position, operation, options,
       object_name
FROM plan_table
WHERE statement_id = explain_out.statement_id
CONNECT BY PRIOR id = parent_id
       AND statement_id = explain_out.statement_id
START WITH id = 0
       ORDER BY id;

BEGIN

-- Loop through information retrieved from PLAN_TABLE:

FOR line IN explain_rows LOOP

-- At start of output, include heading with estimated cost.

IF line.id = 0 THEN
DBMS_OUTPUT.PUT_LINE ('Plan for statement '
|| statement_id
|| ', estimated cost = ' || line.position);
END IF;

-- Output formatted information. LEVEL determines indention level.

DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||

```

```
        line.operation || ' ' || line.options || ' ' ||  
        line.object_name);  
    END LOOP;  
  
END;
```

See Also: [Chapter 168, "UTL_FILE"](#)

Data Structures

The DBMS_OUTPUT package declares 2 collection types for use with the [GET_LINES Procedure](#).

TABLE Types

[CHARARR Table Type](#)

OBJECT Types

[DBMSOUTPUT_LINESARRAY Object Type](#)

CHARARR Table Type

This package type is to be used with the [GET_LINES Procedure](#) to obtain text submitted through the [PUT Procedure](#) and [PUT_LINE Procedure](#).

Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

DBMSOUTPUT_LINESARRAY Object Type

This package type is to be used with the [GET_LINES Procedure](#) to obtain text submitted through the [PUT Procedure](#) and [PUT_LINE Procedure](#).

Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS  
  VARRAY(2147483647) OF VARCHAR2(32767);
```

Summary of DBMS_OUTPUT Subprograms

Table 68–2 *DBMS_OUTPUT Package Subprograms*

Subprogram	Description
DISABLE Procedure on page 68-15	Disables message output
ENABLE Procedure on page 68-16	Enables message output
GET_LINE Procedure on page 68-17	Retrieves one line from buffer
GET_LINES Procedure on page 68-18	Retrieves an array of lines from buffer
NEW_LINE Procedure on page 68-19	Terminates a line created with PUT
PUT Procedure on page 68-20	Places a line in the buffer
PUT_LINE Procedure on page 68-21	Places partial line in buffer

Note: The [PUT Procedure](#) that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the [ENABLE Procedure](#), you do not need to call this procedure if you are using the `SERVEROUTPUT` option of SQL*Plus.

Syntax

```
DBMS_OUTPUT.DISABLE;
```

Pragmas

```
pragma restrict_references (disable, WNDS, RNDS);
```

ENABLE Procedure

This procedure enables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`. Calls to these procedures are ignored if the `DBMS_OUTPUT` package is not activated.

Syntax

```
DBMS_OUTPUT.ENABLE (  
    buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters

Table 68–3 *ENABLE Procedure Parameters*

Parameter	Description
<code>buffer_size</code>	Upper limit, in bytes, the amount of buffered information. Setting <code>buffer_size</code> to <code>NULL</code> specifies that there should be no limit.

Usage Notes

- It is not necessary to call this procedure when you use the `SET SERVEROUTPUT` option of `SQL*Plus`.
- If there are multiple calls to `ENABLE`, then `buffer_size` is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies `buffer_size` (`NOT NULL`).
- `NULL` is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (
  line    OUT VARCHAR2,
  status  OUT INTEGER);
```

Parameters

Table 68–4 *GET_LINE Procedure Parameters*

Parameter	Description
line	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small".
status	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.

GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (
    lines      OUT   CHARARR,
    numlines   IN OUT INTEGER);

DBMS_OUTPUT.GET_LINES (
    lines      OUT   DBMSOUTPUT_LINESARRAY,
    numlines   IN OUT INTEGER);
```

Parameters

Table 68–5 GET_LINES Procedure Parameters

Parameter	Description
lines	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the VARRAY overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
numlines	Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.

NEW_LINE Procedure

This procedure puts an end-of-line marker. The [GET_LINE Procedure](#) and the [GET_LINES Procedure](#) return "lines" as delimited by "newlines". Every call to the [PUT_LINE Procedure](#) or [NEW_LINE Procedure](#) generates a line that is returned by [GET_LINE\(S\)](#).

Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

PUT Procedure

This procedure places a partial line in the buffer.

Note: The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

Parameters

Table 68–6 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 68–7 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

PUT_LINE Procedure

This procedure places a line in the buffer.

Note: The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT_LINE (
    item IN VARCHAR2);
```

Parameters

Table 68–8 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 68–9 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2 DBMS_OUTPUT.PUT_LINE ('hello');
  3 DBMS_LOCK.SLEEP (10);
  4 END;
```

DBMS_PCLXUTIL

The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

See Also: There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

Using DBMS_PCLXUTIL

- [Overview](#)
- [Operational Notes](#)
- [Rules and Limits](#)

Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

```
CREATE INDEX <idx_name> on <tab_name>(…) local(…) unusable;
```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

1. Local index maintenance

By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The *force_opt* parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(…) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using *force_opt* = TRUE:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

Rules and Limits

Note: For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the `job_queue_processes` initialization parameter. Clearly, if the job processes are not started before calling `BUILD_PART_INDEX()`, then the package will not function properly. The background processes are specified by the following `init.ora` parameters:

```
job_queue_processes=n    #the number of background processes = n
```
- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the `j*.trc` trace files.

Summary of DBMS_PCLXUTIL Subprograms

Table 69–1 *DBMS_PCLXUTIL Package Subprograms*

Subprogram	Description
BUILD_PART_INDEX Procedure on page 69-7	Provides intra-partition parallelism for creating partition-wise local indexes

BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
  jobs_per_batch  IN NUMBER    DEFAULT 1,
  procs_per_job   IN NUMBER    DEFAULT 1,
  tab_name        IN VARCHAR2  DEFAULT NULL,
  idx_name        IN VARCHAR2  DEFAULT NULL,
  force_opt       IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 69–2 BUILD_PART_INDEX Procedure Parameters

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel query slaves to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX (2, 4, 'PROJECT', 'IDX', TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

Using DBMS_PIPE

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)

Overview

Pipe functionality has several potential applications:

- **External service interface:** You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- **Independent transactions:** The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- **Alerters (non-transactional):** You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.
- **Debugging:** Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- **Concentrator:** This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either [Public Pipes](#) or [Private Pipes](#).

Constants

```
maxwait  constant integer := 86400000; /* 1000 days */
```

This is the maximum time to wait attempting to send or receive a message.

Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of DBMS_PIPE is considered with regard to the following topics:

- [Public Pipes](#)
- [Writing and Reading Pipes](#)
- [Private Pipes](#)

Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the CREATE_PIPE function with the private flag set to FALSE. You must deallocate explicitly-created pipes by calling the REMOVE_PIPE function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Writing and Reading Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have EXECUTE permission on the DBMS_PIPE package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the PACK_MESSAGE procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the SEND_MESSAGE function, designating the pipe name to be used to send the message. When SEND_MESSAGE is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the RECEIVE_MESSAGE function, designating the pipe name from which to receive the message. The process then calls the UNPACK_MESSAGE procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the CREATE_PIPE function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the REMOVE_PIPE function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to `PACK_MESSAGE` before calling `SEND_MESSAGE`. Similarly, you must call `RECEIVE_MESSAGE` to retrieve the message before accessing the items in the message by calling `UNPACK_MESSAGE`.

Exceptions

DBMS_PIPE package subprograms can return the following errors:

Table 70-1 DBMS_PIPE Errors

Error	Description
ORA-23321:	Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

Examples

- [Example 1: Debugging - PL/SQL](#)
- [Example 3: Execute System Commands](#)
- [Example 4: External Service Interface](#)

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int      status;
    int      msg_length;
    char     retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "SCOTT/TIGER");
    username.len = strlen(username.arr);

    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;

    printf("connected\n");

    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)

```

```

    {
        EXEC SQL EXECUTE
        DECLARE
            len INTEGER;
            typ INTEGER;
            sta INTEGER;
            chr VARCHAR2(2000);
        BEGIN
            chr := '';
            sta := dbms_pipe.receive_message('plsql_debug');
            IF sta = 0 THEN
                DBMS_PIPE.UNPACK_MESSAGE(len);
                DBMS_PIPE.UNPACK_MESSAGE(chr);
            END IF;
            :status := sta;
            :retval := chr;
            IF len IS NOT NULL THEN
                :msg_length := len;
            ELSE
                :msg_length := 2000;
            END IF;
        END;
    END-EXEC;
    IF (status == 0)
        printf("\n%.*s\n", msg_length, retval);
    ELSE
        printf("abnormal status, value is %d\n", status);
    }
}

void sql_error()
{
    char msg[1024];
    int rlen, len;
    len = sizeof(msg);
    sqlglm(msg, &len, &rlen);
    printf("ORACLE ERROR\n");
    printf("%.*s\n", rlen, msg);
    exit(1);
}

```

Example 3: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the *system()* call or executing a SQL command using embedded SQL.

DAEMON.SQL is the source code for the PL/SQL package. This package contains procedures that use the DBMS_PIPE package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro*C daemon to execute the command *system("ls -la")*.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                      timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending. Status = ' ||
        status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
```

```
        RAISE_APPLICATION_ERROR(-20012,
        'Execute_system: Done not received.');
```

```
END IF;

DBMS_PIPE.UNPACK_MESSAGE(command_code);
DBMS_OUTPUT.PUT_LINE('System command executed.  result = ' ||
                    command_code);
RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                    timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);

BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SQL');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20020,
        'Execute_sql: Error while sending.  Status = ' || status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20021,
        'execute_sql: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
        RAISE_APPLICATION_ERROR(-20022,
        'execute_sql: done not received.');
```

```
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(command_code);
    DBMS_OUTPUT.PUT_LINE
        ('SQL command executed.  sqlcode = ' || command_code);
    RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE('STOP');
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20030,
        'stop: error while sending.  status = ' || status);
    END IF;
```

```

    END stop;
END daemon;

```

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

Note: To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```

#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
    char *uid = "scott/tiger";
    int status;
    VARCHAR command[20];
    VARCHAR value[2000];
    VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:\n");
    printf("%. *s\n", msg_length, msg_buffer);
    printf("Daemon quitting.\n");
    exit(1);
}

void
sql_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while executing:\n");
    printf("%. *s\n", msg_length, msg_buffer);
    printf("Daemon continuing.\n");
}

main()
{
    command.len = 20; /*initialize length components*/

```

```
value.len = 2000;
return_name.len = 30;
EXEC SQL WHENEVER SQLERROR DO connect_error();
EXEC SQL CONNECT :uid;
printf("Daemon connected.\n");

EXEC SQL WHENEVER SQLERROR DO sql_error();
printf("Daemon waiting...\n");
while (1) {
    EXEC SQL EXECUTE
        BEGIN
            :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
            IF :status = 0 THEN
                DBMS_PIPE.UNPACK_MESSAGE(:command);
            END IF;
        END;
    END-EXEC;
    IF (status == 0)
    {
        command.arr[command.len] = '\0';
        IF (!strcmp((char *) command.arr, "STOP"))
        {
            printf("Daemon exiting.\n");
            break;
        }

        ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
        {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
            value.arr[value.len] = '\0';
            printf("Will execute system command '%s'\n", value.arr);

            status = system(value.arr);
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.PACK_MESSAGE('done');
                    DBMS_PIPE.PACK_MESSAGE(:status);
                    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
                END;
            END-EXEC;

            IF (status)
            {
                printf
                    ("Daemon error while responding to system command.");
                printf(" status: %d\n", status);
            }
        }
        ELSE IF (!strcmp((char *) command.arr, "SQL")) {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
```

```

value.arr[value.len] = '\0';
printf("Will execute sql command '%s'\n", value.arr);

EXEC SQL WHENEVER SQLERROR CONTINUE;
EXEC SQL EXECUTE IMMEDIATE :value;
status = sqlca.sqlcode;

EXEC SQL WHENEVER SQLERROR DO sql_error();
EXEC SQL EXECUTE
  BEGIN
    DBMS_PIPE.PACK_MESSAGE('done');
    DBMS_PIPE.PACK_MESSAGE(:status);
    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
  END;
END-EXEC;

IF (status)
{
  printf("Daemon error while responding to sql command.");
  printf("  status: %d\n", status);
}
}
ELSE
{
  printf
    ("Daemon error: invalid command '%s' received.\n",
     command.arr);
}
}
ELSE
{
  printf("Daemon error while waiting for signal.");
  printf("  status = %d\n", status);
}
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

```

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

protocol_version	VARCHAR2	- '1', 10 bytes or less
returnpipe	VARCHAR2	- 30 bytes or less
service	VARCHAR2	- 30 bytes or less
arg1	VARCHAR2/NUMBER/DATE	
...		
argn	VARCHAR2/NUMBER/DATE	

The recommended format for returning the result is:

success	VARCHAR2	- 'SUCCESS' if OK, otherwise error message
arg1	VARCHAR2/NUMBER/DATE	
...		

```
argn                                VARCHAR2/NUMBER/DATE
```

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

```
<loop forever>
BEGIN dbms_stock_server.get_request(:stocksymbol); END;
<figure out price based on stocksymbol (probably from some radio
signal), set error if can't find such a stock>
BEGIN dbms_stock_server.return_price(:error, :price); END;
```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe  VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error: ' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                 INTEGER;
    service           VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error: ' || to_char(s) ||
        ' reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
```

```

BEGIN
  IF errormsg IS NULL THEN
    dbms_pipe.pack_message('SUCCESS');
    dbms_pipe.pack_message(price);
  ELSE
    dbms_pipe.pack_message(errormsg);
  END IF;
  s := dbms_pipe.send_message(returnpipe);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' sending on pipe');
  END IF;
END;

```

The procedure called by the client is:

```

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
RETURN VARCHAR2 IS
  s      INTEGER;
  price  VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1'); -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;

```

You would typically only GRANT EXECUTE on DBMS_STOCK_SERVICE to the stock service application server, and would only GRANT EXECUTE on stock_request to those users allowed to use the service.

Summary of DBMS_PIPE Subprograms

Table 70–2 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function on page 70-19	Creates a pipe (necessary for private pipes)
NEXT_ITEM_TYPE Function on page 70-21	Returns datatype of next item in buffer
PACK_MESSAGE Procedures on page 70-22	Builds message in local buffer
PURGE Procedure on page 70-24	Purges contents of named pipe
RECEIVE_MESSAGE Function on page 70-25	Copies message from named pipe into local buffer
REMOVE_PIPE Function on page 70-28	Removes the named pipe
RESET_BUFFER Procedure on page 70-27	Purges contents of local buffer
SEND_MESSAGE Function on page 70-29	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
UNIQUE_SESSION_NAME Function on page 70-31	Returns unique session name
UNPACK_MESSAGE Procedures on page 70-32	Accesses next item in buffer

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
    pipename      IN VARCHAR2,
    maxpipesize   IN INTEGER DEFAULT 8192,
    private       IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 70–3 CREATE_PIPE Function Parameters

Parameter	Description
<code>pipename</code>	<p>Name of the pipe you are creating.</p> <p>You must use this name when you call <code>SEND_MESSAGE</code> and <code>RECEIVE_MESSAGE</code>. This name must be unique across the instance.</p> <p>Caution: Do not use pipe names beginning with <code>ORA\$</code>. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.</p>
<code>maxpipesize</code>	<p>The maximum size allowed for the pipe, in bytes.</p> <p>The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default <code>maxpipesize</code> is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value use the existing, larger value.</p>
<code>private</code>	<p>Uses the default, <code>TRUE</code>, to create a private pipe.</p> <p>Public pipes can be implicitly created when you call <code>SEND_MESSAGE</code>.</p>

Return Values

Table 70–4 CREATE_PIPE Function Return Values

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 70–5 CREATE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `NEXT_ITEM_TYPE`.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values

Table 70–6 *NEXT_ITEM_TYPE* Function Return Values

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to `PACK_MESSAGE`. Then, call `SEND_MESSAGE` to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type `VARCHAR2`, `NCHAR`, `NUMBER`, `DATE`, `RAW` and `ROWID` items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than `VARCHAR` is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (
    item IN VARCHAR2);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NCHAR);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NUMBER);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN DATE);
```

```
DBMS_PIPE.PACK_MESSAGE_RAW (
    item IN RAW);
```

```
DBMS_PIPE.PACK_MESSAGE_ROWID (
    item IN ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

Table 70–7 *PACK_MESSAGE Procedure Parameters*

Parameter	Description
item	Item to pack into the local message buffer.

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

Syntax

```
DBMS_PIPE.PURGE (  
    pipename IN VARCHAR2);
```

Pragmas

```
pragma restrict_references (purge, WNDS, RNDS);
```

Parameters

Table 70–8 *PURGE Procedure Parameters*

Parameter	Description
pipename	Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

Usage Notes

Because `PURGE` calls `RECEIVE_MESSAGE`, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an `ORA-23322` (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (receive_message, WNDS, RNDS);
```

Parameters

Table 70–9 *RECEIVE_MESSAGE Function Parameters*

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA\$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

Return Values

Table 70–10 *RECEIVE_MESSAGE Function Return Values*

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is

overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Exceptions

Table 70–11 *RECEIVE_MESSAGE Function Exceptions*

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

RESET_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

Syntax

```
DBMS_PIPE.REMOVE_PIPE (
    pipename IN VARCHAR2)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

Parameters

Table 70–12 REMOVE_PIPE Function Parameters

Parameter	Description
pipename	Name of pipe that you want to remove.

Return Values

Table 70–13 REMOVE_PIPE Function Return Values

Return	Description
0	Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

Exceptions

Table 70–14 REMOVE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER DEFAULT MAXWAIT,
    maxpipesize   IN INTEGER DEFAULT 8192)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (send_message, WNDS, RNDS);
```

Parameters

Table 70–15 SEND_MESSAGE Function Parameters

Parameter	Description
<code>pipename</code>	<p>Name of the pipe on which you want to place the message.</p> <p>If you are using an explicit pipe, then this is the name that you specified when you called <code>CREATE_PIPE</code>.</p> <p>Caution: Do not use pipe names beginning with 'ORA\$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.</p>
<code>timeout</code>	<p>Time to wait while attempting to place a message on a pipe, in seconds.</p> <p>The default value is the constant <code>MAXWAIT</code>, which is defined as 86400000 (1000 days).</p>
<code>maxpipesize</code>	<p>Maximum size allowed for the pipe, in bytes.</p> <p>The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value simply use the existing, larger value.</p> <p>Specifying <code>maxpipesize</code> as part of the <code>SEND_MESSAGE</code> procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional <code>maxpipesize</code> parameter to override the creation pipe size specifications.</p>

Return Values

Table 70–16 SEND_MESSAGE Function Return Values

Return	Description
0	<p>Success.</p> <p>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</p> <p>If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</p>
1	<p>Timed out.</p> <p>This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</p>
3	<p>An interrupt occurred.</p> <p>If the pipe was implicitly created and is empty, then it is removed.</p>
ORA-23322	<p>Insufficient privileges.</p> <p>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</p>

Exceptions

Table 70–17 SEND_MESSAGE Function Exception

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the `PIPENAME` parameter for your `SEND_MESSAGE` and `RECEIVE_MESSAGE` calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME  
    RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `UNPACK_MESSAGE`.

Note: The `UNPACK_MESSAGE` procedure is overloaded to return items of type `VARCHAR2`, `NCHAR`, `NUMBER`, or `DATE`. There are two additional procedures to unpack `RAW` and `ROWID` items.

Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT VARCHAR2);
```

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NCHAR);
```

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NUMBER);
```

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT DATE);
```

```
DBMS_PIPE.UNPACK_MESSAGE_RAW (
    item OUT RAW);
```

```
DBMS_PIPE.UNPACK_MESSAGE_ROWID (
    item OUT ROWID);
```

Pragmas

```
pragma restrict_references (unpack_message, WNDS, RNDS);
pragma restrict_references (unpack_message_raw, WNDS, RNDS);
pragma restrict_references (unpack_message_rowid, WNDS, RNDS);
```

Parameters

Table 70–18 UNPACK_MESSAGE Procedure Parameters

Parameter	Description
<code>item</code>	Argument to receive the next unpacked item from the local message buffer.

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

DBMS_PREPROCESSOR

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics

- [Using DBMS_PREPROCESSOR](#)
 - Overview
 - Operating Notes
- [Data Structures](#)
 - Table Types
- [Summary of DBMS_PREPROCESSOR Subprograms](#)

Using DBMS_PREPROCESSOR

- [Overview](#)
- [Operating Notes](#)

Overview

There are three styles of subprograms.

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a `VARCHAR2` string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a `VARCHAR2` index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is `VALID` and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single `VARCHAR2` string in the second style, or as a `VARCHAR2` index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the `VARCHAR2` length limit.

Operating Notes

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be `VALID`. Likewise, the source text passed in as a `VARCHAR2` string or a `VARCHAR2` index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.
- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as `CREATE` or `REPLACE`. In general, the input source should be syntactically prepared in a way as if it were obtained from the `ALL_SOURCE` view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

anonymous block	(BEGIN DECLARE) ...
package	PACKAGE <name> ...
package body	PACKAGE BODY <name> ...
procedure	PROCEDURE <name> ...
function	FUNCTION <name> ...
type	TYPE <name> ...
type body	TYPE BODY <name> ...
trigger	(BEGIN DECLARE) ...

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the `ALL_SOURCE` view, the keyword `WRAPPED` always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the [GET_POST_PROCESSED_SOURCE Functions](#) or to one of the [PRINT_POST_PROCESSED_SOURCE Procedures](#), the exception `DBMS_PREPROCESSOR.WRAPPED_INPUT` is raised.

Data Structures

The DBMS_PREPROCESSOR package defines a TABLE type.

Table Types

[SOURCE_LINES_T Table Type](#)

SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

Syntax

```
TYPE source_lines_t IS  
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_PREPROCESSOR Subprograms

Table 71-1 DBMS_PREPROCESSOR Package Subprograms

Subprogram	Description
GET_POST_PROCESSED_SOURCE Functions on page 71-8	Returns the post-processed source text
PRINT_POST_PROCESSED_SOURCE Procedures on page 71-10	Prints post-processed source text

GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    object_type    VARCHAR2,
    schema_name    VARCHAR2,
    object_name    VARCHAR2);
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         VARCHAR2);
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         source_lines_t);
RETURN source_lines_t;
```

Parameters

Table 71–2 GET_POST_PROCESSED_SOURCE Function Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions

Table 71-3 *GET_POST_PROCESSED_SOURCE* Function Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: <ul style="list-style-type: none">Character string buffer too smallA line is too long (> 32767 bytes)

PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls `DBMS_OUTPUT.PUT_LINE` to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    object_type    VARCHAR2,
    schema_name    VARCHAR2,
    object_name    VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source         VARCHAR2);
```

Prints post-processed source text of an `INDEX-BY` table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source         source_lines_t);
```

Parameters

Table 71-4 PRINT_POST_PROCESSED_SOURCE Procedure Parameters

Parameter	Description
<code>object_type</code>	Must be one of <code>PACKAGE</code> , <code>PACKAGE BODY</code> , <code>PROCEDURE</code> , <code>FUNCTION</code> , <code>TYPE</code> , <code>TYPE, BODY</code> or <code>TRIGGER</code> . Case sensitive.
<code>schema_name</code>	The schema name. Case insensitive unless a quoted identifier is used. If <code>NULL</code> , use current schema.
<code>object_name</code>	The name of the object. The <code>object_type</code> is always case insensitive. Case insensitive unless a quoted identifier is used.
<code>source</code>	The source text of the compilation unit
<code>source_lines_t</code>	<code>INDEX-BY</code> table containing the source text of the compilation unit. The source text is a concatenation of all the non- <code>NULL</code> <code>INDEX-BY</code> table elements in ascending index order.

Exceptions

Table 71-5 PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of <code>PACKAGE</code> , <code>PACKAGE BODY</code> , <code>PROCEDURE</code> , <code>FUNCTION</code> , <code>TYPE</code> , <code>TYPE, BODY</code> or <code>TRIGGER</code> .
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The <code>object_name</code> should not be <code>NULL</code> .

Table 71-5 (Cont.) PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-06502	Numeric or value error: <ul style="list-style-type: none">▪ Character string buffer too small▪ A line is too long (> 32767 bytes)

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

DBMS_PREDICTIVE_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining (ODM).

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

Data used by ODM consists of tables or views stored in an Oracle database. Each column in a record (row) holds an item of information. Data mining models are often used to identify important columns or to predict column values.

The `DBMS_PREDICTIVE_ANALYTICS` package supports the following functionality:

- `EXPLAIN` - Ranks attributes in order of influence in explaining a target column.
- `PREDICT` - Predict the value of a column.

This chapter contains the following topics:

- [Using DBMS_PREDICTIVE_ANALYTICS](#)
 - [Overview](#)
- [Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms](#)

Using DBMS_PREDICTIVE_ANALYTICS

This section contains topics which relate to using the DBMS_PREDICTIVE_ANALYTICS package.

- [Overview](#)

Overview

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

DBMS_PREDICTIVE_ANALYTICS automates parts of step 3 and steps 4 and 5 of this process.

The user provides input data in a single table or view. For `EXPLAIN`, the user identifies a column to explain; for `PREDICT`, the user identifies a column to predict and also identifies a case id column. The procedure accepts the input, analyzes the data, performs suitable preprocessing, builds and tests models, selects the best model, and applies the model to data.

Input for `DBMS_PREDICTIVE_ANALYTICS` is the name of a single table or view in an Oracle database. Each column in the table must have one of the following data types:

- NUMBER
- FLOAT
- CHAR
- VARCHAR2
- DATE
- TIMESTAMP

Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Table 72-1 *DBMS_PREDICTIVE_ANALYTICS Package Subprograms*

Subprogram	Purpose
EXPLAIN Procedure on page 72-5	Ranks attributes in order of influence in explaining a target column
PREDICT Procedure on page 72-7	Predicts the value of a column based on values in the input data

EXPLAIN Procedure

The procedure ranks attributes in order of influence in explaining a target column.

The procedure analyzes the input table, performs data preprocessing, builds a model, analyzes the model to identify key columns, and creates a result table listing the important columns and quantifying the explanatory power of each important column.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
    data_table_name      IN VARCHAR2,
    explain_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72–2 EXPLAIN Procedure Parameters

Parameter	Description
data_table_name	Name of input table or view
explain_column_name	Name of column to be explained
result_table_name	Name of table where results are saved
data_schema_name	Name of schema where the input table or view resides. Default: the current schema.

Usage Notes

The result table has the following definition:

```
column_name          VARCHAR2(30)
explanatory_value    NUMBER
rank                 NUMBER
```

[Table 72–3](#) describes the columns in the result table.

Table 72–3 EXPLAIN Procedure Result Table

Column Name	Meaning
column_name	Name of a column in the input data; all columns except the explained column are listed in the result table.
explanatory_value	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1. An individual column's explanatory value is independent of other columns in the input table. Instead, the values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column. An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for PREDICT. In practice, an explanatory power equal to 1 is rarely returned.

Table 72-3 (Cont.) EXPLAIN Procedure Result Table

Column Name	Meaning
rank	Ranking of explanatory power. Rows with equal values for <code>explanatory_power</code> have the same rank. Rank values are not skipped in the event of ties.

Example

The following example performs an EXPLAIN operation and views the results:

```
--Perform EXPLAIN operation
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
    data_table_name      => 'census_dataset',
    explain_column_name => 'class',
    result_table_name   => 'census_explain_result');
END;
/
--View results
SELECT * FROM census_explain_result;
```

COLUMN_NAME	EXPLANATORY_VALUE	RANK
-----	-----	----
RELATIONSHIP	.21234788	1
MARITAL_STATUS	.195201808	2
CAPITAL_GAIN	.102951498	3
OCCUPATION	.06883765	4
EDUCATION	.067517394	5
EDUCATION_NUM	.067517394	5
SEX	.055541542	6
HOURS_PER_WEEK	.032476973	7
AGE	.021933245	8
CAPITAL_LOSS	.013083265	9
RACE	.009670242	10
WORKCLASS	0	11
NATIVE_COUNTRY	0	11
WEIGHT	0	11
PERSON_ID	0	11

15 rows selected.

PREDICT Procedure

This procedure is used to predict values of a specific column. The input consists of a table and a target column, the target column containing the values to predict. The input data must contain some cases in which the target value is known (that is, is not NULL). Cases where the target values are known are used to train models.

PREDICT returns a predicted value for every case, including those where the value is known.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72–4 PREDICT Procedure Parameters

Parameter	Description
data_table_name	Name of input table or view
case_id_column_name	Name of column that uniquely identifies each case in the input data (for example, the column containing the customer id or case id)
target_column_name	Name of the column containing the value to predict (the target)
result_table_name	Name of table where results will be saved
data_schema_name	Name of schema where the input table or view resides and where the result table is written. Default: the current schema.

Usage Notes

The result table has the following definition:

```
case_id_column_name    VARCHAR2 or NUMBER
prediction              VARCHAR2 or NUMBER
probability_number     NUMBER
```

[Table 72–5](#) describes the result table of the PREDICT procedure.

Table 72–5 PREDICT Procedure Result Table

Column Name	Meaning
case_id_column_name	Each of the cases identified in the case_id column. This is the same as the name that was passed in. The data type is the same as input case_id type.
prediction	The predicted value of the target column for the given case. The data type is the same as the input target_column_name type.
probability	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

Predictions are returned for all cases in the input data.

Predicted values for known cases may be interesting in some situations, for example, to perform deviation analysis, that is, to compare predicted values and actual values.

Example

The following example performs a PREDICT operation and display the first 10 predictions. In this example, since the target column `class` is categorical, a probability is returned for each prediction:

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy          => v_accuracy,
        data_table_name   => 'census_dataset',
        case_id_column_name => 'person_id',
        target_column_name => 'class',
        result_table_name => 'census_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/
--View first 10 predictions
SELECT * FROM census_predict_result where rownum < 10;
```

PERSON_ID	PREDICTION	PROBABILITY
2	1	.418787003
7	0	.922977991
8	0	.99869723
9	0	.999999605
10	0	.9999009
11	0	.999999996
12	1	.953949094
15	0	.99999997
16	0	.999968961

9 rows selected.

DBMS_PROFILER

The DBMS_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- [Using DBMS_PROFILER](#)
 - Overview
 - Security Model
 - Operational Notes
 - Exceptions
- [Summary of DBMS_PROFILER Subprograms](#)

Using DBMS_PROFILER

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)

Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

Note: It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on). And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in [Table 73-1](#), [Table 73-2](#), and [Table 73-3](#).

Table 73-1 Columns in Table `PLSQL_PROFILER_RUNS`

Column	Datatype	Definition
<code>runid</code>	NUMBER PRIMARY KEY	Unique run identifier from <code>plsql_profiler_runnumber</code>
<code>related_run</code>	NUMBER	Runid of related run (for client/server correlation)
<code>run_owner</code>	VARCHAR2 (32)	User who started run
<code>run_date</code>	DATE	Start time of run
<code>run_comment</code>	VARCHAR2 (2047)	User provided comment for this run
<code>run_total_time</code>	NUMBER	Elapsed time for this run in nanoseconds
<code>run_system_info</code>	VARCHAR2 (2047)	Currently unused
<code>run_comment1</code>	VARCHAR2 (2047)	Additional comment
<code>spare1</code>	VARCHAR2 (256)	Unused

Table 73-2 Columns in Table `PLSQL_PROFILER_UNITS`

Column	Datatype	Definition
<code>runid</code>	NUMBER	Primary key, references <code>plsql_profiler_runs</code> ,
<code>unit_number</code>	NUMBER	Primary key, internally generated library unit #
<code>unit_type</code>	VARCHAR2 (32)	Library unit type
<code>unit_owner</code>	VARCHAR2 (32)	Library unit owner name
<code>unit_name</code>	VARCHAR2 (32)	Library unit name timestamp on library unit
<code>unit_timestamp</code>	DATE	In the future will be used to detect changes to unit between runs

Table 73–2 (Cont.) Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

Table 73–3 Columns in Table PLSQL_PROFILER_DATA

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(`profrep.sql`) is provided with the PL/SQL demo scripts.

Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

Note: `DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

Operational Notes

- [Typical Run](#)
- [Two Methods of Exception Generation](#)

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a "run". A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

Note: The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, "warm up" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFLOAD.SQL` script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

Note: Do not alter the actual fields of the tables.

See Also: ["FLUSH_DATA Function and Procedure"](#) on page 73-10.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

Exceptions

Table 73–4 *DBMS_PROFILER Exceptions*

Exception	Description
<code>version_mismatch</code>	Corresponds to <code>error_version</code> .
<code>profiler_error</code>	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'
`error_param` constant `binary_integer` := 1;
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'
`error_io` constant `binary_integer` := 2;
- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.
`error_version` constant `binary_integer` := -1;

Summary of DBMS_PROFILER Subprograms

Table 73–5 DBMS_PROFILER Package Subprograms

Subprogram	Description
FLUSH_DATA Function and Procedure on page 73-10	Flushes profiler data collected in the user's session
GET_VERSION Procedure on page 73-11	Gets the version of this API
INTERNAL_VERSION_CHECK Function on page 73-12	Verifies that this version of the DBMS_PROFILER package can work with the implementation in the database
PAUSE_PROFILER Function and Procedure on page 73-13	Pauses profiler data collection
RESUME_PROFILER Function and Procedure on page 73-14	Resumes profiler data collection
START_PROFILER Functions and Procedures on page 73-15	Starts profiler data collection in the user's session
STOP_PROFILER Function and Procedure on page 73-16	Stops profiler data collection in the user's session

FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

Note: Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.FLUSH_DATA;
```

GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

Table 73–6 *GET_VERSION Procedure Parameters*

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
RETURN BINARY_INTEGER;
```

PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.PAUSE_PROFILER;
```

RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.RESUME_PROFILER;
```

START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the `START_PROFILER` function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER (
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER (
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER (
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER);
```

```
DBMS_PROFILER.START_PROFILER (
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '');
```

Parameters

Table 73–7 START_PROFILER Function Parameters

Parameter	Description
<code>run_comment</code>	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
<code>run_number</code>	Stores the number of the run so you can store and later recall the run's data.
<code>run_comment1</code>	Allows you to make interesting comments about the run.

STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.STOP_PROFILER;
```

DBMS_PROPAGATION_ADM

The DBMS_PROPAGATION_ADM package, one of a set of Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

This chapter contains the following topic:

- [Summary of DBMS_PROPAGATION_ADM Subprograms](#)

Summary of DBMS_PROPAGATION_ADM Subprograms

Table 74–1 *DBMS_PROPAGATION_ADM Package Subprograms*

Subprogram	Description
ALTER_PROPAGATION Procedure on page 74-3	Adds, alters, or removes a rule set for a propagation
CREATE_PROPAGATION Procedure on page 74-5	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
DROP_PROPAGATION Procedure on page 74-8	Drops a propagation
START_PROPAGATION Procedure on page 74-10	Starts a propagation
STOP_PROPAGATION Procedure on page 74-11	Stops a propagation

Note: All subprograms commit unless specified otherwise.

ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

See Also: *Oracle Streams Concepts and Administration* and [Chapter 92, "DBMS_RULE_ADM"](#) for more information about rules and rule sets

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
  propagation_name      IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set       IN  BOOLEAN   DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 74–2 ALTER_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p>
remove_rule_set	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

Table 74–2 (Cont.) ALTER_PROPAGATION Procedure Parameters

Parameter	Description
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
  propagation_name      IN VARCHAR2,
  source_queue          IN VARCHAR2,
  destination_queue     IN VARCHAR2,
  destination_dblink   IN VARCHAR2 DEFAULT NULL,
  rule_set_name        IN VARCHAR2 DEFAULT NULL,
  negative_rule_set_name IN VARCHAR2 DEFAULT NULL,
  queue_to_queue       IN BOOLEAN  DEFAULT NULL);
```

Parameters

Table 74-3 CREATE_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. Note: The propagation_name setting cannot be altered after the propagation is created.
source_queue	The name of the source queue, specified as [<i>schema_name</i> .] <i>queue_name</i> . The current database must contain the source queue. For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.
destination_queue	The name of the destination queue, specified as [<i>schema_name</i> .] <i>queue_name</i> . For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.
destination_dblink	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed.

Table 74–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p>
negative_rule_set_name	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
queue_to_queue	<p>If <code>TRUE</code>, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in a Real Application Clusters (RAC) database.</p> <p>If <code>FALSE</code> or <code>NULL</code>, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in a RAC environment.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

- [Chapter 92, "DBMS_RULE_ADM"](#)
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all captured and user-enqueued messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name      IN VARCHAR2,
    drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 74–4 *DROP_PROPAGATION Procedure Parameters*

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

See Also: *Oracle Streams Concepts and Administration* for more information about Streams data dictionary views

The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note: When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(  
    propagation_name IN VARCHAR2);
```

Parameter

Table 74–5 *START_PROPAGATION Procedure Parameter*

Parameter	Description
propagation_name	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
  propagation_name IN VARCHAR2,
  force             IN BOOLEAN DEFAULT FALSE);
```

Parameter

Table 74–6 STOP_PROPAGATION Procedure Parameter

Parameter	Description
propagation_name	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
force	If TRUE, then the procedure stops the propagation and clears the statistics for the propagation. If FALSE, then the procedure stops the propagation without clearing the statistics for the propagation.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the propagation is not started upon database instance startup.

The DBMS_RANDOM package provides a built-in random number generator. DBMS_RANDOM is not intended for cryptography.

This chapter contains the following topics:

- [Using DBMS_RANDOM](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_RANDOM Subprograms](#)

Using DBMS_RANDOM

- [Security Model](#)
- [Operational Notes](#)

Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session.

Operational Notes

- `DBMS_RANDOM.RANDOM` produces integers in $[-2^{31}, 2^{31})$.
- `DBMS_RANDOM.VALUE` produces numbers in $[0,1)$ with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, userid, and process id if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

Summary of DBMS_RANDOM Subprograms

Table 75–1 DBMS_RANDOM Package Subprograms

Subprogram	Description
INITIALIZE Procedure on page 75-6	Initializes the package with a seed value
NORMAL Function on page 75-7	Returns random numbers in a normal distribution
RANDOM Procedure on page 75-8	Generates a random number
SEED Procedures on page 75-9	Resets the seed
STRING Function on page 75-10	Gets a random string
TERMINATE Procedure on page 75-11	Terminates package
VALUE Functions on page 75-12	This function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to low and less than high

Note: The [INITIALIZE Procedure](#), [RANDOM Procedure](#) and the [TERMINATE Procedure](#) are all obsolete and, while currently supported, are included in this release for legacy reasons only.

INITIALIZE Procedure

This procedure initializes the generator (but see [Usage Notes](#)).

Syntax

```
DBMS_RANDOM.INITIALIZE (  
    val IN BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS)
```

Parameters

Table 75–2 INITIALIZE Procedure Parameters

Parameter	Description
val	The seed number used to generate a random number.

Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#) on page 75-9.

NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS)
```

Return Values

Table 75–3 *NORMAL Procedure Parameters*

Parameter	Description
number	Returns a random number.

RANDOM Procedure

This procedure generates a random number (but see [Usage Notes](#)).

Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS)
```

Return Values

Table 75–4 *RANDOM Procedure Parameters*

Parameter	Description
binary_integer	Returns a random integer greater or equal to $-\text{power}(2,31)$ and less than $\text{power}(2,31)$.

Usage Notes

This procedure is obsolete and, although it is currently supported, it should not be used.

SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (  
    seed IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (  
    seed IN VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 75-5 SEED Procedure Parameters

Parameter	Description
seed	Seed number or string used to generate a random number.

Usage Notes

The seed can be a string up to length 2000.

STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING  
  opt IN CHAR,  
  len IN NUMBER)  
RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS)
```

Parameters

Table 75–6 *STRING Function Parameters*

Parameter	Description
opt	Specifies what the returning string looks like: <ul style="list-style-type: none">▪ 'u', 'U' - returning string in uppercase alpha characters▪ 'l', 'L' - returning string in lowercase alpha characters▪ 'a', 'A' - returning string in mixed case alpha characters▪ 'x', 'X' - returning string in uppercase alpha-numeric characters▪ 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.
len	The length of the returning string.

Return Values

Table 75–7 *STRING Function Return Values*

Parameter	Description
VARCHAR2	Returns a VARCHAR2.

TERMINATE Procedure

When you are finished with the package, call the TERMINATE procedure (but see [Usage Notes](#))

Syntax

```
DBMS_RANDOM.TERMINATE
```

Usage Notes

This procedure performs no function and, although it is currently supported, it is obsolete and should not be used.

VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number *x*, where *x* is greater than or equal to *low* and less than *high*.

Syntax

```
DBMS_RANDOM.VALUE  
RETURN NUMBER;
```

```
DBMS_RANDOM.VALUE(  
  low IN NUMBER,  
  high IN NUMBER)  
RETURN NUMBER;
```

Parameters

Table 75–8 VALUE Function Parameters

Parameter	Description
<i>low</i>	The lowest number in a range from which to generate a random number. The number generated may be equal to <i>low</i> .
<i>high</i>	The highest number below which to generate a random number. The number generated will be less than <i>high</i> .

Return Values

Table 75–9 VALUE Function Return Values

Parameter	Description
NUMBER	Returns an Oracle Number.

DBMS_RECTIFIER_DIFF

The DBMS_RECTIFIER_DIFF package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

- [Documentation of DBMS_RECTIFIER_DIFF](#)

Documentation of DBMS_RECTIFIER_DIFF

For a complete description of this package within the context of Replication, see DBMS_RECTIFIER_DIFF in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REDEFINITION

The DBMS_REDEFINITION package provides an interface to perform an online redefinition of tables.

See Also: *Oracle Database Administrator's Guide* for more information about online redefinition of tables

This chapter contains the following topics:

- [Using DBMS_REDEFINITION](#)
 - Overview
 - Constants
 - Operational Notes
- [Summary of DBMS_REDEFINITION Subprograms](#)

Using DBMS_REDEFINITION

- [Overview](#)
- [Constants](#)
- [Operational Notes](#)

Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

Constants

The `DBMS_REDEFINITION` package uses the constants shown in [Table 77-1, "DBMS_REDEFINITION Constants"](#):

Table 77-1 DBMS_REDEFINITION Constants

Constant	Type	Value	Description
<code>CONS_CONSTRAINT</code>	<code>PLS_INTEGER</code>	3	Used to specify that dependent object type is a constraint
<code>CONS_INDEX</code>	<code>PLS_INTEGER</code>	2	Used to specify that dependent object type is a index
<code>CONS_ORIG_PARAMS</code>	<code>PLS_INTEGER</code>	1	Used to specify that indexes should be cloned with their original storage parameters
<code>CONS_TRIGGER</code>	<code>PLS_INTEGER</code>	4	Used to specify that dependent object type is a trigger
<code>CONS_USE_PK</code>	<code>BINARY_INTEGER</code>	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
<code>CONS_USE_ROWID</code>	<code>BINARY_INTEGER</code>	2	Used to indicate that the redefinition should be done using rowids

Operational Notes

- `CONS_USE_PK` and `CONS_USE_ROWID` are constants used as input to the "options_flag" parameter in both the [START_REDEF_TABLE Procedure](#) and [CAN_REDEF_TABLE Procedure](#). `CONS_USE_ROWID` is used to indicate that the redefinition should be done using rowids while `CONS_USE_PK` implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- `CONS_INDEX`, `CONS_TRIGGER` and `CONS_CONSTRAINT` are used to specify the type of the dependent object being (un)registered in [REGISTER_DEPENDENT_OBJECT Procedure](#) and [UNREGISTER_DEPENDENT_OBJECT Procedure](#) (parameter "dep_type").
`CONS_INDEX ==>` dependent object is of type INDEX
`CONS_TRIGGER ==>` dependent object is of type TRIGGER
`CONS_CONSTRAINT==>` dependent object type is of type CONSTRAINT
- `CONS_ORIG_PARAMS` as used as input to the "copy_indexes" parameter in [COPY_TABLE_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

Rules and Limits

For information about various rules and limits that apply to implementation of this package, see the *Oracle Database Administrator's Guide*.

Summary of DBMS_REDEFINITION Subprograms

Table 77–2 DBMS_REDEFINITION Package Subprograms

Subprogram	Description
ABORT_REDEF_TABLE Procedure on page 77-8	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
CAN_REDEF_TABLE Procedure on page 77-9	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure on page 77-10	Copies the dependent objects of the original table onto the interim table
FINISH_REDEF_TABLE Procedure on page 77-12	Completes the redefinition process.
REGISTER_DEPENDENT_OBJECT Procedure on page 77-13	Registers a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table
START_REDEF_TABLE Procedure on page 77-14	Initiates the redefinition process
SYNC_INTERIM_TABLE Procedure on page 77-15	Keeps the interim table synchronized with the original table
UNREGISTER_DEPENDENT_OBJECT Procedure on page 77-16	Unregisters a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table

ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after the [START_REDEF_TABLE Procedure](#) has been called and before the [FINISH_REDEF_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 77-3 ABORT_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
  uname          IN  VARCHAR2,
  tname          IN  VARCHAR2,
  options_flag   IN  PLS_INTEGER := 1,
  part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 77-4 CAN_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table
tname	The name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> ■ If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). The default method of redefinition is using primary keys. ■ If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined.

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  copy_indexes    IN PLS_INTEGER := 1,
  copy_triggers   IN BOOLEAN := TRUE,
  copy_constraints IN BOOLEAN := TRUE,
  copy_privileges IN BOOLEAN := TRUE,
  ignore_errors   IN BOOLEAN := FALSE,
  num_errors      OUT PLS_INTEGER,
  copy_statistics IN BOOLEAN := FALSE);
```

Parameters

Table 77-5 COPY_TABLE_DEPENDENTS Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table being redefined.
int_table	The name of the interim table.
copy_indexes	A flag indicating whether to copy the indexes <ul style="list-style-type: none"> ■ 0 - do not copy any index ■ dbms_redefinition.cons_orig_params - copy the indexes using the physical parameters of the source indexes
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	The number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY_TABLE_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER_DEPENDENT_OBJECT Procedure](#).
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 77-6 FINISH_REDEF_TABLE Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  dep_type        IN PLS_INTEGER,
  dep_owner       IN VARCHAR2,
  dep_orig_name   IN VARCHAR2,
  dep_int_name    IN VARCHAR2);
```

Parameters

Table 77-7 REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA_REDEFINITION_ERRORS if an entry exists for that object.

START_REDEF_TABLE Procedure

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  col_mapping    IN VARCHAR2 := NULL,
  options_flag   IN BINARY_INTEGER := 1,
  orderby_cols   IN VARCHAR2 := NULL,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 77–8 *START_REDEF_TABLE Procedure Parameters*

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
col_mapping	The mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the <code>SELECT</code> clause of a query.) If <code>NULL</code> , all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> ■ If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). The default method of redefinition is using primary keys. ■ If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) <code>ascending</code> / <code>descending</code>) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined.

SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 77-9 SYNC_INTERIM_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH_REDEF_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as CREATE INDEX) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPEPENDENT_OBJECT(  
  uname           IN VARCHAR2,  
  orig_table      IN VARCHAR2,  
  int_table       IN VARCHAR2,  
  dep_type        IN PLS_INTEGER,  
  dep_owner       IN VARCHAR2,  
  dep_orig_name   IN VARCHAR2,  
  dep_int_name    IN VARCHAR2);
```

Parameters

Table 77–10 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

DBMS_REFRESH

The DBMS_REFRESH package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- [Documentation of DBMS_REFRESH](#)

Documentation of DBMS_REFRESH

For a complete description of this package within the context of Replication, see DBMS_REFRESH in the *Oracle Database Advanced Replication Management API Reference*.

The `DBMS_REPAIR` package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

See Also: For detailed information about using the `DBMS_REPAIR` package, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Summary of DBMS_REPAIR Subprograms](#)

Using DBMS_REPAIR

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)

Overview

Note: The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

Security Model

The package is owned by SYS. Execution privilege is not granted to other users.

Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

Table 79–1 lists the parameters and the enumerated constants.

Table 79–1 DBMS_REPAIR Parameters with Enumerated Constants

Parameter	Option	Type	Description
object_type	■ TABLE_OBJECT	BINARY_	
	■ INDEX_OBJECT	INTEGER	
	■ CLUSTER_OBJECT		
action	■ CREATE_ACTION	BINARY_	
	■ DROP_ACTION	INTEGER	
	■ PURGE_ACTION		
table_type	■ REPAIR_TABLE	BINARY_	
	■ ORPHAN_TABLE	INTEGER	
flags	■ SKIP_FLAG	BINARY_	
	■ NOSKIP_FLAG	INTEGER	
object_id	■ ALL_INDEX_ID := 0	BINARY_	Clean up all objects that qualify
wait_for_lock	■ LOCK_WAIT := 1	BINARY_	Specifies whether to try getting DML locks on underlying table [[sub]partition] object
	■ LOCK_NOWAIT := 0	INTEGER	

Note: The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

Operating Notes

The procedure to create the `ORPHAN_KEYS_TABLE` is similar to the one used to create the `REPAIR_TABLE`.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;
```

When invoking the [CHECK_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

Exceptions

Table 79–2 DBMS_REPAIR Exceptions

Exception	Description	Action
942	Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.	
955	Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.	
24120	An invalid parameter was passed to the specified DBMS_REPAIR procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the BLOCK_START and BLOCK_END parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid ACTION parameter was specified.	Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.	Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.
24127	TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.	Do not specify TABLESPACE when performing actions other than CREATE_ACTION.
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

Examples

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');  
  
/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

Summary of DBMS_REPAIR Subprograms

Table 79-3 DBMS_REPAIR Package Subprograms

Subprogram	Description
ADMIN_TABLES Procedure on page 79-10	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
CHECK_OBJECT Procedure on page 79-11	Detects and reports corruptions in a table or index
DUMP_ORPHAN_KEYS Procedure on page 79-13	Reports on index entries that point to rows in corrupt data blocks
FIX_CORRUPT_BLOCKS Procedure on page 79-14	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
ONLINE_INDEX_CLEAN Function on page 79-15	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
REBUILD_FREELISTS Procedure on page 79-16	Rebuilds an object's freelists
SEGMENT_FIX_STATUS Procedure on page 79-17	Fixes the corrupted state of a bitmap entry
SKIP_CORRUPT_BLOCKS Procedure on page 79-18	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
  table_name IN VARCHAR2,
  table_type IN BINARY_INTEGER,
  action IN BINARY_INTEGER,
  tablespace IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 79-4 ADMIN_TABLES Procedure Parameters

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See " Constants " on page 79-5.
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See " Constants " on page 79-5.
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  relative_fno    IN BINARY_INTEGER DEFAULT NULL,
  block_start     IN BINARY_INTEGER DEFAULT NULL,
  block_end       IN BINARY_INTEGER DEFAULT NULL,
  corrupt_count   OUT BINARY_INTEGER);
```

Parameters

Table 79-5 CHECK_OBJECT Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " Constants " on page 79-5.
repair_table_name	Name of the repair table to be populated. The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> .
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  orphan_table_name IN  VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  key_count       OUT BINARY_INTEGER);
```

Parameters

Table 79-6 DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is <code>INDEX_OBJECT</code> . See " Constants " on page 79-5.
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the [CHECK_OBJECT Procedure](#).

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  fix_count       OUT BINARY_INTEGER);
```

Parameters

Table 79-7 *FIX_CORRUPT_BLOCKS Procedure Parameters*

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " Constants " on page 79-5.
repair_table_name	Name of the repair table with the repair directives. Must exist in the <code>SYS</code> schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds. This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns TRUE if all indexes specified were cleaned up and FALSE if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

Parameters

Table 79–8 ONLINE_INDEX_CLEAN Function Parameters

Parameter	Description
object_id	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
wait_for_lock	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If LOCK_NOWAIT is specified, then the lock get does not retry.

REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
  schema_name      IN VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN VARCHAR2 DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 79-9 REBUILD_FREELISTS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " Constants " on page 79-5.

SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  file_number    IN BINARY_INTEGER DEFAULT NULL,
  block_number   IN BINARY_INTEGER DEFAULT NULL,
  status_value   IN BINARY_INTEGER DEFAULT NULL,
  partition_name IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 79–10 *SEGMENT_FIX_STATUS Procedure Parameters*

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: <ul style="list-style-type: none"> ■ 1 = block is full ■ 2 = block is 0-25% free ■ 3 = block is 25-50% free ■ 4 = block is 50-75% free ■ 5 = block is 75-100% free The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

Note: When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
    schema_name  IN VARCHAR2,
    object_name  IN VARCHAR2,
    object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
    flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 79-11 SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be processed.
object_name	Name of the object.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See "Constants" on page 79-5.
flags	If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See "Constants" on page 79-5.

DBMS_REPCAT

The DBMS_REPCAT package provides routines to administer and update the replication catalog and environment.

- [Documentation of DBMS_REPCAT](#)

Documentation of DBMS_REPCAT

For a complete description of this package within the context of Replication, see DBMS_REPCAT in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPCAT_ADMIN

The DBMS_REPCAT_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

- [Documentation of DBMS_REPCAT_ADMIN](#)

Documentation of DBMS_REPCAT_ADMIN

For a complete description of this package within the context of Replication, see DBMS_REPCAT_ADMIN in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPCAT_INSTANTIATE

The DBMS_REPCAT_INSTANTIATE package instantiates deployment templates.

- [Documentation of DBMS_REPCAT_INSTANTIATE](#)

Documentation of DBMS_REPCAT_INSTANTIATE

For a complete description of this package within the context of Replication, see DBMS_REPCAT_INSTANTIATE in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPCAT_RGT

The DBMS_REPCAT_RGT package controls the maintenance and definition of refresh group templates.

- [Documentation of DBMS_REPCAT_RGT](#)

Documentation of DBMS_REPCAT_RGT

For a complete description of this package within the context of Replication, see DBMS_REPCAT_RGT in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPUTIL

The DBMS_REPUTIL package contains subprograms to generate shadow tables, triggers, and packages for table replication, as well as subprograms to generate wrappers for replication of standalone procedure invocations and packaged procedure invocations. This package is referenced only by the generated code.

- [Documentation of DBMS_REPUTIL](#)

Documentation of DBMS_REPUTIL

For a complete description of this package within the context of Replication, see DBMS_REPUTIL in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_RESOURCE_MANAGER

The DBMS_RESOURCE_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

See Also: For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS_RESOURCE_MANAGER](#)
 - Security Model
 - Constants
 - Examples
- [Summary of DBMS_RESOURCE_MANAGER Subprograms](#)

Using DBMS_RESOURCE_MANAGER

- [Security Model](#)
- [Constants](#)
- [Examples](#)

Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures. The procedures to grant and revoke this privilege are in the package [Chapter 86, "DBMS_RESOURCE_MANAGER_PRIVS"](#).

Constants

Table 85–1 Constants - Names and Oracle Enterprise Manager Abbreviations

Constant	Definition
CLIENT_MACHINE	CONSTANT VARCHAR2 (30) := 'CLIENT_MACHINE' ;
CLIENT_OS_USER	CONSTANT VARCHAR2 (30) := 'CLIENT_OS_USER' ;
CLIENT_PROGRAM	CONSTANT VARCHAR2 (30) := 'CLIENT_PROGRAM' ;
MODULE_NAME	CONSTANT VARCHAR2 (30) := 'MODULE_NAME' ;
MODULE_NAME_ACTION	CONSTANT VARCHAR2 (30) := 'MODULE_NAME_ACTION' ;
ORACLE_USER	CONSTANT VARCHAR2 (30) := 'ORACLE_USER'
SERVICE_MODULE	CONSTANT VARCHAR2 (30) := 'SERVICE_MODULE' ;
SERVICE_MODULE_ACTION	CONSTANT VARCHAR2 (30) := 'SERVICE_MODULE_ACTION' ;
SERVICE_NAME	CONSTANT VARCHAR2 (30) := 'SERVICE_NAME' ;

Examples

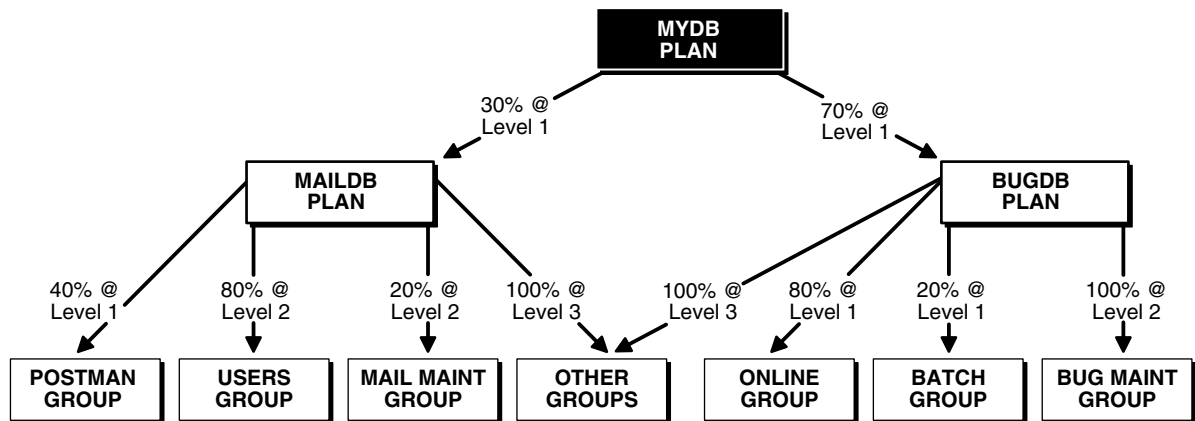

One of the advantages of plans is that they can refer to each other. The entries in a plan can either be consumer groups or subplans. For example, the following is also a set of valid CPU plan directives:

Table 85–2 MYDB PLAN CPU Plan Directives

Subplan/Group	CPU_Level 1
MAILDB Plan	30%
BUGDB Plan	70%

If these plan directives were in effect and there were an infinite number of runnable sessions in all consumer groups, then the MAILDB plan would be assigned 30% of the available CPU resources, while the BUGDB plan would be assigned 70% of the available CPU resources. Breaking this further down, sessions in the "Postman" consumer group would be run 12% (40% of 30%) of the time, while sessions in the "Online" consumer group would be run 56% (80% of 70%) of the time. [Figure 85–1](#) diagram depicts this scenario:

Figure 85–1 Resource Manager Scenario

Conceptually the active sessions are underneath the consumer groups. In other words, a session belongs to a resource consumer group, and this consumer group is used by a plan to determine allocation of processing resources.

A multiplan (plan with one or more subplans) definition of CPU plan directives cannot be collapsed into a single plan with one set of plan directives, because each plan is its own entity. The CPU quanta that is allotted to a plan or subplan gets used only within that plan, unless that plan contains no consumer groups with active sessions. Therefore, in this example, if the Bug Maintenance Group did not use any of its quanta, then it would get recycled within that plan, thus going back to level 1 within the BUGDB PLAN. If the multiplan definition in the preceding example got collapsed into a single plan with multiple consumer groups, then there would be no way to explicitly recycle the Bug Maintenance Group's unused quanta. It would have to be recycled globally, thus giving the mail sessions an opportunity to use it.

The resources for a database can be partitioned at a high level among multiple applications and then repartitioned within an application. If a given group within an

application does not need all the resources it is assigned, then the resource is only repartitioned within the same application.

The following example uses the default plan and consumer group allocation methods:

```
BEGIN
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'bugdb_plan',
    COMMENT => 'Resource plan/method for bug users sessions');
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'maildb_plan',
    COMMENT => 'Resource plan/method for mail users sessions');
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'mydb_plan',
    COMMENT => 'Resource plan/method for bug and mail users sessions');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Online_group',
    COMMENT => 'Resource consumer group/method for online bug users sessions');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Batch_group',
    COMMENT => 'Resource consumer group/method for bug users sessions who run batch
jobs');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Maintenance_
group',
    COMMENT => 'Resource consumer group/method for users sessions who maintain
the bug db');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Mail_users_group',
    COMMENT => 'Resource consumer group/method for mail users sessions');

Summary of DBMS_RESOURCE_MANAGER Subprograms

Table 85-3 DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
CLEAR_PENDING_AREA Procedure on page 85-11	Clears the work area for the resource manager
CREATE_CONSUMER_GROUP Procedure on page 85-12	Creates entries which define resource consumer groups
CREATE_PENDING_AREA Procedure on page 85-13	Creates a work area for changes to resource manager objects
CREATE_PLAN Procedure on page 85-15	Creates entries which define resource plans
CREATE_PLAN_DIRECTIVE Procedure on page 85-16	Creates resource plan directives
CREATE_SIMPLE_PLAN Procedure on page 85-18	Creates a single-level resource plan containing up to eight consumer groups in one step
DELETE_CONSUMER_GROUP Procedure on page 85-19	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure on page 85-20	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure on page 85-21	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure on page 85-22	Deletes resource plan directives
SET_CONSUMER_GROUP_MAPPING Procedure on page 85-23	Adds, deletes, or modifies pairs for the login and run-time attribute mappings
SET_CONSUMER_GROUP_MAPPING_PRI Procedure on page 85-24	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_GROUP Procedure on page 85-25	Assigns the initial resource consumer group for a user
SUBMIT_PENDING_AREA Procedure on page 85-26	Submits pending changes for the resource manager
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure on page 85-27	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_GROUP_FOR_USER Procedure on page 85-28	Changes the resource consumer group for all sessions with a given user name
SWITCH_PLAN Procedure on page 85-29	Sets the current resource manager plan
UPDATE_CONSUMER_GROUP Procedure on page 85-30	Updates entries which define resource consumer groups

Table 85-3 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
UPDATE_PLAN Procedure on page 85-31	Updates entries which define resource plans
UPDATE_PLAN_DIRECTIVE Procedure on page 85-32	Updates resource plan directives
VALIDATE_PENDING_AREA Procedure on page 85-34	Validates pending changes for the resource manage

CLEAR_PENDING_AREA Procedure

This procedure lets you clear pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

CREATE_CONSUMER_GROUP Procedure

This procedure lets you create entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2,  
    comment        IN VARCHAR2,  
    cpu_mth        IN VARCHAR2 DEFAULT 'ROUND-ROBIN');
```

Parameters

Table 85–4 CREATE_CONSUMER_GROUP Procedure Parameters

Parameter	Description
consumer_group	The name of the consumer group.
comment	The user's comment.
cpu_mth	The resource allocation method for distributing CPU among sessions in the consumer group. The default is ROUND-ROBIN, which uses a round-robin scheduler to ensure sessions are fairly executed. RUN-TO-COMPLETION specifies that sessions with the largest active time are scheduled ahead of other sessions

CREATE_PENDING_AREA Procedure

This procedure lets you make changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to do your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

Note: Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

The following rules must be adhered to, and they are checked whenever the `validate` or `submit` procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- For Oracle8i, the plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 32 plan directives coming from any given plan (that is, no plan can have more than 32 children).
- There cannot be more than 32 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix the problem(s) and reissue the `validate` or `submit` procedures.

CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
  plan                IN VARCHAR2,
  comment             IN VARCHAR2,
  cpu_mth             IN VARCHAR2 DEFAULT 'EMPHASIS',
  active_sess_pool_mth IN VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
  parallel_degree_limit_mth IN VARCHAR2 DEFAULT
    'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
  queueing_mth       IN VARCHAR2 DEFAULT 'FIFO_TIMEOUT', );
```

Parameters

Table 85-5 CREATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
comment	User's comment.
cpu_mth	The resource allocation method for specifying how much CPU each consumer group or sub plan gets. EMPHASIS, the default method, is for multilevel plans that use percentages to specify how CPU is distributed among consumer groups. RATIO is for single-level plans that use ratios to specify how CPU is distributed.
active_sess_pool_mth	The Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	The resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	The Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available.

Usage Notes

If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

CREATE_PLAN_DIRECTIVE Procedure

This procedure lets you create resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  comment             IN VARCHAR2,
  cpu_p1              IN NUMBER   DEFAULT NULL,
  cpu_p2              IN NUMBER   DEFAULT NULL,
  cpu_p3              IN NUMBER   DEFAULT NULL,
  cpu_p4              IN NUMBER   DEFAULT NULL,
  cpu_p5              IN NUMBER   DEFAULT NULL,
  cpu_p6              IN NUMBER   DEFAULT NULL,
  cpu_p7              IN NUMBER   DEFAULT NULL,
  cpu_p8              IN NUMBER   DEFAULT NULL,
  active_sess_pool_p1 IN NUMBER   DEFAULT NULL,
  queueing_p1         IN NUMBER   DEFAULT NULL,
  parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  switch_group        IN VARCHAR2 DEFAULT NULL,
  switch_time         IN NUMBER   DEFAULT NULL,
  switch_estimate     IN BOOLEAN  DEFAULT FALSE,
  max_est_exec_time   IN NUMBER   DEFAULT NULL,
  undo_pool           IN NUMBER   DEFAULT NULL,
  max_idle_time       IN NUMBER   DEFAULT NULL,
  max_idle_blocker_time IN NUMBER   DEFAULT NULL,
  switch_time_in_call IN NUMBER   DEFAULT NULL);
```

Parameters

Table 85–6 CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
comment	Comment for the plan directive.
cpu_p1	For EMPHASIS, specifies the CPU percentage at the first level. For RATIO, specifies the weight of CPU usage. Default is NULL for all CPU parameters.
cpu_p2	For EMPHASIS, specifies the CPU percentage at the second level. Not applicable for RATIO.
cpu_p3	For EMPHASIS, specifies the CPU percentage at the third level. Not applicable for RATIO.
cpu_p4	For EMPHASIS, specifies the CPU percentage at the fourth level. Not applicable for RATIO.
cpu_p5	For EMPHASIS, specifies the CPU percentage at the fifth level. Not applicable for RATIO.
cpu_p6	For EMPHASIS, specifies the CPU percentage at the sixth level. Not applicable for RATIO.
cpu_p7	For EMPHASIS, specifies the CPU percentage at the seventh level. Not applicable for RATIO.

Table 85–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
cpu_p8	For EMPHASIS, specifies the CPU percentage at the eighth level. Not applicable for RATIO.
active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
switch_group	Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
switch_time	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
max_est_exec_time	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_time	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
switch_time_in_call	Specifies time (in seconds) that a session can execute before an action is taken. At the end of the top call, the consumer group of the session is restored to its original consumer group. Default is NULL, which means unlimited. Both SWITCH_TIME_IN_CALL and SWITCH_TIME cannot be specified.

Usage Notes

- All parameters default to NULL. However, for the EMPHASIS CPU resource allocation method, this case would starve all the users.
- For max_idle_time and max_idle_blocker_time, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter switch_time_in_call is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using switch_time_in_call, the resource usage of one client will not affect a future client that happens to be executed on the same session.

CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the `CREATE_CONSUMER_GROUP` and `CREATE_RESOURCE_PLAN_DIRECTIVES` procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
  SIMPLE_PLAN      IN  VARCHAR2  DEFAULT,
  CONSUMER_GROUP1 IN  VARCHAR2  DEFAULT,
  GROUP1_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP2 IN  VARCHAR2  DEFAULT,
  GROUP2_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP3 IN  VARCHAR2  DEFAULT,
  GROUP3_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP4 IN  VARCHAR2  DEFAULT,
  GROUP4_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP5 IN  VARCHAR2  DEFAULT,
  GROUP5_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP6 IN  VARCHAR2  DEFAULT,
  GROUP6_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP7 IN  VARCHAR2  DEFAULT,
  GROUP7_CPU      IN  NUMBER     DEFAULT,
  CONSUMER_GROUP8 IN  VARCHAR2  DEFAULT,
  GROUP8_CPU      IN  NUMBER     DEFAULT);
```

DELETE_CONSUMER_GROUP Procedure

This procedure lets you delete entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2);
```

Parameters

Table 85–7 *DELETE_CONSUMER_GROUP Procedure Parameters*

Parameters	Description
consumer_group	The name of the consumer group to be deleted.

DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (  
    plan IN VARCHAR2);
```

Parameters

Table 85–8 *DELETE_PLAN Procedure Parameters*

Parameter	Description
plan	The name of the resource plan to delete.

DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (  
    plan IN VARCHAR2);
```

Parameters

Table 85–9 *DELETE_PLAN_CASCADE Procedure Parameters*

Parameters	Description
plan	The name of the plan.

Usage Notes

If DELETE_PLAN_CASCADE encounters any error, then it rolls back, and nothing is deleted.

DELETE_PLAN_DIRECTIVE Procedure

This procedure lets you delete resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (  
    plan            IN VARCHAR2,  
    group_or_subplan IN VARCHAR2);
```

Parameters

Table 85–10 *DELETE_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the group or subplan.

SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(
  attribute      IN VARCHAR2,
  value          IN VARCHAR2,
  consumer_group IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 85–11 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

Parameters	Description
attribute	The mapping attribute to add/modify. It can be one of the Constants listed.
value	The attribute value to match.
consumer_group	The name of the mapped consumer group, or NULL to delete a mapping.

Usage Notes

If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is NULL, then any mapping from the given attribute and value will be deleted.

SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI (
  explicit           IN NUMBER,
  oracle_user       IN NUMBER,
  service_name      IN NUMBER,
  client_os_user    IN NUMBER,
  client_program    IN NUMBER,
  client_machine    IN NUMBER,
  module_name       IN NUMBER,
  module_name_action IN NUMBER,
  service_module    IN NUMBER,
  service_module_action IN NUMBER);
```

Parameters

Table 85–12 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

Parameters	Description
explicit	The priority of the explicit mapping.
oracle_user	The priority of the Oracle user name mapping.
service_name	The priority of the client service name mapping.
client_os_user	The priority of the client operating system user name mapping.
client_program	The priority of the client program mapping.
client_machine	The priority of the client machine mapping.
module_name	The priority of the application module name mapping.
module_name_action	The priority of the application module name and action mapping.
service_module	The priority of the service name and application module name mapping.
module_name_action	The priority of the service name, application module name, and application action mapping.

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
 - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.

SET_INITIAL_CONSUMER_GROUP Procedure

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

Parameters

Table 85–13 SET_INITIAL_CONSUMER_GROUP Procedure Parameters

Parameters	Description
user	The name of the user.
consumer_group	The user's initial consumer group.

Usage Notes

The ADMINISTER_RESOURCE_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

Note: These semantics are similar to those for ALTER USER DEFAULT ROLE.

If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT_CONSUMER_GROUP.

DEFAULT_CONSUMER_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have DEFAULT_CONSUMER_GROUP as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT_CONSUMER_GROUP.

SUBMIT_PENDING_AREA Procedure

This procedure lets you submit pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

Note: A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure lets you change the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (  
    session_id      IN NUMBER,  
    session_serial  IN NUMBER,  
    consumer_group  IN VARCHAR2);
```

Parameters

Table 85–14 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

Parameter	Description
session_id	SID column from the view V\$SESSION.
session_serial	SERIAL# column from view V\$SESSION.
consumer_group	The name of the consumer group to switch to.

SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure lets you change the resource consumer group for all sessions with a given user ID. It also change the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (  
    user          IN VARCHAR2,  
    consumer_group IN VARCHAR2);
```

Parameters

Table 85–15 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

Parameter	Description
user	The name of the user.
consumer_group	The name of the consumer group to switch to.

Usage Notes

The [SWITCH_CONSUMER_GROUP_FOR_SESS Procedure](#) and SWITCH_CONSUMER_GROUP_FOR_USER procedures let you to raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.

These procedures cause the session to be moved into the newly specified consumer group immediately.

SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
  plan_name          IN  VARCHAR2,
  sid                IN  VARCHAR2 DEFAULT '*',
  allow_scheduler_plan_switches IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 85–16 SWITCH_PLAN Procedure Parameters

Parameter	Description
plan_name	The name of the plan to which to switch. Passing in an empty string (") for the plan_name, disables the resource manager
sid	The sid parameter is relevant only in a Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To re-enable automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

UPDATE_CONSUMER_GROUP Procedure

This procedure lets you update entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2,  
    new_comment    IN VARCHAR2 DEFAULT NULL,  
    new_cpu_mth    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 85–17 UPDATE_CONSUMER_GROUP Procedure Parameter

Parameter	Description
consumer_group	The name of consumer group.
new_comment	New user's comment.
new_cpu_mth	The name of new method for CPU resource allocation.

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
  plan                IN VARCHAR2,
  new_comment         IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth         IN VARCHAR2 DEFAULT NULL,
  new_active_sess_pool_mth IN VARCHAR2 DEFAULT NULL,
  new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
  new_queueing_mth    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 85–18 UPDATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of resource plan.
new_comment	New user's comment.
new_cpu_mth	The name of new allocation method for CPU resources.
new_active_sess_pool_mth	The name of new method for maximum active sessions.
new_parallel_degree_limit_mth	The name of new method for degree of parallelism.
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature.

Usage Notes

- If the parameters to [UPDATE_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

UPDATE_PLAN_DIRECTIVE Procedure

This procedure lets you update resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  new_comment         IN VARCHAR2 DEFAULT NULL,
  new_cpu_p1          IN NUMBER   DEFAULT NULL,
  new_cpu_p2          IN NUMBER   DEFAULT NULL,
  new_cpu_p3          IN NUMBER   DEFAULT NULL,
  new_cpu_p4          IN NUMBER   DEFAULT NULL,
  new_cpu_p5          IN NUMBER   DEFAULT NULL,
  new_cpu_p6          IN NUMBER   DEFAULT NULL,
  new_cpu_p7          IN NUMBER   DEFAULT NULL,
  new_cpu_p8          IN NUMBER   DEFAULT NULL,
  new_active_sess_pool_p1 IN NUMBER DEFAULT NULL,
  new_queueing_p1     IN NUMBER   DEFAULT NULL,
  new_parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  new_switch_group    IN VARCHAR2 DEFAULT NULL,
  new_switch_time     IN NUMBER   DEFAULT NULL,
  new_switch_estimate IN BOOLEAN  DEFAULT FALSE,
  new_max_est_exec_time IN NUMBER DEFAULT NULL,
  new_undo_pool       IN NUMBER   DEFAULT NULL,
  new_max_idle_time   IN NUMBER   DEFAULT NULL,
  new_max_idle_blocker_time IN NUMBER DEFAULT NULL,
  new_switch_time_in_call IN NUMBER DEFAULT NULL);
```

Parameters

Table 85–19 UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
new_comment	Comment for the plan directive.
new_cpu_p1	For EMPHASIS, specifies the CPU percentage at the first level. For RATIO, specifies the weight of CPU usage. Default is NULL for all CPU parameters.
new_cpu_p2	For EMPHASIS, specifies the CPU percentage at the second level. Not applicable for RATIO.
new_cpu_p3	For EMPHASIS, specifies the CPU percentage at the third level. Not applicable for RATIO.
new_cpu_p4	For EMPHASIS, specifies the CPU percentage at the fourth level. Not applicable for RATIO.
new_cpu_p5	For EMPHASIS, specifies the CPU percentage at the fifth level. Not applicable for RATIO.
new_cpu_p6	For EMPHASIS, specifies the CPU percentage at the sixth level. Not applicable for RATIO.
new_cpu_p7	For EMPHASIS, specifies the CPU percentage at the seventh level. Not applicable for RATIO.

Table 85–19 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_cpu_p8</code>	For EMPHASIS, specifies the CPU percentage at the eighth level. Not applicable for RATIO.
<code>new_active_sess_pool_p1</code>	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
<code>new_queueing_p1</code>	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
<code>new_switch_group</code>	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
<code>new_switch_time</code>	Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
<code>new_switch_estimate</code>	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
<code>new_max_est_exec_time</code>	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
<code>new_undo_pool</code>	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
<code>new_parallel_degree_limit_p1</code>	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
<code>new_max_idle_time</code>	Indicates the maximum session idle time. Default is NULL, which means unlimited.
<code>new_max_idle_blocker_time</code>	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
<code>new_switch_time_in_call</code>	Specifies time (in seconds) that a session can execute before an action is taken. At the end of the top call, the consumer group of the session is restored to its original consumer group. Default is NULL, which means unlimited. Both SWITCH_TIME_IN_CALL and SWITCH_TIME cannot be specified.

Usage Notes

- If the parameters for UPDATE_PLAN_DIRECTIVE are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.

VALIDATE_PENDING_AREA Procedure

This procedure lets you validate pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

DBMS_RESOURCE_MANAGER_PRIVS

The DBMS_RESOURCE_MANAGER_PRIVS package maintains privileges associated with the Resource Manager.

See Also: For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms](#)

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Table 86–1 *DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms*

Subprogram	Description
GRANT_SWITCH_CONSUMER_GROUP Procedure on page 86-3	Grants the privilege to switch to resource consumer groups
GRANT_SYSTEM_PRIVILEGE Procedure on page 86-4	Performs a grant of a system privilege
REVOKE_SWITCH_CONSUMER_GROUP Procedure on page 86-5	Revokes the privilege to switch to resource consumer groups.
REVOKE_SYSTEM_PRIVILEGE Procedure on page 86-6	Performs a revoke of a system privilege

GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
    grantee_name  IN VARCHAR2,
    consumer_group IN VARCHAR2,
    grant_option  IN BOOLEAN);
```

Parameters

Table 86–2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also: [Chapter 85, "DBMS_RESOURCE_MANAGER"](#)

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
    'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
    dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (  
    grantee_name    IN VARCHAR2,  
    privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',  
    admin_option    IN BOOLEAN);
```

Parameters

Table 86–3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
<code>grantee_name</code>	Name of the user or role to whom privilege is to be granted.
<code>privilege_name</code>	Name of the privilege to be granted.
<code>admin_option</code>	TRUE if the grant is with <code>admin_option</code> , FALSE otherwise.

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: `ADMINISTER_RESOURCE_MANAGER`. Database administrators have this system privilege with the `ADMIN` option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the `ADMIN` option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called `scott` without the `ADMIN` option:

```
BEGIN  
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (  
    grantee_name => 'scott',  
    privilege_name => 'ADMINISTER_RESOURCE_MANAGER',  
    admin_option => FALSE);  
END;  
/
```

REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
    revokee_name  IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

Parameters

Table 86-4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the DEFAULT_CONSUMER_GROUP consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from PUBLIC, then any users who could previously only use the consumer group through PUBLIC will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to mail_maintenance_group from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
    'scott', 'mail_maintenance_group');
END;
/
```

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (  
    revokee_name    IN VARCHAR2,  
    privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 86–5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
revokee_name	Name of the user or role from whom privilege is to be revoked.
privilege_name	Name of the privilege to be revoked.

Examples

The following call revokes the ADMINISTER_RESOURCE_MANAGER from user scott:

```
BEGIN  
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');  
END;  
/
```

DBMS_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Using DBMS_RESUMABLE](#)
 - Operational Notes
- [Summary of DBMS_RESUMABLE Subprograms](#)

Using DBMS_RESUMABLE

- [Operational Notes](#)

Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

Summary of DBMS_RESUMABLE Subprograms

Table 87–1 DBMS_RESUMABLE Package Subprograms

Subprogram	Description
ABORT Procedure on page 87-5	Aborts a suspended resumable space allocation
GET_SESSION_TIMEOUT Function on page 87-6	Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code>
GET_TIMEOUT Function on page 87-7	Returns the current timeout value of resumable space allocations for the current session
SET_SESSION_TIMEOUT Procedure on page 87-8	Sets the timeout of resumable space allocations for a session with <code>session_id</code>
SET_TIMEOUT Procedure on page 87-9	Sets the timeout of resumable space allocations for the current session
SPACE_ERROR_INFO Function on page 87-10	Looks for space-related errors in the error stack, otherwise returning <code>FALSE</code>

ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (  
    session_id IN NUMBER);
```

Parameters

Table 87–2 ABORT Procedure Parameters

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (  
    session_id IN NUMBER)  
RETURN NUMBER;
```

Parameters

Table 87-3 GET_SESSION_TIMEOUT Function Parameters

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

Return Values

Table 87-4 GET_SESSION_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds.

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT  
RETURN NUMBER;
```

Return Values

Table 87-5 GET_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.

SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (  
    session_id IN NUMBER,  
    timeout    IN NUMBER);
```

Parameters

Table 87–6 *SET_SESSION_TIMEOUT Procedure Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.
<code>timeout</code>	The timeout of the resumable space allocation.

SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (  
    timeout IN NUMBER);
```

Parameters

Table 87–7 *SET_TIMEOUT Procedure Parameters*

Parameter	Description
timeout	The timeout of the resumable space allocation.

SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
  error_type      OUT VARCHAR2,
  object_type     OUT VARCHAR2,
  object_owner    OUT VARCHAR2,
  table_space_name OUT VARCHAR2,
  object_name     OUT VARCHAR2,
  sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 87–8 SPACE_ERROR_INFO Function Parameters

Parameter	Description
error_type	The space error type. It will be one of the following: <ul style="list-style-type: none"> ▪ NO MORE SPACE ▪ MAX EXTENTS REACHED ▪ SPACE QUOTA EXCEEDED
object_type	The object type. It will be one of the following: <ul style="list-style-type: none"> ▪ TABLE ▪ INDEX ▪ CLUSTER ▪ TABLE SPACE ▪ ROLLBACK SEGMENT ▪ UNDO SEGMENT ▪ LOB SEGMENT ▪ TEMP SEGMENT ▪ INDEX PARTITION ▪ TABLE PARTITION ▪ LOB PARTITION ▪ TABLE SUBPARTITION ▪ INDEX SUBPARTITION ▪ LOB SUBPARTITION The type can also be <code>NULL</code> if it does not apply.
object_owner	The owner of the object. <code>NULL</code> if it cannot be determined.
table_space_name	The table space where the object resides. <code>NULL</code> if it cannot be determined.
object_name	The name of rollback segment, temp segment, table, index, or cluster.
sub_object_name	The partition name or sub-partition name of <code>LOB</code> , <code>TABLE</code> , or <code>INDEX</code> . <code>NULL</code> if it cannot be determined.

DBMS_RLMGR

The DBMS_RLMGR package contains various procedures to create and manage rules and rule sessions by the Rules Manager.

See Also: *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.

This chapter contains the following topic:

- [Summary of Rules Manager Subprograms](#)

Summary of Rules Manager Subprograms

Table 88–1 describes the subprograms in the DBMS_RLMGR package.

All the values and names passed to the procedures defined in the DBMS_RLMGR package are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 88–1 DBMS_RLMGR Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the event structure (also the Expression Filter attribute set)
ADD_EVENT Procedures	Adds an event to a rule class in an active session
ADD_FUNCTIONS Procedure	Adds a Function, a Type, or a Package to the approved list of functions with an event structure (also the Expression Filter attribute set)
ADD_RULE Procedure	Adds a rule to the rule class
CONSUME_EVENT Function	Consumes an event using its identifiers and prepares the corresponding rule for action execution
CONSUME_PRIM_EVENTS Function	Consumes one or more primitive events with all or none semantics
CREATE_EVENT_STRUCTURE Procedure	Creates an event structure
CREATE_RULE_CLASS Procedure	Creates a rule class
DELETE_RULE Procedure	Deletes a rule from a rule class
DROP_EVENT_STRUCTURE Procedure	Drops an event structure
DROP_RULE_CLASS Procedure	Drops a rule class
GRANT_PRIVILEGE Procedure	Grants a privilege on a rule class to another user
PROCESS_RULES Procedure	Process the rules for a given event
RESET_SESSION Procedure	Starts a new rule session within a database session
REVOKE_PRIVILEGE Procedure	Revokes a privilege on a rule class from a user

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to an event structure, which is also the Expression Filter attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct IN VARCHAR2,
    attr_name    IN VARCHAR2,
    attr_type    IN VARCHAR2,
    attr_defvl   IN VARCHAR2 default NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the event structure:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct IN VARCHAR2,
    attr_name    IN VARCHAR2,
    tab_alias    IN rlm$table_alias);
```

Parameters

Table 88–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
event_struct	Name of the event structure or attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
tab_alias	The type that identifies the database table to which the attribute is aliased
attr_defvl	Default value for the elementary attribute

Usage Notes

- This procedure adds an elementary attribute to an event structure. The event structure is internally managed as the Expression Filter attribute set. If the event structure was originally created from an existing object type, then additional attributes cannot be added.

Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions, which is equivalent to an event structure that is used for a rule class.

- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter*.

- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct => 'HRAttrSet',
    attr_name => 'HRREP',
    attr_type => 'VARCHAR2(30)');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct => 'HRAttrSet',
    attr_name => 'DEPT',
    tab_alias => exf$table_alias('DEPT'));
END;
```

ADD_EVENT Procedures

This procedure adds a primitive event to a rule class in an active rule session. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds a string representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
    rule_class      IN VARCHAR2,
    event_inst      IN VARCHAR2,
    event_type      IN VARCHAR2 default null);
```

Adds an AnyData representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
    rule_class      IN VARCHAR2,
    event_inst      IN sys.AnyData);
```

Parameters

Table 88–3 ADD_EVENT Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to add a primitive or a simple event to a rule class within an active rule session. By default, a rule session is the same as the database session. Optionally, multiple (sequential) rule sessions can be started within a database session by using the `RESET_SESSION` or `PROCESS_RULES` procedures.
- When the rule class is configured for simple events (consisting of only one primitive event structure), the `event_type` argument for the `ADD_EVENT` procedure can be ignored. Also, when the AnyData format of the event instance is passed, the event type information is embedded in the AnyData instance. In all other cases, the name of the primitive event structure being added to the rule class should be assigned to the `event_type` argument.
- For a valid event instance, the `ADD_EVENT` procedure processes the rules in the rule class and captures the results in the rule class results view (configured at the time of rule class creation). These results are preserved until the end of the rule session.
- When schema extended name is used for the rule class, you should have `PROCESS_RULES` privilege on the rule class. See the [GRANT_PRIVILEGE Procedure](#) for additional information. The value specified for the `event_type` argument is always resolved in the rule class owner's schema and should not use schema extended names. When a composite event structure is configured with a table alias

primitive event type, the name of the corresponding table should be assigned to the `event_type` argument.

Examples

The following commands add two events to the `CompTravelPromo` rule class that is configured for two types of primitive events (`AddFlight` and `AddRentalCar`).

```
BEGIN
  DBMS_RLMGR.ADD_EVENT(rule_class => 'CompTravelPromo',
                      event_inst =>
                        AddFlight.getVarchar(987, 'Abcair', 'Boston',
                                             'Orlando', '01-APR-2003', '08-APR-2003'),
                      event_type => 'AddFlight');

  DBMS_RLMGR.ADD_EVENT(rule_class => 'Scott.CompTravelPromo',
                      event_inst =>
                        AnyData.convertObject(
                          AddRentalCar(987, 'Luxury', '03-APR-2003',
                                       '08-APR-2003', NULL)));
END;
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the event structure, which is also the Expression Filter attribute set.

Syntax

```
DBMS_RLMGR.ADD_FUNCTIONS (
    event_struct IN VARCHAR2,
    funcs_name  IN VARCHAR2);
```

Parameters

Table 88–4 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
event_struct	Name of the event structure to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use in the rule conditions. If the expression set refers to a user-defined function, the expression set must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list.
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the rule condition are considered valid. The conditional expression can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ASET_FUNCTIONS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
    DBMS_RLMGR.ADD_FUNCTIONS (attr_set => 'Car4Sale',
                              funcs_name => 'HorsePower');
    DBMS_RLMGR.ADD_FUNCTIONS (attr_set => 'Car4Sale',
                              funcs_name => 'Scott.CrashTestRating');
END;
```

ADD_RULE Procedure

This procedure adds new rules to a rule class.

Syntax

```
DBMS_RLMGR.ADD_RULE (
    rule_class      IN  VARCHAR2,
    rule_id        IN  VARCHAR2,
    rule_cond      IN  VARCHAR2,
    actprf_nml     IN  VARCHAR2 DEFAULT NULL,
    actprf_vall    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 88–5 ADD_RULE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Unique identifier for the rule within the rule class
rule_cond	The condition for the rule. The condition uses the variables defined in the rule class's event structure.
actprf_nml	The list of action preference names for which values will be assigned through the actprf_vall argument
actprf_vall	The list of action preference values for the names list assigned to the actprf_nml argument

Usage Notes

- This procedure is used to add new rules to the rule class. The rule condition passed to the ADD_RULE procedure is validated using the event structure associated with the rule class. The action preferences names list is a subset of action preference categories configured during rule class creation.
- When schema extended name is used for the rule class, you should have ADD RULE privilege on the rule class. See the [GRANT_PRIVILEGE Procedure](#) for more information.
- Alternately, the owner of the rule class can add the rules using SQL INSERT statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users.

Note: The AUTOCOMMIT property of the rule class is ignored if the new rules are added using the SQL INSERT statement instead of the ADD_RULE procedure.

- See the [CREATE_RULE_CLASS Procedure](#) procedure for the structure of the rule class table.

Examples

The following command adds a rule to the rule class.

```

BEGIN
DBMS_RLMGR.ADD_RULE (
    rule_class => 'CompTravelPromo',
    rule_id => 'AB_AV_FL',
    rule_cond =>
        '<condition>
            <and join="Flt.CustId = Car.CustId">
                <object name="Flt">
                    Airline='Abcair' and ToCity='Orlando'
                </object>
                <object name="Car">
                    CarType = 'Luxury'
                </object>
            </and>
        </condition>' ,
    actprf_nml => 'PromoType, OfferedBy',
    actprf_vall => ''RentalCar', 'Acar'');
END;

```

With proper privileges, the following SQL INSERT statement can be used to add the rule to the rule class.

```

INSERT INTO CompTravelPromo (rlm$ruleid, rlm$rulecond, PromoType, OfferedBy)
VALUES ('AB_AV_FL',
    '<condition>
        <and join="Flt.CustId = Car.CustId">
            <object name="Flt">
                Airline='Abcair' and ToCity='Orlando'
            </object>
            <object name="Car">
                CarType = 'Luxury'
            </object>
        </and>
    </condition>',
    'RentalCar', 'Acar');

```

CONSUME_EVENT Function

This function consumes an event and prepares the corresponding rule for action execution. This is required only when the action (or rule execution) is carried by the user's application and not in the callback.

Syntax

```
DBMS_RLMGR.CONSUME_EVENT (
    rule_class      IN VARCHAR2,
    event_ident     IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 88–6 CONSUME_EVENT Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifier obtained from the corresponding rule class results view (or arguments of the action callback procedure in the case of rule class configured for RULE based consumption policy)

Returns

The function returns:

- 1 -- If the event is successfully consumed.
- 0 -- If the event is expired (owing to duration policy) or consumed by another session prior to this call.

Usage Notes

- When an **EXCLUSIVE** consumption policy is set for the events in a rule class, an event must be deleted from the system immediately after the rule it matched is executed (action is executed). When the rule action is carried in the rule class callback procedure by calling the **PROCESS_RULES** procedure, the rule manager automatically handles the consumption of the events. However, when you request the results from matching events with rules in a rule class results view using the **ADD_EVENT** procedure, you should take appropriate action to indicate the exact rule-event combination that is to be used for rule execution. The **CONSUME_EVENT** procedure performs the required housekeeping services when the unique identifier for the event used in a rule execution is passed in.
- Since there could be a time lag between fetching the rule class matching results and the execution of the user initiated action, the application should execute the action only if the **CONSUME_EVENT** call succeeds in consuming the event. This avoids any race condition with parallel sessions trying to consume the same events. When the event is successfully consumed, this call returns 1. In all other cases, it returns 0. A return value of 0 implies that the event is already consumed by another session and hence it is not available for this session.
- The **CONSUME_EVENT** procedure deletes the events configured with **EXCLUSIVE** consumption policy and does nothing for events configured for 4 consumption policy.

- Unlike the EXCLUSIVE and SHARED consumption policies, which are determined at the rule class level, a RULE consumption policy can be used to determine the consumption of an event on a rule by rule basis. That is a subset of the rules in a rule class may be configured such that when they are matched, the event is deleted from the system. At the same time the other set of rules could leave the event in the system even after executing the corresponding action. In this scenario, the action callback procedure implemented by the application developer can call CONSUME_EVENT function (with appropriate arguments) to conditionally consume the event for certain rules. Also see the use of [CONSUME_PRIM_EVENTS Function](#) for rule classes configured for RULE consumption policy

Examples

The following commands identify an event that is used for a rule execution and consumes it using its identifier.

```
var eventid VARCHAR(40);
var evtcnsm NUMBER;

BEGIN
  SELECT rlm$eventid INTO :eventid FROM MatchingPromos WHERE rownum < 2;

  -- carry the required action for a rule matched by the above event --
  :evtcnsm := DBMS_RLMGR.CONSUME_EVENT(rule_class => 'TravelPromotion',
                                     event_ident => :eventid);
END;
```

CONSUME_PRIM_EVENTS Function

This function consumes a set of primitive events with all or nothing semantics in the case of a rule class configured with `RULE` based consumption policy.

Syntax

```
DBMS_RLMGR.CONSUME_PRIM_EVENTS (
    rule_class      IN VARCHAR2,
    event_ids       IN RLM$EVENTIDS)
RETURN NUMBER;
```

Parameters

Table 88–7 CONSUME_PRIM_EVENTS Function Parameters

Parameter	Description
<code>rule_class</code>	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
<code>event_id</code>	Event identifiers obtained from the corresponding rule class results view or the arguments of the action callback procedure

Returns

The function returns:

- 1 -- If all the events, the identifiers for which are passed in, are successfully consumed.
- 0 -- If one or more primitive event could not be consumed.

Usage Notes

When the rule class is configured for `RULE` based consumption policy, the `CONSUME_PRIM_EVENTS` function can be used to consume one or more primitive events that constitute a composite event. This operation will succeed only when all the events passed in are still valid and are available for consumption. Any user initiated action should be implemented after checking the return value of the `CONSUME_PRIM_EVENTS` call.

Examples

The following commands show the body of the action callback procedure for a rule class configured for `RULE` consumption policy. This demonstrates the use of `CONSUME_PRIM_EVENTS` procedure to consume the events before executing the action for the matched rules.

```
create or replace procedure PromoAction (
    Flt      AddFlight,
    Flt_EvtId ROWID,    --- rowid for the flight primitive event
    Car      AddRentalCar,
    Car_EvtId ROWID,
    rlm$rule TravelPromotions%ROWTYPE) is
    evtcnsmd NUMBER;
BEGIN
    evtcnsmd := DBMS_RLMGR.CONSUME_PRIM_EVENTS(
        rule_class => 'TravelPromotions',
        event_ids => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));
```

```
if (evtcnsmd = 1) then
  -- consume operation was successful; perform the action ---
  OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
end if;
END;
```

CREATE_EVENT_STRUCTURE Procedure

This procedure creates an event structure.

Syntax

```
DBMS_RLMGR.CREATE_EVENT_STRUCTURE (  
    event_struct IN VARCHAR2);
```

Parameters

Table 88–8 CREATE_EVENT_STRUCTURE Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to be created in the current schema

Usage Notes

This procedure creates a dummy the event structure in the current schema. One or more attributes can be added to this event structure using the `ADD_ELEMENTARY_ATTRIBUTE` procedure.

Examples

The following command creates the event structure.

```
BEGIN  
    DBMS_RLMGR.CREATE_EVENT_STRUCT(event_struct => 'AddFlight');  
END;
```

CREATE_RULE_CLASS Procedure

This procedure creates a rule class.

Syntax

```
DBMS_RLMGR.CREATE_RULE_CLASS (
  rule_class      IN  VARCHAR2,
  event_struct    IN  VARCHAR2,
  action_cbk      IN  VARCHAR2,
  actprf_spec     IN  VARCHAR2  default null,
  rslt_viewnm     IN  VARCHAR2  default null,
  rlcls_prop      IN  VARCHAR2  default <simple/>);
```

Parameters

Table 88–9 CREATE_RULE_CLASS Procedure Parameters

Parameter	Description
rule_class	The name of the rule class to be created in the current schema
event_struct	The name of the object type or an Expression Filter attribute set in the current schema that represents the event structure for the rule class
action_cbk	The name of the action callback procedure to be created for the rule class
actprf_spec	The specification (name and SQL datatype pairs) for the action preferences associated with the rule class
rlst_viewnm	The name of the rule class results view that lists the matching events and rules within a session. A view with this name is created in the current schema.
rlcls_prop	The XML document for setting the rule class properties. By default, the rule class created is for simple events (non-composite).

Usage Notes

- For successful creation of a rule class, you should have sufficient privileges to create views, object types, tables, packages, and procedures.
- This command creates the rule class and its dependent objects in the user's schema. For this operation to succeed the name specified for the event structure should refer to an existing object type or an Expression Filter attribute set in the user's schema. When an object type is used for an event structure, the `CREATE_RULE_CLASS` procedure implicitly creates an attribute set for the object type. In the case of a rule class configured for composite events, the previous procedure also creates attribute sets for the object types that are directly embedded in the event structure's object type (or the attribute set). A maximum of 32 embedded objects (and/or table aliases) can be specified with an event structure that is used for a composite rule class. The types of dependent objects created with this procedure and their structure depend on the properties of the rule class and its event structure. The minimum set of dependent objects created for a rule class is as follows:
 - Rule class table – A rule class table that shares the name of the rule class is created in the user's schema to store the rule definitions (rule identifiers, rule conditions, rule descriptions, and action preferences). This table implicitly has three columns, `rlm$ruleid`, `rlm$rulecond`, and `rlm$ruledesc` to store the rule identifiers, rule conditions, and rule descriptions respectively. In addition to

these three columns, the rule class table has few columns according to the rule classes' access preference specification. For example, if a TravelPromotion rule class uses 'PromoType VARCHAR(20), OfferedBy VARCHAR(20)' as its access preference specification (assigned to `actpref_spec` argument), the rule class table is created with the following structure.

```
TABLE TravelPromotion (
    rlm$ruleid VARCHAR(100),      -- rule identifier column --
    PromoType VARCHAR(20),      -- access preference 1 --
    OfferedBy VARCHAR(20),      -- access preference 2 --
    rlm$rulecond VARCHAR(4000),  -- rule condition --
    rlm$ruledesc VARCHAR(1000)); -- rule description --
```

The rule class table structure varies from one rule class to another based on the exact list of action preference categories specified for the rule class.

- Action Callback Procedure – The skeleton for the action callback procedure with the given name is created in the user's schema and it is associated with the rule class. During rule evaluation, the callback procedure is called for each matching rule and event. You should implement the body of the action callback procedure to perform the appropriate action for each rule. The exact action for a rule can be determined based on the event that matched the rule and rule definition along with its action preferences. This information is passed to the action callback procedure through its arguments. Hence, the argument list for the action callback procedure depends on the event structure associated with the rule class and the rule class itself.

In the case of a rule class configured for simple events (`<simple/>` assigned to the properties of the rule class), the event that matches a rule is passed through a `rlm$event` argument that is declared to be of the same type as the event structure. Additionally, the rule definitions are passed to the action callback procedure using an `rlm$rule` argument that is declared as ROWTYPE of the corresponding rule class table. For example, the structure of the PromoAction action callback procedure created for a TravelPromotion rule class configured for a simple (non-composite) AddFlight event structure is as follows:

```
PROCEDURE PromoAction (rlm$event AddFlight,
    rlm$rule TravlePromotion%ROWTYPE);
```

In the case of a rule class created for composite events (`<composite/>` assigned to the properties of the rule class), the action callback procedure is created to pass each primitive event as a separate argument. For example, the CompPromoAction action callback procedure created for a rule class CompTravelPromo configured for a composite event with AddFlight and AddRentalCar primitive events are shown as follows:

```
-- composite event structure --
TYPE TSCompEvent (Flt AddFlight,
    Car AddRentalCar);
-- corresponding action callback procedure --
PROCEDURE PromoAction (Flt AddFlight,
    Car AddRentalCar,
    rlm$rule CompTravelPromo%ROWTYPE)
```

- Rule class results view – A view to display the results from matching some events with rules is created in the same schema as the rule class. By default, this view is created with a system-generated name. Optionally, the rule class creator can specify a name for this view with the `rlst_viewnm` argument of

the `CREATE_RULE_CLASS` procedure. When the events are added to the rule manager within a rule session using the `ADD_EVENT` procedure, the list of matching events and rules are displayed in the rule class results view.

The structure of the view defined for the rule class results depends on the event structure and the action preferences configured with the rule class. Minimally, the view has three columns to display the system generated event identifier (`rlm$eventid`), the identifier of the rule it matches (`rlm$ruleid`), and the rule condition (`rlm$rulecond`). Additionally, it has columns to display the event information and the rule action preferences.

In the case of a rule class configured for simple events, the event information is displayed as `rlm$event` that is declared to be of the event structure type. So, a `MatchingPromos` view created for the `TravelPromotion` rule class configured for a simple `AddFlight` event structure is as follows:

```
VIEW MatchingPromos (
    rlm$eventid ROWID,
    rlm$event AddFlight,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

In the case of a rule class configured for composite events, the primitive events matching a rule are displayed separately using corresponding columns. For the above `CompTravelPromo` rule class, a `MatchingCompPromos` view is created with the following structure.

```
VIEW MatchingCompPromos (
    rlm$eventid ROWID,
    Flt AddFlight,
    Car AddRentalCar,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

The values from the `rlm$eventid` column are used to enforce rule class consumption policies when the corresponding rule is executed. See the [CONSUME_EVENT Function](#) procedure for more information.

Examples

The following commands create a rule class for simple events (of `AddFlight` type).

```
CREATE or REPLACE TYPE AddFlight AS OBJECT (
    CustId NUMBER,
    Airline VARCHAR(20),
    FromCity VARCHAR(30),
    ToCity VARCHAR(30),
    Depart DATE,
    Return DATE);
BEGIN
    DBMS_RLMGR.CREATE_RULE_CLASS (
        rule_class => 'TravelPromotion', -- rule class name --
        event_struct => 'AddFlight', -- event struct name --
```

```
        action_cbk    => 'PromoAction', -- callback proc name --
        rslt_viewnm   => 'MatchingPromos', -- results view --
        actprf_spec   => 'PromoType VARCHAR(20),
                        OfferedBy VARCHAR(20)');
END;
```

The following commands create a rule class for composite events consisting of two primitive events (AddFlight and AddRentalCar).

```
CREATE or REPLACE TYPE TSCompEvent (Flt AddFlight,
                                   Car AddRentalCar);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
    rule_class    => 'CompTravelPromo', -- rule class name --
    event_struct => 'TSCompEvent', -- event struct name --
    action_cbk   => 'CompPromoAction', -- callback proc name --
    rslt_viewnm  => 'MatchingCompPromos', -- results view --
    actprf_spec  => 'PromoType VARCHAR(20),
                    OfferedBy VARCHAR(20)',
    properties   => '<composite/>');
END;
```

DELETE_RULE Procedure

This procedure deletes a rule from a rule class.

Syntax

```
DBMS_RLMGR.DELETE_RULE (
  rule_class  IN  VARCHAR2,
  rule_id     IN  VARCHAR2);
```

Parameters

Table 88–10 *DELETE_RULE Procedure Parameters*

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Identifier for the rule to be deleted

Usage Notes

- This procedure is used to delete a rule from the rule class. The identifier for the rule to be deleted can be obtained by querying the rule class table (that shares the same name as the rule class). Alternately, the owner of the rule class can use a SQL DELETE statement on one rule class table to delete a rule.
- When schema extended name is used for the rule class, you should have DELETE RULE privilege on the rule class. See the [GRANT_PRIVILEGE Procedure](#) procedure for more information.

Note: AUTOCOMMIT property of the rule class is ignored if the rules are deleted with the SQL DELETE statement instead of the DELETE_RULE procedure.

- See the [CREATE_RULE_CLASS Procedure](#) procedure for the structure of the rule class table.

Examples

The following command deletes a rule from the rule class.

```
BEGIN
  DBMS_RLMGR.DELETE_RULE (
    rule_class => 'CompTravelPromo',
    rule_id    => 'AB_AV_FL');
END;
```

Alternately, the following SQL DELETE statement can be issued to delete the above rule from the rule class.

```
DELETE FROM CompTravelPromo WHERE rlm$ruleid = 'AB_AV_FL';
```

DROP_EVENT_STRUCTURE Procedure

This procedure drops an event structure.

Syntax

```
DBMS_RLMGR.DROP_EVENT_STRUCTURE (
    event_struct IN VARCHAR2);
```

Parameters

Table 88–11 DROP_EVENT_STRUCTURE Procedure Parameter

Parameter	Description
event_struct	Name of the event structure in the current schema

Usage Notes

This procedure drops the event structure from the current schema. This drops all the dependent objects created to manage the event structure.

Examples

The following command drops the event structure.

```
BEGIN
    DBMS_RLMGR.DROP_EVENT_STRUCTURE(event_struct => 'AddFlight');
END;
```

DROP_RULE_CLASS Procedure

This procedure drops a rule class.

Syntax

```
DBMS_RLMGR.DROP_RULE_CLASS (
    rule_class IN VARCHAR2);
```

Parameters

Table 88–12 *DROP_RULE_CLASS Procedure Parameter*

Parameter	Description
rule_class	The name of the rule class in the current schema

Usage Notes

This procedure drops the rule class from the current schema. This drops all the dependent objects created to manage the rule class. Because an event structure in a user's schema can be shared across multiple rule classes, the event structure is not dropped with this command. The `DROP_EVENT_STRUCTURE` API should be used for the composite event as well as the individual primitive events to cleanup unused event structures.

Examples

The following command drops the rule class.

```
BEGIN
    DBMS_RLMGR.DROP_RULE_CLASS(rule_class => 'CompTravelPromo');
END;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on a rule class to another user.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE (
    rule_class    IN  VARCHAR2,
    priv_type     IN  VARCHAR2,
    to_user       IN  VARCHAR2);
```

Parameters

Table 88–13 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	The name of the rule class in the current schema
priv_type	Type of rule class privilege to be granted
to_user	The user to whom the privilege is to be granted

Usage Notes

- This procedure grants appropriate privileges to a user who is not the owner of the rule class. The types of privileges that can be granted to a user are:
 - PROCESS RULES: A user with PROCESS RULES privilege on a rule class can process the rules in the rule class using the PROCESS_RULES procedure or the ADD_EVENT procedure. Also, the user with this privilege can select from the corresponding rule class results view.
 - ADD RULE: A user with ADD RULE privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant INSERT privileges on one rule class table to other users.
 - DELETE RULE: A user with DELETE RULE privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant DELETE privileges on one rule class table to other users.
 - ALL: Granting the ALL privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.
- The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user.
- A user should also have EXECUTE privileges on the primitive event types associated with a rule class in order to make use of the corresponding rule class results view

Examples

The following command grants PROCESS RULES privilege on TravelPromo rule class to the user SCOTT.

```
BEGIN
    DBMS_RLMGR.GRANT_PRIVILEGE(rule_class => 'TravelPromo',
                               priv_type => 'PROCESS RULES',
```

```
to_user => 'SCOTT');  
END;
```

PROCESS_RULES Procedure

This procedure processes the rules for a given event. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Processes the rules for a string representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES (
    rule_class    IN VARCHAR2,
    event_inst    IN VARCHAR2,
    event_type    IN VARCHAR2 default null);
```

Processes the rules for an AnyData representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES (
    rule_class    IN VARCHAR2,
    event_inst    IN sys.AnyData);
```

Parameters

Table 88–14 PROCESS_RULES Procedure Parameters

Parameter	Description
rule_class	The name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to process the rules in a rule class for an event instance assigned to the event_inst argument.
- In the case of a rule class configured for simple events (non-composite), the event instance is an instantiation of the corresponding event structure. The rules are evaluated (conclusively) for this event and the corresponding action callback procedure is called for each matching rule. If the event does not match any rule, no further action is performed. If the event matches two or more rules, the ordering clause configured for the rule class is used to order them accordingly to invoke the action callback procedure. If the rule class is configured for EXCLUSIVE consumption policy, once the first rule in this order is executed (and the corresponding action callback procedure is called), the rest of the rules that matched the event are ignored.
- In the case of a rule class configured for composite events, the event instance assigned to the event_inst argument is an instantiation of one of the primitive type within the composite event. When the instance is represented as a string, the corresponding type name should be assigned to the event_type argument. The PROCESS_RULES call on a rule class configured for composite events performs

various actions depending on the state of the rule class and the kind of rules in the rule class.

- The rules operating only on the primitive event passed in are evaluated conclusively and the action callback procedure is called for the matching rules, as described in previous paragraph.
- In the case of a rule operating on more than one primitive event, the event instance passed through `PROCESS_RULES` procedure could match only a part of the rule.
 - * If there is (are) another primitive event instance(s) that matches the rest of the rule, the current event instance is combined with the other instance(s) to form a complete composite event that matches a rule in the rule class. So, the event instance assigned to the `event_inst` argument of the `PROCESS_RULES` procedure could be combined with various other primitive events (previously processed) to evaluate one or more rules conclusively. The rule classes' action callback procedure is called for each such combination of primitive events (composite event) and the rule. The ordering clause for the rule class and the consumption policy for the primitive events in taken into account while invoking the action callback procedure.
 - * If there is no other primitive event that matches the rest of the rule, the current event instance and its (incremental) evaluation results are recorded in the database. These results are preserved until either the event is consumed or deleted from the system owing to the duration policy used for the rule class.

Examples

The following command processes the rules in the `TravelPromotion` rule class for the given events.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES (
    rule_class => 'TravelPromotion',
    event_inst =>
      AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                          '01-APR-2003', '08-APR-2003'));
END;
```

The following commands process the rules in the `CompTravelPromo` rule class for the two primitive events shown.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES(
    rule_class => 'CompTravelPromo',
    event_inst =>
      AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                          '01-APR-2003', '08-APR-2003'),
    event_type => 'AddFlight');
  DBMS_RLMGR.PROCESS_RULES(
    rule_class => 'Scott.CompTravelPromo',
    event_inst =>
      AnyData.convertObject(AddRentalCar(987, 'Luxury', '03-APR-2003',
                                         '08-APR-2003', NULL)));
END;
```

RESET_SESSION Procedure

This procedure starts a new session and thus discards the results in the rule class results view.

Syntax

```
DBMS_RLMGR.RESET_SESSION (  
    rule_class IN VARCHAR2);
```

Parameters

Table 88–15 RESET_SESSION Procedure Parameter

Parameter	Description
rule_class	The name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.

Usage Notes

- When the `ADD_EVENT` procedure is used to add events to the rule class, the results from matching rules with events are recorded in the rule class results view. By default, these results are reset at the end of the database session. Alternately, the [RESET_SESSION Procedure](#) can be used to reset and start a new rule session within a database session.
- This procedure is only applicable while using [ADD_EVENT Procedures](#) to evaluate the rules.

Examples

The following command resets a rule class session.

```
BEGIN  
    DBMS_RLMGR.RESET_SESSION(  
        rule_class => 'CompTravelPromo');  
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes privileges on a rule class from another user.

Syntax

```
DBMS_RLMGR.REVOKE_PRIVILEGE (
  rule_class      IN VARCHAR2,
  priv_type       IN VARCHAR2,
  from_user       IN VARCHAR2);
```

Parameters

Table 88–16 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	The name of the rule class in the current schema
priv_type	Type of rule class privilege to be revoked
from_user	The user from whom the privilege is to be revoked

Usage Notes

This procedure revokes appropriate privileges from a user. The types of privileges that can be revoked are the same as the types listed in the [GRANT_PRIVILEGE Procedure](#) description. Rule class privileges cannot be revoked from the owner of the rule class.

Examples

The following command revokes PROCESS RULES privilege on TravelPromo rule class from the user SCOTT.

```
BEGIN
  DBMS_RLMGR.REVOKE_PRIVILEGE(rule_class => 'TravelPromo',
                               priv_type  => 'PROCESS RULES',
                               from_user   => 'SCOTT');
END;
```

The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS_RLS is available with the Enterprise Edition only.

See Also: *Oracle Database Security Guide* for usage information on DBMS_RLS .

Using DBMS_RLS

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (  
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

Note: The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');  
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', FALSE);
```

Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v\$vpd_policies.

A synonym can reference only a view or a table.

Summary of DBMS_RLS Subprograms

Table 89–1 DBMS_RLS Subprograms Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure on page 89-7	Adds a policy associated with a policy group
ADD_POLICY Procedure on page 89-9	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure on page 89-13	Adds the context for the active application
CREATE_POLICY_GROUP Procedure on page 89-14	Creates a policy group
DELETE_POLICY_GROUP Procedure on page 89-15	Deletes a policy group
DISABLE_GROUPED_POLICY Procedure on page 89-16	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure on page 89-17	Drops a policy associated with a policy group
DROP_POLICY Procedure on page 89-18	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure on page 89-19	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure on page 89-20	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure on page 89-21	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure on page 89-22	Reparses the SQL statements associated with a refreshed policy
REFRESH_POLICY Procedure on page 89-23	Causes all the cached statements associated with the policy to be reparsed

ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY (
    object_schema  VARCHAR2,
    object_name    VARCHAR2,
    policy_group   VARCHAR2,
    policy_name    VARCHAR2,
    function_schema VARCHAR2,
    policy_function VARCHAR2,
    statement_types VARCHAR2,
    update_check   BOOLEAN,
    enabled        BOOLEAN,
    static_policy  IN BOOLEAN FALSE,
    policy_type    IN BINARY_INTEGER NULL,
    long_predicate IN BOOLEAN FALSE,
    sec_relevant_cols IN VARCHAR2);
```

Parameters

Table 89–2 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy; must be unique for the same table or view.
function_schema	The schema owning the policy function.
policy_function	The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 89–4 . Specifying any of these policy types overrides the value of static_policy.

Table 89–2 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries (<code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See "Usage Notes" on page 89-11 for restrictions and additional information about this option.

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE_POLICY_GROUP Procedure](#) on page 89-14.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, `SYS_DEFAULT`, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with `EXEMPT ACCESS POLICY` system privilege.
- If no `object_schema` is specified, the current log-on user schema is assumed.

ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: [Operational Notes](#) on page 89-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
    object_schema          IN VARCHAR2 NULL,
    object_name           IN VARCHAR2,
    policy_name           IN VARCHAR2,
    function_schema       IN VARCHAR2 NULL,
    policy_function       IN VARCHAR2,
    statement_types       IN VARCHAR2 NULL,
    update_check          IN BOOLEAN FALSE,
    enable                IN BOOLEAN TRUE,
    static_policy         IN BOOLEAN FALSE,
    policy_type           IN BINARY_INTEGER NULL,
    long_predicate        IN BOOLEAN FALSE,
    sec_relevant_cols     IN VARCHAR2,
    sec_relevant_cols_opt IN BINARY_INTEGER NULL);
```

Parameters

Table 89–3 ADD_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified, the current log-on user schema is assumed.
object_name	Name of table, view, or synonym to which the policy is added.
policy_name	Name of policy to be added. It must be unique for the same table or view.
function_schema	Schema of the policy function (current default schema, if NULL).
policy_function	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.

Table 89–3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
<code>static_policy</code>	The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privilege user who has the <code>EXEMPT ACCESS POLICY</code> privilege.
<code>policy_type</code>	Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in Table 89–4 . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries (<code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See "Usage Notes" on page 89-11 for restrictions and additional information about this option.

Table 89–4 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
<code>STATIC</code>	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as <code>SYS_CONTEXT</code> or <code>SYSDATE</code> . Applies to only one object.
<code>SHARED_STATIC</code>	Same as <code>STATIC</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
<code>CONTEXT_SENSITIVE</code>	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
<code>SHARED_CONTEXT_SENSITIVE</code>	Same as <code>CONTEXT_SENSITIVE</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
<code>DYNAMIC</code>	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function on each statement parsing or execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- If no object_schema is specified, the current log-on user schema is assumed.
- The policy functions which generate dynamic predicates are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table of view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of WNDS (write no database state).

See Also: The *Oracle Database Application Developer's Guide - Fundamentals* has more details about the RESTRICT_REFERENCES pragma.

- Dynamic predicates generated out of different policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```
- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
