Oracle® Access Manager
Configuration Manager Installation and Administration Guide
10g (10.1.4.0.1)
B32392-01

January 2007
This manual provides Oracle Access Manager Configuration Manager installation and setup details as well as information about pushing configuration data changes from one Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment to another.

This Oracle Access Manager Configuration Manager Installation and Administration Guide provides information about pushing configuration data changes from one Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment to another. For example, when pushing changes from a development deployment to a pre-production deployment. Included are considerations, prerequisites, and step-by-step instructions to help ensure your success.

Note: Oracle COREid was previously known as Oblix NetPoint. Oracle Access Manager was previously known as Oracle COREid. Oracle COREid 7.0.4 was made available as part of Oracle Application Server 10g Release 2 (10.1.2). For this reason, Oracle COREid 7.0.4 manuals were branded with 10g Release 2 (10.1.2).

This Preface covers the following topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

This guide targets the needs of anyone who is responsible for installing and managing the Oracle Access Manager Configuration Manager. In addition, this book is helpful for anyone responsible for pushing configuration data changes from one Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment to another. In this guide, configuration data refers to Oracle Access Manager, or Oracle COREid, configuration data and access policy data stored in an LDAP directory.

This document assumes that you are familiar with your network architecture, your LDAP directory, as well as firewall and internet security. In addition, you need to be familiar with your existing Oracle Access Manager, or Oracle COREid, deployments.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to
facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

http://www.oracle.com/accessibility/

Accessibility of Code Examples in Documentation
Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation
This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services
Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Related Documents
For more information about Oracle Access Manager Release 10g (10.1.4.0.1), see the following documents:

- Oracle Access Manager Introduction—Provides an introduction to Oracle Access Manager, a road map to Oracle Access Manager manuals, and a glossary of terms.

- Oracle Application Server Release Notes—Late breaking Oracle Access Manager details. The release notes are available with the platform-specific documentation. The most current version of the release notes is available on Oracle Technology Network at: http://www.oracle.com/technology/documentation.

- Oracle Access Manager Installation Guide—Explains how to install and configure the components.

- Oracle Access Manager Upgrade Guide—Explains how to upgrade earlier versions to the latest version.

- Oracle Access Manager Identity and Common Administration Guide—Explains how to configure Identity System applications to display information about users, groups, and organizations; how to assign permissions to users to view and modify the data that is displayed in the Identity System applications; and how to configure workflows that link together Identity application functions, for example, adding basic information about a user, providing additional information about the user, and approving the new user entry, into a chain of automatically performed steps. This book also describes administration functions that are common to the Identity and Access Systems, for example, directory profile configuration, password policy configuration, logging, and auditing.

- Oracle Access Manager Access Administration Guide—Describes how to protect resources by defining policy domains, authentication schemes, and authorization schemes; how to allow users to access multiple resources with a single login by
configuring single- and multi-domain single sign-on; and how to design custom
login forms. This book also describes how to set up and administer the Access
System.

- **Oracle Access Manager Deployment Guide**—Provides information for people who
plan and manage the environment in which Oracle Access Manager runs. This
guide covers capacity planning, system tuning, failover, load balancing, caching,
and migration planning.

- **Oracle Access Manager Customization Guide**—Explains how to change the
appearance of Oracle Access Manager applications and how to control Oracle
Access Manager by making changes to operating systems, Web servers, directory
servers, directory content, or by connecting CGI files or JavaScripts to Oracle
Access Manager screens. This guide also describes the Access Manager API and
the authorization and authentication plug-in APIs.

- **Oracle Access Manager Developer Guide**—Explains how to access Identity System
functionality programmatically using IdentityXML and WSDL, how to create
custom WebGates (known as AccessGates), and how to develop plug-ins. This
guide also provides information to be aware of when creating CGI files or
JavaScripts for Oracle Access Manager.

- **Oracle Access Manager Integration Guide**—Explains how to set up Oracle Access
Manager to run with third-party products such as BEA WebLogic, the Plumtree
portal, and IBM WebSphere.

- **Oracle Access Manager Schema Description**—Provides details about the Oracle
Access Manager schema.

For more information about Oracle COREid Release 7.0.4, see the following manuals:

- **Oracle COREid Access and Identity Introduction Guide**—Provides an introduction to
Oracle COREid, a road map to Oracle COREid manuals, and a glossary of terms.

- **Oracle COREid Access and Identity Release Notes**—Late breaking Oracle COREid
details. The release notes are available with the platform-specific documentation.
The most current version of the release notes and Oracle COREid Access and
Identity documentation is available on Oracle Technology Network at:

- **Oracle COREid Access and Identity Installation Guide**—Explains how to install and
configure the components.

- **Oracle COREid Access and Identity Upgrade Guide**—Explains how to upgrade earlier
versions to Oracle COREid Release 7.0.4.

- **Oracle COREid Access and Identity Administration Guide Volume 1**—Explains how to
configure Identity System applications to display information about users, groups,
and organizations; how to assign permissions to users to view and modify the
data that is displayed in the Identity System applications; and how to configure
workflows that link together Identity application functions, for example, adding
basic information about a user, providing additional information about the user,
and approving the new user entry, into a chain of automatically performed steps.
This book also describes administration functions that are common to the Identity
and Access Systems, for example, directory profile configuration, password policy
configuration, logging, and auditing.

- **Oracle COREid Access and Identity Administration Guide Volume 2**—Describes how to
protect resources by defining policy domains, authentication schemes, and
authorization schemes; how to allow users to access multiple resources with a
single login by configuring single- and multi-domain single sign-on; and how to
design custom login forms. This book also describes how to set up and administer the Access System.

- **Oracle COREid Access and Identity Deployment Guide**—Provides information for people who plan and manage the environment in which Oracle COREid runs. This guide covers capacity planning, system tuning, failover, load balancing, caching, and migration planning.

- **Oracle COREid Access and Identity Customization Guide**—Explains how to change the appearance of Oracle COREid applications and how to control Oracle COREid by making changes to operating systems, Web servers, directory servers, directory content, or by connecting CGI files or JavaScripts to Oracle COREid screens. This guide also describes the Access Manager API and the authorization and authentication plug-in APIs.

- **Oracle COREid Access and Identity Developer Guide**—Explains how to access Identity System functionality programmatically using IdentityXML and WSDL, how to create custom WebGates (known as AccessGates), and how to develop plug-ins. This guide also provides information to be aware of when creating CGI files or JavaScripts for Oracle COREid.

- **Oracle COREid Access and Identity Integration Guide**—Explains how to set up Oracle COREid to run with third-party products such as BEA WebLogic, the Plumtree portal, and IBM WebSphere.

- **Oracle COREid Access and Identity Schema Description**—Provides details about the Oracle COREid schema.

## Conventions

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong></td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td><strong>italic</strong></td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td><strong>monospace</strong></td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Oracle Access Manager Configuration Manager is a standalone application that is available as part of the Oracle Access Manager 10g (10.1.4.0.1) release. It is a Java application that automates the process of managing and migrating Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, configuration data. This chapter introduces this new application and includes the following topics:

- Deployment Scenarios
- About the Oracle Access Manager Configuration Manager
- Migration Strategies, Methodology, and Task Overview
- Data Migration Planning and Deliverables
- Backup and Recovery Strategies
- Downtime Assessment and Example
- Deployment Support and Interoperability

**Deployment Scenarios**

Your enterprise may include more than one installation (deployment) of either Oracle Access Manager 10g (10.1.4.0.1) or Oracle COREid Release 7.0.4. Like many customers, you may have several software deployments in various settings:

- Development deployments are ideally a sandbox-type setting where the dependency on the overall deployment is minimal
- QA deployments are typically a smaller shared deployment used for testing
- Pre-production deployments are typically a shared deployment used for testing with a wider audience
- Production deployments are fully shared and available within your enterprise on a daily basis

Deployments in your enterprise may have different designations. You may even have multiple deployments of the same type. Oracle Access Manager Configuration Manager uses automated processing to streamline your data migration tasks, help eliminate errors, and reduce system downtime to a minimum. Using Configuration Manager, you easily migrate configuration data (push a copy) from one Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment to another. For example, if you defined and tested a new password policy in your QA deployment you can propagate the new policy to a production deployment of the same release.

For more information, see "About the Oracle Access Manager Configuration Manager".
About the Oracle Access Manager Configuration Manager

Configuration management refers to the life-cycle management of specific Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, configuration data. Oracle Access Manager Configuration Manager enables you to automate the task of pushing configuration data changes from a specified directory in one deployment (the source) to an associated directory in another deployment of the same release (the target).

Configuration data refers to product-specific Oracle Access Manager, or Oracle COREid, configuration and access policy data. This data is stored in the oblix tree of a Lightweight Directory Access Protocol (LDAP) directory within each Oracle Access Manager, or Oracle COREid, deployment. Oracle Access Manager migrates only LDAP data, not files, by connecting to the LDAP directory in each deployment. With Oracle Access Manager Configuration Manager, the term environment refers to an LDAP directory.

---

**Note:** The process of pushing selected data to another environment is sometimes known as horizontal data migration, because you are copying configuration data changes for a specific release only.

---

When you migrate data using Oracle Access Manager Configuration Manager (also known as the Configuration Manager), you select entries in the source configuration tree to be copied to the associated target. With Configuration Manager, you may migrate only data between only the following source and target environments:

- A designated Oracle Access Manager 10g (10.1.4.0.1) source to an associated Oracle Access Manager 10g (10.1.4.0.1) target
- A designated Oracle COREid Release 7.0.4 source to an associated Oracle COREid Release 7.0.4 target

As an example, suppose you have defined and tested a new password policy in an Oracle COREid Release 7.0.4 development deployment. Using Oracle Access Manager Configuration Manager, you can propagate the new password policy from this Oracle COREid Release 7.0.4 development deployment to your Oracle COREid Release 7.0.4 QA deployment as shown in Figure 1–1.
The deployments depicted in Figure 1–1 are only an example. Your deployments may differ. For example, your deployments may be Oracle Access Manager 10g (10.1.4.0.1). For more information, see Deployment Support and Interoperability on page 1-14.

**Process overview: Preparing for and migrating data**

1. **Repository**: After adding details about the repository to Oracle Access Manager Configuration Manager, information related to migration activities is stored in the repository.

   For more information, see "Configuration Manager Repository" on page 1-4.

2. **Environments**: After adding details about two different environments for Oracle COREid Release 7.0.4, environments, or two different environments for Oracle Access Manager 10g (10.1.4.0.1), environment information is stored in the repository and you can form an association to use for migration activities.

   For more information, see "Environments" on page 1-4 and Deployment Support and Interoperability on page 1-14.

3. **Association**: After defining an association, Configuration Manager connects to:
   - The source (the environment that contains the configuration data you want to migrate)
   - The target (the environment that you want to receive the configuration data changes)

   For more information, see "Associations" on page 1-5.

4. **Migration**: Using Configuration Manager, you perform the automated migration processes outlined here:
   a. Create a snapshot of the target environment
   b. Select entries in the configuration tree of the source environment
   c. Compare details of selected entries between the source and target
   d. Customize entries on the target, if desired,
e. Preview the data to confirm this is what you want to migrate

f. Migrate the selected configuration data

The selected configuration data is copied from the source to the target. A transaction record is created in the repository that includes details about the migrated data.

For more information, see "Supported Data Types for Migration" on page 1-5, "Physical Entries and Logical Objects" on page 1-7, "Migration Transactions" on page 1-9, and "About Snapshots" on page 1-13.

---

**Note:** You may export selected configuration data to a Lightweight Directory Interchange Format (LDIF) file. LDIF files are ASCII format files that you can use to exchange and synchronize data between Lightweight Directory Access Protocol (LDAP) serves using an external tool. For more information, see "LDIF Files for Offline Data Importation" on page 1-9.

---

5. After migrating data, Oracle recommends that you test the changes in the live target deployment to validate that things are operating as expected.

For more information about validating migration success, see Chapter 4.

### Configuration Manager Repository

Oracle Access Manager Configuration Manager requires its own data store known as a repository. The Configuration Manager supports only the Oracle Database Server as its repository. The repository must be independent of any Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment.

The Oracle Database that you install for use as the Oracle Access Manager Configuration Manager repository is where migration information is stored. Table 1–1 lists the information that is stored in the repository.

<table>
<thead>
<tr>
<th>Data in the Repository</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment (Directory) Details</td>
</tr>
<tr>
<td>Association Details</td>
</tr>
<tr>
<td>Transformation Rules</td>
</tr>
<tr>
<td>Snapshots</td>
</tr>
<tr>
<td>Transaction Data (logical objects migrated)</td>
</tr>
<tr>
<td>Audit Details</td>
</tr>
<tr>
<td>LDIF Files to Import</td>
</tr>
</tbody>
</table>

For more information, see "Installing and Setting up the Oracle Database Repository" on page 2-5.

### Environments

The term environment refers to an LDAP directory server that is installed and configured to operate within a specific Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment. The LDAP directory (environment)
includes Oracle Access Manager, or Oracle COREid, configuration data in the oblix tree.

Oracle Access Manager Configuration Manager does not require that the DIT (DN suffix) structure on each environment be exactly the same. For example, you may have one environment with a configuration DN of o=Oblix, ou=Config, ou=Dev, o=Root1, and another with a configuration DN of o=Oblix, ou=Config, ou=QA, o=Root2.

You add details about individual environments to Oracle Access Manager Configuration Manager. Environment details are stored in the Configuration Manager repository and are available within the Configuration Manager. For more information, see "Adding and Managing Environment Details in the Configuration Manager" on page 3-4.

After you have defined at least two environments within the Configuration Manager, you can form an association as described next.

**Associations**

An association consists of a pair of environments that you define within the Configuration Manager. Each association includes a designated source environment from which data objects are selected, and a designated target to which the data is copied. For example, you may want to define associations to push data:

- From Development to QA
- From QA to Pre-production
- From Pre-production to Production

You may form an association between any two defined environments in the Configuration Manager. Both environments in an association are presumed to belong to deployments of the same release (either 10g (10.1.4.0.1) or release 7.0.4).

Any environment may be designated as either a source or a target. A single environment may be a source in one association as well as a target in another association.

You may define and use multiple associations. However, only one association is used during each migration operation. All the history related to a specific migration between the designated source and target belongs to the association.

For more information, see "Creating and Managing Associations" on page 3-12.

---

**Caution:** You may not use the Oracle Access Manager Configuration Manager to migrate data from a release 7.0.4 deployment to a release 10g (10.1.4.0.1) deployment nor vice versa. For more information, see Deployment Support and Interoperability on page 1-14

---

**Supported Data Types for Migration**

This discussion outlines the types of configuration and runtime data that you can migrate using Oracle Access Manager Configuration Manager.

Oracle Access Manager migrates only LDAP data for migration, not files. This data includes product-specific Oracle Access Manager, or Oracle COREid, configuration and access policy data like res-ops for access control policies, DB profiles and instances, and other items. The data is stored in the oblix tree of an LDAP directory (environment) within your Oracle Access Manager, or Oracle COREid, deployments.
Table 1–2 outlines the configuration data types that you can migrate, for both the Identity and Access System.

**Table 1–2 Configuration Data Types Supported for Migration**

<table>

</tbody>
</table>

As stated earlier, Oracle Access Manager Configuration Manager migrates only data in the LDAP directory of a deployment. It does not migrate any files.

Table 1–4 outlines the types of data that are not supported for migration using Oracle Access Manager Configuration Manager. To migrate data listed in Table 1–4, you may have (or know of) other code management products that can be used for check in, check out, and deployment. Migrating data types in Table 1–4 is outside the scope of this manual.
Physical Entries and Logical Objects

In an LDAP directory, information is stored as physical entities. Many times, a group of physical entities are logically related so tightly that an individual physical entity may not make much sense with respect to the application. For example, workflow participants do not make much sense as a single entity. Such physical entities can be grouped together in Oracle Access Manager Configuration Manager under the name of one object known as a logical object. A logical object may also be a one-to-one mapping with a physical entity.

One logical object may have dependencies on other logical objects. For example, in Oracle Access Manager, and Oracle COREid, Workflow Definition consists of configuration information that can be considered as a logical object with dependencies on workflow steps which in turn have dependencies on workflow participants as shown in Figure 1–2. If you choose to migrate the workflow step to the target deployment, the Configuration Manager identifies dependent objects such as participants, mail notifiees, and the like. A dependent logical object is a child logical object that does not exist as a separate logical object on its own. As an example, a workflow target subflow is a dependent logical object that is not a logical object on its own.

Figure 1–2 Logical Objects and Dependents

![Logical Object Diagram]

When migrating data using the Oracle Access Manager Configuration Manager, all dependent logical objects are migrated along with respective parent logical objects. You cannot clear a dependent logical object.

A related logical object is a child that exists as a separate logical object on its own. For example a lost password policy is both a logical object and a child (related) logical object of a password policy. The password policy is a logical object. Figure 1–3 illustrates a workflow definition. Here, a sub flow is both a logical object and a related logical object. When migrating data using the Oracle Access Manager Configuration Manager, you can either select or clear a related logical object for migration.

Table 1–4 Not Supported for Migration Using the Configuration Manager Application

<table>
<thead>
<tr>
<th>Identity System Data that You Cannot Migrate Using Configuration Manager</th>
<th>Access System Data that You Cannot Migrate Using Configuration Manager</th>
</tr>
</thead>
<tbody>
<tr>
<td>PPP Catalog (and associated called scripts/code)</td>
<td>Authentication Plug-in Code (if any)</td>
</tr>
<tr>
<td>Javascripts</td>
<td>Authorization Plug-in Code (if any)</td>
</tr>
<tr>
<td>Images</td>
<td></td>
</tr>
<tr>
<td>Stylesheets</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Logical Object (Parent) -- Workflow Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependent (Child)</td>
</tr>
<tr>
<td>- Workflow Steps</td>
</tr>
<tr>
<td>- Workflow Participants</td>
</tr>
<tr>
<td>- Workflow Mail Notifiees</td>
</tr>
<tr>
<td>- Workflow Target Subflow</td>
</tr>
</tbody>
</table>

When migrating data using the Oracle Access Manager Configuration Manager, all dependent logical objects are migrated along with respective parent logical objects. You cannot clear a dependent logical object.

A related logical object is a child that exists as a separate logical object on its own. For example, a lost password policy is both a logical object and a child (related) logical object of a password policy. The password policy is a logical object. Figure 1–3 illustrates a workflow definition. Here, a sub flow is both a logical object and a related logical object. When migrating data using the Oracle Access Manager Configuration Manager, you can either select or clear a related logical object for migration.
Using Oracle Access Manager Configuration Manager, you can select any number of displayed logical object types, or specific logical objects, to migrate, as described in "About Selecting Logical Objects to Migrate" on page 3-31. After selecting logical object types or specific objects, and before migrating the data, you have the opportunity to compare differences between the source and target in a navigation tree within the Configuration Manager as shown in Figure 1–4.

About Comparing and Customizing Logical Objects in Configuration Manager

On the Compare and Migrate page, you may expand items to see details about attributes and dependents. Symbols beside logical object names indicate differences between the source and target before migration. For more information about the symbols, see "About Comparing Data Before Migration" on page 3-32.
Some attributes include system- or environment-specific settings such as hostnames, IP addresses, and domain names. You may apply changes to customize settings and attributes before, during, or after migration:

- After creating an association and before migrating data, you may create an optional transformation rule for the directory association that will be applied automatically during migration. On the Customize page, you can view logical objects as they are before the rule is applied (Before Migration) and as they are after the rule is applied (After Migration). For more information, see "Adding and Managing Optional Transformation Rules" on page 3-17.

- During the migration, on the Customize page, you may select and customize attributes manually. After manual edits, you can view the logical object as it is before the change is applied (Before Migration) and as it will be after the change is applied (After Migration). For more information, see "About Customizing the Target" on page 3-34.

- After migration, you can make attribute value changes using either of the following methods:
  - On the Rollback Transaction, Customize page, you may edit attributes manually much as you did if you changed attributes manually during migration. For more information, see "Rolling Back Changes Made During a Specific Transaction" on page 5-3.
  - Directly in the target Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment as described in the book introduced in "Related Documents" on page -viii.

  For more information, see "About Customizing the Target" on page 3-34.

**Migration Transactions**

A transaction record is created automatically each time you migrate configuration data from a source to a target using Oracle Access Manager Configuration Manager. Each transaction record includes the entire group of logical objects and dependents, and selected related objects, that were migrated from the source to the target in an association.

A list of all transactions is available within Oracle Access Manager Configuration Manager. You may choose a particular transaction and view the changes made during that migration. You may also select a transaction and roll back the changes to return the logical objects on the target to the state they were in before that particular migration.

For more information about transactions and rolling back changes, see Chapter 5.

**LDIF Files for Offline Data Importation**

In addition to using automated Oracle Access Manager Configuration Manager processes to migrate configuration data, you may use the Configuration Manager to export selected configuration data that you want to migrate to an LDIF file. You may want to export transaction data to an LDIF file.

Exporting to an LDIF file enables you to use Oracle Access Manager Configuration Manager with directory environments that do not provide write access to the target directory, for example, a production deployment. You may choose to use the Export to LDIF option when:

- You want to modify the LDIF file, then import the data using an external tool.
You want to upload the LDIF file at a scheduled time (off peak time, for example).

You want to get the approval from a manager before changing the target environment.

This method employs Oracle Access Manager Configuration Manager to add environments and to form and select an association. You then select, compare, and customize logical object types on the target, and export the selections to an LDIF file using the Configuration Manager. Oracle recommends that you take a snapshot of the target environment using the Configuration Manager just before importing the data. You import the data using an external tool; this topic is outside the scope of this manual.

If you import data using the LDIF file and external tool, a transaction record is not created because the actual migration occurs offline (outside of the Oracle Access Manager Configuration Manager).

**Note:** You cannot use the Configuration Manager to import data from an LDIF file. External tools are outside the scope of this manual.

For more information, see "About Exporting Data to an LDIF File (Optional)" on page 3-36.

**Migration Strategies, Methodology, and Task Overview**

This discussion provides a very high level introduction to the sequence of tasks that you must perform when migrating data. This is only a starting point in your planning. Figure 1–5 outlines the migration tasks that you and your team will complete when pushing configuration data changes from one Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment to another.

**Figure 1–5  Migration Tasks**

Troubleshoot Any Issues
Appendix B
Task overview: Migrating data with Oracle Access Manager Configuration Manager

1. Review this chapter to learn about the Oracle Access Manager Configuration Manager, as well as:

   - Deployment Scenarios
   - Migration Strategies, Methodology, and Task Overview
   - Data Migration Planning and Deliverables (planning worksheets are provided in Appendix A)
   - Backup and Recovery Strategies
   - Downtime Assessment and Example
   - Deployment Support and Interoperability

2. Use Chapter 2 as a guide as you install and setup required components before data migration, which includes:

   a. Installing and Setting up the Oracle Database Repository for use with the Configuration Manager
   b. Installing and Configuring OC4J
   c. Deploying the Configuration Manager
   d. Touring the Configuration Manager
   e. Assigning Configuration Manager Administrator and User Roles
   f. Adding Repository Details in the Configuration Manager

3. Use Chapter 3 as a guide to prepare and migrate configuration data from one a source environment to a target environment in a Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment. This includes:

   a. Notifying Other Administrators before and after migration
   b. Adding and Managing Environment Details in the Configuration Manager:
      Create, view, modify and delete directory details for existing Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments
   c. Creating and Managing Associations:
      Create new associations, view settings, enable/disable, and delete associations
   d. Adding and Managing Optional Transformation Rules that will be applied to all logical attributes in the directory association during migration
   e. Making and Managing Snapshots to make a backup copy of the oblix tree of the target before migrating data; you may restore the snapshot to return the target to its condition before migration, if needed
   f. Migrating Data from the Source to the Target:
      selecting an association; selecting logical object types; comparing selected objects on the source with those on the target; customizing selected objects; previewing changes; adding a transaction description; and migrating data

      During the operation you may choose to export data to an LDIF file, then import the data offline using an external tool. For more information, see About Exporting Data to an LDIF File (Optional).
   g. Restarting Servers After Migration is required to flush their caches and update the servers with the latest configuration data from the target environment
4. Use Chapter 4 for Validating Migration Success. It includes suggestions about validating migrated data in a live target deployment. Oracle recommends that you create your own tests to validate data changes in both the source deployment before migrating data and the target deployment after migrating data.

5. Review Troubleshooting Configuration Manager Issues in Appendix B if needed.

Data Migration Planning and Deliverables

Planning and preparation are key components of any successful data migration strategy. This section discusses the planning considerations and inventory items that you and your team need to create to ensure your success.

Planning and Notifications: Before starting any data migration using Oracle Access Manager Configuration Manager, Oracle strongly recommends that you and your team become familiar with all topics suggested in Figure 1–5 on page 1-10 and the task overview that follows the figure. Oracle recommends that you schedule specific migration windows and that you notify other administrators about planned activities in any deployment for which they are responsible.

Deployment Inventories: Before starting any migration activities, Oracle recommends that you take inventory of your existing Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments. Table 1–5 identifies the details that you need to collect for each deployment that will be involved in the migration. Details can be gathered from existing installation (or upgrade) worksheets and records or you can gather fresh information directly from the deployment.

<table>

<td>Worksheet for Access Servers on page A-10</td>
</tr>
<tr>
<td>Workflows and Access Control Lists</td>
<td>Worksheet for Configurations on page A-11</td>
</tr>
</tbody>
</table>

Test Development: To help ensure data correctness before migration, Oracle recommends that you develop specific tests that evaluate configuration data changes in the source deployment. After migration, you can use these same tests in the target deployment to ensure that everything is working as expected.

For more information about planning, see "Planning for Configuration Manager Deployment" on page 2-1.

Backup and Recovery Strategies

The Oracle Access Manager Configuration Manager provides several ways to help you back up data before migration, and restore the backup after migration if needed:
About Snapshots

Oracle Access Manager Configuration Manager provides a SnapShot function that enables you to create a backup copy of the entire oblix tree in the selected environment (LDAP directory). A snapshot includes only the logical objects in the configuration tree. For example, workflow definitions are part of the snapshot but workflow instances are not.

If you are migrating data using the Configuration Manager, Oracle recommends that you create a snapshot of the target just before migration. If you export configuration data to an LDIF file, Oracle recommends that you create a snapshot of the target just before importing the LDIF file.

Using the Configuration Manager, you may restore a snapshot to revert all changes that were made since the snapshot was captured. This restores the logical objects in the directory to the state they were in at the time the snapshot was made.

When you restore a snapshot, the entire oblix tree is restored to the directory. As a result of the restoration, all changes to the entire oblix tree are revoked. Revoked changes include both migration changes made using the Configuration Manager, as well as changes made outside the Configuration Manager.

Caution: Restoring a snapshot reverts all changes made after the snapshot was taken. Snapshot restoration returns the directory to the state it was in at the time the snapshot was made.

When you restore the content of a snapshot, a new snapshot is created automatically to capture the current state of the environment. Using the new snapshot, you may undo the restoration.

For more information, see "Making and Managing Snapshots" on page 3-24.

About Transactions

Oracle Access Manager Configuration Manager creates a transaction record each time you migrate data. Each transaction record includes the entire group of logical objects, related objects, and dependents that were migrated.

Note: No transaction record is created during data migration using an external tool. For example, no transaction record is created if you export data to an LDIF file using the Configuration Manager, then import the data using an external tool.

You may view details of transaction records for a selected association. In addition, you may choose a particular transaction record and:

- View the changes made during a specific migration transaction.
- Roll back the changes made during the selected transaction.

Rolling back a transaction, reverts only the changes made to logical objects during the migration transaction. During the rollback operation, a new transaction record is created.
Downtime Assessment and Example

You change configuration data for Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, directly using the Identity (COREid) or Access System Consoles. Your changes are automatically written to the directory directly from the deployment. In this case, appropriate entries in the server cache are flushed immediately and the server is updated with the latest configuration data. To migrate those changes to another deployment without the Configuration Manager, you repeat the manual process.

Note: Manually altering data in one deployment to match data in another deployment is a time consuming and error-prone task.

Using Oracle Access Manager Configuration Manager, you can push changes for supported logical object types from the source environment to an associated target. The automated processes are performed fairly quickly and eliminate the unintentional introduction of errors.

Oracle Access Manager Configuration Manager migrates a single logical object in approximately 100 milliseconds. Your total actual migration time will depend on the number of logical objects selected for migration, as well as number of related objects and dependents. For example, it may take more time to migrate one policy domain with many host identifiers and authentication schemes than to migrate 50 or more password policies.

Note: The speed and capacity of computers hosting critical components (source and target environments, OC4J, Oracle Database repository, and Oracle Access Manager Configuration Manager) will also impact the speed and duration of migration operations.

After migrating data using the Configuration Manager, you must manually restart Identity Servers and Access Servers in the target deployment to flush their caches and update the servers with the latest configuration data from the target directory. For more information, see “Restarting Servers After Migration” on page 3-41.

You may use Configuration Manager functions to roll back a transaction. A rollback takes as long to complete as the original migration. If needed, you may restore an environment snapshot to revert all changes made to the oblix tree. The time it takes to restore a snapshot depends on the amount of configuration data that was backed up. For more information about managing transactions and rolling back changes, see Chapter 5.

Deployment Support and Interoperability

When you migrate data, all selected entries in the oblix configuration tree are copied from the source environment to the target in an association. Using Oracle Access Manager Configuration Manager you may migrate data only between:

- A designated source environment for Oracle Access Manager 10g (10.1.4.0.1) to an associated target within an Oracle Access Manager 10g (10.1.4.0.1) deployment
For more information about Oracle Access Manager 10g (10.1.4.0.1), see the manuals for this release as described in "Related Documents" on page -viii.

- From a designated source environment for Oracle COREid Release 7.0.4 to an associated target within an Oracle COREid Release 7.0.4 deployment

For more information about Oracle COREid Release 7.0.4, see the manuals for the release as described in "Related Documents" on page -viii.

Note: You do not need to upgrade Oracle COREid Release 7.0.4 to Oracle Access Manager 10g (10.1.4.0.1). Also, Oracle Access Manager Configuration Manager does not perform an upgrade.

As shown in Table 1–6, both deployments represented in an association are presumed to be of the same release (either both 10g (10.1.4.0.1) or both release 7.0.4). Oracle Access Manager Configuration Manager operates equally with homogeneous deployments for either release.

<table>
<thead>
<tr>
<th>From a Designated Source of Release</th>
<th>To a Designated Target of Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Access Manager 10g (10.1.4.0.1)</td>
<td>Oracle Access Manager 10g (10.1.4.0.1)</td>
</tr>
<tr>
<td>Oracle COREid Release 7.0.4</td>
<td>Oracle COREid Release 7.0.4</td>
</tr>
</tbody>
</table>

Caution: You may not use the Oracle Access Manager Configuration Manager to migrate data from a release 7.0.4 deployment to a release 10g (10.1.4.0.1) deployment nor vice versa.

Oracle Access Manager Configuration Manager is a Java Application hosted on OC4J. One or more instances of the Oracle Access Manager Configuration Manager deployed as an OC4J application will interoperate with the following additional components:

- Oracle Database repository
- Oracle Containers for J2EE (OC4J): One instance of the OC4J in either a standalone configuration or installed as a managed component of Oracle Application Server
- Multiple environments to use as a source and target must be installed independently for Oracle Access Manager 10g (10.1.4.0.1) deployments
- Multiple environments to use as a source and target must be installed independently for Oracle COREid Release 7.0.4 deployments

For information about deploying and setting up the Configuration Manager, see Chapter 2.
This chapter describes how to prepare for, deploy, and setup Oracle Access Manager Configuration Manager. The following topics are included in this chapter:

- Planning for Configuration Manager Deployment
- Setting Up a Repository and Installing OC4J
- Deploying the Configuration Manager
- Assigning Configuration Manager Administrator and User Roles
- Touring the Configuration Manager
- Adding Repository Details in the Configuration Manager
- Ensuring the Repository is Available to the Configuration Manager

Planning for Configuration Manager Deployment

The following discussions introduce deployment and planning considerations for Oracle Access Manager Configuration Manager:

- About Deploying the Configuration Manager
- About Planning the Number of Configuration Manager Instances Needed
- Taking Inventory and Testing Operations in Existing Deployments
- Deciding and Confirming Administrator Rights

About Deploying the Configuration Manager

Oracle Access Manager Configuration Manager is a Java Application hosted on OC4J. A typical Oracle Access Manager Configuration Manager deployment includes the components and applications illustrated in Figure 2–1. A description follows the figure.

Note: OC4J and Oracle Access Manager Configuration Manager must be installed together on a single platform.
Planning for Configuration Manager Deployment

The sample Oracle Access Manager Configuration Manager deployment depicted in Figure 2–1 shows Oracle COREid Release 7.0.4 environments. However your deployment may include Oracle Access Manager 10g (10.1.4.0.1).

Administrators and users access Oracle Access Manager Configuration Manager through a Web browser. The Configuration Manager deployment includes:

- **Repository**: One Oracle Database to use as the Configuration Manager repository. For more information, see “Installing and Setting up the Oracle Database Repository” on page 2-5.

- **OC4J**: One instance of the OC4J in either a standalone configuration, as depicted in Figure 2–1, or installed as a managed component of Oracle Application Server. For more information, see ”Installing and Configuring OC4J” on page 2-6.

- **The Configuration Manager**: One or more instances of the Oracle Access Manager Configuration Manager deployed as an OC4J application. OC4J and the Configuration Manager are installed together on a single platform. For more information, see “About Planning the Number of Configuration Manager Instances Needed” on page 2-3.

- **Environments**: At least two Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments and environments (source and target LDAP directories) must be installed independently.

Installing and configuring Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments is outside the scope of this manual. For more information about these activities, see “Related Documents” on page -viii.

Oracle Access Manager Configuration Manager reads only from a single master or replica server and writes to only a single master LDAP directory. The installation of directory environments is outside the scope of this manual. For more information, see your vendor documentation.
About Planning the Number of Configuration Manager Instances Needed

Most enterprises need only one instance of the Oracle Access Manager Configuration Manager, as shown in Figure 2–1 on page 2-2. If you encounter performance issues with multiple users, you may install additional Oracle Access Manager Configuration Manager instances.

---

**Caution:** Multiple users migrating changes for the same logical object in the same target, could create an inconsistent state on the target. Oracle recommends that users coordinate before migrating data.

---

One Oracle Database repository can serve multiple Configuration Manager instances. Multiple Configuration Manager instances may be connected to a single repository. There are no restrictions regarding the listening port of the repository when you have multiple Configuration Manager instances. Details in the repository may be viewed and managed from any Configuration Manager instance that is connected to that repository. For more information, see "Installing and Setting up the Oracle Database Repository" on page 2-5.

Whether you have one, or more, Configuration Manager instances you need only one OC4J instance. For more information, see "Installing and Configuring OC4J" on page 2-6.

Deciding and Confirming Administrator Rights

The following guidelines apply to Oracle Access Manager Configuration Manager administrators:

- Deploying the Configuration Manager requires OC4J administrator privileges. This role is created automatically during OC4J installation and setup.

- Managing repository details within the Configuration Manager requires **HMAdmin** privileges. This role must be defined in OC4J and assigned to any individual who will manage details and test the repository connection within the Configuration Manager.

- Configuration Manager functions, except managing the repository, require the **HMUser** role. The **HMUser** role must be defined in OC4J and assigned to individuals who will add environment details, create associations, make snapshots, migrate data, and manage transactions within the Configuration Manager.

---

**Note:** A user with write privileges to an environment (directory) can perform all migration functions when they have **HMUser** privileges. Those with **HMAdmin** privileges can perform only System Configuration functions in the Configuration Manager.

---

Information about defining administrator privileges in OC4J is described in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3) and in "Installing and Configuring OC4J" on page 2-6.
To decide or confirm administrator rights
1. Adhere to your own corporate policies when designating administrators, choosing administrator log in IDs, choosing temporary or permanent passwords, collecting and disseminating information, and so on.
2. Communicate with your team as you decide and assign administrator rights as well as UserIDs and passwords for OC4J, Oracle Database, and Oracle Access Manager Configuration Manager login.

Taking Inventory and Testing Operations in Existing Deployments
This discussion introduces the details that you need to collect and tests you need to create before starting any data migration activities in a live deployment. Before starting migration activities, Oracle recommends that you perform the activities here:

- Take an inventory within Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments that will be involved in the migration.
- Create and perform tests in the source deployment to ensure that data changes are producing the results you expect.

**Taking Inventory:** Table 2–1 identifies the details that you need to collect for each installed Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment and where to find the worksheets where you can record the information. You can find inventory details on installation or upgrade worksheets for each deployment or you can gather fresh details from the deployment itself.

### Table 2–1 Details Needed for Each Existing 10g (10.1.4.0.1) or release 7.0.4 Deployment

<table>
<thead>
<tr>
<th>Component</th>
<th>For Specific Details Needed See</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory Server Instance</td>
<td>Worksheet for Directory Instances on page A-3</td>
</tr>
<tr>

<td>Worksheet for DIT and Object Definition Details on page A-4</td>
</tr>
<tr>
<td>Database Instance Profiles</td>
<td>Worksheet for Database Instance Profiles on page A-6</td>
</tr>
<tr>
<td>Identity Servers</td>
<td>Worksheet for Identity Servers on page A-7</td>
</tr>
<tr>
<td>Policy Manager Details (also known as the Access Manager in Oracle COREid Release 7.0.4)</td>
<td>Worksheet for Policy Manager (release 7.0.4 Access Manager) Instances on page A-8</td>
</tr>
<tr>
<td>Identity Servers</td>
<td>Worksheet for Access Servers on page A-10</td>
</tr>
</tbody>
</table>

**Creating Tests:** Before migrating data to another deployment, be sure to create and perform tests to help you confirm that changes in the source are producing the desired result. In addition, you may need to "true up" the target to ensure that migrated changes operate as expected. For example if you are migrating workflow data, you want to ensure that all participants mentioned in the source environment are also present in the target. Otherwise, the workflow in the target deployment may not work properly. The Oracle Access Manager Configuration Manager does not inform you if participants are missing in the target environment.

**To take inventory, test changes in the source deployment, and true up the target**
1. Before migration, fill in a copy of the worksheets in Appendix A as you gather and record information about existing deployments and their directories.
2. Develop appropriate tests to validate functions in the source deployment that are impacted by configuration data changes to ensure that the changes produce the expected and desired result

---

**Note:** After migrating data, you can use the same tests to validate migrated changes in the target deployment.

---

### Setting Up a Repository and Installing OC4J

You must perform all activities described in the following task overview to set up the host and prepare for Oracle Access Manager Configuration Manager installation.

**Task overview: Setting up a host and preparing for Configuration Manager installation includes**

1. Installing and Setting up the Oracle Database Repository
2. Installing and Configuring OC4J

### Installing and Setting up the Oracle Database Repository

This discussion provides an overview of installing and setting up the Oracle Database repository for use with the Configuration Manager.

You must install Oracle Database Server 10g Release 2 (10.2) as the Oracle Access Manager Configuration Manager repository. The following editions are supported:

- Enterprise Edition
- Standard Edition
- Express Edition (XE)

The Configuration Manager communicates with the Oracle Database in the standard way, and does *not* use Oracle Call Interface (OCI). The Configuration Manager uses the repository to store details about environments, associations, transformation rules, snapshots, transaction records, audit information, and LDIF files.

Only one repository is needed even when you plan to install multiple instances of the Oracle Access Manager Configuration Manager. For more information, see "About Planning the Number of Configuration Manager Instances Needed" on page 2-3.

**To install Oracle Database Server 10g Release 2 (10.2)**

1. Verify support certifications on MetaLink, as usual. For example:
   a. Go to on [https://metalink.oracle.com](https://metalink.oracle.com).
   b. Log in to MetaLink as directed.
   c. Click the Certify tab.
   d. Click View Certifications by Product.
   e. Select the Database/Server option and click Submit.
   f. Choose Oracle Database - YourEdition and click Submit.
2. Refer to the appropriate Oracle Database Server Installation Guide for your specific platform for installation and setup details.
3. See the Oracle Database Concepts 10g Release 2 (10.2) for more information about Oracle Database administration and management.
4. Use the Oracle Database Administrator’s Guide 10g Release 2 (10.2) for details about managing Oracle Database processes, tablespaces, datafiles, tempfiles, managing schema files, Oracle-managed files, and more.

After installing the repository, you are ready to complete activities in "Installing and Configuring OC4J". After installing OC4J, you can deploy the Configuration Manager then add details about the installed repository to the Configuration Manager.

Installing and Configuring OC4J

This discussion introduces the Oracle Container for J2EE (OC4J) installation and setup. Both OC4J and Oracle Access Manager Configuration Manager are installed together on a single platform. Before you can deploy Oracle Access Manager Configuration Manager, you must install OC4J 10g Release 3 (10.1.3).

OC4J provides a complete Java 2 Enterprise Edition (J2EE) 1.4-compliant environment. OC4J provides all the containers, APIs, and services mandated by the J2EE specification.

OC4J is distributed in two configurations, both of which are supported by Oracle Access Manager Configuration Manager:

- **Standalone Configuration**: In this configuration, OC4J is installed as a single, standalone instance that is managed, started and stopped directly as a self-contained component. This OC4J configuration, also known as an *unmanaged configuration*, offers a robust J2EE-compliant container that is easy to administer. In this configuration, a single OC4J instance is installed into a single ORACLE_HOME (the root directory in which Oracle software is installed).

  Web communication in an OC4J standalone configuration is provided through the built-in OC4J Web server, which supports HTTP and HTTPS communications natively without the use of the Oracle HTTP Server (OHS). The default Web site is defined in the default-web-site.xml file, which specifies the default HTTP listener on port 8888. Additional Web sites may be defined on different ports using variations of this file. See the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3) for instructions on creating and managing additional Web sites in OC4J.

  For installation details, see "Installing and Configuring OC4J in a Standalone Configuration" on page 2-6.

- **Managed Configuration**: In this configuration, OC4J is installed as a component of Oracle Application Server, in a group of one or more OC4J instances within an Oracle Application Server cluster. Oracle Application Server provides support for HTTP session and stateful session Enterprise JavaBean replication and load balancing across a group of OC4J instances within a cluster topology.

  For information, see "Installing OC4J as a Managed Component of Oracle Application Server" on page 2-9.

Installing and Configuring OC4J in a Standalone Configuration

The standalone OC4J configuration is comprised of the following components, and requires 80 MB of free space:

- Oracle Containers for J2EE 10g Release 3 (10.1.3)
- Oracle Enterprise Manager 10g Application Server Control Console

  This Web-based administration application is installed by default with OC4J and is enabled immediately after installation. See details about the Oracle Enterprise
Manager 10g Application Server Control Console in Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3) for details on using this management interface.

The standalone OC4J distribution, which includes the Application Server Control Console, is provided as a ZIP archive. During installation you are asked to provide a port number where OC4J communicates. You may assign any port number; the default port is 8888.

**Administrator Account and Role**: During installation you are asked to provide a password for the oc4jadmin account. This account is assigned the oc4j-administrators role that is used to manage users and roles and to connect to the JMX MBean server. If you do not assign a password for this account when OC4J is installed, you are prompted to set it the first time you start OC4J. The password can later be changed through the Setup page in the Application Server Control Console. The following procedure includes details about setting the password for the oc4jadmin account. For more information, see details about installing standalone OC4J in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

**Starting and Stopping OC4J**: You can start an OC4J server instance in a standalone environment using the default configuration with one of the OC4J command scripts, or with the executable oc4j.jar archive. You can stop a standalone OC4J server by invoking the -shutdown command in the admin_client.jar or admin.jar command-line utility or an oc4j.cmd or oc4j executable script. For more information, see the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

**Default Web Site**: Once installed the OC4J standalone distribution includes a default Web site where applications can be accessed, and a Web site that allows the Application Server Control Management interface to be used. In a standalone OC4J configuration, the default Web site is configured to receive HTTP requests directly on a specific port. The default port is 8888. Alternatively, the site can be configured to receive secure HTTPS requests. The default Web sites are provided so that you can start using OC4J immediately. For more information, see the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

The following procedure provides information you need to install the OC4J standalone configuration for use with Oracle Access Manager Configuration Manager. These steps are not intended to replace the OC4J installation details available in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

**To install the OC4J standalone server**

1. Enter Metalink and ensure that your host computer is compatible with this Oracle Access Manager Configuration Manager release:

   a. Go to on [https://metalink.oracle.com](https://metalink.oracle.com).

   b. Log in to MetaLink as directed.

   c. Click the Certify tab.

   d. Click View Certifications by Product.

   e. Select the Application Server option and click Submit.

   f. Choose Oracle Identity Manager and click Submit.

   g. Click Oracle Identity Management Certification Information 10g (10.1.4.0.1) (html) to display the Oracle Identity Management page.
h. Click the link for Section 6, "Oracle Access Manager Certification" to display the certification matrix.

2. Before installing a standalone OC4J server, ensure the prerequisites described in the *Oracle Containers for J2EE Configuration and Administration Guide* 10g Release (10.1.3) been met. For example:

   a. On the OC4J host computer, download and install the Java 2 Platform, Standard Edition (J2SE) Development Kit (JDK) release 5.0 or higher.
   
   b. After installing J2SE, ensure that the appropriate environment variables are set. For example, `JAVA_HOME`, `ORACLE_HOME`, and `J2EE_HOME`.

3. Locate and download the OC4J distribution ZIP archive from:

   For Development:
   Oracle Containers for J2EE (OC4J) 10g Release 3 (10.1.3.1.0)

4. Install the standalone OC4J distribution using instructions in the *Oracle Containers for J2EE Configuration and Administration Guide* 10g Release (10.1.3).

   See instructions for extracting the oc4j_extended.zip file into the directory that will serve as the OC4J installed directory (also known as `ORACLE_HOME`) with the archive utility of your choice.

   The installer automatically creates the required directory structure for you. You can start an OC4J server instance in a standalone environment using the default configuration with one of the oc4j command scripts or the executable oc4j.jar archive. For more information about starting and stopping OC4J, see the corresponding chapter in the *Oracle Containers for J2EE Configuration and Administration Guide* 10g Release (10.1.3).

5. Set a password for the OC4J Administrator account the first time OC4J is started (the user name for this account is set to `oc4jadmin` by default).

   ________________
   Note: You can change the password for this account. For more information, see information on tools for administering OC4J in the *Oracle Containers for J2EE Configuration and Administration Guide* 10g Release (10.1.3).
   ________________

6. Ensure that the installation is a success by entering the URL to the OC4J home page then login as the `oc4jadmin`. For example:

   http://hostname:port/em/console

   where *hostname* refers to computer that hosts OC4J standalone configuration; *port* refers to the HTTP port number on which OC4J host listens; and `em/console` connects to the OC4J console.

7. Proceed as follows:

   ■ **Installation Successful** (perform activities described next):
     
     – **Assigning Configuration Manager Administrator and User Roles** ensures that users can log in to the Oracle Access Manager Configuration Manager after deployment
     
     – **Deploying the Configuration Manager** using the Enterprise Manager browser console
Installing OC4J as a Managed Component of Oracle Application Server

When installing OC4J as a managed component of Oracle Application Server you use advanced installation steps for the J2EE Server configuration. This configuration requires 570 M.B of free space.

In a J2EE Server configuration, the following components are installed:

- Oracle Containers for J2EE (OC4J) 10g (10.1.3.1.0) in one or more instances in one or more groups
  This component provides a complete Java 2 Enterprise Edition (J2EE) environment for developing Java applications.
- Oracle Enterprise Manager 10g Application Server Control Console (used for Web-based management of Oracle Application Server)
- Oracle HTTP Server 1.3, which provides front-end Web communication and load-balancing functionality is included with this installation
- Oracle Process Manager and Notification Server (OPMN), which includes the Oracle Notification Server (ONS)

OPMN provides process control and monitoring for Oracle Application Server instances and their components. ONS is installed by default on every Oracle Application Server host. In a managed environment, you must use OPMN to start and stop all components, including OC4J and Oracle HTTP Server communications between components. See the discussion on starting OC4J in an Oracle Application Server environment in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3) for details.

OC4J runtime options and system properties can be manually set in the OPMN configuration file, opmn.xml. See details on the OC4J runtime configuration in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3) for details.

Oracle Application Server provides support for HTTP session and stateful session Enterprise JavaBean replication and load balancing across a group of OC4J instances within a cluster topology. For details about cluster technology and application clustering in OC4J, see the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

In an Oracle Application Server clustered environment, a single Application Server Control Console can be used to manage all OC4J instances in a cluster. For more information, see the discussion on Oracle Enterprise Manager 10g Application Server Control Console and tools for administering OC4J in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Installation of the various managed components is accomplished using the Oracle Universal Installer. OPMN must be installed in every ORACLE_HOME directory to enable monitoring of each installed component. The Oracle Universal Installer provides a number of installation options:

- Integrated Web Server, J2EE Server, and Process Management

  In this configuration, all components are installed into a single ORACLE_HOME directory, including OC4J, Oracle HTTP Server, and OPMN. Multiple OC4J instances can be created within this ORACLE_HOME directory. Multiple host
computers, each hosting one or more OC4J instances, can be included in an Oracle Application Server cluster.

- **J2EE Server and Process Management**
  
  This installation includes OC4J and OPMN. It can be utilized as a standalone OPMN-managed OC4J instance for development or testing purposes, or can be included within an Oracle Application Server cluster.

- **Web Server and Process Management**
  
  This installation includes only Oracle HTTP Server and OPMN. It can be used as a standalone Oracle HTTP Server instance, typically serving as the front-end Web listener for an Oracle Application Server cluster.

The following procedure provides information you need to install the OC4J as a managed component for use with Oracle Access Manager Configuration Manager. These steps are not intended to replace the OC4J installation details available in the *Oracle Application Server Installation Guide*.

**To install Oracle Application Server J2EE Server configuration**

1. Enter Metalink and ensure that your host computer is compatible with this Oracle Access Manager Configuration Manager release:
   
   a. Go to on [https://metalink.oracle.com](https://metalink.oracle.com).
   
   b. Log in to MetaLink as directed.
   
   c. Click the Certify tab.
   
   d. Click View Certifications by Product.
   
   e. Select the Application Server option and click Submit.
   
   f. Choose Oracle Identity Manager and click Submit.
   
   g. Click Oracle Identity Management Certification Information 10g (10.1.4.0.1) (html) to display the Oracle Identity Management page.
   
   h. Click the link for Section 6, "Oracle Access Manager Certification" to display the certification matrix

2. Perform activities as described for J2EE Server installation in the *Oracle Application Server Installation Guide* as follows:
   
   a. Verify requirements.
   
   b. Review the discussion about things you should know before starting the installation.
   
   c. Review topics about advanced installation of the J2EE Server.

3. Access the Oracle Enterprise Manager 10g Application Server Control Console using the following URL:

   http://hostname:port/em/console

   where hostname refers to computer that hosts Oracle Enterprise Manager 10g Application Server Control Console; port refers to the HTTP port number on which host listens; and em/console connects to the console.

4. Proceed as follows:
   
   - **Installation Successful** (perform the following activities in the order specified):
Deploying and Setting Up the Configuration Manager

This discussion explains how to deploy Oracle Access Manager Configuration Manager as an OC4J application. Any Web server supported by OC4J is supported for the Configuration Manager. No Microsoft certification is available nor expected.

The Oracle Access Manager Configuration Manager application is distributed as a .war file that can be deployed using OC4J. The .war file requires 7.77 MB of free disk space.

The following procedure describes how to deploy and test the Configuration Manager. For details about starting and stopping OC4j, see the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Check Table 2–2 to confirm that prerequisites have been completed before starting the following procedure.

### Table 2–2  Deployment Prerequisites

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Tasks</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Install the Oracle Database Repository</td>
<td>Installing and Setting up the Oracle Database Repository on page 2-5</td>
</tr>
<tr>
<td></td>
<td>Install OC4J</td>
<td>Installing and Configuring OC4J on page 2-6</td>
</tr>
</tbody>
</table>

To deploy the Configuration Manager using OC4J

1. Go to the OC4J home page, if you have not already done so, then login as the oc4jadmin. For example:
   
   http://hostname:port/em/console

   where hostname refers to computer that hosts OC4j standalone configuration; port refers to the HTTP port number on which OC4j host listens; and em/console connects to the OC4j console.

2. On the OC4J home page, click the Applications tab. For example:
   
   Applications

3. On the Applications page, click the Deploy button:
   
   Deploy

   The Select Archive page appears.

4. Fill in the path to the Oracle Access Manager Configuration Manager .war file archive using the Browse button, then click the Next button as shown in Figure 2–2.
The Application Attributes page appears.

5. On the Application Attributes page, specify the values in Table 2-3 for the Configuration Manager Application Attributes, then click the Next button and compare your page with the one in Figure 2-3.

<table>
<thead>
<tr>
<th>Configuration Manager Application Attributes</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>OracleConfigurationManager</td>
</tr>
<tr>
<td>Parent Application</td>
<td>default</td>
</tr>
<tr>
<td>Bind Web Module to Site</td>
<td>Default-web-site</td>
</tr>
<tr>
<td>Web Module Context Root</td>
<td>OCM</td>
</tr>
</tbody>
</table>

When you finish, the Application Attributes page should look something like the one in Figure 2-3.
When you click Next button, the Deployment Settings page appears.

6. On the Deployment Settings page, click the Deploy button as shown in Figure 2–4 to deploy Oracle Access Manager Configuration Manager.

Figure 2–4 Deployment Settings Page

7. View the confirmation message that appears, as shown in Figure 2–5.
8. On the Confirmation page, click the Return button in the lower-right corner (to return to the OC4J home page).

9. Test the deployment to ensure it is successful by entering the URL to the Configuration Manager home page in a browser window. For example:

   \[ \text{https://hostname:port/ocm/faces/index.jsp} \]

   where \( \text{hostname} \) refers to computer that hosts the Configuration Manager; \( \text{port} \) refers to the HTTP port number on which the Configuration Manager host listens; /ocm refers to Web Module Context Root specified on the Application Attributes page while deploying the Oracle Access Manager Configuration Manager application; and faces/index.jsp connects to the Configuration Manager application’s Login page.

   The Configuration Manager Login page should appear, as shown here.

10. Proceed as follows:
    - **Deployment Successful**: Perform activities in the following order:
      - **Logging In**: Enter the login name and password that were defined for your use with the Configuration Manager, then click the Login button. For more information, see "Assigning Configuration Manager Administrator and User Roles" on page 2-15.
Assigning Configuration Manager Administrator and User Roles

The procedure in this discussion guides as you create then assign the administrator roles needed for Oracle Access Manager Configuration Manager.

Oracle Access Manager Configuration Manager requires only OC4J for security. Within OC4J, the Configuration Manager application requires two security roles that provide specific privileges for the Configuration Manager. Only users assigned with the following roles can perform tasks in Oracle Access Manager Configuration Manager:

- **HMAdmin**: This role enables you to perform only System Configuration functions for the repository within Oracle Access Manager Configuration Manager. To perform all other Configuration Manager activities, individuals must be assigned the **HMUser** role.

- **HMUser**: This role enables you to perform all Configuration Manager functions except System Configuration functions. A user with write privileges to an environment (directory) can perform all migration functions when they have **HMUser** privileges: add environment details, make associations and add transformation rules, take snapshots, migrate data, and manage transactions.

The **HMAdmin** and **HMUser** roles that you create in OC4J will not inherit any existing OC4J roles. Nor are RMI Login Permission or administration permission granted when you create the **HMAdmin** and **HMUser** role.

During Configuration Manager deployment using OC4J, you defined a specific application name for Oracle Access Manager Configuration Manager. In the following procedure, you will create the roles within OC4J that are required for administrators and users of Oracle Access Manager Configuration Manager, then assign those roles to specific users that you define within OC4J.

Check Table 2–4 to confirm that prerequisites have been completed before starting the following procedure.

### Table 2–4 Assigning Configuration Manager Roles in OC4J Prerequisites

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Tasks</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deploy</td>
<td>Deploy the Configuration Manager</td>
<td>Deploying the Configuration Manager on page 2-11</td>
</tr>
</tbody>
</table>

#### To create and assign HMAdmin and HMUser roles in OC4J

1. Go to the OC4J home page and login as the *oc4jadmin*. For example:

   ```
   http://hostname:port/em/console
   ```

   where *hostname* refers to computer that hosts OC4j standalone configuration; *port* refers to the HTTP port number on which OC4j host listens; and *em/console* connects to the OC4j console.
2. On the OC4J home page click the Applications tab, then locate and click the link you defined for Oracle Access Manager Configuration Manager as shown in Figure 2–6. For example:

Applications

OracleConfigurationManager

Figure 2–6 OC4J Applications Tab

The Applications tab for Oracle Access Manager Configuration Manager opens.

3. Click the Administration tab to display the page for Oracle Access Manager Configuration Manager. For example:

Administration

4. On the Administration tab, click the Security Provider icon in the Go To Task column, as shown in Figure 2–7.
5. On the Security Provider page, click the Realms tab.

6. Perform the following steps to create the **HMAdmin** and **HMUser** roles for Oracle Access Manager Configuration Manager as follows:

a. On the Realms subtab, locate and click the link (in the Roles column) that is associated with the Realm Name as shown in Figure 2–8.

---

**Figure 2–7  Administration Tab for Oracle Access Manager Configuration Manager**

The Security Provider page appears.

**Figure 2–8  Realms Subtab: Realm Name, Roles, and Users**

---
The Roles page appears and includes a Create button.

b. On the Roles page, click the Create button to display the Add Role page.

The Add Role page appears as shown in Figure 2–9.

**Figure 2–9  Add Role Page**

![Add Role Page](image)

c. On the Add Role page, enter the following details for the **HMAdmin** role, then click OK:

- **Name**: HMAdmin
- **Grant RMI Login Permission**: Leave blank.
- **Grant Administration Permission**: Leave blank.
- **Assign Roles**: Ignore; there are no roles to be inherited by HMAdmin.
- **OK**: Click the OK button when you finish to establish the **HMAdmin** role.

d. On the Add Role page, create the **HMUser** role using the following information as a guide:

- **Name**: HMUser
- **Grant RMI Login Permission**: Leave blank.
- **Grant Administration Permission**: Leave blank.
- **Assign Roles**: Ignore; there are no roles to be inherited by HMUser.
- **OK**: Click the OK button when you finish to establish the **HMUser** role.

Your Roles page should look something like the one in Figure 2–10.
7. Add users, and assign to the Configuration Manager application the administrator or user roles that you just created, by performing the following activities:

   a. On the Realms subtab, locate and click the link in the Users column associated with the Realm Name as shown in Figure 2–11.

   b. On the Users page, click the Create button under the Results label. For example:

      Create

   c. On the Add User Page add the requested details, then click OK as shown in Figure 2–12. For example:

      - **Username**: Enter the userid for logging in to the Configuration Manager.
      - **Password/Confirm Password**: Enter the password for this user; then confirm the password by entering it a second time.
      - **Assign Roles**: From the Available Roles list, select the desired role for this user then click the Move arrow to add these to the Selected Roles list. For example:

      HMAadmin

      or
Assigning Configuration Manager Administrator and User Roles

HMUser

**Note:** A single user may be assigned both **HMAdmin** and **HMUser** roles.

---

**Figure 2–12  Add User Page**

---

- Click **OK** to complete the operation.

  A Confirmation page appears where you can verify information for this new user.

- On the Confirmation page, review the User Name and Roles as shown in **Figure 2–13** to ensure that everything is accurate.
8. Repeat step 7 to add other Oracle Access Manager Configuration Manager administrators and users, if needed.

9. Click Logout when you finish to leave OC4J.

With at least one Oracle Access Manager Configuration Manager administrator assigned, repository details may be added in the Configuration Manager.

10. After the roles and users have been created, restart the Oracle Access Manager Configuration Manager application.

Touring the Configuration Manager

Topics in this discussion provide a quick tour to orient you to Oracle Access Manager Configuration Manager.

If you log in to Oracle Access Manager Configuration Manager as a user with only HMAdmin privileges, you see only the System Configuration tab. If you log in as a user with HMUser privileges, you see all function tabs except System Configuration. If you are assigned both roles, all tabs are available. For more information see, "Assigning Configuration Manager Administrator and User Roles".

After logging in to Oracle Access Manager Configuration Manager, a Welcome page appears as shown in Figure 2–14. As with other Oracle Web-based applications, Function tabs are provided across the top of the page with corresponding links at the bottom of the page.
To access the Configuration Manager

1. Go the Configuration Manager home page. For example:
   
   https://hostname:port/ocm/faces/index.jsp

   where hostname refers to computer that hosts the Configuration Manager; port refers to the HTTP port number on which the Configuration Manager host listens; /ocm refers to Web Module Context Root specified on the Application Attributes page while deploying the Oracle Access Manager Configuration Manager application; and faces/index.jsp connects to the Configuration Manager application’s Login page.

   The Login page appears.

2. Log in as an individual with either HMUser or HMAdmin privileges, depending upon the activities you intend to perform. For example:

   HMUser_Name
   Password

3. As you proceed with the tour, refer to the following discussions:

   - Logout Link
   - Cancel and Back Buttons on Configuration Manager Pages
   - Navigational Aids for Tables
   - SnapShots Tab
   - Migration Tab
   - Transactions Tab
   - System Configuration Tab
   - Messages in the Configuration Manager

Logout Link

The Logout link appears in the upper-right corner of Configuration Manager pages. You select the Logout link to conclude your session.

Cancel and Back Buttons on Configuration Manager Pages

A Cancel button is provided on a number of Oracle Access Manager Configuration Manager pages. When you click Cancel, the current operation is terminated without completion and you are returned to the originating page for the function. For example
if you cancel a migration operation, you are returned to the Select Logical Object Types to Compare page.

A Back button is included on some Oracle Access Manager Configuration Manager pages. When you click the Back button you are returned to the previous page. This is similar to using the Back button in the Web browser itself. For example if you click Back while viewing environment details, you are returned to the Environment List page.

Navigational Aids for Tables

When you have more than one environment, association, snapshot, or transaction the corresponding list page itemizes information in a table. Figure 2–15 shows a typical list page and table details.

Figure 2–15  Navigational Aids for Tables

![Navigational Aids for Tables](image)

When a table contains less than 10 items, all are visible at one time. If a table contains more than 10 items, navigational aids are included. For example, the table in Figure 2–15 includes navigational aids at the top-right side of the table:

- **Previous**: Click Previous to return (go back) to the previous page.
- **Next**: Click Next to proceed (go forward) to the next page.
- **List**: Select a specific range of items from the list, or select Show All to display all the rows in the table.

SnapShots Tab

The SnapShot function enables you to create a backup copy of the entire oblix tree in an LDAP directory of one of your environments. When you select the SnapShots tab, the SnapShot List page appears. From here, you can create a new snapshot or select a snapshot to restore or delete a snapshot.

Details for existing snapshots of the selected environment are organized in a table as shown in Figure 2–16. The table is empty until you select an environment from the Select Environment list.
Touring the Configuration Manager

Figure 2–16  Snapshot Tab

For more information, see "Making and Managing Snapshots" on page 3-24.

Migration Tab

Figure 2–17 shows the Migration tab. Related functions are available on secondary tabs: environments, Associations, Migrate. The Migrate secondary tab includes a progress indicator, as shown in Figure 2–17.

You choose the corresponding secondary tab to perform tasks that involve:

- **Environments**: From this secondary tab you can create, view, modify, or delete details about existing environments. Before you can migrate data, you must add at least two environments to Configuration Manager: one to use as the source and one to use as the target.

  For more information, see "Adding and Managing Environment Details in the Configuration Manager" on page 3-4.

- **Associations**: From this secondary tab you can create, view, modify, or delete details about directory associations. Before you can migrate data, you must create an association between two environments defined in Configuration Manager: one to use as the source and one to use as the target.

  For more information, see "Creating and Managing Associations" on page 3-12.
Migrate: After defining environments and forming an association, you can migrate configuration data using this secondary tab. You can migrate data directly using Oracle Access Manager Configuration Manager. Alternatively, you may choose to export data to an LDIF file and then use an external utility to import the data offline.

For more information, see “Migrating Data from the Source to the Target” on page 3-29.

Transactions Tab

A transaction record is created automatically each time you migrate data using Oracle Access Manager Configuration Manager. A transaction ID is assigned automatically when the record is created. You can provide an optional transaction description.

When you select the Transactions tab, the Transactions List page appears. After selecting an association, all related transaction records are organized in a table as shown in Figure 2–18. The table is empty until you select an association.

You can view details for the record or view specific changes made during the transaction or roll back changes made during the transaction.

For more information about transactions and rolling back changes, see Chapter 5.

System Configuration Tab

A repository is required to contain details about directory environments and associations, snapshot content, audit details, migration transaction data, and any optional LDIF files you may choose to create using Configuration Manager.

Only when you log in as an individual with HMAdmin privileges, is the System Configuration tab available as shown in Figure 2–19. Until a repository is defined in the Configuration Manager, the form is empty.
Touring the Configuration Manager

Figure 2–19  System Configuration Tab

From the System Configuration tab, an individual with **HMAdmin** privileges can perform the following repository-related tasks in Configuration Manager:

- **View**: Repository details are displayed automatically whenever the System Configuration tab is selected. The form is empty until a repository is defined in the Configuration Manager.

- **Edit**: Enables you to add or alter repository details. Repository details must be added before migration tasks can be performed.

- **Test Connection**: Ensures that the repository is accessible.

- **Cleanup Repository**: Clears the data in the Oracle Access Manager Configuration Manager repository tables.

- **Upload Schema**: Appears only when there is no Oracle Access Manager Configuration Manager schema present in the Oracle Database repository.

For more information about System Configuration functions, see "Adding Repository Details in the Configuration Manager" on page 2-27.

**Messages in the Configuration Manager**

There are several types of messages that may appear when working with Oracle Access Manager Configuration Manager:

- **Informational or Confirmation Messages**: Confirm that an operation completed successfully. Informational messages appear near the top of the page as shown in Figure 2–20. In this example, the Test Connection operation was used for the repository. Upon completion, you are returned to the System Configuration page where a message confirms the success of the operation.
Adding Repository Details in the Configuration Manager

Figure 2–20  Informational Message

- Request for Action or Verification: Required before critical and irreversible operations are completed. For example, your verification is needed before deleting an environment or association or transformation rule. A window like the one in Figure 2–21 asks for your confirmation. You click OK to verify and complete the operation, or Cancel to terminate the operation without completing it.

Figure 2–21  Typical Request for Your Action

- Error Messages: Announce a problem when an operation cannot be completed successfully. Error messages take the form shown in Figure 2–22 and include information to help you assess the problem and recover.

Figure 2–22  Typical Error Message

Adding Repository Details in the Configuration Manager

A repository is required to contain details about directory environments and associations, snapshot content, audit details, migration transaction data, and any optional LDIF files you may create using Configuration Manager. This discussion describes how to ensure that the Configuration Manager can communicate with its repository.
Before starting activities in this discussion, confirm that prerequisites described in Table 2–5 are completed.

Table 2–5  Repository Prerequisites

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Task</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Assign Configuration Manager administrator role to individuals using OC4J</td>
<td>Assigning Configuration Manager Administrator and User Roles on page 2-15</td>
</tr>
</tbody>
</table>

From the System Configuration page, you click the Edit button and enter details for your repository. There is no Add button for the System Configuration tab. Sample details that you need to supply are shown in Figure 2–23. If you log in with only HMUser privileges, the System Configuration tab does not appear.

Figure 2–23  A Completed Edit System Configuration Page

To add repository details to Oracle Access Manager Configuration Manager

1. Enter the Oracle Access Manager Configuration Manager, if you haven’t already done so. For example:

   https://hostname:port/ocm

   where hostname refers to computer that hosts the Configuration Manager; port refers to the HTTP port number on which the Configuration Manager host listens; and /ocm refers to Web Module Context Root specified on the Application Attributes page while deploying the Oracle Access Manager Configuration Manager application.

   The Welcome page appears.

2. Log in as an individual with HMAdmin privileges, as defined in OC4J in the previous procedure.

   HMAdmin_Name
   Password

3. Click the System Configuration tab on the right side of the page.

   Note: Only users with HMAdmin privileges defined in OC4J for this application will see the System Configuration tab.

4. On the System Configuration page, click the Edit button.
5. On the Edit System Configuration page, enter appropriate information to identify details for your Configuration Manager repository. For example:

- **Repository Type**: Oracle DB is the only item listed and the only repository that is supported for this application.
- **Host**: Your Oracle Database Host Name expressed as either the full DNS hostname or an IP address.
- **Port**: Port number on which the Oracle Database host communicates.
- **UserID**: The Oracle Database Administrator userID.
- **Password**: The password for the Oracle Database Administrator userID. There are no password restrictions.
- Click Save to retain this information (otherwise, click the Back button).

The System Configuration page returns and includes a Test Connection button that you can use to ensure that the repository is accessible from the Configuration Manager.

6. Click the Test Connection button to ensure that this repository is accessible to the Configuration Manager. For example:

An informational message appears to confirm success, as shown here.

7. Proceed as follows:

- **Connection Successful**: An informational message appears declaring the operation was a success. You are ready to upload the schema as described in step 8.
- **Connection Not Successful**: An error message appears. In this case, confirm that all repository details are accurately entered (edit them if needed), confirm that the Oracle Database instance is running, test the connection again, then proceed with the next step to upload the schema.

8. **Upload Schema**: When you add repository details you need to upload the Configuration Manager schema as follows:

   a. Click the Upload Schema button. For example:

      Upload Schema

   b. In the Upload Schema window, enter the directory administrator’s UserID and password, then click Upload to complete the operation (or Cancel to terminate the operation without completion).
Ensuring the Repository is Available to the Configuration Manager

Data can be written to the repository only when it is live and accessible. Any individual with *HMAdmin* privileges can use the Test Connection procedure to ensure that the repository is available to the Configuration Manager.

After the operation completes successfully, an informational message confirms the status as shown in Figure 2–24.

9. Proceed as follows:
   - **Schema Upload Successful**: A message informs you that the database is configured successfully and you are ready to prepare for and perform migration tasks as described in Chapter 3.
   - **Schema Upload Not Successful**: In this case, a message like the one here appears. Retry the upload, then proceed to Chapter 3.
To confirm that the Configuration Manager repository is available

1. From the Oracle Access Manager Configuration Manager home page, log in as a user with **HMAdmin** privileges, then click the System Configuration tab on the right side of the page:

   ![System Configuration]

   - **Repository Type**: Oracle DB
   - **Host**: 141.144.60.200
   - **Port**: 1521
   - **User ID**: nm
   - **Password**

   - **Test Connection**  |  **Clean Up Repository**

   ![Test Connection]

   **Note**: Only users with **HMAdmin** privileges defined in OC4J have access to the System Configuration tab. If you log in as a user with only **HMUser** privileges, the System Configuration tab does **not** appear.

2. On the System Configuration page, click the Test Connection button then review the informational message to confirm that this repository is accessible.

   ![Test Connection]

3. Proceed as follows:

   - **Connection Successful**: An informational message appears and you are ready to continue with activities in this chapter.

   - **Connection Not Successful**: An error message appears. In this case, contact the Oracle Database administrator to confirm that the Oracle Database instance is running, test the connection again, then proceed with the activities in this chapter.
This chapter provides the information that you need to prepare for and migrate configuration data from a source LDAP directory (environment) to a target. Topics in this chapter include:

- About Migrating Data
- Accessing the Configuration Manager
- Notifying Other Administrators
- Adding and Managing Environment Details in the Configuration Manager
- Creating and Managing Associations
- Adding and Managing Optional Transformation Rules
- Making and Managing Snapshots
- Migrating Data from the Source to the Target
- Restarting Servers After Migration

About Migrating Data

After completing activities in Chapter 2, Oracle Access Manager Configuration Manager is ready to use for migration activities.

Figure 3–1 provides an overview of the procedures involved in preparing for and migrating data using the Oracle Access Manager Configuration Manager. Additional information follows the figure.
Figure 3–1 Preparing for and Migrating Data using Configuration Manager

Task overview: Migrating data includes

1. **Notifying Other Administrators**: Recommended both before and after any data migration and described on page 3-3.

2. **Adding Environment Details to the Configuration Manager**: Required before you can form an association, and described on page 3-4.

3. **Creating a Directory Association**: Required before migration, and described on page 3-12.

4. **Adding and Managing Optional Transformation Rules**: Optional and applied automatically during migration, as described on page 3-17.

5. **Creating a Snapshot**: Recommended before any data migration, as described on page 3-24.

6. **Migrating Data from the Source to the Target** is described on page 3-29.

7. **Restarting Servers After Migration**: Required after data migration, and described on page 3-41.

8. **Validating Migration Success**: Recommended to ensure that everything in the target deployment works as expected, and described in Chapter 4.

You may **not** use the Oracle Access Manager Configuration Manager to migrate data from a release 7.0.4 deployment to a release 10g (10.1.4.0.1) deployment nor vice versa. For more information, see "Deployment Support and Interoperability" on page 1-14.
Accessing the Configuration Manager

The procedure in this discussion explains how to access Oracle Access Manager Configuration Manager.

You must log in with appropriate rights for the tasks that you want to perform using the Configuration Manager. There are two types of OC4J roles for the Configuration Manager, which must be defined by the OC4J administrator:

- **HMAdmin** role is required to perform System Configuration activities, including testing the connection with the repository.
- **HMUser** role enables you to perform all activities except System Configuration.

Before you start this procedure, confirm that all prerequisites described in Table 3–1 have been performed.

### Table 3–1 Oracle Access Manager Configuration Manager Access Prerequisites

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Task</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set up a repository for Oracle Access Manager Configuration Manager and install OC4J.</td>
<td>Setting Up a Repository and Installing OC4J on page 2-5</td>
<td></td>
</tr>
<tr>
<td>Deploy Oracle Access Manager Configuration Manager as an OC4J application.</td>
<td>Deploying the Configuration Manager on page 2-11</td>
<td></td>
</tr>
<tr>
<td>Assign OC4J roles to individuals to provide access privileges to the Configuration Manager. Check with your OC4J administrator to learn your login ID and password for the Configuration Manager.</td>
<td>Assigning Configuration Manager Administrator and User Roles on page 2-15</td>
<td></td>
</tr>
<tr>
<td>Add repository details to the Configuration Manager.</td>
<td>Adding Repository Details in the Configuration Manager on page 2-27</td>
<td></td>
</tr>
</tbody>
</table>

**To access the Configuration Manager**

1. Access the Configuration Manager home page as usual. For example:

   ```
   https://hostname:port/ocm/faces/index.jsp
   ```

   where `hostname` refers to computer that hosts the Configuration Manager; `port` refers to the HTTP port number on which the Configuration Manager host listens; `/ocm` refers to Web Module Context Root specified on the Application Attributes page while deploying the Oracle Access Manager Configuration Manager application; and `/faces/index.jsp` connects to the Configuration Manager application’s Login page.

   The Login page appears.

2. Log in as an individual with **HMUser** privileges (defined in OC4J) for the activities you intend to perform. For example:

   ```
   HMUser_Name
   Password
   ```

3. Proceed with activities in this chapter.

**Notifying Other Administrators**

Oracle recommends that you schedule specific migration windows for promoting changes and restarting servers. Further, Oracle recommends that you notify other administrators both before and after migrating data in a deployment for which they have responsibility.
Your migration team can collect and confirm details regarding the logical object types (or logical objects) that will be migrated, the source and target directories, when backups (snapshots) will be made. The migration team can send this information to others to ensure solid coordination. When the migration is complete, you can notify the same administrators so they can assist in restarting servers and validation procedures.

To notify other administrators
1. Create a list of all administrators in any deployment that will be impacted by the change.
2. Create an email that includes all relevant details for the administrator, deployment, and situation. For example:

   ANNOUNCING DATA MIGRATION THAT MAY IMPACT YOUR DEPLOYMENT:

   CONFIGURATION DATA WILL BE MIGRATED FOR:
   Oracle Access Manager 10g (10.1.4.0.1)
   (OR Oracle COREid Release 7.0.4, if this is your deployment)

   WHEN:  Date and time

   SOURCE DIRECTORY: DNS hostname
   TARGET DIRECTORY: DNS hostname

   A SNAPSHOT OF THE TARGET DIRECTORY WILL BE MADE: Date and time

   MIGRATED CHANGES MUST BE PROPOGATED TO ANY REPLICA.

   IDENTITY AND ACCESS SERVERS MUST BE RESTARTED AFTER DATA MIGRATION TO
   ENSURE DATA SYNCHRONIZATION.

3. Send the email to all administrators who may impacted before the migration.
4. Send a follow up email to all administrators after the migration to announce what was done.

Adding and Managing Environment Details in the Configuration Manager
This discussion provides step-by-step procedures to add and manage environment details in the Configuration Manager. The Configuration Manager repository must be online for these activities. Oracle recommends that the source and target environments are also online.

Note: Any environment that is involved when making a directory snapshot, migrating data, or rolling back a transaction must be live and online. To ensure that an environment is available to the Configuration Manager, see "Testing the Environment Connection" on page 3-11.

Table 3–2 shows the prerequisite tasks that must be completed before you can complete activities to add and manage directory details in the Configuration Manager.
The task overview that follows outlines details about managing environments using the Configuration Manager.

**Table 3–2 Environment Prerequisites**

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Task</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Install and setup the repository, OC4J, Oracle Access Manager Configuration Manager, and administrators and user roles.</td>
<td>Chapter 2</td>
</tr>
</tbody>
</table>

**Task overview: Managing environment details for existing deployments includes**

1. **Viewing Environment Details in the Configuration Manager**
2. **Adding Environment Details to the Configuration Manager**: Required before you can form an association and migrate data
3. **Modifying Environment Details in the Configuration Manager**
4. **Deleting Environment Details in the Configuration Manager**
5. **Testing the Environment Connection**

**Viewing Environment Details in the Configuration Manager**

The procedure in this discussion explains how you view environment details that were added to the Configuration Manager. This activity can be performed by any individual with **hmuser** privileges.

The Environments List page appears as shown in Figure 3–2 when you select the Migrate tab, then select the Environments secondary tab. If there are no environment details in the Configuration Manager, the table is empty. In this case, skip to "Adding Environment Details to the Configuration Manager" on page 3-7.

![Figure 3–2 Environments List Page](image)

When you click a name in the Environment Name column, the View Environment page appears as shown in Figure 3–3. Details about this page follow the figure.
Adding and Managing Environment Details in the Configuration Manager

**Figure 3–3 View Environment Page**

The View Environment page includes the following details:

- **Environment Name**: The unique name that was entered when details about this directory server were added to the Configuration Manager.

- **Environment Type**: The release for which this directory server is installed (Oracle Access Manager 10g (10.1.4.0.1) or Oracle COREid Release 7.0.4).

- **Environment Description**: An optional statement that further identifies this directory and its deployment.

- **Directory Type**: The supported directory server type.

- **Host Name**: The DNS hostname of the computer where this directory is installed (either full DNS hostname or IP address).

- **Port**: The port number on which this directory server communicates.

- **Configuration DN**: The bind DN for configuration data for Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4. For example: `o=oblix,o=company,c=us`.

  Similar to the searchbase for user data. The configuration DN must be specified to identify the node in the DIT under which the Oracle Access Manager schema and configuration data are stored. For more information about its use and location within Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments, see the corresponding Installation Guide as described in "Related Documents" on page -viii.

- **User DN**: The administrator ID, also known as a bind DN or root DN, for the Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, directory.

  This directory account should have Read, Write, Add, Delete, Search, Compare, and Self-write permissions. The method to create a user with these privileges varies among directory vendors. See your directory documentation for details. For more information about its use and location within Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployments see the corresponding Installation Guide as described in "Related Documents" on page -viii.

- **Password**: The User DN directory administrator password.
Adding and Managing Environment Details in the Configuration Manager

■ **Environment URL**: The URL to the LDAP directory.

■ **Enable SSL**: True if enabled; False if not enabled.

**To view environment details that were added to the Configuration Manager**

1. From Oracle Access Manager Configuration Manager, select the Migration tab, then select Environments to display the Manage Environment page. For example: Migration, Environments

2. Click the desired Environment Name to view details about the selected directory. For example:

   ![Environment Name](image)

3. From the View Environment page you can perform any of the following activities:
   - Click the Test Environment button to ensure that this directory is live and online.
   - Click the Back button to return to the Manage Environment page.
   - Click the Edit button to modify details for the selected directory. In this case, proceed to “Modifying Environment Details in the Configuration Manager” on page 3-10.

**Adding Environment Details to the Configuration Manager**

The procedure in this discussion explains how to add environment details to the Configuration Manager. Any individual with **hmUser** privileges can add environment details. The Oracle Access Manager Configuration Manager repository must be online. Oracle recommends that the environment (LDAP directory) is also online.

---

**Note:** After adding details for at least two LDAP directory environments, you can form an association that specifies a source and target for data migration.

---

**Failover and Load Balancing**: Oracle Access Manager Configuration Manager does not support directory failover or load balancing. For each existing deployment, the Configuration Manager writes to only a single master LDAP directory and reads from only a single master or replica server.

In a replicated directory environment, you must add details for only the master directory (the one on which write operations take place) as the target environment. Otherwise, the objects that you select for migration cannot be written into the target and migration will fail. After migrating configuration data to the master LDAP directory you must ensure that the changes have fully propagated to the replicas before restarting Identity and Access Servers.

When you select the Create New button from the Environment List page, the Add Environment page appears. A filled in sample is shown in Figure 3–4. Your environment will differ.
Lists are provided from which you can select the environment type (OAM 1014 or COREid704) and directory type. In this example the environment type is OAM1014.

Fields are provided where you enter other information for the environment. When defining an environment name and description, you may use any combination of upper and lower case alpha/numeric characters, as well as spaces and punctuation. If the environment is SSL-enabled, be sure to specify that on the Add environment page. For more information, see the following procedure.

**To add details about an existing environment**

1. From Oracle Access Manager Configuration Manager, select the Migration tab, then select Environments.

   Migration, Environments

2. On the Environment List page, click the Create New button.

   Create New

3. On the Add Environment page, provide the information for this specific directory server using the guidelines in this procedure overview. For example:

   - **Environment Name**: Enter a unique and descriptive name for this directory server. You may want to include details about the environment, hostname, port, or other identifying characteristics. For example:
     
     10104DEV

   - **Environment Type**: Select the type of environment for which this directory server is installed (either release (10g 10.1.4.0.1) or release 7.0.4).

     OAM1014

   - **Environment Description**: Enter a brief optional statement that further identifies this directory and its environment. For example:
dev

- **Directory Type**: Select the type of directory server from those listed. For example:
  
  Active Directory

- **Host Name**: Enter the complete DNS hostname (DNS_hostname.domain.com) or IP Address of the computer where this directory is installed. For example:
  
  141.144.68.137

- **Port**: Enter the port number on which this directory server communicates.

- **Configuration DN**: Enter the configuration DN for Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, data. For example:
  
  OU=oblix,OU=company1,DC=obps0737,DC=persistent,DC=co,DC=in

- **User DN**: Enter the directory administrator ID for this environment (LDAP directory). For example:
  
  cn=administrator,cn=users,dc=obps0737,dc=persistent,dc=co,dc=in

- **Password**: Enter the directory administrator password: For example:
  
  Your_password

- **Environment URL**: The URL to the LDAP directory. For example:
  
  http://141.144.74.35:3333/access/oblix/

  For more information, see "Viewing Environment Details in the Configuration Manager" on page 3-5.

4. **Enable SSL**: If SSL is enabled for this directory, click Enable SSL at the bottom of the page, then load a certificate for this directory using the following steps. For example:
   
   a. Check the box beside Enable SSL.
   
   b. Click the add Certificate link (beside the Enable SSL check box) to display the Upload Certificate dialog box then fill in requested details. For example:
   
   c. **CA Certificate File**: Enter (or browse and select) the absolute path to the CA Certificate file for this directory.
   
   d. **Keystore Password**: Enter the password for the keystore file.
   
   e. Click the Upload button to obtain the certificate (or Cancel to dismiss the dialog box without uploading the certificate).
      
      - **Certificate Upload Successful**: You are returned to the page where you started. In this case, proceed to step 5.
      
      - **Certificate Upload Not Successful**: An error message appears to help you solve the problem. In this case, click the Cancel button on the error window, verify the location of the files and password, and complete the certificate steps again.

5. Click Save when you have finished filling in the details for this directory server.

Save
6. Repeat the steps in this procedure to add environment details for at least one other
LDAP directory in another deployment of the same release.

Modifying Environment Details in the Configuration Manager

Modifying environment details can be performed by any individual with HMUser
privileges. The Oracle Access Manager Configuration Manager repository must be
online. Oracle recommends that the environment (LDAP directory) is also online.

You may alter most environment details in the Configuration Manager as described in
the following procedure, which means all details except Environment Name and
Environment Type. For example, you may want to re-enter something that was stated
incorrectly. For this operation you use the option in the Select column to choose the
desired name; do not click the name itself.

For information and guidelines about each entry, see "Adding Environment Details to
the Configuration Manager" on page 3-7.

Note: When modifying details, the environment name and
environment type cannot be modified.

To modify details about a directory environment

1. From Oracle Access Manager Configuration Manager, select the Migration tab,
then select Environments. For example:
   Migration, Environments

2. In the Select column, click the option beside the desired environment name, then
click the Modify button. For example:
   Modify

3. On the Modify Environment page, edit any details about this directory that you
want to change.

4. Click Save when you have finished editing the details (or Cancel to terminate the
operation before completion).

Save

Deleting Environment Details in the Configuration Manager

You may delete environment details in the Configuration Manager as described in the
following procedure. Any individual with HMUser privileges can delete an
environment. The Oracle Access Manager Configuration Manager repository must be
online. Oracle recommends that the LDAP directory is also online.

A deleted environment is no longer available to use when forming associations or
migrating data. You cannot delete an environment that is defined as part of an
association.

Note: If an environment is a part of an association, you must first
delete the association and then delete the environment.
For this operation you use the option in the Select column to choose the desired name; do not click the name itself. During this operation, you are asked to verify that this is what you want to do. When the operation is completed, you are returned to the Manage Environments page where an informational message notifies you that the selected items were deleted.

**To delete environment details from the Configuration Manager**

1. From Oracle Access Manager Configuration Manager, select the Migration tab, then select Manage Environments. For example:
   
   Migration, Environments

2. Click the option beside the desired Environment Name, then click the Delete button. For example:

   ![Delete](image)

   Delete

   A message asks you to verify this is what you want to do before the operation is performed, as shown here.

   ![Verify](image)

3. Verify the removal by clicking OK in the message window (or Cancel to terminate the operation without completing it).

   ![OK](image)

4. On the Manage Environments page, review the informational message to validate that the operation was successful and confirm that the environment details are no longer listed.

**Testing the Environment Connection**

The environment must be live and online during snapshot, migration, and transaction operations. Any individual with **HMUser** privileges can test an environment connection.

If there is any problem with the connection, notify the directory administrator.

**To ensure the environment is live and online**

1. From Oracle Access Manager Configuration Manager select the Migration tab, then click Environments. For example:
   
   Migration, Environments

2. Click the desired name in the Environment Name column to view details. For example:
Creating and Managing Associations

Discussions here explain how to view, create, enable, disable, and delete a directory association using Oracle Access Manager Configuration Manager. Before proceeding, confirm that prerequisite activities outlined in Table 3–3 are completed.

### Task overview: Creating and managing directory associations

1. **Viewing Settings for a Directory Association**
2. **Creating a Directory Association** is required before you can migrate data
3. **Enabling/Disabling a Directory Association**
4. **Deleting a Directory Association**

### Viewing Settings for a Directory Association

You can view association settings as described in the following procedure. If you have not yet created an association, see "Creating a Directory Association" on page 3-14.

Any individual with **HMUser** privileges can view association settings. The Oracle Access Manager Configuration Manager repository must be online. Oracle recommends that the environments involved are also online.

When you select the Associations secondary tab under the Migrate tab, the Association List page appears. A sample is shown in Figure 3–5. The table is empty when no associations exist in the Configuration Manager.
Association details include:

- **Association Name**: The unique name entered to identify this associated directory pair.
- **Association Description**: A brief optional statement entered for this association.
- **Source Environment**: The name of the source environment (the LDAP directory that contains the data you will migrate).
- **Target Environment**: The name of the target environment (the LDAP directory to which data will be migrated).
- **Status**: Enabled or Disabled. Each association is enabled automatically when created.

When you click a name in the table, the Association Details page appears as shown in Figure 3–6.

### Figure 3–6 Association Details Page

To view association settings

1. From the Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:

   Migration, Associations
2. On the Association List page, click a name in the Association Name column. For example:

3. On the Association Details page, view the settings for this directory pair. For example:

4. Click the Back button to return to the Association List page.

5. Proceed to the following discussions, if desired:
   - Creating a Directory Association
   - Enabling/Disabling a Directory Association
   - Deleting a Directory Association
   - Adding and Managing Optional Transformation Rules

Creating a Directory Association

Data migration requires a directory association that specifies the migration path between a source and target environment. Any individual with HMUser privileges can create an association. The Oracle Access Manager Configuration Manager repository must be online. Oracle recommends that the LDAP directories involved are also online.

When you select the Associations secondary tab under the Migrate tab, the Association List page appears. You click the Create New button to display the Add Association page, which is shown in Figure 3–7.

Figure 3–7  Add Association Page

When you enter an association name and optional description, you may use any combination of upper and lower case alpha/numeric characters, as well as spaces and punctuation. Lists are provided from which you can select the source and target environments from those that have been defined in the Configuration Manager.

After selecting a source environment, a list of possible target environments is established based on the release of your chosen source. For example, if the selected source environment is release 7.0.4, the Target Environment list is populated only with other release 7.0.4 environments defined in the Configuration Manager. The association is enabled automatically when you create it.
If the desired environment is not listed, you may need to add it. For more information, see "Adding Environment Details to the Configuration Manager" on page 3-7.

---

**Note:** Once an association is created, you cannot modify the details. You may remove an association, as described in "Deleting a Directory Association" on page 3-16.

---

**To create an association**

1. From the Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:
   
   Migration, Associations

2. On the Association List page, click the Create New button. For example:
   
   Create New

3. On the Add Association page, enter the following details to identify the source and target directories in this associated pair. For example:
   
   - **Association Name**: Enter a unique name that identifies this associated directory pair at a glance. For example:
     
     1014Dev–QA
   
   - **Association Description**: Enter a brief optional statement that further identifies this associated pair. For example:
     
     Password Policy
   
   - **Source Environment**: Select the name of the desired source directory from the list of existing environments. For example:
     
     10104DEV
   
   - **Target Environment**: Select the name of the desired target directory from those listed. For example:
     
     10104QA

4. Select Save to create the association (otherwise, select Cancel to terminate the operation).
   
   Save

   The Associations List page appears. The association is enabled for use automatically.

---

**Enabling/Disabling a Directory Association**

This discussion explains how to disable or enable a directory association. Any individual with **HMUser** privileges can enable or disable an association. The Oracle Access Manager Configuration Manager repository, and the associated LDAP directories, must be online.

The association must be enabled for data migration. When you create a new association it is enabled for use automatically. When an association is disabled, you cannot migrate data nor view a transaction record for the association.

You do not need to disable an association before you delete it. However, Oracle recommends that you first disable then delete the association.
To enable (or disable) a directory association

1. From the Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:
   
   Migration, Associations

2. On the Association List page, select the option beside the desired association name. For example:

3. **Enable the Association**: On the Association List page, click the Enable button. For example:
   
   Enable
   A message informs you that the association is Enabled and the Status column states “enabled”.

4. **Disable the Association**: On the Association List page, click the Disable button. For example:
   
   Disable
   A message informs you that the association is Disabled and the Status column states “disabled”.

5. Proceed to the following discussions, if needed:
   - Viewing Settings for a Directory Association
   - Creating a Directory Association
   - Deleting a Directory Association
   - Adding and Managing Optional Transformation Rules

Deleting a Directory Association

This discussion explains how to delete a directory association. Any individual with **HMUser** privileges can delete an association. The Oracle Access Manager Configuration Manager repository, and the associated LDAP directories, must be online.

Oracle recommends that you disable the association before deleting it. When you delete an association, all migration transactions related to this association are also removed. However, snapshots for a deleted association remain until you explicitly delete the snapshot.

---

**Note**: You cannot delete an environment that is part of an association. You must first delete the association and then delete the environment.

---

During the delete operation, you are asked to confirm that this is the action you want to take. When the association is deleted, you are returned to the Association List page where an informational message notifies you that the removal was a success.

To delete an association

1. From the Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:
Migration, Associations

2. On the Association List page Select column, select the option beside the desired association name then click the Delete button. For example:

Delete

A message asks you to verify that this is what you want to do, as shown here.

3. Verify the removal by clicking OK (or click Cancel to terminate the operation without completing it).

OK

4. On the Association List, review the informational message that confirms that the item was deleted.

5. Proceed to following discussions as needed:
   - Viewing Settings for a Directory Association
   - Creating a Directory Association
   - Enabling/Disabling a Directory Association
   - Adding and Managing Optional Transformation Rules

Adding and Managing Optional Transformation Rules

As discussed in Chapter 1, you have the following options for applying changes to logical object attributes:

- After creating an association, you may create optional transformation rules that will be applied during the migration operation using the procedure in this discussion.

- During the migration operation, transformation rules are applied and then you may customize attributes manually as described in "Migrating Data" on page 3-37.

- After migration, you can change attribute values as follows:
  - On the Rollback Transaction, Customization page. For more information, see "Rolling Back Changes Made During a Specific Transaction" on page 5-3.
  - Directly in the target Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment.

A transformation rule is one that you define for a specific directory association before you start migrating data. Transformation rules are applied during the customization phase of the migration operation. Each transformation rule converts existing logical object attribute values and system specific settings to a value that you specify when you define the rule. On the Customize page, you can see the logical object as it is...
before the rule is applied (Before Migration) and as it is after the rule is applied (After Migration).

For example, suppose you are migrating 20 password policies and you want to change the Number of login tries allowed attribute value from 2 to 3 (or you want to change Hostname variations while migrating Host identifiers). You can create a transformation rule before data migration that be applied and perform these activities during data migration.

Any individual with HMUser privileges can perform tasks related to transformation rules. While performing these tasks, the Oracle Access Manager Configuration Manager repository and the associated LDAP directories must be online.

Confirm that the prerequisite tasks outlined in Table 3–4 are completed before you start defining optional transformation rules.

### Table 3–4 Transformation Rule Prerequisites

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Task</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Add environment details for at least two LDAP directories within deployments of the same release.</td>
<td>Adding Environment Details to the Configuration Manager on page 3-7</td>
</tr>
<tr>
<td></td>
<td>Create at least one directory association to specify the source and target environments for your transformation rule</td>
<td>Creating a Directory Association on page 3-14</td>
</tr>
</tbody>
</table>

**Task overview: Adding and managing transformation rules includes**

1. Viewing Transformation Rules
2. Adding an Optional Transformation Rule
3. Modifying a Transformation Rule
4. Deleting a Transformation Rule

**Viewing Transformation Rules**

You use the procedure in this discussion to view an existing transformation rule for a directory association. Any individual with HMUser privileges can perform this task. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online.

When you select the Associations secondary tab under the Migrate tab, the Association List page appears. After selecting a name in the Association Name column to display the Association Details page, you click the Transformation Rules subtab. Details about existing transformation rules for the association appear in a table as shown in Figure 3–8. Initially, the Transformation Rule table displays only the logical object types on the target for which a transformation rule exists. If no rule exists, a message states "No Transformation Rules were found".
Figure 3–8  Transformation Rules Page and Table

You click the Show arrow beside the desired logical object type to expand details. Figure 3–9 shows the types of details outlined for the transformation rule, which include Attribute, Operator, Old Value, and New Value. The Edit, Delete, and Add Transformation Rule buttons are also available.

Figure 3–9  Rule Details with Edit, Delete, and Add Transformation Rule Buttons

To view a transformation rule
1. From the Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:

   Migration, Associations

2. In the Association Name column, click the desired name. For example:

   [Association Name]

   The Association Details page appears.

3. On the Association Details page, click the Transformation Rule subtab. For example:

   Association Details

4. Click the Show arrow beside the desired logical object type to display the corresponding rules and attributes. For example:
5. Proceed to the following discussions if desired:
   - Adding an Optional Transformation Rule
   - Modifying a Transformation Rule
   - Deleting a Transformation Rule

Adding an Optional Transformation Rule

You use the procedure in this discussion to add an optional transformation rule for a
directory association that will automatically change an attribute value on the target
during data migration. Any individual with \textit{HMUser} privileges can perform this task.
The Oracle Access Manager Configuration Manager repository and associated LDAP
directories must be online.

You start this operation much the same as you would when viewing a transformation
rule. For example, you select an existing association name and then select the
Transformation Rule subtab. If the desired association is not listed, ensure that it was
formed as described in "Creating a Directory Association" on page 3-14.

From the Transformation Rule subtab, you select the Add Transformation Rule button.
On the Add Transformation Rule page, lists are initially empty and fields are blank.
The available attributes depend on the logical object type you select. The available
operators depend upon the attribute you select. In the Attribute list, system-specific
attributes are shown with an asterisk, *.

You select a logical object type and a related attribute to which the rule will be applied.
You then select an operator. To finish, you enter the old parameter value and a new
parameter value as described in the following procedure. A completed transformation
rule will look like the example in Figure 3–10.

\textbf{Figure 3–10 Add Transformation Rule Page}

![Add Transformation Rules](image)

To add a transformation rule to a directory association

1. From Oracle Access Manager Configuration Manager, select the Migration tab,
   then select Associations. For example:
   
   Migration, Associations

2. In the Association Name column, click the desired name. For example:
The Association Details page appears.

3. Click the Transformation Rules subtab. For example:

   Transformation Rules

   The Transformation Rules page appears with the Add Transformation Rule button. Included is a table of logical object types for which rules are defined within this association. The table is empty if no rules are defined for this association.

4. Click the Add Transformation Rule button to display the page where you can create a new rule.

   Add Transformation Rule

   The Add Transformation Rules page provides lists from which you select specific elements of the rule and a field where you enter a specific parameter for this rule.

5. On the Add Transformation Rules page, select from the lists to define this rule. For example:

   ■ **Logical Object Type**: Select the appropriate logical object type from the list. For example:
     
     Password Policy

   ■ **Attribute**: Select the desired attribute from the list, which varies depending upon the selected logical object type. For example:
     
     Number of Login Tries Allowed

   ■ **Operator**: Select the appropriate operator for this attribute and rule. For example:
     
     Replace

   ■ **Old Value**: Enter the old value of the parameter. For example:
     
     2

   ■ **New Value**: Enter the new value of the parameter. For example:
     
     3

6. Click the Save button to complete the operation (or Cancel to terminate without saving this rule).

   Save

   The Association Details page appears with a message announcing that your transformation rule has been saved.

7. Click the Transformation Rule subtab to add other transformation rules or to modify or delete a transformation rule.

**Modifying a Transformation Rule**

Any individual with **HMUser** privileges can perform this task. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online.

You use the procedure here to edit an existing transformation rule for an association. For example, you can use this procedure to make a correction using the page shown in Figure 3–11.
Adding and Managing Optional Transformation Rules

Figure 3–11  Edit Transformation Rule Page

This procedure is similar to creating a transformation rule. However when you edit a rule, the Logical Object Type and Attribute are fixed and cannot be changed. Only the operator list, and the old and new value fields are active and may be used to modify current information.

To edit a transformation rule
1. From Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:
   Migration, Associations
2. In the Association Name column, click the desired name. For example:
   The Association Details page appears.
3. Click the Transformation Rules subtab to display the Transformation Rules page. For example:
   Transformation Rules
   The Transformation Rules page organizes logical object types for which rules have been created in a table.
4. Click the Show arrow beside the desired logical object type to display details about this rule. For example:
   Show
5. Select the attribute option to edit. For example:
6. Click the Edit button to display the page where you can modify this rule.
7. Modify the details for this transformation rule using the guidelines in "Adding an Optional Transformation Rule" on page 3-20.
8. Click Save to retain this change (or Cancel to terminate the operation).
9. Repeat this procedure to modify other transformation rules or proceed to following discussions as needed:
Adding an Optional Transformation Rule
Deleting a Transformation Rule

Deleting a Transformation Rule

You use the procedure in this discussion to remove an existing transformation rule from the association. Any individual with *HMUser* privileges can perform this task. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online.

The delete operation cannot be undone. Before the rule is deleted, a message asks you to verify that this is the action you want to take. After the transformation rule is deleted, an informational message notifies you that operation was a success. You cannot restore a deleted transformation rule; instead, it must be re-created.

To delete a transformation rule

1. From Oracle Access Manager Configuration Manager, select the Migration tab, then select Associations. For example:

   Migration, Associations

2. In the Association Name column, click the desired name. For example:

   Association Details

   The Association Details page appears containing both the current Association Settings and the Transformation Rules subtab.

3. On the Association Details page, click the Transformation Rules subtab.

4. Click the Show arrow to display the desired rule. For example:

   Show

5. On the Transformation Rules page, select the option beside the desired attribute to delete. For example:

6. Click the Delete button to remove this rule. For example:

   Delete

   A message asks you to verify this operation.

7. Verify by clicking OK in the message window (or click Cancel to terminate the operation without completing it). For example:

   OK

8. Review the informational message and confirm that the item no longer appears in the rules table.

9. Repeat as needed to remove other rules.

10. Proceed to the following discussions before migrating data:

   - Making and Managing Snapshots
Making and Managing Snapshots

Oracle Access Manager Configuration Manager provides a SnapShot function that enables you to create a backup copy of the entire oblix tree in a selected environment (LDAP directory defined in the Configuration Manager). You may restore a snapshot to restore the entire oblix tree to the directory.

Making a snapshot does not significantly impact performance of the directory nor Oracle Access Manager Configuration Manager performance.

Confirm that all prerequisite tasks in Table 3–5 have been performed before making a snapshot.

### Table 3–5 Snapshot Prerequisites

<table>
<thead>
<tr>
<th>Confirm</th>
<th>Prerequisite Task</th>
<th>Look In</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Add environment details in the Configuration Manager</td>
<td>Adding Environment Details to the Configuration Manager on page 3-7</td>
</tr>
<tr>
<td></td>
<td>Notify administrators of the snapshot window in advance</td>
<td>Notifying Other Administrators on page 3-3</td>
</tr>
<tr>
<td></td>
<td>Confirm that the appropriate environment is accessible to the Configuration Manager</td>
<td>Testing the Environment Connection on page 3-11</td>
</tr>
</tbody>
</table>

Any individual with HMUser privileges can perform the tasks outlined in the following overview. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online.

**Task overview: Making and managing snapshots**

1. Viewing the SnapShot List
2. Creating a Snapshot
3. Deleting a Snapshot
4. Restoring the Content of a Snapshot

**Viewing the SnapShot List**

You may view some information about a snapshot made using Oracle Access Manager Configuration Manager. However, you cannot view the actual content of a snapshot. Any individual with HMUser privileges can perform this task. The Oracle Access Manager Configuration Manager repository and environment must be online.

You start from the SnapShots tab and select an environment name from the Select Environment list. The table is empty until you select an environment. If snapshots exist for this environment, details are organized in a table as shown in Figure 3–12. Details that you can view include the snapshot name, an optional description, the date the snapshot was created, and the individual who created the snapshot. The table is empty if no snapshots exist for this environment.
You may view snapshot details using the following procedure. However, you cannot view the content of a snapshot.

**To view snapshot details**

1. From Oracle Access Manager Configuration Manager, select the SnapShots tab. For example:

   SnapShots

   The SnapShots List page appears. At this point, you may either select an environment or create a new snapshot.

2. From the Select Environments list, choose an environment. For example:

   SnapShot List

   If snapshots exist for the selected environment, details are organized in a table. Otherwise, a message in the table informs you that no items were found.

3. Proceed to the following discussions, as needed:

   - Creating a Snapshot
   - Deleting a Snapshot
   - Restoring the Content of a Snapshot

**Creating a Snapshot**

You use the following procedure to create a snapshot of an existing environment. Any individual with HMUser privileges can perform this task. The Oracle Access Manager Configuration Manager repository and the environment must be online.

The snapshot may be used only by Oracle Access Manager Configuration Manager. If you are migrating configuration data using the Configuration Manager, Oracle recommends that make a snapshot of the target just before migrating data. If you are using the Configuration Manager to export configuration data to an LDIF file, Oracle recommends that you create a snapshot of the target just before importing the LDIF file.

There is no significant impact on LDAP directory nor Configuration Manager performance during the snapshot process. The duration of the snapshot process depends on the amount of configuration data in the oblix tree in the selected environment.
From the SnapShots tab you select an environment from the list, and then click the Create New button to display the Add SnapShot page. You enter the snapshot name and optional description in the fields provided.

When naming a snapshot or adding a description, you may use any combination of upper and lower case alpha/numeric characters, as well as spaces and punctuation. You then select an environment from the Select Environment list. A completed Add SnapShot page is shown in Figure 3–13.

**Figure 3–13  Add SnapShot Page**

When you click the Save button, the snapshot is created. When the process completes, an informational message confirms that the operation was successful. The new snapshot name and details appear in the table on the SnapShot List page. You cannot view the actual content of a snapshot.

**To create a snapshot**

1. From Oracle Access Manager Configuration Manager, select the Snapshots tab. For example:
   
   SnapShots

2. Select an environment from the Select Environments list. For example:

   **SnapShot List**

   * Select Environment: 10104QA

3. Click the Create New button to display the Add Snapshot page.

   Create New

4. Fill in the Add SnapShot page with information appropriate to your environment, as follows:

   - **SnapShot Name**: Enter a unique name that will identify this specific snapshot in the list. For example:
     
     10104QA - Dec 14

---

**Note**: Oracle recommends that you schedule a window of time for this operation and notify other administrators before starting. For more information, see "Notifying Other Administrators" on page 3-3.
• **Description**: Enter an optional description to further distinguish this from other snapshots in the list. For example:

*Before migrating Manager Workflow*

• **Select Environment**: From the list, select the specific directory for which you want to capture a snapshot. For example:

10104QA

5. Select Save to assign this information and create the snapshot (otherwise select Cancel to terminate the operation without creating the snapshot).

Save

When the operation completes, you are returned to the Snapshot List page where you should see a message confirming that the Snapshot was saved.

6. Check the message and the table to confirm that the snapshot is available for possible restoration later.

• **Snapshot Successful**: Proceed with migration.

• **Snapshot Not Successful**: If you receive an error message, test the connection to the environment and the repository to ensure that these are live and online.

### Deleting a Snapshot

You may use the following procedure to delete a snapshot. Any individual with **HMUser** privileges can perform this task. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online.

---

**Note**: Once a snapshot is deleted, you cannot use this snapshot for any restoration operation in the Configuration Manager.

---

Deleting a snapshot cannot be undone. During this procedure, a message asks you to verify that you do want to delete the snapshot. When you confirm, the operation completes and you are returned to the SnapShots List page. An informational message notifies you that the snapshot was deleted; related details are removed from the table.

**To delete a snapshot**

1. From Oracle Access Manager Configuration Manager, select the SnapShots tab. For example:

   SnapShots

2. Select an environment from the Select Environments list. For example:

   **SnapShot List**

   • Select Environment 10104QA

3. In the Select column, click the option beside the name of the snapshot you want to delete. For example:

   ![snapshot]

4. Click the Delete button.
Delete
A message asks you to verify that you want to delete the snapshot.

5. Click OK in the message window to verify removing the snapshot (otherwise, click Cancel to terminate the operation).

OK

6. On the SnapShots List page, review the informational message and validate that the selected item was deleted.

Restoring the Content of a Snapshot
You may want to restore a snapshot if configuration data in the oblix tree of the environment becomes inconsistent or is corrupted as a result of changes that are external to Oracle Access Manager Configuration Manager. Any individual with HMUser privileges can perform this task. The Oracle Access Manager Configuration Manager repository and the appropriate environment must be online.

When you restore a snapshot that was made using Oracle Access Manager Configuration Manager, the entire oblix tree is restored to the directory. Revoked changes include both migration changes made using the Configuration Manager, as well as changes made outside the Configuration Manager.

Caution: Restoring a snapshot reverts all changes made after the snapshot was taken and returns the directory to the state it was in at the time the snapshot was made.

Before the restoration commences, you are asked to verify that you want to restore the selected snapshot. After your verification a new snapshot is created to capture the current state of the directory, and then the selected earlier snapshot is restored. If you believe that too many changes were reverted during the restoration, you can restore the snapshot that was made during the restoration.

Note: If you created a directory backup using any application other than Oracle Access Manager Configuration Manager, you cannot use Configuration Manager to restore the backup.

To restore the content of a snapshot
1. From Oracle Access Manager Configuration Manager, select the SnapShots tab. For example:

SnapShots

2. Select an environment from the Select Environments list. For example:

3. In the Select column, click the option beside the name of the snapshot you want to restore. For example:
4. Click the Restore button. For example:
   
   Restore
   
   A message asks you to verify that you want to complete the Restore operation, which reverts the oblix tree in the environment to its previous condition.

5. Click OK to complete the restoration (or Cancel to terminate the operation).

   OK
   
   After you verify the operation a new snapshot is made of the environment in its current state, and then the content of the selected snapshot is restored.

6. On the SnapShots List, review the informational message to confirm success; you should see the new snapshot details in the table.

Migrating Data from the Source to the Target

Topics in this discussion include migration overviews that explain the migration process and all activities you will perform. Following the overviews is a step-by-step procedure to guide you. Any individual with **HMUser** privileges can perform this task. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online during all migration activities.

---

**Note:** Oracle recommends that you schedule a migration window and notify administrators before migrating data. For more information, see "Notifying Other Administrators" on page 3-3.

---

Figure 3–14 illustrates the migration process and tasks that you will perform using the Configuration Manager. Additional details follow the figure.
The following task overview presumes that you have completed all prerequisite tasks in Table 3–6 on page 3-37.

**Task overview: Migrating data after selecting the Migration tab, and Migrate subtab**

1. Select a directory association to specify the migration path: Required and described in "About Selecting an Association" on page 3-31.

2. Select logical object (logical object types) to migrate: Required and introduced in "About Selecting Logical Objects to Migrate" on page 3-31.

3. Compare the logical objects that you selected in a navigation tree:
   - To review the differences on the source and the target
   - To see related objects that you can select and migrate as well as dependents that will be migrated automatically
For more information, see "About Comparing Data Before Migration", on page 3-32.

4. Customize the selected logical objects:
   - **Automated**: To automatically apply any optional transformation rules that were defined for this association. For more information, see "Adding and Managing Optional Transformation Rules" on page 3-17.
   - **Optional**: Edit logical object attributes manually to assign new values that will be applied to the target during migration. For more information, see "About Customizing the Target" on page 3-34.

5. Preview the target system to review the selected logical objects as they are now and as they will be when migration completes. For more information, see "About Previewing Before Migration" on page 3-36.

6. Enter a unique transaction description to identity the record of this migration, which is created automatically, then Migrate the data. For more information, see "Migrating Data" on page 3-37.

   **Alternative**: Export data to an LDIF file then import the data offline (using an external tool to import the data). For more information, see "About Exporting Data to an LDIF File (Optional)" on page 3-36.

7. Restart all Identity Servers and Access Servers in the target environment, as described in "Restarting Servers After Migration" on page 3-41.

---

**Caution**: You may not use the Oracle Access Manager Configuration Manager to migrate data from a release 7.0.4 environment to a release 10g (10.1.4.0.1) environment nor vice versa. For more information, see "Deployment Support and Interoperability" on page 1-14.

---

### About Selecting an Association

The LDAP directory environments that you will use during the migration must be online and accessible to the Configuration Manager.

You start data migration by selecting the Migration tab, then the Migrate secondary tab. The Select Logical Objects to Compare page appears. A progress indicator appears at the top of the page: Select is highlighted. From here, you must select an association to specify the migration path from a source environment to a target environment.

*Figure 3–15  Association Name, Select Logical Objects to Compare Page*

- **Select Association**
  - 10104Dev-QA
  - 10104DEV

You are ready to select logical object types, as described next.

### About Selecting Logical Objects to Migrate

After selecting an association, a folder appears representing the source environment. You can select the expansion icon to the left of the icon to display logical object types on the source. A scroll bar beside the list enables you to scroll up and down as needed.
When you click the expansion icon beside the folder, all supported logical object types in the environment are displayed as shown in Figure 3–16. A check box beside each logical object type enables you to select (or clear) items to compare. No defaults are selected.

Figure 3–16  Partial Logical Object Types List

Each logical object folder includes an expansion icon. When you expand a logical object type, you can see the logical objects grouped under that type. You can select as many logical object types (or logical objects) as needed:

- Select the check box beside a logical object type to compare all logical objects of a particular type.
- Click the expansion icon beside a folder to expand the type and display logical objects.

After selecting logical object types (or logical objects), your next activity is to compare the selected logical object types as described next.

About Comparing Data Before Migration

You have the opportunity to view and compare differences between logical objects on the source and target at one time.

After selecting items on the Select Logical Object Types to Compare page and clicking the Compare button, the Compare and Migrate page appears. Both the source and target environments are shown. In the progress indicator, Compare is highlighted. Scroll bars are available on both the page and browser window.

When you click either title, Source Environment or Target Environment, details about both environments expand into a navigation tree. Expanded information is based on the logical object types (or logical objects) that you selected.

Expanding Objects to Compare: Initially, folders for the source and target environment are collapsed. You click the icon to the left of a folder to expand or collapse the navigation tree for the object.
Expanding an object in one view results in an expansion of the object in both views. Expanded objects show attributes, related objects, and dependents. For more information about related objects and dependents, see "Physical Entries and Logical Objects" on page 1-7. A sample Compare and Migrate page is shown in Figure 3–17.

**Figure 3–17  Partial Compare and Migrate Page**

Only Differences are Displayed: Whether you select logical object types or specific logical objects, the Compare and Migrate page shows only the differences between the source and target. For example, suppose that you have five workflows: WF1, WF2, WF3, WF4, and WF5 in the source environment and suppose that:

- WF1 is also present in the target with a different Description attribute
- WF2 and WF3 are not in the target environment
- WF4 and WF5 are the same in the source and the target environments

If you selected only the logical object type User Manager Workflow Definition, the Compare and Migrate page will display WF1 because it has a different Description attribute, as well as WF2 and WF3 which are not yet on the target.

However, if you selected logical objects WF1, WF2, WF4, the Compare and Migrate page shows WF1 because it has a different attribute value, and WF2 because it does not exist on the target at this time. However, WF4 is not shown because it is the same in both the source and target environments.

Symbols Highlight Differences When Comparing Objects to Migrate: The following symbols may appear between an object name and its check box to alert you to differences as shown in Figure 3–17. For example, the:

- +: Add Icon appears only when the object is present in one directory but not both.
  - An + (Add icon) in the Source Environment list indicates that the object is present on the source directory but not on the target directory.
Migrating Data from the Source to the Target

- An + (Add icon) in the Target Environment list indicates that the object is present on the target directory but not the source directory.

- !: Diff Icon (!) appears when the logical object has differing attribute values or dependents, or both.

The example in Figure 3–17 shows the following differences (among others):

- Policy1 (displayed with the Add + icon) is present only in the source.

- Policy2 (displayed with the Diff ! icon) is the same logical object in the source and target but has different attribute values for the Number of Login tries Allowed and Password Minimum Age on the source and target.

Steps to compare data are included in the procedure under Migrating Data on page 3-37.

Selecting Objects to Customize and Migrate: After comparing the differences between the source and target, you select the check box beside objects in the source tree that you want to migrate. When all desired objects are selected on the source, you click the Next button to display the Customize page. If you click Cancel, you are returned to the Select Logical Objects to Compare page.

The next step is to customize data on the target before migration, as described next.

About Customizing the Target

You can resolve differences in attribute values by creating optional transformation rules or by manually customizing attributes during migration.

After selecting logical objects on the Compare and Migrate page and clicking Next, any transformation rules that were defined for the association are applied automatically. The Customize page appears and shows how objects on the target have been customized by the application of transformation rule, if any. In the progress indicator, Customize is highlighted.

Initially, only the titles of the two environments are shown. When you expand either environment, details of both environments are presented in a navigation tree:

- **Target Environment - Before Migration**: The current and exact state of logical objects in the target LDAP directory before transformation rules and any manual customizations are applied.

- **Target Environment - After Migration**: The state of logical objects on the target as they will be after transformation rules, manual customization, and migration are completed.

A sample Customize page is shown in Figure 3–18. In this example, objects are expanded. Differences in attributes and dependents are visible. Again, the Add (+) and the Diff (!) icons indicate differences between the target before and after migration.
Clicking the Cancel button terminates the Customize operation and returns you to the Select Logical Object Types to Compare page.

**Manually Customizing Attributes**: Attributes in the Target Environment - After Migration tree include an update button labeled with two dots (..). Selecting an update button opens an Update Attribute window where you can manually assign a new value for the attribute. The new value will be assigned during the data migration. Alternatively, you may customize attributes after migration within your Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, deployment.

For example, suppose that in both views the Password Policy Enable is (False). To manually customize the value of this attribute, you select the (..) button beside Password Policy Enable (False). In the Update Attribute window, you enter a new value, in this case true, and save it. Figure 3–19 provides an example of the Update Attribute window.

**Figure 3–19 Update Attribute Window**

When you select Save, you are returned to the Customize page and the new value is reflected in the Target Environment - After Migration tree. If you canceled the update, you are returned to the Customize page with no changes made to the attribute.

When you finish customizing attributes and select the Next button the Preview page appears, as described next.
About Previewing Before Migration

The Preview page provides you with a final opportunity to evaluate any customizations and to verify the logical objects that will be migrated. In the progress indicator, Migrate is highlighted.

On the Preview page, you expand icons as you did on other pages. The Diff ! icon appears only to identify attribute value differences on the target before and after the migration.

Before you select the Migrate button you need to enter a unique transaction description, as described next.

Selecting the Back button returns you to the Customize page. Selecting the Cancel button returns you to the initial Select Logical Objects to Compare page, with nothing selected.

About Transactions and Migrating the Data

Before you select the Migrate button, Oracle recommends that you enter a unique transaction description in the field provided at the bottom of the Preview page. A unique numeric Transaction ID is assigned automatically during data migration. A unique description will help identify this transaction from others later on. You may use a transaction record to roll back any changes made during this migration, as described in Chapter 5.

When you click the Migrate button, data migration begins. When migration completes, an informational message appears stating the operation was successful. For details about the time to complete data migration, see "Downtime Assessment and Example" on page 1-14.

---

**Note:** Alternatively, you may choose to export data to an LDIF file, as described next.

---

After migrating data, you must restart all Identity and Access Servers in the target deployment, as described in "Restarting Servers After Migration" on page 3-41.

About Exporting Data to an LDIF File (Optional)

Oracle Access Manager Configuration Manager allows you to export data to an LDIF file instead of migrating data automatically. If you export data to an LDIF file you can edit the LDIF file offline using a text editor, if desired, then import the LDIF file using an external tool offline.

The export method includes using Oracle Access Manager Configuration Manager to select an association, select logical object types on the source, and compare selected objects on the source with those on the target. You also preview changes after the application of transformation rules and customize data manually using Configuration Manager if you choose. Instead of assigning a transformation description and migrating data with Configuration Manager, you export your selections to an LDIF file.

After exporting data to an LDIF file, you import it offline at a later time. In this case, no transaction record is created because the actual migration occurs independently. Without a transaction record, rolling back changes is not possible using the Oracle Access Manager Configuration Manager.
Steps to export data to an LDIF file are included in the procedure on "Migrating Data", next. In this case, Oracle recommends that you make a snapshot of the target directory just before importing the LDIF file using an external tool.

Note: Details of importing the LDIF file are outside the scope of this manual.

Whether you export data to an LDIF file or migrate data automatically using the Configuration Manager, you must restart all Identity and Access Servers in the target deployment. For more information, see "Restarting Servers After Migration" on page 3-41.

**Migrating Data**

Any individual with **HMUser** privileges can perform data migration. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online. Confirm that all prerequisite tasks in Table 3–6 are completed before you use the procedure in this section to migrate data.

<table>
<thead>
<tr>
<th>Table 3–6 Migration Prerequisites</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Confirm</strong></td>
<td><strong>Prerequisite Task</strong></td>

</tr>
</tbody>
</table>

To migrate data from the source to the target

1. **Test Environment**: Perform the following activities to confirm that the source and target environments in the association are accessible to the Configuration Manager:
   a. From Oracle Access Manager Configuration Manager, select the Migration tab, click Environments. For example:
      
      Migration, Environments
   b. Click the source Environment Name to view details. For example:
      
      `1016DEV`
   c. On the View Environment page, click the Test Environment button.
      
      Test Environment
   d. Read the informational message to confirm that the environment connection is successful.
      
      If there is any problem with the connection, notify the directory administrator. The directory must be live and online during the migration.
   e. Repeat these activities with the target environment to ensure that it is live and online.
2. From the Oracle Access Manager Configuration Manager, select the Migration tab, then click Migrate. For example:
   Migration, Migrate

3. From the Select Association list, choose the desired association. For example:
   *

4. Perform the following steps to select logical objects to compare and migrate:
   a. Expand the association icon to display a list of supported logical object types. For example:
      *

   b. Select all logical object types that you want to include in this migration.

5. **Compare**: Perform the following steps to compare differences and view dependents of selected logical object types on the source and target directories:
   a. Click the Compare button to display the Compare and Migrate page. For example:
      Compare
      The Compare and Migrate page appears.
   b. **Show Differences**: On the Compare and Migrate page, perform the following steps to review any differences:
      – Expand objects by clicking the expansion icon beside the folder.
      – Add + icon: Determine whether the Add icon is only in the target, or only in the source.
      – Diff ! icon: Determine which objects are designated with the Diff ! icon (differing attribute values or dependents).
   c. **Show Dependents**: Perform the following activities to show dependents for a logical object:
      – Click the expansion icon beside a logical object to expand it.
      – Look for and expand the list of dependents and attributes.
      Dependents are migrated automatically; there is no way to select these independently. However, you must select logical objects and related logical objects to migrate.
   d. **Select Logical Objects and Related Objects for Migration**: From the Source, check the box beside each item you want to select (or click a checked box to clear it).
e. On the Compare and Migrate page, click the Next button to display the Customize page.

Next

For more information about comparing logical objects, see "About Comparing Data Before Migration" on page 3-32.

When you select the Next button, any transformation rules created for this association are applied automatically. The Customize page appears. The body of the page is divided in two segments: Target Environment - Before Migration and Target Environment - After Migration.

6. Customize: On the Customize page, perform the following activities:
   a. Review details of the Target Environment - After Migration to see how the application of any transformation rules has changed objects.
   b. Observe and document differences between the Target Environment - After Migration and the Target Environment - Before Migration; pay attention to any item flagged with the Diff (!) icon because you may want to update attributes.
   c. Proceed as desired for your environment:
      - Update Attributes Before Migration: Proceed to step 7 if you want to perform this optional activity.
      - Preview Data: Proceed to step 8 to review all information before migration.
      - Cancel the Migration: Click the Cancel button to return to the Select Logical Objects to Compare page.

For more information, see "About Customizing the Target" on page 3-34.

7. Update Attributes: From the Customize page, perform the following optional activities if desired. After expanding objects in the Target Environment - After Migration list:
   a. In your browser window, enable pop-ups for this site.
   b. Click the updated button (..) beside the attribute you want to change to open the Update Attributes window. For example:

   ![Updated Attribute Example]

   c. In the Update Attributes window, add the new value and click Save. For example:
- **Attribute Name**: The current attribute name is fixed and cannot be changed.
- **Attribute Old Value**: The current attribute value is fixed.
- **Attribute New Value**: Enter the new attribute value you want to assign using guidelines in "About Customizing the Target" on page 3-34.
- **Save**: Click the Save button to save the updated attribute value and return to the Customization page.
- Repeat as needed for each attribute you want to change in the Target Environment - After Migration list.

d. When you finish with the Customize page, click the Next button to call the Preview page.

8. **Preview the Target**: On the Preview page, expand icons and review all information to confirm that this is what you want to migrate, then proceed as appropriate for your migration. For example:
- **Export Data to an LDIF File**: Proceed to step 9 to export data to an LDIF file for customizing or importing with an external tool. In this case, no transaction record is created.
- **Migrate Data Now**: Skip to step 10 to assign a transaction description then continue with following steps.
- **Cancel the Migration**: Click the Cancel button to return to the Select Logical Objects to Compare page.

9. **Export to LDIF File (Optional)**: Use the following steps only to export the selected logical objects to an LDIF file (to import offline at a later time).

a. Click the Export to LDIF button.

Export to LDIF

b. In the Open MigrationData window, click Open with Notepad (default).

Open with Notepad (default)

c. In the Notepad window, you may review and edit the data to be exported, then save the file.

Save

d. In the Save as window, locate the destination directory for this file and enter a file name with the .ldif extension and click Save. For example.

MigrationData_12_16.ldif

The file is created in the location you specify. No transaction record is created. For more information, see "About Exporting Data to an LDIF File (Optional)" on page 3-36.

e. Before using an external tool to import the LDIF file, make a snapshot of the target directory.

Use of external tools to migrate data using an LDIF file are outside the scope of this manual.

10. **Assign a Transaction Description (Required)**: In the Transaction Description field at the bottom of the Preview page:
a. Enter a unique name to help you recognize the record of this specific transaction later on. For example:

10104DevQA_12_14

b. Click Save.

11. **Migrate Data**: On the Preview page, click the Migrate button. For example:

Migrate

A unique Transaction ID is assigned, then the migration operation completes. The amount of time it takes to perform the migration has several factors. For more information, see "Downtime Assessment and Example" on page 1-14.

An informational message confirms that the migration is complete as shown here. The transaction ID and description are also shown.

12. Review the informational message, then note the transaction ID assigned during the migration (and description that you provided).

After migration, you need to shut down and restart all Identity Servers and Access Servers to flush the caches and update the configuration with the new information.

13. Proceed to "Restarting Servers After Migration" to ensure data synchronization after migration.

### Restarting Servers After Migration

When you alter data directly using the Identity or Access System Console, changes are automatically written to the directory from the server. In this case, appropriate entries in the server cache are flushed and the server is updated with the latest configuration data automatically.

However when you use the Oracle Access Manager Configuration Manager to migrate changes, or you export data to an LDIF file and import it offline, changes are written to the directory only. In this case, the servers are not directly involved. As a result, immediately after migrating data with the Configuration Manager you must manually restart all Identity Servers and Access Servers in the target environment to flush their caches and update the servers with the latest configuration data from the target directory.
Restarting Servers After Migration

**Caution:** When multiple servers are involved, it is particularly important to avoid delays that could result in data synchronization issues between the server and the directory. During a rolling restart, there will be a period of inconsistency until all servers have been restarted.

Restarting 10g (10.1.4.0.1) Policy Manager components (known in release 7.0.4 as the Access Manager component), is not required after data migration.

**Caution:** If you have a replicated directory environment, you must ensure that the migration changes made to the master LDAP directory are fully propagated to the replicas before restarting Identity and Access Servers.

**To ensure data synchronization after migration**

1. **Replicated Environment:** Immediately after migrating data, ensure that all changes have fully propagated to the replicas before performing server restarts as described in following steps.

2. Immediately after migrating data, restart all Identity Servers (Identity Server Service on Windows platforms) in the target installation.

4. Validate the target environment and data changes as described in Chapter 4, "Validating Migration Success".
Validating Migration Success

This chapter suggests how to validate the success of a data migration performed using the Oracle Access Manager Configuration Manager. Topics in this chapter include:

- About Validating Migrated Changes
- Validating Migrated Data with Oracle Access Manager 10g (10.1.4.0.1)
- Validating Migrated Data with Oracle COREid Release 7.0.4

About Validating Migrated Changes

As discussed in Chapter 1, Oracle recommends that you develop specific tests to help you quickly evaluate the configuration data changes in the source deployment before you began migrating data. After migration, you can use these same tests in the target deployment to ensure that everything is working as expected.

Caution: Oracle strongly recommends that you "true up" any dependencies in the target deployment. For example if you migrated workflow data, ensure that all workflow participants mentioned in the source directory are included in the target. Otherwise, the workflow in the target deployment may not work properly.

Confirm that the prerequisite tasks outlined in Table 4–1 have been performed before starting tasks in this chapter.

<table>
<thead>
<tr>
<th>Table 4–1 Validation Prerequisites</th>
</tr>
</thead>
<tbody>
<tr>
<td>Confirm</td>
</tr>
<tr>

</tbody>
</table>

For more information you can use to ensure that the migrated data operates properly, see the following topics:

- Validating Migrated Data with Oracle Access Manager 10g (10.1.4.0.1)
- Validating Migrated Data with Oracle COREid Release 7.0.4
Validating Migrated Data with Oracle Access Manager 10g (10.1.4.0.1)

Oracle recommends that you use the migrated data in your Oracle Access Manager 10g (10.1.4.0.1) deployment to ensure that the changes were properly migrated and everything is working as expected.

Refer to following discussions for details about validating migrated data within your target Oracle Access Manager 10g (10.1.4.0.1) deployment:

- Validating Identity System Data Migration in 10g (10.1.4.0.1)
- Validating Access System Data Migration in 10g (10.1.4.0.1)

Validating Identity System Data Migration in 10g (10.1.4.0.1)

To validate data migration, you will perform tasks in the Oracle Access Manager 10g (10.1.4.0.1) Identity System Console and applications that rely on the target directory and migrated data.

The following procedure provides steps and an outline of activities you might perform to validate migrated data. Step 5 includes several suggestions about activities you might want to perform. However, the actual tasks you perform will depend on the data you have migrated.

To validate 10g (10.1.4.0.1) Identity System data migration

1. Identify the Identity System applications and functions that are impacted by the migrated data and develop a plan to test these in the target Identity System and applications.

2. In the target installation, ensure that all Identity Server services and WebPass Web server instances are running.

3. Go to the Identity System Console from your browser by specifying the appropriate URL. For example:

   http://hostname:port/identity/oblix

   where hostname refers to computer that hosts the Web server; port refers to the HTTP port number of the WebPass Web server instance; /identity/oblix connects to the Identity System Console.

   The Oracle Access Manager landing page appears.

4. Perform any of the following tasks, or others, to prove that the migrated data is operating properly. For example:

   - Review panels in the User Manager, Group Manager, or Organization Manager.

   - Verify audit policies for the User Manager, Group Manager, Organization Manager, if these are impacted.

   - Review attribute access control policies in the User Manager, Group Manager, or Organization Manager.
Validating Migrated Data with Oracle Access Manager 10g (10.1.4.0.1)

Validating Migration Success

4-3

– Review the Master Auditing Policy and the Global Auditing Policy, if appropriate.
– Verify Password and Lost Password policies, if such data changes were migrated.
– Validate any migrated workflow configuration details, when data changes were migrated.
– Review object class definitions, if appropriate after migration.
– Verify Identity Server and WebPass definitions; server settings; administrator information; and directory options.

5. Log out, as usual.

For information about performing specific tasks, see the Oracle Access Manager Identity and Common Administration Guide.

Validating Access System Data Migration in 10g (10.1.4.0.1)

To validate data migration in the Access System, you will perform tasks in the Oracle Access Manager 10g (10.1.4.0.1) Access System Console and applications that rely on the target directory and migrated data.

The following procedure provides steps and an outline of activities you might perform to validate migrated data. Step 5 includes several suggestions about activities you might want to perform. However, the actual tasks you perform will depend on the data you have migrated.

To verify a successful 10g (10.1.4.0.1) Access System data migration

1. Identify the Access System applications and functions that are impacted by your migrated data and develop a plan to test these.
2. Make sure all Policy Manager Web server and WebPass Web server instances are running.
3. Go to the Access System Console from your browser by specifying the appropriate URL. For example:
   
   http://hostname:port/access/oblix

   where hostname refers to computer that hosts the Web server; port refers to the HTTP port number of the WebPass Web server instance; /access/oblix connects to the Access System Console.

   The Oracle Access Manager landing page appears.
4. Log in as a Master Administrator.
5. Perform one or more of the following tasks, or others, to validate migrated data. For example:
   ▪ Validate authentication and authorization scheme details that are impacted.
   ▪ Look at reports data.
   ▪ Review impacted policy domains.
6. Log out, as usual.

For more information about performing specific tasks, see Oracle Access Manager Access Administration Guide.
Validating Migrated Data with Oracle COREid Release 7.0.4

Oracle recommends that you use the migrated data in your Oracle COREid Release 7.0.4 deployment to ensure that the changes were properly migrated and everything is working as expected.

The following procedures describe how to validate successful data migrations in Oracle COREid Release 7.0.4:

- Validating Identity System Data Migration in Oracle COREid Release 7.0.4
- Validating Access System Data Migration in Oracle COREid Release 7.0.4

Note: The procedures you complete to validate the success of the migration in a live target deployment are essentially the same regardless of your product release (10g (10.1.4.0.1) versus release 7.0.4). Only certain product terms differ.

Validating Identity System Data Migration in Oracle COREid Release 7.0.4

To validate data migration Identity System, you will perform tasks in the Oracle COREid Release 7.0.4 System Console and applications that rely on the target directory and migrated data.

The following procedure provides steps and an outline of activities you might perform to validate migrated data. Step 5 includes several suggestions about activities you might want to perform. However, the actual tasks you perform will depend on the data you have migrated.

To validate Identity System data migration in release 7.0.4

1. Identify the Identity System applications and functions that are impacted by your migrated data and develop a plan to test these.
2. Make sure all Identity Server services and WebPass Web server instances are running.
3. Go to the COREid System Console from your browser by specifying the appropriate URL. For example:

   http://hostname:port/identity/oblix

   where hostname refers to computer that hosts the Web server; port refers to the HTTP port number of the WebPass Web server instance; /identity/oblix connects to the COREid System Console.

   The COREid landing page appears.
4. Log in as a Master Administrator.
5. Using the COREid System Console or applications, perform the following tasks, or others, to validate data that may be impacted by the migration. For example:
   - Review panels in the User Manager, Group Manager, or Organization Manager.
   - Verify audit policies for the User Manager, Group Manager, Organization Manager, if these are impacted.
   - Review attribute access control policies in the User Manager, Group Manager, or Organization Manager
Validating Migrated Data with Oracle COREid Release 7.0.4

- Review the Master Auditing Policy and the Global Auditing Policy, if appropriate.
- Verify Password and Lost Password policies, if such data changes were migrated.
- Validate any migrated workflow configuration details, when data changes were migrated.
- Review object class definitions, if appropriate after migration.
- Verify Identity Server and WebPass definitions; server settings; administrator information; and directory options.

6. Log out, as usual.

For more information about performing specific tasks, see the Oracle COREid Access and Identity Administration Guide Volume 1.

Validating Access System Data Migration in Oracle COREid Release 7.0.4

To validate data migration Access System, you will perform tasks in the Oracle COREid Release 7.0.4 Access System Console and applications that rely on the target directory and migrated data.

The following procedure provides steps and an outline of activities you might perform to validate migrated data. Step 5 includes several suggestions about activities you might want to perform. However, the actual tasks you perform will depend on the data you have migrated.

To verify a successful Access System data migration in release 7.0.4

1. Identify the Access System applications and functions that are impacted by your migrated data and develop a plan to test these.

2. Make sure your Access Manager Web server and WebPass Web server instances are running.

3. Go to the Access Manager/Access System Console from your browser by specifying the appropriate URL. For example:

   http://hostname:port/access/oblix

   where hostname refers to computer that hosts the Web server; port refers to the HTTP port number of the WebPass Web server instance; /access/oblix connects to the Access System Console.

   The Access System landing page appears.

4. Log in to the Access Manager/Access System Console as a Master Administrator.

5. Perform any of the following tasks, or others, to validate the migrated data. For example:
   - Validate authentication and authorization scheme details that are impacted.
   - Look at reports data.
   - Review impacted policy domains.

6. Log out, as usual.

For more information about specific tasks, see Oracle COREid Access and Identity Administration Guide Volume 2.
Managing Transactions and Rolling Back Changes

This chapter explains how to view transaction records created by the Oracle Access Manager Configuration Manager during migration and how to roll back changes for a specific transaction. Also discussed is how to restore the content of a specific environment snapshot made using the Configuration Manager. Topics in this chapter include:

- Viewing Transaction Details for an Associated Directory Pair
- Rolling Back Changes Made During a Specific Transaction
- Restoring the Content of an Environment (Directory) Snapshot

**Viewing Transaction Details for an Associated Directory Pair**

A transaction record is created automatically each time you perform a migration with Oracle Access Manager Configuration Manager. From the Transaction List page, you can select an association and view existing transaction records for that association.

*Figure 5–1* shows a sample Transactions List page. Details you can view include the Transaction ID assigned automatically during the migration; the description that was entered during the migration; the name of the user who performed the migration; the date on which the migration was performed; and the status of the migration transaction.

*Figure 5–1  Transactions List Page*
You may select a transaction record to view the changes made during the selected migration in greater detail. Figure 5–2 shows an example of the View Transactions page and the types of details that you can view for the selected migration transaction.

**Figure 5–2  Viewing Differences Between the Target Before and After Migration**

As shown in Figure 5–2, each folder has an expansion icon. Symbols appear between the folder icon and the object name indicate that the following types of changes occurred during the migration:

- +: Add Icon (+) appears only when the object is present in one directory but not both.
- !: The Diff Icon (!) appears when the logical object has differing attribute values or dependents.

If you have used Oracle Access Manager Configuration Manager to migrate data, you have seen these symbols when comparing and customizing the target. For more information about the symbols used to show differences, see "About Customizing the Target" on page 3-34.

**Note:** You cannot explicitly delete a transaction record. Transaction records are deleted only when you delete the association to which the records belong.

**To view transaction details**

1. From Oracle Access Manager Configuration Manager home page, click the Transactions tab. For example:

   Transactions
2. From the Select Association list, select the desired directory association. For example:

   ![Select Association](image)

   The Transactions List page appears with existing transactions for the selected association.

3. In the Select column, click the option beside the desired Transaction ID to select it. For example:

   ![Select Transaction and View](image)

   372

4. Click the View button to display the details of this transaction. For example:

   View

5. Review the details in the transaction record to ensure that this is what you want.

6. Click the Back button on this page to return to the Transaction List. For example:

   Back

---

## Rolling Back Changes Made During a Specific Transaction

You may select a transaction record, then revert (roll back) the changes made during data migration using Oracle Access Manager Configuration Manager. Rolling back a transaction reverts only those changes made to logical objects during data migration using Oracle Access Manager Configuration Manager.

There are any number of reasons you may choose to roll back a migration transaction. For example, consider a scenario where you changed logical objects in the source deployment (workflows, policy domains, and WebGates). After testing and validating that the changes produced the desired result in the source deployment, you migrated the data to a target deployment. However, if post-migration testing in the target deployment did not produce the results you expected, you may choose to roll back the transaction to restore the target environment. Considering a different scenario, suppose that you migrate and validate a change to one object in the target environment, and then decide to delete the object from the target. In this case, you may either roll back the transaction to remove the migrated logical object from the target or delete it directly using the Identity or Access System Console.

Before you perform a rollback, be sure to confirm that the environment involved is accessible by the Configuration Manager. When you roll back a transaction, Oracle Access Manager Configuration Manager returns the target environment to the state it was in before the migration by:

- Removing logical objects on the target that were added during the migration (this does not include related logical objects)

For example, suppose that the logical object `Access Client`, which uses the (related) logical object `Access Server`, was added to the target during migration. If you roll back the transaction, `Access Client` is removed but not the related logical object `Access Server`. 

---

Managing Transactions and Rolling Back Changes 5-3
Reverting logical objects on the target to their state before migration, which means that:

- Migrated logic objects that had different attributes or dependents before migration are reverted to their pre-migration state.
- Transformation rules are reverted (undone) during the rollback operation. Logical objects that were affected by the application of transformation rules are restored to their pre-migration (their state before the rules were applied).
- Any manual customizations made to attribute values during the migration are reverted (undone) during the rollback operation.

Following is a brief overview of the rollback process. After selecting the environment and initiating the rollback operation, a Customize page appears as shown in Figure 5–3. Scroll bars are provided, as usual. In the progress indicator, Customize is highlighted.

**Figure 5–3 Customize Page During the Rollback Operation**

The rollback Customize page provides a navigation tree of the:

- **Target Environment - Before Rollback**: The target as it is now, after the migration transaction and before this rollback operation.
- **Target Environment - After Rollback**: The target as it will be after this rollback operation. The rollback operation returns the target to this pre-migration state. It is in this view that you may customize attributes before rolling back the changes.

On the Customize page, symbols that appear between the folder icon and the object name indicates the following types of changes:
Rolling Back Changes Made During a Specific Transaction

- +: Add Icon (+) appears only when the object is present in one directory but not both.
- !: The Diff Icon (!) appears when the logical object has differing attribute values or dependents.

From the Customize page, you may manually update attributes in the Target Environment - After Rollback view. The process is similar to the customization you can perform during migration. For more information about customizing attributes, see "About Customizing the Target" on page 3-34.

Whether you customize attributes or not, you click the Next button to proceed to the Rollback Transaction page. A sample Rollback Transaction page is shown in Figure 5–4.

Figure 5–4 Rollback Transaction Page

The Rollback Transaction page enables a final review and validation before the actual rollback. The page shows the target both as it is now (before) and as it will be (after) this rollback operation. In the progress indicator, Rollback is highlighted.

The Rollback Transaction page includes four buttons and a Transaction Description field where you enter a unique description for the record that will be created during this rollback operation. You may use the new transaction to roll back this rollback operation and restore the target to the state it is in at this moment (after the original migration and before rolling back changes).

Using the buttons on the Rollback Transaction page enables you to:

- Rollback: Revert the changes made during the selected transaction and restore the environment to the condition you see in the Target Environment - After Rollback view as described in the following procedure.

You are asked to verify that this is what you want to do. When the operation completes you are notified with an informational message that appears on the Confirm page. A transaction record is created for this rollback operation.
To roll back the changes made during a specific migration transaction

1. In the Configuration Manager, select the Transactions tab. For example:
   Transactions

2. From the Select Association list, select the desired directory association. For example:

   ![Select Association](image)

   The Transactions List page appears with existing transactions for the selected association.

3. Click the option beside the desired transaction to select it.

4. Click the Rollback button:
   Rollback

5. Customize Attributes (Optional): Perform the following optional steps to update attributes manually; new values are assigned during the rollback operation. Otherwise, click Next and skip to step 6.
   a. On the Customize page, click the button labeled (.) beside the attribute you want to change (to open the Update Attributes window).
   b. In the Update Attribute window, add the new value and click Save. For example:
      - **Attribute Name**: The current attribute name is fixed and cannot be changed.
      - **Attribute Old Value**: The current attribute value.
      - **Attribute New Value**: Enter the new attribute value in the field provided.
      - **Save**: Click the Save button to save the updated attribute value and return to the Customization page.
   c. Repeat as needed for each attribute you want to change in the After Rollback view.
   d. When you finish with the Customize page click the Next button to display the Rollback Transaction page, then proceed with one of the following activities:
Rolling Back Changes Made During a Specific Transaction

- **Export Data to an LDIF File:** Proceed step 6 if you want to create an optional LDIF file to edit or use when importing data with an external tool. No transaction record is created.

- **Roll Back Changes:** Proceed to step 7 to create a transaction record and roll back changes.

- **Cancel the Rollback Operation:** Click Cancel to terminate the rollback without completing it.

6. **Export to LDIF File (Optional):** Perform the following steps, in order, only if you want to export the data to an LDIF file to import using an external tool. Otherwise, skip to step 7.
   a. On the Rollback Transaction page, click the Export to LDIF button. For example:
      
      Export to LDIF
   b. In the Open MigrationData window, select a text editor (or click Open with Notepad (default)). For example:
      
      Open with Notepad (default)
   c. In the Notepad window review and edit the data to be exported, then save the file. For example:
      
      Save
   d. In the Save as window, locate the destination directory for this file and enter a file name with the .ldif extension and click Save. For example.
      
      MigrationData_01_07.ldif

      The file is created in the location you specify. No transaction record is created.
   e. Before using an external tool to import the LDIF file, make a snapshot of the target directory as described in "Creating a Snapshot" on page 3-25.

7. **Roll Back:** On the Rollback Transaction page, complete the following activities to complete the operation:
   a. Enter a Transaction Description in the field provided, to name the record that is created during this rollback operation. For example:
      
      Roll back of Transaction 1372
   b. Click the Rollback button to revert the changes made during the original migration transaction. For example:
      
      Rollback
   c. Click OK to validate and start the rollback. For example:
      
      OK
   d. Check the informational message when the operation completes, to confirm that the rollback is successful, as shown next.
8. Restart Identity and Access Servers to ensure data synchronization after migration, as described in "Restarting Servers After Migration" on page 3-41.

Restoring the Content of an Environment (Directory) Snapshot

For your convenience, the following information about restoring the content of an environment snapshot is repeated from Chapter 3

You may want to restore a snapshot if configuration data in the oblix tree of the environment becomes inconsistent or is corrupted as a result of changes that are external to Oracle Access Manager Configuration Manager. Any individual with HMUser privileges can perform this task. The Oracle Access Manager Configuration Manager repository and associated LDAP directories must be online.

When you restore a snapshot that was made using Oracle Access Manager Configuration Manager, the entire oblix tree is restored to the directory. Revoked changes include both migration changes made using the Configuration Manager, as well as changes made outside the Configuration Manager.

Caution: Restoring a snapshot reverts all changes made after the snapshot was taken and returns the directory to the state it was in at the time the snapshot was made.

Before the restoration commences, you are asked to verify that you do want to restore the selected snapshot. After your verification a new snapshot is created to capture the current state of the directory, and then the older selected snapshot is restored. If you believe that too many changes were reverted during the restoration, you can restore the snapshot that was made during the restoration.

Note: If you created a directory backup using any application other than Oracle Access Manager Configuration Manager, you cannot use Configuration Manager to restore the backup.

To restore the content of a snapshot

1. From Oracle Access Manager Configuration Manager, select the SnapShots tab. For example:
   SnapShots
2. Select an environment from the Select Environments list. For example:

   **SnapShot List**
   * Select Environment 10'046A

3. In the Select column, click the option beside the name of the snapshot you want to restore. For example:

   - snapshot2

4. Click the Restore button. For example:

   - Restore

   A message asks you to verify that you want to complete the operation (and revert the status of the environment to its previous state).

5. Click OK to verify and complete the operation (or Cancel to terminate the operation).

   - OK

   After verifying that this is what you want to do, a new snapshot is made of the environment in its current state, then the content of the selected snapshot is restored.

6. On the SnapShots List, review the informational message to confirm success; you should see the new snapshot listed.
Planning Worksheets and Tracking Checklists

Before migrating data, your team must create a document that defines and records a detailed plan for each installed deployment. You also need details about components and data within each deployment. This chapter provides worksheet templates that you can copy and fill in, and checklists you can copy and use to track migration activities:

- About Completing Planning Worksheets and Checklists
- Worksheet for Your Overall Deployment
- Worksheet for Directory Instances
- Worksheet for DIT and Object Definition Details
- Worksheet for Directory Server Profiles
- Worksheet for Database Instance Profiles
- Worksheet for Identity Servers
- Worksheet for Policy Manager (release 7.0.4 Access Manager) Instances
- Worksheet for Access Servers
- Worksheet for Configurations
- Checklist for Deploying and Setting Up the Configuration Manager
- Checklist for Configuration Data Migration
- Checklist for Migration of Other Data Using Another Tool

About Completing Planning Worksheets and Checklists

Oracle recommends that you copy and fill in the worksheets in this appendix to record the details for each installed deployment. Oracle Access Manager installation or upgrade worksheets provide a starting point. Any details that you can access and print from your deployment will save you time and eliminate the possibility of errors.

---

**Note:** Store worksheets, printed copies, and other recorded details about your installation in a secure location for tracking purposes.

---

This appendix also provides three checklists. You use the first checklist to track application deployment and setup. You use the second checklist to track data migration activities. The third checklist identifies data that is not supported for migration using Oracle Access Manager Configuration Manager.
# Worksheet for Your Overall Deployment

Use the space in Table A–1 to record general information about your deployment.

## Table A–1 Details for Your Overall Deployment

Checklist for Migration of Other Data Using Another Tool

Oracle Access Manager Configuration Manager migrates only data in the LDAP directory. It does not migrate any files.

The items in Table A–12 are not supported for migration using Oracle Access Manager Configuration Manager. To migrate data in Table A–12, you must use other code management products for check in, check out, and deployment. Details of other tools are outside the scope of this manual.

Troubleshooting Configuration Manager Issues

The information here is provided to help you when troubleshooting issues that arise during installation and setup of the Oracle Access Manager Configuration Manager and data migration. Topics in this chapter include:

- Accessing and Using the Log File
- Accessing and Using the Audit File
- Troubleshooting OC4J Installation and Setup Issues
- Troubleshooting Oracle Database Installation and Setup Issues
- Troubleshooting Configuration Manager Issues

Accessing and Using the Log File

Oracle Access Manager Configuration Manager uses Oracle Diagnostic Logging for Java (ODL) to produce log files. The ODL library is incorporated into the Configuration Manager in ojdl.jar.

The log file helps you verify Configuration Manager activities such as migrating data, creating snapshots, adding a new environment, and so on. Log entries include details about Oracle Access Manager Configuration Manager, the Oracle Database repository, and environments (directory servers). For example, if you attempt to add new environment (directory) details in Configuration Manager when the repository is offline, a log entry is created stating that the database is not running.

Log File Naming: The current ODL log file naming standard is followed. This means that the each new log file is created and named log.xml. The generated log file is stored as:

$OC4J_Home/j2ee/home/log/OAMCMLogs/log.xml

Log File Rotation: Log rotation is automatic and based on file size. This means that log files rotate automatically when the current log reaches a certain size. The maximum limit for log file size is 100 MB. When the current file reaches the size limit, a new file is created as log.xml and the content in the earlier version is archived with a different name. Archived log files are named as logindex.xml, where index is a number. Older archived files have a lower index number: log1.xml is the oldest, log2.xml is the next oldest, and so on.

You update parameters in the following file to set up log file rotation:

oc4j_install_dir/j2ee/home/config/j2ee-logging.xml
The following HMLogger entries are key to Configuration Manager log file rotation (the value of the maxFileSize is in bytes):

```xml
<log_handlers>
  <log_handlername='HMLog-Handler'
    class='oracle.core.ojdl.logging.ODLHandlerFactory'>
    <property name='path' value='..log/OAMCMLogs'/>
    <property name='maxFileSize' value='10485760'/>
    <property name='maxLogSize' value='104857600'/>
    <property name='encoding' value='UTF-8'/>
  </log_handler>
</log_handlers>
```

**Log File Content and Logging Levels**

The log file includes the operation name, the individual who performed the operation, a time stamp, the status of the operation, and any errors as discussed later. J2SE includes two standard formatters:

- SimpleFormatter: Writes brief human-readable summaries of log records.
- XMLFormatter: Writes detailed XML-structured information.

You may either view the log file as an XML file or apply a stylesheet of your own design to view the files. Oracle Access Manager Configuration Manager does not provide stylesheets for this purpose.

Normal event information is provided to administrators. Low-level traces and debug information can be provided to advanced administrators. For details about specific events and who can view these, see Table B–4.

The log file looks something like the following example:

```xml
<Message>
  <Header>
    <TSTZ_ORIGINATING>2006-07-20T18:57:17.968+05:30</TSTZ_ORIGINATING>
    <COMPONENT_ID>oracle</COMPONENT_ID>
    <MSG_TYPE>NOTIFICATION</MSG_TYPE>
    <MSG_LEVEL>1</MSG_LEVEL>
    <HOST_ID>ps0065</HOST_ID>
    <HOST_NWADDR>10.77.199.149</HOST_NWADDR>
    <MODULE_ID>hm.log.HMLogger</MODULE_ID>
    <THREAD_ID>10</THREAD_ID>
    <USER_ID>sharadchandra_chaval</USER_ID>
  </HEADER>
  <CORRELATION_DATA>
    <EXEC_CONTEXT_ID><UNIQUE_ID>10.77.199.149:25178:1153402038031:0</UNIQUE_ID><SEQ>0</SEQ></EXEC_CONTEXT_ID>
  </CORRELATION_DATA>
  <PAYLOAD>
    <MSG_TEXT>Entering Into Method - com.oracle.hm.hmobjectshandler.HMObjectsHandler.getInstance</MSG_TEXT>
  </PAYLOAD>
</MESSAGE>
```

...
Each log message contains a number of required attributes, and may contain additional optional attributes.

**Required Attributes:** All diagnostics log messages must have the following attributes:

- Time stamp
- Component ID
- Message type
- Message ID (for each message of the type Notification and greater)
- Execution Context ID
- Message level
- Message text
- Module ID (use the component ID if the component is a single module component)

**Optional Attributes:** Diagnostics log messages may have the following attributes:

- Organization ID
- Instance ID
- User ID
- Message Arguments
- Process ID
- Thread ID
- Host ID
- Host Network Address
- Supplemental Detail

**Note:** The Logging Service will be able to provide the Instance ID, Process ID, Host ID, and Host Network Address. Avoid using implicit attributes.

**Component-Specific Attributes:** Components may add additional component specific attributes using the supplemental attributes fields. The definition and contents of these attributes are specific to each component. For supplemental, Oracle Enterprise Manager requires user-friendly names (WIP, for example).

**Implicit Attributes:** The value of some attributes may be implicit from the context, even if it does not appear explicitly in the log message. For example, if a component has a private log that only contains log messages for that component (for example, a log for OC4J that has messages only for that OC4J instance), then all log messages are
assumed to have the component ID attribute set to the component that owns the log. Avoid using implicit attributes.

Table B–1 provides more information about ODL log message text format fields.

</tr>
</tbody>
</table>
**Table B–2** (Cont.) Log File Diagnostic Message Attributes

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message ID</td>
<td>A short identifier that uniquely identifies the message. The Message ID should be in the format <code>&lt;component prefix&gt;-&lt;message number&gt;</code>, where <code>&lt;component prefix&gt;</code> is a short component prefix (a six character maximum) and <code>&lt;message number&gt;</code> is a five digit number.</td>
<td>MAS-12345</td>
</tr>
<tr>
<td>Message Type</td>
<td>The type of the message. The five defined message types are: INTERNAL_ERROR, ERROR, ERROR, WARNING, NOTIFICATION, and TRACE. In addition, the value UNKNOWN may be used when the type is not known.</td>
<td>NOTIFICATION</td>
</tr>
<tr>
<td>Message Level</td>
<td>The level qualifies the message type, indicating the degree of severity of the message. The value is an integer from 1 (highest severity) to 32 (lowest severity).</td>
<td>1</td>
</tr>
<tr>
<td>Host ID</td>
<td>The host name where the message originates. For Java, this should be the value returned by java.net.InetAddress.getLocalHost().getHostName().</td>
<td>mjgoncal-sun.us.oracle.com</td>
</tr>
<tr>
<td>Host NW Addr</td>
<td>The network address of the host where the message originates. For Java, this should be the value returned by java.net.InetAddress.getLocalHost().getHostAddress().</td>
<td>138.1.42.113</td>
</tr>
<tr>
<td>Module ID</td>
<td>An identifier of the module that originated the message. The value is component specific</td>
<td>main</td>
</tr>
<tr>
<td>Process ID</td>
<td>An identifier of the process or execution unit that generated the message. The value should be the operating system PID, or some other value that can be used to identify the process.</td>
<td>1234</td>
</tr>
<tr>
<td>Thread ID</td>
<td>An identifier of the thread that generated the message.</td>
<td>main</td>
</tr>
<tr>
<td>User ID</td>
<td>The user whose execution context originated the message</td>
<td>scott</td>
</tr>
<tr>
<td>Supplemental Attributes</td>
<td>A list of supplemental, application specific, message attributes. Each supplemental attribute must have a name and value</td>
<td>name=URL, value=/dmsoc4j/Spy</td>
</tr>
<tr>
<td>Execution Context ID</td>
<td>A global unique identifier and a sequence number of the thread of execution that the originating component participates in. The identifier can be used to correlate messages from several components that may be involved in the same thread of execution.</td>
<td>1234567890,1</td>
</tr>
<tr>
<td>Message Text</td>
<td>A descriptive text for the message. This should be a short description of the event, with at most 1000 characters.</td>
<td>java.lang.NullPointerException at Test.main(Test.java:20)</td>
</tr>
<tr>
<td>Supplemental Detail</td>
<td>Supplemental information about the event. This can contain more detailed information than the message text. A Java stack trace, for example, should be in the supplemental detail, not in the message text.</td>
<td>java.lang.NullPointerException at Test.main(Test.java:20)</td>
</tr>
</tbody>
</table>

**Logging Levels and Message Types**

In `java.util.logging`, levels are represented by objects of class `java.util.logging.Level`. There is a small number of predefined levels (SEVERE, WARNING, INFO, CONFIG, FINE, FINEER, FINEST). However, applications may create additional levels. Each level is uniquely identified by an integer value. Therefore, it is possible to create one new level object for each possible integer value.

Java levels are mapped to ODL message types and levels. In general, only the ODL message types and levels should be exposed in the component configuration. Mapping of ODL message type and level to `java.util.logging.Level` will be provided by a subclass of the `Level` class. All possible Java levels (from `Integer.MIN_VALUE` to `Integer.MAX_VALUE`) have a mapping. Components are not restricted to using the predefined levels. The mapping for the predefined java levels as shown in Table B–3.
Java levels with an integer value that falls between two predefined levels are mapped to the next mapped MessageType (with the ODL level set to an appropriate value), depending on the difference between the level and the next predefined level. Java levels less than FINEST and greater than SEVERE.intValue() + 100 are mapped to UNKNOWN.

Messages of type INTERNAL_ERROR, ERROR, WARNING and NOTIFICATION have a message ID composed of a short component prefix (3 to 6 characters) and a 5-digit message number. For example, MAS-12345.

Table B–4 outlines the log file message types and levels in greater detail.

<table>
<thead>
<tr>
<th>ODL Message Type/Level (Java Level)</th>
<th>Intended Audience</th>
<th>Description</th>
<th>Expected Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERNAL_ERROR:1 (SEVERE.intValue()+100)</td>
<td>System Administrators, Application Developers, Oracle Support</td>
<td>A serious problem that may be caused by a bug in the product and that should be reported to Oracle Support. The occurrence of an internal error triggers the generation of an incident by the Diagnosability Framework.</td>
<td>Low. No performance impact.</td>
</tr>
<tr>
<td>ERROR:1 (SEVERE)</td>
<td>System Administrators, Application Developers, Oracle Support</td>
<td>A serious problem that requires immediate attention from the System Administrator. This is not caused by a bug in the product</td>
<td>Low. No performance impact.</td>
</tr>
<tr>
<td>WARNING:1 (WARNING)</td>
<td>System Administrators, Application Developers, Oracle Support</td>
<td>A potential problem that should be reviewed by the System Administrator.</td>
<td>Low. No performance impact.</td>
</tr>
<tr>
<td>NOTIFICATION:1 (INFO)</td>
<td>System Administrators, Application Developers, Oracle Support</td>
<td>A normal event that occurs in the System. No performance impact. This is the default Level at which the product is shipped.</td>
<td>Low</td>
</tr>
<tr>
<td>NOTIFICATION:16 (CONFIG)</td>
<td>System Administrators, Application Developers, Oracle Support</td>
<td>A finer level of granularity for reporting normal events. Minimal performance impact. While this is not the default Level for the product, it should be possible to enable this level broadly in a production environment without having a significant performance impact in the product.</td>
<td>Low to moderate.</td>
</tr>
</tbody>
</table>
Accessing and Using the Audit File

Oracle Access Manager Configuration Manager audits certain events and stores all audit entries in the Oracle Database repository, in the OCMAUDIT table. You may query the OCMAUDIT table within the Oracle Database repository and use external applications to view these reports.

Oracle Access Manager Configuration Manager audits the event types for the functions outlined in Table B–5.

Table B–5  Audited Event Types and Functions

<table>
<thead>

Table B–4 (Cont.) Log File Message Types

<table>
<thead>
<tr>
<th>ODL Message Type/Level (Java Level)</th>
<th>Intended Audience</th>
<th>Description</th>
<th>Expected Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRACE:1 (FINE)</td>
<td>Advanced System Administrators, Advanced Application Developers, Oracle Support</td>
<td>Trace or debug information for events that are meaningful to end users of the product, such as public API entry/exit points. The messages should be clear enough to be understood by someone who does not know internal implementation details. Small performance impact. This level may be enabled broadly occasionally on a production environment to debug issues with the product. Enabling logging at this level may have a small performance impact, but not to the point of making the product unusable. It should be possible to enable this level on a production system to write to a circular memory buffer (MemoryHandler) without a significant performance impact</td>
<td>Moderate</td>
</tr>
<tr>
<td>TRACE:16 (FINER)</td>
<td>Oracle Support</td>
<td>Detailed trace or debug information that can help Oracle Support diagnose problems with a particular subsystem. The messages should be clear enough to be understood by Oracle Support engineers who have a deep knowledge of the product but may not know full details of the internal implementation. This level should not be enabled on a production environment, except on special situations to debug issues with the product. It is not expected that this level will be enabled broadly for the product, but only for a few specific sub-systems (loggers).</td>
<td>High</td>
</tr>
<tr>
<td>TRACE:32(FINEST)</td>
<td>Oracle DDR</td>
<td>Very detailed trace or debug information that usually is intended for an Oracle developer working on the product and who knows enough details about the implementation of the sub-system that generates the message. This level is not expected to be enabled in a production environment and it is intended to be used to debug the product on a test or development environment</td>
<td>Very high</td>
</tr>
</tbody>
</table>
A report is generated by exporting the Oracle Access Manager Configuration Manager audit table from the Oracle Database repository to a Microsoft Excel spreadsheet. You may use Crystal Reports to view an audit report of your own configuration.

To create an audit report
1. Query the OCMAUDIT table in the Oracle Database repository.
2. Export the OCMAUDIT table into a spreadsheet application.
3. Use an external reporting tool (Crystal Reports) to view the report.

Table B–6 shows a sample audit report from Oracle Access Manager Configuration Manager.

Troubleshooting OC4J Installation and Setup Issues

Discussions in this section provide tips to help if you encounter problems during OC4J installation and setup, including:

- Changing the Password for the OC4J Administrator
- Configuring OC4J to Recognize Oracle Access Manager Configuration Manager
- Confirming the OC4J Host is Ready for OC4J installation
- Defining Administrator Privileges in OC4J
- Installing OC4J in a Standalone Configuration
- OC4J Welcome Page Fails to Appear
- Starting and Stopping OC4J
- Using the Oracle Enterprise Manager 10g Application Server Control Console

For more information, see troubleshooting tips in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).
Changing the Password for the OC4J Administrator

**Problem:** Changing the Password for the OC4J administrator

During installation you are asked to provide a password for the `oc4jadmin` account. If you do not assign a password for this account when OC4J is installed, you are prompted to set it the first time you start OC4J.

**Solution:**

For information about changing the password after installation, see the chapter on Tools for Administering OC4J in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Configuring OC4J to Recognize Oracle Access Manager Configuration Manager

**Problem:** Configuring OC4J to recognize Oracle Access Manager Configuration Manager

How do I configure OC4J to recognize the Configuration Manager application?

**Solution:**

You must deploy Oracle Access Manager Configuration Manager using Oc4J, as described in "Deploying the Configuration Manager" on page 2-11. For instructions on creating additional Web sites in OC4J, see the chapter on Managing Web Sites in OC4J in Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Confirming the OC4J Host is Ready for OC4J installation

**Problem:** Confirming the OC4J host is ready for OC4J installation

How can I confirm that the intended host computer is setup appropriately before I install a standalone OC4J server?

**Solution:**

Before installing a standalone OC4J server, ensure the prerequisites described in "Installing and Configuring OC4J" on page 2-6 are met. For more information, see Chapter 2 of the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Defining Administrator Privileges in OC4J

**Problem:** Defining administrator privileges in OC4J

How do I define administrator privileges for OC4J?

**Solution:**

During OC4J standalone installation, you are asked to provide a password for the `oc4jadmin` account. This account is assigned the `oc4j-administrators` role that is used to manage users and roles and to connect to the JMX MBean server. If you do not assign a password for this account when OC4J is installed, you are prompted to set it the first time you start OC4J.

For an overview and steps, "Installing and Configuring OC4J" on page 2-6. For more information about defining administrator privileges in OC4J, see the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).
Installing OC4J in a Standalone Configuration

**Problem: Installing OC4J in a standalone configuration**
How do I install OC4J in a standalone configuration to operate with Oracle Access Manager Configuration Manager?

**Solution:**
The OC4J standalone configuration is installed in the same manner whether you will use it with Oracle Access Manager Configuration Manager or not. For an overview and steps, see "Installing and Configuring OC4J" on page 2-6. For more information, see the chapter on Installing Standalone OC4J in Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

OC4J Welcome Page Fails to Appear

**Problem: OC4J Welcome page fails to appear**
After installation, what do I do if the Welcome page does not appear?

**Solution:**
Confirm that you have entered the appropriate URL for the host, port, and console (http://hostname:port/em/console, for example). For specific troubleshooting tips, see the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Starting and Stopping OC4J

**Problem: Starting and Stopping OC4J**
How do I start and stop OC4J?

**Solution:**
For information about starting and stopping OC4J, see the corresponding chapter in the Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).

Using the Oracle Enterprise Manager 10g Application Server Control Console

**Problem: Using the Oracle Enterprise Manager 10g Application Server Control Console**

**Solution:**
The Oracle Enterprise Manager 10g Application Server Control Console is a Web-based administration application that is installed by default with OC4J and enabled immediately after installation. For more information on using this management interface, see the discussion on the Oracle Enterprise Manager 10g Application Server Control Console in Oracle Containers for J2EE Configuration and Administration Guide 10g Release (10.1.3).
Troubleshooting Oracle Database Installation and Setup Issues

This discussion includes information to assist if you encounter problems or errors installing or setting up the Oracle Database repository for Oracle Access Manager Configuration Manager. The following topics are included:

- Installing Oracle Database on a Specific Platform
- Oracle Database Administration and Management Issues
- Managing Oracle Database Processes and File Issues

Installing Oracle Database on a Specific Platform

**Problem: Installing on a specific platform**
How can I ensure that I have properly set up the intended host before installation?

**Solution:**
Refer to the appropriate Oracle Database Server Installation Guide for your specific platform for installation and setup details.

Oracle Database Administration and Management Issues

**Problem: Oracle Database administration and management issues**
How can I properly perform administration and management of the Oracle Database?

**Solution:**
See the Oracle Database Concepts 10g Release 2 (10.2) for more information about Oracle Database administration and management.

Managing Oracle Database Processes and File Issues

**Problem: Managing Oracle Database processes and files**
How can I manage Oracle Database processes and files?

**Solution:**
Use the Oracle Database Administrator’s Guide 10g Release 2 (10.2) for details about managing Oracle Database processes, tablespaces, datafiles, tempfiles, managing schema files, Oracle-managed files, and more.

Troubleshooting Configuration Manager Issues

If an operation cannot be completed successfully using the Configuration Manager, an error message usually appears to inform you of the problem. Following discussions provide information to assist if you encounter problems or errors using Oracle Access Manager Configuration Manager. Topics include:

- Cannot Create a Snapshot
- Cannot View the Content of an Environment (Directory) Snapshot
- Configuration Manager Installation, Setup, and Repository Issues
- Environment Issues within the Configuration Manager
Association and Transformation Rule Issues

Cannot Create a Snapshot

**Problem:** Error occurs and message states "Unable to create snapshot"
Creating a new snapshot operation fails.

**Solution:**
Test the connection to the environment to ensure that it is live and online, as described in "Testing the Environment Connection" on page 3-11. Test the repository connection to ensure that it is live and online, as described in "Ensuring the Repository is Available to the Configuration Manager" on page 2-30.

Cannot View the Content of an Environment (Directory) Snapshot

**Problem:** Cannot view the content of an environment (directory) snapshot
During a view snapshot operation, only the snapshot name, description, data created, and individual who created the snapshot are listed.

**Solution:**
You may view the details about a snapshot; however, you cannot view the contents of a snapshot.

Configuration Manager Installation, Setup, and Repository Issues

**Problem:** Configuration Manager Welcome page does not appear
The Welcome page does not appear after deploying Oracle Access Manager Configuration Manager.

**Solution:**
Confirm that you have completed all steps in "Deploying the Configuration Manager" on page 2-11. For more information, see troubleshooting tips related to deploying an application in the Oracle Containers for J2EE Configuration and Administration Guide.

**Problem:** Cannot access the System Configuration tab or add repository details
System Configuration tab not available to add a repository, upload the Configuration Manager schema, or to test the connection between the Configuration Manager and its repository.

**Solution:**
Oracle Access Manager Configuration Manager System Configuration functions are available only to individuals who log in with **HMAdmin** privileges. For more information, see "Assigning Configuration Manager Administrator and User Roles" on page 2-15.

**Problem:** Repository connection test not successful
When the repository connection test is not successful an error message appears.
Solution:
Confirm that all repository details are accurately entered and edit them if needed. Confirm that the Oracle Database instance is running, then test the connection again as described in "Adding Repository Details in the Configuration Manager" on page 2-27. If the connection test is still unsuccessful, contact the Oracle Database administrator.

Environment Issues within the Configuration Manager

This discussion includes solutions to several issues that you may encounter when working with LDAP directory environments in Oracle Access Manager Configuration Manager. Any environment that is involved when making a directory snapshot, migrating data, or rolling back a transaction must be live and online.

Problem: Certificate Upload Not Successful
An error message appears when you add environment (directory) details and have an unsuccessful attempt to upload a certificate for SSL-enabled communication.

Solution:
Review the message, then click the Cancel button on the error window. Verify the location of the certificate files and the password, then perform the certificate steps again as described in "Adding Environment Details to the Configuration Manager" on page 3-7.

Problem: Connection Failure
When I test the connection to an environment, the informational message states "Connection failure. For details refer to log file."

Solution:
Notify the directory administrator, and give the location of the log file as described in "Accessing and Using the Log File" on page B-1.

Problem: Environment details not available in Configuration Manager
The environment I want is not listed when I view environments or attempt to form an association.

Solution:
Ensure that the environment (directory) details have been added to the Configuration Manager, as described in "Adding Environment Details to the Configuration Manager" on page 3-7.

Association and Transformation Rule Issues

Problem: Association details not available in Configuration Manager
The association I want is not listed when I view associations or attempt to add a transformation rule.

Solution:
Ensure that the association has been formed, as described in "Creating a Directory Association" on page 3-14.
Association is not listed for selection during migration

The desired association does not appear in the Select Association list on the Migrate subtab, Select Logical Objects to Compare page.

Solution:
Confirm that the desired association is enabled, as described in "Enabling/Disabling a Directory Association" on page 3-15.

Problem: Transformation rule does not operate as expected

After previewing the logical objects to be migrated, it appears that a transformation rule did produce the expected results.

Solution:
View (and modify, if needed) the rule to ensure that it specifies the appropriate logical object type and attribute, as well as the correct operator and parameter. For more information, see "Modifying a Transformation Rule" on page 3-21.
Association
A term used to describe a designated source directory and target directory pair. Each directory association includes a designated source directory from which logical objects are selected for migration to a designated target directory. All the history related to the migration of logical objects between the designated source and target directory pair belongs to the association.

Attribute
One or more characteristics or traits related to logical (and physical) objects. For example, the logical object "Workflow Definition" includes a name attribute and a description attribute in addition to other attributes.

configuration data
Oracle Access Manager, or Oracle COREid, product-specific configuration data and access policy data stored in a Lightweight Directory Access Protocol (LDAP) directory

Configuration Management
Life-cycle management of specific Oracle Access Manager (or Oracle COREid) configuration data. The Oracle Access Manager Configuration Manager enables you to push changes from one deployment to another deployment within the same release. See also Environment.

COREid
The product formerly known as "Oblix NetPoint" or "Oblix COREid" has been renamed "Oracle COREid". Oracle COREid Release 7.0.4 was made available as part of Oracle Application Server 10g Release 2 (10.1.2). See also Oracle Access Manager.

Delta
The difference between the logical objects of the source directory and the logical objects of the target directory in an associated pair (prior to migration). See also Logical Object

Deployment
Each individual installation of Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4 is known as a deployment. Your enterprise may include one or more deployment types, for example a development or QA or production or pre-production deployment. You may have multiple deployments of the same type.
Directory
An LDAP directory that is installed and configured for Oracle Access Manager 10g (10.1.4.0.1) or Oracle COREid Release 7.0.4. Each directory that you add to the Oracle Access Manager Configuration Manager may be designated as either the source or target in an association pair. See also Environment.

Environment
A supported LDAP directory server that is installed and configured to work with Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, within various deployments (development, or QA, or production) within your enterprise. Such directories include either, or Oracle COREid, configuration data stored as physical entities, which correspond to logical objects. See also Logical Object.

export
You may export selected configuration data to a Lightweight Directory Interchange Format (LDIF) file, then import the data later using an external tool.

globalization
Support for multi-lingual applications and software products that can be accessed and run anywhere simultaneously, without modification, while rendering content in the native user’s language and locale preferences. Oracle Access Manager 10g (10.1.4.0.1) has undergone a globalization process. See also internationalization.

Horizontal Migration
The process of copying configuration data changes from one Oracle Access Manager 10g (10.1.4.0.1), or Oracle COREid Release 7.0.4, environment to another. You cannot migrate 10g (10.1.4.0.1) data to a release 7.0.4 deployment, nor vice versa. See also Environment.

import
You may export selected configuration data to a Lightweight Directory Interchange Format (LDIF) file, then import the data later using an external tool.

internationalization
The Oracle internationalization standard requires software products and applications, such as Oracle Access Manager, to be usable on any language operating system with non-US keyboards or other country specific hardware. Applications do not have hard-coded dependencies on language strings, do inter-operate with non-US versions of other products, can handle multibyte characters and differences in a distributed deployment, and can detect the user’s desired locale. Oracle Access Manager 10g (10.1.4.0.1) meets these requirements. See also globalization.

LDAP

LDIF file
Lightweight Directory Interchange Format (LDIF) file. LDIF files are ASCII format files that you can use to exchange and synchronize data between Lightweight Directory Access Protocol (LDAP) serves using an external tool.
**Logical Object**
For most applications you may have a repository (a database or directory server) that stores the data as physical entities (tables in a database or LDAP entries in a directory server). Many times, a group of physical entities are logically related so tightly that an individual physical entity may not make much sense with respect to the application. These physical entities can be grouped together under the name of one object (called a logical object). A logical object may also be a one-to-one mapping with a physical entity.

A logical object may have dependencies on other logical objects. For example in Oracle Access Manager 10g (10.1.4.0.1) and Oracle COREid Release 7.0.4, Workflow Definition is configuration information that can be considered as a logical object with dependencies on workflow steps which in turn have dependencies on workflow participants.

Oracle Access Manager Configuration Manager migrates (copies) logical objects from one installed deployment to another. For example, from an Oracle Access Manager 10g (10.1.4.0.1) Development directory to another Oracle Access Manager 10g (10.1.4.0.1) Development directory or to an Oracle Access Manager 10g (10.1.4.0.1) Production directory. Migration of each logical object is atomic (the logical object and all its dependents are copied to the target). See also LogicalObject.

**LogicalObject**
The inmemory structure of the logical object and its attribute-values and the dependent logical objects. This represents the actual logical object that exists in the particular environment (directory). LogicalObject defines the mapping of a logical object type to one or more physical entities. It also defines the dependencies among the logical objects of a directory in an association pair. Migration of one logical object is atomic (the logical object and all its dependents are copied to the target). See also Logical Object.

**Migration**
The process of pushing (copying) selected logical objects (and related physical entities) from the designated source to the designated target directory of an associated pair. For example, if you have defined and tested a new password policy in your QA deployment you can propagate the policy to a Production system using Oracle Access Manager Configuration Manager. When you migrate data, all selected entries in the configuration tree are copied from the source directory server to the target directory server in the associated pair.

**Oracle Access Manager**
Starting with release 10g (10.1.4.0.1), the product formerly known as Oracle COREid is now named Oracle Access Manager. See also COREid.

**Repository**
The Oracle Database that you install for use with the Oracle Access Manager Configuration Manager. The repository is where migration information is stored, including migration transaction data, snapshots, LDIF files to import, and audit details. Configuration Manager log files are not stored in the repository.

**Restore**
Restore a directory snapshot to revert changes made to the logical objects since the snapshot.
Roll Back
Revert changes made during a specific migration transaction and return the logical objects in the target directory to their state before the specific migration. See also Transaction.

Source
The directory in an Oracle Access Manager Configuration Manager associated pair that is designated to send a copy of the configuration data changes to the target. See also Target.

Snapshot
A backup copy of the configuration data for all logical objects in the designated directory made at a given point in time using Oracle Access Manager Configuration Manager. A snapshot will include only the logical objects (workflow definitions, for example, but not the workflow instances). A snapshot can be used to restore (return) the directory to the state it was in at the time the snapshot was made.

System Configuration
A tab in the Oracle Access Manager Configuration Manager that enables individuals with the HMAdmin privilege to enter and edit Oracle Access Manager Configuration Manager repository information. See also Repository.

Target
The recipient environment in an Oracle Access Manager Configuration Manager associated pair (the directory designated to receive a copy of the configuration data changes from the source). See also Environment and Source.

Transaction
A record that is created each time you migrate configuration data from a source to a target using the Oracle Access Manager Configuration Manager. Each transaction record includes the entire group of logical objects (and their dependencies) that were migrated from the source to the target of the associated pair. A list of all transactions is available. You may choose a particular transaction and view the changes made during that transaction. You may select a transaction and rollback the changes to restore the target to the state it was in before that migration. See also Logical Object.

Transformation Rule
A rule you can define for a directory association. A transformation rule enables you to change the value of selected logical object attributes automatically during migration. See also Migration.

To take inventory, test changes in the source deployment, and true up the target, 2-4
Repository
To add repository details to Oracle Access Manager Configuration Manager, 2-28
To confirm that the repository is available, 2-31
To install Oracle Database Server 10g Release 2 (10.2), 2-5
Rollback
To roll back the changes made during a specific migration transaction, 5-6
Snapshot
To create a snapshot, 3-26
To delete a snapshot, 3-27
To restore the content of a snapshot, 3-28, 5-8
To view snapshot details, 3-25
Transaction
To roll back the changes made during a specific migration transaction, 5-6
To view transaction details, 5-2
Transformation rule
To add a transformation rule, 3-20
To delete a transformation rule, 3-23
To edit a transformation rule, 3-22
To view a transformation rule, 3-19
Validate
To validate 10g (10.1.4.0.1) Identity System data migration, 4-2
To verify 10g (10.1.4.0.1) Access System data migration, 4-3
To verify Access System data migration in release 7.0.4, 4-5
