This example drops the baseline 'oltp_peakload_b1' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
  baseline_name => 'oltp_peakload_b1');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(  
  template_name      IN VARCHAR2,  
  dbid               IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–18 *DROP_BASELINE_TEMPLATE Procedure Parameters*

Parameter	Description
template_name	Name of the template to remove
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE (
  low_snap_id   IN NUMBER,
  high_snap_id  IN NUMBER
  dbid          IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–19 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (default to local DBID).

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the `dba_hist_snapshot` view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The `INTERVAL` setting affects how often snapshots are automatically captured.
- The `RETENTION` setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a `NUMBER` and the second takes a `VARCHAR2` for the `topnsql` argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention IN NUMBER DEFAULT NULL,
    interval  IN NUMBER DEFAULT NULL,
    topnsql   IN NUMBER DEFAULT NULL,
    dbid      IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
    retention IN NUMBER DEFAULT NULL,
    interval  IN NUMBER DEFAULT NULL,
    topnsql   IN VARCHAR2,
    dbid      IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–20 *MODIFY_SNAPSHOT_SETTINGS Procedure Parameters*

Parameter	Description
<code>retention</code>	<p>New retention time (in minutes). The specified value must be in the range of <code>MIN_RETENTION</code> (1 day) to <code>MAX_RETENTION</code> (100 years).</p> <p>If <code>ZERO</code> is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the old value for retention is preserved.</p> <p>NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.</p>
<code>interval</code>	<p>New interval setting between each snapshot, in units of minutes. The specified value must be in the range <code>MIN_INTERVAL</code> (10 minutes) to <code>MAX_INTERVAL</code> (1 year).</p> <p>If <code>ZERO</code> is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting.</p> <p>If <code>NULL</code> is specified, the current value is preserved.</p>

Table 145–20 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
topnsql	<ul style="list-style-type: none"> ■ If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 100000000. Specifying NULL will keep the current setting. ■ If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.

Examples

This example changes the `interval` setting to one hour and the `retention` setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS (
  interval => 60,
  retention => 20160);
```

If you query the `DBA_HIST_WR_CONTROL` table after this procedure is executed, you will see the changes to these settings.

MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(  
    window_size    IN    NUMBER,  
    dbid           IN    NUMBER DEFAULT NULL);
```

Parameters

Table 145–21 *MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters*

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (default to local DBID)

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the [MODIFY_SNAPSHOT_SETTINGS Procedures](#) can be used to adjust the retention setting.

REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the TOP list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(  
    sql_id      IN VARCHAR2,  
    dbid        IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–22 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(  
  old_baseline_name    IN  VARCHAR2,  
  new_baseline_name    IN  VARCHAR2,  
  dbid                 IN  NUMBER DEFAULT NULL);
```

Parameters

Table 145–23 *RENAME_BASELINE Procedure Parameters*

Parameter	Description
old_baseline_name	Old baseline name
new_baseline_name	New baseline name
dbid	Database ID (default to local DBID)

SELECT_BASELINE_METRICS Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the [AWR_BASELINE_METRIC_TYPE Object Type](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRICS (
  baseline_name      IN VARCHAR2,
  dbid               IN NUMBER DEFAULT NULL,
  instance_num       IN NUMBER DEFAULT NULL)
RETURN awr_baseline_metric_type_table PIPELINED;
```

Parameters

Table 145–24 *SELECT_BASELINE_METRICS Procedure Parameters*

Parameter	Description
baseline_name	Name of the baseline for which we would like to view metrics
dbid	Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.
instance_num	Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.

The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

See Also: *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

The chapter contains the following topics:

- [Using DBMS_XA](#)
 - Overview
 - Security Model
 - Constants
 - Operational Notes
- [Data Structures](#)
 - OBJECT Types
 - TABLE Types
- [Summary of DBMS_XA Subprograms](#)

Using DBMS_XA

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)

Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (XID) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

Security Model

This package is created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

Any `DBMS_XA` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_XA` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

`SELECT` privilege on `SYS.DBA_PENDING_TRANSACTIONS` is required for users who need to execute `XA_RECOVER` subprogram.

`FORCE ANY TRANSACTION` privilege is required for users who need to manipulate XA transactions created by other users.

Constants

The DBMS_XA package uses the constants shown in [Table 146–1](#) for use in the flag field of the `XA_START` Function and the `XA_END` Function.

Table 146–1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in [Table 146–2](#) for Possible Return Values

Table 146–2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed

Table 146–2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVALID	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, `XA_PREPARE/COMMIT/ROLLBACK/FORGET` may not be called when the transaction is still associated with the current session. Only after `XA_END` has been called so that there is not any transaction associated with the current session, the application may call `XA_PREPARE/COMMIT/ROLLBACK/FORGET`.

`XAER_PROTO` error is returned from `XA_PREPARE/COMMIT/ROLLBACK/FORGET` if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

Data Structures

The DBMS_XA package uses the following OBJECT type and associated TABLE type.

OBJECT Types

- [DBMS_XA_XID Object Type](#)

TABLE Types

- [DBMS_XA_XID_ARRAY Table Type](#)

DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

See Also: For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
    gtrid       IN NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
    gtrid       IN RAW,
    bqual       IN RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
    formatid    IN NUMBER,
    gtrid       IN RAW,
    bqual       IN RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
    RETURN SELF AS RESULT)
```

Attributes

Table 146–3 DBMS_XA_XID Object Type

Attribute	Description
formatid	Format identifier, a number identifying different transaction managers (TM)
gtrid	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
bqual	Branch qualifier, of which the maximum size is 64 bytes

DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

Summary of DBMS_XA Subprograms

Table 146-4 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure on page 146-12	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (RAC)
XA_COMMIT Function on page 146-13	Commits the global transaction specified by <code>xid</code>
XA_END Function on page 146-14	Disassociates the current session from the transaction branch specified by <code>xid</code>
XA_FORGET Function on page 146-15	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function on page 146-16	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function on page 146-17	Prepares the transaction branch specified in <code>xid</code> for committing the transaction subsequently if possible
XA_RECOVER Function on page 146-18	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function on page 146-19	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function on page 146-20	Sets the transaction timeout in seconds for the current session
XA_START Function on page 146-21	Associates the current session with the transaction branch specified by <code>xid</code>

DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
  xid          IN DBMS_XA_XID,
  onePhase     IN BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 146-5 XA_COMMIT Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type on page 146-9
<code>onePhase</code>	If <code>TRUE</code> , apply single phase commit

Return Values

See [Table 146-2, "DBMS_XA Constants for Possible Return Values"](#). Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

XA_END Function

This function disassociates the current session from the transaction branch specified by `xid`.

A transaction manager calls `XA_END` when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When `XA_END` successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists.

Syntax

```
DBMS_XA.XA_END (
    xid    IN  DBMS_XA_XID,
    flag   IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 146–6 XA_END Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type on page 146-9
<code>flag</code>	See Table 146–1, "DBMS_XA Constants for Flag Field of XA_START & XA_END Functions" .

Return Values

See [Table 146–2, "DBMS_XA Constants for Possible Return Values"](#). Possible return values in error are `XAER_RMERR`, `XAER_RMFAILED`, `XAER_NOTA`, `XAER_INVALID`, `XAER_PROTO`, or `XA_RB*`.

Usage Notes

- `TMSUCCESS` or `TMSUSPEND` may be specified in `flag`, and the transaction branch is disassociated with the current session in detached state if the return value is `XA_OK`. `TMFAIL` is not supported. `XA_END` may be called with either `TMSUCCESS` or `TMSUSPEND` to disassociate the transaction branch identified by `xid` from the current session.
- `XA_OK` is returned if `XA_END` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the application should proceed for other normal operations.
- Executing a `ROLLBACK` statement without calling `XA_END` first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until `XA_END` is called.
- Executing a `COMMIT` statement without calling `XA_END` first will result in `ORA-02089: COMMIT is not allowed in a subordinate session`.
- Executing a `COMMIT` or a `ROLLBACK` statement after `XA_END` has no effect on the transaction identified by `xid`, since this transaction is no longer associated with the current session. To commit the transaction ID or the [XA_ROLLBACK Function](#) to commit/rollback the transaction specified by the `xid`.

XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (  
    xid          IN DBMS_XA_XID)  
RETURN PLS_INTEGER;
```

Parameters

Table 146-7 XA_FORGET Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 146-9

Return Values

See [Table 146-2, "DBMS_XA Constants for Possible Return Values"](#). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER  
RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

XA_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
    xid IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 146–8 XA_PREPARE Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type on page 146-9

Return Values

See [Table 146–2, "DBMS_XA Constants for Possible Return Values"](#). Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVALID`, or `XAER_PROTO`.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER  
RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See [DBMS_XA_XID_ARRAY Table Type](#)

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
  xid          IN DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 146–9 XA_ROLLBACK Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 146-9

Return Values

See [Table 146–2, "DBMS_XA Constants for Possible Return Values"](#). Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (  
    seconds IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 146–10 XA_SETTIMEOUT Function Parameters

Parameter	Description
seconds	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See [Table 146–2, "DBMS_XA Constants for Possible Return Values"](#). Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, or XAER_INVALID.

Usage Notes

Only if return value is XA_OK, is the timeout value successfully set.

XA_START Function

This function associates the current session with a transaction branch specified by the `xid`.

Syntax

```
DBMS_XA.XA_START (
  xid IN DBMS_XA_XID,
  flag IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 146–11 XA_START Function Parameters

Parameter	Description
<code>xid</code>	See DBMS_XA_XID Object Type on page 146-9
<code>flag</code>	See Table 146–1, "DBMS_XA Constants for Flag Field of XA_START & XA_END Functions" .

Return Values

See [Table 146–2, "DBMS_XA Constants for Possible Return Values"](#)

Usage Notes

- If `TMJOIN` or `TMRESUME` is specified in `flag`, the start is for joining an existing transaction branch identified by the `xid`. `TMJOIN` flag should be used when the transaction is detached with `TMSUCCESS` flag. `TMRESUME` should be used when the transaction branch is detached with `TMSUSPEND` flag. `XA_START` may be called with either flag to join an existing transaction branch.
- If `TMNOFLAGS` is specified in `flag`, and neither `TMJOIN` nor `TMRESUME` is specified, a new transaction branch is to be started. If the transaction branch specified in `xid` already exists, `XA_START` returns an `XAER_DUPID` error code.
- Possible return values in error include: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_DUPID`, `XAER_OUTSIDE`, `XAER_NOTA`, `XAER_INVAL`, and `XAER_PROTO`.
- `XA_OK` is returned if `XA_START` succeeds. An application must check the return value and handle error cases. Only when `XA_OK` is returned, the PL/SQL application should proceed for other normal operations.
- Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. `XAER_PROTO` will be returned if `XA_START` is called with an active global transaction branch associated with the session. `XAER_OUTSIDE` will be returned if `XA_START` is called with a local transaction associated with the current session.

The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

See Also:

- *Oracle XML DB Developer's Guide*
- *Oracle Database New Features Guide*

This chapter contains the following topics:

- [Using DBMS_XDB](#)
 - Overview
 - Constants
- [Summary of DBMS_XDB Subprograms](#)

Using DBMS_XDB

This section contains topics which relate to using the DBMS_XDB package.

- [Overview](#)
- [Constants](#)

Overview

The DBMS_XDB package supports the following features:

- The Resource Management functionality provides [LINK Procedures](#), [EXISTSRESOURCE Function](#), [LOCKRESOURCE Function](#), [GETLOCKTOKEN Procedure](#), [UNLOCKRESOURCE Function](#), [CREATERESOURCE Functions](#), [RENAMERESOURCE Procedure](#), [DELETERESOURCE Procedure](#), [GETRESOID Function](#), [CREATEOIDPATH Function](#), [REBUILDHIERARCHICALINDEX Procedure](#) and [CREATEFOLDER Function](#) subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use [CHECKPRIVILEGES Function](#), [GETACLDOCUMENT Function](#), [CHANGEPRIVILEGES Function](#) and [GETCHILDRESPATHS Function](#), [LINK Procedures](#), [LINK Procedures](#), [LINK Procedures](#), [LINK Procedures](#), [LINK Procedures](#), [LINK Procedures](#) for Oracle Resources. [ACLCHECKPRIVILEGES Function](#) provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- Configuration Session Management is supported by [CFG_REFRESH Procedure](#), [CFG_GET Function](#) and [CFG_UPDATE Procedure](#). methods.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. [GETXDB_TABLESPACE Function](#) and [MOVEXDB_TABLESPACE Procedure](#) enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

Constants

Table 147–1 *Defined Constants for DBMS_XDB*

Constant	Type	Value	Description
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.

Summary of DBMS_XDB Subprograms

Table 147–2 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function on page 147-8	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
ADDMIMEMAPPING Procedure on page 147-9	Adds a mime mapping to the XDB configuration
ADDSCHEMALOCMAPPING Procedure on page 147-10	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure on page 147-11	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure on page 147-12	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure on page 147-13	Adds a security role REF to a specified servlet in the XDB configuration
ADDXMLEXTENSION Procedure on page 147-14	Adds adds an XML extension to the XDB configuration
APPENDPATH Procedure on page 147-15	Appends a childpath to a parentpath
APPENDPATH Procedure on page 147-15	Takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource
CFG_GET Function on page 147-17	Retrieves the session's configuration information
CFG_REFRESH Procedure on page 147-18	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure on page 147-19	Updates the configuration information
CHANGEOWNER Procedure on page 147-20	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function on page 147-21	Adds a specified ACE to a specified resource's ACL
COPYRESOURCE Procedure on page 147-23	Copies the resource at the source path to a new resource at the destination path
CHECKPRIVILEGES Function on page 147-22	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function on page 147-24	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function on page 147-25	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions on page 147-26	Creates a new resource
DELETEMIMEMAPPING Procedure on page 147-28	Deletes the mime mapping from the XDB configuration
DELETERESOURCE Procedure on page 147-29	Deletes a resource from the hierarchy

Table 147-2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
DELETERESOURCEMETADATA Procedures on page 147-30	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)
DELETESCHEMALOCMAPPING Procedure on page 147-31	Deletes the schema location mapping for the specified schema URL from the XDB configuration.
DELETESERVLET Procedure on page 147-32	Deletes a servlet from XDB configuration
DELETESERVLETMAPPING Procedure on page 147-33	Deletes the servlet mapping for the specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure on page 147-34	Deletes the specified role from a servlet in the XDB configuration
DELETXMLEXTENSION Procedure on page 147-35	Deletes the specified XML extension from the XDB configuration
EXISTSRESOURCE Function on page 147-36	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function on page 147-37	Retrieves ACL document that protects resource given its path name
GETCHILDRESPATHS Function on page 147-38	Returns a cursor over the absolute paths of all the child resources
GETCONTENTBLOB Function on page 147-39	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function on page 147-40	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function on page 147-41	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function on page 147-42	Retrieves the contents of a resource returned as a REF to an XMLTYPE
GETCONTENTXMLTYPE Function on page 147-43	Retrieves the contents of a resource returned as an XMLTYPE
GETFTPPORT Function on page 147-44	Gets the value of the current FTP port
GETHTTPPORT Function on page 147-45	Gets the value of the current HTTP port
GETLOCKTOKEN Procedure on page 147-47	Returns that resource's lock token for the current user given a path to a resource
GETLISTENERENDPOINT Procedure on page 147-46	Retrieves the parameters of a listener end point corresponding to the XML DB HTTP server
GETRESOID Function on page 147-49	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function on page 147-50	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function on page 147-51	Returns TRUE if the resource has BLOB content
HASCHARCONTENT Function on page 147-52	Returns TRUE if the resource has character content
HASXMLCONTENT Function on page 147-53	Returns TRUE if the resource has XML content

Table 147-2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
HASXMLREFERENCE Function on page 147-54	Returns TRUE if the resource has REF to XML content
ISFOLDER Function on page 147-55	Returns TRUE if the resource is a folder or container
LINK Procedures on page 147-56	Creates a link to an existing resource
LOCKRESOURCE Function on page 147-57	Gets a WebDAV-style lock on that resource given a path to that resource
MOVEXDB_TABLESPACE Procedure on page 147-58	Moves the XDB (user) to the specified tablespace
PROCESSLINKS Procedure on page 147-59	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure on page 147-60	Deletes all user metadata from a resource
REBUILDHIERARCHICALINDEX Procedure on page 147-61	Rebuilds the hierarchical index after import or export operations
RENAMERESOURCE Procedure on page 147-62	Renames the XDB resource
SETACL Procedure on page 147-63	Sets the ACL on a specified resource
SETCONTENT Procedures on page 147-64	Replaces the contents of a specified resource with specified datatype
SETFTPSPORT Procedure on page 147-66	Sets the FTP port to a new value
SETHTTPSPORT Procedure on page 147-67	Sets the HTP port to a new value
SETLISTENERENDPOINT Procedure on page 147-68	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure on page 147-69	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface or on both localhost and non-localhost interfaces
SPLITPATH Procedure on page 147-70	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure on page 147-71	Changes the modification time of the resource to the current time
UPDATERESOURCEMETADATA Procedures on page 147-72	Updates metadata for a resource
UNLOCKRESOURCE Function on page 147-74	Unlocks the resource given a lock token and resource path

ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(  
    acl_path IN VARCHAR2,  
    owner    IN VARCHAR2,  
    privs   IN xmltype)  
RETURN PLS_INTEGER;
```

Parameters

Table 147–3 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
acl_path	Absolute path in the Hierarchy for ACL document
owner	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
privs	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function .

ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>  
<extension>extension</extension>  
<mime-type>mime-type</mime-type>  
</mime-mapping>
```

Syntax

```
DBMS_XDB.ADDMIMEMAPPING(  
    extension    IN    VARCHAR2,  
    mime-type    IN    VARCHAR2);
```

Parameters

Table 147–4 ADDMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is being added
mime-type	Mime type

ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
  <namespace>namespace</namespace>
  <element>element</element>
  <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB.ADDSCHEMALOCMAPPING (
  namespace    IN   VARCHAR2,
  element      IN   VARCHAR2,
  schemaURL    IN   VARCHAR2);
```

Parameters

Table 147–5 *ADDSCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
namespace	Namespace
element	Element
schemaURL	Schema URL

ADDSERVLET Procedure

This procedure adds the following servlet to XDB configuration:

```
<servlet>
  <servlet-name>name</servlet-name>
  <servlet-language>language</servlet-language>
  <display-name>dispname</display-name>
  <description>descript</description>
  <servlet-class>class</servlet-class>
  <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB.ADDSERVLET(
  name          IN  VARCHAR2,
  language      IN  VARCHAR2,
  dispname      IN  VARCHAR2,
  icon          IN  VARCHAR2 := NULL,
  descript      IN  VARCHAR2 := NULL,
  class         IN  VARCHAR2 := NULL,
  jspfile       IN  VARCHAR2 := NULL,
  plsqli       IN  VARCHAR2 := NULL);
```

Parameters

Table 147–6 *ADDSERVLET Procedure Parameters*

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
plsqli	The class / jspfile / plsqli function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema

ADDSERVLETMAPPING Procedure

This procedure adds the following servlet mapping to XDB configuration:

```
<servlet-mapping>
  <servlet-pattern>pattern</servlet-pattern>
  <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB.ADDSERVLETMAPPING (
  pattern IN VARCHAR2,
  name    IN VARCHAR2);
```

Parameters

Table 147–7 *ADDSERVLETMAPPING Procedure Parameters*

Parameter	Description
pattern	Servlet pattern
name	Servlet name

ADDSERVLETSECROLE Procedure

This procedure adds the following security role REF to a specified servlet in XDB configuration:

```
<security-role-ref>
  <role-name>rolename</role-name>
  <role-link>rolelink</role-link>
  <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB.ADDSERVLETSECROLE (
  servname    IN    VARCHAR2,
  rolename    IN    VARCHAR2,
  rolelink    IN    VARCHAR2,
  descript    IN    VARCHAR2 := NULL);
```

Parameters

Table 147–8 *ADDSERVLETSECROLE Procedure Parameters*

Parameter	Description
servname	Sservlet name
rolename	Role name
rolelink	Role link
descript	Description

ADDXMLEXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB.ADDXMLEXTENSION(  
    extension IN VARCHAR2);
```

Parameters

Table 147–9 ADDXMLEXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be added

APPENDPATH Procedure

This procedure appends a childpath to a parentpath.

Syntax

```
DBMS_XDB.APPENDPATH (  
    abspath      OUT  VARCHAR2,  
    parentpath  IN   VARCHAR2,  
    childpath    IN   VARCHAR2);
```

Parameters

Table 147-10 APPENDPATH Procedure

Parameter	Description
abspath	Absolute path of the resource
parentpath	Parentpath
childpath	Childpath

APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN XMLTYPE);
```

```
DBMS_XDB.APPENDRESOURCEMETADATA (
  abspath IN VARCHAR2,
  metadata IN REF SYS.XMLTYPE);
```

Parameters

Table 147–11 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata will be stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that the REF passed in must be unique. In other words, there must not be a REF with the same value in the resource metadata, as this would violate uniqueness of properties. An error will be thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB.CFG_GET  
RETURN SYS.XMLType;
```

CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB.CFG_REFRESH;
```

CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB.CFG_UPDATE(  
    xdbconfig IN SYS.XMLTYPE);
```

Parameters

Table 147–12 *CFG_UPDATE Procedure Parameters*

Parameter	Description
<code>xdbconfig</code>	The new configuration data

CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB.CHANGEOWNER(  
    abspath    IN    VARCHAR2,  
    owner      IN    VARCHAR2,  
    recurse    IN    BOOLEAN := FALSE);
```

Parameters

Table 147–13 *CHANGEOWNER Procedure Parameters*

Parameter	Description
abspath	Absolute path of the resource
owner	New owner for the resource
recurse	If TRUE, recursively change owner of all resources in the folder tree

CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES (
    res_path IN VARCHAR2,
    ace      IN xmltype)
RETURN PLS_INTEGER;
```

Parameters

Table 147–14 *CHANGEPRIVILEGES Function Parameters*

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB.CHECKPRIVILEGES (  
    res_path  IN  VARCHAR2,  
    privs     IN  xmltype)  
RETURN PLS_INTEGER;
```

Parameters

Table 147–15 CHECKPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
privs	An XMLType instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

COPYRESOURCE Procedure

The procedure copies the resource at a source path to a new resource at a destination path. If the `recurse` flag is `TRUE`, this produces a recursive (deep) copy.

Syntax

```
DBMS_XDB.COPYRESOURCE (
    srcpath    IN    VARCHAR2,
    dstpath    IN    VARCHAR2,
    recurse    IN    BOOLEAN := TRUE );
```

Parameters

Table 147–16 *COPYRESOURCE Function Parameters*

Parameter	Description
<code>srcpath</code>	Source abspath.
<code>dstpath</code>	Destination abspath
<code>recurse</code>	If <code>TRUE</code> , recursively copy subfolders

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB.CREATEFOLDER(  
    path IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 147–17 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB.CREATEOIDPATH(  
    oid IN RAW)  
RETURN VARCHAR2;
```

Parameters

Table 147–18 *CREATEOIDPATH Function Parameters*

Parameter	Description
oid	Object ID of the resource

CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB.CREATERESOURCE (  
    abspath          IN VARCHAR2,  
    data             IN VARCHAR2,  
    createfolders   IN BOOLEAN := FALSE)  
RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB.CREATERESOURCE (  
    abspath          IN VARCHAR2,  
    data             IN SYS.XMLTYPE,  
    createfolders   IN BOOLEAN := FALSE)  
RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE (  
    abspath          IN VARCHAR2,  
    datarow         IN REF SYS.XMLTYPE,  
    createfolders   IN BOOLEAN := FALSE)  
RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE (  
    abspath          IN VARCHAR2,  
    data             IN BLOB,  
    csid            IN NUMBER :=0,  
    createfolders   IN BOOLEAN := FALSE)  
RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (  
    abspath          IN VARCHAR2,  
    data             IN BFILE,  
    csid            IN NUMBER :=0,  
    createfolders   IN BOOLEAN := FALSE)  
RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (  
    abspath          IN VARCHAR2,  
    data             IN CLOB,  
    createfolders   IN BOOLEAN := FALSE)  
RETURN BOOLEAN;
```

Parameters

Table 147–19 *CREATERESOURCE Function Parameters*

Parameter	Description
<code>abspath</code>	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if <code>/foo/bar.txt</code> is passed in, then folder <code>/foo</code> must already exist.
<code>data</code>	The new resource's contents. The data will be parsed to check if it contains a schema-based XML document, and the contents will be stored as schema-based in the schema's default table. Otherwise, it will be saved as binary data.
<code>datarow</code>	REF to an <code>XMLType</code> row to be used as the contents
<code>csid</code>	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: <ul style="list-style-type: none"> ■ From the <code>abspath</code> extension, determine the resource's MIME type. ■ If the MIME type is <code>*/xml</code>, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; ■ Otherwise, it is defaulted to the database character set.
<code>createfolders</code>	If <code>TRUE</code> , create the parent folders if they do not exist

Return Values

`TRUE` if operation successful; `FALSE`, otherwise.

DELETMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETMIMEMAPPING(  
    extension    IN    VARCHAR2,);
```

Parameters

Table 147–20 DELETMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB.DELETERESOURCE(  
    path          IN      VARCHAR2,  
    delete_option IN      PLS_INTEGER);
```

Parameters

Table 147–21 *DELETERESOURCE Procedure Parameters*

Parameter	Description
path	Path name of the resource to delete
delete_option	The option that controls how a resource is deleted; defined in Table 147–1 on page 147-4: <ul style="list-style-type: none">▪ DELETE_RESOURCE▪ DELETE_RECURSIVE▪ DELETE_FORCE▪ DELETE_RECURSIVE_FORCE

DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It will also take an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only or schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
  abspath          IN  VARCHAR2,
  metadata         IN  REF SYS.XMLTYPE,
  delete_option    IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
  abspath          IN  VARCHAR2,
  metadatans       IN  VARCHAR2,
  metadataname     IN  VARCHAR2,
  delete_option    IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 147–22 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
metadata	REF to the piece of metadata (schema based) to be deleted
metadatans	Namespace of the metadata fragment to be removed
metadataname	Local name of the metadata fragment to be removed
delete_option	Only applicable for schema-based metadata, this can be one of the following: <ul style="list-style-type: none"> ▪ DELETE_RES_METADATA_CASCADE - deletes the corresponding row in the metadata table ▪ DELETE_RES_METADATA_NOCASCADE - does not delete the row in the metadata table

DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(  
    schemaURL IN VARCHAR2);
```

Parameters

Table 147–23 *DELETESCHEMALOCMAPPING Procedure Parameters*

Parameter	Description
schemaURL	Schema URL

DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLET (  
    name          IN  VARCHAR2);
```

Parameters

Table 147–24 DELETESERVLET Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETMAPPING(  
    name      IN  VARCHAR2);
```

Parameters

Table 147–25 *DELETESERVLETMAPPING Procedure Parameters*

Parameter	Description
name	Servlet name

DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETSECROLE(  
    servname    IN    VARCHAR2,  
    rolename    IN    VARCHAR2);
```

Parameters

Table 147–26 *DELETESERVLETSECROLE Procedure Parameters*

Parameter	Description
<code>servname</code>	Servlet name
<code>rolename</code>	Name of the role to be deleted

DELETXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETXMLEXTENSION(  
    extension IN VARCHAR2);
```

Parameters

Table 147–27 *DELETXMLEXTENSION Procedure Parameters*

Parameter	Description
extension	XML extension to be deleted

EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB.EXISTSRESOURCE(  
    abspath IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 147–28 *EXISTSRESOURCE Function Parameters*

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(  
  abspath IN VARCHAR2)  
RETURN sys.xmltype;
```

Parameters

Table 147–29 *GETACLDOCUMENT Function Parameters*

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

GETCHILDRESPATHS Function

This function returns a cursor over the absolute paths of all the child resources.

Syntax

```
DBMS_XDB.GETCHILDRESPATHS (  
    abspath    IN    VARCHAR2) ;  
RETURN SYS_REFCURSOR;
```

Parameters

Table 147–30 *GETCHILDRESPATHS Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

Return Values

A cursor over the absolute paths of all the child resources.

GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
  abspath   IN   VARCHAR2,
  csid      OUT  PLS_INTEGER,
  locksrc   IN   BOOLEAN := FALSE)
RETURN BLOB;
```

Parameters

Table 147–31 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(  
    abspath IN VARCHAR2,  
    RETURN CLOB;
```

Parameters

Table 147–32 *GETCONTENTCLOB Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2 (  
    abspath    IN    VARCHAR2,  
    RETURN BLOB;
```

Parameters

Table 147–33 *GETCONTENTVARCHAR2 Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a REF to an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 147–34 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE (  
    abspath    IN    VARCHAR2,  
    RETURN SYS.XMLTYPE;
```

Parameters

Table 147-35 *GETCONTENTXMLTYPE Function Parameters*

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB.GETFTPPORT  
RETURN NUMBER;
```

GETHTTPPORT Function

This procedure gets the value of the current HTTP port.

Syntax

```
DBMS_XDB.GETHTTPPORT  
RETURN NUMBER;
```

GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB.GETLISTENERENDPOINT (  
    endpoint IN NUMBER,  
    host      OUT VARCHAR2,  
    port     OUT NUMBER,  
    protocol OUT NUMBER);
```

Parameters

Table 147–36 *GETLISTENERENDPOINT Procedure Parameters*

Parameter	Description
endpoint	End point to be retrieved. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point listens
port	Port on which the listener end point listens
protocol	Transport protocol accepted by the listener end point

GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB.GETLOCKTOKEN(  
  path          IN      VARCHAR2,  
  locktoken     OUT     VARCHAR2);
```

Parameters

Table 147-37 *GETLOCKTOKEN Procedure Parameters*

Parameter	Description
path	Path name to the resource
locktoken	Logged-in user's lock token for the resource

Usage Notes

The user must have READPROPERTIES privilege on the resource.

GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB.GETPRIVILEGES (  
    res_path    IN    VARCHAR2)  
RETURN sys.xmltype;
```

Parameters

Table 147–38 *GETPRIVILEGES Function Parameters*

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB.GETRESOID(  
    abspath IN VARCHAR2)  
RETURN RAW;
```

Parameters

Table 147-39 *GETRESOID Function Parameters*

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE  
RETURN VARCHAR2;
```

HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASBLOBCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 147-40 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASCHARCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 147–41 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLCONTENT  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 147-42 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLREFERENCE  
  (abspath IN VARCHAR2)  
  RETURN BOOLEAN;
```

Parameters

Table 147–43 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB.DBMS_XDB.ISFOLDER  
    (abspath IN VARCHAR2)  
    RETURN BOOLEAN;
```

Parameters

Table 147-44 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB.LINK(
  srcpath      IN  VARCHAR2,
  linkfolder   IN  VARCHAR2,
  linkname     IN  VARCHAR2);

DBMS_XDB.LINK(
  srcpath      IN  VARCHAR2,
  linkfolder   IN  VARCHAR2,
  linkname     IN  VARCHAR2,
  linktype     IN  PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 147–45 LINK Procedure Parameters

Parameter	Description
srcpath	Path name of the resource to which a link is created
linkfolder	Folder in which the new link is placed
linkname	Name of the new link
linktype	Type of link to be created: <ul style="list-style-type: none"> ■ DBMS_XDB.LINK_TYPE_HARD (default) ■ DBMS_XDB.LINK_TYPE_WEAK ■ DBMS_XDB.LINK_TYPE_SYMBOLIC

LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB.LOCKRESOURCE(  
    path      IN VARCHAR2,  
    depthzero IN BOOLEAN,  
    shared    IN boolean)  
RETURN BOOLEAN;
```

Parameters

Table 147–46 LOCKRESOURCE Function Parameters

Parameter	Description
path	Path name of the resource to lock.
depthzero	Currently not supported
shared	Passing TRUE will obtain a shared write lock

Return Values

TRUE if successful.

Usage Notes

The user must have UPDATE privileges on the resource.

MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB.MOVEXDB_TABLESPACE(  
    new_tablespace IN VARCHAR2);
```

Parameters

Table 147–47 *MOVEXDB_TABLESPACE Procedure Parameters*

Parameter	Description
<code>new_tablespace</code>	Name of the tablespace where the XDB will be moved

Usage Notes

This operation waits for all concurrent XDB sessions to exit.

PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(  
  abspath IN VARCHAR2,  
  recurse IN BOOLEAN := FALSE);
```

Parameters

Table 147-48 *PROCESSLINKS Procedure Parameters*

Parameter	Description
abspath	Absolute path of the resource. If the path is a folder, use the <code>recurse</code> flag.
recurse	Used only if <code>abspath</code> specifies a folder. If <code>TRUE</code> , process links of all resources in the folder hierarchy rooted at the specified resource. If <code>FALSE</code> , process links of all documents in this folder only.

PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA (  
  
  abspath IN VARCHAR2);
```

Parameters

Table 147–49 *PURGERESOURCEMETADATA Procedure Parameters*

Parameter	Description
abspath	Absolute path of the resource

REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB.REBUILDHIERARCHICALINDEX;
```

RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB.RENAMERESOURCE (  
    srcpath      IN  VARCHAR2,  
    destfolder  IN  CARCHAR2,  
    newname     IN  VARCHAR2);
```

Parameters

Table 147–50 RENAMERESOURCE Procedure Parameters

Parameter	Description
srcpath	Absolute path in the Hierarchy for the source resource destination folder
destfolder	Absolute path in the Hierarchy for the destination folder
newname	Name of the child in the destination folder

SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB.SETACL(  
    res_path IN VARCHAR2,  
    acl_path IN VARCHAR2);
```

Parameters

Table 147-51 SETACL Procedure Parameters

Parameter	Description
res_path	Absolute path in the Hierarchy for resource
acl_path	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have <write-acl> privileges on the resource.

SETCONTENT Procedures

This procedure replaces the contents of a resource with a specified datatype.

Syntax

Replaces the contents of the a resource with a specified CLOB:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   CLOB);
```

Replaces the contents of a resource with a specified BLOB:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   BLOB,
    csid       IN   PLS_INTEGER);
```

Replaces the contents of a resource with a specified XMLTYPE:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   SYS.XMLTYPE);
```

Replaces the contents of a resource with a specified string:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   VARCHAR2);
```

Replaces the contents of a resource with a specified REF to an XMLTYPE

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   CLOB,
    sticky     IN   BOOLEAN := TRUE);
```

Replaces the contents of a resource with a specified BFILE:

```
DBMS_XDB.SETCONTENT (
    abspath    IN   VARCHAR2,
    data       IN   CLOB,
    csid       IN   PLS_INTEGER);
```

Parameters

Table 147–52 SETCONTENT Procedure Parameters

Parameter	Description
abspath	Absolute path in the Hierarchy for resource
data	Input varying with overload: <ul style="list-style-type: none"> ■ CLOB data ■ BLOB data ■ XMLTYPE data ■ string data ■ REF to XMLTYPE data ■ a BFILE

Table 147-52 (Cont.) SETCONTENT Procedure Parameters

Parameter	Description
<code>csid</code>	Character set id of the BLOB or BFILE
<code>sticky</code>	Whether or not the REF is sticky

SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB.SETFTPPORT(  
    new_port IN NUMBER);
```

Parameters

Table 147–53 *SETFTPPORT Procedure Parameters*

Parameter	Description
<code>new_port</code>	Value to which the FTP port will be set

SETHHTPPORT Procedure

This procedure sets the HTP port to a new value.

Syntax

```
DBMS_XDB.SETHTTPPORT(  
    new_port IN NUMBER);
```

Parameters

Table 147–54 *SETHHTPPORT Procedure Parameters*

Parameter	Description
new_port	Value to which the HTTP port will be set

SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB.SETLISTENERENDPOINT (
    endpoint IN NUMBER,
    host      IN VARCHAR2,
    port      IN NUMBER,
    protocol  IN NUMBER);
```

Parameters

Table 147–55 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB.SETLISTENERLOCALACCESS (  
    l_access    BOOLEAN);
```

Parameters

Table 147–56 *SETLISTENERLOCALACCESS Procedure Parameters*

Parameter	Description
<code>l_access.</code>	<code>TRUE</code> or <code>FALSE</code> .

SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB.SPLITPATH(  
    abspath      IN  VARCHAR2,  
    parentpath  OUT VARCHAR2,  
    childpath   OUT VARCHAR2);
```

Parameters

Table 147-57 SPLITPATH Procedure Parameters

Parameter	Description
abspath	Absolute path to be split
parentpath	Parentpath
childpath	Childpath

TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB.DBMS_XDB.TOUCHRESOURCE  
    (abspath IN VARCHAR2);
```

Parameters

Table 147-58 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
abspath_path	Absolute path of the resource

UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath   IN VARCHAR2,
  oldmetadata IN REF SYS.XMLTYPE,
  newmetadata IN REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath      IN VARCHAR2,
  oldmetadata   IN REF SYS.XMLTYPE,
  newmetadata   IN XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath      IN VARCHAR2,
  oldns        IN VARCHAR2,
  oldname      IN VARCHAR,
  newmetadata   IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA (
  abspath      IN VARCHAR2,
  oldns        IN VARCHAR2,
  oldname      IN VARCHAR,
  newmetadata   IN REF SYS.XMLTYPE);
```

Parameters

Table 147–59 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of REF, it stores the REF in the resource and the metadata is stored in a separate table. Uniqueness of REFs is enforced. In the case where the XMLTYPE is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(  
    path      IN VARCHAR2,  
    deltoken IN VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 147–60 UNLOCKRESOURCE Function Parameters

Parameter	Description
path	Path name to the resource
deltoken	Lock token to be removed

Return Values

TRUE if operation successful.

Usage Notes

The user must have UPDATE privileges on the resource.

DBMS_XDB_ADMIN

The DBMS_XDB_ADMIN package provides an interface to manage the XMLIndex on the XML DB repository.

See Also: *Oracle XML DB Developer's Guide* for information about "Using XMLIndex on Oracle XML DB Repository"

This chapter contains the following topics:

- [Summary of DBMS_XDB_ADMIN Subprograms](#)

Summary of DBMS_XDB_ADMIN Subprograms

This table lists the package subprograms in alphabetical order.

Table 148–1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATEREPOSITORYXMLINDEX Procedure on page 148-3	Creates an XMLIndex on the XML DB repository
DROPREPOSITORYXMLINDEX Procedure on page 148-4	Drops the XMLIndex on the XML DB repository
XMLINDEXADDPATH Procedure on page 148-5	Takes a path in XML DB repository as an input and indexes all the resources under this given path
XMLINDEXREMOVEPATH Procedure on page 148-6	Removes the index for the given path

CREATEREPOSITORYXMLINDEX Procedure

This procedure creates an XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
```

DROPREPOSITORYXMLINDEX Procedure

This procedure drops the XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```

XMLINDEXADDPATH Procedure

This procedure adds to the repository xmlindex the resource identified by path (when recurse is FALSE) or adds to the repository xmlindex the sub-tree of resources rooted at path (when recurse is TRUE). The default value for recurse is TRUE.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXADDPATH(
  path          IN VARCHAR2,
  recurse       IN BOOLEAN);
```

Parameters

Table 148–2 XMLINDEXADDPATH Procedure Parameters

Parameter	Description
path	Path to a resource
recurse	TRUE or FALSE

Examples

```
DECLARE
  ret BOOLEAN;
BEGIN
  ret := DBMS_XDB_ADMIN.XMLINDEXADDPATH('/PurchaseOrder', FALSE);
END;
```

XMLINDEXREMOVEPATH Procedure

This procedure removes from the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or removes from the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(  
    path          IN VARCHAR2,  
    isrecursive   IN BOOLEAN)  
RETURN BOOLEAN;
```

Parameters

Table 148–3 XMLINDEXREMOVEPATH Procedure Parameters

Parameter	Description
<code>path</code>	Path to a resource
<code>recurse</code>	TRUE or FALSE

Examples

```
DECLARE  
    ret BOOLEAN;  
BEGIN  
    ret := DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(  
        '/PurchseOrder', FALSE);  
    ret := DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(  
        '/PurchseOrder/CompanyA', TRUE);  
END;
```

DBMS_XDBRESOURCE

The DBMS_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

See Also: Oracle XML DB Developer's Guide for examples of "Using DBMS_XDBRESOURCE"

This chapter contains the following topics:

- [Using DBMS_XDBRESOURCE](#)
 - Overview
- [Summary of DBMS_XDBRESOURCE Subprograms](#)

Using DBMS_XDBRESOURCE

- [Overview](#)

Overview

The `DBMS_XDBRESOURCE` package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in `DBMS_XMLDOM` package, an `XDBResource` instance could be converted to a `DOMDocument` type by using `DBMS_XDBRESOURCE.MAKEDOCUMENT` routine.

Summary of DBMS_XDBRESOURCE Subprograms

Table 149–1 DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
FREERESOURCE Procedure on page 149-7	Frees any memory associated with an XDBResource
GETACL Function on page 149-8	Given an XDBResource, returns its ACL as string
GETACLDOCFROMRES Function on page 149-9	Returns the ACL Document for the given resource as XMLType
GETAUTHOR Function on page 149-10	Given an XDBResource, returns its author
GETCHARACTERSET Function on page 149-11	Given an XDBResource, returns its character set
GETCOMMENT Function on page 149-12	Given an XDBResource, returns its comment
GETCONTENTBLOB Function on page 149-13	Returns the contents of the resource as a BLOB
GETCONTENTCLOB Function on page 149-14	Returns the contents of the resource as a CLOB
GETCONTENTREF Function on page 149-15	Returns the contents of the resource as an XMLTypeRef
GETCONTENTTYPE Function on page 149-16	Given an XDBResource, returns its content-type
GETCONTENTXML Function on page 149-17	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function on page 149-18	Returns the contents of the resource as a string
GETCREATIONDATE Function on page 149-19	Given an XDBResource, returns its creation date
GETCREATOR Function on page 149-20	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function on page 149-21	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function on page 149-22	Given an XDBResource, returns its display name
GETLANGUAGE Function on page 149-23	Given an XDBResource, returns its language
GETLASTMODIFIER Function on page 149-24	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function on page 149-25	Given an XDBResource, returns its modification date
GETOWNER Function on page 149-26	Given an XDBResource, returns its owner.
GETREFCOUNT Function on page 149-27	Given an XDBResource, returns its reference count
GETVERSIONID Function on page 149-28	Given an XDBResource, returns its version ID.
HASACLCHANGED Function on page 149-29	Returns TRUE if the ACL of the given resource has changed, FALSE otherwise

Table 149–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
HASAUTHORCHANGED Function on page 149-30	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function on page 149-31	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function on page 149-32	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function on page 149-33	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function on page 149-34	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function on page 149-35	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise
HASCREATIONDATECHANGED Function on page 149-36	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCREATORCHANGED Function on page 149-37	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCUSTOMMETADATACHANGED Function on page 149-38	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise
HASDISPLAYNAMECHANGED Function on page 149-39	Returns TRUE if the display name of the given resource has changed, FALSE otherwise
HASLANGUAGECHANGED Function on page 149-40	Returns TRUE if the language of the given resource has changed, FALSE otherwise
HASLASTMODIFIERCHANGED Function on page 149-41	Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise
HASMODIFICATIONDATECHANGED Function on page 149-42	Returns TRUE if the modification date of the given resource has changed, FALSE otherwise
HASOWNERCHANGED Function on page 149-43	Returns TRUE if the owner of the given resource has changed, FALSE otherwise
HASREFCOUNTCHANGED Function on page 149-44	Returns TRUE if the reference count of the given resource has changed, FALSE otherwise
HASVERSIONIDCHANGED Function on page 149-45	Returns TRUE if the version ID of the given resource has changed, FALSE otherwise
ISFOLDER Function on page 149-46	Returns TRUE if the given resource is a folder, FALSE otherwise
ISNULL Function on page 149-47	Returns TRUE if input resource is NULL, FALSE otherwise
MAKEDOCUMENT Function on page 149-48	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
SAVE Procedure on page 149-49	Updates the resource with any modifications
SETACL Procedure on page 149-50	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure on page 149-51	Sets the author of the given XDBResource to the specified string
SETCHARACTERSET Procedure on page 149-52	Sets the character set of the given XDBResource to a specified character set

Table 149–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
SETCOMMENT Procedure on page 149-53	Sets a comment associated with the given XDBResource
SETCONTENT Procedures on page 149-54	Replaces the contents of the given resource with the given CLOB
SETCONTENTTYPE Procedure on page 149-55	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure on page 149-56	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure on page 149-57	Sets the display name of the given XDBResource
SETLANGUAGE Procedure on page 149-58	Sets the language of the given XDBResource
SETOWNER Procedure on page 149-59	Sets the owner of the given XDBResource

FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.FREERESOURCE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–2 *FREERESOURCE Procedure Parameters*

Parameter	Description
res	XDBResource to free

GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESEROUCE.GETACL (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–3 *GETACL Function Parameters*

Parameter	Description
res	XDBResource

GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as XMLType.

Syntax

```
DBMS_XDBRESOURCE.GETACLDOCFROMRES (  
    res IN XDBResource)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 149–4 GETACL Function Parameters

Parameter	Description
res	XDBResource

GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESEROUCE.GETAUTHOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–5 *GETAUTHOR Function Parameters*

Parameter	Description
res	XDBResource

GETCHARACTERSET Function

Given an XDBResource, this function returns its character set.

Syntax

```
DBMS_XDBRESOURCE.GETCHARACTERSET (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–6 *GETCHARACTERSET Function Parameters*

Parameter	Description
res	XDBResource

GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESEROUCE.GETCOMMENT (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–7 *GETCOMMENT Function Parameters*

Parameter	Description
res	XDBResource

GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTBLOB (  
    res IN XDBResource)  
RETURN BLOB;
```

Parameters

Table 149–8 *GETCONTENTBLOB Function Parameters*

Parameter	Description
res	XDBResource

GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTCLOB (  
    res IN XDBResource)  
RETURN CLOB;
```

Parameters

Table 149–9 *GETCONTENTCLOB Function Parameters*

Parameter	Description
res	XDBResource

GETCONTENTREF Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTREF (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–10 *GETCONTENTREF Function Parameters*

Parameter	Description
res	XDBResource

GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTTYPE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–11 *GETCONTENTTYPE Function Parameters*

Parameter	Description
res	XDBResource

GETCONTENTXML Function

This function returns the contents of the resource as an XMLTypeRef.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTXML (  
    res IN XDBResource)  
RETURN XMLType;
```

Parameters

Table 149–12 *GETCONTENTXML Function Parameters*

Parameter	Description
res	XDBResource

GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTVARCHAR2 (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–13 *GETCONTENTVARCHAR2 Function Parameters*

Parameter	Description
res	XDBResource

GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

Parameters

Table 149–14 *GETCREATIONDATE Function Parameters*

Parameter	Description
res	XDBResource

GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATOR (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–15 *GETCREATOR Function Parameters*

Parameter	Description
res	XDBResource

GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (  
    res          IN    XDBResource,  
    xpath       IN    VARCHAR2,  
    namespace   IN    VARCHAR2)  
RETURN XMLType;
```

Parameters

Table 149–16 *GETCUSTOMMETADATA Function Parameters*

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESEROUCE.GETDISPLAYNAME (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–17 *GETDISPLAYNAME Function Parameters*

Parameter	Description
res	XDBResource

GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESEROUCE.GETLANGUAGE (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–18 *GETLANGUAGE Function Parameters*

Parameter	Description
res	XDBResource

GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESEROUCE.GETLASTMODIFIER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–19 *GETLASTMODIFIER Function Parameters*

Parameter	Description
res	XDBResource

GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESEROUCE.GETMODIFICATIONDATE (  
    res IN XDBResource)  
RETURN TIMESTAMP;
```

Parameters

Table 149–20 *GETMODIFICATIONDATE Function Parameters*

Parameter	Description
res	XDBResource

GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESEROUCE.GETOWNER (  
    res IN XDBResource)  
RETURN VARCHAR2;
```

Parameters

Table 149–21 *GETOWNER Function Parameters*

Parameter	Description
res	XDBResource

GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESEROUCE.GETREFCOUNT (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 149–22 *GETREFCOUNT Function Parameters*

Parameter	Description
res	XDBResource

GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESEROUCE.GETVERSIONID (  
    res IN XDBResource)  
RETURN PLS_INTEGER;
```

Parameters

Table 149–23 *GETVERSIONID Function Parameters*

Parameter	Description
res	XDBResource

HASACLCHANGED Function

This function returns TRUE if the ACL of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASACLCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–24 *GETACL Function Parameters*

Parameter	Description
res	XDBResource

HASAUTHORCHANGED Function

This function returns TRUE if the author of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–25 HASAUTHORCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCHANGED (  
    res          IN    XDBResource,  
    xpath        IN    VARCHAR2,  
    namespace    IN    VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 149–26 *HASCHANGED Function Parameters*

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

HASCHARACTERSETCHANGED Function

This function returns TRUE if the character set of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCHARACTERSETCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCOMMENTCHANGED Function

This function returns TRUE if the comment of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCONTENTCHANGED Function

This function returns TRUE if the contents of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–29 HASCONTENTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCONTENTTYPECHANGED Function

This function returns TRUE if the content-type of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCREATIONDATECHANGED Function

This function returns TRUE if the creation date of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATIONDATECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATORCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCUSTOMMETADATACHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–33 *HASCUSTOMMETADATACHANGED Function Parameters*

Parameter	Description
res	XDBResource

HASDISPLAYNAMECHANGED Function

This function returns TRUE if the display name of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASDISPLAYNAMECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASLANGUAGECHANGED Function

This function returns TRUE if the language of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLANGUAGECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLASTMODIFIERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASMODIFICATIONDATECHANGED Function

This function returns TRUE if the modification date of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
res	XDBResource

HASOWNERCHANGED Function

This function returns TRUE if the owner of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASOWNERCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–38 HASOWNERCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASREFCOUNTCHANGED Function

This function returns TRUE if the reference count of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASVERSIONIDCHANGED Function

This function returns TRUE if the version ID of the given resource has changed, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASVERSIONIDCHANGED (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
res	XDBResource

ISFOLDER Function

This function returns TRUE if the given resource is a folder, FALSE otherwise.

Syntax

```
DBMS_XDBRESEROUCE.ISFOLDER (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–41 ISFOLDER Function Parameters

Parameter	Description
res	XDBResource

ISNULL Function

This function returns TRUE if input resource is NULL.

Syntax

```
DBMS_XDBRESEROUCE.ISNULL (  
    res IN XDBResource)  
RETURN BOOLEAN;
```

Parameters

Table 149–42 *ISNULL Function Parameters*

Parameter	Description
res	Input resource

MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also: The [DBMS_XMLDOM](#) package

Syntax

```
DBMS_XDBRESEROUCE.MAKEDOCUMENT (  
    res IN XDBResource)  
RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 149–43 *MAKEDOCUMENT Function Parameters*

Parameter	Description
res	XDBResource

SAVE Procedure

This procedure updates the resource with any modifications.

Syntax

```
DBMS_XDBRESOURCE.SAVE (  
    res IN XDBResource);
```

Parameters

Table 149–44 *SAVE Procedure Parameters*

Parameter	Description
res	XDBResource

SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESEROUCE.SETACL (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
```

Parameters

Table 149–45 SETACL Procedure Parameters

Parameter	Description
res	XDBResource
ACLPath	Absolute path of the new ACL

SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESEROUCE.SETAUTHOR (  
    res      IN OUT  XDBResource,  
    author   IN      VARCHAR2);
```

Parameters

Table 149–46 *SETAUTHOR Procedure Parameters*

Parameter	Description
res	XDBResource
author	Author

SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESEROUCE.SETCHARACTERSET (  
    res      IN OUT  XDBResource,  
    charSet  IN      VARCHAR2);
```

Parameters

Table 149–47 *SETCHARACTERSET Procedure Parameters*

Parameter	Description
res	XDBResource
charset	New character set

SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETCOMMENT (  
    res      IN OUT  XDBResource,  
    comment  IN      VARCHAR2);
```

Parameters

Table 149–48 *SETCOMMENT Procedure Parameters*

Parameter	Description
res	XDBResource
comment	New comment

SETCONTENT Procedures

This procedure replaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      BFILE,
  csid     IN      NUMBER);
```

```
DBMS_XDBRESEROUCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      BLOB,
  csid     IN      PLS_INTEGER);
```

```
DBMS_XDBRESEROUCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      CLOB);
```

```
DBMS_XDBRESEROUCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      REF SYS.XMLType,
  sticky   IN      BOOLEAN := TRUE);
```

```
DBMS_XDBRESEROUCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      VARCHAR2);
```

```
DBMS_XDBRESEROUCE.SETCONTENT (
  res      IN OUT  XDBResource,
  data     IN      SYS.XMLType);
```

Parameters

Table 149–49 SETCONTENT Procedure Parameters

Parameter	Description
res	XDBResource
data	Data input as BFILE, BLOB, CLOB, string, XMLType
csid	Character set ID of the BFILE, BLOB
sticky	If TRUE creates a sticky REF, otherwise non-sticky

SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENTTYPE (  
    res          IN OUT XDBResource,  
    conttype    IN      VARCHAR2);
```

Parameters

Table 149–50 *SETCONTENTTYPE Procedure Parameters*

Parameter	Description
res	XDBResource
conttype	New content-type

SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESEROUCE.SETCUSTOMMETADATA (  
    res          IN OUT  XDBResource,  
    xpath        IN      VARCHAR2,  
    namespace    IN      VARCHAR2,  
    newMetadata  IN      XMLType);
```

Parameters

Table 149–51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETDISPLAYNAME (  
    res      IN OUT  XDBResource,  
    name     IN     VARCHAR2);
```

Parameters

Table 149-52 *SETDISPLAYNAME Procedure Parameters*

Parameter	Description
res	XDBResource
name	New display name

SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETLANGUAGE (  
    res      IN OUT  XDBResource,  
    ACLPath  IN      VARCHAR2);
```

Parameters

Table 149–53 *SETLANGUAGE Procedure Parameters*

Parameter	Description
res	XDBResource
ACLPath	New path

SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESOURCE.SETOWNER (  
    res      IN OUT  XDBResource,  
    owner    IN      VARCHAR2);
```

Parameters

Table 149–54 *SETOWNER Procedure Parameters*

Parameter	Description
res	XDBResource
owner	New owner

DBMS_XDB_VERSION

Oracle XML DB versioning APIs are found in the `DBMS_XDB_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- [Summary of DBMS_XDB_VERSION Subprograms](#)

See Also: *Oracle XML DB Developer's Guide*

Summary of DBMS_XDB_VERSION Subprograms

Table 150–1 DBMS_XDB_VERSION Package Subprograms

Method	Description
CHECKIN Function on page 150-3	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure on page 150-4	Checks out a VCR before updating or deleting it
GETCONTENTSBOBBYRES ID Function on page 150-5	Obtain contents as a BLOB
GETCONTENTSCLOB BYRES ID Function on page 150-6	Obtain contents as a CLOB
GETCONTENTSXMLBYRES ID Function on page 150-7	Obtain contents as an XMLType
GETPREDECESSORS Function on page 150-8	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function on page 150-9	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function on page 150-10	Obtains the resource as an XMLType, given the resource object ID
GETSUCCESSORS Function on page 150-11	Retrieves the list of successors by path name
GETSUCCSBYRESID Function on page 150-12	Retrieves the list of successors by resource id
MAKEVERSIONED Function on page 150-13	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function on page 150-14	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(  
    pathname VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 150–2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. [CHECKIN Function](#) doesn't have to take the same path name that was passed to [CHECKOUT Procedure](#) operation. However, the [CHECKIN Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [CHECKIN Function](#) because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to [CHECKIN Function](#) the resource.

CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout (  
    pathname    VARCHAR2);
```

Parameters

Table 150–3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot [CHECKOUT Procedure](#) the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the [CHECKOUT Procedure](#) operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBBYRESID(  
    resid      DBMS_XDB.resid_type)  
RETURN BLOB;
```

Parameters

Table 150–4 *GETCONTENTSBLOBBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

GETCONTENTSCLOBYPRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBYPRESID(  
    resid      DBMS_XDB.resid_type)  
RETURN CLOB;
```

Parameters

Table 150–5 *GETCONTENTSCLOBYPRESID Function Parameters*

Parameter	Description
resid	The resource id.

GETCONTENTSXMLBYRESID Function

This function obtains contents as an XMLType.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(  
    resid      DBMS_XDB.resid_type)  
RETURN XMLType;
```

Parameters

Table 150–6 *GETCONTENTSXMLBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

Return Values

If the contents are not valid XML, returns NULL.

GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS (  
    pathname          VARCHAR2)  
RETURN resid_list_type;
```

Parameters

Table 150–7 *GETPREDECESSORS Function Parameters*

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if `PATHNAME` is illegal.

GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(  
    resid      resid_type)  
RETURN resid_list_type;
```

Parameters

Table 150–8 *GETPREDSBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the RESID is illegal.

GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system will not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(  
    resid      resid_type)  
RETURN XMLType;
```

Parameters

Table 150–9 *GETRESOURCEBYRESID Function Parameters*

Parameter	Description
<code>resid</code>	The resource id.

GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS (  
    pathname VARCHAR2)  
RETURN resid_list_type;
```

Parameters

Table 150–10 *GETSUCCESSORS Function Parameters*

Parameter	Description
pathname	The path name of the resource.

Usage Notes

Getting successors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the PATHNAME is illegal.

GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(  
    resid    resid_type)  
RETURN resid_list_type;
```

Parameters

Table 150–11 *GETSUCCSBYRESID Function Parameters*

Parameter	Description
resid	The resource id.

Usage Notes

Getting successors by RESID is more efficient than by PATHNAME.

Exceptions

An exception is raised if the PATHNAME is illegal.

MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
    pathname  VARCHAR2)
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 150–12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource will be created, and the given path name will be bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(  
    pathname    VARCHAR2)  
RETURN DBMS_XDB.resid_type;
```

Parameters

Table 150–13 *UNCHECKOUT Function Parameters*

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. [UNCHECKOUT Function](#)[CHECKOUT Procedure](#) doesn't have to take the same path name that was passed to operation. However, the [UNCHECKOUT Function](#) path name and the [CHECKOUT Procedure](#) path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to [UNCHECKOUT Function](#), because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to [UNCHECKOUT Function](#) the resource.

Exceptions

An exception is raised if the path name doesn't exist.

The `DBMS_XDBT` package provides a convenient mechanism for administrators to set up a `CONTEXT` index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the `CONTEXT` index.

The `DBMS_XDBT` package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- [Using DBMS_XDBT](#)
 - Overview
 - Operational Notes
- [Summary of DBMS_XDBT Subprograms](#)

Using DBMS_XDBT

- [Overview](#)
- [Operational Notes](#)

Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- [DROPPREFERENCES Procedure](#) Drop any existing index preferences using the procedure.
- Create new index preferences using the [CREATEPREFERENCES Procedure](#) procedure.
- Create the CONTEXT index using the [CREATEINDEX Procedure](#) procedure.
- Set up automatic synchronization of the index using the [CONFIGUREAUTOSYNC Procedure](#) procedure.

Operational Notes

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.

Table 151–1 General Indexing Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
IndexName	XDB\$CI	The name of the CONTEXT index.
IndexTablespace	XDB\$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.

Table 151–2 Filtering Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SkipFilterTypes	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilterTypes	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB\$CI_FILTER	Name of the filter preference.

Table 151–3 Stoplist Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
StoplistPref	XDB\$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

Table 151–4 Sectioning and Section Group Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.
SectiongroupP ref	XDB\$CI_SECTIONGROUP	Name of the section group.

Table 151–5 Other Index Preference Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
DatastorePref	XDB\$CI_DATASTORE	The name of the datastore preference.
StoragePref	XDB\$CI_STORAGE	The name of the storage preference.
WordlistPref	XDB\$CI_WORDLIST	The name of the wordlist preference.
DefaultLexerPref	XDB\$CI_DEFAULT_LEXER	The name of the default lexer preference.

Table 151–6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME.

Summary of DBMS_XDBT Subprograms

Table 151–7 DBMS_XDBT Package Subprograms

Subprogram	Description
CONFIGUREAUTOSYNC Procedure on page 151-7	Configures the CONTEXT index for automatic maintenance, SYNC
CREATEDATASTOREPREF Procedure on page 151-8	Creates a USER datastore preference for the CONTEXT index
CREATEFILTERPREF Procedure on page 151-9	Creates a filter preference for the CONTEXT index
CREATEINDEX Procedure on page 151-10	Creates the CONTEXT index on the XML DB hierarchy
CREATELEXERPREF Procedure on page 151-11	Creates a lexer preference for the CONTEXT index
CREATEPREFERENCES Procedure on page 151-12	Creates preferences required for the CONTEXT index on the XML DB hierarchy
CREATESECTIONGROUPPREF Procedure on page 151-13	Creates a storage preference for the CONTEXT index
CREATESTOPLISTPREF Procedure on page 151-14	Creates a section group for the CONTEXT index
CREATESTORAGEPREF Procedure on page 151-15	Creates a wordlist preference for the CONTEXT index
CREATEWORLDSLIPREF Procedure on page 151-16	Creates a stoplist for the CONTEXT index
DROPPREFERENCES Procedure on page 151-17	Drops any existing preferences

CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views
- The configuration parameter `AutoSyncPolicy` can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
SYNC_BY_PENDING_COUNT	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount configuration setting on page 151-5). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter on page 151-5) to determine if the number of documents exceeds the threshold.
SYNC_BY_TIME	The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter on page 151-5).
SYNC_BY_PENDING_COUNT_AND_TIME	A combination of both of the preceding options.

CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

Usage Notes

- The name of the datastore preference can be modified; see the `DatastorePref` configuration setting.
- The default `USER` datastore procedure also filters the incoming document. The `DBMS_XDBT` package provides a set of configuration settings that control the filtering process.
- The `SkipFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as `author`, remain unindexed.
 - The `NullFilter_Types` array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
 - All other documents use the `INSO` filter through the `IFILTER` API.

CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see [CREATEDATASTOREPREF Procedure](#) for more details.

CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later `SYNCs`, will use.

CREATELEXERPREF Procedure

This procedure creates a BASIC `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the `SectiongroupPref` configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the `AUTO_SECTION_GROUP` or the `PATH_SECTION_GROUP`; see the `SectionGroup` configuration setting.

CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

CREATEWORLDLISTPREF Procedure

This procedure creates a wordlist preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORLDLISTPREF;
```

Usage Notes

- The name of the wordlist preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- [Using DBMS_XDBZ](#)
 - Constants
- [Summary of DBMS_XDBZ Subprograms](#)

See Also: *Oracle XML DB Developer's Guide*

Using DBMS_XDBZ

This section contains topics which relate to using the DBMS_XDBZ package.

- [Constants](#) on page 152-3

Constants

The DBMS_XDBZ package uses the constants shown in following tables.

- [DBMS_XDBZ Constants - Name Format](#) on page 152-3
- [DBMS_XDBZ Constants - Enable Option](#) on page 152-3
- [DBMS_XDBZ Constants - Enable Option Exercised](#) on page 152-3

Table 152–1 DBMS_XDBZ Constants - Name Format

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

Table 152–2 DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the ENABLE_HIERARCHY Procedure
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 152–3 DBMS_XDBZ Constants - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_CONTENTS</code>
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with <code>hierarchy_type</code> as <code>ENABLE_RESMETADATA</code>

Summary of DBMS_XDBZ Subprograms

Table 152-4 *DBMS_XDBZ Package Subprograms*

Method	Description
DISABLE_HIERARCHY Procedure on page 152-5	Disables repository support for the specified XMLTYPE table or view
ENABLE_HIERARCHY Procedure on page 152-6	Enables repository support for the specified XMLType table or view
GET_ACLOID Function on page 152-7	Retrieves the ACL Object ID for the specified resource
GET_USERID Function on page 152-8	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function on page 152-9	Determines if repository support for the specified XMLType table or view is enabled
PURGELDAPCACHE Function on page 152-10	Purges the LDAP nickname cache

DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(  
  object_schema IN VARCHAR2,  
  object_name   IN VARCHAR2);
```

Parameters

Table 152-5 *DISABLE_HIERARCHY Procedure Parameters*

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view

ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular XMLType table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

See Also: *Oracle XML DB Developer's Guide* for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  hierarchy_type IN PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 152–6 *ENABLE_HIERARCHY Procedure Parameters*

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view
hierarchy_type	How to enable the hierarchy. <ul style="list-style-type: none"> ▪ ENABLE_CONTENTS - enable hierarchy for contents, that is, this table will store contents of resources in the repository ▪ ENABLE_RESMETADATA - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources <p>If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.</p>

GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(  
    aclpath IN VARCHAR2,  
    acloid  OUT RAW)  
RETURN BOOLEAN;
```

Parameters

Table 152-7 GET_ACLOID Function Parameters

Parameter	Description
aclpath	ACL resource path for the repository
acloid	The returned Object ID

Return Values

Returns TRUE if successful.

GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the USERID is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the USERID is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(  
    username IN VARCHAR2,  
    userid   OUT RAW,  
    format   IN BINARY_INTEGER := NAME_FORMAT_SHORT)  
RETURN BOOLEAN;
```

Parameters

Table 152–8 GET_USERID Function Parameters

Parameter	Description
username	Name of the database or LDAP user.
userid	Return parameter for the matching user id.
format	Format of the specified user name; valid options are: <ul style="list-style-type: none">■ DBMS_XDBZ.NAME_FORMAT_SHORT (default) -- DB user name or LDAP nickname■ DBMS_XDBZ.NAME_FORMAT_DISTINGUISHED -- LDAP distinguished name.

Return Values

Returns TRUE if successful.

IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
  object_schema IN VARCHAR2,
  object_name   IN VARCHAR2,
  hierarchy_type IN PLS_INTEGER := IS_ENABLED_CONTENTS)
RETURN BOOLEAN;
```

Parameters

Table 152–9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view
hierarchy_type	The type of hierarchy to check for. <ul style="list-style-type: none"> ▪ IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_CONTENTS ▪ IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE  
RETURN BOOLEAN;
```

The DBMS_XEVENT package provides event-related types and supporting subprograms.

See Also: *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

This chapter contains the following topics:

Using DBMS_XEVENT

- [Constants](#)

Constants

The DBMS_XEVENT package uses the constants shown in [Table 153–1](#):

Table 153–1 DBMS_XEVENT Constants

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

Subprogram Groups

- [XDBEvent Type Subprograms](#)
- [XDBRepositoryEvent Type Subprograms](#)
- [XDBHandlerList Type Subprograms](#)
- [XDBHandler Type Subprograms](#)
- [XDBPath Type Subprograms](#)
- [XDBLink Type Subprograms](#)

XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

Table 153–2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function on page 153-17	Returns the name of the user executing the operation that triggers the event
GETEVENT Function on page 153-18	Returns a value identifying the triggering event
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 153–3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function on page 153-15	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function on page 153-20	Returns an XDBHandlerList object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function on page 153-21	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function on page 153-23	Returns an XDBLink object for the target resource
GETLOCK Function on page 153-25	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function on page 153-29	Returns the original XDBResource object before the operation was executed
GETOPENACCESSMODE Function on page 153-30	Returns the access mode for the open operation
GETOPENDENYMODE Function on page 153-31	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function on page 153-32	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function on page 153-33	Returns the value of a request or session-specific parameter
GETPARENT Function on page 153-34	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function on page 153-38	Returns the XDBPath object representing the path of the resource for which the event was fired
GETRESOURCE Function on page 153-39	Returns an XDBResource object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function on page 153-42	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function on page 153-43	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBEVENT Function on page 153-44	Converts an XDBRepositoryEvent object to an XDBEvent type
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL
SETRENDERPATH Procedure on page 153-48	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure on page 153-49	sets the BLOB from which the rendered contents can be read

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 153–4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure on page 153-14	Clears the handler list
GETFIRST Function on page 153-19	Returns the first handler in the list
GETNAME Function on page 153-27	Returns the next handler in the list
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL
REMOVE Procedure on page 153-47	Removes the specified handler from the handler list

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 153–5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function on page 153-22	Returns the implementation language of the handler
GETSCHEMA Function on page 153-40	Returns the schema of the handler's source
GETSOURCE Function on page 153-41	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 153–6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function on page 153-27	Returns the string representation of the path
GETPARENTPATH Function on page 153-37	Returns the parent's path
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 153–7 XDBLink Type Subprograms

Subprogram	Description
GETCHILDROID Function on page 153-16	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function on page 153-35	Returns the link's parent folder's name
GETPARENTOID Function on page 153-36	Returns the link's parent folder's OID
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL

The [Summary of DBMS_XEVENT Subprograms](#) contains a complete listing of all subprograms in the package.

Summary of DBMS_XEVENT Subprograms

Table 153–8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure on page 153-14	Clears the handler list	XDBHandlerList Type Subprograms on page 153-7
GETAPPLICATIONDATA Function on page 153-15	Returns the <applicationData> element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms on page 153-6
GETCHILDROID Function on page 153-16	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms on page 153-10
GETCURRENTUSER Function on page 153-17	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms on page 153-5
GETEVENT Function on page 153-18	Returns a value identifying the triggering event	XDBEvent Type Subprograms on page 153-5
GETFIRST Function on page 153-19	Returns the first handler in the list	XDBHandlerList Type Subprograms on page 153-7
GETHANDLERLIST Function on page 153-20	Returns an <code>XDBHandlerList</code> object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms on page 153-6
GETINTERFACE Function on page 153-21	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms on page 153-6
GETLANGUAGE Function on page 153-22	Returns the implementation language of the handler	XDBHandler Type Subprograms on page 153-8
GETLINK Function on page 153-23	Returns an <code>XDBLink</code> object for the target resource	XDBRepositoryEvent Type Subprograms on page 153-6
GETLOCK Function on page 153-25	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms on page 153-5
GETNAME Function on page 153-27	Returns the string representation of the path	XDBPath Type Subprograms on page 153-9
GETNAME Function on page 153-27	Returns the next handler in the list	XDBHandlerList Type Subprograms on page 153-7
GETOLDRESOURCE Function on page 153-29	Returns the original <code>XDBResource</code> object before the operation was executed	XDBRepositoryEvent Type Subprograms on page 153-5
GETOPENACCESSMODE Function on page 153-30	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms on page 153-5

Table 153–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETOPENDENYMODE Function on page 153-31	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms on page 153-5
GETOUTPUTSTREAM Function on page 153-32	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms on page 153-5
GETPARAMETER Function on page 153-33	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms on page 153-5
GETPARENT Function on page 153-34	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms on page 153-5
GETPARENTNAME Function on page 153-35	Returns the link's parent folder's name	XDBLink Type Subprograms on page 153-10
GETPARENTOID Function on page 153-36	Returns the link's parent folder's OID	XDBLink Type Subprograms on page 153-10
GETPARENTNAME Function on page 153-35	Returns the parent's path	XDBPath Type Subprograms on page 153-9
GETPATH Function on page 153-38	Returns the <code>XDBPath</code> object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms on page 153-5
GETRESOURCE Function on page 153-39	Returns an <code>XDBResource</code> object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms on page 153-5
GETSCHEMA Function on page 153-40	Returns the schema of the handler's source	XDBHandler Type Subprograms on page 153-8
GETSOURCE Function on page 153-41	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms on page 153-8
GETUPDATEBYTECOUNT Function on page 153-42	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms on page 153-5
GETUPDATEBYTEOFFSET Function on page 153-43	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms on page 153-5
GETXDBEVENT Function on page 153-44	Converts an <code>XDBRepositoryEvent</code> object to an <code>XDBEvent</code> type	XDBRepositoryEvent Type Subprograms on page 153-5

Table 153–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
ISNULL Functions on page 153-45	Returns TRUE if input argument is NULL	XDBEvent Type Subprograms on page 153-5 XDBRepositoryEvent Type Subprograms on page 153-6 XDBHandlerList Type Subprograms on page 153-7 XDBHandler Type Subprograms on page 153-8 XDBPath Type Subprograms on page 153-9
REMOVE Procedure on page 153-47	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms on page 153-7
SETRENDERPATH Procedure on page 153-48	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms on page 153-5
SETRENDERSTREAM Procedure on page 153-49	sets the BLOB from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms on page 153-5

CLEAR Procedure

this procedure clears the handler list.

See Also: [XDBHandlerList Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (  
    hl          IN OUT  XDBHandlerList);
```

Parameters

Table 153–9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (  
    ev IN XDBRepositoryEvent)  
RETURN XMLType;
```

Parameters

Table 153–10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETCHILDROID Function

This function returns the OID of the resource to which the link is pointing.

See Also: [XDBLink Type Subprograms](#) on page 153-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDROID (  
    link IN XDBLink)  
RETURN RAW;
```

Parameters

Table 153–11 *GETCHILDROID Function Parameters*

Parameter	Description
link	Link

GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

See Also: [XDBEvent Type Subprograms](#) on page 153-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (  
    ev IN XDBEvent)  
RETURN VARCHAR2;
```

Parameters

Table 153–12 *GETCURRENTUSER Function Parameters*

Parameter	Description
ev	Event of XDBEvent type

GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

See Also: [XDBEvent Type Subprograms](#) on page 153-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (  
    ev IN XDBEvent)  
RETURN XDBEventID;
```

Parameters

Table 153–13 *GETEVENT Function Parameters*

Parameter	Description
ev	Event of XDBEvent type

GETFIRST Function

This function returns the first handler in the list.

See Also: [XDBHandlerList Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (  
    hl IN XDBHandlerList)  
RETURN XDBHandler;
```

Parameters

Table 153–14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (  
    ev IN XDBRepositoryEvent)  
RETURN XDBHandlerList;
```

Parameters

Table 153–15 *GETHANDLERLIST Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (  
    ev IN XDBRepositoryEvent)  
RETURN VARCHAR2;
```

Parameters

Table 153–16 *GETINTERFACE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also: [XDBHandler Type Subprograms](#) on page 153-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

Parameters

Table 153–17 *GETLANGUAGE Function Parameters*

Parameter	Description
handler	Handler

GETLINK Function

This function returns an `XDBLink` object for the target resource. For a `link*` or `unlink*` event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (  
    ev IN XDBRepositoryEvent)  
RETURN XDBLink;
```

Parameters

Table 153–18 *GETLINK Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

GETLINKNAME Function

This function returns the name of the link.

See Also: [XDBLink Type Subprograms](#) on page 153-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (  
    link IN XDBLink)  
RETURN VARCHAR2;
```

Parameters

Table 153–19 *GETLINKNAME Function Parameters*

Parameter	Description
link	Link

GETLOCK Function

This function returns the lock object corresponding to the current operation. It is only valid for lock and unlock events.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK (  
    ev IN XDBRepositoryEvent)  
RETURN XDBLock;
```

Parameters

Table 153–20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

See Also: [XDBHandler Type Subprograms](#) on page 153-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

Parameters

Table 153–21 *GETLANGUAGE Function Parameters*

Parameter	Description
handler	Handler

GETNAME Function

This function returns the string representation of the path.

See Also: [XDBPath Type Subprograms](#) on page 153-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (  
    path IN XDBPath)  
RETURN VARCHAR2;
```

Parameters

Table 153–22 *GETNAME Function Parameters*

Parameter	Description
path	Path

GETNEXT Function

This function returns the next handler in the list.

See Also: [XDBHandlerList Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (  
    hl IN XDBHandlerList)  
RETURN XDBHandler;
```

Parameters

Table 153–23 *GETNEXT Function Parameters*

Parameter	Description
hl	Handler list

GETOLDRESOURCE Function

This function returns the original XDBResource object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (  
    ev IN XDBRepositoryEvent)  
RETURN XDBResource;
```

Parameters

Table 153–24 GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (  
    ev IN XDBRepositoryEvent)  
RETURN PLS_INTEGER;
```

Parameters

Table 153–25 *GETOPENACCESSMODE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (  
    ev IN XDBRepositoryEvent)  
RETURN PLS_INTEGER;
```

Parameters

Table 153–26 *GETOPENDENYMODE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (  
    ev IN XDBRepositoryEvent)  
RETURN BLOB;
```

Parameters

Table 153–27 *GETOUTPUTSTREAM Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (
  ev   IN   XDBRepositoryEvent,
  key  IN   VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 153–28 *GETPARAMETER Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type
key	Supported parameters: <ul style="list-style-type: none"> ▪ ACCEPT ▪ ACCEPT-LANGUAGE ▪ ACCEPT-CHARSET ▪ ACCEPT_ENCODING

GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (  
    ev IN XDBRepositoryEvent)  
    RETURN XDBResource;
```

Parameters

Table 153–29 *GETPARENT Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARENTNAME Function

This function returns the link's parent folder's name.

See Also: [XDBLink Type Subprograms](#) on page 153-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (  
    link IN XDBLink)  
RETURN VARCHAR2;
```

Parameters

Table 153–30 GETPARENTNAME Function Parameters

Parameter	Description
link	Link

GETPARENTOID Function

This function returns the link's parent folder's OID.

See Also: [XDBLink Type Subprograms](#) on page 153-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (  
    link IN XDBLink)  
RETURN RAW;
```

Parameters

Table 153–31 *GETPARENTOID Function Parameters*

Parameter	Description
link	Link

GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

See Also: [XDBPath Type Subprograms](#) on page 153-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (  
    path IN XDBPath,  
    level IN INTEGER)  
RETURN XDBPath;
```

Parameters

Table 153–32 GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (  
    ev IN XDBRepositoryEvent)  
RETURN XDBPath;
```

Parameters

Table 153–33 *GETPATH Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a `link*` or `unlink*` event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (  
    ev IN XDBRepositoryEvent)  
RETURN XDBResource;
```

Parameters

Table 153–34 *GETRESOURCE Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETSCHEMA Function

This function returns the schema of the handler's source.

See Also: [XDBHandler Type Subprograms](#) on page 153-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

Parameters

Table 153–35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

See Also: [XDBHandler Type Subprograms](#) on page 153-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (  
    handler IN XDBHandler)  
RETURN VARCHAR2;
```

Parameters

Table 153–36 *GETSOURCE Function Parameters*

Parameter	Description
handler	Handler

GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (  
    ev IN XDBRepositoryEvent)  
    RETURN NUMBER;
```

Parameters

Table 153–37 *GETUPDATEBYTECOUNT Function Parameters*

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (  
    ev IN XDBRepositoryEvent)  
RETURN NUMBER;
```

Parameters

Table 153–38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

See Also: [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBEVENT (  
    ev IN XDBRepositoryEvent)  
RETURN XDBEvent;
```

Parameters

Table 153–39 *GETXDBEVENT Function Parameters*

Parameter	Description
ev	Event of <code>XDBRepositoryEvent</code> type

ISNULL Functions

This function returns TRUE if input argument is NULL.

See Also:

- [XDBEvent Type Subprograms](#) on page 153-5 for other subprograms in this group
- [XDBRepositoryEvent Type Subprograms](#) on page 153-6 for other subprograms in this group

- [XDBHandler Type Subprograms](#) on page 153-8 for other subprograms in this group
- [XDBPath Type Subprograms](#) on page 153-9 for other subprograms in this group
- [XDBLink Type Subprograms](#) on page 153-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN  XDBEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN  XDBRepositoryEvent)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN  XDBHandlerList)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN  XDBHandler)
RETURN BOOLEAN;
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN  XDBPath)
RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN  XDBLink)
RETURN BOOLEAN;
```

Parameters

Table 153–40 ISNULL Function Parameters

Parameter	Description
ev	Event of specified type
hl	Handler list
handler	Handler

Table 153–40 (Cont.) ISNULL Function Parameters

Parameter	Description
path	Path

REMOVE Procedure

This procedure removes the specified handler from the handler list.

See Also: [XDBHandlerList Type Subprograms](#) on page 153-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (  
    hl          IN OUT  XDBHandlerList,  
    handler    IN      XDBHandler);
```

Parameters

Table 153–41 REMOVE Procedure Parameters

Parameter	Description
hl	Handler list
handler	Handler

SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by [GETOUTPUTSTREAM Function](#) is written to or after the [SETRENDERSTREAM Procedure](#) is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (  
    ev      IN  XDBRepositoryEvent,  
    path    IN  VARCHAR2);
```

Parameters

Table 153–42 *SETRENDERPATH Procedure Parameters*

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (  
    ev    IN    XDBRepositoryEvent,  
    istr  IN    BLOB);
```

Parameters

Table 153–43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

The `DBMS_XMLDOM` package is used to access `XMLType` objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

Using DBMS_XMLDOM

- [Overview](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)
- [Subprogram Groups](#)

Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

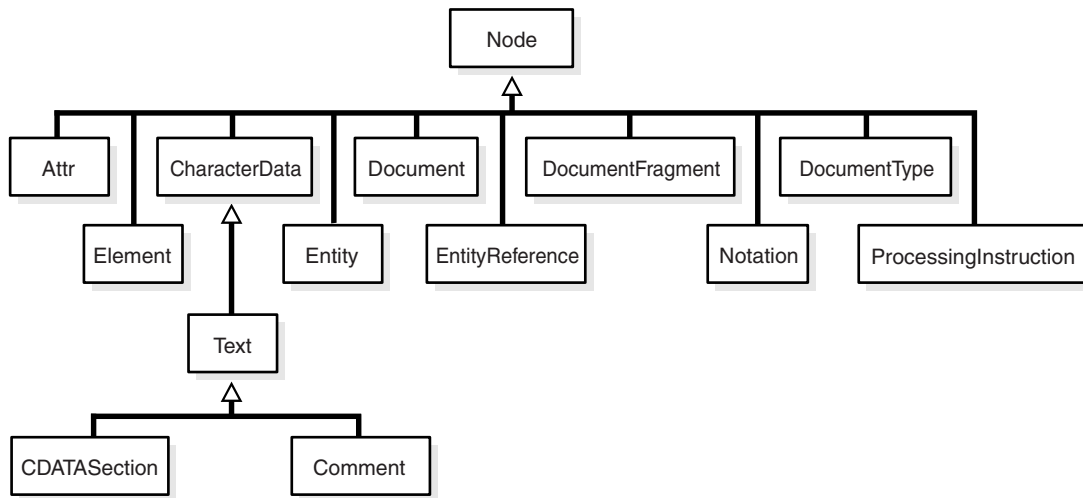

- Before database startup, the read-from and write-to directories in the `initialization.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.

With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform [APPENDCHILD Function](#) on a `DOMNode n`, the [APPENDCHILD Function](#) PL/SQL function on page 154-40 is provided.
- To perform `setAttribute` on a `DOMElement elem` [SETATTRIBUTE Procedures](#), use PL/SQL procedure on page 154-137.

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see [Figure 154-1](#)). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `makeXXX` functions, where `DOMXXX` is the desired DOM type.

Figure 154-1 Inheritance Diagram for DOM Types

The implementation of this interface follows the REC-DOM-Level-1-19981001.

Constants

Defined constants of DBMS_XMLDOM are listed in [Table 154-1](#).

Table 154-1 *Defined Constants for DBMS_XMLDOM*

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDATASection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

Types

The following types for `DBMS_XMLDOM.DOMTYPE` are defined in [Table 154-2](#):

Table 154-2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDATASection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

Exceptions

The exceptions listed in [Table 154–3](#) are defined for DBMS_XMLDOM:

Table 154–3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- [DOMNode Subprograms](#) on page 154-10
- [DOMAttr Subprograms](#) on page 154-12
- [DOMCDATASection Subprograms](#) on page 154-13
- [DOMCharacterData Subprograms](#) on page 154-14
- [DOMComment Subprograms](#) on page 154-15
- [DOMDocument Subprograms](#) on page 154-16
- [DOMDocumentFragment Subprograms](#) on page 154-18
- [DOMDocumentType Subprograms](#) on page 154-19
- [DOMElement Subprograms](#) on page 154-20
- [DOMEntity Subprograms](#) on page 154-21
- [DOMEntityReference Subprograms](#) on page 154-22
- [DOMImplementation Subprograms](#) on page 154-23
- [DOMNamedNodeMap Subprograms](#) on page 154-24
- [DOMNodeList Subprograms](#) on page 154-25
- [DOMNotation Subprograms](#) on page 154-26
- [DOMProcessingInstruction Subprograms](#) on page 154-27
- [DOMText Subprograms](#) on page 154-28

DOMNode Subprograms

Table 154–4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function on page 154-39	Adopts a node from another document.
APPENDCHILD Function on page 154-40	Appends a new child to the node.
CLONENODE Function on page 154-42	Clones the node.
FREENODE Procedure on page 154-57	Frees all resources associated with the node.
GETATTRIBUTES Function on page 154-60	Retrieves the attributes of the node.
GETCHILDNODES Function on page 154-61	Retrieves the children of the node.
GETEXPANDEDNAME Procedure and Functions on page 154-68	Retrieves the expanded name of the node.
GETFIRSTCHILD Function on page 154-69	Retrieves the first child of the node.
GETLASTCHILD Function on page 154-71	Retrieves the last child of the node.
GETLOCALNAME Procedure and Functions on page 154-73	Retrieves the local part of the qualified name.
GETNAMESPACE Procedure and Functions on page 154-76	Retrieves the node's namespace URI.
GETNEXTSIBLING Function on page 154-77	Retrieves the next sibling of the node.
GETNODENAME Function on page 154-79	Retrieves the Name of the Node.
GETNODETYPE Function on page 154-78	Retrieves the Type of the node.
GETNODEVALUE Function on page 154-80	Retrieves the Value of the Node.
GETNODEVALUEASBINARYSTREAM Function & Procedure on page 154-81	Retrieves Node Value as binary stream.
GETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 154-82	Retrieves Node Value as character stream.
GETOWNERDOCUMENT Function on page 154-86	Retrieves the owner document of the node.
GETPARENTNODE Function on page 154-88	Retrieves the parent of this node.
GETPREFIX Function on page 154-89	Retrieves the namespace prefix.
GETPREVIOUSIBLING Function on page 154-90	Retrieves the previous sibling of the node.
GETSCHEMANODE Function on page 154-93	Retrieves the associated schema URI.
HASATTRIBUTES Function on page 154-102	Tests if the node has attributes.
HASCHILDNODES Function on page 154-103	Tests if the node has child nodes.
IMPORTNODE Function on page 154-105	Imports a node from another document.
INSERTBEFORE Function on page 154-106	Inserts a child before the reference child.
ISNULL Functions on page 154-108	Tests if the node is NULL
MAKEATTR Function on page 154-112	Casts the node to an Attribute.
MAKECDATASECTION Function on page 154-113	Casts the node to a CData Section.

Table 154–4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
MAKECHARACTERDATA Function on page 154-114	Casts the node to Character Data.
MAKECOMMENT Function on page 154-115	Casts the node to a Comment.
MAKEDOCUMENT Function on page 154-116	Casts the node to a DOM Document.
MAKEDOCUMENTFRAGMENT Function on page 154-117	Casts the node to a DOM Document Fragment.
MAKEDOCUMENTTYPE Function on page 154-118	Casts the node to a DOM Document Type.
MAKEELEMENT Function on page 154-119	Casts the node to a DOM Element.
MAKEENTITY Function on page 154-120	Casts the node to a DOM Entity.
MAKEENTITYREFERENCE Function on page 154-121	Casts the node to a DOM Entity Reference.
MAKENOTATION Function on page 154-125	Casts the node to a DOM Notation.
MAKEPROCESSINGINSTRUCTION Function on page 154-126	Casts the node to a DOM Processing Instruction.
MAKETEXT Function on page 154-127	Casts the node to a DOM Text.
REMOVECHILD Function on page 154-132	Removes a specified child from a node.
REPLACECHILD Function on page 154-134	Replaces the old child with a new child.
SETNODEVALUE Procedure on page 154-142	Sets the Value of the node.
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 154-143	Sets the Node Value as binary stream.
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 154-144	Sets the Node Value as a character stream
SETPREFIX Procedure on page 154-145	Sets the namespace prefix.
USEBINARYSTREAM Function on page 154-151	Establishes that the stream is valid.
WRITETOBUFFER Procedures on page 154-152	Writes the contents of the node to a buffer.
WRITETOCLOB Procedures on page 154-153	Writes the contents of the node to a CLOB.
WRITETOFILE Procedures on page 154-154	Writes the contents of the node to a file.

DOMAttr Subprograms

Table 154–5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions on page 154-68	Retrieves the expanded name of the attribute.
GETLOCALNAME Procedure and Functions on page 154-73	Retrieves the local name of the attribute.
GETNAME Functions on page 154-74	Retrieves the name of the attribute.
GETNAMESPACE Procedure and Functions on page 154-76	Retrieves the NS URI of the attribute.
GETOWNERELEMENT Function on page 154-87	Retrieves the Element node, parent of the attribute.
GETQUALIFIEDNAME Functions on page 154-92	Retrieves the Qualified Name of the attribute.
GETSPECIFIED Function on page 154-94	Tests if attribute was specified in the element.
GETVALUE Function on page 154-98	Retrieves the value of the attribute.
ISNULL Functions on page 154-108	Tests if the Attribute node is NULL.
MAKENODE Functions on page 154-122	Casts the Attribute to a node.
SETVALUE Procedure on page 154-147	Sets the value of the attribute.

DOMCDataSection Subprograms

Table 154–6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 154-108	Tests if the CDataSection is NULL.
MAKENODE Functions on page 154-122	Casts the CDataSection to a node.

DOMCharacterData Subprograms

Table 154–7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure on page 154-41	Appends the given data to the node data.
DELETEDATA Procedure on page 154-52	Deletes the data from the given offSets.
GETDATA Functions on page 154-63	Retrieves the data of the node.
GETLENGTH Functions on page 154-72	Retrieves the length of the data.
INSERTDATA Procedure on page 154-107	Inserts the data in the node at the given offSets.
ISNULL Functions on page 154-108	Tests if the CharacterData is NULL.
MAKENODE Functions on page 154-122	Casts the CharacterData to a node.
REPLACEDATA Procedure on page 154-135	Changes a range of characters in the node.
SETDATA Procedures on page 154-139	Sets the data to the node.
SUBSTRINGDATA Function on page 154-150	Retrieves the substring of the data.

DOMComment Subprograms

Table 154–8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 154-108	Tests if the comment is NULL.
MAKENODE Functions on page 154-122	Casts the Comment to a node.

DOMDocument Subprograms

Table 154–9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions on page 154-43	Creates an Attribute.
CREATEDATASECTION Function on page 154-44	Creates a <code>CDataSection</code> node.
CREATECOMMENT Function on page 154-45	Creates a Comment node.
CREATEDOCUMENT Function on page 154-46	Creates a new Document.
CREATEDOCUMENTFRAGMENT Function on page 154-47	Creates a new Document Fragment.
CREATEELEMENT Functions on page 154-48	Creates a new Element.
CREATEENTITYREFERENCE Function on page 154-49	Creates an Entity reference.
CREATEPROCESSINGINSTRUCTION Function on page 154-50	Creates a Processing Instruction.
CREATETEXTNODE Function on page 154-51	Creates a Text node.
FREEDOCFRAG Procedure on page 154-55	Frees the document fragment.
FREEDOCUMENT Procedure on page 154-56	Frees the document.
GETDOCTYPE Function on page 154-64	Retrieves the DTD of the document.
GETDOCUMENTELEMENT Function on page 154-65	Retrieves the root element of the document.
GETELEMENTSBYTAGNAME Functions on page 154-66	Retrieves the elements in the by tag name.
GETIMPLEMENTATION Function on page 154-70	Retrieves the DOM implementation.
GETSTANDALONE Function on page 154-95	Retrieves the standalone property of the document.
GETVERSION Function on page 154-99	Retrieves the version of the document.
GETXMLTYPE Function on page 154-100	Retrieves the <code>XMLType</code> associated with the DOM Document.
ISNULL Functions on page 154-108	Tests if the document is <code>NULL</code> .
MAKENODE Functions on page 154-122	Casts the document to a node.
NEWDOMDOCUMENT Functions on page 154-128	Creates a new document.
SETDOCTYPE Procedure on page 154-140	Sets the DTD of the document.
SETSTANDALONE Procedure on page 154-146	Sets the standalone property of the document.
SETVERSION Procedure on page 154-148	Sets the version of the document.
WRITETOBUFFER Procedures on page 154-152	Writes the document to a buffer.
WRITETOCLOB Procedures on page 154-153	Writes the document to a <code>CLOB</code> .

Table 154–9 (Cont.) Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
WRITETOFILE Procedures on page 154-154	Writes the document to a file.

DOMDocumentFragment Subprograms

Table 154–10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure on page 154-55	Frees the specified document fragment.
ISNULL Functions on page 154-108	Tests if the DocumentFragment is NULL .
MAKENODE Functions on page 154-122	Casts the Document Fragment to a node.
WRITETOBUFFER Procedures on page 154-152	Writes the contents of a document fragment into a buffer.

DOMDocumentType Subprograms

Table 154–11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function on page 154-53	Finds the specified entity in the document type.
FINDNOTATION Function on page 154-54	Finds the specified notation in the document type.
GETENTITIES Function on page 154-67	Retrieves the nodemap of entities in the Document type.
GETNAME Functions on page 154-74	Retrieves the name of the Document type.
GETNOTATIONS Function on page 154-84	Retrieves the nodemap of the notations in the Document type.
GETPUBLICID Functions on page 154-91	Retrieves the public ID of the document type.
GETSYSTEMID Functions on page 154-96	Retrieves the system ID of the document type.
ISNULL Functions on page 154-108	Tests if the Document Type is <code>NULL</code> .
MAKENODE Functions on page 154-122	Casts the document type to a node.

DOMElement Subprograms

Table 154–12 Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
GETATTRIBUTE Functions on page 154-58	Retrieves the attribute node by name.
GETATTRIBUTENODE Functions on page 154-59	Retrieves the attribute node by name.
GETCHILDRENBYTAGNAME Functions on page 154-62	Retrieves children of the element by tag name.
GETELEMENTSBYTAGNAME Functions on page 154-66	Retrieves elements in the subtree by tagname.
GETEXPANDEDNAME Procedure and Functions on page 154-68	Retrieves the expanded name of the element.
GETLOCALNAME Procedure and Functions on page 154-73	Retrieves the local name of the element.
GETNAMESPACE Procedure and Functions on page 154-76	Retrieves the NS URI of the element.
GETQUALIFIEDNAME Functions on page 154-92	Retrieves the qualified name of the element.
GETTAGNAME Function on page 154-97	Retrieves the Tag name of the element.
HASATTRIBUTE Functions on page 154-101	Tests if an attribute exists.
ISNULL Functions on page 154-108	Tests if the Element is <code>NULL</code> .
MAKENODE Functions on page 154-122	Casts the Element to a node.
NORMALIZE Procedure on page 154-129	Normalizes the text children of the element.
REMOVEATTRIBUTE Procedures on page 154-130	Removes the attribute specified by the name.
REMOVEATTRIBUTENODE Function on page 154-131	Removes the attribute node in the element.
RESOLVENAMESPACEPREFIX Function on page 154-136	Resolve the prefix to a namespace URI.
SETATTRIBUTE Procedures on page 154-137	Sets the attribute specified by the name.
SETATTRIBUTENODE Functions on page 154-138	Sets the attribute node in the element.

DOMEntity Subprograms

Table 154–13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function on page 154-83	Retrieves the notation name of the entity.
GETPUBLICID Functions on page 154-91	Retrieves the public Id of the entity.
GETSYSTEMID Functions on page 154-96	Retrieves the system Id of the entity.
ISNULL Functions on page 154-108	Tests if the Entity is NULL.
MAKENODE Functions on page 154-122	Casts the Entity to a node.

DOMEntityReference Subprograms

Table 154–14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 154-108	Tests if the DOMEntityReference is NULL.
MAKENODE Functions on page 154-122	Casts the DOMEntityReference to NULL.

DOMImplementation Subprograms

Table 154–15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 154-108	Tests if the DOMImplementation node is NULL.
HASFEATURE Function on page 154-104	Tests if the DOMImplementation implements a feature.

DOMNamedNodeMap Subprograms

Table 154–16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions on page 154-72	Retrieves the number of items in the map.
GETNAMEDITEM Function on page 154-75	Retrieves the item specified by the name.
ISNULL Functions on page 154-108	Tests if the NamedNodeMap is NULL.
ITEM Functions on page 154-111	Retrieves the item given the index in the map.
REMOVENAMEDITEM Function on page 154-133	Removes the item specified by name.
SETNAMEDITEM Function on page 154-141	Sets the item in the map specified by the name.

DOMNodeList Subprograms

Table 154–17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions on page 154-72	Retrieves the number of items in the list.
ISNULL Functions on page 154-108	Tests if the <code>NodeList</code> is <code>NULL</code> .
ITEM Functions on page 154-111	Retrieves the item given the index in the <code>NodeList</code> .

DOMNotation Subprograms

Table 154–18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions on page 154-91	Retrieves the public Id of the notation.
GETSYSTEMID Functions on page 154-96	Retrieves the system Id of the notation.
ISNULL Functions on page 154-108	Tests if the Notation is NULL .
MAKENODE Functions on page 154-122	Casts the notation to a node.

DOMProcessingInstruction Subprograms

Table 154–19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions on page 154-63	Retrieves the data of the processing instruction.
GETTARGET Function on page 154-85	Retrieves the target of the processing instruction.
ISNULL Functions on page 154-108	Tests if the Processing Instruction is NULL.
MAKENODE Functions on page 154-122	Casts the Processing Instruction to a node.
SETDATA Procedures on page 154-139	Sets the data of the processing instruction.

DOMText Subprograms

Table 154–20 *Summary of DOMText Subprograms; DBMS_XMLDOM*

Method	Description
ISNULL Functions on page 154-108	Tests if the text is NULL.
MAKENODE Functions on page 154-122	Casts the text to a node.
SPLITTEXT Function on page 154-149	Splits the contents of the text node into 2 text nodes.

Summary of DBMS_XMLDOM Subprograms

Table 154–21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function on page 154-39	Adopts a node from another document	DOMNode Subprograms on page 154-10
APPENDCHILD Function on page 154-40	Appends a new child to the node	DOMNode Subprograms on page 154-10
APPENDDATA Procedure on page 154-41	Appends the given data to the node data	DOMCharacterData Subprograms on page 154-14
CLONENODE Function on page 154-42	Clones the node	DOMNode Subprograms on page 154-10
CREATEATTRIBUTE Functions on page 154-43	Creates an Attribute	DOMDocument Subprograms on page 154-16
CREATECDATASECTION Function on page 154-44	Creates a <code>CDataSection</code> node	DOMDocument Subprograms on page 154-16
CREATECOMMENT Function on page 154-45	Creates a Comment node	DOMDocument Subprograms on page 154-16
CREATEDOCUMENT Function on page 154-46	Creates a new Document	DOMDocument Subprograms on page 154-16
CREATEDOCUMENTFRAGMENT Function on page 154-47	Creates a new Document Fragment	DOMDocument Subprograms on page 154-16
CREATEELEMENT Functions on page 154-48	Creates a new Element	DOMDocument Subprograms on page 154-16
CREATEENTITYREFERENCE Function on page 154-49	Creates an Entity reference	DOMDocument Subprograms on page 154-16
CREATEPROCESSINGINSTRUCTION Function on page 154-50	Creates a Processing Instruction	DOMDocument Subprograms on page 154-16
CREATETEXTNODE Function on page 154-51	Creates a Text node	DOMDocument Subprograms on page 154-16
DELETEDATA Procedure on page 154-52	Deletes the data from the given offsets	DOMCharacterData Subprograms on page 154-14
FINDENTITY Function on page 154-53	Finds the specified entity in the document type	DOMDocumentType Subprograms on page 154-19
FINDNOTATION Function on page 154-54	Finds the specified notation in the document type	DOMDocumentType Subprograms on page 154-19

Table 154–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
FREEDOCFRAG Procedure on page 154-55	Frees the document fragment	DOMDocument Subprograms on page 154-16 and DOMDocumentFragment Subprograms on page 154-18
FREEDOCUMENT Procedure on page 154-56	Frees the document	DOMDocument Subprograms on page 154-16
FREENODE Procedure on page 154-57	Frees all resources associated with the node	DOMNode Subprograms on page 154-10
GETATTRIBUTE Functions on page 154-58	Retrieves the attribute node by name	DOMELEMENT Subprograms on page 154-20
GETATTRIBUTENODE Functions on page 154-59	Retrieves the attribute node by name	DOMELEMENT Subprograms on page 154-20
GETATTRIBUTES Function on page 154-60	Retrieves the attributes of the node	DOMNode Subprograms on page 154-10
GETCHILDNODES Function on page 154-61	Retrieves the children of the node	DOMNode Subprograms on page 154-10
GETCHILDRENBYTAGNAME Functions on page 154-62	Retrieves children of the element by tag name	DOMCharacterData Subprograms on page 154-14
GETDATA Functions on page 154-63	Retrieves <ul style="list-style-type: none"> ▪ the data of the node ▪ the data of the processing instruction 	<ul style="list-style-type: none"> ▪ DOMCharacterData Subprograms on page 154-14 ▪ DOMProcessingInstruction Subprograms on page 154-27
GETDOCTYPE Function on page 154-64	Retrieves the DTD of the document	DOMDocument Subprograms on page 154-16
GETDOCUMENTELEMENT Function on page 154-65	Retrieves the root element of the document	DOMDocument Subprograms on page 154-16
GETELEMENTSBYTAGNAME Functions on page 154-66	Retrieves <ul style="list-style-type: none"> ▪ the elements in the by tag name ▪ elements in the subtree by tagname 	<ul style="list-style-type: none"> ▪ DOMDocument Subprograms on page 154-16 ▪ DOMELEMENT Subprograms on page 154-20
GETENTITIES Function on page 154-67	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms on page 154-19

Table 154–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETEXPANDEDNAME Procedure and Functions on page 154-68	Retrieves <ul style="list-style-type: none"> ▪ the expanded name of the node ▪ the expanded name of the attribute ▪ the expanded name of the element 	<ul style="list-style-type: none"> ▪ DOMNode Subprograms on page 154-10 ▪ DOMAttr Subprograms on page 154-12 ▪ DOMElement Subprograms on page 154-20
GETFIRSTCHILD Function on page 154-69	Retrieves the first child of the node	DOMNode Subprograms on page 154-10
GETIMPLEMENTATION Function on page 154-70	Retrieves the DOM implementation	DOMDocument Subprograms on page 154-16
GETLASTCHILD Function on page 154-71	Retrieves the last child of the node	DOMNode Subprograms on page 154-10
GETLENGTH Functions on page 154-72	Retrieves <ul style="list-style-type: none"> ▪ the length of the data ▪ the number of items in the map ▪ the number of items in the list 	<ul style="list-style-type: none"> ▪ DOMCharacterData Subprograms on page 154-14 ▪ DOMNamedNodeMap Subprograms on page 154-24 ▪ DOMNodeList Subprograms on page 154-25
GETLOCALNAME Procedure and Functions on page 154-73	Retrieves <ul style="list-style-type: none"> ▪ the local part of the qualified name ▪ the local name of the attribute ▪ the local name of the element 	<ul style="list-style-type: none"> ▪ DOMNode Subprograms on page 154-10 ▪ DOMAttr Subprograms on page 154-12 ▪ DOMElement Subprograms on page 154-20
GETNAME Functions on page 154-74	Retrieves <ul style="list-style-type: none"> ▪ the name of the attribute ▪ the name of the Document type 	<ul style="list-style-type: none"> ▪ DOMAttr Subprograms on page 154-12 ▪ DOMDocumentType Subprograms on page 154-19
GETNAMEDITEM Function on page 154-75	Retrieves <ul style="list-style-type: none"> ▪ an item specified by name ▪ and namespace URI on page 154-24) 	<ul style="list-style-type: none"> ▪ DOMNamedNodeMap Subprograms on page 154-24 ▪ DOMNamedNodeMap Subprograms

Table 154–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETNAMESPACE Procedure and Functions on page 154-76	Retrieves <ul style="list-style-type: none"> ▪ the node's namespace URI ▪ the NS URI of the attribute ▪ the NS URI of the element 	<ul style="list-style-type: none"> ▪ DOMNode Subprograms on page 154-10 ▪ DOMAttr Subprograms on page 154-12 ▪ DOMElement Subprograms on page 154-20
GETNEXTSIBLING Function on page 154-77	Retrieves the next sibling of the node	DOMNode Subprograms on page 154-10
GETNODENAME Function on page 154-79	Retrieves the Name of the Node	DOMNode Subprograms on page 154-10
GETNODETYPE Function on page 154-78	Retrieves the Type of the node	DOMNode Subprograms on page 154-10
GETNODEVALUE Function on page 154-80	Retrieves the Value of the Node	DOMNode Subprograms on page 154-10
GETNODEVALUEASBINARY STREAM Function & Procedure on page 154-81	Retrieves the Node Value as binary stream	DOMNode Subprograms on page 154-10
GETNODEVALUEASCHARACTER STREAM Function & Procedure on page 154-82	Retrieves the Node Value as character stream	DOMNode Subprograms on page 154-10
GETNOTATIONNAME Function on page 154-83	Retrieves the notation name of the entity	DOMEntity Subprograms on page 154-21
GETNOTATIONS Function on page 154-84	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms on page 154-19
GETTARGET Function on page 154-85	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms on page 154-27
GETOWNERDOCUMENT Function on page 154-86	Retrieves the owner document of the node	DOMNode Subprograms on page 154-10
GETOWNERELEMENT Function on page 154-87	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms on page 154-12
GETPARENTNODE Function on page 154-88	Retrieves the parent of this node	DOMNode Subprograms on page 154-10
GETPREFIX Function on page 154-89	Retrieves the namespace prefix)	DOMNode Subprograms on page 154-10
GETPREVIOUS SIBLING Function on page 154-90	Retrieves the previous sibling of the node	DOMNode Subprograms on page 154-10
GETPUBLICID Functions on page 154-91	Retrieves <ul style="list-style-type: none"> ▪ the public ID of the document type ▪ the public Id of the entity ▪ the public Id of the notation 	<ul style="list-style-type: none"> ▪ DOMDocumentType Subprograms on page 154-19 ▪ DOMEntity Subprograms on page 154-21 ▪ DOMNotation Subprograms on page 154-26

Table 154–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETQUALIFIEDNAME Functions on page 154-92	Retrieves <ul style="list-style-type: none"> ▪ the Qualified Name of the attribute ▪ the qualified name of the element 	<ul style="list-style-type: none"> ▪ DOMAttr Subprograms on page 154-12 ▪ DOMELEMENT Subprograms on page 154-20
GETSCHEMANODE Function on page 154-93	Retrieves the associated schema URI	DOMNode Subprograms on page 154-10
GETSPECIFIED Function on page 154-94	Tests if attribute was specified in the element.	DOMAttr Subprograms on page 154-12
GETSTANDALONE Function on page 154-95	Retrieves the standalone property of the document	DOMDocument Subprograms on page 154-16
GETSYSTEMID Functions on page 154-96	Retrieves <ul style="list-style-type: none"> ▪ the system ID of the document type ▪ the system Id of the entity ▪ the system Id of the notation 	<ul style="list-style-type: none"> ▪ DOMDocumentType Subprograms on page 154-19 ▪ DOMEntity Subprograms on page 154-21 ▪ DOMNotation Subprograms on page 154-26

MAKETEXT Function on page 154-127	Casts the node to a DOM Text	DOMNode Subprograms on page 154-10
NEWDOMDOCUMENT Functions on page 154-128	Creates a new document	DOMDocument Subprograms on page 154-16
NORMALIZE Procedure on page 154-129	Normalizes the text children of the element	DOMElement Subprograms on page 154-20

Table 154–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVEATTRIBUTE Procedures on page 154-130	Removes the attribute specified by the name	DOMElement Subprograms on page 154-20
REMOVEATTRIBUTENODE Function on page 154-131	Removes the attribute node in the element	DOMElement Subprograms on page 154-20
REMOVECHILD Function on page 154-132	Removes a specified child from a node	DOMNode Subprograms on page 154-10
REMOVENAMEDITEM Function on page 154-133	Removes the item specified by name	DOMNamedNodeMap Subprograms on page 154-24
REPLACECHILD Function on page 154-134	Replaces the old child with a new child	DOMNode Subprograms on page 154-10
REPLACEDATA Procedure on page 154-135	Changes a range of characters in the node	DOMCharacterData Subprograms on page 154-14
RESOLVENAMESPACEPREFIX Function on page 154-136	Resolve the prefix to a namespace URI	DOMElement Subprograms on page 154-20
SETATTRIBUTE Procedures on page 154-137	Sets the attribute specified by the name	DOMElement Subprograms on page 154-20
SETATTRIBUTENODE Functions on page 154-138	Sets the attribute node in the element	DOMElement Subprograms on page 154-20
SETDATA Procedures on page 154-139	Sets <ul style="list-style-type: none"> ■ the data to the node ■ the data of the processing instruction 	<ul style="list-style-type: none"> ■ DOMCharacterData Subprograms on page 154-14 ■ DOMProcessingInstruction Subprograms on page 154-27
SETDOCTYPE Procedure on page 154-140	Sets the DTD of the document.	DOMDocument Subprograms on page 154-16
SETNAMEDITEM Function on page 154-141	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms on page 154-24
SETNODEVALUE Procedure on page 154-142	Sets the Value of the node	DOMNode Subprograms on page 154-10
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 154-143	Sets the Node Value as a binary stream	DOMNode Subprograms on page 154-10
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 154-144	Sets the Node Value as a character stream	DOMNode Subprograms on page 154-10
SETPREFIX Procedure on page 154-145	Sets the namespace prefix	DOMNode Subprograms on page 154-10
SETSTANDALONE Procedure on page 154-146	Sets the standalone property of the document	DOMDocument Subprograms on page 154-16

Table 154–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
SETVALUE Procedure on page 154-147	Sets the value of the attribute	DOMAttr Subprograms on page 154-12
SETVERSION Procedure on page 154-148	Sets the version of the document	DOMDocument Subprograms on page 154-16
SPLITTEXT Function on page 154-149	Splits the contents of the text node into 2 text nodes	DOMText Subprograms on page 154-28
SUBSTRINGDATA Function on page 154-150	Retrieves the substring of the data	DOMCharacterData Subprograms on page 154-14
USEBINARYSTREAM Function on page 154-151	Estrablishes that the stream is valid for use	DOMNode Subprograms on page 154-10
WRITETOBUFFER Procedures on page 154-152	Writes <ul style="list-style-type: none"> ▪ the contents of the node to a buffer ▪ the document to a buffer ▪ the contents of a document fragment into a buffer 	<ul style="list-style-type: none"> ▪ DOMNode Subprograms on page 154-10 ▪ DOMDocument Subprograms on page 154-16 ▪ DOMDocumentFragment Subprograms on page 154-18
WRITETOCLOB Procedures on page 154-153	Writes <ul style="list-style-type: none"> ▪ the contents of the node to a CLOB ▪ the document to a CLOB 	<ul style="list-style-type: none"> ▪ DOMNode Subprograms on page 154-10 ▪ DOMDocument Subprograms on page 154-16
WRITETOFILE Procedures on page 154-154	Writes <ul style="list-style-type: none"> ▪ the contents of the node to a file ▪ the document to a file 	<ul style="list-style-type: none"> ▪ DOMNode Subprograms on page 154-10 ▪ DOMDocument Subprograms on page 154-16

ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

See Also: [DOMNode Subprograms](#) on page 154-10 for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(  
    doc          IN  DOMDocument,  
    importedNode IN  DOMNode)  
RETURN DOMNODE;
```

Parameters

Table 154–22 *ADOPTNODE Function Parameters*

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.APPENDCHILD(  
    n          IN      DOMNode,  
    newchild  IN      DOMNode)  
RETURN DOMNODE;
```

Parameters

Table 154–23 APPENDCHILD Function Parameters

Parameter	Description
<code>n</code>	DOMNode
<code>newchild</code>	The child to be appended to the list of children of node <code>n</code>

APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also: [DOMCharacterData Subprograms](#) on page 154-14

Syntax

```
DBMS_XMLDOM.APPENDDATA (  
  cd      IN      DOMCHARACTERDATA,  
  arg     IN      VARCHAR2);
```

Parameters

Table 154–24 APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.CLONENODE (  
    n          IN    DOMNODE,  
    deep       IN    BOOLEAN)  
RETURN DOMNODE;
```

Parameters

Table 154–25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN   DOMDOCUMENT,
  name     IN   VARCHAR2)
RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE (
  doc      IN   DOMDOCUMENT,
  qname    IN   VARCHAR2,
  ns       IN   VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 154–26 CREATEATTRIBUTE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(  
  doc      IN      DOMDOCUMENT,  
  data     IN      VARCHAR2)  
RETURN DOMCDATASECTION;
```

Parameters

Table 154–27 CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATECOMMENT (  
    doc      IN      DOMDOCUMENT,  
    data     IN      VARCHAR2)  
RETURN DOMCOMMENT;
```

Parameters

Table 154–28 *CREATECOMMENT Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(  
  namespaceURI      IN      VARCHAR2,  
  qualifiedName     IN      VARCHAR2,  
  doctype           IN      DOMTYPE := NULL)  
RETURN DOMDOCUMENT;
```

Parameters

Table 154–29 *CREATEDOCUMENT Function Parameters*

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 154–30 *CREATEDOCUMENTFRAGMENT Function Parameters*

Parameter	Description
doc	DOMDocument

CREATEELEMENT Functions

This function creates a DOMELEMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

Creates a DOMELEMENT with specified name:

```
DBMS_XMLDOM.CREATEELEMENT (  
    doc          IN      DOMDOCUMENT,  
    tagName     IN      VARCHAR2)  
RETURN DOMELEMENT;
```

Creates a DOMELEMENT with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT (  
    doc          IN      DOMDOCUMENT,  
    tagName     IN      VARCHAR2,  
    ns          IN      VARCHAR2)  
RETURN DOMELEMENT;
```

Parameters

Table 154–31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

CREATEENTITYREFERENCE Function

This function creates a DOENTITYREFERENCE node.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE (  
    doc          IN      DOMDOCUMENT,  
    name        IN      VARCHAR2)  
RETURN DOENTITYREFERENCE;
```

Parameters

Table 154–32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(  
  doc      IN      DOMDocument,  
  target   IN      VARCHAR2,  
  data     IN      VARCHAR2)  
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 154–33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE (  
  doc      IN      DOMDocument,  
  data     IN      VARCHAR2)  
RETURN DOMTEXT;
```

Parameters

Table 154–34 *CREATETEXTNODE Function Parameters*

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also: [DOMCharacterData Subprograms](#) on page 154-14

Syntax

```
DBMS_XMLDOM.DELETEDATA (  
  cd          IN      DOMCHARACTERDATA,  
  offset      IN      NUMBER,  
  cnt         IN      NUMBER);
```

Parameters

Table 154–35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

FINDENTITY Function

This function finds an entity in the given DTD, and returns that entity if found.

See Also: [DOMDocumentType Subprograms](#) on page 154-19

Syntax

```
DBMS_XMLDOM.FINDENTITY (  
    dt      IN      DOMDOCUMENTTYPE,  
    name    IN      VARCHAR2,  
    par     IN      BOOLEAN)  
RETURN DUMENTITY;
```

Parameters

Table 154–36 *FINDENTITY Function Parameters*

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

FINDNOTATION Function

This function finds the notation in the given DTD, and returns it, if found.

See Also: [DOMDocumentType Subprograms](#) on page 154-19

Syntax

```
DBMS_XMLDOM.FINDNOTATION(  
    dt          IN      DOMDocumentType,  
    name       IN      VARCHAR2)  
RETURN DOMNOTATION;
```

Parameters

Table 154–37 *FINDNOTATION Function Parameters*

Parameter	Description
dt	The DTD
name	The notation to find

FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

See Also: [DOMDocument Subprograms](#) on page 154-16 and [DOMDocumentFragment Subprograms](#) on page 154-18

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG (  
    df      IN      DOMDOCUMENTFRAGMENT) ;
```

Parameters

Table 154–38 *FREEDOCFRAG Procedure Parameters*

Parameter	Description
df	DOM document fragment

FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT (  
    doc      IN      DOMDOCUMENT);
```

Parameters

Table 154–39 *FREEDOCUMENT Procedure Parameters*

Parameter	Description
doc	DOMDOCUMENT

FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.FREENODE (  
    n          IN      DOMNODE);
```

Parameters

Table 154–40 *FREENODE Procedure Parameters*

Parameter	Description
n	DOMNODE

GETATTRIBUTE Functions

This function returns the value of a DOMELEMENT's attribute by name.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE (  
    elem      IN      DOMELEMENT,  
    name      IN      VARCHAR2,  
    ns        IN      VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 154–41 *GETATTRIBUTE Function Parameters*

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

GETATTRIBUTENODE Functions

This function returns an attribute node from the `DOMELEMENT` by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also: [DOMElement Subprograms](#) on page 154-20

Syntax

Returns an attribute node from the `DOMELEMENT` by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2)
RETURN DOMATTR;
```

Returns an attribute node from the `DOMELEMENT` by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE (
    elem      IN      DOMELEMENT,
    name      IN      VARCHAR2,
    ns        IN      VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 154–42 *GETATTRIBUTENODE Function Parameters*

Parameter	Description
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Attribute name; * matches any attribute
<code>ns</code>	Namespace

GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(  
    n          IN          DOMNode)  
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 154–43 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(  
    n          IN      DOMNode)  
RETURN DOMNodeList;
```

Parameters

Table 154–44 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNode

GETCHILDRENBYTAGNAME Functions

This function returns the children of the DOMELEMENT.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

Returns children of the DOMELEMENT given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME (
  elem      IN      DOMELEMENT,
  name      IN      VARCHAR2,
  ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 154–45 *GETCHILDRENBYTAGNAME Function Parameters*

Parameter	Description
elem	The DOMELEMENT
name	Tag name
ns	Namespace

GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#) on page 154-14):

```
DBMS_XMLDOM.GETDATA (
    cd      IN  DOMCHARACTERDATA)
RETURN VARCHAR2;
```

Returns the content data of the DOMProcessingInstruction (See Also: [DOMProcessingInstruction Subprograms](#) on page 154-27):

```
DBMS_XMLDOM.GETDATA (
    pi      IN  DOMPROCESSINGINSTRUCTION)
RETURN VARCHAR2;
```

Parameters

Table 154–46 *GETDATA Function Parameters*

Parameter	Description
cd	DOMCHARACTERDATA
pi	The DOMPROCESSINGINSTRUCTION

GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(  
    doc          IN      DOMDOCUMENT)  
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 154–47 *GETDOCTYPE Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT (  
    doc      IN      DOMDOCUMENT)  
RETURN DOMELEMENT;
```

Parameters

Table 154–48 *GETDOCUMENTELEMENT Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a `DOMNODELIST` of all the elements with a given tagname (See Also: [DOMDocument Subprograms](#) on page 154-16):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    doc          IN      DOMDOCUMENT,
    tagname      IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name (See Also: [DOMElement Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem        IN      DOMELEMENT,
    name        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Returns the element children of the `DOMELEMENT` given the tag name and namespace (See Also: [DOMElement Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME (
    elem        IN      DOMELEMENT,
    name        IN      VARCHAR2,
    ns          IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 154–49 *GETELEMENTSBYTAGNAME Function Parameters*

Parameter	Description
<code>doc</code>	<code>DOMDOCUMENT</code>
<code>tagname</code>	Name of the tag to match on
<code>elem</code>	The <code>DOMELEMENT</code>
<code>name</code>	Tag name; using a wildcard(*) would match any tag
<code>ns</code>	Namespace

GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

See Also: [DOMDocumentType Subprograms](#) on page 154-19

Syntax

```
DBMS_XMLDOM.GETENTITIES(  
    dt          IN      DOMDocumentType)  
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 154–50 *GETENTITIES Function Parameters*

Parameter	Description
dt	DOMDOCUMENTTYPE

GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if it is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: [DOMNode Subprograms](#) on page 154-10)

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    n          IN      DOMNODE
    data       OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    a          IN      DOMAttr)
RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: [DOMElement Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.GETEXPANDEDNAME (
    elem       IN      DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 154–51 *GETEXPANDEDNAME Procedure and Function Parameters*

Parameter	Description
n	DOMNODE
data	Returned expanded name of the <code>Node</code>
a	DOMATTR
elem	DOMELEMENT

GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(  
    n          IN          DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 154–52 *GETFIRSTCHILD Function Parameters*

Parameter	Description
n	DOMNODE

GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(  
    doc      IN      DOMDOCUMENT)  
RETURN DOMIMPLEMENTATION;
```

Parameters

Table 154–53 *GETIMPLEMENTATION Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(  
    n      IN  DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 154–54 *GETLASTCHILD Function Parameters*

Parameter	Description
n	DOMNODE

GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because `CharacterData` nodes may be empty (See Also: [DOMCharacterData Subprograms](#) on page 154-14):

```
DBMS_XMLDOM.GETLENGTH (
    cd      IN      DOMCHARACTERDATA)
RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is 0 to `length-1`, inclusive (See Also: [DOMNamedNodeMap Subprograms](#) on page 154-24):

```
DBMS_XMLDOM.GETLENGTH (
    nnm     IN      DOMNAMEDNODEMAP)
RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is 0 to `length-1`, inclusive (See Also: [DOMNodeList Subprograms](#) on page 154-25):

```
DBMS_XMLDOM.GETLENGTH (
    nl      IN      DOMNODELIST)
RETURN NUMBER;
```

Parameters

Table 154–55 *GETLENGTH Function Parameters*

Parameter	Description
<code>cd</code>	<code>DOMCHARACTERDATA</code>
<code>nnm</code>	<code>DOMNAMEDNODEMAP</code>
<code>nl</code>	<code>DOMNODELIST</code>

GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: [DOMNode Subprograms](#) on page 154-10):

```
DBMS_XMLDOM.GETLOCALNAME (
  n          IN    DOMNODE,
  data       OUT   VARCHAR2);
```

Returns the local name of the DOMAttr (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.GETLOCALNAME (
  a          IN    DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) on page 154-20)

```
DBMS_XMLDOM.GETLOCALNAME (
  elem       IN    DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 154–56 *GETLOCALNAME Procedure and Function Parameters*

Parameter	Description
n	DOMNode
data	Returned local name.
a	DOMAttr.
elem	DOMELEMENT.

GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the name of this attribute (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.GETNAME (  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the DOCTYPE keyword (See Also: [DOMDocumentType Subprograms](#) on page 154-19):

```
DBMS_XMLDOM.GETNAME (  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN VARCHAR2;
```

Parameters

Table 154–57 *GETNAME Function Parameters*

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

GETNAMEDITEM Function

This function retrieves a node specified by name.

See Also: [DOMNamedNodeMap Subprograms](#) on page 154-24

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM (
  nnm      IN  DOMNAMEDNODEMAP,
  name     IN  VARCHAR2)
RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM (
  nnm      IN  DOMNAMEDNODEMAP,
  name     IN  VARCHAR2,
  ns       IN  VARCHAR2)
RETURN DOMNODE;
```

Parameters

Table 154–58 *GETNAMEDITEM Function Parameters*

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: [DOMNode Subprograms](#) on page 154-10):

```
DBMS_XMLDOM.GETNAMESPACE (
    n          IN    DOMNODE,
    data      OUT   VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.GETNAMESPACE (
    a          IN    DOMATTR)
RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.GETNAMESPACE (
    elem      IN    DOMELEMENT)
RETURN VARCHAR2;
```

Parameters

Table 154–59 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns NULL.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(  
    n          IN      DOMNODE)  
RETURN DOMNode;
```

Parameters

Table 154–60 *GETNEXTSIBLING Function Parameters*

Parameter	Description
n	DOMNODE

GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETNODETYPE (  
    n          IN      DOMNODE)  
RETURN NUMBER;
```

Parameters

Table 154–61 *GETNODETYPE Function Parameters*

Parameter	Description
n	DOMNODE

GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETNODENAME (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

Parameters

Table 154–62 *GETNODENAME Function Parameters*

Parameter	Description
n	DOMNODE

GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETNODEVALUE (  
    n          IN      DOMNODE)  
RETURN VARCHAR2;*
```

Parameters

Table 154–63 *GETNODEVALUE Function Parameters*

Parameter	Description
n	DOMNODE

GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node data type must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n      IN      DOMNODE)
RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The data type of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
    n      in      DOMNODE,
    value  in      SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 154–64 *GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters*

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 154–65 *GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters*

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

GETNOTATIONNAME Function

This function returns the notation name of the `DOENTITY`.

See Also: [DOMEntity Subprograms](#) on page 154-21

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(  
    ent      IN      DOENTITY)  
RETURN VARCHAR2;
```

Parameters

Table 154–66 *GETNOTATIONNAME Function Parameters*

Parameter	Description
ent	DOENTITY

GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also: [DOMDocumentType Subprograms](#) on page 154-19

Syntax

```
DBMS_XMLDOM.GETNOTATIONS (  
    dt          IN      DOMDOCUMENTTYPE)  
RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 154–67 *GETNOTATIONS Function Parameters*

Parameter	Description
dt	DOMDOCUMENTTYPE

GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

See Also: [DOMProcessingInstruction Subprograms](#) on page 154-27

Syntax

```
DBMS_XMLDOM.GETTARGET (  
    pi          IN      DOMPROCESSINGINSTRUCTION)  
RETURN VARCHAR2;
```

Parameters

Table 154–68 *GETTARGET Function Parameters*

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENT;
```

Parameters

Table 154–69 *GETOWNERDOCUMENT Function Parameters*

Parameter	Description
n	DOMNODE

GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: [DOMAttr Subprograms](#) on page 154-12

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(  
    a          IN      DOMATTR)  
RETURN DOMELEMENT;
```

Parameters

Table 154–70 *GETOWNERELEMENT Function Parameters*

Parameter	Description
a	Attribute

GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETPARENTNODE (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 154–71 *GETPARENTNODE Function Parameters*

Parameter	Description
n	DOMNODE

GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETPREFIX(  
    n          IN      DOMNODE)  
RETURN VARCHAR2;
```

Parameters

Table 154–72 *GETPREFIX Function Parameters*

Parameter	Description
n	DOMNODE

GETPREVIOUSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns NULL.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETPREVIOUSIBLING(  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 154–73 *GETPREVIOUSIBLING Function Parameters*

Parameter	Description
n	DOMNODE

GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the given DTD (See Also: [DOMDocumentType Subprograms](#) on page 154-19):

```
DBMS_XMLDOM.GETPUBLICID (
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the public identifier of the DUMENTITY (See Also: [DOMEntity Subprograms](#) on page 154-21):

```
DBMS_XMLDOM.GETPUBLICID (
    ent        IN      DUMENTITY)
RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: [DOMNotation Subprograms](#) on page 154-26):

```
DBMS_XMLDOM.GETPUBLICID (
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 154–74 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the DOMATTR (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Returns the qualified name of the DOMELEMENT (See Also: [DOMELEMENT Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.GETQUALIFIEDNAME (  
    elem      IN      DOMELEMENT)  
RETURN VARCHAR2;
```

Parameters

Table 154–75 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE (  
    n          IN      DOMNODE)  
RETURN DOMNODE;
```

Parameters

Table 154–76 *GETSCHEMANODE Function Parameters*

Parameter	Description
n	DOMNODE

GETSPECIFIED Function

If this attribute was explicitly given a value in the original document, this is true; otherwise, it is false.

See Also: [DOMAttr Subprograms](#) on page 154-12

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(  
    a          IN      DOMATTR)  
RETURN BOOLEAN;
```

Parameters

Table 154–77 *GETSPECIFIED Function Parameters*

Parameter	Description
a	DOMATTR

GETSTANDALONE Function

This function returns the standalone property associated with the `DOMDOCUMENT`.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.GETSTANDALONE (  
    doc          IN      DOMDOCUMENT)  
RETURN VARCHAR2;
```

Parameters

Table 154–78 *GETSTANDALONE Function Parameters*

Parameter	Description
<code>doc</code>	<code>DOMDOCUMENT</code> .

GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the given DTD (See Also: [DOMDocumentType Subprograms](#) on page 154-19):

```
DBMS_XMLDOM.GETSYSTEMID (
    dt          IN      DOMDOCUMENTTYPE)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: [DOMEntity Subprograms](#) on page 154-21):

```
DBMS_XMLDOM.GETSYSTEMID (
    ent        IN      DOMENTITY)
RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: [DOMNotation Subprograms](#) on page 154-26):

```
DBMS_XMLDOM.GETSYSTEMID (
    n          IN      DOMNOTATION)
RETURN VARCHAR2;
```

Parameters

Table 154–79 *GETSYSTEMID Function Parameters*

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

```
DBMS_XMLDOM.GETTAGNAME(  
    elem      IN      DOMELEMENT)  
RETURN VARCHAR2;
```

Parameters

Table 154–80 *GETTAGNAME Function Parameters*

Parameter	Description
elem	The DOMELEMENT

GETVALUE Function

This function retrieves the value of the attribute.

See Also: [DOMAttr Subprograms](#) on page 154-12

Syntax

```
DBMS_XMLDOM.GETVALUE (  
    a          IN      DOMATTR)  
RETURN VARCHAR2;
```

Parameters

Table 154–81 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.GETVERSION(  
    doc          IN      DOMDOCUMENT)  
RETURN VARCHAR2;
```

Parameters

Table 154–82 *GETVERSION Function Parameters*

Parameter	Description
doc	DOMDOCUMENT

GETXMLTYPE Function

This function returns the XMLType associated with the DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.GETXMLTYPE (  
    doc          IN      DOMDOCUMENT)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 154–83 GETXMLTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

HASATTRIBUTE Functions

Verifies whether an attribute has been defined for `DOMELEMENT`, or has a default value.

See Also: [DOMElement Subprograms](#) on page 154-20

Syntax

Verifies whether an attribute with the specified name has been defined for `DOMElement`:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2)
RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for `DOMELEMENT`; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE (
    elem      IN  DOMELEMENT,
    name      IN  VARCHAR2,
    ns        IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 154–84 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The <code>DOMELEMENT</code>
name	Attribute name; * matches any attribute
ns	Namespace

HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Parameters

Table 154–85 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

HASCHILDNODES Function

This function determines whether this node has any children.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.HASCHILDNODES (  
    n          IN      DOMNODE)  
RETURN BOOLEAN;
```

Parameters

Table 154–86 *HASCHILDNODES Function Parameters*

Parameter	Description
n	DOMNODE

HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also: [DOMImplementation Subprograms](#) on page 154-23

Syntax

```
DBMS_XMLDOM.HASFEATURE (  
    di          IN      DOMIMPLEMENTATION,  
    feature     IN      VARCHAR2,  
    version     IN      VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 154–87 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.IMPORTNODE (
    doc          IN  DOMDOCUMENT,
    importedNode IN  DOMNODE,
    deep         IN  BOOLEAN)
RETURN DOMNODE;
```

Parameters

Table 154–88 *IMPORTNODE Function Parameters*

Parameter	Description
doc	Document from which the node is imported
importedNode	Node to import
deep	Setting for recursive import. <ul style="list-style-type: none"> ■ If this value is <code>TRUE</code>, the entire subtree of the node will be imported with the node. ■ If this value is <code>FALSE</code>, only the node itself will be imported.

Usage Notes

Note that the [ADOPTNODE Function](#) removes the node from the source document while the [IMPORTNODE Function](#) clones the node in the source document.

INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.INSERTBEFORE (  
    n           IN      DOMNODE,  
    newchild   IN      DOMNODE,  
    refchild   IN      DOMNODE)  
RETURN DOMNode;
```

Parameters

Table 154–89 *INSERTBEFORE Function Parameters*

Parameter	Description
<code>n</code>	DOMNODE
<code>newChild</code>	The child to be inserted in the DOMNODE
<code>refChild</code>	The reference node before which the <code>newchild</code> is to be inserted

INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: [DOMCharacterData Subprograms](#) on page 154-14

Syntax

```
DBMS_XMLDOM.INSERTDATA(  
  cd      IN      DOMCHARACTERDATA,  
  offset  IN      NUMBER,  
  arg     IN      VARCHAR2);
```

Parameters

Table 154–90 *INSERTDATA Procedure Parameters*

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the given DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNode Subprograms](#) on page 154-10):

```
DBMS_XMLDOM.ISNULL (
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

Checks that the given DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.ISNULL (
    a          IN      DOMATTR)
RETURN BOOLEAN;
```

Checks that the given DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCDATASection Subprograms](#) on page 154-13):

```
DBMS_XMLDOM.ISNULL (
    cds        IN      DOMCDATASECTION)
RETURN BOOLEAN;
```

Checks that the given DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMCharacterData Subprograms](#) on page 154-14):

```
DBMS_XMLDOM.ISNULL (
    cd         IN      DOMCHARACTERDATA)
RETURN BOOLEAN;
```

Checks that the given DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMComment Subprograms](#) on page 154-15):

```
DBMS_XMLDOM.ISNULL (
    com        IN      DOMCOMMENT)
RETURN BOOLEAN;
```

Checks that the given DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocument Subprograms](#) on page 154-16):

```
DBMS_XMLDOM.ISNULL (
    doc        IN      DOMDOCUMENT)
RETURN BOOLEAN;
```

Checks that the given DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentFragment Subprograms](#) on page 154-18):

```
DBMS_XMLDOM.ISNULL (
    df         IN      DOMDOCUMENTFRAGMENT)
RETURN BOOLEAN;
```

Checks that the given DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMDocumentType Subprograms](#) on page 154-19):

```
DBMS_XMLDOM.ISNULL (
    dt         IN      DOMDOCUMENTTYPE)
RETURN BOOLEAN;
```

```
RETURN BOOLEAN;
```

Checks that the given `DOMELEMENT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMElement Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.ISNULL (
    elem      IN      DOMELEMENT)
RETURN BOOLEAN;
```

Checks that the given `DOMENTITY` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntity Subprograms](#) on page 154-21):

```
DBMS_XMLDOM.ISNULL (
    ent       IN      DUMENTITY)
RETURN BOOLEAN;
```

Checks that the given `DOMENTITYREFERENCE` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMEntityReference Subprograms](#) on page 154-22):

```
DBMS_XMLDOM.ISNULL (
    EREF      IN      DUMENTITYREFERENCE)
RETURN BOOLEAN;
```

Checks that the `DOMIMPLEMENTATION` is NULL; returns TRUE if it is NULL (See Also: [DOMImplementation Subprograms](#) on page 154-23):

```
DBMS_XMLDOM.ISNULL (
    di        IN      DOMIMPLEMENTATION)
RETURN BOOLEAN;
```

Checks that the given `DOMNAMEDNODEMAP` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNamedNodeMap Subprograms](#) on page 154-24):

```
DBMS_XMLDOM.ISNULL (
    nnm       IN      DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

Checks that the given `DOMNODELIST` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNodeList Subprograms](#) on page 154-25):

```
DBMS_XMLDOM.ISNULL (
    nl        IN      DOMNODELIST)
RETURN BOOLEAN;
```

Checks that the given `DOMNOTATION` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMNotation Subprograms](#) on page 154-26):

```
DBMS_XMLDOM.ISNULL (
    n         IN      DOMNOTATION)
RETURN BOOLEAN;
```

Checks that the given `DOMPROCESSINGINSTRUCTION` is NULL; returns TRUE if it is (See Also: [DOMProcessingInstruction Subprograms](#) on page 154-27):

```
DBMS_XMLDOM.ISNULL (
    pi        IN      DOMPROCESSINGINSTRUCTION)
RETURN BOOLEAN;
```

Checks that the given `DOMTEXT` is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: [DOMText Subprograms](#) on page 154-28):

```
DBMS_XMLDOM.ISNULL (
    t         IN      DOMTEXT)
```

RETURN BOOLEAN;

Parameters

Table 154–91 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL`. (See Also: [DOMNamedNodeMap Subprograms](#) on page 154-24):

```
DBMS_XMLDOM.ITEM(
  nnm      IN      DOMNAMEDNODEMAP,
  index    IN      NUMBER)
RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If `index` is greater than or equal to the number of nodes in the list, this returns `NULL`. (See Also: [DOMNodeList Subprograms](#) on page 154-25):

```
DBMS_XMLDOM.ITEM(
  nl       IN      DOMNODELIST,
  index    IN      NUMBER)
RETURN DOMNODE;
```

Parameters

Table 154–92 *ITEM Function Parameters*

Parameter	Description
<code>nnm</code>	DOMNAMEDNODEMAP
<code>index</code>	The index in the node map at which the item is to be retrieved
<code>nl</code>	DOMNODELIST
<code>index</code>	The index in the <code>NodeList</code> used to retrieve the item

MAKEATTR Function

This function casts a given DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEATTR (  
    n          IN      DOMNODE)  
RETURN DOMATTR;
```

Parameters

Table 154–93 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECDATASECTION Function

This function casts a given DOMNODE to a DOMCDATASECTION.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION (  
    n          IN      DOMNODE)  
RETURN DOMCDATASECTION;
```

Parameters

Table 154–94 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECHARACTERDATA Function

This function casts a given DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA (  
    n          IN      DOMNode)  
RETURN DOMCharacterData;
```

Parameters

Table 154–95 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECOMMENT Function

This function casts a given DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKECOMMENT (  
    n          IN      DOMNODE)  
RETURN DOMCOMMENT;
```

Parameters

Table 154–96 *MAKECOMMENT Function Parameters*

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENT Function

This function casts a given DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT (  
    n          IN      DOMNODE)  
RETURN DOMDocument;
```

Parameters

Table 154–97 *MAKEDOCUMENT Function Parameters*

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTFRAGMENT Function

This function casts a given DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 154–98 *MAKEDOCUMENTFRAGMENT Function Parameters*

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTTYPE Function

This function casts a given DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE (  
    n          IN      DOMNODE)  
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 154–99 *MAKEDOCUMENTTYPE Function Parameters*

Parameter	Description
n	DOMNODE to cast.

MAKEELEMENT Function

This function casts a given DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEELEMENT (  
    n          IN      DOMNODE)  
RETURN DOMELEMENT;
```

Parameters

Table 154–100 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITY Function

This function casts a given DOMNODE to a DUMENTITY, and returns the DUMENTITY.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEENTITY (  
    n          IN      DOMNODE)  
RETURN DUMENTITY;
```

Parameters

Table 154–101 MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITYREFERENCE Function

This function casts a given DOMNODE to a DUMENTITYREFERENCE, and returns the DUMENTITYREFERENCE.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(  
    n          IN      DOMNODE)  
RETURN DUMENTITYREFERENCE;
```

Parameters

Table 154–102 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Cast given `DOMATTR` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMAttr Subprograms](#) on page 154-12):

```
DBMS_XMLDOM.MAKENODE (
    a          IN    DOMATTR)
RETURN DOMNODE;
```

Cast the `DOMCDATASECTION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMCDATASection Subprograms](#) on page 154-13):

```
DBMS_XMLDOM.MAKENODE (
    cds        IN    DOMCDATASECTION)
RETURN DOMNODE;
```

Cast the given `DOMCHARACTERDATA` as a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMCharacterData Subprograms](#) on page 154-14):

```
DBMS_XMLDOM.MAKENODE (
    cd         IN    DOMCHARACTERDATA)
RETURN DOMNODE;
```

Cast the given `DOMCOMMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMComment Subprograms](#) on page 154-15):

```
DBMS_XMLDOM.MAKENODE (
    com        IN    DOMCOMMENT)
RETURN DOMNODE;
```

Cast the `DOMDOCUMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocument Subprograms](#) on page 154-16):

```
DBMS_XMLDOM.MAKENODE (
    doc        IN    DOMDOCUMENT)
RETURN DOMNODE;
```

Cast the given `DOMDOCUMENTFRAGMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocumentFragment Subprograms](#) on page 154-18):

```
DBMS_XMLDOM.MAKENODE (
    df         IN    DOMDOCUMENTFRAGMENT)
RETURN DOMNode;
```

Cast the given `DOMDOCUMENTTYPE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMDocumentType Subprograms](#) on page 154-19):

```
DBMS_XMLDOM.MAKENODE (
    dt         IN    DOMDOCUMENTTYPE)
RETURN DOMNODE;
```

Cast the given `DOMELEMENT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMElement Subprograms](#) on page 154-20):

```
DBMS_XMLDOM.MAKENODE (
    elem       IN    DOMELEMENT)
RETURN DOMNODE;
```

```
RETURN DOMNODE;
```

Casts given `DOMENTITY` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntity Subprograms](#) on page 154-21):

```
DBMS_XMLDOM.MAKENODE (
    ent      IN      DOMENTITY)
RETURN DOMNODE;
```

Casts the `DOMENTITYREFERENCE` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMEntityReference Subprograms](#) on page 154-22):

```
DBMS_XMLDOM.MAKENODE (
    eref     IN      DOMENTITYREFERENCE)
RETURN DOMNODE;
```

Casts the `DOMNOTATION` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMNotation Subprograms](#) on page 154-26):

```
DBMS_XMLDOM.MAKENODE (
    n        IN      DOMNOTATION)
RETURN DOMNODE;
```

Casts the `DOMPROCESSINGINSTRUCTION` to a `DOMNODE`, and returns the `DOMNODE` (See Also: [DOMProcessingInstruction Subprograms](#) on page 154-27):

```
DBMS_XMLDOM.MAKENODE (
    pi       IN      DOMPROCESSINGINSTRUCTION)
RETURN DOMNODE;
```

Casts the `DOMTEXT` to a `DOMNODE`, and returns that `DOMNODE` (See Also: [DOMText Subprograms](#) on page 154-28):

```
DBMS_XMLDOM.MAKENODE (
    t        IN      DOMTEXT)
RETURN DOMNODE;
```

Parameters

Table 154–103 *MAKENODE Function Parameters*

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast

Table 154–103 (Cont.) MAKENODE Function Parameters

Parameter	Description
t	DOMTEXT to cast

MAKENOTATION Function

This function casts a given DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKENOTATION(  
    n          IN      DOMNODE)  
RETURN DOMNOTATION;
```

Parameters

Table 154–104 *MAKENOTATION Function Parameters*

Parameter	Description
n	DOMNODE to cast

MAKEPROCESSINGINSTRUCTION Function

This function casts a given DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION (  
    n          IN      DOMNODE)  
RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 154–105 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKETEXT Function

This function casts a given DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.MAKETEXT (  
    n          IN      DOMNODE)  
RETURN DOMTEXT;
```

Parameters

Table 154–106 *MAKETEXT Function Parameters*

Parameter	Description
n	DOMNODE to cast

NEWDOMDOCUMENT Functions

This function returns a new `DOMDOCUMENT` instance.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

Returns a new `DOMDOCUMENT` instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT  
RETURN DOMDOCUMENT;
```

Returns a new `DOMDOCUMENT` instance created from the specified `XMLType` object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (  
    xmlDoc    IN SYS.XMLTYPE)  
RETURN DOMDOCUMENT;
```

Returns a new `DOMDOCUMENT` instance created from the specified `CLOB`:

```
DBMS_XMLDOM.NEWDOMDOCUMENT (  
    clob      IN CLOB)  
RETURN DOMDOCUMENT;
```

Parameters

Table 154–107 *NEWDOMDOCUMENT Function Parameters*

Parameter	Description
<code>xmlDoc</code>	<code>XMLType</code> source for the <code>DOMDOCUMENT</code>
<code>clob</code>	<code>CLOB</code> source for the <code>DOMDOCUMENT</code>

NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

```
DBMS_XMLDOM.NORMALIZE(  
    elem          IN      DOMELEMENT);
```

Parameters

Table 154–108 *NORMALIZE Procedure Parameters*

Parameter	Description
elem	The DOMELEMENT

REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE (  
    elem      IN    DOMELEMENT,  
    name      IN    VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE (  
    elem      IN    DOMELEMENT,  
    name      IN    VARCHAR2,  
    ns        IN    VARCHAR2);
```

Parameters

Table 154–109 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(  
    elem      IN      DOMELEMENT,  
    oldAttr   IN      DOMATTR)  
RETURN DOMAttr;
```

Parameters

Table 154–110 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT.
oldAttr	The old DOMATTR.

REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.REMOVECHILD(  
    n           IN      DOMNode,  
    oldchild    IN      DOMNode)  
RETURN DOMNODE;
```

Parameters

Table 154–111 REMOVECHILD Function Parameters

Parameter	Description
<code>n</code>	DOMNode
<code>oldChild</code>	The child of the node <code>n</code> to be removed

REMOVENAMEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: [DOMNamedNodeMap Subprograms](#) on page 154-24

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM (
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2)
RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM (
  nnm      IN      DOMNamedNodeMap,
  name     IN      VARCHAR2,
  ns       IN      VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 154–112 *REMOVENAMEDITEM Function Parameters*

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node. If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.REPLACECHILD(  
    n           IN      DOMNode,  
    newchild   IN      DOMNode,  
    oldchild   IN      DOMNode)  
RETURN DOMNode;
```

Parameters

Table 154–113 *REPLACECHILD Function Parameters*

Parameter	Description
<code>n</code>	<code>DOMNode</code>
<code>newchild</code>	The new child which is to replace the old child
<code>oldchild</code>	The child of the node <code>n</code> which is to be replaced

REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also: [DOMCharacterData Subprograms](#) on page 154-14

Syntax

```
DBMS_XMLDOM.REPLACEDATA (
  cd          IN      DOMCHARACTERDATA,
  offset      IN      NUMBER,
  cnt         IN      NUMBER,
  arg         IN      VARCHAR2);
```

Parameters

Table 154–114 *REPLACEDATA Procedure Parameters*

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

RESOLVENAMESPACEPREFIX Function

This function resolves the given namespace prefix, and returns the resolved namespace.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(  
    elem      IN      DOMELEMENT,  
    prefix    IN      VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 154–115 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
elem	The DOMELEMENT
prefix	Namespace prefix

SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT's attribute by name.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE (
  elem      IN  DOMELEMENT,
  name      IN  VARCHAR2,
  value     IN  VARCHAR2);
```

Sets the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE (
  elem      IN  DOMELEMENT,
  name      IN  VARCHAR2,
  value     IN  VARCHAR2,
  ns        IN  VARCHAR2);
```

Parameters

Table 154–116 *SETATTRIBUTE Function Parameters*

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
value	Attribute value
ns	Namespace

SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

See Also: [DOMELEMENT Subprograms](#) on page 154-20

Syntax

Adds a new attribute node to the DOMELEMENT:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
  elem      IN  DOMELEMENT,
  newAttr   IN  DOMATTR)
RETURN DOMATTR;
```

Adds a new attribute node to the DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE (
  elem      IN  DOMELEMENT,
  newAttr   IN  DOMATTR,
  ns        IN  VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 154–117 SETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
newAttr	The new DOMATTR
ns	The namespace

SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: [DOMCharacterData Subprograms](#) on page 154-14):

```
DBMS_XMLDOM.SETDATA (
  cd      IN      DOMCHARACTERDATA,
  data    IN      VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: [DOMProcessingInstruction Subprograms](#) on page 154-14):

```
DBMS_XMLDOM.SETDATA (
  pi      IN      DOMPROCESSINGINSTRUCTION,
  data    IN      VARCHAR2);
```

Parameters

Table 154–118 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the given name, system id and public id and sets it in the document. This DTD can later be retrieved using the [GETDOCTYPE Function](#).

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(  
  doc      IN  DOMDocument,  
  name     IN  VARCHAR2,  
  sysid    IN  VARCHAR2,  
  pubid    IN  VARCHAR2);
```

Parameters

Table 154–119 *SETDOCTYPE Procedure Parameters*

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

SETNAMEDITEM Function

This function adds a node using its `nodeName` attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, `NULL` is returned.

As the `nodeName` attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also: [DOMNamedNodeMap Subprograms](#) on page 154-24

Syntax

Adds a node using its `nodeName` attribute:

```
DBMS_XMLDOM.SETNAMEDITEM (
    nnm      IN      DOMNAMEDNODEMAP,
    arg      IN      DOMNODE)
RETURN DOMNode;
```

Adds a node using its `nodeName` attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM (
    nnm      IN      DOMNAMEDNODEMAP,
    arg      IN      DOMNODE,
    ns       IN      VARCHAR2)
RETURN DOMNode;
```

Parameters

Table 154–120 SETNAMEDITEM Function Parameters

Parameter	Description
<code>nnm</code>	<code>DOMNAMEDNODEMAP</code>
<code>arg</code>	The Node to be added using its <code>nodeName</code> attribute
<code>ns</code>	Namespace

SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.SETNODEVALUE (  
    n          IN      DOMNODE,  
    nodeValue IN      VARCHAR2);
```

Parameters

Table 154–121 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

This function returns an instance of the PL/SQL XMLBINARYOUTPUTSTREAM into which the caller can write the node value. The data type of the node must be RAW or BLOB – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
    n      IN      DOMNODE)
RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The data type of the node must be RAW or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
    n      in      DOMNODE,
    value  in      SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 154–122 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

This function returns an instance of the PL/SQL XMLCHARACTEROUTPUTSTREAM type into which the caller can write the node value. The data type of the node can be any valid XDB data type. If the type is not character or CLOB, the character data written to the stream is converted to the node data type. If the data type of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE)
RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of SYS.UTL_CHARACTERINPUTSTREAM from which XDB reads to populate the node. The data type of the node may be any valid type supported by XDB. If a non-character data type, the character data read from the stream is converted to the data type of the node. If the data type of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM (
    n          IN      DOMNODE,
    value      IN      SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 154–123 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the given value.

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.SETPREFIX(  
    n          IN      DOMNODE,  
    prefix    IN      VARCHAR2);
```

Parameters

Table 154–124 *SETPREFIX Procedure Parameters*

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(  
    doc          IN      DOMDOCUMENT,  
    newvalue     IN      VARCHAR2);
```

Parameters

Table 154–125 *SETSTANDALONE Procedure Parameters*

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: [DOMAttr Subprograms](#) on page 154-12

Syntax

```
DBMS_XMLDOM.SETVALUE (  
    a          IN      DOMATTR,  
    value     IN      VARCHAR2);
```

Parameters

Table 154–126 *SETVALUE Procedure Parameters*

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also: [DOMDocument Subprograms](#) on page 154-16

Syntax

```
DBMS_XMLDOM.SETVERSION(  
  doc          IN      DOMDOCUMENT,  
  version      IN      VARCHAR2);
```

Parameters

Table 154–127 *SETVERSION Procedure Parameters*

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

See Also: [DOMText Subprograms](#) on page 154-28

Syntax

```
DBMS_XMLDOM.SPLITTEXT(  
    t           IN      DOMTEXT,  
    offset     IN      NUMBER)  
RETURN DOMText;
```

Parameters

Table 154–128 *SPLITTEXT Function Parameters*

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

SUBSTRINGDATA Function

This function extracts a range of data from the node.

See Also: [DOMCharacterData Subprograms](#) on page 154-14

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA (  
  cd          IN      DOMCHARACTERDATA,  
  offset     IN      NUMBER,  
  cnt        IN      NUMBER)  
RETURN VARCHAR2;
```

Parameters

Table 154–129 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

USEBINARYSTREAM Function

This function returns TRUE if the data type of the node is RAW or BLOB so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed via an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM..

See Also: [DOMNode Subprograms](#) on page 154-10

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM (
    n          IN      DOMNODE)
RETURN BOOLEAN;
```

Parameters

Table 154–130 *USEBINARYSTREAM Function Parameters*

Parameter	Description
n	DOMNODE

WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: [DOMNode Subprograms](#) on page 154-10):

```
DBMS_XMLDOM.WRITETOBUFFER (
    n          IN          DOMNODE,
    buffer     IN OUT     VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: [DOMDocument Subprograms](#) on page 154-16):

```
DBMS_XMLDOM.WRITETOBUFFER (
    doc        IN          DOMDOCUMENT,
    buffer     IN OUT     VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: [DOMDocumentFragment Subprograms](#) on page 154-18):

```
DBMS_XMLDOM.WRITETOBUFFER (
    df         IN          DOMDOCUMENTFRAGMENT,
    buffer     IN OUT     VARCHAR2);
```

Parameters

Table 154–131 *WRITETOBUFFER Procedure Parameters*

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified CLOB using the database character set (See Also: [DOMNode Subprograms](#) on page 154-10):

```
DBMS_XMLDOM.WRITETOCLOB (
  n          IN          DOMNODE,
  c1         IN OUT     CLOB);
```

Writes XML document to a specified CLOB using database character set (See Also: [DOMDocument Subprograms](#) on page 154-16):

```
DBMS_XMLDOM.WRITETOCLOB (
  doc        IN          DOMDOCUMENT,
  c1         IN OUT     CLOB);
```

Parameters

Table 154–132 *WRITETOCLOB Procedure Parameters*

Parameter	Description
n	DOMNODE
c1	CLOB to which to write
doc	DOMDOCUMENT

WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the given character set, which is passed in as a separate parameter (See Also: [DOMNode Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  n          IN      DOMNODE,
  fileName   IN      VARCHAR2,
  charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc        IN      DOMDOCUMENT,
  filename   IN      VARCHAR2);
```

Writes an XML document to a specified file using given character set (See Also: [DOMDocument Subprograms](#)):

```
DBMS_XMLDOM.WRITETOFILE (
  doc        IN      DOMDOCUMENT,
  fileName   IN      VARCHAR2,
  charset    IN      VARCHAR2);
```

Parameters

Table 154–133 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE
fileName	File to which to write
charset	Given character set
doc	DOMDOCUMENT
charset	Character set

The `DBMS_XMLGEN` package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a `CLOB`. This package is similar to the `DBMS_XMLQUERY` package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- [Summary of DBMS_XMLGEN Subprograms](#)

See Also: *Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using `DBMS_XMLGEN`

Summary of DBMS_XMLGEN Subprograms

Table 155–1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure on page 155-3	Closes the context and releases all resources
CONVERT Functions on page 155-4	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function on page 155-5	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions on page 155-6	Gets the XML document
GETXMLTYPE Functions on page 155-7	Gets the XML document and returns it as XMLType
NEWCONTEXT Functions on page 155-8	Creates a new context handle
RESTARTQUERY Procedure on page 155-9	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure on page 155-10	Sets whether special characters such as \$, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure on page 155-11	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure on page 155-12	Sets NULL handling options
SETROWSETTAG Procedure on page 155-13	Sets the name of the element enclosing the entire result
SETROWTAG Procedure on page 155-14	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure on page 155-15	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure on page 155-16	Forces the use of the collection column name appended with the tag <code>_ITEM</code> for collection elements
USENULLATTRIBUTEINDICATOR Procedure on page 155-17	Specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document.

CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (  
    ctx IN ctxHandle);
```

Parameters

Table 155–2 *CLOSECONTEXT Procedure Parameters*

Parameter	Description
ctx	The context handle to close.

CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
    xmlData IN VARCHAR2,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
    xmlData IN CLOB,
    flag    IN NUMBER := ENTITY_ENCODE)
RETURN CLOB;
```

Parameters

Table 155–3 *CONVERT Function Parameters*

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is < . Unescaping is the reverse transformation.

GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the [GETXML Functions](#) call. This count does not include the number of rows skipped before generating the XML. Note that [GETXML Functions](#) always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (  
    ctx      IN      ctxHandle)  
RETURN NUMBER;
```

Parameters

Table 155–4 *GETNUMROWSPROCESSED Function Parameters*

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 155-8.

Usage Notes

This function is used to determine the terminating condition if calling [GETXML Functions](#) in a loop.

GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of [GETXML Functions](#) to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this [GETXML Functions](#) call is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    tmpclob      IN OUT NCOPY CLOB,
    dtdOrSchema IN number := NONE)
RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    ctx          IN ctxHandle,
    dtdOrSchema IN number := NONE)
RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the `DBMS_LOB.FREETEMPORARY` call:

```
DBMS_XMLGEN.GETXML (
    sqlQuery     IN VARCHAR2,
    dtdOrSchema  IN number := NONE)
RETURN CLOB;
```

Parameters

Table 155–5 *GETXML Function Parameters*

Parameter	Description
<code>ctx</code>	The context handle obtained from the <code>newContext</code> call.
<code>tmpclob</code>	The CLOB to which the XML document is appended.
<code>sqlQuery</code>	The SQL query string.
<code>dtdOrSchema</code>	Generate a DTD or a schema? Only <code>NONE</code> is supported.

Usage Notes

When the rows indicated by the [SETSKIPROWS Procedure](#) call are skipped, the maximum number of rows as specified by the [SETMAXROWS Procedure](#) call (or the entire result if not specified) is fetched and converted to XML. Use the [GETNUMROWSPROCESSED Function](#) to check if any rows were retrieved.

GETXMLTYPE Functions

This function gets the XML document and returns it as an `XMLTYPE`. `XMLTYPE` operations can be performed on the results.

This function is overloaded.

Syntax

Generates the XML document and returns it as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
  ctx          IN ctxhandle,
  dtdOrSchema IN number := NONE)
RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a `sys.XMLType`:

```
DBMS_XMLGEN.GETXMLTYPE (
  sqlQuery     IN VARCHAR2,
  dtdOrSchema IN number := NONE)
RETURN sys.XMLType
```

Parameters

Table 155–6 *GETXMLTYPE Function Parameters*

Parameter	Description
<code>ctx</code>	The context handle obtained from the <code>newContext</code> call.
<code>sqlQuery</code>	The SQL query string.
<code>dtdOrSchema</code>	Generate a DTD or a schema? Only <code>NONE</code> is supported.

NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in [GETXML Functions](#) and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (  
    query      IN VARCHAR2)  
RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (  
    queryString IN SYS_REFCURSOR)  
RETURN ctxHandle;
```

Parameters

Table 155–7 NEWCONTEXT Function Parameters

Parameter	Description
query	The query, in the form of a VARCHAR, the result of which must be converted to XML.
queryString	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (  
  ctx IN ctxHandle);
```

Parameters

Table 155–8 *RESTARTQUERY Procedure Parameters*

Parameter	Description
ctx	The context handle corresponding to the current query.

SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to < . The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, " , ' , which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (  
  ctx IN ctxHandle,  
  conv IN BOOLEAN);
```

Parameters

Table 155–9 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
ctx	The context handle obtained from one of the NEWCONTEXT Functions call on page 155-8.
conv	TRUE indicates that conversion is needed.

SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invocation of the [GETXML Functions](#) call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxRows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (  
  ctx          IN ctxHandle,  
  maxRows     IN NUMBER);
```

Parameters

Table 155–10 *SETMAXROWS Procedure Parameters*

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>maxRows</code>	The maximum number of rows to get for each call to GETXML Functions

SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the `flag` parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(  
  ctx IN ctx,  
  flag IN NUMBER);
```

Parameters

Table 155–11 *SETNULLHANDLING Procedure Parameters*

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>flag</code>	The NULL handling option set. <ul style="list-style-type: none">■ <code>DROP_NULLS CONSTANT NUMBER:= 0</code>; (Default) Leaves out the tag for NULL elements.■ <code>NULL_ATTR CONSTANT NUMBER:= 1</code>; Sets <code>xsi:nil="true"</code>.■ <code>EMPTY_TAG CONSTANT NUMBER:= 2</code>; Sets, for example, <code><foo/></code>.

SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is ROWSET.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
  ctx          IN ctxHandle,
  rowSetTagName IN VARCHAR2);
```

Parameters

Table 155–12 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 155-8.
rowSetTagName	The name of the document element. Passing NULL indicates that you do not want the ROWSET element present.

Usage Notes

The user can set the rowSetTag to NULL to suppress the printing of this element. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is ROW.

Syntax

```
DBMS_XMLGEN.SETROWTAG (  
  ctx          IN ctxHandle,  
  rowTagName  IN VARCHAR2);
```

Parameters

Table 155–13 SETROWTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 155-8.
rowTagName	The name of the ROW element. Passing NULL indicates that you do not want the ROW element present.

Usage Notes

The user can set the name of the element to NULL to suppress the ROW element itself. However, an error is produced if both the row and the rowset are NULL and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the [GETXML Functions](#). It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See [GETNUMROWSPROCESSED Function](#) on page 155-5.

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (  
  ctx          IN ctxHandle,  
  skipRows    IN NUMBER);
```

Parameters

Table 155–14 *SETSKIPROWS Procedure Parameters*

Parameter	Description
<code>ctx</code>	The context handle corresponding to the query executed.
<code>skipRows</code>	The number of rows to skip for each call to <code>getXML</code> .

USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (  
    ctx IN ctxHandle);
```

Parameters

Table 155–15 *USEITEMTAGSFORCOLL Procedure Parameters*

Parameter	Description
ctx	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the `_ITEM` tag appended to it. If there is a collection of `NUMBER`, the default tag name for the collection elements is `NUMBER`.

USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the [SETNULLHANDLING Procedure](#).

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(  
  ctx          IN   ctxType,  
  attrind     IN   BOOLEAN := TRUE);
```

Parameters

Table 155–16 *USENULLATTRIBUTEINDICATOR Procedure Parameters*

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate NULL?

The DBMS_XMLINDEX package provides an interface to implement asynchronous indexing .

See Also: *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

This chapter contains the following topics:

Using DBMS_XMLINDEX

- [Overview](#)

Overview

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.

Summary of DBMS_XMLINDEX Subprograms

This table lists the package subprograms in alphabetical order.

Table 156–1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure on page 156-5	Creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
CREATENUMBERINDEX Procedure on page 156-6	Creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex
SYNCINDEX Procedure on page 156-7	Synchronizes the index manually

CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2,
  date_index_clause IN VARCHAR2);
```

```
DBMS_XMLINDEX.CREATEDATEINDEX (
  xml_index_schema IN VARCHAR2,
  xml_index_name   IN VARCHAR2,
  date_index_name  IN VARCHAR2,
  xmltypename     IN VARCHAR2);
```

Parameters

Table 156–2 *CREATEDATEINDEX Procedure Parameters*

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
  xml_index_schema  IN  VARCHAR2,
  xml_index_name    IN  VARCHAR2,
  num_index_name    IN  VARCHAR2,
  num_index_clause  IN  VARCHAR2,
  xmltypename       IN  VARCHAR2);
```

Parameters

Table 156–3 *CREATENUMBERINDEX Procedure Parameters*

Parameter	Description
<code>xml_index_schema</code>	Name of the owner of the <code>XMLIndex</code>
<code>xml_index_name</code>	Name of the <code>XMLIndex</code>
<code>num_index_name</code>	Name of the secondary index to be created for number values in the <code>VALUE</code> column of the <code>PATH TABLE</code> of <code>XMLIndex</code> named <code>xml_index_name</code> and owned by <code>xml_index_schema</code>
<code>num_index_clause</code>	Storage clause to be applied to the number index during its creation. This is a string argument appended to the <code>CREATE INDEX</code> statement for creating the number index.
<code>xmltypename</code>	The type to which values in the <code>VALUE</code> column of the path table are to be cast. Acceptable values are the following strings: <code>FLOAT</code> , <code>DOUBLE</code> , <code>DECIMAL</code> , <code>INTEGER</code> , <code>NONPOSITIVEINTEGER</code> , <code>NEGATIVEINTEGER</code> , <code>LONG</code> , <code>INT</code> , <code>SHORT</code> , <code>BYTE</code> , <code>NONNEGATIVEINTEGER</code> , <code>UNSIGNEDLONG</code> , <code>UNSIGNEDINT</code> , <code>UNSIGNEDSHORT</code> , <code>UNSIGNEDBYTE</code> , <code>POSITIVEINTEGER</code> .

SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (  
    xml_index_schema    IN VARCHAR2,  
    xml_index_name      IN VARCHAR2);
```

Parameters

Table 156–4 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI');
```

DBMS_XMLPARSER

Using `DBMS_XMLPARSER`, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

Summary of DBMS_XMLPARSER Subprograms

Table 157–1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER on page 157-3	Frees a parser object.
GETDOCTYPE on page 157-4	Gets parsed DTD.
GETDOCUMENT on page 157-5	Gets DOM document.
GETRELEASEVERSION on page 157-5	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE on page 157-7	Returns validation mode.
NEWPARSER on page 157-8	Returns a new parser instance
PARSE on page 157-9	Parses XML stored in the given url/file.
PARSEBUFFER on page 157-10	Parses XML stored in the given buffer
PARSECLOB on page 157-10	Parses XML stored in the given clob
PARSEDTD on page 157-12	Parses DTD stored in the given url/file
PARSEDTDBUFFER on page 157-13	Parses DTD stored in the given buffer
PARSEDTDCLOB on page 157-14	Parses DTD stored in the given clob
SETBASEDIR on page 157-15	Sets base directory used to resolve relative URLs.
SETDOCTYPE on page 157-16	Sets DTD.
SETERRORLOG on page 157-17	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE on page 157-18	Sets white space preserve mode
SETVALIDATIONMODE on page 157-19	Sets validation mode.
SHOWWARNINGS on page 157-20	Turns warnings on or off.

FREEPARSER

Frees a parser object.

Syntax

```
PROCEDURE freeParser(  
    p Parser);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(  
  p Parser)  
RETURN DOMDocumentType;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT (  
  p Parser)  
RETURN DOMDocument;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion  
RETURN VARCHAR2;
```

GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(  
  p Parser)  
RETURN BOOLEAN;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser  
RETURN Parser;
```

PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

Syntax	Description
<pre>FUNCTION parse(url VARCHAR2) RETURN DOMDocument;</pre>	<p>Returns the built DOM Document.</p> <p>This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.</p>
<pre>PROCEDURE parse(p Parser, url VARCHAR2);</pre>	<p>Any changes to the default parser behavior should be effected before calling this procedure.</p>

Parameter	IN / OUT	Description
url	(IN)	Complete path of the url/file to be parsed.
p	(IN)	Parser instance.

PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(  
  p  Parser,  
  doc VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(  
  p  Parser,  
  doc CLOB);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(  
  p      Parser,  
  url   VARCHAR2,  
  root  VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

PARSEDTDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(  
  p    Parser,  
  dtd  VARCHAR2,  
  root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

PARSEDTCLOB

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTCLOB(  
  p    Parser,  
  dtd  CLOB,  
  root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(  
  p Parser,  
  dir VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

SETDOCTYPE

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(  
  p   Parser,  
  dtd DOMDocumentType);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

SETERRORLOG

Sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(  
p          Parser,  
fileName VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

SETPRESERVEWHITESPACE

Sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(  
  p Parser,  
  yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

SETVALIDATIONMODE

Sets validation mode.

Syntax

```
PROCEDURE setValidationMode(  
  p  Parser,  
  yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

SHOWWARNINGS

Turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(  
  p Parser,  
  yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

DBMS_XMLQUERY

DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- [Using DBMS_XMLQUERY](#)
 - Constants
 - Types
- [Summary of DBMS_XMLQUERY Subprograms](#)

Using DBMS_XMLQUERY

- [Constants](#)
- [Types](#)

Constants

Table 158–1 Constants of DBMS_XMLQUERY

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to db.records -- ROW
DEFAULT_DATE_FORMAT	Default date mask -- 'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specifies that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

Types

Table 158–2 *Types of DBMS_XMLQUERY*

Type	Description
ctxType	The type of the query context handle. This is the return type of NEWCONTEXT

Summary of DBMS_XMLQUERY Subprograms

Table 158–3 DBMS_XMLQUERY Package Subprograms

Method	Description
CLOSECONTEXT on page 158-7	Closes or deallocates a particular query context.
GETDTD on page 158-8	Generates the DTD.
GETEXCEPTIONCONTENT on page 158-9	Returns the thrown exception's error code and error message.
GETNUMROWSPROCESSED on page 158-10	Returns the number of rows processed for the query.
GETVERSION on page 158-11	Prints the version of the XSU in use.
GETXML on page 158-12	Generates the XML document.
NEWCONTEXT on page 158-13	Creates a query context and it returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 158-14	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an <code>OracleXMLSQLException</code> .
REMOVEXSLTPARAM on page 158-15	Removes a particular top-level stylesheet parameter.
SETBINDVALUE on page 158-16	Sets a value for a particular bind name.
SETCOLLIDATTRNAME on page 158-17	Sets the name of the id attribute of the collection element's separator tag.
SETDATAHEADER on page 158-17	Sets the XML data header.
SETDATEFORMAT on page 158-19	Sets the format of the generated dates in the XML document.
SETENCODINGTAG on page 158-20	Sets the encoding processing instruction in the XML document.
SETERRORTAG on page 158-21	Sets the tag to be used to enclose the XML error documents.
SETMAXROWS on page 158-22	Sets the maximum number of rows to be converted to XML.
SETMETAHEADER on page 158-23	Sets the XML meta header.
SETRAISEEXCEPTION on page 158-24	Tells the XSU to throw the raised exceptions.
SETRAISENOROWSEXCEPTION on page 158-25	Tells the XSU to throw or not to throw an <code>OracleXMLNoRowsException</code> in the case when for one reason or another, the XML document generated is empty.
SETROWIDATTRNAME on page 158-26	Sets the name of the id attribute of the row enclosing tag.
SETROWIDATTRVALUE on page 158-27	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
SETROWSETTAG on page 158-28	Sets the tag to be used to enclose the XML dataset.
SETROWTAG on page 158-29	Sets the tag to be used to enclose the XML element.
SETSKIPROWS on page 158-30	Sets the number of rows to skip.

Table 158-3 (Cont.) DBMS_XMLQUERY Package Subprograms

Method	Description
SETSQLTOXMLNAMEESCAPING on page 158-31	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETSTYLESHEETHEADER on page 158-32	Sets the stylesheet header.
SETTAGCASE on page 158-33	Specifies the case of the generated XML tags.
SETXSLT on page 158-34	Registers a stylesheet to be applied to generated XML.
SETXSLTPARAM on page 158-35	Sets the value of a top-level stylesheet parameter.
USENULLATTRIBUTEINDICATOR on page 158-36	Specifies whether to use an XML attribute to indicate NULLness.
USETYPEFORCOLLELEMTAG on page 158-37	Tells the XSU to use the collection element's type name as the collection element tag name.

CLOSECONTEXT

Closes or deallocates a particular query context

Syntax

```
PROCEDURE CLOSECONTEXT(  
  ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax	Description
<pre>FUNCTION GETDTD(ctxHdl IN ctxType, withVer IN BOOLEAN := false) RETURN CLOB;</pre>	Function that generates the DTD based on the SQL query used to initialize the context.
<pre>PROCEDURE GETDTD(ctxHdl IN ctxType, xDoc IN CLOB, withVer IN BOOLEAN := false);</pre>	Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output CLOB for XML document result.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
withVer	(IN)	Generate the version information? TRUE for yes.
xDoc	(IN)	CLOB into which to write the generated XML document.

GETEXCEPTIONCONTENT

Returns the thrown exception's SQL error code and error message through the procedure's OUT parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(  
  ctxHdl IN ctxType,  
  errNo OUT NUMBER,  
  errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(OUT)	Error number.
errMsg	(OUT)	Error message.

GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

```
FUNCTION GETNUMROWSPROCESSED(  
  ctxHdl IN ctxType)  
RETURN NUMBER;
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETVERSION

Prints the version of the XSU in use.

Syntax

```
PROCEDURE GETVERSION();
```

GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

Syntax	Description
<pre>FUNCTION GETXML(sqlQuery IN VARCHAR2, metaType IN NUMBER := NONE) RETURN CLOB;</pre>	This function uses a SQL query in string form.
<pre>FUNCTION GETXML(sqlQuery IN CLOB, metaType IN NUMBER := NONE) RETURN CLOB;</pre>	This function uses a SQL query in CLOB form.
<pre>FUNCTION GETXML(ctxHdl IN ctxType, metaType IN NUMBER := NONE) RETURN CLOB;</pre>	This function generates the XML document based on a SQL query used to initialize the context.
<pre>PROCEDURE GETXML(ctxHdl IN ctxType, xDoc IN CLOB, metaType IN NUMBER := NONE);</pre>	This procedure generates the XML document based on the SQL query used to initialize the context.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
metaType	(IN)	XML metadata type (NONE, DTD, or SCHEMA).
sqlQuery	(IN)	SQL query.
xDoc	(IN)	CLOB into which to write the generated XML document.

NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

Syntax	Description
<pre>FUNCTION NEWCONTEXT(sqlQuery IN VARCHAR2) RETURN ctxType;</pre>	Creates a query context from a string.
<pre>FUNCTION NEWCONTEXT(sqlQuery IN CLOB) RETURN ctxType;</pre>	Creates a query context from a CLOB.

Parameter	IN / OUT	Description
sqlQuery	(IN)	SQL query, the results of which to convert to XML.

PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an `OracleXMLSQLException`.

Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	TRUE if want to propagate original exception, FALSE to wrap in <code>OracleXMLException</code> .

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE REMOVEXSLTPARAM(  
  ctxHdl IN ctxType,  
  name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

SETBINDVALUE

Sets a value for a particular bind name.

Syntax

```
PROCEDURE SETBINDVALUE(  
  ctxHdl IN ctxType,  
  bindName IN VARCHAR2,  
  bindValue IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

SETCOLLIDATTRNAME

Sets the name of the id attribute of the collection element's separator tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETCOLLIDATTRNAME(  
  ctxHdl IN ctxType,  
  attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the `header` parameter unsets the data header.

Syntax

```
PROCEDURE SETDATAHEADER(  
  ctxHdl IN ctxType,  
  header IN CLOB := null,  
  tag IN VARCHAR2 := null);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>header</code>	(IN)	Header.
<code>tag</code>	(IN)	Tag used to enclose the data header and the rowset.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

Syntax

```
PROCEDURE SETDATEFORMAT(  
  ctxHdl IN ctxType,  
  mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>mask</code>	(IN)	The date mask.

SETENCODINGTAG

Sets the encoding processing instruction in the XML document.

Syntax

```
PROCEDURE SETENCODINGTAG(  
  ctxHdl IN ctxType,  
  enc IN VARCHAR2 := DB_ENCODING);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

Syntax

```
PROCEDURE SETERRORTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

```
PROCEDURE SETMAXROWS (  
  ctxHdl IN ctxType,  
  rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

SETMETAHEADER

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

Syntax

```
PROCEDURE SETMETAHEADER(  
  ctxHdl IN ctxType,  
  header IN CLOB := null);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>Header</code>	(IN)	Header.

SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

```
PROCEDURE SETRAISEEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN:=true);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>flag</code>	(IN)	Throw raised exceptions? <code>TRUE</code> for yes, otherwise <code>FALSE</code> .

SETRAISENOROWSEXCEPTION

Specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN:=false);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Throws an <code>OracleXMLNoRowsException</code> if set to <code>TRUE</code> .

SETROWIDATTRNAME

Sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETROWIDATTRNAME(  
  ctxHdl IN ctxType,  
  attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
attrName	(IN)	Attribute name.

SETRROWIDATTRVALUE

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

Syntax

```
PROCEDURE SETROWIDATTRVALUE(  
  ctxHdl IN ctxType,  
  colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>colName</code>	(IN)	Column whose value is to be assigned to the row id attribute.

SETROWSETTAG

Sets the tag to be used to enclose the XML dataset.

Syntax

```
PROCEDURE SETROWSETTAG (  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a db.record.

Syntax

```
PROCEDURE SETROWTAG(  
  ctxHdl IN ctxType,  
  tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETSKIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

Syntax

```
PROCEDURE SETSKIPROWS(  
  ctxHdl IN ctxType,  
  rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

SETSQLTOXMLNAMEESCAPING

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING (  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

SETSTYLESHEETHEADER

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing `NULL` for the `uri` argument will unset the stylesheet header and the stylesheet type.

Syntax

```
PROCEDURE SETSTYLESHEETHEADER(  
  ctxHdl IN ctxType,  
  uri IN VARCHAR2,  
  type IN VARCHAR2 := 'text/xml');
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>uri</code>	(IN)	Stylesheet URI.
<code>type</code>	(IN)	Stylesheet type; defaults to "text/xml".

SETTAGCASE

Specifies the case of the generated XML tags.

Syntax

```
PROCEDURE SETTAGCASE(  
  ctxHdl IN ctxType,  
  tCase IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: <ul style="list-style-type: none">■ 0 for as are■ 1 for lower case■ 2 for upper case

SETXSLT

Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

Syntax	Description
<pre>PROCEDURE SETXSLT(ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);</pre>	To un-register the stylesheet pass in a null for the uri.
<pre>PROCEDURE SETXSLT(ctxHdl IN ctxType, stylesheet CLOB, ref IN VARCHAR2 := null);</pre>	To un-register the stylesheet pass in a null or an empty string for the stylesheet.

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>uri</code>	(IN)	Stylesheet URI.
<code>stylesheet</code>	(IN)	Stylesheet.
<code>ref</code>	(IN)	URL to include, imported and external entities.

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE SETXSLTPARAM(  
  ctxHdl IN ctxType,  
  name IN VARCHAR2,  
  value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(  
  ctxHdl IN ctxType,  
  flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on use of the type name?

DBMS_XMLSAVE provides XML to database-type functionality.

 - Constants
 - Types
- [Summary of DBMS_XMLSAVE Subprograms](#)

Using DBMS_XMLSAVE

- [Constants](#)
- [Types](#)

Constants

Table 159–1 Constants of DBMS_XMLSAVE

Constant	Description
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_FORMAT	Default date mask: 'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database entities the XSU should be case insensitive.

Types

Table 159–2 *Types of DBMS_XMLSAVE*

Type	Description
ctxType	The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT .

Summary of DBMS_XMLSAVE Subprograms

Table 159-3 DBMS_XMLSAVE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 159-6	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 159-7	Clears the update column list.
CLOSECONTEXT on page 159-8	It closes/deallocates a particular save context.
DELETEXML on page 159-9	Deletes records specified by data from the XML document, from the table specified at the context creation time.
GETEXCEPTIONCONTENT on page 159-10	Via its arguments, this method returns the thrown exception's error code and error message.
INSERTXML on page 159-11	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 159-12	Creates a save context, and returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 159-13	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an <code>OracleXMLSQLException</code> .
REMOVEXSLTPARAM on page 159-14	Removes the value of a top-level stylesheet parameter
SETBATCHSIZE on page 159-15	Changes the batch size used during DML operations.
SETCOMMITBATCH on page 159-17	Sets the commit batch size.
SETDATEFORMAT on page 159-17	Sets the format of the generated dates in the XML document.
SETIGNORECASE on page 159-18	The XSU does mapping of XML elements to database.
SETKEYCOLUMN on page 159-19	This methods adds a column to the key column list.
SETPRESERVEWHITESPACE on page 159-20	Tells the XSU whether to preserve whitespace or not.
SETROWTAG on page 159-21	Names the tag used in the XML document to enclose the XML elements corresponding to database.
SETSQLTOXMLNAMEESCAPING on page 159-22	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETUPDATECOLUMN on page 159-23	Adds a column to the update column list.
SETXSLT on page 159-24	Registers a XSL transform to be applied to the XML to be saved.
SETXSLTPARAM on page 159-25	Sets the value of a top-level stylesheet parameter.
UPDATEXML on page 159-26	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

Syntax	Description
<pre>FUNCTION deleteXML(ctxHdl IN ctxPType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Uses a VARCHAR2 type for the xDoc parameter.
<pre>FUNCTION deleteXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Uses a CLOB type for the xDoc parameter.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

Syntax

```
PROCEDURE getExceptionContent(  
    ctxHdl IN ctxType,  
    errNo OUT NUMBER,  
    errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

Syntax	Description
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

PROPAGATEORIGINALEXCEPTION

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather than, wrapping it with an OracleXMLSQLException.

Syntax

```
PROCEDURE propagateOriginalException(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Propagate the original exception? 0=FALSE, 1=TRUE.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter.

Syntax

```
PROCEDURE removeXSLTParam(  
    ctxHdl IN ctxType,  
    name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

```
PROCEDURE setBatchSize(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

SETCOMMITBATCH

Sets the commit batch size. The commit batch size refers to the number of records inserted after which a commit should follow. If `batchSize` is less than 1 or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is 0.

Syntax

```
PROCEDURE setCommitBatch(  
    ctxHdl IN ctxType,  
    batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
<code>ctxHdl</code>	(IN)	Context handle.
<code>batchSize</code>	(IN)	Commit batch size.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

Syntax

```
PROCEDURE setDateFormat(  
    ctxHdl IN ctxType,  
    mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
mask	(IN)	Syntax of the date format pattern..

SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

Syntax

```
PROCEDURE setIgnoreCase(  
    ctxHdl IN ctxType,  
    flag IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

Syntax

```
PROCEDURE setPreserveWhitespace(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE setSQLToXMLNameEscaping(  
    ctxHdl IN ctxType,  
    flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

```
PROCEDURE setUpdateColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax	Description
<pre>PROCEDURE setXSLT(ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a URI.
<pre>PROCEDURE setXSLT(ctxHdl IN ctxType, stylesheet IN CLOB, ref IN VARCHAR2 := null);</pre>	Passes in the stylesheet through a CLOB.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
uri	(IN)	URI to the stylesheet to register.
ref	(IN)	URL for include, import, and external entities.
stylesheet	(IN)	CLOB containing the stylesheet to register

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

Syntax

```
PROCEDURE setXSLTParam(  
    ctxHdl IN ctxType,  
    name IN VARCHAR2,  
    value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
<pre>FUNCTION updateXML(ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION updateXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script `dbmsxsch.sql` during Oracle database installation.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- [Using DBMS_XMLSCHEMA](#)
 - Overview
 - Constants
 - Views
 - Operational Notes
- [Summary of DBMS_XMLSCHEMA Subprograms](#)

Using DBMS_XMLSCHEMA

This section contains topics which relate to using the DBMS_XMLSCHEMA package.

- [Overview](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

Overview

This package provides subprograms to

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

Constants

The `DBMS_XMLSCHEMA` package uses the constants shown in following tables.

- [DBMS_XMLSCHEMA Constants - Delete Option](#)
- [DBMS_XMLSCHEMA Constants - Enable Hierarchy](#)
- [DBMS_XMLSCHEMA Constants - Register CSID](#)

Table 160–1 DBMS_XMLSCHEMA Constants - Delete Option

Constant	Type	Value	Description
<code>DELETE_RESTRICT</code>	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
<code>DELETE_INVALIDATE</code>	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
<code>DELETE_CASCADE</code>	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if <code>gentypes</code> argument was set to <code>TRUE</code> during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
<code>DELETE_CASCADE_FORCE</code>	NUMBER	4	This option is similar to <code>DELETE_CASCADE</code> except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 160–2 DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
<code>ENABLE_HIERARCHY_NONE</code>	PLS_INTEGER	1	The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will not be called on any tables created while registering that schema
<code>ENABLE_HIERARCHY_CONTENTS</code>	PLS_INTEGER	2	The <code>ENABLE_HIERARCHY</code> procedure of the <code>DBMS_XDBZ</code> package will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code>

Table 160–2 (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_ RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 160–3 DBMS_XMLSCHEMA Constants - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

Views

The DBMS_XMLSCHEMA package uses the views shown in [Table 160–4](#). The columns of these views are described in detail in the *Oracle Database Reference*.

Table 160–4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMLType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

Operational Notes

Guidelines for Using In-Place XML Schema Evolution

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

Summary of DBMS_XMLSCHEMA Subprograms

Table 160–5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure on page 160-9	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure on page 160-10	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure on page 160-12	Removes the schema from the database
GENERATEBEAN Procedure on page 160-13	Generates the Java bean code corresponding to a registered XML schema
GENERATESCHEMA Function on page 160-14	Generates an XML schema from an oracle type name
GENERATESCHEMAS Function on page 160-15	Generates several XML schemas from an oracle type name
INPLACEEVOLVE Procedure on page 160-16	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure on page 160-18	Removes the XML schema
REGISTERSCHEMA Procedures on page 160-19	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure on page 160-23	Registers an XML schema specified by a URI name

COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(  
    schemaur1 IN VARCHAR2);
```

Parameters

Table 160–6 *COMPILESCHEMA Procedure Parameters*

Parameter	Description
<code>schemaur1</code>	URL identifying the schema

COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based XMLType tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new XMLType tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
  schemaurls      IN  XDB$STRUBG_LIST_T,
  newschemas      IN  XMLSequenceType,
  transforms      IN  XMLSequenceType :=NULL,
  preserveolddocs IN  BOOLEAN :=FALSE,
  maptablename    IN  VARCHAR2 :=NULL,
  generatetables IN  BOOLEAN :=TRUE,
  force           IN  BOOLEAN :=FALSE,
  schemaowners    IN  XDB$STRING_LIST_T :=NULL,
  parallelDegree IN  PLS_INTEGER := 0,
  options         IN  PLS_INTEGER := 0);
```

Parameters

Table 160–7 COPYEVOLVE Procedure Parameters

Parameter	Description
schemaurls	VARRAY of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the FORCE parameter is TRUE, URLs should be in the order of dependency.
newschemas	VARRAY of new schema documents. Should be specified in same order as the corresponding URLs.
transforms	VARRAY of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.

Table 160–7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: <ul style="list-style-type: none"> ■ SCHEMA_URL - VARCHAR2 (700) - URL of schema to which this table conforms ■ SCHEMA_OWNER - VARCHAR2 (30) - Owner of the schema ■ ELEMENT_NAME - VARCHAR2 (256) - Element to which this table conforms ■ TAB_NAME - VARCHAR2 (65) - Qualified table name: <owner_name>.<table_name> ■ COL_NAME - VARCHAR2 (4000) - Name of the column (NULL for XMLType tables) ■ TEMP_TABNAME - VARCHAR2 (30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: <ul style="list-style-type: none"> ■ new tables will not be generated after registration of new schemas ■ preserveolddocs must be TRUE ■ maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because [COPYEVOLVE Procedure](#) deletes all conforming documents prior to implementing the schema evolution.

DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA (
  schemaur1      IN  VARCHAR2,
  delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

See Also: "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 160–8 DELETESCHEMA Procedure Parameters

Parameter	Description
schemaur1	URL identifying the schema to be deleted
delete_option	Delete options: <ul style="list-style-type: none"> ▪ DELETE_RESTRICT - Schema deletion fails if there are any tables or schemas that depend on this schema ▪ DELETE_INVALIDATE - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. ▪ DELETE_CASCADE - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. ▪ DELETE_CASCADE_FORCE - Similar to DELETE_CASCADE except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 160–9 DELETESCHEMA Procedure Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

GENERATEBEAN Procedure

This procedure can be used to generate the Java bean code corresponding to a registered XML schema.

Syntax

```
DBMS_XMLSCHEMA.GENERATEBEAN(
  schemaur1 IN VARCHAR2);
```

Parameters

Table 160–10 *GENERATEBEAN Procedure Parameters*

Parameter	Description
schemaur1	Name identifying a registered XML schema

Exceptions

Table 160–11 *GENERATEBEAN Procedure Exceptions*

Exception	Description
ORA-31001	Invalid resource handle or path name

Usage Notes

Note that there is also an option to generate the beans as part of the registration procedure itself (see the `genbean` parameter of the [REGISTERSHEMA Procedures](#) on page 160-19).

GENERATESCHEMA Function

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (XMLType).

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMA (
  schemaname      IN  VARCHAR2,
  typename        IN  VARCHAR2,
  elementname     IN  VARCHAR2 := NULL,
  recurse         IN  BOOLEAN  := TRUE,
  annotate        IN  BOOLEAN  := TRUE,
  embedcoll       IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

Parameters

Table 160–12 *GENERATESCHEMA Function Parameters*

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema. Defaults to typename.
recurse	Whether or not to also generate schema for all types referred to by the type specified
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections should be embedded in the type which refers to them, or create a <code>complextyp</code> . Cannot be <code>FALSE</code> if annotations are turned on

Exceptions

Table 160–13 *GENERATESCHEMA Procedure Exceptions*

Exception	Description
ORA-31001	Invalid resource handle or path name

GENERATESCHEMAS Function

This function generates XML schema(s) from an Oracle type name. It returns a collection of `XMLTypes`, one XML Schema document for each database schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS (
  schemaname   IN  VARCHAR2,
  typename     IN  VARCHAR2,
  elementname  IN  VARCHAR2 := NULL,
  schemaurl    IN  VARCHAR2 := NULL,
  annotate     IN  BOOLEAN := TRUE,
  embedcoll    IN  BOOLEAN := TRUE )
RETURN SYS.XMLTYPE;
```

Parameters

Table 160–14 *GENERATESCHEMAS Procedure Parameters*

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema defaults to <code>typeName</code>
schemaurl	Specifies base URL where schemas will be stored, needed by top level schema for import statement
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections be embedded in the type which refers to them, or create a <code>complextype</code> . Cannot be <code>FALSE</code> if annotations are turned on

Exceptions

Table 160–15 *GENERATESCHEMAS Procedure Exceptions*

Exception	Description
ORA-31001	Invalid resource handle or path name

INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE (
  schemaURL   IN   VARCHAR2,
  diffXML     IN   XMLType,
  flags       IN   NUMBER);
```

Parameters

Table 160–16 *INPLACEEVOLVE Procedure Parameters*

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	<p>The following bits may be set in this parameter to control the behavior of this procedure:</p> <ul style="list-style-type: none"> ▪ INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. ▪ INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. <p>That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition:</p> <ul style="list-style-type: none"> ▪ Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. ▪ Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the [REGISTERSHEMA Procedures](#) and the [REGISTERURI Procedure](#) at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

PURGESCHEMA Procedure

This procedure removes the XML schema.

See Also: "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(  
    schemaid IN RAW);
```

Parameters

Table 160–17 *PURGESCHEMA Procedure Parameters*

Parameter	Description
schemaid	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

See Also: "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a VARCHAR2:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
  schemadoc      IN  BFILE,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := TRUE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := TRUE,
  owner          IN  VARCHAR2 := '',
  csid           IN  NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options        IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaurl      IN  VARCHAR2,
```

```

schemadoc      IN BLOB,
local          IN BOOLEAN := TRUE,
genTypes      IN BOOLEAN := TRUE,
genBean       IN BOOLEAN := FALSE,
force         IN BOOLEAN := FALSE,
owner         IN VARCHAR2 := NULL,
enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
options       IN PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB and identifies the character set id of the schema document:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1    IN VARCHAR2,
  schemadoc    IN BLOB,
  local        IN BOOLEAN := TRUE,
  gentypes     IN BOOLEAN := TRUE,
  genbean      IN BOOLEAN := TRUE,
  gentables    IN BOOLEAN := TRUE,
  force        IN BOOLEAN := TRUE,
  owner        IN VARCHAR2 := '',
  csid         IN NUMBER,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options      IN PLS_INTEGER := 0);

```

Registers the schema specified as a CLOB

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1    IN VARCHAR2,
  schemadoc    IN CLOB,
  local        IN BOOLEAN := TRUE,
  gentypes     IN BOOLEAN := TRUE,
  genbean      IN BOOLEAN := FALSE,
  force        IN BOOLEAN := FALSE,
  owner        IN VARCHAR2 := NULL,
  options      IN PLS_INTEGER := 0);

```

Registers the schema specified as an XMLTYPE.

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1    IN VARCHAR2,
  schemadoc    IN SYS.XMLTYPE,
  local        IN BOOLEAN := TRUE,
  gentypes     IN BOOLEAN := TRUE,
  genbean      IN BOOLEAN := FALSE,
  force        IN BOOLEAN := FALSE,
  owner        IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
  options      IN PLS_INTEGER := 0);

```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```

DBMS_XMLSCHEMA.REGISTERSCHEMA (
  schemaur1    IN VARCHAR2,
  schemadoc    IN SYS.URIType,
  local        IN BOOLEAN := TRUE,
  gentypes     IN BOOLEAN := TRUE,
  genbean      IN BOOLEAN := FALSE,
  force        IN BOOLEAN := FALSE,
  owner        IN VARCHAR2 := NULL,
  enablehierarchy IN PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,

```

```
options          IN PLS_INTEGER := 0);
```

Parameters

Table 160–18 REGSITERSHEMA Procedure Parameters

Parameter	Description
schemaur1	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside <code>schemalocation</code> attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? <ul style="list-style-type: none"> ■ By default, all schemas are registered as local schemas, under <code>/sys/schemas/<username>/...</code> ■ If a schema is registered as global, it is added under <code>/sys/schemas/PUBLIC/...</code> <p>You need write privileges on the directory to be able to register a schema as global.</p>
gentypes	Determines whether the schema compiler generates object types. By default, <code>TRUE</code> . If you use binary XML, you must be set <code>gentypes</code> to <code>FALSE</code> .
genbean	Determines whether the schema compiler generates Java beans. By default, <code>FALSE</code> .
gentables	Determines whether the schema compiler generates default tables. By default, <code>TRUE</code>
force	If this parameter is set to <code>TRUE</code> , the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is <code>FALSE</code> .
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	<ul style="list-style-type: none"> ■ <code>ENABLE_HIERARCHY_NONE</code> - enable hierarchy will not be called on any tables created while registering that schema ■ <code>ENABLE_HIERARCHY_CONTENTS</code> - enable hierarchy will be called for all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_CONTENTS</code>. This is the default. ■ <code>ENABLE_HIERARCHY_RESMETADATA</code> - enable hierarchy will be called on all tables created during schema registration with <code>hierarchy_type</code> as <code>DBMS_XDBZ.ENABLE_RESMETADATA</code>. Users should pass in <code>DBMS_XMLSCHEMA.ENABLE_RESMETADATA</code> for schemas they intend to use as resource metadata tables.

Table 160–18 (Cont.) REGSITERSchema Procedure Parameters

Parameter	Description
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:</p> <ul style="list-style-type: none">▪ REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)▪ REGISTER_BINARYXML - Register the schema for Binary XML▪ REGISTER_NT_AS_IOT - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI (
  schemaur1      IN  VARCHAR2,
  schemadocuri   IN  VARCHAR2,
  local          IN  BOOLEAN := TRUE,
  gentypes       IN  BOOLEAN := TRUE,
  genbean        IN  BOOLEAN := FALSE,
  gentables      IN  BOOLEAN := TRUE,
  force          IN  BOOLEAN := FALSE,
  owner          IN  VARCHAR2 := NULL,
  options        IN  PLS_INTEGER := 0);
```

Parameters

Table 160–19 REGISTERURI Procedure Parameters

Parameter	Description
schemaur1	Uniquely identifies the schema document. Can be used inside schemaLocation attribute of XML Schema import element.
schemadocuri	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a URIType instance using the urifactory - and invokes the REGISTERSHEMA Procedures function.
local	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under /sys/schemas/ <username>/... If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... The user needs write privileges on the directory to register a global schema.
gentypes	Determines whether the compiler generate object types. By default, TRUE.
genbean	Determines whether the compiler generate Java beans. By default, FALSE.
gentables	Determines whether the compiler generate default tables. TRUE by default.
force	TRUE: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.

Table 160–19 (Cont.) REGISTERURI Procedure Parameters

Parameter	Description
options	<p>Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a BITOR of the desired bits. Possible bits:</p> <ul style="list-style-type: none">REGISTER_NODOCID - this will suppress the creation of the DOCID column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the DOCID column)

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

Using DBMS_XMLSTORE

- [Types](#)

Types

Table 161-1 *Types of DBMS_XMLSTORE*

Type	Description
ctxType	The type of the query context handle. This is the return type of NEWCONTEXT .

Summary of DBMS_XMLSTORE Subprograms

Table 161–2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 161-5	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 161-6	Clears the update column list.
CLOSECONTEXT on page 161-7	It closes/deallocates a particular save context.
DELETEXML on page 161-8	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML on page 161-9	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 161-10	Creates a save context, and returns the context handle.
SETKEYCOLUMN on page 161-11	This method adds a column to the key column list.
SETROWTAG on page 161-12	Names the tag used in the XML document, to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN on page 161-13	Adds a column to the "update column list".
UPDATEXML on page 161-14	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(  
    ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax	Description
<pre>FUNCTION deleteXML(ctxHdl IN ctxPType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Uses a VARCHAR2 type for the xDoc parameter.
<pre>FUNCTION deleteXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Uses a CLOB type for the xDoc parameter.
<pre>FUNCTION deleteXML(ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</pre>	Uses an XMLType type for the xDoc parameter.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless [SETUPDATECOLUMN](#) is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax	Description
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.
<pre>FUNCTION insertXML(ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</pre>	Passes in the xDoc parameter as an XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(  
    targetTable IN VARCHAR2)  
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETROWTAG

Names the tag used in the XML document, to enclose the XML elements corresponding to database records.

Syntax

```
PROCEDURE setRowTag(  
    ctxHdl IN ctxType,  
    tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for [INSERTXML](#) to DBMS_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(  
    ctxHdl IN ctxType,  
    colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
<pre>FUNCTION updateXML(ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a VARCHAR2.
<pre>FUNCTION updateXML(ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a CLOB.
<pre>FUNCTION updateXML(ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;</pre>	Passes in the xDoc parameter as a XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

DBMS_XMLTRANSLATIONS

The DBMS_XMLTRANSLATIONS package provides an interface to perform translations so that strings can be searched or displayed in various languages.

See Also: For more information, see the *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- [Summary of DBMS_XMLTRANSLATIONS Subprograms](#)

Summary of DBMS_XMLTRANSLATIONS Subprograms

Table 162–1 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLETRANSLATION Procedure on page 162-3	Disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values
ENABLETRANSLATION Procedure on page 162-4	Enables translations in the current session
EXTRACTXLIFF Function & Procedure on page 162-5	Extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository
GETBASEDOCUMENT Function on page 162-8	Returns the base document with all the translations
MERGEXLIFF Functions on page 162-9	Merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository
SETSOURCELANG Function on page 162-12	Sets the source language to a particular language at the specified XPATH
TRANSLATEXML Function on page 162-14	Returns the document in the specified language
UPDATETRANSLATION Function on page 162-3	Updates the translation in a particular language at the specified XPATH

DISABLETRANSLATION Procedure

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Syntax

```
DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
```

ENABLETRANSLATION Procedure

This procedure enables translations in the current session. This is the default behavior.

Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```

EXTRACTXLIFF Function & Procedure

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF (
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF (
  abspath  IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

Parameters

Table 162–2 *EXTRACTXLIFF Function Parameters*

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be extracted
xpath	XPATH at which specifies the location of the element that needs to be translated. If no XPATH is specified, the entire document is processed.
namespace	Namespace
abspath	Absolute path of the resource from which the XLIFF is to be extracted

Return Values

The translations in the XLIFF format

Examples

Extracting the Translation from an XMLTYPE

Let doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <title xml:lang="es">
    Security Class Example - ES
```

```

    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>

```

Let the `xpath = '/securityClass/title'`. The output of `EXTRACTXLIFF` will be as follows:

```

<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>

```

Extracting the Translation from a Resource

Let the resource `'/public/security.xml' =`

```

<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
  <privilege name="privilege1"/>
  <aggregatePrivilege name="iStorePOApprover">
    <title>
      iStore Purchase Order Approver
    </title>
    <privilegeRef name="is:privilege1"/>
    <privilegeRef name="oa:submitPO"/>
    <privilegeRef name="oa:privilege3"/>
  </aggregatePrivilege>
  <privilege name="privilege2">
    <title xml:lang="en">
      secondary privilege
    </title>
    <title xml:lang="fr" xdb:srclang="true">
      secondary privilege - FR
    </title>
    <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
    <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
  </privilege>

```

```
    </privilege>
  </privlist>
</securityClass>
```

And let XPATH = "", then the extracted XLIFF is

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

GETBASEDOCUMENT Function

This function returns the base document with all the translations.

Syntax

```
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT (
    doc    IN XMLTYPE)
RETURN XMLTYPE;
```

Parameters

Table 162–3 *GETBASEDOCUMENT Function Parameters*

Parameter	Description
doc	Input XMLTYPE

Return Values

The XMLTYPE which contains the base document with all the translations

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

MERGEXLIFF Functions

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
  doc      IN XMLTYPE,
  xliiff   IN XMLTYPE)
RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.MERGEXLIFF(
  xliiff   IN XMLTYPE);
```

Parameters

Table 162–4 *MERGEXLIFF Function & Procedure Parameters*

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be merged
xliiff	Translations in the XLIFF format

Return Values

The result of merging 'xliiff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE

Consider the following input XMLTYPE:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="es">
    Security Class Example - ES
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
  <privilege name="privilege1"/>
  <aggregatePrivilege name="iStorePOApprover">
    <title>
      iStore Purchase Order Approver
    </title>
    <privilegeRef name="is:privilege1"/>
    <privilegeRef name="oa:submitPO"/>
  </aggregatePrivilege>
</securityClass>
```

```

        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
</privlist>
</securityClass>

```

Let the input XLIFF be as follows:

```

<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"]/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
  </xliff>

```

The output of merge will be as follows:

```

<securityClass xmlns="http://xmlns.oracle.com/xdm/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example Modified
  </title>
  <title xml:lang="es">
    Security Class Example Mod - ES
  </title>
  <title xml:lang="fr">
    Security Class Example Mod - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
  <privlist>
  <privilege name="privilege1"/>
  <aggregatePrivilege name="iStorePOApprover">
    <title>
      iStore Purchase Order Approver
    </title>

```

```
<privilegeRef name="is:privilege1"/>
<privilegeRef name="oa:submitPO"/>
<privilegeRef name="oa:privilege3"/>
</aggregatePrivilege>
<privilege name="privilege2">
  <title xml:lang="en" xdb:srclang="true">
    secondary privilege modified
  </title>
  <title xml:lang="fr">
    secondary privilege mod - FR
  </title>
  <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
  <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
</privilege>
</privlist>
</securityClass>
```

Merge XLIFF Translations into a Resource

If the input document in the above example were to be stored in the repository at `'/public/security.xml'`, then merging the above XLIFF will have the same effect.

SETSOURCELANG Function

This function sets the source language to a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.SETSOURCELANG (
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  lang     IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

Parameters

Table 162–5 SETSOURCELANG Function Parameters

Parameter	Description
doc	XMLTYPE for which the source language is to be set
xpath	XPATH at which the source language is to be set
lang	Source language
namespace	Namespace

Return Values

The updated document

Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
```

```
        targetNamespace="xmlns.oracle.com/example">
<name>
    securityClassExample
</name>
<title xml:lang="en">
    Security Class Example
</title>
<title xml:lang="fr" xdb:srclang="true">
    Security Class Example - FR
</title>
<inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML Function

This function returns the document in the specified language.

Syntax

```
DBMS_XMLTRANSLATIONS.TRANSULATEXML (
  doc    IN  XMLTYPE,
  lang   IN  VARCHAR2)
RETURN XMLTYPE;
```

Parameters

Table 162–6 *TRANSLATEXML Function Parameters*

Parameter	Description
doc	Input XMLTYPE
lang	Language

Return Values

The XMLTYPE which contains the document in the specified language

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML (doc, 'fr') will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="fr">
    Security Class Example - FR
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

UPDATETRANSLATION Function

This function updates the translation in a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
  doc      IN  XMLTYPE,
  xpath    IN  VARCHAR2,
  lang     IN  VARCHAR2,
  value    IN  VARCHAR2,
  namespace IN VARCHAR2 := NULL)
RETURN XMLTYPE;
```

Parameters

Table 162–7 UPDATETRANSLATION Function Parameters

Parameter	Description
doc	XMLTYPE for which the translation is to be updated
xpath	XPATH at which the translation is to be updated
lang	Language for which the translation is to be updated
value	New translation
namespace	Namespace

Return Values

The updated document

Examples

For example,

```
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
  xmlns:is="xmlns.oracle.com/iStore"
  xmlns:oa="xmlns.oracle.com/OracleApps"
  targetNamespace="xmlns.oracle.com/example">
  <name>
    securityClassExample
  </name>
  <title xml:lang="en" xdb:srclang="true">
    Security Class Example
  </title>
  <title xml:lang="fr">
    Oracle
  </title>
  <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

The `DBMS_XPLAN` package provides an easy way to display the output of the `EXPLAIN PLAN` command in several, predefined formats. You can also use the `DBMS_XPLAN` package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS_ALL` fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the `EXPLAIN PLAN` command, the AWR, and SQL tuning set, see *Oracle Database Performance Tuning Guide*.
- For more information on the `V$SQL_PLAN` and `V$SQL_PLAN_STATISTICS` fixed views, see *Oracle Database Reference*.

This chapter contains the following topics:

- [Using DBMS_XPLAN](#)
 - Overview
 - Security Model
 - Examples
- [Summary of DBMS_XPLAN Subprograms](#)

Using DBMS_XPLAN

- [Overview](#)
- [Security Model](#)
- [Examples](#)

Overview

The DBMS_XPLAN package supplies five table functions:

- DISPLAY - to format and display the contents of a plan table.
- DISPLAY_AWR - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- DISPLAY_CURSOR - to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY_SQL_PLAN_BASELINE - to display one or more execution plans for the SQL statement identified by SQL handle
- DISPLAY_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function `DISPLAY_CURSOR` requires to have select privileges on the following fixed views: `V$SQL_PLAN`, `V$SESSION` and `V$SQL_PLAN_STATISTICS_ALL`.

Using the [DISPLAY_AWR Function](#) requires the user to have `SELECT` privileges on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`.

Using the [DISPLAY_SQLSET Function](#) requires the user to have the `SELECT` privilege on `ALL_SQLSET_STATEMENTS` and `ALL_SQLSET_PLANS`.

Using [DISPLAY_SQL_PLAN_BASELINE Function](#) the user requires the user to have the `SELECT` privilege on `DBA_SQL_PLAN_BASELINES`.

All these privileges are automatically granted as part of the `SELECT_CATALOG` role.

Examples

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a `SELECT` statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.ename='benoit';
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

Plan hash value: 3693697075

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT		1	57	6 (34)	00:00:01
* 1	HASH JOIN		1	57	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	37	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	80	3 (34)	00:00:01

Predicate Information (identified by operation id):

```
1 - access("E"."DEPTNO"="D"."DEPTNO")
2 - filter("E"."ENAME"='benoit')
```

15 rows selected.

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function `DISPLAY_CURSOR` formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename FROM emp e, dept d
  WHERE e.deptno = d.deptno
  AND e.empno=7369;
```

ENAME

SMITH

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0

```
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT					
* 1	HASH JOIN		1	16	6 (34)	00:00:01
* 2	TABLE ACCESS FULL	EMP	1	13	3 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	12	3 (34)	00:00:01

Predicate Information (identified by operation id):

- 1 - access("E"."DEPTNO"="D"."DEPTNO")
- 2 - filter("E"."EMPNO"=7369)

21 rows selected.

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';
```

SQL_ID	CHILD_NUMBER
gwp663cqh5qbf	0

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR(('gwp663cqh5qbf',0));
```

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0

```
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time
0	SELECT STATEMENT				7 (100)	
1	SORT GROUP BY		4	64	7 (43)	00:00:01
* 2	HASH JOIN		14	224	6 (34)	00:00:01
3	TABLE ACCESS FULL	DEPT	4	44	3 (34)	00:00:01
4	TABLE ACCESS FULL	EMP	14	70	3 (34)	00:00:01

Predicate Information (identified by operation id):

- 2 - access("E"."DEPTNO"="D"."DEPTNO")

Instead of issuing two queries, one to get the `sql_id` and `child_number` pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and display_cursor table functions. In [Displaying a Plan Table Using DBMS_XPLAN.DISPLAY](#) on page 163-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
WHERE e.deptno = d.deptno
AND e.ename = 'hermann'
ORDER BY e.empno;
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

Id	Operation	Name	Rows	Bytes	Cost (%CPU)	Time	TQ	INOUT	PQ Distrib
0	SELECT STATEMENT		1	117	6 (50)	00:00:01			
1	PX COORDINATOR								
2	PX SEND QC (ORDER)	:TQ10003	1	117	6 (50)	00:00:01	Q1,03	P->S	QC (ORDER)
3	SORT ORDER BY		1	117	6 (50)	00:00:01	Q1,03	PCWP	
4	PX RECEIVE		1	117	5 (40)	00:00:01	Q1,03	PCWP	
5	PX SEND RANGE	:TQ10002	1	117	5 (40)	00:00:01	Q1,02	P->P	RANGE
* 6	HASH JOIN		1	117	5 (40)	00:00:01	Q1,02	PCWP	
7	PX RECEIVE		1	87	2 (50)	00:00:01	Q1,02	PCWP	
8	PX SEND HASH	:TQ10001	1	87	2 (50)	00:00:01	Q1,01	P->P	HASH
9	PX BLOCK ITERATOR		1	87	2 (50)	00:00:01	Q1,01	PCWC	
* 10	TABLE ACCESS FULL	EMP	1	87	2 (50)	00:00:01	Q1,01	PCWP	
11	BUFFER SORT						Q1,02	PCWC	
12	PX RECEIVE		4	120	3 (34)	00:00:01	Q1,02	PCWP	
13	PX SEND HASH	:TQ10000	4	120	3 (34)	00:00:01		S->P	HASH
14	TABLE ACCESS FULL	DEPT	4	120	3 (34)	00:00:01			

Predicate Information (identified by operation id):

```
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
```

When the query is parallel, information related to parallelism is reported: table queue number (TQ column), table queue type (INOUT) and table queue distribution method (PQ Distrib).

By default, if several plans in the plan table match the statement_id parameter passed to the display table function (default value is NULL), only the plan corresponding to the last EXPLAIN PLAN command is displayed. Hence, there is no need to purge the plan table after each EXPLAIN PLAN. However, you should purge the plan table regularly to ensure good performance in the execution of the DISPLAY table function. If no plan table is created, Oracle will use a global temporary table to store any plan information for individual users and will preserve its content

throughout the lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the EXPLAIN PLAN command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

Summary of DBMS_XPLAN Subprograms

Table 163–1 *DBMS_XPLAN Package Subprograms*

Subprogram	Description
DISPLAY Function on page 163-10	Displays the contents of the plan table
DISPLAY_AWR Function on page 163-13	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function on page 163-16	Displays the execution plan of any cursor in the cursor cache
DISPLAY_SQL_PLAN_BASELINE Function on page 163-19	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function on page 163-21	Displays the execution plan of a given statement stored in a SQL tuning set

DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or `V$SQL_PLAN_STATISTICS_ALL` if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
  table_name      IN VARCHAR2 DEFAULT 'PLAN_TABLE',
  statement_id    IN VARCHAR2 DEFAULT NULL,
  format          IN VARCHAR2 DEFAULT 'TYPICAL',
  filter_preds    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 163–2 *DISPLAY Function Parameters*

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to <code>PLAN_TABLE</code> , which is the default plan table for the <code>EXPLAIN PLAN</code> command. If <code>NULL</code> is specified it also defaults to <code>PLAN_TABLE</code> .
statement_id	Specifies the <code>statement_id</code> of the plan to be displayed. This parameter defaults to <code>NULL</code> , which is the default when the <code>EXPLAIN PLAN</code> command is executed without a <code>set statement_id</code> clause. If no <code>statement_id</code> is specified, the function will show you the plan of the most recent explained statement.

Table 163–2 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	<p>Controls the level of details for the plan. It accepts four values:</p> <ul style="list-style-type: none"> ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p> <p>If the target plan table (see <code>table_name</code> parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view <code>V\$SQL_PLAN_STATISTICS_ALL</code>), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).</p>

Table 163–2 (Cont.) DISPLAY Function Parameters

Parameter	Description
<code>filter_preds</code>	<p>SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: <code>filter_preds=>'plan_id = 10'</code></p> <p>Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see WARNING under Usage Notes)</p>

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

WARNING: Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last EXPLAIN PLAN command stored in the plan table:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as `statement_id='foo'`:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```

DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR (
  sql_id          IN      VARCHAR2,
  plan_hash_value IN      NUMBER DEFAULT NULL,
  db_id           IN      NUMBER DEFAULT NULL,
  format          IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 163–3 *DISPLAY_AWR Table Function Parameters*

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.
plan_hash_value	Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function will return all stored execution plans for a given SQL_ID.
db_id	Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database will be used, as shown in V\$DATABASE.
format	Controls the level of details for the plan. It accepts four values: <ul style="list-style-type: none"> ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 163–3 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
	<p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as <code>PARTITION</code>) or logical additions to the base plan table output (such as <code>PREDICATE</code>). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ■ <code>ROWS</code> - if relevant, shows the number of rows estimated by the optimizer ■ <code>BYTES</code> - if relevant, shows the number of bytes estimated by the optimizer ■ <code>COST</code> - if relevant, shows optimizer cost information ■ <code>PARTITION</code> - if relevant, shows partition pruning information ■ <code>PARALLEL</code> - if relevant, shows PX information (distribution method and table queue information) ■ <code>PREDICATE</code> - if relevant, shows the predicate section ■ <code>PROJECTION</code> -if relevant, shows the projection section ■ <code>ALIAS</code> - if relevant, shows the "Query Block Name / Object Alias" section ■ <code>REMOTE</code> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ <code>NOTE</code> - if relevant, shows the note section of the explain plan <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.</p>

Usage Notes

- To use the `DISPLAY_AWR` functionality, the calling user must have `SELECT` privilege on `DBA_HIST_SQL_PLAN`, `DBA_HIST_SQLTEXT`, and `V$DATABASE`, otherwise it will show an appropriate error message.
- Here are some ways you might use variations on the `format` parameter:
 - Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
 - Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
 - Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
 - Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
      (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null, 'ALL' )) tf
WHERE ht.sql_text like '%TOTO%';
```

DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as I/O, memory and timing) can be reported (based on the V\$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
  sql_id          IN VARCHAR2 DEFAULT NULL,
  child_number   IN NUMBER   DEFAULT NULL,
  format         IN VARCHAR2 DEFAULT 'TYPICAL');
```

Parameters

Table 163–4 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V\$SQL or V\$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V\$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session will be displayed.
child_number	Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.
format	Controls the level of details for the plan. It accepts four values: <ul style="list-style-type: none"> ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). <p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).</p>

Table 163–4 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	Format keywords must be separated by either a comma or a space:
	<ul style="list-style-type: none"> ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION - if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan ■ IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to ALL), this format will show IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. ■ MEMSTATS - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' ■ LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution.
	The following two formats are deprecated but supported for backward compatibility:
	<ul style="list-style-type: none"> ■ RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. ■ RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor
	Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT privilege on the fixed views V\$SQL_PLAN_STATISTICS_ALL, V\$SQL and V\$SQL_PLAN, otherwise it will show an appropriate error message.
- Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (  
    DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (  
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (  
    DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  format          IN VARCHAR2 := 'TYPICAL')
RETURN dbms_xplan_type_table;
```

Parameters

Table 163–5 *DISPLAY_SQL_PLAN_BASELINE Function Parameters*

Parameter	Description
sql_handle	SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.
plan_name	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
format	Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans. It is possible that the `plan_id` stored in the SQL management base may not match with the `plan_id` of the generated plan. A mismatch between stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and will be bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
  FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(
    'SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
```

```
FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
      WHERE sql_text like '%HR2%') pb,
      TABLE(DEMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
                                                  'BASIC')) t;
```

DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
  sqlset_name      IN VARCHAR2,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER := NULL,
  format           IN VARCHAR2 := 'TYPICAL',
  sqlset_owner     IN VARCHAR2 := NULL)
RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

Table 163–6 *DISPLAY_SQLSET Function Parameters*

Parameter	Description
sqlset_name	Name of the SQL Tuning Set
sql_id	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function <code>DBMS_SQLTUNE.SELECT_SQLSET</code>
plan_hash_value	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.
format	Controls the level of details for the plan. It accepts four values: <ul style="list-style-type: none"> ▪ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ▪ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ▪ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ▪ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 163–6 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	<p>For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as <code>PARTITION</code>) or logical additions to the base plan table output (such as <code>PREDICATE</code>). Format keywords must be separated by either a comma or a space:</p> <ul style="list-style-type: none"> ■ <code>ROWS</code> - if relevant, shows the number of rows estimated by the optimizer ■ <code>BYTES</code> - if relevant, shows the number of bytes estimated by the optimizer ■ <code>COST</code> - if relevant, shows optimizer cost information ■ <code>PARTITION</code> - if relevant, shows partition pruning information ■ <code>PARALLEL</code> - if relevant, shows PX information (distribution method and table queue information) ■ <code>PREDICATE</code> - if relevant, shows the predicate section ■ <code>PROJECTION</code> -if relevant, shows the projection section ■ <code>ALIAS</code> - if relevant, shows the "Query Block Name / Object Alias" section ■ <code>REMOTE</code> - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ <code>NOTE</code> - if relevant, shows the note section of the explain plan ■ <code>IOSTATS</code> - assuming that basic plan statistics are collected when SQL statements are executed (either by using the <code>gather_plan_statistics</code> hint or by setting the parameter <code>statistics_level</code> to <code>ALL</code>), this format will show IO statistics for <code>ALL</code> (or only for the <code>LAST</code> as shown below) executions of the cursor. ■ <code>MEMSTATS</code> - Assuming that PGA memory management is enabled (that is, <code>pga_aggregate_target</code> parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ <code>ALLSTATS</code> - A shortcut for ' <code>IOSTATS MEMSTATS</code> ' ■ <code>LAST</code> - By default, plan statistics are shown for all executions of the cursor. The keyword <code>LAST</code> can be specified to see only the statistics for the last execution. <p>The following two formats are deprecated but supported for backward compatibility:</p> <ul style="list-style-type: none"> ■ <code>RUNSTATS_TOT</code> - Same as <code>IOSTATS</code>, that is, displays IO statistics for all executions of the specified cursor. ■ <code>RUNSTATS_LAST</code> - Same as <code>IOSTATS LAST</code>, that is, displays the runtime statistics for the last execution of the cursor <p>Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-<code>PROJECTION</code>' excludes projection information.</p>
<code>sqlset_owner</code>	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use `'ALL -PROJECTION -NOTE'` to display everything except the projection and note sections.
- Use `'TYPICAL PROJECTION'` to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply `'PROJECTION'` is equivalent.
- Use `'-BYTES -COST -PREDICATE'` to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use `'BASIC ROWS'` to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID `'gwp663cqh5qbf'` and PLAN HASH 3693697075 in the SQL Tuning Set called `'OLTP_optimization_0405'`:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_SQLSET(
    'OLTP_optimization_0405', 'gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID `'atfwcg8anrykp'` stored in the SQL tuning set:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_SQLSET(
    'OLTP_optimization_0405', 'gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
  DBMS_XPLAN.DISPLAY_SQLSET(
    'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST'));
```

DBMS_XSLPROCESSOR

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- [Using DBMS_XSLPROCESSOR](#)
 - Overview
- [Summary of DBMS_XSLPROCESSOR Subprograms](#)

See Also:

- *Oracle XML DB Developer's Guide*

Using DBMS_XSLPROCESSOR

This section contains topics which relate to using the DBMS_XSLPROCESSOR package.

- [Overview](#) on page 164-3

Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

Summary of DBMS_XSLPROCESSOR Subprograms

Table 164–1 DBMS_XSLPROCESSOR Package Subprograms

Method	Description
CLOB2FILE Procedure on page 164-5	Writes content of a CLOB into a file
FREEPROCESSOR Procedure on page 164-6	Frees a processor object
FREESTYLESHEET Procedure on page 164-7	Frees a stylesheet object
NEWPROCESSOR Function on page 164-7	Returns a new processor instance
NEWSTYLESHEET Functions on page 164-9	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures on page 164-10	Transforms an input XML document
READ2CLOB Function on page 164-12	Reads content of the file into a CLOB
REMOVEPARAM Procedure on page 164-13	Removes a top-level stylesheet parameter
RESETPARAMS Procedure on page 164-14	Resets the top-level stylesheet parameters
SELECTNODES Function on page 164-15	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function on page 164-16	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure on page 164-17	Sets errors to be sent to the specified file
SETPARAM Procedure on page 164-18	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure on page 164-19	Turns warnings on or off
TRANSFORMNODE Function on page 164-20	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure on page 164-21	Gets the value of the first node that matches a pattern

CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(
  cl          IN  CLOB;
  flocation  IN  VARCHAR2,
  fname      IN  VARCHAR2,
  csid       IN  NUMBER:=0);
```

Parameters

Table 164–2 CLOB2FILE Procedure Parameters

Parameter	Description
CLOB	File directory
flocation	File directory
fname	File name
csid	Character set id of the file <ul style="list-style-type: none"> ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, content of the output file will be in the database character set

FREEPROCESSOR Procedure

This procedure Frees a Processor object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(  
  p IN Processor);
```

Parameters

Table 164–3 *FREEPROCESSOR Procedure Parameters*

Parameter	Description
p	Processor

FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(  
  ss IN Stylesheet);
```

Parameters

Table 164–4 *FREESTYLESHEET Procedure Parameters*

Parameter	Description
ss	Stylesheet

NEWPROCESSOR Function

This function returns a new `Processor` instance. The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR  
RETURN Processor;
```

NEWSTYLE SHEET Functions

This function creates and returns a new `Stylesheet` instance. The options are described in the following table.

Syntax

Creates and returns a new `stylesheet` instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLE SHEET (
    xml doc IN  DOMDOCUMENT,
    ref     IN  VARCHAR2)
RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLE SHEET (
    inp  IN  VARCHAR2,
    ref  IN  VARCHAR2)
RETURN Stylesheet;
```

Parameters

Table 164–5 NEWSTYLE SHEET Function Parameters

Parameter	Description
<code>xml doc</code>	DOMDocument to use for construction
<code>inp</code>	Input URL to use for construction
<code>ref</code>	Reference URL

PROCESSXSL Functions and Procedures

This function transforms input `XMLDocument`. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input `XMLDocument` using given `DOMDocument` and `stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p      IN  Processor,
  ss     IN  Stylesheet,
  xmldoc IN  DOMDOCUMENT),
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as URL and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p      IN  Processor,
  ss     IN  Stylesheet,
  url    IN  VARCHAR2,
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given document as CLOB and the `Stylesheet`, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p      IN  Processor,
  ss     IN  Stylesheet,
  clb    IN  CLOB)
RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the `stylesheet`, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR. (
  p          IN  Processor,
  ss         IN  Stylesheet,
  xmldoc     IN  DOMDOCUMENT,
  dir        IN  VARCHAR2,
  fileName   IN  VARCHAR2);
```

Transforms input `XMLDocument` using given URL and the `stylesheet`, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN  Processor,
  ss         IN  Stylesheet,
  url        IN  VARCHAR2,
  dir        IN  VARCHAR2,
  fileName   IN  VARCHAR2);
```

Transforms input `XMLDocument` using given `DOMDOCUMENT` and the `stylesheet`, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN  Processor,
```

```

ss          IN          Stylesheet,
xml doc     IN          DOMDOCUMENT,
cl          IN OUT     CLOB);

```

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and returns the resultant document fragment:

```

DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN          Processor,
  ss         IN          Stylesheet,
  xmldf     IN          DOMDOCUMENTFRAGMENT)
RETURN DOMDOCUMENTFRAGMENT;

```

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to the specified file in a specified directory:

```

DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN          Processor,
  ss         IN          Stylesheet,
  xmldf     IN          DOMDOCUMENTFRAGMENT,
  dir       IN          VARCHAR2,
  filename  IN          VARCHAR2);

```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a buffer:

```

DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN          Processor,
  ss         IN          Stylesheet,
  xmldf     IN          DOMDOCUMENTFRAGMENT,
  buf       IN OUT     VARCHAR2);

```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

```

DBMS_XSLPROCESSOR.PROCESSXSL (
  p          IN          Processor,
  ss         IN          Stylesheet,
  xmldf     IN          DOMDOCUMENTFRAGMENT,
  cl        IN OUT     CLOB);

```

Parameters

Table 164–6 *PROCESSXSL Function and Procedure Parameters*

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xml doc	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xmldf	XMLDocumentFragment being transformed

READ2CLOB Function

This function reads content of a file into a CLOB.

Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(  
  flocation IN VARCHAR2,  
  fname     IN VARCHAR2,  
  csid      IN NUMBER:=0)  
RETURN CLOB;
```

Parameters

Table 164–7 *READ2CLOB Function Parameters*

Parameter	Description
flocation	File directory
fname	File name
csid	Character set id of the file <ul style="list-style-type: none">▪ Must be a valid Oracle id; otherwise returns an error▪ If 0, input file is assumed to be in the database character set

REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(  
  ss      IN  Stylesheet,  
  name    IN  VARCHAR2);
```

Parameters

Table 164–8 REMOVEPARAM Procedure Parameters

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter

RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(  
    ss IN    Stylesheet);
```

Parameters

Table 164–9 *RESETPARAMS Procedure Parameters*

Parameter	Description
ss	Stylesheet instance

SELECTNODES Function

This function selects nodes which match the supplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(  
  n          IN  DBMS_XMLDOM.DOMNODE,  
  pattern    IN  VARCHAR2,  
  namespace  IN  VARCHAR2 := NULL)  
RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 164–10 *SELECTNODES Function Parameters*

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

SELECTSINGLENODE Function

This function selects the first node from the tree that match the supplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(  
  n          IN  DBMS_XMLDOM.DOMNODE,  
  pattern    IN  VARCHAR2,  
  namespace  IN  VARCHAR2 := NULL)  
RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 164–11

Parameter	Description
n	Root DOMNode of the tree
pattern	Pattern to use
namespace	Namespace declared

SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

Note: This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(  
    p          IN    Processor,  
    fileName  IN    VARCHAR2);
```

Parameters

Table 164–12 *SETERRORLOG Procedure Parameters*

Parameter	Description
p	Processor instance
fileName	Complete path of the file to use as the error log

SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid XPath expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(  
  ss      IN  Stylesheet,  
  name    IN  VARCHAR2,  
  value   IN  VARCHAR2);
```

Parameters

Table 164–13 *SETPARAM Procedure Parameters*

Parameter	Description
ss	Stylesheet instance
name	Name of the parameter
value	Value of the parameter

SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS (  
  p      IN  Processor,  
  yes    IN  BOOLEAN);
```

Parameters

Table 164–14 *SHOWWARNINGS Procedure Parameters*

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(  
  n      IN  DOMNODE,  
  ss     IN  Stylesheet)  
RETURN DOMDocumentFragment;
```

Parameters

Table 164–15 TRANSFORMNODE Function Parameters

Parameter	Description
n	DOMNode to transform
ss	Stylesheet to use

VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF (
  n          IN    DBMS_XMLDOM.DOMNODE,
  pattern    IN    VARCHAR2,
  namespace  IN    VARCHAR2 := NULL)
RETURN VARCHAR2;
```

```
DBMS_XSLPROCESSOR.VALUEOF (
  n          IN    DBMS_XMLDOM.DOMNODE,
  pattern    IN    VARCHAR2,
  val       OUT   VARCHAR2,
  namespace  IN    VARCHAR2 := NULL);
```

Parameters

Table 164–16 *VALUEOF Function and Procedure Parameters*

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

The `DEBUG_EXTPROC` package enables you to start up the `extproc` agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- [Using `DEBUG_EXTPROC`](#)
 - Security Model
 - Operational Notes
 - Rules and Limits
- [Summary of `DEBUG_EXTPROC` Subprograms](#)

Using DEBUG_EXTPROC

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)

Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

Operational Notes

To install the package, run the script `DBGEXTP.SQL`.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.

- Ensure that you have execute privileges on package `DEBUG_EXTPROC`

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

Note: These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT` to startup the extproc agent in this session; for example, execute `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed `DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT`
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

Rules and Limits

Note: DEBUG_EXTPROC works only on platforms with debuggers that can attach to a running process.

Summary of DEBUG_EXTPROC Subprograms

Table 165–1 *DEBUG_EXTPROC Package Subprograms*

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure on page 165-7	Starts up the extproc agent process in the session

STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session. This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, <A>.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- [Using HTF](#)
 - Operational Notes
 - Rules and Limits
 - Examples
- [Summary of Tags](#)
- [Summary of HTF Subprograms](#)

Using HTF

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)

Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE_SC Function](#) or the [ESCAPE_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE_URL Function](#).
- The [FORMAT_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.PRINT function. It then prints its parameters to the generated web page.

Rules and Limits

If you use values of the LONG data type in functions such as `HTF . PRINT`, `HTF . PRN`, `HTF . PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the function.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
  HTP.P (HTF.HTMLOPEN); -- generates <HTML>
  HTP.P (HTF.HEADOPEN); -- generates <HEAD>
  HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
  HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
  HTP.P (HTF.BODYOPEN); -- generates <BODY>
  HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
  HTP.P (HTF.BODYCLOSE); -- generates </BODY>
  HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

[HTMLOPEN Function](#), [HTMLCLOSE Function](#) - generate <HTML> and </HTML>

[HEADOPEN Function](#), [HEADCLOSE Function](#) - generate <HEAD> and </HEAD>

[BODYOPEN Function](#), [BODYCLOSE Function](#) - generate <BODY> and </BODY>

Comment Tag

[COMMENT Function](#) - generates <!-- and -->

[http://www.w3.org.BASE Function](#) - generates <BASE>

[LINKREL Function](#) - generates <LINK> with the REL attribute

[LINKREV Function](#) - generates <LINK> with the REV attribute

[TITLE Function](#) - generates <TITLE>

[META Function](#) - generates <META>

[SCRIPT Function](#) - generates <SCRIPT>

[STYLE Function](#) - generates <STYLE>

[ISINDEX Function](#) - generates <ISINDEX>

Applet Tags

[APPLETOPEN Function](#), [APPLETCLOSE Function](#) - generate <APPLET> and </APPLET>

[PARAM Function](#) - generates <PARAM>

List Tags

[OLISTOPEN Function](#), [OLISTCLOSE Function](#) - generate and

[ULISTOPEN Function](#), [ULISTCLOSE Function](#) - generate and

[DLISTOPEN Function](#), [DLISTCLOSE Function](#) - generate <DL> and </DL>

[DLISTTERM Function](#) - generates <DT>

[DLISTDEF Function](#) - generates <DD>

[DIRLISTOPEN Function](#), [DIRLISTCLOSE Function](#) - generate <DIR> and </DIR>

[LISTHEADER Function](#) - generates <LH>

[LISTINGOPEN Function](#), [LISTINGCLOSE Function](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Function](#) - generate <MENU> and </MENU>

[LISTITEM Function](#) - generates

Form Tags

[FORMOPEN Function](#), [FORMCLOSE Function](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Function](#) - generates <INPUT TYPE="CHECKBOX">

[FORMHIDDEN Function](#) - generates <INPUT TYPE="HIDDEN">

[FORMIMAGE Function](#) - generates `<INPUT TYPE="IMAGE">`

[FORMPASSWORD Function](#) - generates `<INPUT TYPE="PASSWORD">`

[FORMRADIO Function](#) - generates `<INPUT TYPE="RADIO">`

[FORMSELECTOPEN Function](#), [FORMSELECTCLOSE Function](#) - generate `<SELECT>` and `</SELECT>`

[FORMSELETOPTION Function](#) - generates `<OPTION>`

[FORMTEXT Function](#) - generates `<INPUT TYPE="TEXT">`

[FORMTEXTAREA Function](#) - generate `<TEXTAREA>`

[FORMTEXTAREAOPEN Function](#), [FORMTEXTAREACLOSE Function](#) - generate `<TEXTAREA>` and `</TEXTAREA>`

[FORMRESET Function](#) - generates `<INPUT TYPE="RESET">`

[FORMSUBMIT Function](#) - generates `<INPUT TYPE="SUBMIT">`

Table Tags

[TABLEOPEN Function](#), [TABLECLOSE Function](#) - generate `<TABLE>` and `</TABLE>`

[TABLECAPTION Function](#) - generates `<CAPTION>`

[TABLEROWOPEN Function](#), [TABLEROWCLOSE Function](#) - generate `<TR>` and `</TR>`

[TABLEHEADER Function](#) - generates `<TH>`

[TABLEDATA Function](#) - generates `<TD>`

IMG, HR, and A Tags

[HR Function](#), [LINE Function](#) - generate `<HR>`

[IMG Function](#), [IMG2 Function](#) - generate ``

[ANCHOR Function](#), [ANCHOR2 Function](#) - generate `<A>`

[MAPOPEN Function](#), [MAPCLOSE Function](#) - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

[HEADER Function](#) - generates heading tags (`<H1>` to `<H6>`)

[PARA Function](#), [PARAGRAPH Function](#) - generate `<P>`

[PRN Functions](#), [PRINT Functions](#) - generate any text that is passed in

[PRN Functions](#), [S Function](#) - generate any text that is passed in; special characters in HTML are escaped

[PREOPEN Function](#), [PRECLOSE Function](#) - generate `<PRE>` and `</PRE>`

[BLOCKQUOTEOPEN Function](#), [BLOCKQUOTECLOSE Function](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`

[DIV Function](#) - generates `<DIV>`

[NL Function](#), [BR Function](#) - generate `
`

[NOBR Function](#) - generates `<NOBR>`

[WBR Function](#) - generates `<WBR>`

[PLAINTEXT Function](#) - generates <PLAINTEXT>

[ADDRESS Function](#) - generates <ADDRESS>

[MAILTO Function](#) - generates <A> with the MAILTO attribute

[AREA Function](#) - generates <AREA>

[BGSOUND Function](#) - generates <BGSOUND>

Character Formatting Tags

[BASEFONT Function](#) - generates <BASEFONT>

[BIG Function](#) - generates <BIG>

[BOLD Function](#) - generates

[CENTER Function](#) - generates <CENTER> and </CENTER>

[CENTEROPEN Function](#), [CENTERCLOSE Function](#) - generate <CENTER> and </CENTER>

[CITE Function](#) - generates <CITE>

[CODE Function](#) - generates <CODE>

[DFN Function](#) - generates <DFN>

[EM Function](#), [EMPHASIS Function](#) - generate

[FONTOPEN Function](#), [FONTCLOSE Function](#) - generate and

[ITALIC Function](#) - generates <I>

[KBD Function](#), [KEYBOARD Function](#) - generate <KBD> and </KBD>

[S Function](#) - generates <S>

[SAMPLE Function](#) - generates <SAMP>

[SMALL Function](#) - generates <SMALL>

[STRIKE Function](#) - generates <STRIKE>

[STRONG Function](#) - generates

[SUB Function](#) - generates <SUB>

[SUP Function](#) - generates <SUP>

[TELETYPE Function](#) - generates <TT>

[UNDERLINE Function](#) - generates <U>

[VARIABLE Function](#) - generates <VAR>

Frame Tags

[FRAME Function](#) - generates <FRAME>

[FRAMESETOPEN Function](#), [FRAMESETCLOSE Function](#) - generate <FRAMESET> and </FRAMESET>

[NOFRAMESOPEN Function](#), [NOFRAMESCLOSE Function](#) - generate <NOFRAMES> and </NOFRAMES>

Summary of HTF Subprograms

Table 166–1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function on page 166-15	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Function on page 166-16	Generates the <A> and tags which specify the source or destination of a hypertext link
ANCHOR2 Function on page 166-17	Generates the <A> and tags which specify the source or destination of a hypertext link
APPLETCLOSE Function on page 166-18	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Function on page 166-19	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Function on page 166-20	Generates the <AREA> tag, which defines a client-side image map
BASE Function on page 166-21	Generates the <BASE> tag which records the URL of the document
BASEFONT Function on page 166-22	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Function on page 166-23	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Function on page 166-24	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function on page 166-25	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function on page 166-26	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function on page 166-27	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Function on page 166-28	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Function on page 166-29	Generates the and tags which direct the browser to display the text in boldface
BR Function on page 166-30	Generates the tag which begins a new line of text
CENTER Function on page 166-31	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Function on page 166-32	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Function on page 166-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function on page 166-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Function on page 166-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically

Table 166–1 (Cont.) HTF Package Subprograms

Subprogram	Description
COMMENT Function on page 166-36	Generates This function generates the comment tags <code><!-- ctext --></code>
DFN Function on page 166-37	Generates the <code><DFN></code> and <code></DFN></code> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function on page 166-38	Generates the <code></DIR></code> tag which ends a directory list section
DIRLISTOPEN Function on page 166-39	Generates the <code><DIR></code> which starts a directory list section
DIV Function on page 166-40	Generates the <code><DIV></code> tag which creates document divisions
DLISTCLOSE Function on page 166-41	Generates the <code></DL></code> tag which ends a definition list
DLISTDEF Function on page 166-42	Generates the <code><DD></code> tag, which inserts definitions of terms
DLISTOPEN Function on page 166-43	Generates the <code><DL></code> tag which starts a definition list
DLISTTERM Function on page 166-44	Generates the <code><DT></code> tag which defines a term in a definition list <code><DL></code>
EM Function on page 166-45	Generates the <code></code> and <code></code> tags, which define text to be emphasized
EMPHASIS Function on page 166-46	Generates the <code></code> and <code></code> tags, which define text to be emphasized
ESCAPE_SC Function on page 166-47	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function on page 166-48	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function on page 166-50	Generates the <code></code> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function on page 166-50	Generates the <code></code> which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function on page 166-51	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function on page 166-52	Generates the <code><INPUT></code> tag with <code>TYPE="checkbox"</code> which inserts a checkbox element in a form
FORMCLOSE Function on page 166-53	Generates the <code></FORM></code> tag which marks the end of a form section in an HTML document
FORMFILE Function on page 166-54	Generates the <code><INPUT></code> tag with <code>TYPE="file"</code> which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function on page 166-55	Generates the <code><INPUT></code> tag with <code>TYPE="hidden"</code> which inserts a hidden form element
FORMIMAGE Function on page 166-56	Generates the <code><INPUT></code> tag with <code>TYPE="image"</code> which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function on page 166-57	Generates the <code><FORM></code> tag which marks the beginning of a form section in an HTML document

Table 166-1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMPASSWORD Function on page 166-58	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function on page 166-59	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function on page 166-60	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function on page 166-61	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function on page 166-62	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELETOPTION Function on page 166-63	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function on page 166-64	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function on page 166-65	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function on page 166-66	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function on page 166-67	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function on page 166-68	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function on page 166-69	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function on page 166-70	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function on page 166-71	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function on page 166-72	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function on page 166-73	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function on page 166-74	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function on page 166-75	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function on page 166-76	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function on page 166-77	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function on page 166-79	Generates the </HTML> tag which marks the end of an HTML document

Table 166–1 (Cont.) HTF Package Subprograms

Subprogram	Description
HTMLOPEN Function on page 166-79	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function on page 166-80	Generates the tag which directs the browser to load an image onto the HTML page
IMG2 Function on page 166-81	Generates the tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function on page 166-82	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
ITALIC Function on page 166-83	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function on page 166-84	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function on page 166-85	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function on page 166-86	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function on page 166-87	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function on page 166-88	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function on page 166-89	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function on page 166-90	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function on page 166-91	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function on page 166-92	Generates the tag, which indicates a list item
MAILTO Function on page 166-93	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function on page 166-94	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function on page 166-95	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function on page 166-96	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function on page 166-97	Generates the <MENU> tag which create a list that presents one line for each item
META Function on page 166-98	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers

Table 166–1 (Cont.) HTF Package Subprograms

Subprogram	Description
NL Function on page 166-86	Generates the tag which begins a new line of text
NOBR Function on page 166-100	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function on page 166-101	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Function on page 166-102	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Function on page 166-103	Generates the tag which defines the end of an ordered list
OLISTOPEN Function on page 166-104	Generates the tag which marks the beginning of an ordered list
PARA Function on page 166-105	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function on page 166-106	Adds attributes to the <P> tag
PARAM Function on page 166-107	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Function on page 166-108	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function on page 166-109	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function on page 166-110	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions on page 166-111	Generates the specified parameter as a string terminated with the \n newline character
PRN Functions on page 166-112	Generates the specified parameter as a string
S Function on page 166-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function on page 166-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function on page 166-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function on page 166-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Function on page 166-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function on page 166-118	Generates the and tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function on page 166-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page

Table 166–1 (Cont.) HTF Package Subprograms

Subprogram	Description
SUB Function on page 166-120	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Function on page 166-121	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function on page 166-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function on page 166-123	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Function on page 166-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function on page 166-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function on page 166-126	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function on page 166-127	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function on page 166-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Function on page 166-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function on page 166-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function on page 166-131	Generates the tag which marks the end of an unordered list
ULISTOPEN Function on page 166-132	Generates the tag which marks the beginning of an unordered list
UNDERLINE Function on page 166-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function on page 166-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function on page 166-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
  cvalue      IN      VARCHAR2
  cnowrap     IN      VARCHAR2  DEFAULT NULL
  cclear      IN      VARCHAR2  DEFAULT NULL
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–2 ADDRESS Function Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Function

This function and the [ANCHOR2 Function](#) functions generate the <A> and HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the [ANCHOR2 Function](#) provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (  
    curl           IN          VARCHAR2,  
    ctext         IN          VARCHAR2,  
    cname         IN          VARCHAR2  DEFAULT NULL,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Function

This function and the [ANCHOR Function](#) generate the <A> and HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this functions provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
  curl          IN          VARCHAR2,
  ctext        IN          VARCHAR2,
  cname        IN          VARCHAR2  DEFAULT NULL,
  ctarget      IN          varchar2  DEFAULT NULL,
  cattributes  IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using [APPLETOPEN Function](#) on page 166-19

Syntax

```
HTF.APPLETCLOSE  
RETURN VARCHAR2;
```

APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with [APPLETCLOSE Function](#) on page 166-18 which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (
  ccode          IN          VARCHAR2,
  cheight       IN          NUMBER,
  cwidth        IN          NUMBER,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–5 *APPLETOPEN Function Parameters*

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the [PARAM Function](#) function on page 166-107.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
  ccoords      IN      VARCHAR2
  cshape       IN      VARCHAR2  DEFAULT NULL,
  chref        IN      VARCHAR2  DEFAULT NULL,
  cnohref      IN      VARCHAR2  DEFAULT NULL,
  ctarget      IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–6 AREA Function Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Function

This function generates the <BASE> tag which records the URL of the document.

Syntax

```
HTF.BASE (  
    ctarget          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–7 *BASE Function Parameters*

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTF.BASEFONT (  
    nsize    IN    INTEGER)  
    RETURN VARCHAR2;
```

Parameters

Table 166–8 *BASEFONT Function Parameters*

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (
  csrc          IN          VARCHAR2,
  cloop         IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–10 *BIG Function Parameters*

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Function

This function generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Function](#).

Syntax

```
HTF.BLOCKQUOTECLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Function](#).

Syntax

```
HTF.BLOCKQUOTEOPEN (  
    cnowrap          IN          VARCHAR2  DEFAULT NULL,  
    cclear           IN          VARCHAR2  DEFAULT NULL,  
    cattributes      IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–11 *BLOCKQUOTEOPEN Function Parameters*

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Function

This function generates the `</BODY>` tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the [BODYOPEN Function](#).

Syntax

```
HTF.BODYCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the [BODYCLOSE Function](#).

Syntax

```
HTF.BODYOPEN (  
    cbackground    IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–12 *BODYOPEN Function Parameters*

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')  
RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Function

This function generates the and tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–13 BOLD Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

BR Function

This function generates the
 tag which begins a new line of text. It performs the same operation as the [NL Function](#).

Syntax

```
HTF.BR (  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–14 BR Function Parameters

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (  
    ctext          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 166–15 *CENTER Parameters*

Parameter	Description
ctext	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Function

This function generates the `</CENTER>` tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the [CENTEROPEN Function](#).

Syntax

```
HTF.CENTERCLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center. You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Function](#).

Syntax

```
HTF.CENTEROPEN  
    RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–16 CITE Function Parameters

Parameter	Description
cctx	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>cctx</CITE>
```

CODE Function

This function generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–17 *CODE Function Parameters*

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (  
    ctext          IN          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 166–18 *COMMENT Function Parameters*

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (  
    ctext          IN          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 166–19 *DFN Function Parameters*

Parameter	Description
c text	The text to render in italics.

Examples

This function generates

```
<DFN>c text</DFN>
```

DIRLISTCLOSE Function

This function generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the [DIRLISTOPEN Function](#).

Syntax

```
HTF.DIRLISTCLOSE  
RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `` tag directly or invoke the [LISTITEM Function](#) so that the `` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the [DIRLISTCLOSE Function](#).

Syntax

```
HTF.DIRLISTOPEN  
RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the tag directly or invoke the [LISTITEM Function](#) so that the tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Function

This function generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Function](#).

Syntax

```
HTF.DLISTCLOSE  
RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

Examples

This function generates

```
</DL>
```

DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (  
  ctext          IN          VARCHAR2  DEFAULT NULL,  
  cclear         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–21 *DLISTDEF Function Parameters*

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Function](#).

Syntax

```
HTF.DLISTOPEN (  
  cclear          IN          VARCHAR2  DEFAULT NULL,  
  cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–22 *DLISTOPEN Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Function](#) and definitions are inserted using the [DLISTDEF Function](#).

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTF.DLISTTERM (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–23 *DLISTTERM Function Parameters*

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Function

This function generates the and tags, which define text to be emphasized. It performs the same task as the [EMPHASIS Function](#).

Syntax

```
HTF.EM(  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–24 *EM Function Parameters*

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Function

This function generates the and tags, which define text to be emphasized. It performs the same task as the [EM Function](#).

Syntax

```
HTF.EMPHASIS(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &
- " to "
- < to <
- > to >

This function performs the same operation as HTP. [PRINTS Procedure](#) and HTP. [PS Procedure](#).

Syntax

```
HTF.ESCAPE_SC(  
    ctext          IN          VARCHAR2);
```

Parameters

Table 166–26 *ESCAPE_SC Procedure Parameters*

Parameter	Description
ctext	The text string to convert.

ESCAPE_URL Function

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- & to &
- " to "
- < to <
- > to >
- % to &25

Syntax

```
HTF.ESCAPE_URL(  
    p_url          IN          VARCHAR2);
```

Parameters

Table 166–27 *ESCAPE_URL Procedure Parameters*

Parameter	Description
p_url	The string to convert.

FONTCLOSE Function

This function generates the `` tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the [FONTOPEN Function](#).

Syntax

```
HTF.FONTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</FONT>
```

FONTOPEN Function

This function generates the which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the [FONTCLOSE Function](#).

Syntax

```
HTF.FONTOPEN(  
  ccolor      IN      VARCHAR2  DEFAULT NULL,  
  cface       IN      VARCHAR2  DEFAULT NULL,  
  csize       IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–28 *FONTOPEN Function Parameters*

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMAT_CELL Function

This function formats column values inside an HTML table using the [TABLEDATA Function](#). It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
  columnValue      IN      VARCHAR2
  format_numbers   IN      VARCHAR2  DEFAULT NULL
)
RETURN VARCHAR2;
```

Parameters

Table 166–29 *FORMAT_CELL Function Parameters*

Parameter	Description
columnValue	The value that needs to be formatted in an HTML table.
format_numbers	The format that numeric data is displayed in. If the value of this parameter is not NULL, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

FORMCHECKBOX Function

This function generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2  DEFAULT 'ON',  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–30 *FORMCHECKBOX Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Function

This function generates the `</FORM>` tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the [FORMOPEN Function](#).

Syntax

```
HTF.FORMCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

FORMFILE Function

This function generates the <INPUT> tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(  
  cname          IN          VARCHAR2,  
  caccept        IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–31 *FORMFILE Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–32 *FORMHIDDEN Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Function

This function generates the <INPUT> tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```
HTF.FORMIMAGE (  
    cname          IN          VARCHAR2,  
    csrc           IN          VARCHAR2,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–33 *FORMIMAGE Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the [FORMCLOSE Function](#).

Syntax

```
HTF.FORMOPEN (
  curl          IN          VARCHAR2,
  cmethod       IN          VARCHAR2  DEFAULT 'POST',
  ctargget      IN          VARCHAR2  DEFAULT NULL,
  cenctype      IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–34 FORMOPEN Function Parameters

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctargget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctargget" ENCTYPE="cenctype"
cattributes>
```

FORMPASSWORD Function

This function generates the <INPUT> tag with `TYPE="password"` which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(  
  cname          IN          VARCHAR2,  
  csize          IN          VARCHAR2,  
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,  
  cvalue         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–35 *FORMPASSWORD Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csize</code>	The value for the <code>SIZE</code> attribute.
<code>cmaxlength</code>	The value for the <code>MAXLENGTH</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"  
VALUE="cvalue" cattributes>
```

FORMRADIO Function

This function generates the <INPUT> tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2,
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–36 FORMRADIO Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(  
  cvalue          IN          VARCHAR2  DEFAULT 'Reset',  
  cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–37 FORMRESET Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Function](#). The values are inserted using [FORMSELECTOPTION Function](#).

Syntax

```
HTF.FORMSELECTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

FORMSELECTOPEN Function

This function generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Function](#). The values are inserted using [FORMSELETOPTION Function](#).

Syntax

```
HTF.FORMSELECTOPEN (
    cname          IN          VARCHAR2,
    cprompt        IN          VARCHAR2  DEFAULT NULL,
    nsize          IN          INTEGER   DEFAULT NULL,
    cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELETOPTION('Messier');
HTF.FORMSELETOPTION('Howe');
HTF.FORMSELETOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELETOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELETOPTION(
  cvalue          IN          VARCHAR2,
  cselected       IN          VARCHAR2  DEFAULT NULL,
  cattributes     IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–39 *FORMSELETOPTION Function Parameters*

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under [Examples](#) of the [FORMSELECTOPEN Function](#).

FORMSUBMIT Function

This function generates the <INPUT> tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(  
  cname          IN          VARCHAR2  DEFAULT NULL,  
  cvalue         IN          VARCHAR2  DEFAULT 'Submit',  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–40 FORMSUBMIT Function Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Function

This function generates the <INPUT> tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT (
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2  DEFAULT NULL,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–41 *FORMTEXT Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(  
    cname          IN          VARCHAR2,  
    nrows          IN          INTEGER,  
    ncolumns       IN          INTEGER,  
    calign         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–42 *FORMTEXTAREA Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"  
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA Function](#) except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–43 *FORMTEXTAREA2 Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Function

This function generates the `</TEXTAREA>` tag which ends a text area form element. You open a text area element by means of either [FORMTEXTAREAOPEN Function](#) or [FORMTEXTAREAOPEN2 Function](#).

Syntax

```
HTF.FORMTEXTAREACLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN2 Function](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

Syntax

```
HTF.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–44 *FORMTEXTAREAOPEN Function Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN Function](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Function](#).

Syntax

```
HTF.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Function

This function generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN         VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–46 *FRAME Function Parameters*

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Function

This function generates the `</FRAMESET>` tag which ends a frameset section. You mark the beginning of a frameset section by means of the [FRAMESETOPEN Function](#).

Syntax

```
HTF.FRAMESETCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the [FRAMESETCLOSE Function](#).

Syntax

```
HTF.FRAMESETOPEN(
  crows          IN          VARCHAR2  DEFAULT NULL,
  ccols          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–47 *FRAMESETOPEN Function Parameters*

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Function

This function generates the `</HEAD>` tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the [HEADOPEN Function](#).

Syntax

```
HTF.HEADCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
  nsize      IN      INTEGER,
  cheader    IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cnowrap    IN      VARCHAR2  DEFAULT NULL,
  cclear     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–48 *HEADER Function Parameters*

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1, 'Overview')
RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the [HEADCLOSE Function](#).

Syntax

```
HTF.HEADOPEN  
RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

HR Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [LINE Function](#).

Syntax

```
HTF.HR (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–49 *HR Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Function

This function generates the `</HTML>` tag which marks the end of an HTML document. You use the [HTMLOPEN Function](#) to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document. You use the [HTMLCLOSE Function](#) to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN  
RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

IMG Function

This function generates the tag which directs the browser to load an image onto the HTML page. The [IMG2 Function](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTF.IMG (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–50 *IMG Function Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Function

This function generates the tag, which directs the browser to load an image onto the HTML page. The [IMG Function](#) performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2 (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2  DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–51 *IMG2 Function Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the USEMAP attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(  
  cprompt      IN      VARCHAR2  DEFAULT NULL,  
  curl         IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–52 ISINDEX Function Parameters

Parameter	Description
<code>cprompt</code>	The value for the PROMPT attribute.
<code>curl</code>	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Function

This function generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–53 *ITALIC Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates
`<I cattributes>ctext</I>`

KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KEYBOARD Function](#).

Syntax

```
HTF.KBD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–54 KBD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KBD Function](#).

Syntax

```
HTF.KEYBOARD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–55 *KEYBOARD Function Parameters*

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

LINE Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [HR Function](#).

Syntax

```
HTF.LINE(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  csrc        IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–56 *LINE Function Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>csrc</code>	The value for the SRC attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of [LINKREV Function](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Function](#).

Syntax

```
HTF.LINKREL(  
    crel          IN          VARCHAR2,  
    curl          IN          VARCHAR2,  
    ctitle       IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the [LINKREL Function](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Function](#).

Syntax

```
HTF.LINKREV(  
  crev          IN          VARCHAR2,  
  curl          IN          VARCHAR2,  
  ctitle       IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–58 LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER(  
  ctext          IN          VARCHAR2,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–59 LISTHEADER Function Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

LISTINGCLOSE Function

This function generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Function](#).

Syntax

```
HTF.LISTINGCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

LISTINGOPEN Function

This function generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Function](#).

Syntax

```
HTF.LISTINGOPEN  
    RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

LISTITEM Function

This function generates the tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
  ctext          IN          VARCHAR2  DEFAULT NULL,
  cclear         IN          VARCHAR2  DEFAULT NULL,
  cdingbat       IN          VARCHAR2  DEFAULT NULL,
  csrc           IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
  address      IN      VARCHAR2,
  ctext       IN      VARCHAR2,
  cname       IN      VARCHAR2,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–61 MAILTO Function Parameters

Parameter	Description
address	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:address" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Function

This function generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the [MAPOPEN Function](#).

Syntax

```
HTF.MAPCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Function](#).

Syntax

```
HTF.MAPOPEN(  
  cname          IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–62 MAPOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Function

This function generates the `</MENU>` tag which ends a list that presents one line for each item. To begin a list of this kind, use the [MENULISTOPEN Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

MENULISTOPEN Function

This function generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the [MENULISTCLOSE Function](#). The items in the list appear more compact than an unordered list. The [LISTITEM Function](#) defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN  
    RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(  
  chttp_equiv IN VARCHAR2,  
  cname       IN VARCHAR2,  
  ccontent    IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 166–63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Function

This function generates the
 tag which begins a new line of text. It performs the same operation as the [BR Function](#).

Syntax

```
HTF.NL(  
  cclear          IN          VARCHAR2  DEFAULT NULL,  
  cattributes     IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–64 NL Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR (  
  ctext          IN          VARCHAR2)  
  RETURN VARCHAR2;
```

Parameters

Table 166–65 *NOBR Function Parameters*

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Function

This function generates the `</NOFRAMES>` tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the [FRAMESETOPEN Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

Syntax

```
HTF.NOFRAMESCLOSE  
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

NOFRAMESOPEN Function

This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the [FRAMESETCLOSE Function](#). See also [FRAME Function](#), [FRAMESETOPEN Function](#) and [FRAMESETCLOSE Function](#).

Syntax

```
HTF.NOFRAMESOPEN  
    RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

OLISTCLOSE Function

This function generates the `` tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the [OLISTOPEN Function](#). Numbered items are added using [LISTITEM Function](#).

Syntax

```
HTF.OLISTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

OLISTOPEN Function

This function generates the tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the [OLISTCLOSE Function](#). Numbered items are added using [LISTITEM Function](#).

Syntax

```
HTF.OLISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–66 *OLISTOPEN Function Parameters*

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the [PARAGRAPH Function](#).

Syntax

```
HTF.PARA  
RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the [PARA Function](#).

Syntax

```
HTF.PARAGRAPH(  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cnowrap        IN          VARCHAR2  DEFAULT NULL,  
    cclear         IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–67 *PARAGRAPH Function Parameters*

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Function](#) to begin the invocation. Use one [PARAM Function](#) for each desired name-value pair, and use [APPLETCLOSE Function](#) to end the applet invocation.

Syntax

```
HTF.PARAM(  
  cname          IN          VARCHAR2  
  cvalue         IN          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 166–68 *PARAM Function Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–69 *PLAINTEXT Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in fixed-width font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Function

This function generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Function](#).

Syntax

```
HTF.PRECLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

PREOPEN Function

This function generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Function](#).

Syntax

```
HTF.PREOPEN(  
  cclear          IN          VARCHAR2  DEFAULT NULL,  
  cwidth         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–70 *PREOPEN Function Parameters*

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The [PRN Functions](#) performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (
  cbuf      IN      VARCHAR2)
RETURN VARCHAR2;
```

```
HTF.PRINT (
  dbuf      IN      DATE)
RETURN VARCHAR2;
```

```
HTF.PRINT (
  nbuf      IN      NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 166–71 PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as
. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use
 to control how the browser renders the HTML source.
- These functions do not have function equivalents.

PRN Functions

These functions generate the specified parameter as a string. Unlike the [PRINT Functions](#) the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (  
    cbuf      IN      VARCHAR2)  
RETURN VARCHAR2;
```

```
HTF.PRN (  
    dbuf      IN      DATE)  
RETURN VARCHAR2;
```

```
HTF.PRN (  
    nbuf      IN      NUMBER)  
RETURN VARCHAR2;
```

Parameters

Table 166–72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [STRIKE Function](#).

Syntax

```
HTF.S (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–74 *SAMPLE Function Parameters*

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
  cscript          IN          VARCHAR2,
  clanguage        IN          VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–75 *SCRIPT Function Parameters*

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–76 *SMALL Function Parameters*

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Function

This function generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [S Function](#).

Syntax

```
STRIKE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–77 *STRIKE Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Function

This function generates the `` and `` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTF.STRONG(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–78 *STRONG Function Parameters*

Parameter	Description
<code>ctext</code>	The text to be emphasized.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(  
    cstyle          IN          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 166–79 *STYLE Function Parameters*

Parameter	Description
cstyle	The the style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

SUB Function

This function generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(  
  ctext          IN          VARCHAR2,  
  calign        in          VARCHAR2  DEFAULT NULL,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–80 SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Function

This function generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(  
  ctext          IN          VARCHAR2,  
  calign         in          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(  
    ccaption      IN      VARCHAR2,  
    calign        in      VARCHAR2  DEFAULT NULL,  
    cattributes   IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Function

This function generates the `</TABLE>` tag which marks the end of an HTML table. To define the beginning of an HTML table, use the [TABLEOPEN Function](#) on page 166-126.

Syntax

```
HTF.TABLECLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crowspan	The value for the COLSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER (
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the [TABLECLOSE Function](#).

Syntax

```
HTF.TABLEOPEN(  
  cborder      IN      VARCHAR2  DEFAULT NULL  
  calign       IN      VARCHAR2  DEFAULT NULL,  
  cnowrap     IN      VARCHAR2  DEFAULT NULL,  
  cclear      IN      VARCHAR2  DEFAULT NULL  
  cattributes  IN      VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–85 TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Function

This function generates the `</TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the [TABLEROWOPEN Function](#).

Syntax

```
HTF.TABLEROWCLOSE  
    RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the [TABLEROWCLOSE Function](#).

Syntax

```
HTF.TABLEROWOPEN(
    calign          IN          VARCHAR2    DEFAULT NULL,
    cvalign         IN          VARCHAR2    DEFAULT NULL,
    cdp             IN          VARCHAR2    DEFAULT NULL,
    cnowrap         IN          VARCHAR2    DEFAULT NULL,
    cattributes     IN          VARCHAR2    DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–86 *TABLEROWOPEN Function Parameters*

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–87 TELETYPE Function Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(  
    ctitle          IN          VARCHAR2)  
    RETURN VARCHAR2;
```

Parameters

Table 166–88 TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Function

This function generates the `` tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the [ULISTOPEN Function](#). Add list items with [LISTITEM Function](#).

Syntax

```
HTF.ULISTCLOSE  
RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

ULISTOPEN Function

This function generates the tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the [ULISTCLOSE Function](#). Add list items with [LISTITEM Function](#).

Syntax

```
HTF.ULISTOPEN(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cdingbat    IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 166–89 *ULISTOPEN Function Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(  
  ctext          IN          VARCHAR2,  
  cattributes   IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–90 *UNDERLINE Function Parameters*

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL)  
RETURN VARCHAR2;
```

Parameters

Table 166–91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR  
RETURN VARCHAR2;
```

Examples

This function generates

<WBR>

The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- [Using HTP](#)
 - Operational Notes
 - Rules and Limits
 - Examples
- [Summary of Tags](#)
- [Summary of HTP Subprograms](#)

Using HTP

- [Operational Notes](#)
- [Rules and Limits](#)
- [Examples](#)

Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The [PRINTS Procedure](#) and the [PS Procedure](#) do not have HTF function equivalents. Use the [ESCAPE_SC Function](#) or the [ESCAPE_URL Function](#) if you need a string conversion function. Note that while there is a [ESCAPE_SC Procedure](#) that performs the same operation as the [PRINTS Procedure](#) and the [PS Procedure](#), there is no procedural equivalent for the [ESCAPE_URL Function](#).
- The [FORMAT_CELL Function](#) does not have an HTP equivalent. The function formats column values inside an HTML table using [TABLEDATA Function](#) which does have an HTP equivalent in the [TABLEDATA Procedure](#). The advantage of this using the [FORMAT_CELL Function](#) is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.PRINT procedure. It then prints its parameters to the generated web page.

Rules and Limits

If you use values of the LONG data type in procedures such as `HTP.PRINT`, `HTP.PRN`, `HTP.PRINTS`, `HTP.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the procedure.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;          -- generates <HEAD>
    HTP.TITLE('Hello');    -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;        -- generates </HEAD>
    HTP.BODYOPEN;          -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;         -- generates </BODY>
    HTP.HTMLCLOSE;         -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

[HTMLOPEN Procedure](#), [HTMLCLOSE Procedure](#) - generate <HTML> and </HTML>

[HEADOPEN Procedure](#), [HEADCLOSE Procedure](#) - generate <HEAD> and </HEAD>

[BODYOPEN Procedure](#), [BODYCLOSE Procedure](#) - generate <BODY> and </BODY>

Comment Tag

[COMMENT Procedure](#) - generates <!-- and -->

Tags in the <HEAD> Area

[BASE Procedure](#) - generates <BASE>

[LINKREL Procedure](#) - generates <LINK> with the REL attribute

[LINKREV Procedure](#) - generates <LINK> with the REV attribute

[TITLE Procedure](#) - generates <TITLE>

[META Procedure](#) - generates <META>

[SCRIPT Procedure](#) - generates <SCRIPT>

[STYLE Procedure](#) - generates <STYLE>

[ISINDEX Procedure](#) - generates <ISINDEX>

Applet Tags

[APPLETOPEN Procedure](#), [APPLETCLOSE Procedure](#) - generate <APPLET> and </APPLET>

[PARAM Procedure](#) - generates <PARAM>

List Tags

[OLISTOPEN Procedure](#), [OLISTCLOSE Procedure](#) - generate and

[ULISTOPEN Procedure](#), [ULISTCLOSE Procedure](#) - generate and

[DLISTOPEN Procedure](#), [DLISTCLOSE Procedure](#) - generate <DL> and </DL>

[DLISTTERM Procedure](#) - generates <DT>

[DLISTDEF Procedure](#) - generates <DD>

[DIRLISTOPEN Procedure](#), [DIRLISTCLOSE Procedure](#) - generate <DIR> and </DIR>

[LISTHEADER Procedure](#) - generates <LH>

[LISTINGOPEN Procedure](#), [LISTINGCLOSE Procedure](#) - generate <LISTING> and </LISTING>

[MENULISTOPEN Procedure](#) - generate <MENU> and </MENU>

[LISTITEM Procedure](#) - generates

Form Tags

[FORMOPEN Procedure](#), [FORMCLOSE Procedure](#) - generate <FORM> and </FORM>

[FORMCHECKBOX Procedure](#) - generates `<INPUT TYPE="CHECKBOX">`
[FORMHIDDEN Procedure](#) - generates `<INPUT TYPE="HIDDEN">`
[FORMIMAGE Procedure](#) - generates `<INPUT TYPE="IMAGE">`
[FORMPASSWORD Procedure](#) - generates `<INPUT TYPE="PASSWORD">`
[FORMRADIO Procedure](#) - generates `<INPUT TYPE="RADIO">`
[FORMSELECTOPEN Procedure](#), [FORMSELECTCLOSE Procedure](#) - generate `<SELECT>` and `</SELECT>`
[FORMSELETOPTION Procedure](#) - generates `<OPTION>`
[FORMTEXT Procedure](#) - generates `<INPUT TYPE="TEXT">`
[FORMTEXTAREA Procedure](#) - generate `<TEXTAREA>`
[FORMTEXTAREAOPEN Procedure](#), [FORMTEXTAREACLOSE Procedure](#) - generate `<TEXTAREA>` and `</TEXTAREA>`
[FORMRESET Procedure](#) - generates `<INPUT TYPE="RESET">`
[FORMSUBMIT Procedure](#) - generates `<INPUT TYPE="SUBMIT">`

Table Tags

[TABLEOPEN Procedure](#), [TABLECLOSE Procedure](#) - generate `<TABLE>` and `</TABLE>`
[TABLECAPTION Procedure](#) - generates `<CAPTION>`
[TABLEROWOPEN Procedure](#), [TABLEROWCLOSE Procedure](#) - generate `<TR>` and `</TR>`
[TABLEHEADER Procedure](#) - generates `<TH>`
[TABLEDATA Procedure](#) - generates `<TD>`

IMG, HR, and A Tags

[HR Procedure](#), [LINE Procedure](#) - generate `<HR>`
[IMG Procedure](#), [IMG2 Procedure](#) - generate ``
[ANCHOR Procedure](#), [ANCHOR2 Procedure](#) - generate `<A>`
[MAPOPEN Procedure](#), [MAPCLOSE Procedure](#) - generate `<MAP>` and `</MAP>`

Paragraph Formatting Tags

[HEADER Procedure](#) - generates heading tags (`<H1>` to `<H6>`)
[PARA Procedure](#), [PARAGRAPH Procedure](#) - generate `<P>`
[PRN Procedures](#), [PRINT Procedures](#) - generate any text that is passed in
[PRINTS Procedure](#), [PS Procedure](#) - generate any text that is passed in; special characters in HTML are escaped
[PREOPEN Procedure](#), [PRECLOSE Procedure](#) - generate `<PRE>` and `</PRE>`
[BLOCKQUOTEOPEN Procedure](#), [BLOCKQUOTECLOSE Procedure](#) - generate `<BLOCKQUOTE>` and `</BLOCKQUOTE>`
[DIV Procedure](#) - generates `<DIV>`
[NL Procedure](#), [BR Procedure](#) - generate `
`

[NOBR Procedure](#) - generates <NOBR>
[WBR Procedure](#) - generates <WBR>
[PLAINTEXT Procedure](#) - generates <PLAINTEXT>
[ADDRESS Procedure](#) - generates <ADDRESS>
[MAILTO Procedure](#) - generates <A> with the MAILTO attribute
[AREA Procedure](#) - generates <AREA>
[BGSOUND Procedure](#) - generates <BGSOUND>

Character Formatting Tags

[BASEFONT Procedure](#) - generates <BASEFONT>
[BIG Procedure](#) - generates <BIG>
[BOLD Procedure](#) - generates
[CENTER Procedure](#) - generates <CENTER> and </CENTER>
[CENTEROPEN Procedure](#), [CENTERCLOSE Procedure](#) - generate <CENTER> and </CENTER>
[CITE Procedure](#) - generates <CITE>
[CODE Procedure](#) - generates <CODE>
[DFN Procedure](#) - generates <DFN>
[EM Procedure](#), [EMPHASIS Procedure](#) - generate
[FONTOPEN Procedure](#), [FONTCLOSE Procedure](#) - generate and
[ITALIC Procedure](#) - generates <I>
[KBD Procedure](#), [KEYBOARD Procedure](#) - generate <KBD> and </KBD>
[S Procedure](#) - generates <S>
[SAMPLE Procedure](#) - generates <SAMP>
[SMALL Procedure](#) - generates <SMALL>
[STRIKE Procedure](#) - generates <STRIKE>
[STRONG Procedure](#) - generates
[SUB Procedure](#) - generates <SUB>
[SUP Procedure](#) - generates <SUP>
[TELETYPE Procedure](#) - generates <TT>
[UNDERLINE Procedure](#) - generates <U>
[VARIABLE Procedure](#) - generates <VAR>

Frame Tags

[FRAME Procedure](#) - generates <FRAME>
[FRAMESETOPEN Procedure](#), [FRAMESETCLOSE Procedure](#) - generate <FRAMESET> and </FRAMESET>
[NOFRAMESOPEN Procedure](#), [NOFRAMESCLOSE Procedure](#) - generate <NOFRAMES> and </NOFRAMES>

Summary of HTP Subprograms

Table 167–1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure on page 167-15	Generates the <code><ADDRESS></code> and <code></ADDRESS></code> tags which specify the address, author and signature of a document
ANCHOR Procedure on page 167-16	Generates the <code><A></code> and <code></code> tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure on page 167-17	Generates the <code><A></code> and <code></code> tags which specify the source or destination of a hypertext link
APPLETCLOSE Procedure on page 167-18	Closes the applet invocation with the <code></APPLET></code> tag
APPLETOPEN Procedure on page 167-19	Generates the <code><APPLET></code> tag which begins the invocation of a Java applet
AREA Procedure on page 167-20	Generates the <code><AREA></code> tag, which defines a client-side image map
BASE Procedure on page 167-21	Generates the <code><BASE></code> tag which records the URL of the document
BASEFONT Procedure on page 167-22	Generates the <code><BASEFONT></code> tag which specifies the base font size for a Web page
BGSOUND Procedure on page 167-23	Generates the <code><BGSOUND></code> tag which includes audio for a Web page
BIG Procedure on page 167-24	Generates the <code><BIG></code> and <code></BIG></code> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure on page 167-25	Generates the <code></BLOCKQUOTE></code> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure on page 167-26	Generates the <code><BLOCKQUOTE></code> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure on page 167-27	Generates the <code></BODY></code> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure on page 167-28	Generates the <code><BODY></code> tag which marks the beginning of the body section of an HTML document
BOLD Procedure on page 167-29	Generates the <code></code> and <code></code> tags which direct the browser to display the text in boldface
BR Procedure on page 167-30	Generates the <code>
</code> tag which begins a new line of text
CENTER Procedure on page 167-31	Generates the <code><CENTER></code> and <code></CENTER></code> tags which center a section of text within a Web page
CENTERCLOSE Procedure on page 167-32	Generates the <code></CENTER></code> tag which marks the end of a section of text to center

Table 167-1 (Cont.) HTP Package Subprograms

Subprogram	Description
CENTEROPEN Procedure on page 167-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Procedure on page 167-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Procedure on page 167-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Procedure on page 167-36	Generates This procedure generates the comment tags <!-- ctext -->
DFN Procedure on page 167-37	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure on page 167-38	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Procedure on page 167-39	Generates the <DIR> which starts a directory list section
DIV Procedure on page 167-40	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Procedure on page 167-41	Generates the </DL> tag which ends a definition list
DLISTDEF Procedure on page 167-42	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Procedure on page 167-43	Generates the <DL> tag which starts a definition list
DLISTTERM Procedure on page 167-44	Generates the <DT> tag which defines a term in a definition list <DL>
EM Procedure on page 167-45	Generates the and tags, which define text to be emphasized
EMPHASIS Procedure on page 167-46	Generates the and tags, which define text to be emphasized
ESCAPE_SC Procedure on page 167-47	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure on page 167-48	Generates the tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure on page 167-49	Generates the which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure on page 167-50	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Procedure on page 167-51	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMOPEN Procedure on page 167-52	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMFILE Procedure on page 167-53	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure on page 167-54	Generates the <INPUT> tag with TYPE="hidden" which inserts a hidden form element

Table 167-1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMIMAGE Procedure on page 167-55	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure on page 167-56	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure on page 167-57	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Procedure on page 167-58	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Procedure on page 167-59	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure on page 167-60	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELETOPTION Procedure on page 167-61	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure on page 167-62	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure on page 167-63	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure on page 167-64	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure on page 167-65	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure on page 167-66	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure on page 167-67	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure on page 167-68	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure on page 167-69	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure on page 167-70	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure on page 167-71	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure on page 167-72	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Procedure on page 167-73	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure on page 167-74	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure on page 167-75	Generates the <HR> tag, which generates a line in the HTML document

Table 167-1 (Cont.) HTP Package Subprograms

Subprogram	Description
HTMLCLOSE Procedure on page 167-76	Generates the <code></HTML></code> tag which marks the end of an HTML document
HTMLOPEN Procedure on page 167-77	Generates the <code><HTML></code> tag which marks the beginning of an HTML document
IMG Procedure on page 167-78	Generates the <code></code> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure on page 167-79	Generates the <code></code> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the <code>USEMAP</code> attribute
ISINDEX Procedure on page 167-80	Creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program
ITALIC Procedure on page 167-81	Generates the <code><I></code> and <code></I></code> tags which direct the browser to render the text in italics
KBD Procedure on page 167-82	Generates the <code><KBD></code> and <code></KBD></code> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure on page 167-83	Generates the <code><KBD></code> and <code></KBD></code> tags, which direct the browser to render the text in monospace font
LINE Procedure on page 167-84	Generates the <code><HR></code> tag, which generates a line in the HTML document
LINKREL Procedure on page 167-85	Generates the <code><LINK></code> tag with the <code>REL</code> attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Procedure on page 167-86	Generates the <code><LINK></code> tag with the <code>REV</code> attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure on page 167-87	Generates the <code><LH></code> and <code></LH></code> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Procedure on page 167-88	Generates the <code></LISTING></code> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure on page 167-89	Generates the <code><LISTING></code> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure on page 167-90	Generates the <code></code> tag, which indicates a list item
MAILTO Procedure on page 167-91	Generates the <code><A></code> tag with the <code>HREF</code> set to 'mailto' prepended to the mail address argument
MAPCLOSE Procedure on page 167-92	Generates the <code></MAP></code> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Procedure on page 167-93	Generates the <code><MAP></code> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure on page 167-94	Generates the <code></MENU></code> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure on page 167-95	Generates the <code><MENU></code> tag which create a list that presents one line for each item

Table 167-1 (Cont.) HTP Package Subprograms

Subprogram	Description
META Procedure on page 167-96	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure on page 167-97	Generates the tag which begins a new line of text
NOBR Procedure on page 167-98	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure on page 167-99	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure on page 167-100	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Procedure on page 167-101	Generates the tag which defines the end of an ordered list
OLISTOPEN Procedure on page 167-102	Generates the tag which marks the beginning of an ordered list
PARA Procedure on page 167-103	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure on page 167-104	Adds attributes to the <P> tag
PARAM Procedure on page 167-105	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure on page 167-106	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure on page 167-107	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure on page 167-108	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures on page 167-109	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure on page 167-110	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures on page 167-111	Generates the specified parameter as a string
PS Procedure on page 167-112	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure on page 167-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure on page 167-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure on page 167-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure on page 167-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font

Table 167-1 (Cont.) HTP Package Subprograms

Subprogram	Description
STRIKE Procedure on page 167-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure on page 167-118	Generates the and tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure on page 167-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure on page 167-120	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Procedure on page 167-121	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure on page 167-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure on page 167-123	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Procedure on page 167-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure on page 167-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure on page 167-126	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure on page 167-127	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure on page 167-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure on page 167-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Procedure on page 167-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure on page 167-131	Generates the tag which marks the end of an unordered list
ULISTOPEN Procedure on page 167-132	Generates the tag which marks the beginning of an unordered list
UNDERLINE Procedure on page 167-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Procedure on page 167-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure on page 167-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
  cvalue      IN      VARCHAR2
  cnowrap    IN      VARCHAR2  DEFAULT NULL
  cclear     IN      VARCHAR2  DEFAULT NULL
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167-2 ADDRESS Procedure Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Procedure

This procedure and the [ANCHOR2 Procedure](#) procedures generate the `<A>` and `` HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the [ANCHOR2 Procedure](#) provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
    curl          IN          VARCHAR2,
    ctext        IN          VARCHAR2,
    cname        IN          VARCHAR2  DEFAULT NULL,
    cattributes  IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–3 ANCHOR Procedure Parameters

Parameter	Description
<code>curl</code>	The value for the <code>HREF</code> attribute.
<code>ctext</code>	The string that goes between the <code><A></code> and <code></code> tags.
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either `HREF` or `NAME` is required. `HREF` specifies to where to link. `NAME` allows this tag to be a target of a hypertext link.

ANCHOR2 Procedure

This procedure and the [ANCHOR Procedure](#) generate the <A> and HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
    curl          IN          VARCHAR2,
    ctext         IN          VARCHAR2,
    cname         IN          VARCHAR2  DEFAULT NULL,
    ctarget       IN          varchar2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–4 ANCHOR2 Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using [APPLETOPEN Procedure](#).

Syntax

```
HTP.APPLETCLOSE;
```

APPLETOPEN Procedure

This procedure generates the `<APPLET>` tag which begins the invocation of a Java applet. You close the applet invocation with [APPLETCLOSE Procedure](#) which generates the `</APPLET>` tag.

Syntax

```
HTP.APPLETOPEN (
  ccode          IN          VARCHAR2,
  cheight        IN          NUMBER,
  cwidth         IN          NUMBER,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–5 *APPLETOPEN Procedure Parameters*

Parameter	Description
<code>ccode</code>	The the value for the <code>CODE</code> attribute which specifies the name of the applet class.
<code>cheight</code>	The value for the <code>HEIGHT</code> attribute.
<code>cwidth</code>	The value for the <code>WIDTH</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the [PARAM Procedure](#) procedure.
- Use the `cattributes` parameter to specify the `CODEBASE` attribute since the PL/SQL cartridge does not know where to find the class files. The `CODEBASE` attribute specifies the virtual path containing the class files.

AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
  ccoords      IN      VARCHAR2
  cshape       IN      VARCHAR2  DEFAULT NULL,
  chref        IN      VARCHAR2  DEFAULT NULL,
  cnohref      IN      VARCHAR2  DEFAULT NULL,
  ctarget      IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–6 AREA Procedure Parameters

Parameter	Description
<code>ccords</code>	The the value for the COORDS attribute.
<code>cshape</code>	The value for the SHAPE attribute.
<code>chref</code>	The value for the HREF attribute.
<code>cnohref</code>	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
<code>ctarget</code>	The value for the TARGET attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
  ctarget      IN      VARCHAR2  DEFAULT NULL,
  cattributes  IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–7 *BASE Procedure Parameters*

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Procedure

This procedure generates the `<BASEFONT>` tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (  
    nsize    IN    INTEGER);
```

Parameters

Table 167–8 *BASEFONT Procedure Parameters*

Parameter	Description
<code>nsize</code>	The value for the <code>SIZE</code> attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
  csrc          IN          VARCHAR2,
  cloop         IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–9 BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–10 *BIG Procedure Parameters*

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the [BLOCKQUOTEOPEN Procedure](#).

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the [BLOCKQUOTECLOSE Procedure](#).

Syntax

```
HTP.BLOCKQUOTEOPEN (  
    cnowrap      IN      VARCHAR2  DEFAULT NULL,  
    cclear       IN      VARCHAR2  DEFAULT NULL,  
    cattributes  IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–11 *BLOCKQUOTEOPEN Procedure Parameters*

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Procedure

This procedure generates the `</BODY>` tag which marks the end of a body section of an HTML document. You mark the beginning of a body section by means of the [BODYOPEN Procedure](#).

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the [BODYCLOSE Procedure](#).

Syntax

```
HTP.BODYOPEN (  
    cbackground IN VARCHAR2 DEFAULT NULL,  
    cattributes IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 167–12 BODYOPEN Procedure Parameters

Parameter	Description
<code>cbackground</code>	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Procedure

This procedure generates the and tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–13 *BOLD Procedure Parameters*

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

BR Procedure

This procedure generates the
 tag which begins a new line of text. It performs the same operation as the [NL Procedure](#).

Syntax

```
HTP.BR(  
    cclear          IN          VARCHAR2  DEFAULT NULL,  
    cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–14 BR Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 167–15 *CENTER Parameters*

Parameter	Description
<code>ctext</code>	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Procedure

This procedure generates the `</CENTER>` tag which marks the end of a section of text to center. You mark the beginning of a section of text to center by means of the [CENTEROPEN Procedure](#).

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

CENTEROPEN Procedure

This procedure generates the <CENTER> tag which mark the beginning of a section of text to center. You mark the beginning of a of a section of text to center by means of the [CENTERCLOSE Procedure](#).

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–16 CITE Procedure Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

CODE Procedure

This procedure generates the `<CODE>` and `</CODE>` tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–17 *CODE Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to render as code.
<code>cattributes</code>	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<CODE cattributes>ctext</CODE>
```

COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 167–18 *COMMENT Procedure Parameters*

Parameter	Description
<code>ctext</code>	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (  
    ctext          IN          VARCHAR2);
```

Parameters

Table 167–19 *DFN Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Procedure

This procedure generates the `</DIR>` tag which ends a directory list section. You start a directory list section with the [DIRLISTOPEN Procedure](#).

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the `` tag directly or invoke the [LISTITEM Procedure](#) so that the `` tag appears directly after the `</DIR>` tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the [DIRLISTCLOSE Procedure](#).

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the tag directly or invoke the [LISTITEM Procedure](#) so that the tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (  
    calign          IN          VARCHAR2  DEFAULT NULL,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–20 *DIV Procedure Parameters*

Parameter	Description
<code>calign</code>	The value for the ALIGN attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Procedure

This procedure generates the `</DL>` tag which ends a definition list. You start a definition list by means of the [DLISTOPEN Procedure](#).

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

Examples

This procedure generates

```
</DL>
```

DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTP.DLISTDEF (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 167–21 DLISTDEF Procedure Parameters

Parameter	Description
<code>ctext</code>	The definition of the term.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the [DLISTCLOSE Procedure](#).

Syntax

```
HTP.DLISTOPEN (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–22 *DLISTOPEN Procedure Parameters*

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the [DLISTTERM Procedure](#) and definitions are inserted using the [DLISTDEF Procedure](#).

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (  
    ctext          IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 167–23 *DLISTTERM Procedure Parameters*

Parameter	Description
<code>ctext</code>	The term.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Procedure

This procedure generates the and tags, which define text to be emphasized. It performs the same task as the [EMPHASIS Procedure](#).

Syntax

```
HTP.EM(  
    ctext          IN          VARCHAR2,  
    cattributes   IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 167–24 *EM Procedure Parameters*

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates
<EM *cattributes*>ctext

EMPHASIS Procedure

This procedure generates the `` and `` tags, which define text to be emphasized. It performs the same task as the [EM Procedure](#).

Syntax

```
HTP.EMPHASIS(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–25 EMPHASIS Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to emphasize.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates
`<EM cattributes>ctext`

ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &
- " to "
- < to <
- > to >

This procedure performs the same operation as [PRINTS Procedures](#) and [PS Procedure](#).

Syntax

```
HTP.ESCAPE_SC(  
    ctext          IN          VARCHAR2);
```

Parameters

Table 167–26 *ESCAPE_SC Procedure Parameters*

Parameter	Description
ctext	The text string to convert.

FONTCLOSE Procedure

This procedure generates the `` tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the [FONTOPEN Procedure](#).

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

FONTOPEN Procedure

This procedure generates the which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the [FONTCLOSE Procedure](#).

Syntax

```
HTP.FONTOPEN(
  ccolor      IN      VARCHAR2  DEFAULT NULL,
  cface       IN      VARCHAR2  DEFAULT NULL,
  csize       IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–27 *FONTOPEN Procedure Parameters*

Parameter	Description
<code>ccolor</code>	The value for the <code>COLOR</code> attribute.
<code>cface</code>	The value for the <code>FACE</code> attribute
<code>csize</code>	The value for the <code>SIZE</code> attribute
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMCHECKBOX Procedure

This procedure generates the `<INPUT>` tag with `TYPE="checkbox"` which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2  DEFAULT 'ON',  
  cchecked       IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–28 *FORMCHECKBOX Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document. You mark the beginning of the form section by means of the [FORMOPEN Procedure](#).

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the [FORMCLOSE Procedure](#).

Syntax

```
HTP.FORMOPEN (
    curl          IN          VARCHAR2,
    cmethod       IN          VARCHAR2  DEFAULT 'POST',
    ctarger       IN          VARCHAR2  DEFAULT NULL,
    cenctype      IN          VARCHAR2  DEFAULT NULL,
    cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–29 FORMOPEN Procedure Parameters

Parameter	Description
<code>curl</code>	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
<code>cmethod</code>	The value for the METHOD attribute. The value can be "GET" or "POST".
<code>ctarger</code>	The value for the TARGET attribute.
<code>cenctype</code>	The value for the ENCTYPE attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarger" ENCTYPE="cenctype"
cattributes>
```

FORMFILE Procedure

This procedure generates the <INPUT> tag with `TYPE="file"` which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
  cname          IN          VARCHAR2,
  caccept        IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167-30 FORMFILE Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>caccept</code>	A comma-delimited list of MIME types for upload.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(  
  cname          IN          VARCHAR2,  
  cvalue         IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167-31 FORMHIDDEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Procedure

This procedure generates the <INPUT> tag with `TYPE="image"` which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with `.x` appended, and the y coordinate with `.y` appended. Any `VALUE` attribute is ignored.

Syntax

```
HTP.FORMIMAGE (
  cname          IN          VARCHAR2,
  csrc           IN          VARCHAR2,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–32 FORMIMAGE Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute that specifies the image file.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–33 *FORMPASSWORD Procedure Parameters*

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Procedure

This procedure generates the `<INPUT>` tag with `TYPE="radio"`, which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO (
  cname          IN          VARCHAR2,
  cvalue         IN          VARCHAR2,
  cchecked       IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–34 FORMRADIO Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cchecked</code>	If the value for this parameter is not <code>NULL</code> , the <code>CHECKED</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Procedure

This procedure generates the `<INPUT>` tag with `TYPE="reset"` which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(  
  cvalue      IN      VARCHAR2  DEFAULT 'Reset',  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–35 FORMRESET Procedure Parameters

Parameter	Description
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Procedure

This procedure generates the `</SELECT>` tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the [FORMSELECTOPEN Procedure](#). The values are inserted using [FORMSELECTOPTION Procedure](#).

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the [FORMSELECTCLOSE Procedure](#). The values are inserted using [FORMSELETOPTION Procedure](#).

Syntax

```
FORMSELECTOPEN(
  cname          IN          VARCHAR2,
  cprompt        IN          VARCHAR2  DEFAULT NULL,
  nsize          IN          INTEGER   DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
  'Pick the greatest player:');
HTP.FORMSELETOPTION('Messier');
HTP.FORMSELETOPTION('Howe');
HTP.FORMSELETOPTION('Gretzky');
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
  cvalue      IN      VARCHAR2,
  cselected   IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the [FORMSELECTOPEN Procedure](#).

FORMSUBMIT Procedure

This procedure generates the `<INPUT>` tag with `TYPE="submit"` which creates a button that, when clicked, submits the form. If the button has a `NAME` attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(  
  cname          IN          VARCHAR2  DEFAULT NULL,  
  cvalue         IN          VARCHAR2  DEFAULT 'Submit',  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–38 FORMSUBMIT Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Procedure

This procedure generates the <INPUT> tag with `TYPE="text"`, which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT (
  cname          IN          VARCHAR2,
  csize          IN          VARCHAR2  DEFAULT NULL,
  cmaxlength     IN          VARCHAR2  DEFAULT NULL,
  cvalue         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–39 FORMTEXT Procedure Parameters

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>csize</code>	The value for the <code>SIZE</code> attribute.
<code>cmaxlength</code>	The value for the <code>MAXLENGTH</code> attribute.
<code>cvalue</code>	The value for the <code>VALUE</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA2 Procedure](#) which in addition has the *cwrap* parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         , IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–40 FORMTEXTAREA Procedure Parameters

Parameter	Description
<i>cname</i>	The value for the <i>NAME</i> attribute.
<i>nrows</i>	The value for the <i>ROWS</i> attribute. This is an integer.
<i>ncolumns</i>	The value for the <i>COLS</i> attribute. This is an integer.
<i>calign</i>	The value for the <i>ALIGN</i> attribute.
<i>cattributes</i>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the [FORMTEXTAREA Procedure](#) except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–41 *FORMTEXTAREA2 Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element. You open a text area element by means of either [FORMTEXTAREAOPEN Procedure](#) or [FORMTEXTAREAOPEN2 Procedure](#).

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN2 Procedure](#) which in addition has the `cwrap` parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

Syntax

```
HTP.FORMTEXTAREAOPEN (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–42 *FORMTEXTAREAOPEN Procedure Parameters*

Parameter	Description
<code>cname</code>	The value for the <code>NAME</code> attribute.
<code>nrows</code>	The value for the <code>ROWS</code> attribute. This is an integer.
<code>ncolumns</code>	The value for the <code>COLS</code> attribute. This is an integer.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the [FORMTEXTAREAOPEN Procedure](#) except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the [FORMTEXTAREACLOSE Procedure](#).

Syntax

```
HTP.FORMTEXTAREAOPEN2 (
  cname          IN          VARCHAR2,
  nrows          IN          INTEGER,
  ncolumns       IN          INTEGER,
  calign         IN          VARCHAR2  DEFAULT NULL,
  cwrap          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute. This is an integer.
ncolumns	The value for the COLS attribute. This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Procedure

This procedure generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTP.FRAME (
  csrc          IN          VARCHAR2,
  cname         IN          VARCHAR2  DEFAULT NULL,
  cmarginwidth  IN          VARCHAR2  DEFAULT NULL,
  cmarginheight IN          VARCHAR2  DEFAULT NULL,
  cscrolling    IN          VARCHAR2  DEFAULT NULL,
  cnoresize     IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167-44 *FRAME Procedure Parameters*

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Procedure

This procedure generates the `</FRAMESET>` tag which ends a frameset section. You mark the beginning of a frameset section by means of the [FRAMESETOPEN Procedure](#).

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.FRAMESETOPEN(
  crows          IN          VARCHAR2  DEFAULT NULL,
  ccols          IN          VARCHAR2  DEFAULT NULL,
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–45 *FRAMESETOPEN Procedure Parameters*

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Procedure

This procedure generates the `</HEAD>` tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the [HEADOPEN Procedure](#).

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTP.HEADER(
  nsize      IN      INTEGER,
  cheader    IN      VARCHAR2,
  calign     IN      VARCHAR2  DEFAULT NULL,
  cnowrap    IN      VARCHAR2  DEFAULT NULL,
  cclear     IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–46 *HEADER Procedure Parameters*

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1, 'Overview');
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the [HEADCLOSE Procedure](#).

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [LINE Procedure](#).

Syntax

```
HTP.HR (
  cclear      IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–47 HR Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>csrc</code>	The value for the SRC attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Procedure

This procedure generates the `</HTML>` tag which marks the end of an HTML document. You use the [HTMLOPEN Procedure](#) to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the [HTMLCLOSE Procedure](#) to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

IMG Procedure

This procedure generates the tag which directs the browser to load an image onto the HTML page. The [IMG2 Procedure](#) performs the same operation but additionally uses the `cusemap` parameter.

Syntax

```
HTP.IMG (
    curl          IN          VARCHAR2    DEFAULT NULL,
    calign        IN          VARCHAR2    DEFAULT NULL,
    calt          IN          VARCHAR2    DEFAULT NULL,
    cismap        IN          VARCHAR2
DEFAULT NULL,
    cattributes  IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 167–48 *IMG Procedure Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Procedure

This procedure generates the tag, which directs the browser to load an image onto the HTML page. The [IMG Procedure](#) performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTP.IMG2 (
  curl          IN          VARCHAR2  DEFAULT NULL,
  calign        IN          VARCHAR2  DEFAULT NULL,
  calt          IN          VARCHAR2  DEFAULT NULL,
  cismap        IN          VARCHAR2
DEFAULT NULL,
  cusemap       IN          VARCHAR2  DEFAULT NULL,
  cattributes   IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–49 *IMG2 Procedure Parameters*

Parameter	Description
<code>curl</code>	The value for the SRC attribute.
<code>calign</code>	The value for the ALIGN attribute.
<code>calt</code>	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
<code>cismap</code>	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
<code>cusemap</code>	The value for the USEMAP attribute which specifies a client-side image map.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "enter value," then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX (  
  cprompt      IN      VARCHAR2  DEFAULT NULL,  
  curl         IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–50 ISINDEX Procedure Parameters

Parameter	Description
<code>cprompt</code>	The value for the PROMPT attribute.
<code>curl</code>	The value for the HREF attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Procedure

This procedure generates the `<I>` and `</I>` tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–51 *ITALIC Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in italics.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<I cattributes>ctext</I>
```

KBD Procedure

This procedure generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KEYBOARD Procedure](#).

Syntax

```
HTP.KBD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–52 KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the [KBD Procedure](#).

Syntax

```
HTP.KEYBOARD(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–53 *KEYBOARD Procedure Parameters*

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the [HR Procedure](#).

Syntax

```
HTP.LINE(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  csrc        IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167-54 *LINE Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>csrc</code>	The value for the SRC attribute which specifies a custom image as the source of the line.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of [LINKREV Procedure](#). This tag indicates a relationship between documents but does not create a link. To create a link, use the [ANCHOR Procedure](#).

Syntax

```
HTP.LINKREL(  
  crel          IN          VARCHAR2,  
  curl          IN          VARCHAR2,  
  ctitle        IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–55 LINKREL Procedure Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the [LINKREL Procedure](#). This tag indicates a relationship between documents, but does not create a link. To create a link, use the [ANCHOR Procedure](#).

Syntax

```
HTP.LINKREV(  
  crev          IN          VARCHAR2,  
  curl          IN          VARCHAR2,  
  ctitle       IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–56 LINKREV Procedure Parameters

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–57 LISTHEADER Procedure Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LH cattributes>ctext</LH>
```

LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the [LISTINGOPEN Procedure](#).

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

LISTINGOPEN Procedure

This procedure generates the `<LISTING>` tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the [LISTINGCLOSE Procedure](#).

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

LISTITEM Procedure

This procedure generates the tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(  
  ctext          IN          VARCHAR2  DEFAULT NULL,  
  cclear         IN          VARCHAR2  DEFAULT NULL,  
  cdingbat       IN          VARCHAR2  DEFAULT NULL,  
  csrc           IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–58 LISTITEM Procedure Parameters

Parameter	Description
<code>ctext</code>	The text for the list item.
<code>cclear</code>	The value for the CLEAR attribute.
<code>cdingbat</code>	The value for the DINGBAT attribute.
<code>csrc</code>	The value for the SRC attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
  caddress      IN      VARCHAR2,
  ctext         IN      VARCHAR2,
  cname         IN      VARCHAR2,
  cattributes   IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 167–59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Procedure

This procedure generates the `</MAP>` tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the [MAOPEN Procedure](#).

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

MAOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the [MAPCLOSE Procedure](#).

Syntax

```
HTP.MAOPEN(  
  cname          IN          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–60 MAOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Procedure

This procedure generates the `</MENU>` tag which ends a list that presents one line for each item. To begin a list of this kind, use the [MENULISTOPEN Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

MENULISTOPEN Procedure

This procedure generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the [MENULISTCLOSE Procedure](#). The items in the list appear more compact than an unordered list. The [LISTITEM Procedure](#) defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(  
  chttp_equiv    IN      VARCHAR2,  
  cname          IN      VARCHAR2,  
  ccontent       IN      VARCHAR2);
```

Parameters

Table 167–61 META Procedure Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Procedure

This procedure generates the
 tag which begins a new line of text. It performs the same operation as the [BR Procedure](#).

Syntax

```
HTP.NL(  
  cclear          IN          VARCHAR2  DEFAULT NULL,  
  cattributes     IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–62 NL Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Procedure

This procedure generates the `<NOBR>` and `</NOBR>` tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR (  
  ctext          IN          VARCHAR2) ;
```

Parameters

Table 167–63 *NOBR Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Procedure

This procedure generates the `</NOFRAMES>` tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the [FRAMESETOPEN Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the [FRAMESETCLOSE Procedure](#). See also [FRAME Procedure](#), [FRAMESETOPEN Procedure](#) and [FRAMESETCLOSE Procedure](#).

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

OLISTCLOSE Procedure

This procedure generates the `` tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the [OLISTOPEN Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

OLISTOPEN Procedure

This procedure generates the tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the [OLISTCLOSE Procedure](#). Numbered items are added using [LISTITEM Procedure](#).

Syntax

```
HTP.OLISTOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwrap       IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–64 *OLISTOPEN Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cwrap</code>	The value for the WRAP attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the [PARAGRAPH Procedure](#).

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the [PARA Procedure](#).

Syntax

```
HTP.PARAGRAPH(  
    calign          IN          VARCHAR2    DEFAULT NULL,  
    cnowrap        IN          VARCHAR2    DEFAULT NULL,  
    cclear         IN          VARCHAR2    DEFAULT NULL,  
    cattributes    IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 167–65 PARAGRAPH Procedure Parameters

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value for this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use [APPLETOPEN Procedure](#) to begin the invocation. Use one [PARAM Procedure](#) for each desired name-value pair, and use [APPLETCLOSE Procedure](#) to end the applet invocation.

Syntax

```
HTP.PARAM(  
  cname          IN          VARCHAR2  
  cvalue         IN          VARCHAR2);
```

Parameters

Table 167–66 *PARAM Procedure Parameters*

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Procedure

This procedure generates the `<PLAINTEXT>` and `</PLAINTEXT>` tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–67 *PLAINTEXT Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in fixed-width font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Procedure

This procedure generates the `</PRE>` tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the [PREOPEN Procedure](#).

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the [PRECLOSE Procedure](#).

Syntax

```
HTP.PREOPEN(  
  cclear      IN      VARCHAR2  DEFAULT NULL,  
  cwidth     IN      VARCHAR2  DEFAULT NULL,  
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–68 *PREOPEN Procedure Parameters*

Parameter	Description
<code>cclear</code>	The value for the CLEAR attribute.
<code>cwidth</code>	The value for the WIDTH attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The [PRN Procedures](#) performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
  cbuf      IN      VARCHAR2);
```

```
HTP.PRINT (
  dbuf      IN      DATE);
```

```
HTP.PRINT (
  nbuf      IN      NUMBER);
```

Parameters

Table 167–69 PRINT Procedure Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as
. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use
 to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the [PS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

Syntax

```
HTP.PRINTS (  
    ctext      IN      VARCHAR2);
```

Parameters

Table 167–70 PRINTS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) on page 167-3 for the HTF implementation).

PRN Procedures

These procedures generate the specified parameter as a string. Unlike the [PRINT Procedures](#) the string is not terminated with the \n newline character.

Syntax

```
HTP.PRN (
    cbuf      IN      VARCHAR2);
```

```
HTP.PRN (
    dbuf      IN      DATE);
```

```
HTP.PRN (
    nbuf      IN      NUMBER);
```

Parameters

Table 167–71 PRN Procedure Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- < to <
- > to >
- " to "
- & to &

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the [PRINTS Procedure](#) perform the same operation as the [PRN Procedures](#) but with character substitution.

Syntax

```
HTP.PS (  
    ctext      IN      VARCHAR2);
```

Parameters

Table 167–72 PS Procedure Parameters

Parameter	Description
ctext	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see [Operational Notes](#) on page 167-3 for the HTF implementation).

S Procedure

This procedure generates the `<S>` and `</S>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [STRIKE Procedure](#).

Syntax

```
HTP.S (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–73 S Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

SAMPLE Procedure

This procedure generates the `<SAMP>` and `</SAMP>` tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–74 *SAMPLE Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in monospace font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Procedure

This procedure generates the `<SCRIPT>` and `</SCRIPT>` tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
  cscript      IN      VARCHAR2,
  clanguage    IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–75 *SCRIPT Procedure Parameters*

Parameter	Description
<code>cscript</code>	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
<code>clanguage</code>	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Procedure

This procedure generates the `<SMALL>` and `</SMALL>` tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–76 *SMALL Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in small font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Procedure

This procedure generates the `<STRIKE>` and `</STRIKE>` tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as [S Procedure](#).

Syntax

```
HTP.STRIKE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–77 *STRIKE Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be rendered in strikethrough type.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Procedure

This procedure generates the `` and `` tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTP.STRONG(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–78 *STRONG Procedure Parameters*

Parameter	Description
<code>ctext</code>	The text to be emphasized.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at <http://www.w3.org>. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(  
    cstyle          IN          VARCHAR2);
```

Parameters

Table 167–79 *STYLE Procedure Parameters*

Parameter	Description
cstyle	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

SUB Procedure

This procedure generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(  
  ctext          IN          VARCHAR2,  
  calign         in          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–80 SUB Procedure Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Procedure

This procedure generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(  
  ctext          IN          VARCHAR2,  
  calign         in          VARCHAR2  DEFAULT NULL,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–81 SUP Procedure Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION(  
    ccaption      IN      VARCHAR2,  
    calign        in      VARCHAR2  DEFAULT NULL,  
    cattributes   IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–82 TABLECAPTION Procedure Parameters

Parameter	Description
cctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Procedure

This procedure generates the `</TABLE>` tag which marks the end of an HTML table. To define the beginning of an HTML table, use the [TABLEOPEN Procedure](#).

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA (
    cvalue      IN      VARCHAR2  DEFAULT NULL,
    calign      IN      VARCHAR2  DEFAULT NULL,
    cdp         IN      VARCHAR2  DEFAULT NULL,
    cnowrap     IN      VARCHAR2  DEFAULT NULL,
    crowspan    IN      VARCHAR2  DEFAULT NULL,
    ccolspan    IN      VARCHAR2  DEFAULT NULL,
    cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–83 TABLEDATA Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crowspan	The value for the COLSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER (
  cvalue      IN      VARCHAR2  DEFAULT NULL,
  calign      IN      VARCHAR2  DEFAULT NULL,
  cdp         IN      VARCHAR2  DEFAULT NULL,
  cnowrap     IN      VARCHAR2  DEFAULT NULL,
  crowspan    IN      VARCHAR2  DEFAULT NULL,
  ccolspan    IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–84 TABLEHEADER Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the [TABLECLOSE Procedure](#).

Syntax

```
HTP.TABLEOPEN (
    cborder      IN      VARCHAR2  DEFAULT NULL
    calign       IN      VARCHAR2  DEFAULT NULL,
    cnowrap      IN      VARCHAR2  DEFAULT NULL,
    cclear       IN      VARCHAR2  DEFAULT NULL
    cattributes  IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–85 TABLEOPEN Procedure Parameters

Parameter	Description
<code>border</code>	The value for the <code>BORDER</code> attribute.
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Procedure

This procedure generates the `</TR>` tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the [TABLEROWOPEN Procedure](#).

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the [TABLEROWCLOSE Procedure](#).

Syntax

```
HTP.TABLEROWOPEN(
    calign          IN          VARCHAR2    DEFAULT NULL,
    cvalign         IN          VARCHAR2    DEFAULT NULL,
    cdp             IN          VARCHAR2    DEFAULT NULL,
    cnowrap         IN          VARCHAR2    DEFAULT NULL,
    cattributes     IN          VARCHAR2    DEFAULT NULL);
```

Parameters

Table 167–86 *TABLEROWOPEN Procedure Parameters*

Parameter	Description
<code>calign</code>	The value for the <code>ALIGN</code> attribute.
<code>cvalign</code>	The value for the <code>VALIGN</code> attribute.
<code>cdp</code>	The value for the <code>DP</code> attribute.
<code>cnowrap</code>	If the value of this parameter is not <code>NULL</code> , the <code>NOWRAP</code> attribute is added to the tag.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Procedure

This procedure generates the `<TT>` and `</TT>` tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–87 TELETYPE Procedure Parameters

Parameter	Description
<code>ctext</code>	The text to render in a fixed width typewriter font.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(  
    ctitle          IN          VARCHAR2);
```

Parameters

Table 167–88 TITLE Procedure Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Procedure

This procedure generates the `` tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the [ULISTOPEN Procedure](#). Add list items with [LISTITEM Procedure](#).

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

ULISTOPEN Procedure

This procedure generates the tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the [ULISTCLOSE Procedure](#). Add list items with [LISTITEM Procedure](#).

Syntax

```
HTP.ULISTOPEN(
  cclear      IN      VARCHAR2  DEFAULT NULL,
  cwrap       IN      VARCHAR2  DEFAULT NULL,
  cdingbat    IN      VARCHAR2  DEFAULT NULL,
  csrc        IN      VARCHAR2  DEFAULT NULL,
  cattributes IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–89 ULISTOPEN Procedure Parameters

Parameter	Description
<code>cclear</code>	The value for the <code>CLEAR</code> attribute.
<code>cwrap</code>	The value for the <code>WRAP</code> attribute.
<code>cdingbat</code>	The value for the <code>DINGBAT</code> attribute.
<code>csrc</code>	The value for the <code>SRC</code> attribute.
<code>cattributes</code>	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE (  
  ctext          IN          VARCHAR2,  
  cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–90 *UNDERLINE Procedure Parameters*

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(  
    ctext          IN          VARCHAR2,  
    cattributes    IN          VARCHAR2  DEFAULT NULL);
```

Parameters

Table 167–91 *VARIABLE Procedure Parameters*

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content. These include content such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia `ORD_DICOM` package provides functions and procedures to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- [Documentation of ORD_DICOM](#)

Documentation of ORD_DICOM

For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM in the *Oracle Multimedia DICOM Developer's Guide*.

ORD_DICOM_ADMIN

This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia ORD_DICOM_ADMIN package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

- [Documentation of ORD_DICOM_ADMIN](#)

Documentation of ORD_DICOM_ADMIN

For a complete description of this package within the context of Oracle Multimedia, see ORD_DICOM_ADMIN in the *Oracle Multimedia DICOM Developer's Guide*.

The OWA_CACHE package provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications.

Using OWA_CACHE

- [Constants](#)

Constants

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`

Summary of OWA_CACHE Subprograms

Table 170–1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure on page 170-5	Disables the cache for this particular request
GET_ETAG Function on page 170-6	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function on page 170-7	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure on page 170-8	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure on page 170-9	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure on page 170-10	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure on page 170-11	Sets up the headers for a surrogate-control header for web cache

DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG  
RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise NULL.

GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL  
RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

SET_CACHE Procedure

This sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE (  
    p_etag      IN      VARCHAR2,  
    p_level     IN      VARCHAR2);
```

Parameters

Table 170–2 SET_CACHE Procedure Parameters

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(
  p_expires    IN    NUMBER,
  p_level      IN    VARCHAR2);
```

Parameters

Table 170-3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

VALUE_ERROR is thrown if If the etag was not passed in

SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(  
    p_value          IN          VARCHAR2);
```

Parameters

Table 170–4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header

Exceptions

VALUE_ERROR is thrown if If p_value is greater than 55 in length.

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- [Using OWA_COOKIE](#)
 - Overview
 - Types
 - Rules and Limits
- [Summary of OWA_COOKIE Subprograms](#)

Using OWA_COOKIE

- [Overview](#)
- [Types](#)
- [Rules and Limits](#)

Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

Types

This data type contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.
```

```
TYPE COOKIE IS RECORD (  
    name          VARCHAR2(4000),  
    vals          vc_arr,  
    num_vals      INTEGER);
```

Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

Summary of OWA_COOKIE Subprograms

Table 171–1 OWA_COOKIE Package Subprograms

Subprogram	Description
GET Function on page 171-7	Gets the value of the specified cookie
GET_ALL Procedure on page 171-8	Gets all cookie name-value pairs
REMOVE Procedure on page 171-9	Removes the specified cookie
SEND procedure on page 171-10	Generates a "Set-Cookie" line in the HTTP header

GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

```
OWA_COOKIE.GET(  
    name          IN          VARCHAR2)  
RETURN COOKIE;
```

Parameters

Table 171–2 GET Procedure Parameters

Parameter	Description
name	The name of the cookie.

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(  
    names          OUT      vc_arr,  
    vals           OUT      vc_arr,  
    num_vals       OUT      INTEGER);
```

Parameters

Table 171–3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(  
  name          IN          VARCHAR2,  
  val           IN          VARCHAR2,  
  path          IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 171–4 REMOVE Procedure Parameters

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(  
    name          in          varchar2,  
    value         in          varchar2,  
    expires       in          date          DEFAULT NULL,  
    path          in          varchar2     DEFAULT NULL,  
    domain        in          varchar2     DEFAULT NULL,  
    secure        in          varchar2     DEFAULT NULL);
```

Parameters

Table 171–5 SEND Procedure Parameters

Parameter	Description
name	The name of the cookie.
value	The value of the cookie.
expires	The date at which the cookie will expire
path	The value for the path field.
domain	The value for the domain field.
secure	If the value of this parameter is not NULL, the "secure" field is added to the line.

The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Constants

- `dbms_server_timezone` CONSTANT VARCHAR2(3) := 'PST';
- `dbms_server_gmtdiff` CONSTANT NUMBER := NULL;

Summary of OWA_CUSTOM Subprograms

Table 172–1 OWA_CUSTOM Package Subprograms

Subprogram	Description
AUTHORIZE Function on page 172-5	Provides a Global PLSQL Agent Authorization callback function

AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

Syntax

```
OWA_CUSTOM.AUTHORIZE  
RETURN BOOLEAN;
```

The OWA_IMAGE package provides an interface to access the coordinates where a user clicked on an image.

Using OWA_IMAGE

- [Overview](#)
- [Types](#)
- [Variables](#)
- [Examples](#)

Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

Types

This data type (`point`) contain the X and Y values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

Variables

This package variable (`null_point`) of TYPE `POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

Examples

```
CREATE OR REPLACE PROCEDURE process_image
  (my_img in OWA_IMAGE.POINT)
AS
  x integer := OWA_IMAGE.GET_X(my_img);
  y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
  /* process the coordinate */
END
```

Summary of OWA_IMAGE Subprograms

Table 173–1 OWA_IMAGE Package Subprograms

Subprogram	Description
GET_X Function on page 173-8	Gets the X value of a point type
GET_Y Function on page 173-9	Gets the Y value of a point type

GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(  
    p          IN          point)  
RETURN INTEGER;
```

Parameters

Table 173–2 *GET_X Procedure Parameters*

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y (  
    p          IN          point)  
RETURN INTEGER;
```

Parameters

Table 173–3 *GET_Y Procedure Parameters*

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

OWA_OPT_LOCK

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- [Using OWA_OPT_LOCK](#)
 - Overview
 - Types
- [Summary of OWA_OPT_LOCK Subprograms](#)

Using OWA_OPT_LOCK

- [Overview](#)
- [Types](#)

Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The OWA_OPT_LOCK package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the `owa_opt_lock.store_values` procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the `owa_opt_lock.checksum` function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

Types

This data type is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the OWA_TEXT.VC_ARR DATA TYPE.

Summary of OWA_OPT_LOCK Subprograms

Table 174-1 OWA_CACHE Package Subprograms

Subprogram	Description
CHECKSUM Functions on page 174-6	Returns the checksum value
GET_ROWID Function on page 174-7	Returns the ROWID value
STORE_VALUES Procedure on page 174-8	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function on page 174-9	Verifies the stored values against modified values

CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit `checksum` based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
  p_buff      IN      VARCHAR2)
RETURN NUMBER;
```

```
OWA_OPT_LOCK.CHECKSUM(
  p_owner     IN      VARCHAR2,
  p_tname     IN      VARCHAR2,
  p_rowid     IN      ROWID)
RETURN NUMBER;
```

Parameters

Table 174–2 CHECKSUM Procedure Parameters

Parameter	Description
<code>p_buff</code>	The nstring where you want to calculate the <code>checksum</code> .
<code>p_owner</code>	The owner of the table.
<code>p_tname</code>	The table name.
<code>p_rowid</code>	The row in <code>p_tname</code> where you want to calculate the <code>checksum</code> value. Use the GET_ROWID Function to convert VCARRAY values to proper rowids.

GET_ROWID Function

This function returns the ROWID data type from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(  
    p_old_values    IN    varray)  
RETURN ROWID;
```

Parameters

Table 174-3 GET_ROWID Procedure Parameters

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES(  
  p_owner      IN      VARCHAR2,  
  p_tname      IN      VARCHAR2,  
  p_rowid      IN      ROWID);
```

Parameters

Table 174–4 STORE_VALUES Procedure Parameters

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "old_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the [VERIFY_VALUES Function](#).

VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the [STORE_VALUES Procedure](#).

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
  p_old_values IN varray)
RETURN BOOLEAN;
```

Parameters

Table 174–5 VERIFY_VALUES Procedure Parameters

Parameter	Description
p_old_values	<p>A PL/SQL table containing the following information:</p> <ul style="list-style-type: none"> ▪ p_old_values (1) specifies the owner of the table. ▪ p_old_values (2) specifies the table. ▪ p_old_values (3) specifies the rowid of the row to verify. <p>The remaining indexes contain values for the columns in the table.</p> <p>Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.</p>

Return Values

TRUE if no other update has been performed, otherwise FALSE.

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- [Using OWA_PATTERN](#)
 - Types
 - Operational Notes
- [Summary of OWA_PATTERN Subprograms](#)

Using OWA_PATTERN

- [Types](#)
- [Operational Notes](#)

Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to OWA_PATTERN function calls, and it only has to be parsed once.

- OWA_PATTERN.PATTERN

Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following parameters:

- `line` - This is the target to be examined for a match. It can be more than one line of text or a `owa_text.multi_line` data type.
- `pat` - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the `owa_pattern.change` function and procedure, this parameter is called `from_str`.
- `flags` - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- [Wildcards](#)
- [Quantifiers](#)
- [Flags](#)

Wildcards

Wildcard tokens match something other than themselves:

Table 175–1 Wildcard tokens recognized by OWA_PATTERN package

Token	Description
<code>^</code>	Matches newline or the beginning of the target
<code>\$</code>	Matches newline or the end of the target
<code>\n</code>	Matches newline
<code>.</code>	Matches any character except newline
<code>\t</code>	Matches tab
<code>\d</code>	Matches digits [0-9]
<code>\D</code>	Matches non-digits [not 0-9]
<code>\w</code>	Matches word characters (0-9, a-z, A-Z, or <code>_</code>)
<code>\W</code>	Matches non-word characters (not 0-9, a-z, A-Z, or <code>_</code>)
<code>\s</code>	Matches whitespace characters (blank, tab, or newline).
<code>\S</code>	Matches non-whitespace characters (not blank, tab, or newline)
<code>\b</code>	Matches "word" boundaries (between <code>\w</code> and <code>\W</code>)
<code>\x<HEX></code>	Matches the value in the current character set of the two hexadecimal digits
<code>\<OCT></code>	Matches the value in the current character set of the two or three octal digits
<code>\</code>	Followed by any character not covered by another case matches that character
<code>&</code>	Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures .

Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

Table 175–2 Quantifiers

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly <i>n</i> occurrences
{n, }	At least <i>n</i> occurrences
{n, m}	At least <i>n</i> , but not more than <i>m</i> , occurrences

Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

Table 175–3 Flags

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

Summary of OWA_PATTERN Subprograms

Table 175-4 OWA_CACHE Package Subprograms

Subprogram	Description
AMATCH Function on page 175-7	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures on page 175-9	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure on page 175-11	Generates a pattern data type from a VARCHAR2 type
MATCH Function on page 175-12	Determines if a string contains the specified pattern

AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern data type.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern data type.

Note: If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2,
  from_loc      IN          INTEGER,
  pat           IN          VARCHAR2,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2,
  from_loc      IN          INTEGER,
  pat           IN OUT     PATTERN,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2
  from_loc      IN          INTEGER
  pat           IN          varchar2
  backrefs      OUT         owa_text.vc_arr
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.AMATCH (
  line          IN          VARCHAR2
  from_loc      IN          INTEGER
  pat           IN OUT     PATTERN
  backrefs      OUT         owa_text.vc_arr
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 175–5 *AMATCH Procedure Parameters*

Parameter	Description
<code>line</code>	The text to search in.

Table 175–5 (Cont.) AMATCH Procedure Parameters

Parameter	Description
from_loc	The location (in number of characters) in line where the search is to begin.
pat	The string to match. It can contain regular expressions. This can be either a VARCHAR2 or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of line. If there was no match, the function returns 0.

CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` data type. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE (
  line          IN OUT  VARCHAR2,
  from_str      IN      VARCHAR2,
  to_str        IN      VARCHAR2,
  flags         IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
  line          IN OUT  VARCHAR2,
  from_str      IN      VARCHAR2,
  to_str        IN      VARCHAR2,
  flags         IN      VARCHAR2  DEFAULT NULL);
```

```
owa_pattern.change (
  mline        IN OUT  owa_text.multi_line,
  from_str     IN      VARCHAR2,
  to_str       IN      VARCHAR2,
  flags        IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

```
OWA_PATTERN.CHANGE (
  mline        IN OUT  owa_text.multi_line,
  from_str     IN      VARCHAR2,
  to_str       IN      VARCHAR2,
  flags        IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 175–6 *CHANGE Procedure Parameters*

Parameter	Description
<code>line</code>	The text to search in. The output value of this parameter is the altered string.
<code>mline</code>	The text to search in. This is a <code>owa_text.multi_line</code> data type. The output value of this parameter is the altered string.
<code>from_str</code>	The regular expression to replace.
<code>to_str</code>	The substitution pattern.
<code>flags</code>	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If "i" is specified, the search is case-insensitive. If "g" is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "Cats in". It then replaces this string with "& red". The ampersand character "&" indicates "Cats in" because that is what matched the regular expression. Thus, this procedure replaces the string "Cats in pajamas" with "Cats in red" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found      INTEGER;
BEGIN
    theline := 'what is the goal?';
    num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
    HTP.PRINT(num_found); -- num_found is 1
    HTP.PRINT(theline); -- theline is 'what is the idea?'
END;
/
SHOW ERRORS
```

GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```
OWA_PATTERN.GETPAT (  
  arg      IN      VARCHAR2,  
  pat      IN OUT  pattern);
```

Parameters

Table 175-7 GETPAT Procedure Parameters

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
  line          IN          VARCHAR2,
  pat           IN          VARCHAR2,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line          IN          VARCHAR2,
  pat           IN OUT     PATTERN,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  line          IN          VARCHAR2,
  pat           IN          VARCHAR2,
  backrefs     OUT         owa_text.vc_arr,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  line          IN          VARCHAR2,
  pat           IN OUT     PATTERN,
  backrefs     OUT         owa_text.vc_arr,
  flags         IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
owa_pattern.match(
  mline        IN          owa_text.multi_line,
  pat          IN          VARCHAR2,
  rlist        OUT         owa_text.row_list,
  flags        IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

```
OWA_PATTERN.MATCH(
  mline        IN          owa_text.multi_line,
  pat          IN OUT     pattern,
  rlist        OUT         owa_text.row_list,
  flags        IN          VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 175–8 *CHANGE Procedure Parameters*

Parameter	Description
line	The line to search in.
mline	The text to search in. This is a <code>owa_text.multi_line</code> data type..

Table 175–8 (Cont.) CHANGE Procedure Parameters

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext VARCHAR2(256);
pat      VARCHAR2(256);

sometext := 'what is the goal?';
pat      := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
THEN
    HTP.PRINT('Match found');
ELSE
    HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create an OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.

- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

The OWA_SEC package provides an interface for custom authentication.

Using OWA_SEC

- [Operational Notes](#)

Operational Notes

Parameters that have default values are optional.

Summary of OWA_SEC Subprograms

Table 176–1 OWA_SEC Package Subprograms

Subprogram	Description
GET_CLIENT_HOSTNAME Function on page 176-5	Returns the client's hostname
GET_CLIENT_IP Function on page 176-6	Returns the client's IP address
GET_PASSWORD Function on page 176-7	Returns the password that the user entered
GET_USER_ID Function on page 176-8	Returns the username that the user entered
SET_AUTHORIZATION Procedure on page 176-9	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure on page 176-10	Defines the realm that the page is in

GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME  
RETURN VARCHAR2;
```

Return Values

The hostname.

GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP  
    RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address` data type is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is 123.45.67.89 and the variable `ipaddr` is of the `owa_util.ip_address` data type, the variable would contain the following values:

```
ipaddr(1) = 123  
ipaddr(2) = 45  
ipaddr(3) = 67  
ipaddr(4) = 89
```

GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD  
RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID  
RETURN VARCHAR2;
```

Return Values

The username.

SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the [OWA_CUSTOM](#) package, sets the authorization scheme for the PL/SQL Gateway. This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN          INTEGER);
```

Parameters

Table 176–2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description
scheme	<p>The authorization scheme. It is one of the following schemes for SET_AUTHORIZATION:</p> <ul style="list-style-type: none"> ■ <code>OWA_SEC.NO_CHECK</code> - Specifies that the PL/SQL application is not to do any custom authentication. This is the default. ■ <code>OWA_SEC.GLOBAL</code> - Defines an <code>authorize</code> function that is called for all users and all procedures. This is the OWA_CUSTOM.AUTHORIZE Function in the "sys" schema. ■ <code>OWA_SEC.PER_PACKAGE</code> - Define an <code>authorize</code> function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the <code>package.AUTHORIZE</code> function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous <code>authorize</code> function in the user's schema is called. ■ <code>OWA_SEC.CUSTOM</code> - Implements different <code>authorize</code> functions for each user. The function OWA_CUSTOM.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an <code>OWA_CUSTOM.AUTHORIZE Function</code>, the PL/SQL Gateway looks for it in the "sys" schema. <p>The custom <code>authorize</code> function has the following signature:</p> <pre>FUNCTION AUTHORIZE RETURN BOOLEAN;</pre> <p>If the function returns <code>TRUE</code>, authentication succeeded. If it returns <code>FALSE</code>, authentication failed. If the <code>authorize</code> function is not defined, the Gateway returns an error and fails.</p>

SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(  
    realm      IN      VARCHAR2);
```

Parameters

Table 176–3 *SET_PROTECTION_REALM Procedure Parameters*

Parameter	Description
realm	The realm where the page belongs. This string is displayed to the user.

The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- [Using OWA_TEXT](#)
 - Types
- [Summary of OWA_TEXT Subprograms](#)

Using OWA_TEXT

- [Types](#)

Types

- [MULTI_LINE DATA TYPE](#)
- [ROW_LIST DATA TYPE](#)
- [VC_ARR DATA TYPE](#)

MULTI_LINE DATA TYPE

This data type is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (  
    rows          vc_arr,  
    num_rows      INTEGER,  
    partial_row    BOOLEAN);
```

ROW_LIST DATA TYPE

This is the data type for holding data to be processed.

```
TYPE row_list IS RECORD (  
    rows          int_arr,  
    num_rows      INTEGER);
```

```
int_arr IS DEFINED AS:
```

```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

VC_ARR DATA TYPE

This is a component of the [MULTI_LINE DATA TYPE](#) and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of OWA_TEXT Subprograms

Table 177-1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure on page 177-5	Adds text to an existing <code>multi_line</code> type
NEW_ROW_LIST Function and Procedure on page 177-6	Creates a new <code>row_list</code>
PRINT_MULTI Procedure on page 177-7	Prints out the contents of a <code>multi_list</code>
PRINT_ROW_LIST Procedure on page 177-8	Prints out the contents of a <code>row_list</code>
STREAM2MULTI Procedure on page 177-9	Converts a <code>varchar2</code> to a <code>multi_line</code> type

ADD2MULTI Procedure

This procedure adds content to an existing [MULTI_LINE DATA TYPE](#).

Syntax

```
OWA_TEXT.ADD2MULTI (  
    stream          IN          VARCHAR2,  
    mline          IN OUT    multi_line,  
    continue       IN          BOOLEAN DEFAULT TRUE);
```

Parameters

Table 177–2 *ADD2MULTI Procedure Parameters*

Parameter	Description
stream	The text to add.
mline	The OWA_TEXT.MULTI_LINE DATA TYPE. The output of this parameter contains <i>stream</i> .
continue	If TRUE, the procedure appends <i>stream</i> within the previous final row (assuming it is less than 32K). If FALSE, the procedure places <i>stream</i> in a new row.

NEW_ROW_LIST Function and Procedure

This function or procedure creates a new `OWA_TEXT.ROW_LIST` DATA TYPE. The function version uses no parameters and returns a new empty `row_list`. The procedure version creates the `row_list` data type as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist OUT row_list);
```

Parameters

Table 177-3 NEW_ROW_LIST Procedure Parameters

Parameter	Description
<code>rlist</code>	This is an output parameter containing the new <code>row_list</code> data type

Return Values

The function version returns the new `row_list` data type.

PRINT_MULTI Procedure

This procedure uses the [PRINT Procedures](#) or the [PRN Procedures](#) to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_MULTI(  
    mline          IN          multi_line);
```

Parameters

Table 177-4 PRINT_MULTI Procedure Parameters

Parameter	Description
mline	The multi_line data type to print.

Return Values

The contents of the multi_line.

PRINT_ROW_LIST Procedure

This procedure uses the [PRINT Procedures](#) or the [PRN Procedures](#) to print the "rows" field of the OWA_TEXT.ROW_LIST DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(  
    rlist          IN          multi_line);
```

Parameters

Table 177-5 PRINT_ROW_LIST Procedure Parameters

Parameter	Description
rlist	The row_list data type to print.

Return Values

The contents of the row_list.

STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` data type.

Syntax

```
OWA_TEXT.STREAM2MULTI(  
  stream      IN      VARCHAR2  
  mline      OUT     multi_line);
```

Parameters

Table 177-6 *STREAM2MULTI Procedure Parameters*

Parameter	Description
<code>stream</code>	The string to convert.
<code>mline</code>	The stream in <code>OWA_TEXT.MULTI_LINE DATA TYPE</code> format

The OWA_UTIL package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
- *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- [Using OWA_UTIL](#)
 - Overview
 - Types
- [Summary of OWA_UTIL Subprograms](#)

Using OWA_UTIL

- [Overview](#)
- [Types](#)

Overview

The `OWA_UTIL` package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a data type by the Oracle database.

Types

- [DATETYPE Data Type](#)
- [IDENT_ARR Data Type](#)
- [IP_ADDRESS Data Type](#)

DATETYPE Data Type

The [TODATE Function](#) converts an item of this type to the type DATE, which is understood and properly handled as data by the database. The procedure [CHOOSE_DATE Procedure](#) enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Data Type

This data type is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

IP_ADDRESS Data Type

This data type is used by the [GET_CLIENT_IP Function](#) in the "OWA_SEC" package on page 176-1.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Summary of OWA_UTIL Subprograms

Table 178–1 OWA_UTIL Package Subprograms

Subprogram	Description
BIND_VARIABLES Function on page 178-6	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures on page 178-7	Prints a calendar
CELLSPRINT Procedures on page 178-8	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure on page 178-10	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function on page 178-11	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function on page 178-12	Returns the full virtual path for the PL/SQL Gateway
GET_PROCEDURE Function on page 178-13	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure on page 178-14	Closes the HTTP header
LISTPRINT Procedure on page 178-15	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure on page 178-16	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure on page 178-17	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure on page 178-18	Generates the Location line in the HTTP header
SHOWPAGE Procedure on page 178-19	Prints a page generated by the HTP and HTF packages in SQL*Plus
SHOWSOURCE Procedure on page 178-20	Prints the source for the specified subprogram
SIGNATURE procedure on page 178-21	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure on page 178-22	Generates the Status line in the HTTP header
TABLEPRINT Function on page 178-23	Prints the data from a table in the database as an HTML table
TODATE Function on page 178-26	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure on page 178-27	Returns information on the caller of the procedure.

BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES (
    theQuery      IN      VARCHAR2  DEFAULT NULL,
    bv1Name       IN      VARCHAR2  DEFAULT NULL,
    bv1Value      IN      VARCHAR2  DEFAULT NULL,
    bv2Name       IN      VARCHAR2  DEFAULT NULL,
    bv2Value      IN      VARCHAR2  DEFAULT NULL,
    bv3Name       IN      VARCHAR2  DEFAULT NULL,
    bv3Value      IN      VARCHAR2  DEFAULT NULL,
    ...
    bv25Name      IN      VARCHAR2  DEFAULT NULL,
    bv25Value     IN      VARCHAR2  DEFAULT NULL)
RETURN INTEGER;
```

Parameters

Table 178–2 BIND_VARIABLES Function Parameters

Parameter	Description
theQuery	The SQL query statement which must be a SELECT statement
bv1Name	The name of the variable
bv1Value	The value of the variable

Return Values

An integer identifying the opened cursor.

CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the [BIND_VARIABLES Function](#).

Syntax

```
OWA_UTIL.CALENDARPRINT (
  p_query          IN          VARCHAR2,
  p_mf_only        IN          VARCHAR2  DEFAULT 'N' );
```

```
OWA_UTIL.CALENDARPRINT (
  p_cursor         IN          INTEGER,
  p_mf_only        IN          VARCHAR2  DEFAULT 'N' );
```

Parameters

Table 178–3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the [FORMAT_CELL Function](#) in the "HTF" package on page 166-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT (
  p_colCnt      IN    INTEGER,
  p_resultTbl   IN    vc_arr,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor   IN    INTEGER,
  p_max_rows    IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec    IN    NUMBER    DEFAULT 0,
  p_more_data   OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT (
  p_theCursor   IN    INTEGER,
  p_max_rows    IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_skip_rec    IN    NUMBER    DEFAULT 0,
  p_more_data   OUT   BOOLEAN);
```

```
OWA_UTIL.CELLSPRINT (
  p_theQuery    IN    VARCHAR2,
  p_max_rows    IN    NUMBER    DEFAULT 100,
  p_format_numbers IN  VARCHAR2  DEFAULT NULL,
  p_reccnt     OUT   NUMBER);
```

```
OWA_UTIL.CELLSPRINT (
```

```

p_theCursor      IN    INTEGER,
p_max_rows       IN    NUMBER    DEFAULT 100,
p_format_numbers IN    VARCHAR2  DEFAULT NULL,
p_reccnt         OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
  p_theQuery      IN    VARCHAR2,
  p_max_rows      IN    NUMBER    DEFAULT 100,
  p_format_numbers IN    VARCHAR2  DEFAULT NULL,
  p_skip_rec      IN    NUMBER    DEFAULT 0,
  p_more_data     OUT   BOOLEAN,
  p_reccnt       OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
  p_theCursor      IN    INTEGER,
  p_max_rows       IN    NUMBER    DEFAULT 100,
  p_format_numbers IN    VARCHAR2  DEFAULT NULL,
  p_skip_rec       IN    NUMBER    DEFAULT 0,
  p_more_data     OUT   BOOLEAN,
  p_reccnt       OUT   NUMBER);

```

Parameters

Table 178–4 *CELLSPRINT Procedure Parameters*

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function .
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This function generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE (
  p_name      IN      VARCHAR2,
  p_date      IN      DATE      DEFAULT SYSDATE) ;
```

Parameters

Table 178–5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a [GET_CGI_ENV Function](#).
- Use the [TODATE Function](#) to convert the [GET_CGI_ENV Function](#) value to the standard Oracle DATE data type.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
...
<OPTION value="2002">2002
</SELECT>
```

GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(  
    param_name      IN      VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 178–6 *GET_CGI_ENV Function Parameters*

Parameter	Description
param_name	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns NULL.

GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH  
RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE  
RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as [MIME_HEADER Procedure](#), [REDIRECT_URL Procedure](#), or [STATUS_LINE Procedure](#)
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the [BIND_VARIABLES Function](#).

Syntax

```
OWA_UTIL.LISTPRINT (
  p_theQuery    IN      VARCHAR2,
  p_cname       IN      VARCHAR2,
  p_nsize       IN      NUMBER,
  p_multiple    IN      BOOLEAN  DEFAULT FALSE);
```

```
OWA_UTIL.LISTPRINT (
  p_theCursor   IN      INTEGER,
  p_cname       IN      VARCHAR2,
  p_nsize       IN      NUMBER,
  p_multiple    IN      BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 178–7 LISTPRINT Procedure Parameters

Parameter	Description
p_theQuery	The SQL query.
p_theCursor	The cursor ID. This can be the return value from the BIND_VARIABLES Function .
p_cname	The name of the HTML form element.
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
...
</SELECT>
```

MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any `HTP.PRINT` or `HTP.PRN` calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
  ccontent_type  IN      VARCHAR2  DEFAULT 'text/html',
  bclose_header  IN      BOOLEAN    DEFAULT TRUE,
  ccharset       IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 178–8 *MIME_HEADER Procedure Parameters*

Parameter	Description
<code>ccontent_type</code>	The MIME type to generate
<code>bclose_header</code>	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
<code>ccharset</code>	The character set to use. The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(  
    curl          IN          VARCHAR2  
    bclose_header IN          BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 178–9 REDIRECT_URL Function Parameters

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTTP procedure or HTTP function call.

Examples

This procedure generates

```
Location: <curl>\n\n
```

SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the [DBMS_OUTPUT](#) package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (  
    cname          IN      VARCHAR2);
```

Parameters

Table 178–10 *SHOWSOURCE Procedure Parameters*

Parameter	Description
cname	The function or procedure whose source you want to show.

SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the [SHOWSOURCE Procedure](#).

Syntax

```
OWA_UTIL.SIGNATURE;  
  
OWA_UTIL.SIGNATURE (  
    cname          IN          VARCHAR2);
```

Parameters

Table 178–11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30  
View PL/SQL Source
```

STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `http.print` or `http.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(  
  nstatus      IN      INTEGER,  
  creason      IN      VARCHAR2  DEFAULT NULL,  
  bclose_header IN      BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 178–12 STATUS_LINE Procedure Parameters

Parameter	Description
<code>nstatus</code>	The status code.
<code>creason</code>	The string for the status code.
<code>bclose_header</code>	Whether or not to close the HTTP header. If <code>TRUE</code> , two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

```
Status: <nstatus> <creason>\n\n
```

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT (
  ctable          IN          VARCHAR2,
  cattributes     IN          VARCHAR2  DEFAULT NULL,
  ntable_type     IN          INTEGER   DEFAULT HTML_TABLE,
  ccolumns        IN          VARCHAR2  DEFAULT '*',
  cclauses        IN          VARCHAR2  DEFAULT NULL,
  ccol_aliases    IN          VARCHAR2  DEFAULT NULL,
  nrow_min        IN          NUMBER    DEFAULT 0,
  nrow_max        IN          NUMBER    DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 178–13 TABLEPRINT Function Parameters

Parameter	Description
<code>ctable</code>	The database table.
<code>cattributes</code>	Other attributes to be included as-is in the tag.
<code>ntable_type</code>	How to generate the table. Specify <code>HTML_TABLE</code> to generate the table using <code><TABLE></code> tags or <code>PRE_TABLE</code> to generate the table using the <code><PRE></code> tags. These are constants: <ul style="list-style-type: none"> ■ <code>HTML_TABLE CONSTANT INTEGER := 1;</code> ■ <code>PRE_TABLE CONSTANT INTEGER := 2;</code>
<code>ccolumns</code>	A comma-delimited list of columns from <code>ctable</code> to include in the generated table.
<code>cclauses</code>	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
<code>ccol_aliases</code>	A comma-delimited list of headings for the generated table.
<code>nrow_min</code>	The first row, of those retrieved, to display.
<code>nrow_max</code>	The last row, of those retrieved, to display.

Return Values

Returns `TRUE` if there are more rows beyond the `nrow_max` requested, `FALSE` otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, `cattributes` is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

`http://myhost:7777/pls/hr/showemps`

returns to the following to the client:

<PRE>

```
-----
| EMPNO | ENAME | JOB      | MGR  | HIREDATE | SAL | COMM | DEPTNO |
-----|-----|-----|-----|-----|-----|-----|-----|
| 7369 | SMITH | CLERK    | 7902 | 17-DEC-80 | 800 |      | 20      |
| 7499 | ALLEN | SALESMAN | 7698 | 20-FEB-81 | 1600 | 300  | 30      |
| 7521 | WARD  | SALESMAN | 7698 | 22-FEB-81 | 1250 | 500  | 30      |
| 7566 | JONES | MANAGER  | 7839 | 02-APR-81 | 2975 |      | 20      |
| 7654 | MARTIN | SALESMAN | 7698 | 28-SEP-81 | 1250 | 1400 | 30      |
| 7698 | BLAKE | MANAGER  | 7839 | 01-MAY-81 | 2850 |      | 30      |
| 7782 | CLARK | MANAGER  | 7839 | 09-JUN-81 | 2450 |      | 10      |
| 7788 | SCOTT | ANALYST  | 7566 | 09-DEC-82 | 3000 |      | 20      |
| 7839 | KING  | PRESIDENT |      | 17-NOV-81 | 5000 |      | 10      |
| 7844 | TURNER | SALESMAN | 7698 | 08-SEP-81 | 1500 | 0    | 30      |
| 7876 | ADAMS | CLERK    | 7788 | 12-JAN-83 | 1100 |      | 20      |
| 7900 | JAMES | CLERK    | 7698 | 03-DEC-81 | 950  |      | 30      |
| 7902 | FORD  | ANALYST  | 7566 | 03-DEC-81 | 3000 |      | 20      |
| 7934 | MILLER | CLERK    | 7782 | 23-JAN-82 | 1300 |      | 10      |
-----
```

</PRE>

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
  ignore_more BOOLEAN;
begin
  ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
    'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
    'Employee Number, Name, Salary');
END;
```

A request for a URL like

`http://myhost:7777/pls/hr/showemps_10`

would return the following to the client:

<PRE>

```
-----
| Employee Number | Name   | Salary |
-----|-----|-----|
| 7782            | CLARK | 2450   |
| 7839            | KING  | 5000   |
| 7934            | MILLER | 1300   |
-----
```

```
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

TODATE Function

This function converts the [DATETYPE Data Type](#) to the standard Oracle DATE type.

Syntax

```
OWA_UTIL.TODATE (  
    p_dateArray      IN      dateType)  
RETURN DATE;
```

Parameters

Table 178–14 *TODATE Function Parameters*

Parameter	Description
p_dateArray	The value to convert.

WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME (
  owner          OUT   VARCHAR2,
  name           OUT   VARCHAR2,
  lineno        OUT   NUMBER,
  caller_t      OUT   VARCHAR2);
```

Parameters

Table 178–15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

The `SDO_CS` package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- [Documentation of SDO_CS](#)

Documentation of SDO_CS

For a complete description of this package within the context of Oracle Spatial, see SDO_CS in the *Oracle Spatial Developer's Guide*.

SDO_CSW_PROCESS

The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

- [Documentation of SDO_CSW_PROCESS](#)

Documentation of SDO_CSW_PROCESS

For a complete description of this package within the context of Oracle Spatial, see SDO_CSW_PROCESS in the *Oracle Spatial Developer's Guide*.

The SDO_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- [Documentation of SDO_GCDR](#)

Documentation of SDO_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in *Oracle Spatial Developer's Guide*.

The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

- [Documentation of SDO_GEOM](#)

Documentation of SDO_GEOM

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOM in the *Oracle Spatial Developer's Guide*.

The `SDO_GEOR` package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- [Documentation of SDO_GEOR](#)

Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR in the *Oracle Spatial GeoRaster Developer's Guide*.

SDO_GEOR_ADMIN

The SDO_GEOR_ADMIN package contains subprograms for administrative operations related to GeoRaster.

- [Documentation of SDO_GEOR_ADMIN](#)

Documentation of SDO_GEOR_ADMIN

For a complete description of this package within the context of Oracle Spatial, see SDO_GEOR_ADMIN in the *Oracle Spatial GeoRaster Developer's Guide*.

SDO_GEOR_UTL

The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- [Documentation of SDO_GEOR_UTL](#)

Documentation of SDO_GEOR_UTL

For complete description of this package within the context of Oracle Spatial, see SDO_GEOR_UTL in the *Oracle Spatial GeoRaster Developer's Guide*.

The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

- [Documentation of SDO_LRS](#)

Documentation of SDO_LRS

For a complete description of this package within the context of Oracle Spatial, see SDO_LRS in the *Oracle Spatial Developer's Guide*.

The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- [Documentation of SDO_MIGRATE](#)

Documentation of SDO_MIGRATE

For a complete description of this package within the context of Oracle Spatial, see SDO_MIGRATE in the *Oracle Spatial Developer's Guide*.

The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- [Documentation of SDO_NET](#)

Documentation of SDO_NET

For a complete description of this package within the context of Oracle Spatial, see SDO_NET in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

SDO_NET_MEM

The SDO_NET_MEM package contains functions and procedures for performing editing and analysis operations on network data using a network memory object.

- [Documentation of SDO_NET_MEM](#)

Documentation of SDO_NET_MEM

For a complete description of this package within the context of Oracle Spatial, see SDO_NET_MEM in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

The SDO_OLS package contains subprograms for Spatial OpenLS support.

- [Documentation of SDO_OLS](#)

Documentation of SDO_OLS

For a complete description of this package within the context of Oracle Spatial, see SDO_OLS in the *Oracle Spatial Developer's Guide*.

The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

- [Documentation of SDO_PC_PKG](#)

Documentation of SDO_PC_PKG

For a complete description of this package within the context of Oracle Spatial, see SDO_PC_PKG in the *Oracle Spatial Developer's Guide*.

The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

- [Documentation of SDO_SAM](#)

Documentation of SDO_SAM

For a complete description of this package within the context of Oracle Spatial, see SDO_SAM in the *Oracle Spatial Developer's Guide*.

The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

- [Documentation of SDO_TIN_PKG](#)

Documentation of SDO_TIN_PKG

For a complete description of this package within the context of Oracle Spatial, see SDO_TIN_PKG in the *Oracle Spatial Developer's Guide*.

The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- [Documentation of SDO_TOPO](#)

Documentation of SDO_TOPO

For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

SDO_TOPO_MAP

The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- [Documentation of SDO_TOPO_MAP](#)

Documentation of SDO_TOPO_MAP

For a complete description of this package within the context of Oracle Spatial, see SDO_TOPO_MAP in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

The SDO_TUNE package contains Spatial tuning functions and procedures.

- [Documentation of SDO_TUNE](#)

Documentation of SDO_TUNE

For complete description of this package within the context of Oracle Spatial, see SDO_TUNE in the *Oracle Spatial Developer's Guide*.

The SDO_UTIL package contains the utility functions and procedures for Oracle Spatial.

- [Documentation of SDO_UTIL](#)

Documentation of SDO_UTIL

For complete description of this package within the context of Oracle Spatial, see SDO_UTIL in the *Oracle Spatial Developer's Guide*.

SDO_WFS_LOCK

The SDO_WFS_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

- [Documentation of SDO_WFS_LOCK](#)

Documentation of SDO_WFS_LOCK

For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_LOCK in the *Oracle Spatial Developer's Guide*.

SDO_WFS_PROCESS

The SDO_WFS_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

- [Documentation of SDO_WFS_PROCESS](#)

Documentation of SDO_WFS_PROCESS

For a complete description of this package within the context of Oracle Spatial, see SDO_WFS_PROCESS in the *Oracle Spatial Developer's Guide*.

The SEM_APIS package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

- [Documentation of SEM_APIS](#)

Documentation of SEM_APIS

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_APIS in the *Oracle Database Semantic Technologies Developer's Guide*.

The SEM_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

- [Documentation of SEM_PERF](#)

Documentation of SEM_PERF

For a complete description of this package within the context of Oracle Database semantic technology support, see SEM_PERF in the *Oracle Database Semantic Technologies Developer's Guide*.

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- [Summary of UTL_COLL Subprograms](#)

Summary of UTL_COLL Subprograms

Table 202–1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function on page 202-3	Determines whether a collection item is actually a locator or not

IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (
  coln IN STANDARD)
  RETURNS BOOLEAN;
```

Pragmas

Asserts WNDS, WNPS and RNPS pragmas

Parameters

Table 202–2 IS_LOCATOR Function Parameters

Parameter	Description
coln	Nested table or varray item.

Return Values

Table 202–3 IS_LOCATOR Function Return Values

Return Value	Description
1	Collection item is indeed a locator.
0	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno number,
  ph list_t );
/

CREATE TABLE phone_book OF phone_book_t
  NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
  NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
```

```
ELSE
  DBMS_OUTPUT.PUT_LINE('plist is not a locator');
END IF;

IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
  DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
ELSE
  DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

The UTL_COMPRESS package provides a set of data compression utilities.

This chapter contains the following topics:

- [Using UTL_COMPRESS](#)
 - Constants
 - Exceptions
 - Operational Notes
- [Summary of UTL_COMPRESS Subprograms](#)

Using UTL_COMPRESS

- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)

Constants

Define max number of handles for piecewise operations:

```
UTLCOMP_MAX_HANDLE  CONSTANT  PLS_INTEGER := 5;
```

Exceptions

Table 203–1 UTL_COMPRESS Exceptions

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

Operational Notes

- It is the caller's responsibility to free the temporary LOB returned by the LZ* functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or `LZ_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.
- The output of the `UTL_COMPRESS` compressed data is compatible with `gzip`(with `-n` option)/`gunzip` on a single file.

Summary of UTL_COMPRESS Subprograms

Table 203–2 UTL_COMPRESS Package Subprograms

Subprogram	Description
ISOPEN Function on page 203-7	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures on page 203-8	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure on page 203-10	Adds a piece of compressed data
LZ_COMPRESS_CLOSE on page 203-11	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN on page 203-12	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures on page 203-13	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure on page 203-14	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function on page 203-15	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure on page 203-16	Closes and finishes the piecewise uncompress

ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(  
    handle in binary_integer)  
RETURN BOOLEAN;
```

Parameters

Table 203–3 ISOPEN Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then  
    UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);  
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN  
    UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);  
END IF;
```

LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      RAW,
  quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BLOB,
  quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN      BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BFILE,
  quality  IN      BINARY_INTEGER DEFAULT 6)
RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN      BFILE,
  dst      IN OUT NOCOPY BLOB,
  quality  IN      BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 203–4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (  
    handle IN          BINARY_INTEGER,  
    dst    IN OUT NOCOPY BLOB,  
    src    IN          RAW);
```

Parameters

Table 203-5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.
src	The input data to be compressed.

Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - NULL handle, src, dst, or invalid dst.

LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (  
  handle IN          BINARY_INTEGER,  
  dst      IN OUT NOCOPY BLOB);
```

Parameters

Table 203–6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise compress context.
dst	The opened LOB from LZ_COMPRESS_OPEN to store compressed data.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, dst, or invalid dst.

LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (  
    dst          IN OUT NOCOPY BLOB,  
    quality      IN          BINARY_INTEGER DEFAULT 6)  
RETURN BINARY_INTEGER;
```

Parameters

Table 203-7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
dst	User supplied LOB to store compressed data.
quality	Speed versus efficiency of resulting compressed output. <ul style="list-style-type: none">Valid values are the range 1..9, with a default value of 6.1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL `dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN RAW)
RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BLOB,
    dst IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE)
RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS (
    src IN BFILE,
    dst IN OUT NOCOPY BLOB);
```

Parameters

Table 203–8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(  
  handle IN          BINARY_INTEGER,  
  dst    OUT NOCOPY RAW);
```

Parameters

Table 203–9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.
dst	The uncompressed data.

Exceptions

- no_data_found - finished uncompress.
- invalid_handle - out of range invalid or uninitialized handle.
- invalid_argument - NULL handle.

LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(  
    src IN BLOB)  
RETURN BINARY_INTEGER;
```

Parameters

Table 203–10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - NULL src.

Usage Notes

Close the opened handle with `LZ_UNCOMPRESS_CLOSE`

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(  
    handle IN BINARY_INTEGER);
```

Parameters

Table 203–11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

The UTL_DBWS package provides database web services.

This chapter contains the following topics:

- [Using UTL_DBWS](#)
 - Supported Keys and Default Settings for Standard Call Properties
- [Summary of UTL_DBWS Subprograms](#)

Using UTL_DBWS

- [Supported Keys and Default Settings for Standard Call Properties](#)

Supported Keys and Default Settings for Standard Call Properties

Table 204–1 Supported Keys and Default Settings for Standard Call Properties

Key	Explanation of Value, Default value
'USERNAME '	User name for authentication.
'PASSWORD '	Password for authentication.
'ENCODINGSTYLE_URI '	Encoding style specified as a namespace URI. The default value is the SOAP 1.1 encoding http://schemas.xmlsoap.org/soap/encoding/.
'OPERATION_STYLE '	Standard property for operation style. Set to 'RPC' if the operation style is RPC, 'DOCUMENT' if the operation style is document.
'SESSION_MAINTAIN '	This boolean property is used by a service client to indicate whether or not it wants to participate in a session with a service endpoint. If this property is set to 'TRUE', the service client indicates that it wants the session to be maintained. If set to 'FALSE', the session is not maintained. The default value for this property is 'FALSE'
'SOAPACTION_USE '	This boolean property indicates whether or not SOAPAction is to be used. The default value of this property is 'FALSE'.
'SOAPACTION_URI '	Indicates the SOAPAction URI if the SOAPACTION_USE property is set to 'TRUE'

Summary of UTL_DBWS Subprograms

Table 204–2 UTL_DBWS Subprograms

Subprogram	Description
CREATE_CALL Function on page 204-5	Creates a Call instance
CREATE_SERVICE Function on page 204-6	Creates a Service instance
GET_IN_PARAMETER_TYPES Function on page 204-7	Lists the XML type of the input parameters of the Call that is returned
GET_OUT_PARAMETER_TYPES Function on page 204-8	Lists the XML type of the output parameters of the Call that is returned
GET_OUTPUT_VALUES Function on page 204-9	Obtains the output arguments after a Call invocation
GET_PORTS Function on page 204-10	Lists the qualified names of all of the ports in a service
GET_PROPERTY Function on page 204-11	Returns the value of a particular property on a Call
GET_RETURN_TYPE Function on page 204-12	Lists the XML type that is returned by the given Call
GET_SERVICES Function on page 204-13	Lists the qualified names of the services defined in a WDSL document
INVOKE Function on page 204-14	Invokes a specific operation using a synchronous request-response interaction mode
RELEASE_ALL_SERVICES Procedure on page 204-15	Releases all Service instances
RELEASE_CALL Procedure on page 204-16	Releases a particular Call instance
RELEASE_SERVICE Procedure on page 204-17	Releases a particular Service instance
REMOVE_PROPERTY Procedure on page 204-18	Clears the value of a particular property on a Call
SET_PROPERTY Procedure on page 204-19	Sets the value of a particular property on a Call

CREATE_CALL Function

This procedure creates a Call instance.

Syntax

```
UTL_DBWS.CREATE_CALL (
    service_handle  SERVICE,
    port_name      QNAME,
    operation_name  QNAME)
RETURN CALL;
```

Parameters

Table 204–3 CREATE_CALL Function Parameters

Parameter	Description
service_handle	The Service instance to be called.
port_name	The qualified name for the port. Use the first port if this is NULL.
operation_name	The qualified name for the operation.

Return Values

Table 204–4 CREATE_CALL Return Values

Parameter	Description
CALL	Returns a handle to the Call instance.

CREATE_SERVICE Function

This procedure creates a Service instance.

Syntax

```
UTL_DBWS.CREATE_SERVICE(  
    wsdl_document_location URITYPE,  
    service_name           QNAME)  
RETURN SERVICE;
```

Parameters

Table 204–5 CREATE_SERVICE Function Parameters

Parameter	Description
<code>wsdl_document_location</code>	The URL for the WSDL document location for the service
<code>service_name</code>	The qualified name for the service. Use the first service if this is NULL.

Return Values

Table 204–6 CREATE_SERVICE Return Values

Parameter	Description
<code>SERVICE</code>	Returns a handle to the Service instance.

GET_IN_PARAMETER_TYPES Function

This procedure lists the XML type of the input parameters of the Call that is returned.

Syntax

```
UTL_DBWS.GET_IN_PARAMETER_TYPES (  
    call_handle    CALL)  
RETURN QNAME_LIST;
```

Parameters

Table 204–7 *GET_IN_PARAMETER_TYPES Function Parameters*

Parameter	Description
call_handle	The Service instance whose input types are returned.

Return Values

Table 204–8 *GET_IN_PARAMETER_TYPES Function Return Values*

Parameter	Description
QNAME_LIST	The list of the XML type of the input parameters of the Call that is returned.

GET_OUT_PARAMETER_TYPES Function

This procedure lists the XML type of the output parameters of the Call that is returned.

Syntax

```
UTL_DBWS.GET_OUT_PARAMETER_TYPES (  
    call_handle    CALL)  
RETURN QNAME_LIST;
```

Parameters

Table 204–9 *GET_OUT_PARAMETER_TYPES Function Parameters*

Parameter	Description
call_handle	The Service instance whose output types are returned.

Return Values

Table 204–10 *GET_OUT_PARAMETER_TYPES Function Return Values*

Parameter	Description
QNAME_LIST	The list of the XML type of the input parameters of the Call that is returned.

GET_OUTPUT_VALUES Function

This procedure obtains the output arguments after a Call invocation.

Syntax

```
UTL_DBWS.GET_OUTPUT_VALUES (
    call_handle    CALL)
RETURN ANYDATA_LIST;
```

Parameters

Table 204–11 *GET_OUTPUT_VALUES Function Parameters*

Parameter	Description
call_handle	The instance of the Call.

Return Values

Table 204–12 *GET_OUTPUT_VALUES Function Return Values*

Parameter	Description
ANYDATA_LIST	Returns the output arguments in order.

GET_PORTS Function

This procedure lists the qualified names of all of the ports in a service.

Syntax

```
UTL_DBWS.GET_PORTS (  
    service_handle    SERVICE)  
RETURN QNAME_LIST;
```

Parameters

Table 204–13 *GET_PORTS Function Parameters*

Parameter	Description
service_handle	The service instance whose ports are returned

Return Values

Table 204–14 *GET_PORTS Function Return Values*

Parameter	Description
QNAME_LIST	Returns a list of the qualified names of all ports in a service

GET_PROPERTY Function

This procedure returns the value of a particular property on a Call.

Syntax

```
UTL_DBWS.GET_PROPERTY(  
    call_handle    CALL,  
    key            VARCHAR2)  
RETURN value VARCHAR2;
```

Parameters

Table 204–15 *GET_PROPERTY Function Parameters*

Parameter	Description
call_handle	The the instance of the Call.
key	The key for the property (see Using UTL_DBWS on page 204-2)

Return Values

Table 204–16 *GET_PROPERTY Function Return Values*

Parameter	Description
value	Returns the value of a particular property on a Call.

GET_RETURN_TYPE Function

This procedure lists the XML type that is returned by the given Call.

Syntax

```
UTL_DBWS.GET_RETURN_TYPE (  
    call_handle    CALL)  
RETURN QNAME;
```

Parameters

Table 204–17 GET_RETURN_TYPE Function Parameters

Parameter	Description
call_handle	The Service instance whose return type is returned.

Return Values

Table 204–18 GET_RETURN_TYPE Function Return Values

Parameter	Description
QNAME	The type that is returned.

GET_SERVICES Function

This function lists the qualified names of the services defined in a WSDL document.

Syntax

```
UTL_DBWS.GET_SERVICES(  
    wsdl_document_location URITYPE)  
RETURN QNAME_LIST;
```

Parameters

Table 204–19 *GET_SERVICES Function Parameters*

Parameter	Description
wsdl_document_location	The Service instance whose return type is returned.

Return Values

Table 204–20 *GET_SERVICES Function Return Values*

Parameter	Description
QNAME_LIST	A list of the qualified names of the services defined in the WSDL document.

INVOKE Function

This procedure invokes a specific operation using a synchronous request-response interaction mode.

Syntax

```
UTL_DBWS.INVOKE(  
    call_handle    CALL,  
    input_params   ANYDATA_LIST)  
RETURN ANYDATA;
```

Parameters

Table 204–21 INVOKE Function Parameters

Parameter	Description
call_handle	The Service instance whose return type is returned.
input_params	The input parameters for this invocation.

Return Values

Table 204–22 INVOKE Function Return Values

Parameter	Description
ANYDATA	Returns the return value or NULL.

RELEASE_ALL_SERVICES Procedure

This procedure releases all Service instances.

Syntax

```
UTL_DBWS.RELEASE_ALL_SERVICES;
```

RELEASE_CALL Procedure

This procedure releases a particular Call instance.

Syntax

```
UTL_DBWS.RELEASE_CALL(  
    call_handle    CALL);
```

Parameters

Table 204–23 *RELEASE_CALL Procedure Parameters*

Parameter	Description
call_handle	The call instance that is to be released.

RELEASE_SERVICE Procedure

This procedure releases a particular Service instance.

Syntax

```
UTL_DBWS.RELEASE_SERVICE (  
    service_handle    SERVICE);
```

Parameters

Table 204–24 *RELEASE_SERVICE Procedure Parameters*

Parameter	Description
service_handle	The call instance that is to be released.

Usage Notes

This will implicitly release all Call instances that have been created for this Service instance.

REMOVE_PROPERTY Procedure

This procedure clears the value of a particular property on a Call.

Syntax

```
UTL_DBWS.REMOVE_PROPERTY (  
    call_handle    CALL,  
    key            VARCHAR2);
```

Parameters

Table 204–25 REMOVE_PROPERTY Procedure Parameters

Parameter	Description
call_handle	The call instance.
key	The key for the property (see Using UTL_DBWS on page 204-2).

SET_PROPERTY Procedure

This procedure sets the value of a particular property on a Call.

Syntax

```
UTL_DBWS.SET_PROPERTY(  
    call_handle    CALL,  
    key            VARCHAR2,  
    value          VARCHAR2);
```

Parameters

Table 204–26 SET_PROPERTY Function Parameters

Parameter	Description
call_handle	The instance of the Call.
key	The key for the property (see Using UTL_DBWS on page 204-2).
value	The value for the property.

The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- [Summary of UTL_ENCODE Subprograms](#)

Summary of UTL_ENCODE Subprograms

Table 205–1 UTL_ENCODE Package Subprograms

Subprogram	Description
BASE64_DECODE Function on page 205-3	Reads the base 64-encoded RAW input string and decodes it to its original RAW value
BASE64_ENCODE Function on page 205-4	Encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string
MIMEHEADER_DECODE Function on page 205-5	Decodes a string from mime header format
MIMEHEADER_ENCODE Function on page 205-6	Encodes a string into mime header format
QUOTED_PRINTABLE_DECODE Function on page 205-7	Reads the <code>varchar2</code> quoted printable format input string and decodes it to the corresponding RAW string
QUOTED_PRINTABLE_ENCODE Function on page 205-8	Reads the RAW input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function on page 205-9	Decodes a character set sensitive text string
TEXT_ENCODE Function on page 205-10	Encodes a character set sensitive text string
UUDECODE Function on page 205-11	Reads the RAW uuencode format input string and decodes it to the corresponding RAW string
UUENCODE Function on page 205-12	Reads the RAW input string and encodes it to the corresponding uuencode format string

BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES (base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 205–2 BASE64_DECODE Function Parameters

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 205–3 BASE64_DECODE Function Return Values

Return	Description
RAW	Contains the decoded string

BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES (base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 205-4 *BASE64_ENCODE Function Parameters*

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 205-5 *BASE64_ENCODE Function Return Values*

Return	Description
RAW	Contains the encoded base 64 elements

MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
  buf    IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 205–6 *MIMEHEADER_DECODE Function Parameters*

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 205–7 *MIMEHEADER_DECODE Function Return Values*

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?');
```

MIMEHEADER_ENCODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=-
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The `<encoding>` value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The `ENCODING` input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 205–8 *MIMEHEADER_ENCODE Function Parameters*

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> .

Return Values

Table 205–9 *MIMEHEADER_ENCODE Function Return Values*

Return	Description
<code>string</code>	A <code>VARCHAR2</code> encoded string with mime header format tags.

QUOTED_PRINTABLE_DECODE Function

This function reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 205–10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
<code>r</code>	The <code>RAW</code> string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 205–11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
<code>RAW</code>	The decoded string

QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (  
    r IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 205–12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 205–13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

TEXT_DECODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If `NULL`, quoted-printable is selected as a default decoding format. If `encode_charset` is not `NULL`, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
  buf          IN VARCHAR2 CHARACTER SET ANY_CS,
  encode_charset IN VARCHAR2 DEFAULT NULL,
  encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 205–14 TEXT_DECODE Function Parameters

Parameter	Description
<code>buf</code>	The encoded text data.
<code>encode_charset</code>	The source character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code> .

Return Values

Table 205–15 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
<code>string</code>	A <code>VARCHAR2</code> decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
  'Here is some text',
  WE8ISO8859P1,
  UTL_ENCODE.BASE64);
```

TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not NULL. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if `ENCODING` is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
    buf          IN VARCHAR2 CHARACTER SET ANY_CS,
    encode_charset IN VARCHAR2 DEFAULT NULL,
    encoding     IN PLS_INTEGER DEFAULT NULL)
RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 205–16 TEXT_ENCODE Function Parameters

Parameter	Description
<code>buf</code>	The text data.
<code>encode_charset</code>	The target character set.
<code>encoding</code>	The encoding format. Valid values are <code>UTL_ENCODE.BASE64</code> , <code>UTL_ENCODE.QUOTED_PRINTABLE</code> and <code>NULL</code>

Return Values

Table 205–17 TEXT_ENCODE Function Return Values

Return	Description
<code>string</code>	A VARCHAR2 encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
    'Here is some text',
    'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "[UUENCODE Function](#)" on page 205-12 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
    r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 205–18 UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 205–19 UUDECODE Function Return Values

Return	Description
RAW	The decoded RAW string

UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUENCODE (
  r          IN RAW,
  type       IN PLS_INTEGER DEFAULT 1,
  filename   IN VARCHAR2 DEFAULT NULL,
  permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 205–20 UUENCODE Function Parameters

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

Return Values

Table 205–21 UUENCODE Function Return Values

Return	Description
RAW	Contains the uuencode format string

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- [Using UTL_FILE](#)
 - Security Model
 - Types
 - Rules and Limits
 - Exceptions
 - Examples
- [Summary of UTL_FILE Subprograms](#)

Using UTL_FILE

- [Security Model](#)
- [Types](#)
- [Operational Notes](#)
- [Rules and Limits](#)
- [Exceptions](#)
- [Examples](#)

Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in [AWAITING XLINK TARGET].

Assuming the user has both READ and WRITE access to the directory object `user_dir`, the user can open a file located in an accessible directory, but not in subdirectories or parent directories. If a file is a link, the user may be able to open that file as well.

Lastly, the client (text I/O) and server implementations are subject to server-side file system permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

Note: Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged users who need to read these files outside of PL/SQL may need access from a system administrator.

Caution:

- **The privileges needed to access files in a directory object are operating system specific. UTL_FILE directory object privileges give you read and write access to all files within the specified directory.**
 - **Attempting to apply invalid options will give rise to unpredictable results.**
-
-

Types

The contents of `FILE_TYPE` are private to the `UTL_FILE` package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (  
    id          BINARY_INTEGER,  
    datatype BINARY_INTEGER);
```

Operational Notes

The file location and file name parameters are supplied to the `FOPEN` function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the `ALL_DIRECTORIES` view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an `ALL_DIRECTORIES` object.

`UTL_FILE` implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a `GET_LINE` call. For example, the `len` parameter of `UTL_FILE.GET_LINE` specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The `GET_LINE len` parameter, or
- The number of bytes until the next line terminator character, or
- The `max_linesize` parameter specified by `UTL_FILE.FOPEN`

The `FOPEN max_linesize` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The `GET_LINE len` parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of `max_linesize`. If `max_linesize` and `len` are defined to be different values, then the lesser value takes precedence.

`UTL_FILE.GET_RAW` ignores line terminators and returns the actual number of bytes requested by the `GET_RAW len` parameter.

When data encoded in one character set is read and Globalization Support is told (such as by means of `NLS_LANG`) that it is encoded in another character set, the result is indeterminate. If `NLS_LANG` is set, it should be the same as the database character set.

Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note: The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

Exceptions

Table 206–1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Operating system error occurred during the read operation.
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_MAXLINESIZE	The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: <ul style="list-style-type: none"> ■ ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or ■ ABSOLUTE_OFFSET < 0, or ■ Either offset caused a seek past the end of the file
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

Examples

Example 1

Note: The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;
```

```
SQL> CREATE DIRECTORY user_dir AS '/appl/gl/user';
SQL> GRANT READ ON DIRECTORY user_dir TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY user_dir TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN('user_dir', 'u12345.tmp', 'R', 256);
  UTL_FILE.GET_LINE(F1, V1, 32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
  -- seen.
  F1 := UTL_FILE.FOPEN(' user_dir', 'u12345.tmp', 'R');
```

```
UTL_FILE.GET_LINE(F1,V1,32767);
UTL_FILE.FCLOSE(F1);

-- In this example, GET_LINE doesn't specify a number of bytes, so it defaults
to
-- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
defaults to 1024.
-- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
F1 := UTL_FILE.FOPEN('user_dir','u12345.tmp','R');
UTL_FILE.GET_LINE(F1,V1);
UTL_FILE.FCLOSE(F1);
END;
```

Summary of UTL_FILE Subprograms

Table 206–2 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure on page 206-12	Closes a file
FCLOSE_ALL Procedure on page 206-13	Closes all open file handles
FCOPY Procedure on page 206-14	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure on page 206-15	Physically writes all pending output to a file
FGETATTR Procedure on page 206-16	Reads and returns the attributes of a disk file
FGETPOS Function on page 206-17	Returns the current relative offset position within a file, in bytes
FOPEN Function on page 206-18	Opens a file for input or output
FOPEN_NCHAR Function on page 206-20	Opens a file in Unicode for input or output
FREMOVE Procedure on page 206-21	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure on page 206-22	Renames an existing file to a new name, similar to the UNIX mv function
FSEEK Procedure on page 206-23	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure on page 206-24	Reads text from an open file
GET_LINE_NCHAR Procedure on page 206-25	Reads text in Unicode from an open file
GET_RAW Function on page 206-26	Reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function on page 206-27	Determines if a file handle refers to an open file
NEW_LINE Procedure on page 206-28	Writes one or more operating system-specific line terminators to a file
PUT Procedure on page 206-29	Writes a string to a file
PUT_LINE Procedure on page 206-30	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure on page 206-31	Writes a Unicode line to a file
PUT_NCHAR Procedure on page 206-32	Writes a Unicode string to a file
PUTF Procedure on page 206-33	A PUT procedure with formatting

Table 206–2 (Cont.) UTL_FILE Subprograms

Subprogram	Description
PUTF_NCHAR Procedure on page 206-35	A <code>PUT_NCHAR</code> procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Function on page 206-36	Accepts as input a <code>RAW</code> data value and writes the value to the output buffer

FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (  
    file IN OUT FILE_TYPE);
```

Parameters

Table 206–3 FCLOSE Procedure Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call.

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

```
WRITE_ERROR  
INVALID_FILEHANDLE
```

FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

Note: FCLOSE_ALL does not alter the state of the open file handles held by the user. This means that an IS_OPEN test on a file handle after an FCLOSE_ALL call still returns TRUE, even though the file has been closed. No further read or write operations can be performed on a file that was open before an FCLOSE_ALL.

Exceptions

```
WRITE_ERROR
```

FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
  src_location   IN VARCHAR2,
  src_filename   IN VARCHAR2,
  dest_location  IN VARCHAR2,
  dest_filename  IN VARCHAR2,
  start_line     IN BINARY_INTEGER DEFAULT 1,
  end_line       IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 206–4 *FCOPY Procedure Parameters*

Parameters	Description
<code>src_location</code>	Directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive)
<code>src_filename</code>	Source file to be copied
<code>dest_location</code>	Destination directory where the destination file is created.
<code>dest_filename</code>	Destination file created from the source file.
<code>start_line</code>	Line number at which to begin copying. The default is 1 for the first line.
<code>end_line</code>	Line number at which to stop copying. The default is <code>NULL</code> , signifying end of file.

FFLUSH Procedure

FFLUSH physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The FFLUSH procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
    file IN FILE_TYPE);
invalid_maxlinesize EXCEPTION;
```

Parameters

Table 206–5 FFLUSH Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(  
    location    IN VARCHAR2,  
    filename    IN VARCHAR2,  
    fexists     OUT BOOLEAN,  
    file_length OUT NUMBER,  
    blocksize   OUT BINARY_INTEGER);
```

Parameters

Table 206–6 *FGETATTR Procedure Parameters*

Parameters	Description
location	Directory location of the source file, a DIRECTORY_NAME from the ALL_DIRECTORIES view (case sensitive).
filename	The name of the file to be examined.
fexists	A BOOLEAN for whether or not the file exists.
file_length	The length of the file in bytes. NULL if file does not exist.
blocksize	The file system block size in bytes. NULL if the file does not exist.

FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (  
    fileid IN file_type)  
RETURN PLS_INTEGER;
```

Parameters

Table 206–7 FGETPOS Parameters

Parameters	Description
fileid	The directory location of the source file

Return Values

FGETPOS returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns 0 for the beginning of the file.

Usage Notes

If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also [FOPEN_NCHAR Function](#) on page 206-20.

Syntax

```
UTL_FILE.FOPEN (
  location      IN VARCHAR2,
  filename      IN VARCHAR2,
  open_mode     IN VARCHAR2,
  max_linesize IN BINARY_INTEGER)
RETURN file_type;
```

Parameters

Table 206–8 FOPEN Function Parameters

Parameter	Description
location	Directory location of file. This string is a directory object name and is case sensitive. The default is uppercase. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: r -- read text w -- write text a -- append text rb -- read byte mode wb -- write byte mode ab -- append byte mode If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 206–9 FOPEN Function Return Values

Return	Description
file_type	Handle to open file.

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

Exceptions

INVALID_PATH: File location or name was invalid.

INVALID_MODE: The open_mode string was invalid.

INVALID_OPERATION: File could not be opened as requested.

INVALID_MAXLINESIZE: Specified max_linesize is too large or too small.

FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database character set.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL_FILE converts between UTF8 and AL16UTF16 as necessary.

See also [FOPEN Function](#) on page 206-18.

Syntax

```
UTL_FILE.FOPEN_NCHAR (
    location      IN VARCHAR2,
    filename      IN VARCHAR2,
    open_mode     IN VARCHAR2,
    max_linesize  IN BINARY_INTEGER)
RETURN file_type;
```

Parameters

Table 206–10 FOPEN_NCHAR Function Parameters

Parameter	Description
location	Directory location of file.
filename	File name (including extension).
open_mode	Open mode (r,w,a,rb,wb,ab).
max_linesize	Maximum number of characters for each line, including the newline character, for this file. (minimum value 1, maximum value 32767).

FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (  
    location IN VARCHAR2,  
    filename IN VARCHAR2);
```

Parameters

Table 206–11 *FREMOVE Procedure Parameters*

Parameters	Description
location	The directory location of the file, a DIRECTORY_NAME from ALL_DIRECTORIES (case sensitive)
filename	The name of the file to be deleted

Usage Notes

The FREMOVE procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

Syntax

```
UTL_FILE.FRENAME (  
    location IN VARCHAR2,  
    filename IN VARCHAR2,  
    dest_dir IN VARCHAR2,  
    dest_file IN VARCHAR2,  
    overwrite IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 206–12 *FRENAME Procedure Parameters*

Parameters	Description
<code>location</code>	The directory location of the source file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive).
<code>filename</code>	The source file to be renamed.
<code>dest_dir</code>	The destination directory of the destination file, a <code>DIRECTORY_NAME</code> from the <code>ALL_DIRECTORIES</code> view (case sensitive).
<code>dest_file</code>	The new name of the file.
<code>overwrite</code>	The default is <code>FALSE</code> .

Usage Notes

Permission on both the source and destination directories must be granted. You can use the `overwrite` parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is `FALSE` for no overwrite.

FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
    fid           IN utl_file.file_type,
    absolute_offset IN PL_INTEGER DEFAULT NULL,
    relative_offset IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 206–13 FSEEK Procedure Parameters

Parameters	Description
fid	The file ID.
absolute_offset	The absolute location to which to seek; default = NULL
relative_offset	The number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = NULL

Usage Notes

- Using FSEEK, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset > 0`, or backward, if `relative_offset < 0`, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the file, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
    file          IN  FILE_TYPE,
    buffer        OUT VARCHAR2,
    len           IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 206–14 GET_LINE Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call. The file must be open for reading (mode <code>r</code>); otherwise an <code>INVALID_OPERATION</code> exception is raised.
<code>buffer</code>	Data buffer to receive the line read from the file.
<code>len</code>	The number of bytes read from the file. Default is <code>NULL</code> . If <code>NULL</code> , Oracle supplies the value of <code>max_linesize</code> .

Usage Notes

If the line does not fit in the buffer, a `VALUE_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.

If unspecified, Oracle supplies a default value of 1024. See also "[GET_LINE_NCHAR Procedure](#)" on page 206-25.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
READ_ERROR
NO_DATA_FOUND
VALUE_ERROR
```

GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype, such as NCHAR, NCLOB, or VARCHAR2 is specified, PL/SQL will perform standard implicit conversion from NVARCHAR2 after the text is read.

See also [GET_LINE Procedure](#) on page 206-24

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
    file          IN  FILE_TYPE,
    buffer        OUT NVARCHAR2,
    len           IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 206–15 *GET_LINE_NCHAR Procedure Parameters*

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file.
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

GET_RAW Function

This function reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. `UTL_FILE.GET_RAW` ignores line terminators and returns the actual number of bytes requested by the `GET_RAW len` parameter.

Syntax

```
UTL_FILE.GET_RAW (
    fid IN utl_file.file_type,
    r   OUT NOCOPY RAW,
    len IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 206–16 GET_RAW Procedure Parameters

Parameters	Description
fid	The file ID.
r	The RAW data.
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

Usage Notes

The subprogram will raise `No_Data_Found` when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
    h   UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
    Buf RAW(32767);
    Amnt CONSTANT PLS_INTEGER := 32767;
BEGIN
    LOOP
        BEGIN
            Utl_File.Get_Raw(h, Buf, Amnt);
            -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
    END LOOP;
    UTL_FILE.FCLOSE (h);
END;
```

IS_OPEN Function

This function tests a file handle to see if it identifies an open file. `IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (  
    file IN FILE_TYPE)  
RETURN BOOLEAN;
```

Parameters

Table 206–17 *IS_OPEN Function Parameters*

Parameter	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call.

Return Values

TRUE or FALSE

NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from `PUT` because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (  
    file      IN FILE_TYPE,  
    lines     IN NATURAL := 1);
```

Parameters

Table 206–18 *NEW_LINE Procedure Parameters*

Parameters	Description
file	Active file handle returned by an <code>FOPEN</code> or <code>FOPEN_NCHAR</code> call.
lines	Number of line terminators to be written to the file.

Exceptions

```
INVALID_FILEHANDLE  
INVALID_OPERATION  
WRITE_ERROR
```

PUT Procedure

PUT writes the text string stored in the `buffer` parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use `NEW_LINE` to terminate the line or use `PUT_LINE` to write a complete line with a line terminator. See also "[PUT_NCHAR Procedure](#)" on page 206-32.

Syntax

```
UTL_FILE.PUT (
    file      IN FILE_TYPE,
    buffer    IN VARCHAR2);
```

Parameters

Table 206–19 PUT Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.
<code>buffer</code>	Buffer that contains the text to be written to the file. You must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. `PUT_LINE` terminates the line with the platform-specific line terminator character or characters.

See also "[PUT_LINE_NCHAR Procedure](#)" on page 206-31.

Syntax

```
UTL_FILE.PUT_LINE (  
    file      IN FILE_TYPE,  
    buffer    IN VARCHAR2,  
    autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 206–20 *PUT_LINE Procedure Parameters*

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN</code> call.
<code>buffer</code>	Text buffer that contains the lines to be written to the file.
<code>autoflush</code>	Flushes the buffer to disk after the <code>WRITE</code> .

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

Exceptions

```
INVALID_FILEHANDLE  
INVALID_OPERATION  
WRITE_ERROR
```

PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set. This procedure is equivalent to the [PUT_NCHAR Procedure](#), except that the line separator is appended to the written text. See also "[PUT_LINE Procedure](#)" on page 206-30.

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
    file      IN FILE_TYPE,
    buffer    IN NVARCHAR2);
```

Parameters

Table 206–21 *PUT_LINE_NCHAR Procedure Parameters*

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for writing.
<code>buffer</code>	Text buffer that contains the lines to be written to the file.

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

PUT_NCHAR Procedure

This procedure writes the text string stored in the `buffer` parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is `NVARCHAR2`. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before writing the text.

See also [PUT Procedure](#) on page 206-29

Syntax

```
UTL_FILE.PUT_NCHAR (
    file      IN FILE_TYPE,
    buffer    IN NVARCHAR2);
```

Parameters

Table 206–22 PUT_NCHAR Procedure Parameters

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>buffer</code>	Buffer that contains the text to be written to the file. You must have opened the file using mode <code>w</code> or mode <code>a</code> ; otherwise, an <code>INVALID_OPERATION</code> exception is raised.

Usage Notes

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

PUTF Procedure

This procedure is a formatted PUT procedure. It works like a limited `printf()`. See also "[PUTF_NCHAR Procedure](#)" on page 206-35.

Syntax

```
UTL_FILE.PUTF (
  file      IN FILE_TYPE,
  format    IN VARCHAR2,
  [arg1     IN VARCHAR2  DEFAULT NULL,
  . . .
  arg5      IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 206–23 *PUTF Procedure Parameters*

Parameters	Description
file	Active file handle returned by an FOPEN call.
format	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code> .
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

Character Sequence	Meaning
<code>%s</code>	Substitute this sequence with the string value of the next argument in the argument list.
<code>\n</code>	Substitute with the appropriate platform-specific line terminator.

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.

my_world varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
      my_world,
      'greetings for all earthlings');
```

If there are more %s formatters in the format parameter than there are arguments, then an empty string is substituted for each %s for which there is no matching argument.

Exceptions

INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR

PUTF_NCHAR Procedure

This procedure is a formatted version of a [PUT_NCHAR Procedure](#). Using `PUTF_NCHAR`, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements `\n` and `%s`, and up to five arguments to be substituted for consecutive instances of `%s` in the format string. The expected datatype of the format string and the arguments is `NVARCHAR2`.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to `NVARCHAR2` before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
    file      IN FILE_TYPE,
    format    IN NVARCHAR2,
    [arg1     IN NVARCHAR2 DEFAULT NULL,
    . . .
    arg5      IN NVARCHAR2 DEFAULT NULL]);
```

Parameters

Table 206–24 *PUTF_NCHAR Procedure Parameters*

Parameters	Description
<code>file</code>	Active file handle returned by an <code>FOPEN_NCHAR</code> call. The file must be open for reading (mode <code>r</code>). If the file is opened by <code>FOPEN</code> instead of <code>FOPEN_NCHAR</code> , a <code>CHARSETMISMATCH</code> exception is raised.
<code>format</code>	Format string that can contain text as well as the formatting characters <code>\n</code> and <code>%s</code> .
<code>arg1 . . . arg5</code>	From one to five operational argument strings. Argument strings are substituted, in order, for the <code>%s</code> formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each <code>%s</code> for which there is no argument.

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

PUT_RAW Function

This function accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (  
    fid          IN utl_file.file_type,  
    r            IN RAW,  
    autoflush   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 206–25 PUT_RAW Procedure Parameters

Parameters	Description
fid	The file ID.
r	The RAW data written to the buffer.
autoflush	If TRUE, performs a flush after writing the value to the output buffer; default is FALSE.

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.

The UTL_HTTP package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager to set up an Oracle wallet. Non-HTTPS fetches do not require an Oracle wallet.

Using UTL_HTTP

This section contains topics which relate to using the UTL_HTTP package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Exceptions](#)
- [Examples](#)

Overview

With the `UTL_HTTP` package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And `UTL_HTTP` contains a function that can be used in SQL queries.

The package also supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS, directly or through an HTTP proxy.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see [Managing Fine-grained Access to External Network Services in Oracle Database Security Guide](#)

Constants

The UTL_HTTP package uses the constants shown in following tables.

- [UTL_HTTP Constants - HTTP Versions](#)
- [UTL_HTTP Constants - Default Ports](#)
- [UTL_HTTP Constants - HTTP 1.1 Status Codes](#)

Table 207–1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP /1.0'	Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.
HTTP_VERSION_1	VARCHAR2(10)	'HTTP /1.1'	Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.

Table 207–2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 207–3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, via the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.

Table 207-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NON_AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND_CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_REQUIRED	PLS_INTEGER	402	This code is reserved for future use.

Table 207-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIMEOUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined Content-Length.
HTTP_PRECONDITION_FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ENTITY_TOO_LARGE_CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.

Table 207-3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

Datatypes

- [REQ Type](#)
- [RESP Type](#)
- [COOKIE and COOKIE_TABLE Types](#)
- [CONNECTION Type](#)

REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
  url          VARCHAR2(32767),
  method      VARCHAR2(64),
  http_version VARCHAR2(64));
```

Parameters

Table 207–4 REQ Type Parameters

Parameter	Description
url	The URL of the HTTP request. It is set after the request is created by <code>BEGIN_REQUEST</code> .
method	The method to be performed on the resource identified by the URL. It is set after the request is created by <code>BEGIN_REQUEST</code> .
http_version	The HTTP protocol version used to send the request. It is set after the request is created by <code>BEGIN_REQUEST</code> .

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (
  status_code  PLS_INTEGER,
  reason_phrase VARCHAR2(256),
  http_version VARCHAR2(64));
```

Parameters

Table 207–5 *RESP Type Parameters*

Parameter	Description
status_code	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
reason_phrase	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by GET_RESPONSE.
http_version	The HTTP protocol version used in the HTTP response. It is set after the response is processed by GET_RESPONSE.

Usage Notes

The information returned in RESP from the interface GET_RESPONSE is read-only. There are other fields in the RESP record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the UTL_HTTP package. You should not modify the fields.

COOKIE and COOKIE_TABLE Types

The COOKIE type is the PL/SQL record type that represents an HTTP cookie. The COOKIE_TABLE type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
    name VARCHAR2(256),
    value VARCHAR2(1024),
    domain VARCHAR2(256),
    expire TIMESTAMP WITH TIME ZONE,
    path VARCHAR2(1024),
    secure BOOLEAN,
    version PLS_INTEGER,
    comment VARCHAR2(1024));
```

```
TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

Table 207–6 shows the fields for the COOKIE and COOKIE_TABLE record types.

Table 207–6 *Fields of COOKIE and COOKIE_TABLE Type*

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies

Table 207-6 (Cont.) Fields of COOKIE and COOKIE_TABLE Type

Field	Description
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See ["Retrieving and Restoring Cookies"](#) on page 207-21.

CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy_host and proxy_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy_host and proxy_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The SSL field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (
    host VARCHAR2(256),
    port PLS_INTEGER,
    proxy_host VARCHAR2(256),
    proxy_port PLS_INTEGER,
```

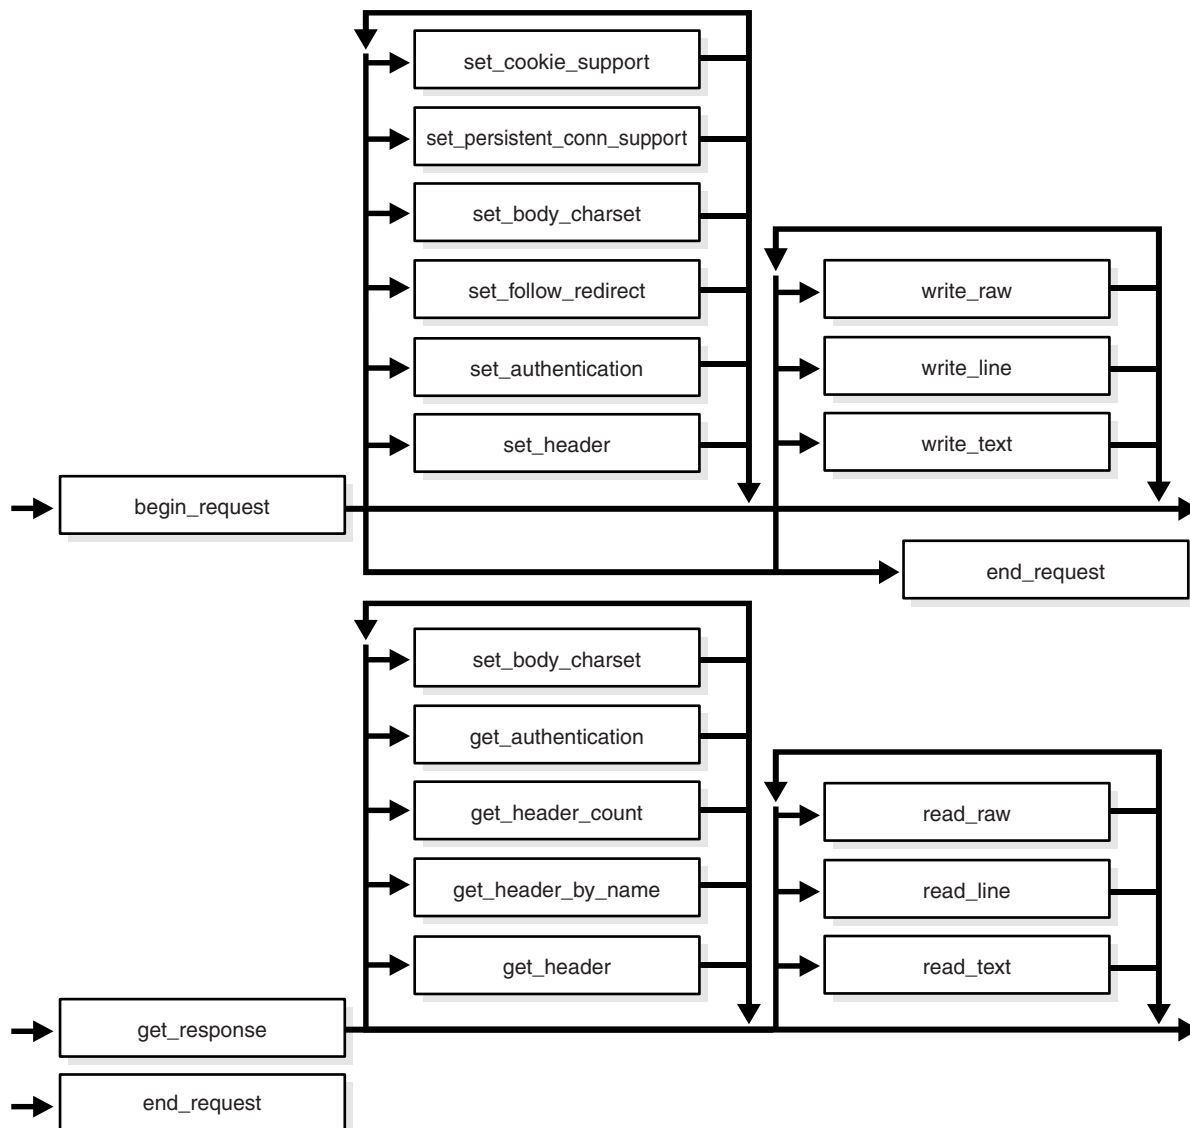

```
ssl BOOLEAN);  
  
TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

Operational Notes

- [Operational Flow](#)
- [Simple HTTP Fetches](#)
- [HTTP Requests](#)
- [HTTP Responses](#)
- [Session Settings](#)
- [Session Settings](#)

Operational Flow

The UTL_HTTP package provides access to the HTTP protocol. The interfaces must be called in the order shown in [Figure 207-1](#), or an exception will be raised.

Figure 207-1 Flow of the Core UTL_HTTP Package

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
 - GET_COOKIE_COUNT
 - GET_COOKIES
 - ADD_COOKIES
 - CLEAR_COOKIES
- Persistent connections
 - GET_PERSISTENT_CONN_COUNT
 - GET_PERSISTENT_CONNS
 - CLOSE_PERSISTENT_CONN
 - CLOSE_PERSISTENT_CONNS

- Interfaces that manipulate attributes and configurations of the UTL_HTTP package in the current session
 - SET_PROXY
 - GET_PROXY
 - SET_COOKIE_SUPPORT
 - GET_COOKIE_SUPPORT
 - SET_FOLLOW_REDIRECT
 - GET_FOLLOW_REDIRECT
 - SET_BODY_CHARSET
 - GET_BODY_CHARSET
 - SET_PERSISTENT_CONN_SUPPORT
 - GET_PERSISTENT_CONN_SUPPORT
 - SET_DETAILED_EXCP_SUPPORT
 - GET_DETAILED_EXCP_SUPPORT
 - SET_WALLET
 - SET_TRANSFER_TIMEOUT
 - GET_TRANSFER_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
 - GET_DETAILED_SQLCODE
 - GET_DETAILED_SQLERRM

NOTE: Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

Simple HTTP Fetches

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST_PIECES call using the optional proxy parameter.

Note: UTL_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable `http_proxy` to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable `no_proxy` to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

See Also: [Simple HTTP Fetches in a Single Call Subprograms](#) on page 207-24

Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also: [Session Settings Subprograms](#) on page 207-25

HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: [HTTP Requests Subprograms](#) on page 207-26

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: [HTTP Responses Subprograms](#) on page 207-27

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: [HTTP Cookies Subprograms](#) on page 207-28

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

See Also: [HTTP Persistent Connections Subprograms](#) on page 207-29

Error Conditions

The UTL_HTTP package provides subprograms to retrieve error information.

See Also: [Error Conditions Subprograms](#) on page 207-30

Exceptions

Table 207-7 lists the exceptions that the `UTL_HTTP` package interface can raise. By default, `UTL_HTTP` raises the exception `request_failed` when a request fails to execute. If the package is set to raise a detailed exception by `set_detailed_excp_support`, the rest of the exceptions will be raised directly (except for the exception `end_of_body`, which will be raised by `READ_TEXT`, `READ_LINE`, and `READ_RAW` regardless of the setting).

Table 207-7 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
<code>REQUEST_FAILED</code>	29273	The request fails to executes	Any HTTP request or response interface when <code>detailed_exception</code> is disabled
<code>BAD_ARGUMENT</code>	29261	The argument passed to the interface is bad	Any HTTP request or response interface when <code>detailed_exception</code> is enabled
<code>BAD_URL</code>	29262	The requested URL is badly formed	<code>BEGIN_REQUEST</code> , when <code>detailed_exception</code> is enabled
<code>PROTOCOL_ERROR</code>	29263	An HTTP protocol error occurs when communicating with the Web server	<code>SET_HEADER</code> , <code>GET_RESPONSE</code> , <code>READ_RAW</code> , <code>READ_TEXT</code> , and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled
<code>UNKNOWN_SCHEME</code>	29264	The scheme of the requested URL is unknown	<code>BEGIN_REQUEST</code> and <code>GET_RESPONSE</code> , when <code>detailed_exception</code> is enabled
<code>HEADER_NOT_FOUND</code>	29265	The header is not found	<code>GET_HEADER</code> , <code>GET_HEADER_BY_NAME</code> , when <code>detailed_exception</code> is enabled
<code>END_OF_BODY</code>	29266	The end of HTTP response body is reached	<code>READ_RAW</code> , <code>READ_TEXT</code> , and <code>READ_LINE</code> , when <code>detailed_exception</code> is enabled
<code>ILLEGAL_CALL</code>	29267	The call to <code>UTL_HTTP</code> is illegal at the current state of the HTTP request	<code>SET_HEADER</code> , <code>SET_AUTHENTICATION</code> , and <code>SET_PERSISTENT_CONN_SUPPORT</code> , when <code>detailed_exception</code> is enabled
<code>HTTP_CLIENT_ERROR</code>	29268	From <code>GET_RESPONSE</code> , the response status code indicates that a client error has occurred (status code in 4xx range). Or from <code>begin_request</code> , the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	<code>GET_RESPONSE</code> , <code>BEGIN_REQUEST</code> when <code>detailed_exception</code> is enabled
<code>HTTP_SERVER_ERROR</code>	29269	From <code>GET_RESPONSE</code> , the response status code indicates that a client error has occurred (status code in 5xx range). Or from <code>begin_request</code> , the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	<code>GET_RESPONSE</code> , <code>BEGIN_REQUEST</code> when <code>detailed_exception</code> is enabled

Table 207-7 (Cont.) UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_exception is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled

NOTE: The `partial_multibyte_char` and `transfer_timeout` exceptions are duplicates of the same exceptions defined in `UTL_TCP`. They are defined in this package so that the use of this package does not require the knowledge of the `UTL_TCP`. As those exceptions are duplicates, an exception handle that catches the `partial_multibyte_char` and `transfer_timeout` exceptions in this package also catch the exceptions in the `UTL_TCP`.

For `REQUEST` and `REQUEST_PIECES`, the `request_failed` exception is raised when any exception occurs and `detailed_exception` is disabled.

Examples

The following examples demonstrate how to use UTL_HTTP.

- [General Usage](#)
- [Handling HTTP Authentication](#)
- [Retrieving and Restoring Cookies](#)

General Usage

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req  UTL_HTTP.REQ;
    resp UTL_HTTP.RESP;
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    LOOP
        UTL_HTTP.READ_LINE(resp, value, TRUE);
        DBMS_OUTPUT.PUT_LINE(value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
    WHEN UTL_HTTP.END_OF_BODY THEN
        UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving HTTP Response Headers

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
    req  UTL_HTTP.REQ;
    resp UTL_HTTP.RESP;
    name VARCHAR2(256);
    value VARCHAR2(1024);
BEGIN
    UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
    req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
    UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
    resp := UTL_HTTP.GET_RESPONSE(req);
    DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
    DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

Handling HTTP Authentication

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url          IN VARCHAR2,
```

```

                                username IN VARCHAR2 DEFAULT NULL,
                                password IN VARCHAR2 DEFAULT NULL,
                                realm    IN VARCHAR2 DEFAULT NULL) AS

    req      UTL_HTTP.REQ;
    resp     UTL_HTTP.RESP;
    my_scheme VARCHAR2(256);
    my_realm  VARCHAR2(256);
    my_proxy  BOOLEAN;
BEGIN
    -- Turn off checking of status code. We will check it by ourselves.
    UTL_HTTP.HTTP_RESPONSE_ERROR_CHECK(FALSE);
    req := UTL_HTTP.BEGIN_REQUEST(url);
    IF (username IS NOT NULL) THEN
        UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
    END IF;
    resp := UTL_HTTP.GET_RESPONSE(req);
    IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
        UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, my_proxy);
        IF (my_proxy) THEN
            DBMS_OUTPUT.PUT_LINE('Web proxy server is protected. ');
            DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the proxy
server. ');
        ELSE
            DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected. ');
            DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the Web page. ');
        END IF;
        UTL_HTTP.END_RESPONSE(resp);
        RETURN;
    END IF;
    FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
        UTL_HTTP.GET_HEADER(resp, i, name, value);
        DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
    END LOOP;
    UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving and Restoring Cookies

```

CREATE TABLE my_cookies (
    session_id  INTEGER,
    name        VARCHAR2(256),
    value       VARCHAR2(1024),
    domain      VARCHAR2(256),
    expire      DATE,
    path        VARCHAR2(1024),
    secure      VARCHAR2(1),
    version     INTEGER);

CREATE SEQUENCE session_id;
SET SERVEROUTPUT ON SIZE 40000

  END LOOP;
  UTL_HTTP.CLEAR_COOKIES;
  UTL_HTTP.ADD_COOKIES(cookies);
END;
/
```

Subprogram Groups

UTL_HTTP subprograms are grouped by function:

- [Simple HTTP Fetches in a Single Call Subprograms](#)
- [Session Settings Subprograms](#)
- [HTTP Requests Subprograms](#)
- [HTTP Responses Subprograms](#)
- [HTTP Cookies Subprograms](#)
- [HTTP Persistent Connections Subprograms](#)
- [Error Conditions Subprograms](#)

Simple HTTP Fetches in a Single Call Subprograms

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 207–8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function on page 207-67	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function on page 207-69	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

Session Settings Subprograms

Table 207–9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure on page 207-45	Retrieves the default character set of the body of all future HTTP requests
GET_COOKIE_SUPPORT Procedure on page 207-47	Retrieves the current cookie support settings
GET_DETAILED_EXCP_SUPPORT Procedure on page 207-49	Checks if the UTL_HTTP package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure on page 207-52	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure on page 207-57	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure on page 207-59	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure on page 207-61	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure on page 207-62	Retrieves the current network transfer timeout value
SET_TRANSFER_TIMEOUT Procedure on page 207-84	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header
SET_COOKIE_SUPPORT Procedures on page 207-75	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure on page 207-77	Sets the UTL_HTTP package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures on page 207-78	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function
SET_PERSISTENT_CONN_SUPPORT Procedure on page 207-80	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure on page 207-82	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure on page 207-83	Sets whether or not <code>GET_RESPONSE</code> raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure on page 207-84	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure on page 207-85	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

HTTP Requests Subprograms

Table 207–10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function on page 207-36	Begins a new HTTP request. <code>UTL_HTTP</code> establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
END_REQUEST Procedure on page 207-42	Ends the HTTP request
SET_HEADER Procedure on page 207-79	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
SET_AUTHENTICATION Procedure on page 207-72	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_BODY_CHARSET Procedures on page 207-73	Sets the character set of the request body when the media type is text but the character set is not specified in the <code>Content-Type</code> header
SET_COOKIE_SUPPORT Procedures on page 207-75	Enables or disables support for the HTTP cookies in the request
SET_FOLLOW_REDIRECT Procedures on page 207-78	Sets the maximum number of times <code>UTL_HTTP</code> follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function on page 207-60
SET_PERSISTENT_CONN_SUPPORT Procedure on page 207-80	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure on page 207-82	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in <code>UTL_TCP</code>)
WRITE_RAW Procedure on page 207-87	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure on page 207-88	Writes some text data in the HTTP request body

HTTP Responses Subprograms

Table 207–11 *UTL_HTTP Subprograms—HTTP Responses*

Subprogram	Description
END_RESPONSE Procedure on page 207-43	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure on page 207-44	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
GET_HEADER Procedure on page 207-53	Returns the n th HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure on page 207-54	Returns the HTTP response header value returned in the response given the name of the header
GET_HEADER_COUNT Function on page 207-55	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function on page 207-60	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
READ_LINE Procedure on page 207-63	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure on page 207-64	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure on page 207-65	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures on page 207-73	Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header

HTTP Cookies Subprograms

Table 207–12 *UTL_HTTP Subprograms—HTTP Cookies*

Subprogram	Description
ADD_COOKIES Procedure on page 207-35	Adds the cookies maintained by UTL_HTTP
CLEAR_COOKIES Procedure on page 207-38	Clears all cookies maintained by the UTL_HTTP package
GET_COOKIE_COUNT Function on page 207-46	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers
GET_COOKIES Function on page 207-48	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers

HTTP Persistent Connections Subprograms

Table 207-13 *UTL_HTTP Subprograms—HTTP Persistent Connections*

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure on page 207-39	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session
CLOSE_PERSISTENT_CONNS Procedure on page 207-40	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session
GET_PERSISTENT_CONN_COUNT Function on page 207-56	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers
GET_PERSISTENT_CONNS Procedure on page 207-58	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers

Error Conditions Subprograms

Table 207-14 *UTL_HTTP Subprograms—Error Conditions*

Subprogram	Description
GET_DETAILED_SQLCODE Function on page 207-50	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function on page 207-51	Retrieves the detailed SQLERRM of the last exception raised

Summary of UTL_HTTP Subprograms

Table 207–15 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure on page 207-35	Adds the cookies maintained by UTL_HTTP	HTTP Cookies Subprograms on page 207-28
BEGIN_REQUEST Function on page 207-36	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms on page 207-26
CLEAR_COOKIES Procedure on page 207-38	Clears all cookies maintained by the UTL_HTTP package	HTTP Cookies Subprograms on page 207-28
CLOSE_PERSISTENT_CONN Procedure on page 207-39	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 207-29
CLOSE_PERSISTENT_CONNS Procedure on page 207-40	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 207-29
END_REQUEST Procedure on page 207-42	Ends the HTTP request	HTTP Requests Subprograms on page 207-26
END_RESPONSE Procedure on page 207-43	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms on page 207-27
GET_AUTHENTICATION Procedure on page 207-44	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms on page 207-27
GET_BODY_CHARSET Procedure on page 207-45	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms on page 207-25
GET_COOKIE_COUNT Function on page 207-46	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 207-28
GET_COOKIE_SUPPORT Procedure on page 207-47	Retrieves the current cookie support settings	Session Settings Subprograms on page 207-25
GET_COOKIES Function on page 207-48	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 207-28
GET_DETAILED_EXCP_SUPPORT Procedure on page 207-49	Checks if the UTL_HTTP package will raise a detailed exception or not	Session Settings Subprograms on page 207-25
GET_DETAILED_SQLCODE Function on page 207-50	Retrieves the detailed SQLCODE of the last exception raised	Error Conditions Subprograms on page 207-30

Table 207–15 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_DETAILED_SQLERRM Function on page 207-51	Retrieves the detailed <code>SQLERRM</code> of the last exception raised	Error Conditions Subprograms on page 207-30
GET_FOLLOW_REDIRECT Procedure on page 207-52	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms on page 207-25
GET_HEADER Procedure on page 207-53	Returns the n^{th} HTTP response header name and value returned in the response	HTTP Responses Subprograms on page 207-27
GET_HEADER_BY_NAME Procedure on page 207-54	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms on page 207-27
GET_HEADER_COUNT Function on page 207-55	Returns the number of HTTP response headers returned in the response	HTTP Responses on page 207-16 and HTTP Responses Subprograms on page 207-27
GET_PERSISTENT_CONN_COUNT Function on page 207-56	Returns the number of network connections currently kept persistent by the <code>UTL_HTTP</code> package to the Web servers	HTTP Persistent Connections Subprograms on page 207-29
GET_HEADER_COUNT Function on page 207-55	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms on page 207-25
GET_PERSISTENT_CONN_SUPPORT Procedure on page 207-57	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms on page 207-25)	HTTP Persistent Connections Subprograms on page 207-29
GET_PERSISTENT_CONNS Procedure on page 207-58	Returns all the network connections currently kept persistent by the <code>UTL_HTTP</code> package to the Web servers	HTTP Persistent Connections Subprograms on page 207-29
GET_PROXY Procedure on page 207-59	Retrieves the current proxy settings	Session Settings Subprograms on page 207-25
GET_RESPONSE Function on page 207-60	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms on page 207-27
GET_RESPONSE_ERROR_CHECK Procedure on page 207-61	Checks if the response error check is set or no	Session Settings Subprograms on page 207-25
GET_TRANSFER_TIMEOUT Procedure on page 207-62	Retrieves the current network transfer timeout value	Session Settings Subprograms on page 207-25
READ_LINE Procedure on page 207-63	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 207-27

Table 207-15 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
READ_RAW Procedure on page 207-64	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 207-27
READ_TEXT Procedure on page 207-65	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 207-27
REQUEST Function on page 207-67	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms on page 207-24
REQUEST_PIECES Function on page 207-69	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms on page 207-24
SET_AUTHENTICATION Procedure on page 207-72	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms on page 207-26
SET_BODY_CHARSET Procedures on page 207-73	Sets the default character set of the body of all future HTTP requests when the media type is <code>text</code> and the character set is not specified in the <code>Content-Type</code> header	Session Settings Subprograms on page 207-25
SET_BODY_CHARSET Procedures on page 207-73	Sets the character set of the request body when the media type is <code>text</code> but the character set is not specified in the <code>Content-Type</code> header	HTTP Requests Subprograms on page 207-26
SET_BODY_CHARSET Procedures on page 207-73	Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header	HTTP Responses Subprograms and Session Settings Subprograms on page 207-25
SET_COOKIE_SUPPORT Procedures on page 207-75	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms on page 207-26
SET_DETAILED_EXCP_SUPPORT Procedure on page 207-77	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms on page 207-25
SET_DETAILED_EXCP_SUPPORT Procedure on page 207-77	Sets the UTL_HTTP package to raise a detailed exception	Session Settings Subprograms on page 207-25
SET_FOLLOW_REDIRECT Procedures on page 207-78	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the <code>GET_RESPONSE</code> function	HTTP Requests Subprograms on page 207-26
SET_HEADER Procedure on page 207-79	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the <code>GET_RESPONSE</code> function	Session Settings Subprograms on page 207-25

Table 207–15 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_HEADER Procedure on page 207-79	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms on page 207-26
SET_PERSISTENT_CONN_SUPPORT Procedure on page 207-80	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms on page 207-26
SET_PROXY Procedure on page 207-82	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings on page 207-16 and Session Settings Subprograms on page 207-25
SET_RESPONSE_ERROR_CHECK Procedure on page 207-83	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	Session Settings Subprograms on page 207-25
SET_TRANSFER_TIMEOUT Procedure on page 207-84	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	Session Settings on page 207-16 and Session Settings Subprograms on page 207-25
SET_WALLET Procedure on page 207-85	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms on page 207-25
WRITE_LINE Procedure on page 207-86	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	HTTP Requests Subprograms on page 207-26
WRITE_RAW Procedure on page 207-87	Writes some binary data in the HTTP request body	HTTP Requests Subprograms on page 207-26
WRITE_TEXT Procedure on page 207-88	Writes some text data in the HTTP request body	HTTP Requests Subprograms on page 207-26

ADD_COOKIES Procedure

This procedure adds the cookies maintained by UTL_HTTP.

See Also: [HTTP Cookies](#) on page 207-16 and [HTTP Cookies Subprograms](#) on page 207-28

Syntax

```
UTL_HTTP.ADD_COOKIES (  
    cookies IN cookie_table);
```

Parameters

Table 207-16 ADD_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

BEGIN_REQUEST Function

This function begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.BEGIN_REQUEST (
    url          IN VARCHAR2,
    method       IN VARCHAR2 DEFAULT 'GET',
    http_version IN VARCHAR2 DEFAULT NULL)
RETURN req;
```

Parameters

Table 207–17 *BEGIN_REQUEST Function Parameters*

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See [Chapter 219, "UTL_URL"](#) for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- UTL_HTTP.BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the web server. For example, a web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of UTL_HTTP.GET_RESPONSE will raise the UTL_HTTP.PROTOCOL_ERROR exception.

A URL will be long when its `QUERY_STRING` (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the `POST` method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Type',
                    value  => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      => req,
                    name   => 'Content-Length',
                    value  => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      => req,
                    data   => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
      (r      => req);
...
```

The programmer must determine whether a particular web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the `SET_WALLET` procedure on how to set up an Oracle wallet.

CLEAR_COOKIES Procedure

This procedure clears all cookies maintained by the UTL_HTTP package.

See Also: [HTTP Cookies](#) on page 207-16 and [HTTP Cookies Subprograms](#) on page 207-28

Syntax

```
UTL_HTTP.CLEAR_COOKIES;
```

CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

See Also: [HTTP Persistent Connections](#) on page 207-16 and [HTTP Persistent Connections Subprograms](#) on page 207-29

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (  
    conn IN connection);
```

Parameters

Table 207-18 *CLOSE_PERSISTENT_CONN Procedure Parameters*

Parameter	Description
conn	The HTTP persistent connection to close

CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the proxy www-proxy at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

See Also: [HTTP Persistent Connections](#) on page 207-16 and [HTTP Persistent Connections Subprograms](#) on page 207-29

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
  host          IN VARCHAR2 DEFAULT NULL,
  port          IN PLS_INTEGER DEFAULT NULL,
  proxy_host    IN VARCHAR2 DEFAULT NULL,
  proxy_port    IN PLS_INTEGER DEFAULT NULL,
  ssl           IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 207–19 CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL

of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.END_REQUEST (  
    r IN OUT NOCOPY req);
```

Parameters

Table 207-20 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.END_RESPONSE (  
    r IN OUT NOCOPY resp);
```

Parameters

Table 207-21 *END_RESPONSE Procedure Parameters*

Parameter	Description
r	The HTTP response

GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
  r           IN OUT NOCOPY resp,
  scheme      OUT VARCHAR2,
  realm       OUT VARCHAR2,
  for_proxy   IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 207–22 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP response
scheme	The scheme for the required HTTP authentication
realm	The realm for the required HTTP authentication
for_proxy	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (  
    charset OUT NOCOPY VARCHAR2);
```

Parameters

Table 207-23 *GET_BODY_CHARSET Procedure Parameters*

Parameter	Description
charset	The default character set of the body of all future HTTP requests

GET_COOKIE_COUNT Function

This function returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers.

See Also: [HTTP Cookies](#) on page 207-16 and [HTTP Cookies Subprograms](#) on page 207-28

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT  
RETURN PLS_INTEGER;
```

GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (  
    enable           OUT BOOLEAN,  
    max_cookies     OUT PLS_INTEGER,  
    max_cookies_per_site OUT PLS_INTEGER);
```

Parameters

Table 207–24 GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
enable	Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)
max_cookies	Indicates the maximum total number of cookies maintained in the current session
max_cookies_per_site	Indicates the maximum number of cookies maintained in the current session for each Web site

GET_COOKIES Function

This function returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers.

See Also: [HTTP Cookies](#) on page 207-16 and [HTTP Cookies Subprograms](#) on page 207-28

Syntax

```
UTL_HTTP.GET_COOKIES (  
    cookies IN OUT NOCOPY cookie_table);
```

Parameters

Table 207-25 GET_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies returned

GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (  
    enable OUT BOOLEAN);
```

Parameters

Table 207-26 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

See Also: [Error Conditions](#) on page 207-17 and [Error Conditions Subprograms](#) on page 207-30

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE  
RETURN PLS_INTEGER;
```

GET_DETAILED_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

See Also: [Error Conditions](#) on page 207-17 and [Error Conditions Subprograms](#) on page 207-30

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM  
RETURN VARCHAR2;
```

GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (  
    max_redirects OUT PLS_INTEGER);
```

Parameters

Table 207-27 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
max_redirects	The maximum number of redirections for all future HTTP requests

GET_HEADER Procedure

This procedure returns the n^{th} HTTP response header name and value returned in the response.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.GET_HEADER (
  r      IN OUT NOCOPY resp,
  n      IN PLS_INTEGER,
  name   OUT NOCOPY VARCHAR2,
  value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 207–28 *GET_HEADER Procedure Parameters*

Parameter	Description
r	The HTTP response
n	The n^{th} header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(  
  r      IN OUT NOCOPY resp,  
  name   IN VARCHAR2,  
  value  OUT NOCOPY VARCHAR2,  
  n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 207–29 *GET_HEADER_BY_NAME Procedure Parameters*

Parameter	Description
r	The HTTP response
name	The name of the HTTP response header for which the value is to return
value	The value of the HTTP response header
n	The n th occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (  
    r IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;
```

Parameters

Table 207-30 *GET_HEADER_COUNT Function Parameters*

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: [HTTP Persistent Connections](#) on page 207-16 and [HTTP Persistent Connections Subprograms](#) on page 207-29

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT  
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (  
    enable      OUT BOOLEAN,  
    max_conns  OUT PLS_INTEGER);
```

Parameters

Table 207-31 *GET_PERSISTENT_CONN_SUPPORT Procedure Parameters*

Parameter	Description
enable	TRUE if persistent connection support is enabled; otherwise FALSE
max_conns	the maximum number of persistent connections maintained in the current session

GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also: [HTTP Persistent Connections](#) on page 207-16 and [HTTP Persistent Connections Subprograms](#) on page 207-29

Syntax

```
UTL_HTTP.get_persistent_conns (  
    connections IN OUT NOCOPY connection_table);
```

Parameters

Table 207-32 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
connections	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_PROXY (  
    proxy          OUT NOCOPY VARCHAR2,  
    no_proxy_domains OUT NOCOPY VARCHAR2);
```

Parameters

Table 207-33 GET_PROXY Procedure Parameters

Parameter	Description
proxy	The proxy (host and an optional port number) currently used by the UTL_HTTP package
no_proxy_domains	The list of hosts and domains for which no proxy is used for all requests

GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.GET_RESPONSE (  
    r IN OUT NOCOPY req)  
RETURN resp;
```

Parameters

Table 207-34 *GET_RESPONSE Procedure Parameters*

Parameter	Description
r	The HTTP response

GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (  
    enable OUT BOOLEAN);
```

Parameters

Table 207-35 *GET_RESPONSE_ERROR_CHECK Procedure Parameters*

Parameter	Description
enable	TRUE if the response error check is set; otherwise FALSE

GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (  
    timeout OUT PLS_INTEGER);
```

Parameters

Table 207-36 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds

READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function `read_line` of `UTL_TCP`. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.READ_LINE (
    r          IN OUT NOCOPY resp,
    data       OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
    remove_crlf IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207–37 READ_LINE Procedure Parameters

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>remove_crlf</code>	Removes the newline characters if set to TRUE

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the "Content-Type" response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.READ_RAW(
  r      IN OUT NOCOPY resp,
  data   OUT NOCOPY RAW,
  len    IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 207–38 READ_RAW Procedure Parameters

Parameter	Description
r	The HTTP response
data	The HTTP response body in binary form
len	The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also: [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27

Syntax

```
UTL_HTTP.READ_TEXT(
  r      IN OUT NOCOPY resp,
  data   OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  len    IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 207–39 *READ_TEXT Procedure Parameters*

Parameter	Description
<code>r</code>	The HTTP response
<code>data</code>	The HTTP response body in text form
<code>len</code>	The maximum number of characters of data to read. If <code>len</code> is NULL, this procedure will read as much input as possible to fill the buffer allocated in <code>data</code> . The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the <code>transfer_timeout</code> amount of time has elapsed. The default is NULL.

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the "Content-Type" response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482 :

`unsupported character set` exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

See Also: [Simple HTTP Fetches](#) on page 207-15 and [Simple HTTP Fetches in a Single Call Subprograms](#) on page 207-24

Syntax

```
UTL_HTTP.REQUEST (
    url          IN VARCHAR2,
    proxy        IN VARCHAR2 DEFAULT NULL,
    wallet_path  IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 207-40 REQUEST Function Parameters

Parameter	Description
url	Uniform resource locator
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\ <username>\WALLETS, and in Unix is, for example, file:/home/<username>/wallets When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</username>
wallet_password	(Optional) Specifies the password required to open the wallet

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQLPLUS> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM
DUAL;
```

REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port] [/]
```

See Also: [Simple HTTP Fetches](#) on page 207-15 and [Simple HTTP Fetches in a Single Call Subprograms](#) on page 207-24

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
    url            IN VARCHAR2,
    max_pieces    IN NATURAL DEFAULT 32767,
    proxy         IN VARCHAR2 DEFAULT NULL,
    wallet_path   IN VARCHAR2 DEFAULT NULL,
    wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 207-41 *REQUEST_PIECES Function Parameters*

Parameter	Description
url	Uniform resource locator
max_pieces	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.
proxy	(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.
wallet_path	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\ <username>\WALLETS, and in Unix is, for example, file:/home/<username>/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</username>
wallet_password	(Optional) Specifies the password required to open the wallet

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SET SERVEROUTPUT ON

DECLARE
  x  UTL_HTTP.HTML_PIECES;
  len PLS_INTEGER;
BEGIN
  x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
  DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved. ');
  DBMS_OUTPUT.PUT_LINE('with total length ');
  IF x.count < 1 THEN
    DBMS_OUTPUT.PUT_LINE('0');
```

```
ELSE
  len := 0;
  FOR i in 1..x.count LOOP
    len := len + length(x(i));
  END LOOP;
  DBMS_OUTPUT.PUT_LINE(i);
END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(  
    r           IN OUT NOCOPY req,  
    username   IN VARCHAR2,  
    password   IN VARCHAR2,  
    scheme     IN VARCHAR2 DEFAULT 'Basic',  
    for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 207-42 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
r	The HTTP request
username	The username for the HTTP authentication
password	The password for the HTTP authentication
scheme	The HTTP authentication scheme. The default, BASIC, denotes the HTTP Basic Authentication scheme.
for_proxy	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.

Usage Notes

Only the HTTP Basic Authentication scheme is supported.

SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- [HTTP Responses](#) on page 207-16 and [HTTP Responses Subprograms](#) on page 207-27
- [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to ISO-8859-1. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
    r          IN OUT NOCOPY req,
    charset IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the "Content-Type" header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the "Content-Type" header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
    r          IN OUT NOCOPY resp,
    charset IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 207-43 *SET_BODY_CHARSET Procedure Parameters*

Parameter	Description
<code>r</code>	The HTTP response.
<code>charset</code>	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If <code>charset</code> is <code>NULL</code> , the database character set is assumed.

SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

See Also:

- [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26
- [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
  r          IN OUT NOCOPY REQ,
  enable    IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
  enable      IN BOOLEAN,
  max_cookies IN PLS_INTEGER DEFAULT 300,
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 207-44 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
r	The HTTP request
enable	Set enable to TRUE to enable HTTP cookie support; FALSE to disable
max_cookies	Sets the maximum total number of cookies maintained in the current session
max_cookies_per_site	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the Set-Cookie HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "[Examples](#)" on page 207-20 for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLERRM` for more detailed information about the error.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (  
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207-45 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
<code>enable</code>	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:

- [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26
- [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
    r              IN OUT NOCOPY req,
    max_redirects IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 207-46 SET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

Usage Notes

If `max_redirects` is set to a positive number, the [GET_RESPONSE Function](#) will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the REQ record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function FOLLOW_REDIRECT and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The SET_FOLLOW_REDIRECT procedure must be called before GET_RESPONSE for any redirection to take effect.

SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.SET_HEADER (
    r          IN OUT NOCOPY req,
    name      IN VARCHAR2,
    value     IN VARCHAR2);
```

Parameters

Table 207-47 SET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP request
name	The name of the HTTP request header
value	The value of the HTTP request header

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET_BODY_CHARSET procedure.

When you set the Transfer-Encoding header with the value `chunked`, UTL_HTTP automatically encodes the request body written by the `WRITE_TEXT`, `WRITE_LINE` and `WRITE_RAW` procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure enables or disables support for the HTTP 1.1 persistent-connection in the request.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r          IN OUT NOCOPY req,
    enable    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207-48 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
r	The HTTP request
enable	TRUE to keep the network connection persistent. FALSE otherwise.

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in ["Examples"](#) on page 207-81.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in HTTP Requests

```

DECLARE
    TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
    paths VC2_TABLE;

UTL_HTTP.fetch_pages(paths IN vc2_table) AS
    url_prefix  VARCHAR2(256) := 'http://www.my-company.com/';
    req         UTL_HTTP.REQ;
    resp        UTL_HTTP.RESP;
    data        VARCHAR2(1024);
BEGIN
    FOR i IN 1..paths.count LOOP
        req := UTL_HTTP.BEGIN_REQUEST(url_prefix || paths(i));
        -- Use persistent connection except for the last request
        IF (i < paths.count) THEN
            UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
        END IF;
        resp := UTL_HTTP.GET_RESPONSE(req);
        BEGIN
            LOOP
                UTL_HTTP.READ_TEXT(resp, data);
                -- do something with the data
            END LOOP;
        EXCEPTION
            WHEN UTL_HTTP.END_OF_BODY THEN
                NULL;
        END;
        UTL_HTTP.END_RESPONSE(resp);
    END LOOP;
END;

BEGIN
    UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);
    paths(1) := '...';
    paths(2) := '...';
    ...
    fetch_pages(paths);
END;

```

SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`. `no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.SET_PROXY (
    proxy          IN VARCHAR2,
    no_proxy_domains IN VARCHAR2);
```

Parameters

Table 207-49 SET_PROXY Procedure Parameters

Parameter	Description
<code>proxy</code>	The proxy (host and an optional port number) to be used by the UTL_HTTP package
<code>no_proxy_domains</code>	The list of hosts and domains for which no proxy should be used for all requests

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com, eng.my-company.com:80`. When `no_proxy_domains` is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
    enable IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 207-50 *SET_RESPONSE_ERROR_CHECK Procedure Parameters*

Parameter	Description
<code>enable</code>	TRUE to check for response errors; otherwise FALSE

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, `GET_RESPONSE` will raise the `HTTP_CLIENT_ERROR` or `HTTP_SERVER_ERROR` exception. If `SET_RESPONSE_ERROR_CHECK` is set to FALSE, `GET_RESPONSE` will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The `GET_RESPONSE` function can raise other exceptions when `SET_RESPONSE_ERROR_CHECK` is set to FALSE.

SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout IN PLS_INTEGER DEFAULT 60);
```

Parameters

Table 207-51 SET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds.

Usage Notes

The default value of the time out is 60 seconds.

SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

See Also: [Session Settings](#) on page 207-16 and [Session Settings Subprograms](#) on page 207-25

Syntax

```
UTL_HTTP.SET_WALLET (
    path          IN VARCHAR2,
    password      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 207–52 SET_WALLET Procedure Parameters

Parameter	Description
path	The directory path that contains the Oracle wallet. The format is file:<directory-path>. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\ <username>\WALLETS, and in Unix is, for example, file:/home/<username>/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</username>
password	The password needed to open the wallet. A second copy of a wallet in a wallet directory that may be opened without a password. That second copy of the wallet is read-only. If the password is NULL, the UTL_HTTP package will open the second, read-only copy of the wallet instead.

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

See Also: *Oracle Database Advanced Security Administrator's Guide* for more information on Wallet Manager

WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.WRITE_LINE(
  r          IN OUT NOCOPY req,
  data      IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 207-53 WRITE_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The `UTL_HTTP` package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.WRITE_RAW(
  r      IN OUT NOCOPY REQ,
  data  IN          RAW);
```

Parameters

Table 207-54 *WRITE_RAW Procedure Parameters*

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: [HTTP Requests](#) on page 207-16 and [HTTP Requests Subprograms](#) on page 207-26

Syntax

```
UTL_HTTP.WRITE_TEXT(
  r      IN OUT NOCOPY REQ,
  data   IN          VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 207-55 WRITE_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. UTL_HTTP performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.

UTL_I18N is a set of services that provides additional globalization functionality for applications written in PL/SQL.

See Also: *Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- [Using UTL_I18N](#)
 - Overview
 - Constants
- [Summary of UTL_I18N Subprograms](#)

Using UTL_I18N

This section contains topics which relate to using the UTL_I18N package.

- [Overview](#)
- [Constants](#)

Overview

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

Constants

The UTL_I18N package uses the constants shown in [Table 208–1](#).

Table 208–1 UTL_I18N Constants

Constant	Type	Value	Description
GENERIC_CONTEXT	PLS_INTEGER	0	Returns the default character set for general cases.
MAIL_GENERIC	PLS_INTEGER	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
ORACLE_TO_IANA	PLS_INTEGER	0	Map from an Oracle character set name to an IANA character set name.
SHIFT_IN	PLS_INTEGER	0	Used with <code>shift_status</code> . Must be set the first time it is called in piecewise conversion.
IANA_TO_ORACLE	PLS_INTEGER	1	Map from an IANA character set name to an Oracle character set name.
MAIL_CONTEXT	PLS_INTEGER	1	The mapping is between an Oracle character set name and an email safe character set name.
MAIL_WINDOWS	PLS_INTEGER	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
SHIFT_OUT	PLS_INTEGER	1	
FWKATAKANA_HIRAGANA	VARCHAR2 (30)	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	VARCHAR2 (30)	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
HIRAGANA_FWKATAKANA	VARCHAR2 (30)	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	VARCHAR2 (30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	VARCHAR2 (30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2 (30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2 (30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2 (30)	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.

Table 208-1 (Cont.) UTL_I18N Constants

Constant	Type	Value	Description
KANA_ HWKATAKANA	VARCHAR2 (30)	'kana_ hwkatakana '	Converts any type of Kana character to a halfwidth Katakana character.

Summary of UTL_I18N Subprograms

Table 208–2 UTL_I18N Package Subprograms

Procedure	Description
ESCAPE_REFERENCE Function on page 208-8	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
GET_COMMON_TIME_ZONES Function on page 208-9	Returns the list of common time zone IDs that are independent of the locales.
GET_DEFAULT_CHARSET Function on page 208-10	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
GET_DEFAULT_ISO_CURRENCY Function on page 208-11	Returns the default ISO 4217 currency code for the specified territory.
GET_DEFAULT_LINGUISTIC_SORT Function on page 208-12	Returns the default linguistic sort name for the specified language.
GET_LOCAL_LANGUAGES Function on page 208-13	Returns the local language names for the specified territory.
GET_LOCAL_LINGUISTIC_SORTS Function on page 208-14	Returns the local linguistic sort names for the specified language.
GET_LOCAL_TERRITORIES Function on page 208-15	Returns the local territory names for the specified language.
GET_LOCAL_TIME_ZONES Function on page 208-16	Returns the local time zone IDs for the specified territory.
GET_TRANSLATION Function on page 208-18	Returns the translation of the language and territory name in the specified translation language.
MAP_CHARSET Function on page 208-19	<ul style="list-style-type: none"> ■ Maps an Oracle character set name to an IANA character set name. ■ Maps an IANA character set name to an Oracle character set name. ■ Maps an Oracle character set name to an e-mail safe character set name.
MAP_FROM_SHORT_LANGUAGE Function on page 208-21	Maps an Oracle short language name to an Oracle language name.
MAP_LANGUAGE_FROM_ISO Function on page 208-22	Returns an Oracle language name from an ISO locale name.
MAP_LOCALE_TO_ISO Function on page 208-23	Returns an ISO locale name from the Oracle language and territory name.
MAP_TERRITORY_FROM_ISO Function on page 208-24	Returns an Oracle territory name from an ISO locale name.
MAP_TO_SHORT_LANGUAGE Function on page 208-25	Maps an Oracle language name to an Oracle short language name.
RAW_TO_CHAR Functions on page 208-26	Converts RAW data that is not encoded in the database character set into a VARCHAR2 string
RAW_TO_NCHAR Functions on page 208-28	Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string
STRING_TO_RAW Function on page 208-30	Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.

Table 208–2 (Cont.) UTL_I18N Package Subprograms

Procedure	Description
TRANSLITERATE Function on page 208-31	Transliterates between Japanese hiragana and katakana.
UNESCAPE_REFERENCE Function on page 208-33	Converts an input string that contains character references to a text string.

ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document.

Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `å` is the numeric character reference for the small letter "a" with a ring above, whereas `å` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str          IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 208–3 ESCAPE_REFERENCE Function Parameters

Parameter	Description
<code>str</code>	Specifies the input string
<code>page_cs_name</code>	Specifies the character set of the document. If <code>page_cs_name</code> is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns 'hello < å'.
'

GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES  
RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```
DECLARE  
    retval UTL_I18N.STRING_ARRAY;  
BEGIN  
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;  
END;  
/
```

GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

See Also: ["MAP_CHARSET Function"](#) on page 208-19 for an explanation of an e-mail safe character set

Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
    language IN VARCHAR2,
    context IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 208–4 GET_DEFAULT_CHARSET Function Parameters

Parameter	Description
language	Specifies a valid Oracle language
context	GENERIC_CONTEXT MAIL_CONTEXT GENERIC_CONTEXT: Returns the default character set for general cases MAIL_CONTEXT: Returns the default e-mail safe character set name
iswindows	If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE if the platform is Windows and FALSE if the platform is not Windows. The default is FALSE. iswindows has no effect if context is set as GENERIC_CONTEXT.

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 208–5 *GET_DEFAULT_ISO_CURRENCY Function Parameters*

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE
    retval VARCHAR2(50);
BEGIN
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (  
    language IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2;
```

Parameters

Table 208–6 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE  
    retval VARCHAR2(50);  
BEGIN  
    SELECT value INTO retval FROM nls_session_parameters  
    WHERE parameter = 'NLS_LANGUAGE';  
    retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);  
    DBMS_OUTPUT.PUT_LINE(retval);  
END;  
/
```

GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
    territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 208–7 *GET_LOCAL_LANGUAGES Function Parameters*

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt    INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 2
DUTCH
FRENCH
```

GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 208–8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the local linguistic sort names for JAPANESE.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
    language IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 208–9 GET_LOCAL_TERRITORIES Function Parameters

Parameter	Description
language	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt    INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
    territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 208–10 GET_LOCAL_TIME_ZONES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
    retval  utl_i18n.string_array;
    retval2 utl_i18n.string_array;
    stpos   INTEGER;
BEGIN
    retval := utl_i18n.get_local_time_zones(
        territory);
    retval2 := utl_i18n.get_common_time_zones;
    stpos := retval.LAST + 1;
    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt   INTEGER;
BEGIN
    DBMS_OUTPUT.ENABLE(100000);
    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
    cnt := retval.FIRST;
```

```
WHILE cnt IS NOT NULL LOOP
  DBMS_OUTPUT.PUT_LINE(retval(cnt));
  cnt := retval.NEXT(cnt);
END LOOP;
END;
/
```

GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
    parameter          IN VARCHAR2 CHARACTER SET ANY_CS,
    trans_language     IN VARCHAR2 'AMERICAN',
    flag               IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 208–11 GET_TRANSLATION Function Parameters

Parameter	Description
parameter	Specifies a valid language name, territory name, or a combined string in the form of <i>language_territory</i> . It is case-insensitive.
trans_language	Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.
flag	Specifies the translation type: <ul style="list-style-type: none"> ▪ LANGUAGE_TRANS: The function returns the language translation. ▪ TERRITORY_TRANS: The function returns the territory translation. ▪ LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation. <p>The default translation type is LANGUAGE_TRANS.</p>

Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
    CURSOR c1 IS
        SELECT value FROM V$NLS_VALID_VALUES
        WHERE parameter = 'LANGUAGE'
    ORDER BY value;
    retval NVARCHAR2(100);
BEGIN
    FOR item IN c1 LOOP
        retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
    END LOOP;
END;
```

MAP_CHARSET Function

This function maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET (
    charset    IN VARCHAR2,
    context    IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag       IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 208–12 MAP_CHARSET Function Parameters

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	GENERIC_CONTEXT MAIL_CONTEXT GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.
flag	<ul style="list-style-type: none"> ■ ORACLE_TO_IANA IANA_TO_ORACLE if GENERIC_CONTEXT is set ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. ■ MAIL_GENERIC MAIL_WINDOWS if MAIL_CONTEXT is set MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the `MAP_CHARSET` function with the `MAIL_CONTEXT | MAIL_GENERIC` option with the database character set name, `WE8DEC`. The result is `WE8ISO8859P1`.
2. Convert the contents stored in the database to `WE8ISO8859P1`.
3. Call the `MAP_CHARSET` function with the `ORACLE_TO_IANA | GENERIC_CONTEXT` option with the e-mail safe character set, `WE8ISO8859P1`. The result is `ISO-8859-1`.
4. Specify `ISO-8859-1` in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns `NULL`.

Note: Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_
ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context, utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
    language          IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 208–13 MAP_FROM_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table `customers` is from the `oe` user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the `GET_DEFAULT_LINGUISTIC_SORT` procedure.

```
DECLARE
    short_n VARCHAR2(10);
    ling_n VARCHAR2(50);
BEGIN
    SELECT nls_language INTO short
    FROM customers WHERE customer_id = 9000;
    ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
        UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
    DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(  
    isocale IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 208–14 MAP_LANGUAGE_FROM_ISO Function Parameters

Parameter	Description
isocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns 'American'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle languages

MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
    ora_language  IN VARCHAR2,
    ora_territory IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 208–15 MAP_LOCALE_TO_ISO Function Parameters

Parameter	Description
ora_language	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns 'en_US'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (  
    isocale IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 208–16 MAP_TERRITORY_FROM_ISO Function Parameters

Parameter	Description
isocale	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `French`).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle territories

MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
    language    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 208–17 MAP_TO_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE
    retval VARCHAR2(100);
BEGIN
    retval := UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');
    DBMS_OUTPUT.PUT_LINE(retval);
END;
/

US
```

RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 208–18 RAW_TO_CHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('6162636465666C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('6162636465666C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
nvalue VARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (
    data          IN RAW,
    src_charset   IN VARCHAR2 DEFAULT NULL,
    scanned_length OUT PLS_INTEGER,
    shift_status  IN OUT PLS_INTEGER)
RETURN NVARCHAR2;
```

Parameters

Table 208–19 RAW_TO_NCHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If <code>src_charset</code> is <code>NULL</code> , then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to <code>SHIFT_IN</code> the first time it is called in piecewise conversion. Note: ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. <code>shift_status</code> cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, `NULL` data, or data whose length is 0, then the function returns a `NULL` string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('6162636465666C2AA'), 'utf8')
```

This returns the following string in the national character set:

```
'abcde' || chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('6162636465666C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde' || chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to 8.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
nvalue NVARCHAR2(1024);
conversion_state PLS_INTEGER = 0;
converted_len PLS_INTEGER;
rtemp RAW(10) = '';
conn utl_tcp.connection;
tlen PLS_INTEGER;

...
conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                remote_port => 2000);

LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
    then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
    else
        rtemp := '';
    end if;
    /* do anything you want with nvalue */
    /* e.g htp.prn(nvalue); */
END LOOP;
utl_tcp.close_connection(conn);
EXCEPTION
    WHEN utl_tcp.end_of_input THEN
        utl_tcp.close_connection(conn);
END;
```

STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(  
    data          IN VARCHAR2 CHARACTER SET ANY_CS,  
    dst_charset   IN VARCHAR2 DEFAULT NULL)  
RETURN RAW;
```

Parameters

Table 208–20 *STRING_TO_RAW Function Parameters*

Parameter	Description
data	Specifies the VARCHAR2 or NVARCHAR2 string to convert.
dst_charset	Specifies the destination character set. If <code>dst_charset</code> is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE  
    r raw(50);  
    s varchar2(20);  
BEGIN  
    s:='abcdef' || chr(170);  
    r:=utl_i18n.string_to_raw(s, 'utf8');  
    dbms_output.put_line(rawtohex(r));  
end;  
/
```

This returns a hex value of ' 616263646566C2AA '.

TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 208–21 TRANSLITERATE Function Parameters

Parameter	Description
data	Specifies the data to be converted. Either CHAR or NCHAR data type can be specified.
name	Specifies the transliteration name string. For a list of valid names, see Table 208–22 .

Constants

These options specify Japanese Kana conversions.

Table 208–22 TRANSLITERATE Function Constants

Constant Name	Value	Description
KANA_FWKATAKANA	'kana_ fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HWKATAKANA	'kana_ hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.
KANA_HIRAGANA	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
FWKATAKANA_ HWKATAKANA	'fwkatakana_ hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
FWKATAKANA_ HIRAGANA	'fwkatakana_ hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
HWKATAKANA_ FWKATAKANA	'hwkatakana_ fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_ HIRAGANA	'hwkatakana_ hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
HIRAGANA_ FWKATAKANA	'hiragana_ fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_ HWKATAKANA	'hiragana_ hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

Usage Notes

The function returns the converted string.

Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

Figure 208–1 Loading Locale-Specific Data to the Database

```

タナカ
たなか
タナカ
↓
たなか
たなか
たなか

```

The following statement normalizes one kana name to hiragana:

```
DECLARE
  Name  japanese_emp.ename%TYPE;
  Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
  SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
  name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
  UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
  WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
    DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

See Also: ["ESCAPE_REFERENCE Function"](#) on page 208-8 for more information about escape sequences

Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (  
    str IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 208–23 UNESCAPE_REFERENCE Function Parameters

Parameter	Description
str	Specifies the input string

Usage Notes

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns 'hello < | |chr(229)'.

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- [Using UTL_INADDR](#)
 - Exceptions
 - Examples
- [Summary of UTL_INADDR Subprograms](#)

Using UTL_INADDR

- [Exceptions](#)
- [Examples](#)

Exceptions

Table 209–1 *Exception - Internet Address Package*

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

Examples

Retrieve the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME); -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS); -- get local IP addr
END;
/
```

Summary of UTL_INADDR Subprograms

Table 209–2 UTL_INADDR Package Subprograms

Subprogram	Description
GET_HOST_ADDRESS Function on page 209-6	Retrieves the IP address of the local or remote host given its name
GET_HOST_NAME Function on page 209-7	Retrieves the name of the local or remote host given its IP address

GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (  
    host IN VARCHAR2 DEFAULT NULL)  
RETURN host_address VARCHAR2;
```

Parameters

Table 209–3 *GET_HOST_ADDRESS Function Parameters*

Parameter	Description
host	The name of the host to retrieve the IP address.

Return Values

Table 209–4 *GET_HOST_ADDRESS Function Return Values*

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown.

GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (
    ip IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

Parameters

Table 209–5 *GET_HOST_NAME Function Parameters*

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

Return Values

Table 209–6 *GET_HOST_NAME Function Return Values*

Parameter	Description
host_name	The name of the local or remote host of the specified IP address

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

UTL_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- [Using UTL_LMS](#)
 - Security Model
- [Summary of UTL_LMS Subprograms](#)

Using UTL_LMS

This section contains topics which relate to using the UTL_LMS package.

- [Security Model](#)

Security Model

This package must be created as the user `SYS`.

Summary of UTL_LMS Subprograms

Table 210–1 UTL_LMS Package Subprograms

Function	Description
FORMAT_MESSAGE Function on page 210-5	Formats a retrieved error message
GET_MESSAGE Function on page 210-6	Retrieves an error message based on error number, product, facility, language, and message specified

FORMAT_MESSAGE Function

This function formats a message retrieved by the `GET_MESSAGE` function and returns the formatted message. If the function fails, then it returns a `NULL` result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

Syntax

```
UTL_LMS.FORMAT_MESSAGE (
    format IN VARCHAR2 CHARACTER SET ANY_CS,
    args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

Table 210–2 *FORMAT_MESSAGE Procedure Parameters*

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

Examples

```
DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
    dbms_output.put_line('before format, message is: '||s);
    dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:

Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.

GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns 0 when it is successful. It returns -1 when it fails.

See Also: *Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

Syntax

```
UTL_LMS.GET_MESSAGE (
    errnum    IN PLS_INTEGER,
    product   IN VARCHAR2,
    facility  IN VARCHAR2,
    language  IN VARCHAR2,
    message   OUT NOCOPY VARCHAR2CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 210-3 *GET_MESSAGE Function Parameters*

Parameter	Description
<code>errnum</code>	Specifies the error number. Example: '972' (for ORA-00972)
<code>product</code>	Specifies the product to which the error message applies Example: 'rdbms'
<code>facility</code>	Specifies the error message prefix Example: 'ora'
<code>language</code>	Specifies the language of the message. The parameter is case-insensitive. The default is <code>NULL</code> , which causes <code>GET_MESSAGE</code> to use the value of the <code>NLS_LANGUAGE</code> session parameter.
<code>message</code>	Specifies the output buffer for the retrieved message

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```
DECLARE
    s varchar2(200);
    i pls_integer;
BEGIN
    i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
    dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

The UTL_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- [Using UTL_MAIL](#)
 - Security Model
 - Operational Notes
 - Rules and Limits
- [Summary of UTL_MAIL Subprograms](#)

Using UTL_MAIL

- [Security Model](#)
- [Operational Notes](#)
- [Rules and Limits](#)

Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions .

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

```
sqlplus sys/<pwd>  
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql  
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the SMTP_OUT_SERVER parameter in the `init.ora` rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.

Rules and Limits

Use UTL_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

Summary of UTL_MAIL Subprograms

Table 211-1 UTL_MAIL Package Subprograms

Subprogram	Description
SEND Procedure on page 211-7	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
SEND_ATTACH_RAW Procedure on page 211-8	Represents the SEND Procedure overloaded for RAW attachments
SEND_ATTACH_VARCHAR2 Procedure on page 211-9	Represents the SEND Procedure overloaded for VARCHAR2 attachments

SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
  sender      IN   VARCHAR2 CHARACTER SET ANY_CS,
  recipients  IN   VARCHAR2 CHARACTER SET ANY_CS,
  cc          IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc        IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject     IN   VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message     IN   VARCHAR2 CHARACTER SET ANY_CS,
  mime_type  IN   VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
  priority   IN   PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 211–2 SEND Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL
subject	A string to be included as email subject string, default is NULL
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii'
priority	The message priority, default is NULL .

SEND_ATTACH_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
  sender          IN    VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN    VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type       IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-ascii',
  priority        IN    PLS_INTEGER DEFAULT 3,
  attachment      IN    RAW,
  att_inline      IN    BOOLEAN DEFAULT TRUE,
  att_mime_type   IN    VARCHAR2 CHARACTER SET ANY_CS
                    DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 211–3 SEND_ATTACH_RAW Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL.
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL.
subject	A string to be included as email subject string, default is NULL.
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii'.
priority	The message priority, the default is NULL.
attachment	A RAW attachment.
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE.
att_mime_type	The mime type of the attachment, default is 'application/octet'.
att_filename	The string specifying a filename containing the attachment, default is NULL.

SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
  sender          IN    VARCHAR2 CHARACTER SET ANY_CS,
  recipients      IN    VARCHAR2 CHARACTER SET ANY_CS,
  cc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  bcc             IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  subject         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  message         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
  mime_type       IN    VARCHAR2 CHARACTER SET ANY_CS
                        DEFAULT 'text/plain; charset=us-ascii',
  priority        IN    PLS_INTEGER DEFAULT 3,
  attachment      IN    VARCHAR2 CHARACTER SET ANY_CS, ,
  att_inline      IN    BOOLEAN DEFAULT TRUE,
  att_mime_type   IN    VARCHAR2 CHARACTER SET ANY_CS
                        DEFAULT 'text/plain; charset=us-ascii',
  att_filename    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 211–4 SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL.
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL.
subject	A string to be included as email subject string, default is NULL.
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii'.
priority	The message priority, the default is NULL.
attachment	A text attachment.
att_inline	Specifies whether the attachment is inline, default TRUE.
att_mime_type	The mime type of the attachment, default is 'text/plain; charset=us-ascii'.
att_filename	The string specifying a filename containing the attachment, default is NULL.

The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- [Using UTL_NLA](#)
 - Overview
 - Rules and Limits
- [Subprogram Groups](#)
 - BLAS Level 1 (Vector-Vector Operations) Subprograms
 - BLAS Level 2 (Matrix-Vector Operations) Subprograms
 - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
 - LAPACK Driver Routines (Linear Equations) Subprograms
 - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
- [Summary of UTL_NLA Subprograms](#)

Using UTL_NLA

This section contains topics which relate to using the UTL_NLA package.

- [Overview](#)
- [Rules and Limits](#)

Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage)(Version 3.0) operations on vectors and matrices represented as VARRAYS.

Standards

For more information on the BLAS and LAPACK standards see

<http://www.netlib.org/blas/>

<http://www.netlib.org/lapack/>

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the `BLAS_` prefix (for example, the [BLAS_ASUM Functions](#)). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the `LAPACK_` prefix (for example, the [LAPACK_GBSV Procedures](#)). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all `/work/` arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, `pack`, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

Rules and Limits

Vectors and matrices are stored in `VARRAYs` with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size $R \times C \leq 1,000,000$.

Subprogram Groups

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 212–1 *BLAS Level 1 (Vector-Vector Operations) Subprograms*

Subprogram	Description
BLAS_ASUM Functions on page 212-17	Computes the sum of the absolute values of the vector components
BLAS_AXPY Procedures on page 212-18	Copies $\alpha X + Y$ into vector Y
BLAS_COPY Procedures on page 212-19	Copies the contents of vector X to vector Y
BLAS_DOT Functions on page 212-20	Returns the dot (scalar) product of two vectors X and Y
BLAS_IAMAX Functions on page 212-30	Computes the index of the first element of a vector that has the largest absolute value
BLAS_NRM2 Functions on page 212-31	Computes the vector 2-norm (Euclidean norm)
BLAS_ROT Procedures on page 212-32	Returns the plane rotation of points
BLAS_ROTG Procedures on page 212-33	Returns the Givens rotation of points
BLAS_SCAL Procedures on page 212-34	Scales a vector by a constant
BLAS_SWAP Procedures on page 212-43	Swaps the contents of two vectors each of size n

BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 212–2 *BLAS Level 2 (Matrix-Vector Operations) Subprograms*

Subprogram	Description
BLAS_GBMV Procedures on page 212-21	Performs the matrix-vector operation $y := \alpha A^*x + \beta y$ or $y := \alpha A'^*x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n band matrix, with k_l sub-diagonals and k_u super-diagonals
BLAS_GEMV Procedures on page 212-26	Performs the matrix-vector operations $y := \alpha A^*x + \beta y$ or $y := \alpha A'^*x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n matrix
BLAS_GER Procedures on page 212-28	Performs a rank 1 operation $A := \alpha x y' + A$ where α is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix
BLAS_SBMV Procedures on page 212-41	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals
BLAS_SPMV Procedures on page 212-35	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form
BLAS_SPR Procedures on page 212-37	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form
BLAS_SPR2 Procedures on page 212-39	Performs a symmetric rank 2 operation $A := \alpha x x' + \alpha y y' + A$ where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form
BLAS_SBMV Procedures on page 212-41	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals
BLAS_SYMV Procedures on page 212-46	Performs a matrix-vector operation $y := \alpha A^*x + \beta y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix
BLAS_SYR Procedures on page 212-48	Performs a symmetric rank 1 operation $A := \alpha x x' + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix
BLAS_SYR2 Procedures on page 212-50	Performs a symmetric rank 2 operation $A := \alpha x x' + \alpha y y' + A$ where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix
BLAS_TBMV Procedures on page 212-57	Performs a matrix-vector operation $x := A^*x$ or $A'^*x = b$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals
BLAS_TBSV Procedures on page 212-59	Solves one of the systems of equation $A^*x = b$ or $A'^*x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals

Table 212–2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_TPMV Procedures on page 212-61	Performs a matrix-vector operation $x := A*x$ or $x := A' *x$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TPSV Procedures on page 212-63	Solves one of the systems of equation $A*x = b$ or $A' *x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TRMV Procedures on page 212-68	Performs a matrix-vector operation $x := A*x$ or $x := A' *x$ where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix
BLAS_TRSV Procedures on page 212-73	Solves one of the systems of equation $A*x = b$ or $A' *x = b$ where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix

BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 212–3 *BLAS Level 3 (Matrix-Matrix Operations) Subprograms*

Subprogram	Description
BLAS_GEMM Procedures on page 212-26	Performs one of the matrix-vector operations $C := \alpha * \text{op}(A) * \text{op}(B) + \beta * C$ where $\text{op}(X)$ is one of $\text{op}(X) = X$ or $\text{op}(X) = X'$ where α and β are scalars, and A , B and C are matrices, with $\text{op}(A)$ an m by k matrix, $\text{op}(B)$ a k by n matrix and C an m by n matrix
BLAS_SYMM Procedures on page 212-44	Performs one of the matrix-vector operations $C := \alpha * A * B + \beta * C$ or $C := \alpha * B * A + \beta * C$ where α and β are scalars, A is a symmetric matrix, and B and C are m by n matrices
BLAS_SYR2K Procedures on page 212-52	Performs one of the symmetric rank2 k operations $C := \alpha * A * B' + \alpha * B * A' + \beta * C$ or $C := \alpha * A' * B + \alpha * B' * A + \beta * C$ where α and β are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case
BLAS_SYRK Procedures on page 212-55	Performs one of the symmetric rank k operations $C := \alpha * A * A' + \beta * C$ or $C := \alpha * A' * A + \beta * C$ where α and β are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case
BLAS_TRMM Procedures on page 212-65	Performs one of the matrix-vector operations $B := \alpha * \text{op}(A) * B$ or $B := \alpha * B * \text{op}(A)$ where α is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and $\text{op}(A)$ is one of two alternatives
BLAS_TRSM Procedures on page 212-70	Performs one of the matrix-vector operations $\text{op}(A) * X = \alpha * B$ or $X * \text{op}(A) = \alpha * B$ where α is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, $\text{op}(A)$ is one of two alternatives. The matrix X is overwritten on B

LAPACK Driver Routines (Linear Equations) Subprograms

Table 212–4 LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GBSV Procedures on page 212-75	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A .
LAPACK_GESV Procedures on page 212-84	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A .
LAPACK_GTSV Procedures on page 212-92	This procedure solves the equation $a * x = b$ where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting.
LAPACK_PBSV Procedures on page 212-94	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite band matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .
LAPACK_POSV Procedures on page 212-96	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .
LAPACK_PPSV Procedures on page 212-98	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .
LAPACK_PTSV Procedures on page 212-100	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by $nrhs$ matrices.
LAPACK_SPSV Procedures on page 212-110	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix stored in packed format, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A .
LAPACK_SYSV Procedures on page 212-120	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric matrix, and x and b are n by $nrhs$ matrices. The diagonal pivoting method is used to factor A .

LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 212–5 *LAPACK Driver Routines (LLS and Eigenvalue Problems)*

Subprogram	Description
LAPACK_GEES Procedures on page 212-77	Computes for an n by n real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z . This gives the Schur factorization $A = Z^*T^*(Z^*T)$.
LAPACK_GEEV Procedures on page 212-89	Computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.
LAPACK_GELS Procedures on page 212-79	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank.
LAPACK_GESDD Procedures on page 212-81	Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_GESVD Procedures on page 212-86	Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * \text{transpose}(V)$.
LAPACK_SBEV Procedures on page 212-102	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A .
LAPACK_SBEVD Procedures on page 212-104	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SPEV Procedures on page 212-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage.
LAPACK_SPEVD Procedures on page 212-108	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_STEV Procedures on page 212-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A .
LAPACK_STEVD Procedures on page 212-114	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SYEV Procedures on page 212-116	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A .
LAPACK_SYEVD Procedures on page 212-118	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Summary of UTL_NLA Subprograms

Table 212–6 UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_ASUM Functions on page 212-17	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures on page 212-18	Copies $\alpha X + Y$ into vector Y	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures on page 212-19	Copies the contents of vector X to vector Y	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_DOT Functions on page 212-20	Returns the dot (scalar) product of two vectors X and Y	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures on page 212-21	Performs the matrix-vector operation $y := \alpha A * x + \beta y$ or $y := \alpha A' * x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n band matrix, with k_1 sub-diagonals and k_u super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures on page 212-26	Performs one of the matrix-vector operations where α and β are scalars, and A , B and C are matrices, with $op(A)$ an m by k matrix, $op(B)$ a k by n matrix and C an m by n matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures on page 212-26	Performs the matrix-vector operations $y := \alpha A * x + \beta y$ or $y := \alpha A' * x + \beta y$ where α and β are scalars, x and y are vectors and A is an m by n matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures on page 212-28	Performs a rank 1 operation $A := \alpha x * y' + A$ where α is a scalar, x is an m element vector, y is an n element vector and A is an m by n matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions on page 212-30	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions on page 212-31	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures on page 212-32	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures on page 212-33	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 212–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SBMV Procedures on page 212-41	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric band matrix, with k super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SCAL Procedures on page 212-34	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SPMV Procedures on page 212-35	Performs a matrix-vector operation $y := \alpha * A * x + \beta * y$ where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR Procedures on page 212-37	Performs a symmetric rank 1 operation $A := \alpha * x * x' + A$ where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR2 Procedures on page 212-39	Performs a symmetric rank 2 operation where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SWAP Procedures on page 212-43	Swaps the contents of two vectors each of size n	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SYMM Procedures on page 212-44	Performs one of the matrix-vector operations where α and β are scalars, A is a symmetric matrix, and B and C are m by n matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYMV Procedures on page 212-46	Performs a matrix-vector operation where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR Procedures on page 212-48	Performs a symmetric rank 1 operation where α is a real scalar, x is an n element vector, and A is an n by n symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2 Procedures on page 212-50	Performs a symmetric rank 2 operation where α is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2K Procedures on page 212-52	Performs one of the symmetric rank2 k operations where α and β are scalars, C is an n by n symmetric matrix and A and B are n by k matrices in the first case and k by n matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYRK Procedures on page 212-55	Performs one of the symmetric rank k operations where α and β are scalars, C is an n by n symmetric matrix and A is an n by k matrix in the first case and a k by n matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TBMV Procedures on page 212-57	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 212-6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_TBSV Procedures on page 212-59	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with $(k + 1)$ diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPMV Procedures on page 212-61	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPSV Procedures on page 212-63	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMM Procedures on page 212-65	Performs one of the matrix-vector operations where α is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and $op(A)$ is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms

LAPACK_GEES Procedures on page 212-77	Computes for an n by n real nonsymmetric matrix A , the eigenvalues, the real Schur form T , and, optionally, the matrix of Schur vectors Z . This gives the Schur factorization $A = Z * T * (Z ** T)$.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GEEV Procedures on page 212-89	Computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GELS Procedures on page 212-79	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GESDD Procedures on page 212-81	Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 212–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_GESV Procedures on page 212-84	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n matrix and x and b are n by $nrhs$ matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A .	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_GESVD Procedures on page 212-86	Computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and/or right singular vectors. The SVD is written $A = U * SIGMA * transpose(V)$.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GTSV Procedures on page 212-92	This procedure solves the equation $a * x = b$ where a is an n by n tridiagonal matrix, by Gaussian elimination with partial pivoting.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PBSV Procedures on page 212-94	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite band matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_POSV Procedures on page 212-96	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PPSV Procedures on page 212-98	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by $nrhs$ matrices. The Cholesky decomposition is used to factor A .	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PTSV Procedures on page 212-100	This procedure computes the solution to a real system of linear equations $a * x = b$ where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by $nrhs$ matrices.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_SBEV Procedures on page 212-102	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SBEVD Procedures on page 212-104	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A . If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SPEV Procedures on page 212-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SPEVD Procedures on page 212-108	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ASUM (
  n      IN      POSITIVEN,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_ASUM (
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_FLT)
RETURN BINARY_FLOAT
```

Parameters

Table 212–7 *BLAS_ASUM Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_AXPY Procedures

This procedure copies $\alpha X + Y$ into vector Y .

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_AXPY (
  n      IN      POSITIVE,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVE,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVE);
```

```
UTL_NLA.BLAS_AXPY (
  n      IN      POSITIVE,
  alpha  IN      SCALAR_DOUBLE,
  x      IN      UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVE,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVE);
```

Parameters

Table 212–8 *BLAS_AXPY Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y . n must be at least zero.
alpha	Specifies the scalar α .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x . incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1 + (n - 1) * \text{abs}(\text{incy}))$
incy	Specifies the increment for the elements of y . incy must not be zero.

BLAS_COPY Procedures

This procedure copies the contents of vector X to vector Y.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_COPY (
  n      IN      POSITIVE,
  x      IN      UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVE,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVE);
```

```
UTL_NLA.BLAS_COPY (
  n      IN      POSITIVE,
  x      IN      UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVE,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVE);
```

Parameters

Table 212–9 *BLAS_COPY Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_DOT Functions

This function returns the dot (scalar) product of two vectors X and Y.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_DOT (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_DBL,
    incx   IN      POSITIVEN,
    y      IN      UTL_NLA_ARRAY_DBL,
    incy   IN      POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_DOT (
    n      IN      POSITIVEN,
    x      IN      UTL_NLA_ARRAY_FLT,
    incx   IN      POSITIVEN,
    y      IN      UTL_NLA_ARRAY_FLT,
    incy   IN      POSITIVEN)
RETURN BINARY_FLOAT;
```

Parameters

Table 212–10 *BLAS_DOT Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_GBMV Procedures

This procedure performs one of the matrix-vector operations

$$y := \alpha * A * x + \beta * y$$

or

$$y := \alpha * A' * x + \beta * y$$

where alpha and beta are scalars, x and y are vectors and A is an m by n band matrix, with k_l sub-diagonals and k_u super-diagonals.

    pack   IN      flag DEFAULT 'C');
```

Parameters

Table 212–11 *BLAS_GBMV Procedure Parameters*

Parameter	Description
trans	Specifies the operation to be performed: <ul style="list-style-type: none"> ■ trans = 'N' or 'n': $y := \alpha * A * x + \beta * y$ ■ trans = 'T' or 't': $y := \alpha * A^T * x + \beta * y$ ■ trans = 'C' or 'c': $y := \alpha * A^C * x + \beta * y$
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy $0 \leq kl$.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy $0 \leq ku$.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). <p>Before entry, the leading $(kl + ku + 1)$ by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row $(ku+1)$ of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row $(ku+2)$, and so on.</p> <p>Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.</p>
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $(kl+ku+1)$.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incx}))$ when trans = 'N' or 'n' and at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incy}))$ when trans = 'N' or 'n' and at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ otherwise. Before entry with beta non-zero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.

```

Parameters

Table 212–12 *BLAS_GEMM Procedure Parameters*

Parameter	Description
transa	Specifies the form of $\text{op}(A)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transa = 'N' or 'n': $\text{op}(A) = A$ transa = 'T' or 't': $\text{op}(A) = A^T$ transa = 'C' or 'c': $\text{op}(A) = A^C$
transb	Specifies the form of $\text{op}(B)$ to be used in the matrix multiplication as follows: <ul style="list-style-type: none"> transb = 'N' or 'n': $\text{op}(B) = B$ transb = 'T' or 't': $\text{op}(B) = B^T$ transb = 'C' or 'c': $\text{op}(B) = B^C$
m	Specifies the number of rows of the matrix $\text{op}(A)$ and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix $\text{op}(B)$ and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix $\text{op}(A)$ and the number of columns of the matrix $\text{op}(B)$. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least $\max(1, k)$.
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = 'N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the array b must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least $\max(1, n)$.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n matrix $(\text{alpha} * \text{op}(A) * \text{op}(B) + \text{beta} * C)$.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least $\max(1, m)$.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> 'C': column-major (default) 'R': row-major

```

Parameters

Table 212–14 *BLAS_GER Procedure Parameters*

Parameter	Description
m	Specifies the number of rows of the matrix A . m must be at least zero.
n	Specifies the number of columns of the matrix A . n must be at least zero.
α	Specifies the scalar α .
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (m - 1) * \text{abs}(\text{incx}))$ Before entry, the incremented array X must contain the m element vector x .
incx	Specifies the increment for the elements of x . incx must not be zero.

Table 212–14 (Cont.) BLAS_GER Procedure Parameters

Parameter	Description
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n - 1) * \text{abs}(\text{incy}))$ Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least $\max(1, m)$
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> ■ 'C': column-major (default) ■ 'R': row-major

BLAS_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_IAMAX (
    n      IN  POSITIVE,
    x      IN  UTL_NLA_ARRAY_DBL,
    incx   IN  POSITIVE,
    RETURN POSITIVE;
```

```
UTL_NLA.BLAS_IAMAX (
    n      IN  POSITIVE,
    x      IN  UTL_NLA_ARRAY_FLT,
    incx   IN  POSITIVE,
    RETURN POSITIVE;
```

Parameters

Table 212–15 *BLAS_IAMAX Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1) * abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_NRM2 (
  n      IN  POSITIVEN,
  x      IN  UTL_NLA_ARRAY_DBL,
  incx   IN  POSITIVEN)
RETURN BINARY_DOUBLE;
```

```
UTL_NLA.BLAS_NRM2 (
  n      IN  POSITIVEN,
  x      IN  UTL_NLA_ARRAY_FLT,
  incx   IN  POSITIVEN)
RETURN BINARY_FLOAT;
```

Parameters

Table 212–16 *BLAS_NRM2 Function Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs (incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_ROT Procedures

This procedure returns the plane rotation of points.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROT (
  n      IN      POSITIVEN,
  x      IN OUT  UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVEN,
  c      IN      SCALAR_DOUBLE,
  s      IN      SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROT (
  n      IN      POSITIVEN,
  x      IN OUT  UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVEN,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVEN,
  c      IN      SCALAR_DOUBLE,
  s      IN      SCALAR_DOUBLE);
```

Parameters

Table 212–17 *BLAS_ROT Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1 + (n-1) * \text{abs}(\text{incy}))$
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

BLAS_ROTG Procedures

This procedure returns the Givens rotation of points.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROTG (
  a  IN OUT  SCALAR_DOUBLE,
  b  IN OUT  SCALAR_DOUBLE,
  c  IN OUT  SCALAR_DOUBLE,
  s  IN OUT  SCALAR_DOUBLE);
```

```
UTL_NLA.BLAS_ROTG (
  a  IN OUT  SCALAR_FLOAT,
  b  IN OUT  SCALAR_FLOAT,
  c  IN OUT  SCALAR_FLOAT,
  s  IN OUT  SCALAR_FLOAT);
```

Parameters

Table 212–18 *BLAS_ROT G Procedure Parameters*

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

BLAS_SCAL Procedures

This procedure scales a vector by a constant.

See Also: [BLAS Level 1 \(Vector-Vector Operations\) Subprograms](#) on page 212-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SCAL (
    n          IN  POSITIVEN,
    alpha     IN  SCALAR_DOUBLE,
    x         IN  OUT UTL_NLA_ARRAY_DBL,
    incx      IN  POSITIVEN);
```

```
UTL_NLA.BLAS_SCAL (
    n          IN  POSITIVEN,
    alpha     IN  SCALAR_FLOAT,
    x         IN  OUT UTL_NLA_ARRAY_FLT,
    incx      IN  POSITIVEN);
```

Parameters

Table 212–19 *BLAS_SCAL Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_SPMV Procedures

This procedure performs the matrix-vector operation

$$y := \alpha * A * x + \beta * y$$

where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix, supplied in packed form.

See Also: [BLAS Level 2 \(Matrix-Vector Operations\) Subprograms](#) on page 212-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPMV (
  uplo   IN      flag,
  n      IN      POSITIVEN,
  alpha  IN      SCALAR_DOUBLE,

BLAS_SWAP Procedures

This procedure swaps the contents of two vectors each of size n .

Syntax

```
UTL_NLA.BLAS_SWAP (
  n      IN      POSITIVE,
  x      IN OUT  UTL_NLA_ARRAY_DBL,
  incx   IN      POSITIVE,
  y      IN OUT  UTL_NLA_ARRAY_DBL,
  incy   IN      POSITIVE);
```

```
UTL_NLA.BLAS_SWAP (
  n      IN      POSITIVE,
  x      IN OUT  UTL_NLA_ARRAY_FLT,
  incx   IN      POSITIVE,
  y      IN OUT  UTL_NLA_ARRAY_FLT,
  incy   IN      POSITIVE);
```

Parameters

Table 212–24 *BLAS_SWAP Procedure Parameters*

Parameter	Description
n	Specifies the number of elements of the vectors x and y . n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least $(1 + (n-1) * \text{abs}(\text{incx}))$
incx	Specifies the increment for the elements of x . incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least $(1 + (n-1) * \text{abs}(\text{incy}))$
incy	Specifies the increment for the elements of y . incy must not be zero.

BLAS_SYMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*B*A + beta*C
```

where alpha and beta are scalars, A is a symmetric matrix, and B and C are m by n matrices.

Parameters

Table 212–25 *BLAS_SYMM Procedure Parameters*

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: <ul style="list-style-type: none"> ■ side='L' or 'l' : C := alpha*A*B + beta*C ■ side='R' or 'r' : C := alpha*B*A + beta*C

Table 212–25 (Cont.) BLAS_SYMM Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: <ul style="list-style-type: none"> ■ uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is m when side = 'L' or 'l', and is n otherwise. Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max(1, n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYMV Procedures

This procedure performs the matrix-vector operation

$$y := \alpha * A * x + \beta * y$$

where α and β are scalars, x and y are n element vectors and A is an n by n symmetric matrix.

a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least $\max(1, m)$, otherwise lda must be at least $\max(1, n)$.
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least $\max(1, m)$.

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where a is a band matrix of order n with k_l sub diagonals and k_u superdiagonals, and x and b are n by $nrhs$ matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

$$a = L * U$$

where L is a product of permutation and unit lower triangular matrices with k_l sub diagonals, and U is upper triangular with $k_l + k_u$ superdiagonals. The factored form of a is then used to solve the system of equations

$$a * x = b$$

LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A , or its transpose, using a QR or LQ factorization of A . It is assumed that A has full rank.

The following options are provided:

1. If `TRANS = 'N'` and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem.

$$\text{minimize } || B - A * X ||$$
2. If `TRANS = 'N'` and $m < n$: find the minimum norm solution of an underdetermined system $A * X = B$.
3. If `TRANS = 'T'` and $m \geq n$: find the minimum norm solution of an undetermined system $A^{**T} * X = B$.
4. If `TRANS = 'T'` and $m < n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem $\text{minimize } || B - A^{**T} * X ||$.

LAPACK_GESDD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where SIGMA is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A , they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns $V^* * T$, not V .

lda	The leading dimension of the array a. $lda \geq \max(1, n)$
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row i of the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. $ldb \geq \max(1, n)$
info	<ul style="list-style-type: none"> ▪ = 0 : successful exit ▪ < 0 : if info = -i, the i-th argument had an illegal value ▪ > 0 : if info = i, U(i, i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: <ul style="list-style-type: none"> ▪ 'C': column-major (default) ▪ 'R': row-major

LAPACK_GESVD Procedures

This procedure computes the singular value decomposition (SVD) of a real m by n matrix A , optionally computing the left and/or right singular vectors. The SVD is written

$$A = U * \text{SIGMA} * \text{transpose}(V)$$

where SIGMA is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A , they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns V^{*T} , not V .

Parameters

Table 212–44 LAPACK_GESVD Procedure Parameters

Parameter	Description
jobu	Specifies options for computing all or part of the matrix U : <ul style="list-style-type: none"> ▪ 'A': All m columns of U are returned in array U. ▪ 'S': The first $\min(m, n)$ columns of U (the left singular vectors) are returned in the array U. ▪ 'O': The first $\min(m, n)$ columns of U (the left singular vectors) are overwritten on the array a. $jobu$ and $jobvt$ cannot both be 'O'. ▪ 'N': No columns of U (no left singular vectors) are computed.
jobvt	Specifies options for computing all or part of the matrix V^{*T} : <ul style="list-style-type: none"> ▪ 'A': All n rows of V^{*T} are returned in the array vt. ▪ 'S': The first $\min(m, n)$ rows of V^{*T} (the right singular vectors) are returned in the array vt. ▪ 'O': The first $\min(m, n)$ rows of V^{*T} (the right singular vectors) are overwritten on the array a. $jobvt$ and $jobu$ cannot both be 'O'. ▪ 'N': No rows of V^{*T} (no right singular vectors) are computed.
m	The order of the matrix a . $M \geq 0$.
n	The order of the matrix a . $N \geq 0$.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A . On exit: <ul style="list-style-type: none"> ▪ If $jobu = 'O'$, A is overwritten with the first $\min(m, n)$ columns of U (the left singular vectors, stored columnwise); ▪ If $jobvt = 'O'$, A is overwritten with the first $\min(m, n)$ rows of V^{*T} (the right singular vectors, stored rowwise); ▪ If $jobu.ne.'O'$ and $jobvt.ne.'O'$, the contents of A are destroyed.
lda	The leading dimension of the array a . $lda \geq \max(1, n)$.
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION ($\min(m, n)$). The singular values of A , sorted so that $S(i) \geq S(i+1)$.
u	UTL_NLA_ARRAY_FLT/DBL, DIMENSION ($ldu, ucol$). (ldu, m) if $jobu = 'A'$ or ($ldu, \min(m, n)$) if $jobu = 'S'$. <ul style="list-style-type: none"> ▪ If $jobu = 'A'$, U contains the m by m orthogonal matrix U. ▪ If $jobu = 'S'$, U contains the first $\min(m, n)$ columns of U (the left singular vectors, stored columnwise). ▪ If $jobu = 'N'$ or 'O', U is not referenced.
ldu	The leading dimension of the array U . $ldu \geq 1$. If $jobu = 'S'$ or 'a', $ldu \geq m$.

LAPACK_GEEV Procedures

This procedure computes for an n by n real nonsymmetric matrix A , the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector $v(j)$ of A satisfies $A * v(j) = \text{lambda}(j) * v(j)$ where $\text{lambda}(j)$ is its eigenvalue.
- The left eigenvector $u(j)$ of A satisfies $u(j)**H * A = \text{lambda}(j) * u(j)**H$ where $u(j)**H$ denotes the conjugate transpose of $u(j)$.

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by $nrhs$ matrices.

a is factored as $A = L * D * L^{*T}$, and the factored form of a is then used to solve the system of equations.

LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where a is an n by n symmetric matrix stored in packed format, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$$A = U * D * U^{**T}, \text{ if } \text{UPLO} = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if } \text{UPLO} = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations $A * X = B$.

LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations

$$a * x = b$$

where a is an n by n symmetric matrix, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor A as

$$A = U * D * U^{**T}, \text{ if } \text{UPLO} = 'U'$$

or

$$A = L * D * L^{**T}, \text{ if } \text{UPLO} = 'L'$$

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations $A * X = B$.

The UTL_RAW package provides SQL functions for manipulating RAW datatypes.

This chapter contains the following topics:

- [Using UTL_RAW](#)
 - Overview
 - Operational Notes
- [Summary of UTL_RAW Subprograms](#)

Using UTL_RAW

- [Overview](#)
- [Operational Notes](#)

Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the `hextoraw` and `rawtohex` functions.

Summary of UTL_RAW Subprograms

Table 213–1 UTL_RAW Package Subprograms

Subprogram	Description
BIT_AND Function on page 213-7	Performs bitwise logical "and" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "anded" result RAW
BIT_COMPLEMENT Function on page 213-8	Performs bitwise logical "complement" of the values in RAW <i>r</i> and returns the "complement'ed" result RAW
BIT_OR Function on page 213-9	Performs bitwise logical "or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "or'd" result RAW
BIT_XOR Function on page 213-10	Performs bitwise logical "exclusive or" of the values in RAW <i>r1</i> with RAW <i>r2</i> and returns the "xor'd" result RAW
CAST_FROM_BINARY_DOUBLE Function on page 213-11	Returns the binary representation of a BINARY_DOUBLE (in RAW)
CAST_FROM_BINARY_FLOAT Function on page 213-12	Returns the binary representation of a BINARY_FLOAT (in RAW)
CAST_FROM_BINARY_INTEGER Function on page 213-13	Returns the binary representation of a BINARY_INTEGER (in RAW)
CAST_FROM_NUMBER Function on page 213-14	Returns the binary representation of a NUMBER (in RAW)
CAST_TO_BINARY_DOUBLE Function on page 213-15	Casts the binary representation of a RAW into a BINARY_DOUBLE
CAST_TO_BINARY_FLOAT Function on page 213-17	Casts the binary representation of a RAW into a BINARY_FLOAT
CAST_TO_BINARY_INTEGER Function on page 213-19	Casts the binary representation of a BINARY_INTEGER (in RAW) into a BINARY_INTEGER
CAST_TO_NUMBER Function on page 213-20	Casts the binary representation of a NUMBER (in RAW) into a NUMBER
CAST_TO_RAW Function on page 213-21	Converts a VARCHAR2 represented using <i>n</i> data bytes into a RAW with <i>n</i> data bytes
CAST_TO_VARCHAR2 Function on page 213-22	Converts a RAW represented using <i>n</i> data bytes into VARCHAR2 with <i>n</i> data bytes
CAST_TO_NVARCHAR2 Function on page 213-23	Converts a RAW represented using <i>n</i> data bytes into NVARCHAR2 with <i>n</i> data bytes
COMPARE Function on page 213-24	Compares RAW <i>r1</i> against RAW <i>r2</i>
CONCAT Function on page 213-25	Concatenates up to 12 RAWs into a single RAW
CONVERT Function on page 213-26	Converts RAW <i>r</i> from character set <i>from_charset</i> to character set <i>to_charset</i> and returns the resulting RAW
COPIES Function on page 213-27	Returns <i>n</i> copies of <i>r</i> concatenated together
LENGTH Function on page 213-28	Returns the length in bytes of a RAW <i>r</i>

Table 213–1 (Cont.) UTL_RAW Package Subprograms

Subprogram	Description
OVERLAY Function on page 213-29	Overlays the specified portion of target RAW with overlay RAW, starting from byte position <code>pos</code> of target and proceeding for <code>len</code> bytes
REVERSE Function on page 213-31	Reverses a byte sequence in RAW <code>r</code> from end to end
SUBSTR Function on page 213-32	Returns <code>len</code> bytes, starting at <code>pos</code> from RAW <code>r</code>
TRANSLATE Function on page 213-34	Translates the bytes in the input RAW <code>r</code> according to the bytes in the translation RAWs <code>from_set</code> and <code>to_set</code>
TRANSLITERATE Function on page 213-36	Converts the bytes in the input RAW <code>r</code> according to the bytes in the transliteration RAWs <code>from_set</code> and <code>to_set</code>
XRANGE Function on page 213-38	Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value <code>start_byte</code> and ending with the value <code>end_byte</code>

BIT_AND Function

This function performs bitwise logical "and" of the values in RAW *r1* with RAW *r2* and returns the "anded" result RAW.

Syntax

```
UTL_RAW.BIT_AND (
    r1 IN RAW,
    r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–2 BIT_AND Function Parameters

Parameter	Description
<i>r1</i>	RAW to "and" with <i>r2</i> .
<i>r2</i>	RAW to "and" with <i>r1</i> .

Return Values

Table 213–3 BIT_AND Function Return Values

Return	Description
RAW	Containing the "and" of <i>r1</i> and <i>r2</i> .
NULL	Either <i>r1</i> or <i>r2</i> input parameter was NULL.

Usage Notes

If *r1* and *r2* differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW *r* and returns the complement'ed result RAW. The result length equals the input RAW *r* length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (  
  r IN RAW)  
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–4 BIT_COMPLEMENT Function Parameters

Parameter	Description
<i>r</i>	RAW to perform "complement" operation.

Return Values

Table 213–5 BIT_COMPLEMENT Function Return Values

Return	Description
RAW	The "complement" of <i>r</i> 1.
NULL	If <i>r</i> input parameter was NULL.

BIT_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR (
  r1 IN RAW,
  r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–6 BIT_OR Function Parameters

Parameters	Description
r1	RAW to "or" with r2.
r2	RAW to "or" with r1.

Return Values

Table 213–7 BIT_OR Function Return Values

Return	Description
RAW	Containing the "or" of r1 and r2.
NULL	Either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW *r1* with RAW *r2* and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (  
    r1 IN RAW,  
    r2 IN RAW)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–8 BIT_XOR Function Parameters

Parameter	Description
<i>r1</i>	RAW to "xor" with <i>r2</i> .
<i>r2</i>	RAW to "xor" with <i>r1</i> .

Return Values

Table 213–9 BIT_XOR Function Return Values

Return	Description
RAW	Containing the "xor" of <i>r1</i> and <i>r2</i> .
NULL	If either <i>r1</i> or <i>r2</i> input parameter was NULL.

Usage Notes

If *r1* and *r2* differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

CAST_FROM_BINARY_DOUBLE Function

This function returns the binary representation of a BINARY_DOUBLE (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
  n          IN BINARY_DOUBLE,
  endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–10 CAST_FROM_BINARY_DOUBLE Function Parameters

Parameter	Description
n	The BINARY_DOUBLE value.
endianness	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
 - byte 0: bit 63 ~ bit 56
 - byte 1: bit 55 ~ bit 48
 - byte 2: bit 47 ~ bit 40
 - byte 3: bit 39 ~ bit 32
 - byte 4: bit 31 ~ bit 24
 - byte 5: bit 23 ~ bit 16
 - byte 6: bit 15 ~ bit 8
 - byte 7: bit 7 ~ bit 0
- The parameter endianness describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

CAST_FROM_BINARY_FLOAT Function

This function returns the binary representation of a `BINARY_FLOAT` (in `RAW`).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
  n          IN BINARY_FLOAT,
  endianness IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–11 CAST_FROM_BINARY_FLOAT Function Parameters

Parameter	Description
<code>n</code>	The <code>BINARY_FLOAT</code> value.
<code>endianness</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation (`RAW`) of the `BINARY_FLOAT` value, or `NULL` if the input is `NULL`.

Usage Notes

- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:
 - byte 0: bit 31 ~ bit 24
 - byte 1: bit 23 ~ bit 16
 - byte 2: bit 15 ~ bit 8
 - byte 3: bit 7 ~ bit 0
- The parameter `endianness` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

	rb0	rb1	rb2	rb3
big_endian	<code>fb0</code>	<code>fb1</code>	<code>fb2</code>	<code>fb3</code>
little_endian	<code>fb3</code>	<code>fb2</code>	<code>fb1</code>	<code>fb0</code>

- In case of machine-endian, the 4 bytes of the `BINARY_FLOAT` argument are copied straight across into the `RAW` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_FROM_BINARY_INTEGER Function

This function returns the binary representation of a `BINARY_INTEGER` (in `RAW`).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
  n          IN BINARY_INTEGER
  endianness IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–12 *CAST_FROM_BINARY_INTEGER Function Parameters*

Parameter	Description
<code>n</code>	The <code>BINARY_INTEGER</code> value.
<code>endianness</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation of the `BINARY_INTEGER` value.

CAST_FROM_NUMBER Function

This function returns the binary representation of a NUMBER (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (  
    n IN NUMBER)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references (cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–13 *CAST_FROM_NUMBER Function Parameters*

Parameter	Description
n	The NUMBER value.

Return Values

The binary representation of the NUMBER value.

CAST_TO_BINARY_DOUBLE Function

This function casts the binary representation of a `BINARY_DOUBLE` (in `RAW`) into a `BINARY_DOUBLE`.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
    r          IN RAW
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–14 CAST_TO_BINARY_DOUBLE Function Parameters

Parameter	Description
<code>r</code>	The binary representation of a <code>BINARY_INTEGER</code> .
<code>endianness</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The `BINARY_DOUBLE` value.

Usage Notes

- If the `RAW` argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is `-0`, `+0` is returned. If the result is `NaN`, the value `BINARY_DOUBLE_NAN` is returned.
- If the `RAW` argument is less than 8 bytes, a `VALUE_ERROR` exception is raised.
- An 8-byte `binary_double` value maps to the IEEE 754 double-precision format as follows:
 - byte 0: bit 63 ~ bit 56
 - byte 1: bit 55 ~ bit 48
 - byte 2: bit 47 ~ bit 40
 - byte 3: bit 39 ~ bit 32
 - byte 4: bit 31 ~ bit 24
 - byte 5: bit 23 ~ bit 16
 - byte 6: bit 15 ~ bit 8
 - byte 7: bit 7 ~ bit 0
- The parameter `endianness` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb7` refer to the bytes in `raw` and `db0 ~ db7` refer to the bytes in `BINARY_DOUBLE`.

	<code>rb0</code>	<code>rb1</code>	<code>rb2</code>	<code>rb3</code>	<code>rb4</code>	<code>rb5</code>	<code>rb6</code>	<code>rb7</code>
big_endian	<code>db0</code>	<code>db1</code>	<code>db2</code>	<code>db3</code>	<code>db4</code>	<code>db5</code>	<code>db6</code>	<code>db7</code>
little_endian	<code>db7</code>	<code>db6</code>	<code>db5</code>	<code>db4</code>	<code>db3</code>	<code>db2</code>	<code>db1</code>	<code>db0</code>

- In case of machine-endian, the 8 bytes of the RAW argument are copied straight across into the BINARY_DOUBLE return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_FLOAT Function

This function casts the binary representation of a `BINARY_FLOAT` (in `RAW`) into a `BINARY_FLOAT`.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
    r          IN RAW
    endianness IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–15 CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
<code>r</code>	The binary representation of a <code>BINARY_FLOAT</code> .
<code>endianness</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The `BINARY_FLOAT` value.

Usage Notes

- If the `RAW` argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is `-0`, `+0` is returned. If the result is `NaN`, the value `BINARY_FLOAT_NAN` is returned.
- If the `RAW` argument is less than 4 bytes, a `VALUE_ERROR` exception is raised.
- A 4-byte `binary_float` value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit 8
byte 3: bit 7 ~ bit 0
```
- The parameter `endianness` describes how the bytes of `BINARY_FLOAT` are mapped to the bytes of `RAW`. In the following matrix, `rb0 ~ rb3` refer to the bytes in `RAW` and `fb0 ~ fb3` refer to the bytes in `BINARY_FLOAT`.

	rb0	rb1	rb2	rb3
big_endian	<code>fb0</code>	<code>fb1</code>	<code>fb2</code>	<code>fb3</code>
little_endian	<code>fb3</code>	<code>fb2</code>	<code>fb1</code>	<code>fb0</code>

- In case of machine-endian, the 4 bytes of the `RAW` argument are copied straight across into the `BINARY_FLOAT` return value. The effect is the same if the user has

passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_INTEGER Function

This function casts the binary representation of a `BINARY_INTEGER` (in `RAW`) into a `BINARY_INTEGER`.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
    r          IN RAW
    endianness IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–16 *CAST_TO_BINARY_INTEGER Function Parameters*

Parameter	Description
<code>r</code>	The binary representation of a <code>BINARY_INTEGER</code> .
<code>endianness</code>	A <code>PLS_INTEGER</code> representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The `BINARY_INTEGER` value

CAST_TO_NUMBER Function

This function casts the binary representation of a NUMBER (in RAW) into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (  
    r IN RAW)  
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–17 *CAST_TO_NUMBER function Parameters*

Parameter	Description
r	The binary representation of a NUMBER

Return Values

The NUMBER value.

CAST_TO_RAW Function

This function converts a VARCHAR2 represented using *n* data bytes into a RAW with *n* data bytes. The data is not modified in any way; only its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
    c IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–18 CAST_TO_RAW Function Parameters

Parameter	Description
c	VARCHAR2 to be changed to a RAW.

Return Values

Table 213–19 CAST_TO_RAW Function Return Values

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field.
NULL	If c input parameter was NULL.

CAST_TO_VARCHAR2 Function

This function converts a RAW represented using *n* data bytes into VARCHAR2 with *n* data bytes.

Note: When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (  
    r IN RAW)  
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–20 CAST_TO_VARCHAR2 Function Parameters

Parameter	Description
<i>r</i>	RAW (without leading length field) to be changed to a VARCHAR2.

Return Values

Table 213–21 CAST_TO_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW.
NULL	If <i>r</i> input parameter was NULL.

CAST_TO_NVARCHAR2 Function

This function converts a RAW represented using *n* data bytes into NVARCHAR2 with *n* data bytes.

Note: When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
  r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–22 CAST_TO_NVARCHAR2 Function Parameters

Parameter	Description
<i>r</i>	RAW (without leading length field) to be changed to a NVARCHAR2).

Return Values

Table 213–23 CAST_TO_NVARCHAR2 Function Return Values

Return	Description
NVARCHAR2	Containing having the same data as the input RAW.
NULL	If <i>r</i> input parameter was NULL.

COMPARE Function

This function compares RAW *r1* against RAW *r2*. If *r1* and *r2* differ in length, then the shorter RAW is extended on the right with *pad* if necessary.

Syntax

```
UTL_RAW.COMPARE (
  r1  IN RAW,
  r2  IN RAW,
  pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–24 COMPARE Function Parameters

Parameter	Description
<i>r1</i>	1st RAW to be compared, may be NULL or 0 length.
<i>r2</i>	2nd RAW to be compared, may be NULL or 0 length.
<i>pad</i>	This is an optional parameter. Byte to extend whichever of <i>r1</i> or <i>r2</i> is shorter. The default: <i>x'00'</i>

Return Values

Table 213–25 COMPARE Function Return Values

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte.

CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
  r1  IN RAW DEFAULT NULL,
  r2  IN RAW DEFAULT NULL,
  r3  IN RAW DEFAULT NULL,
  r4  IN RAW DEFAULT NULL,
  r5  IN RAW DEFAULT NULL,
  r6  IN RAW DEFAULT NULL,
  r7  IN RAW DEFAULT NULL,
  r8  IN RAW DEFAULT NULL,
  r9  IN RAW DEFAULT NULL,
  r10 IN RAW DEFAULT NULL,
  r11 IN RAW DEFAULT NULL,
  r12 IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

Table 213–26 *CONCAT Function Return Values*

Return	Description
RAW	Containing the items concatenated.

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

CONVERT Function

This function converts RAW *r* from character set *from_charset* to character set *to_charset* and returns the resulting RAW.

Both *from_charset* and *to_charset* must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
    r           IN RAW,
    to_charset  IN VARCHAR2,
    from_charset IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–27 CONVERT Function Parameters

Parameter	Description
<i>r</i>	RAW byte-string to be converted.
<i>to_charset</i>	Name of Globalization Support character set to which <i>r</i> is converted.
<i>from_charset</i>	Name of Globalization Support character set in which <i>r</i> is supplied.

Return Values

Table 213–28 CONVERT Function Return Values

Return	Description
RAW	Byte string <i>r</i> converted according to the specified character sets.

Exceptions

Table 213–29 CONVERT Function Exceptions

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> - <i>r</i> missing, NULL, or 0 length - <i>from_charset</i> or <i>to_charset</i> missing, NULL, or 0 length - <i>from_charset</i> or <i>to_charset</i> names invalid or unsupported

COPIES Function

This function returns *n* copies of *r* concatenated together.

Syntax

```
UTL_RAW.COPIES (
  r IN RAW,
  n IN NUMBER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–30 COPIES Function Parameters

Parameters	Description
<i>r</i>	RAW to be copied
<i>n</i>	Number of times to copy the RAW (must be positive).

Return Values

This returns the RAW copied *n* times.

Exceptions

Table 213–31 COPIES Function Exceptions

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none"> - <i>r</i> is missing, NULL or 0 length - <i>n</i> < 1 - Length of result exceeds maximum length of a RAW

LENGTH Function

This function returns the length in bytes of a RAW *r*.

Syntax

```
UTL_RAW.LENGTH (  
    r IN RAW)  
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–32 LENGTH Function Parameters

Parameter	Description
<i>r</i>	The RAW byte stream to be measured.

Return Values

Table 213–33 LENGTH Function Return Values

Return	Description
NUMBER	The current length of the RAW.

OVERLAY Function

This function overlays the specified portion of target RAW with `overlay_str` RAW, starting from byte position `pos` of `target` and proceeding for `len` bytes.

Syntax

```
UTL_RAW.OVERLAY (
  overlay_str IN RAW,
  target      IN RAW,
  pos        IN BINARY_INTEGER DEFAULT 1,
  len        IN BINARY_INTEGER DEFAULT NULL,
  pad        IN RAW             DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–34 OVERLAY Function Parameters

Parameters	Description
<code>overlay_str</code>	Byte-string used to overlay target.
<code>target</code>	Byte-string which is to be overlaid.
<code>pos</code>	Position in target (numbered from 1) to start overlay.
<code>len</code>	The number of target bytes to overlay.
<code>pad</code>	Pad byte used when overlay <code>len</code> exceeds <code>overlay_str</code> length or <code>pos</code> exceeds target length.

Defaults and Optional Parameters

Table 213–35 OVERLAY Function Optional Parameters

Optional Parameter	Description
<code>pos</code>	1
<code>len</code>	To the length of <code>overlay_str</code>
<code>pad</code>	<code>x'00'</code>

Return Values

Table 213–36 OVERLAY Function Return Values

Return	Description
RAW	The target byte_string overlaid as specified.

Usage Notes

If `overlay_str` has less than `len` bytes, then it is extended to `len` bytes using the `pad` byte. If `overlay_str` exceeds `len` bytes, then the extra bytes in `overlay_str` are ignored. If `len` bytes beginning at position `pos` of `target` exceeds the length of `target`, then `target` is extended to contain the entire length of `overlay_str`.

If `len` is specified, it must be greater than or equal to 0. If `pos` is specified, it must be greater than or equal to 1. If `pos` exceeds the length of `target`, then `target` is padded with `pad` bytes to position `pos`, and `target` is further extended with `overlay_str` bytes.

Exceptions

Table 213–37 *OVERLAY Function Exceptions*

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none">- <code>overlay_str</code> is NULL or has 0 length- Target is missing or undefined- Length of target exceeds maximum length of a RAW- <code>len</code> < 0- <code>pos</code> < 1

REVERSE Function

This function reverses a byte sequence in RAW *r* from end to end. For example, `x'0102F3'` would be reversed to `x'F30201'`, and `'xyz'` would be reversed to `'zyx'`. The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (
  r IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–38 REVERSE Function Parameters

Parameter	Description
<i>r</i>	RAW to reverse.

Return Values

Table 213–39 REVERSE Function Return Values

Return	Description
RAW	Containing the "reverse" of <i>r</i> .

Exceptions

Table 213–40 REVERSE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length.

SUBSTR Function

This function returns `len` bytes, starting at `pos` from RAW `r`.

Syntax

```
UTL_RAW.SUBSTR (
  r      IN RAW,
  pos    IN BINARY_INTEGER,
  len    IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–41 SUBSTR Function Parameters

Parameter	Description
<code>r</code>	The RAW byte-string from which a portion is extracted.
<code>pos</code>	The byte position in <code>r</code> at which to begin extraction.
<code>len</code>	The number of bytes from <code>pos</code> to extract from <code>r</code> (optional).

Defaults and Optional Parameters

Table 213–42 SUBSTR Function Exceptions

Optional Parameter	Description
<code>len</code>	Position <code>pos</code> through to the end of <code>r</code> .

Return Values

Table 213–43 SUBSTR Function Return Values

Return	Description
portion of <code>r</code>	Beginning at <code>pos</code> for <code>len</code> bytes long.
NULL	<code>r</code> input parameter was NULL.

Usage Notes

If `pos` is positive, then SUBSTR counts from the beginning of `r` to find the first byte. If `pos` is negative, then SUBSTR counts backward from the end of the `r`. The value `pos` cannot be 0.

If `len` is omitted, then SUBSTR returns all bytes to the end of `r`. The value `len` cannot be less than 1.

Exceptions

Table 213–44 *SUBSTR Function Exceptions*

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: <ul style="list-style-type: none">▪ pos = 0 or > length of r▪ len < 1 or > length of r - (pos-1)

TRANSLATE Function

This function translates the bytes in the input RAW *r* according to the bytes in the translation RAWs *from_set* and *to_set*. If a byte in *r* has a matching byte in *from_set*, then it is replaced by the byte in the corresponding position in *to_set*, or deleted.

Bytes in *r*, but undefined in *from_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from_set* is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
  r          IN RAW,
  from_set  IN RAW,
  to_set    IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–45 TRANSLATE Function Parameters

Parameter	Description
<i>r</i>	RAW source byte-string to be translated.
<i>from_set</i>	RAW byte-codes to be translated, if present in <i>r</i> .
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_str</i> bytes are translated.

Return Values

Table 213–46 TRANSLATE Function Return Values

Return	Description
RAW	Translated byte-string.

Usage Notes

If *to_set* is shorter than *from_set*, then the extra *from_set* bytes have no translation correspondence and any bytes in *r* matching.

Note: Difference from TRANSLITERATE:

- Translation RAWs have no defaults.
 - *r* bytes undefined in the *to_set* translation RAW are deleted.
 - Result RAW may be shorter than input RAW *r*.
-

Exceptions

Table 213-47 *TRANSLATE Function Exceptions*

Error	Description
VALUE_ERROR	Either: <ul style="list-style-type: none">- r is NULL or has 0 length- from_set is NULL or has 0 length- to_set is NULL or has 0 length

TRANSLITERATE Function

This function converts the bytes in the input RAW *r* according to the bytes in the transliteration RAWs *from_set* and *to_set*. Successive bytes in *r* are looked up in the *from_set*, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the *to_set*, or the *pad* byte when no correspondence exists.

Bytes in *r*, but undefined in *from_set*, are copied to the result. Only the first (leftmost) occurrence of a byte in *from_set* is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as *r*.

Syntax

```
UTL_RAW.TRANSLITERATE (
  r          IN RAW,
  to_set     IN RAW DEFAULT NULL,
  from_set   IN RAW DEFAULT NULL,
  pad       IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–48 TRANSLITERATE Function Parameters

Parameter	Description
<i>r</i>	RAW input byte-string to be converted.
<i>from_set</i>	RAW byte-codes to be converted, if present in <i>r</i> (any length).
<i>to_set</i>	RAW byte-codes to which corresponding <i>from_set</i> bytes are converted (any length).
<i>pad</i>	1 byte used when <i>to-set</i> is shorter than the <i>from_set</i> .

Defaults and Optional Parameters

Table 213–49 TRANSLITERATE Function Optional Parameters

Optional Parameter	Description
<i>from_set</i>	x'f00' through x'fff'
<i>to_set</i>	To the NULL string and effectively extended with <i>pad</i> to the length of <i>from_set</i> as necessary.
<i>pad</i>	x'00'.

Return Values

Table 213–50 TRANSLITERATE Function Return Values

Return	Description
RAW	Converted byte-string.

Usage Notes

If the `to_set` is shorter than the `from_set`, then the `pad` byte is placed in the result RAW when a selected `from_set` byte has no corresponding `to_set` byte (as if the `to_set` were extended to the same length as the `from_set` with `pad` bytes).

Note: Difference from `TRANSLATE` :

- `r` bytes undefined in `to_set` are padded.

- Result RAW is always same length as input RAW `r`.

Exceptions

Table 213–51 *TRANSLITERATE Function Exceptions*

Error	Description
VALUE_ERROR	R is NULL or has 0 length.

XRANGE Function

This function returns a RAW containing all valid 1-byte encodings in succession, beginning with the value `start_byte` and ending with the value `end_byte`. If `start_byte` is greater than `end_byte`, then the succession of resulting bytes begins with `start_byte`, wraps through `x fff f` to `x f00 f`, and ends at `end_byte`. If specified, `start_byte` and `end_byte` must be single-byte RAWs.

Syntax

```
UTL_RAW.XRANGE (
  start_byte IN RAW DEFAULT NULL,
  end_byte   IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 213–52 XRANGE Function Parameters

Parameters	Description
<code>start_byte</code>	Beginning byte-code value of resulting sequence.
<code>end_byte</code>	Ending byte-code value of resulting sequence.

Defaults and Optional Parameters

```
start_byte - x f00 f
end_byte   - x fff f
```

Return Values

Table 213–53 XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings.

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- [Using UTL_RECOMP](#)
 - Overview
 - Operational Notes
 - Examples
- [Summary of UTL_RECOMP Subprograms](#)

Using UTL_RECOMP

- [Overview](#)
- [Operational Notes](#)
- [Examples](#)

Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to [RECOMP_PARALLEL Procedure](#).

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using SQL*PLUS.
- You must be connected AS SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
 - STANDARD (standard.sql)
 - DBMS_STANDARD (dbmsstdx.sql)
 - DBMS_JOB (dbmsjob.sql)
 - DBMS_RANDOM (dbmsrand.sql)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

Examples

Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

Summary of UTL_RECOMP Subprograms

Table 214–1 UTL_RECOMP Package Subprograms

Subprogram	Description
RECOMP_PARALLEL Procedure on page 214-7	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
RECOMP_SERIAL Procedure on page 214-8	Recompiles invalid objects in a given schema or all invalid objects in the database

RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the `DBA_Dependencies` view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
  threads IN PLS_INTEGER DEFAULT NULL,
  schema  IN VARCHAR2     DEFAULT NULL,
  flags   IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 214–2 RECOMP_PARALLEL Procedure Parameters

Parameter	Description
threads	The number of recompile threads to run in parallel. If <code>NULL</code> , use the value of <code>'job_queue_processes'</code> .
schema	The schema in which to recompile invalid objects. If <code>NULL</code> , all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(  
    schema IN VARCHAR2 DEFAULT NULL,  
    flags  IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 214–3 RECOMP_SERIAL Procedure Parameters

Parameter	Description
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- [Using UTL_REF](#)
 - Overview
 - Security Model
 - Types
 - Exceptions
- [Summary of UTL_REF Subprograms](#)

Using UTL_REF

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)

Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

Security Model

The procedural option is needed to use this package. This package must be created under `SYS` (connect/as sysdba). Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

You can use the `UTL_REF` package from stored PL/SQL procedures/packages on the server, as well as from client-side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, `UTL_REF` verifies that the invoker has the appropriate privileges to access the object pointed to by the `REF`.

Note: This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if `UTL_REF` is defined under user `SYS`, and user `A` invokes `UTL_REF.SELECT` to select an object from a reference, then user `A` (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, `UTL_REF` operates with the privileges of the client session under which the PL/SQL execution is being done.

Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (  
    name    VARCHAR2(20),  
    id      NUMBER,  
  
    member function GET_ID  
        (name VARCHAR2)  
        RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID()`.

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

Exceptions

Exceptions can be returned during execution of `UTL_REF` functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
 1. The object has been deleted, or the given reference is dangling (invalid).
 2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the `UTL_REF` subprogram must have the proper privilege on the object that is being selected or modified.

Table 215–1 *UTL_REF Exceptions*

Exceptions	Description
<code>errnum == 942</code>	Insufficient privileges.
<code>errnum == 1031</code>	Insufficient privileges.
<code>errnum == 8177</code>	Unable to serialize, if in a serializable transaction.
<code>errnum == 60</code>	Deadlock detected.
<code>errnum == 1403</code>	No data found (if the <code>REF</code> is <code>NULL</code> , and so on.).

The `UTL_REF` package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

Summary of UTL_REF Subprograms

Table 215–2 UTL_REF Package Subprograms

Subprogram	Description
DELETE_OBJECT Procedure on page 215-8	Deletes an object given a reference
LOCK_OBJECT Procedure on page 215-10	Locks an object given a reference
SELECT_OBJECT Procedure on page 215-11	Selects an object given a reference
UPDATE_OBJECT Procedure on page 215-12	Updates an object given a reference

DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
    reference IN REF "<typename>");
```

Parameters

Table 215–3 DELETE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to delete.

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

```
CREATE OR REPLACE TYPE Person_t (
    name    VARCHAR2(64),
    gender  CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
    END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.

```
    thePerson REF Person_t,
    empno     NUMBER(5),
    deptREF   Department_t,
    mgrREF    Employee_t,
    reminders StringArray_t,
```

```

MEMBER PROCEDURE setAddress(addr IN Address_t),
MEMBER procedure addReminder(reminder VARCHAR2);
);

```

```

CREATE TYPE BODY Employee_t (
MEMBER PROCEDURE setAddress(addr IN Address_t) IS
myMgr Employee_t;
meAsPerson Person_t;
BEGIN

```

Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

```

UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
meAsPerson.setAddress(addr);

```

Delegate to thePerson:

```

UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
if mgr is NOT NULL THEN

```

Give the manager a reminder:

```

UTL_REF.LOCK_OBJECT(mgr);
UTL_REF.SELECT_OBJECT(mgr, myMgr);
myMgr.addReminder
('Update address in the employee directory for' ||
thePerson.name || ', new address: ' || addr.asString);
UTL_REF.UPDATE_OBJECT(mgr, myMgr);
END IF;
EXCEPTION
WHEN OTHERS THEN
errnum := SQLCODE;
errmsg := SUBSTR(SQLERRM, 1, 200);

```

LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
 WHERE REF(t) = reference
 FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT (
  reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
  reference IN REF "<typename>",
  object    IN OUT "<typename>");
```

Parameters

Table 215–4 LOCK_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to lock.
object	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

Exceptions

May be raised.

SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
    reference IN REF "<typename>",
    object    IN OUT "<typename>");
```

Parameters

Table 215–5 *SELECT_OBJECT Procedure Parameters*

Parameter	Description
reference	Reference to the object to select or retrieve.
object	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

Exceptions

May be raised.

UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
    reference IN REF "<typename>",
    object    IN    "<typename>");
```

Parameters

Table 215–6 UPDATE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to update.
object	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

Exceptions

May be raised.

The UTL_SMTP package is designed for sending electronic mails (emails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

See Also: How to use the SMTP package to send email in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- [Using UTL_SMTP](#)
 - Overview
 - Security Model
 - Types
 - Reply Codes
 - Exceptions
 - Rules and Limits
 - Examples
- [Summary of UTL_SMTP Subprograms](#)

Using UTL_SMTP

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Reply Codes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

Overview

The protocol consists of a set of commands for an email client to dispatch emails to a SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and will raise an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) will be converted to US7ASCII before it is sent over the wire to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the `DATA` command may be transferred in full 8 bits, but the rest of the SMTP command and response should be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to RAW and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.

`UTL_SMTP` provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, `UTL_SMTP` does not have the functionality to implement an SMTP server for an email clients to send emails using SMTP.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see [Managing Fine-grained Access to External Network Services](#) in [Oracle Database Security Guide](#)

Types

- [CONNECTION Record Type](#)
- [REPLY, REPLIES Record Types](#)

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
  host          VARCHAR2(255),      -- remote host name
  port          PLS_INTEGER,       -- remote port number
  tx_timeout    PLS_INTEGER,       -- Transfer time out (in seconds)
  private_tcp_con utl_tcp.connection, -- private, for implementation use
  private_state PLS_INTEGER        -- private, for implementation use
);
```

Fields

Table 216–1 CONNECTION Record Type Fields

Field	Description
host	The name of the remote host when connection is established. NULL when no connection is established.
port	The port number of the remote SMTP server connected. NULL when no connection is established.
tx_timeout	The time in seconds that the UTL_SMTP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.
private_tcp_con	Private, for implementation use only. You should not modify this field.
private_state	Private, for implementation use only. You should not modify this field.

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with `open_connection`. Changing the values of these fields has no effect on the connection. The fields `private_xxx` are for implementation use only. You should not modify these fields.

REPLY, REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (  
    code    PLS_INTEGER,      -- 3-digit reply code  
    text    VARCHAR2(508)     -- text message  
);  
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER; -- multiple reply lines
```

Fields**Table 216–2 REPLY, REPLIES Record Type Fields**

Field	Description
code	The 3-digit reply code.
text	The text message of the reply.

Reply Codes

The following is a list of the SMTP reply codes.

Table 216–3 SMTP Reply Codes

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; will forward to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but will take message for this user and attempt delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF> . <CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This may be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.

Table 216–3 (Cont.) SMTP Reply Codes

Reply Code	Meaning
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421- service not available.

Table 216-4 UTL_SMTP Exceptions

INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than <code>write_data</code> , <code>write_raw_data</code> or <code>close_data</code> after <code>open_data</code> is called, or calling <code>write_data</code> , <code>write_raw_data</code> or <code>close_data</code> without first calling <code>open_data</code> .
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range.
PERMANENT_ERROR	Raised when receiving a reply code in 500 range.

Rules and Limits

No limitation or range-checking is imposed by the API. However, you should be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

Table 216–5 SMTP Size Limitation

Element	Size Limitation
user	The maximum total length of a user name is 64 characters.
domain	The maximum total length of a domain name or number is 64 characters.
path	The maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators).
command line	The maximum total length of a command line including the command word and the <CRLF> is 512 characters.
reply line	The maximum total length of a reply line including the reply code and the <CRLF> is 512 characters.
text line	The maximum total length of a text line including the <CRLF> is 1000 characters (but not counting the leading dot duplicated for transparency).
recipients buffer	The maximum total number of recipients that must be buffered is 100 recipients.

Examples

The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```

DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',      '"Sender" <sender@foo.com>');
  send_header('To',        '"Recipient" <recipient@foo.com>');
  send_header('Subject',  'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
  BEGIN
    UTL_SMTP.QUIT(c);
  EXCEPTION
    WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
      NULL; -- When the SMTP server is down or unavailable, we don't have
            -- a connection to the server. The QUIT call will raise an
            -- exception that we can ignore.
  END;
  raise_application_error(-20000,
    'Failed to send mail due to the following error: ' || sqlerrm);
END;

```

Summary of UTL_SMTP Subprograms

Table 216–6 UTL_SMTP Package Subprograms

Subprogram	Description
CLOSE_DATA Function and Procedure on page 216-13	Closes the data session
COMMAND Function and Procedure on page 216-14	Performs a generic SMTP command
COMMAND_REPLIES Function on page 216-15	Performs initial handshaking with SMTP server after connecting
DATA Function and Procedure on page 216-16	Performs initial handshaking with SMTP server after connecting, with extended information returned
EHLO Function and Procedure on page 216-17	Performs initial handshaking with SMTP server after connecting, with extended information returned
HELO Function and Procedure on page 216-18	Performs initial handshaking with SMTP server after connecting
HELP Function on page 216-19	Sends HELP command
MAIL Function and Procedure on page 216-20	Initiates a mail transaction with the server, the destination is a mailbox
NOOP Function and Procedure on page 216-21	The null command
OPEN_CONNECTION Functions on page 216-22	Opens a connection to an SMTP server
OPEN_DATA Function and Procedure on page 216-24	Sends the DATA command
QUIT Function and Procedure on page 216-25	Terminates an SMTP session and disconnects from the server
RCPT Function on page 216-26	Specifies the recipient of an e-mail message
RSET Function and Procedure on page 216-27	Terminates the current mail transaction
VERFY Function on page 216-28	Verifies the validity of a destination e-mail address
WRITE_DATA Procedure on page 216-29	Writes a portion of the e-mail message
WRITE_RAW_DATA Procedure on page 216-31	Writes a portion of the e-mail message with RAW data

CLOSE_DATA Function and Procedure

The CLOSE_DATA call ends the e-mail message by sending the sequence <CR><LF> . <CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.CLOSE_DATA (
    c      IN OUT NOCOPY connection);
```

Parameters

Table 216–7 CLOSE_DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 216–8 CLOSE_DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

CLOSE_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

COMMAND Function and Procedure

This function/procedure performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
  c      IN OUT NOCOPY  connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
  c      IN OUT NOCOPY  connection,
  cmd    IN              VARCHAR2,
  arg    IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216–9 *COMMAND Function and Procedure Parameters*

Parameter	Description
c	The SMTP connection.
cmd	The SMTP command to send to the server.
arg	The optional argument to the SMTP argument. A space will be inserted between cmd and arg.

Return Values

Table 216–10 *COMMAND Function and Procedure Return Values*

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

COMMAND_REPLIES Function

This function performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
  c      IN OUT NOCOPY  connection,
  cmd   IN              VARCHAR2,
  arg   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 216–11 *COMMAND_REPLIES Function Parameters*

Parameter	Description
c	The SMTP connection.
cmd	The SMTP command to send to the server.
arg	The optional argument to the SMTP argument. A space will be inserted between cmd and arg.

Return Values

Table 216–12 *COMMAND_REPLIES Function Return Values*

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

DATA Function and Procedure

This function/procedure specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
  c      IN OUT NOCOPY connection
  body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;

UTL_SMTP.DATA (
  c      IN OUT NOCOPY connection
  body  IN  VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 216–13 DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP Connection.
body	The text of the message to be sent, including headers, in [RFC822] format.

Return Values

Table 216–14 DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY , REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF> . <CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF> . <CR><LF> (single period) in body to <CR><LF> . . <CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA call should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command will not be returned to the caller.

EHLO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting, with extended information returned.

Syntax

```
UTL_SMTP.EHLO (
  c          IN OUT NOCOPY connection,
  domain IN)
RETURN replies;
```

```
UTL_SMTP.EHLO (
  c          IN OUT NOCOPY connection,
  domain IN);
```

Parameters

Table 216–15 EHLO Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
domain	The domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 216–16 EHLO Function and Procedure Return Values

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO

HELO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting.

Syntax

```
UTL_SMTP.HELO (
  c          IN OUT NOCOPY  connection,
  domain    IN              VARCHAR2)
RETURN reply;

UTL_SMTP.HELO (
  c          IN OUT NOCOPY  connection,
  domain    IN              VARCHAR2);
```

Parameters

Table 216–17 HELO Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
domain	The domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 216–18 HELO Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to [OPEN_CONNECTION Functions](#) before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO

HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
  c          IN OUT NOCOPY  connection,
  command   IN             VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 216–19 HELP Function Parameters

Parameter	Description
<code>c</code>	The SMTP connection.
<code>command</code>	The command to get the help message.

Return Values

Table 216–20 HELP Function Return Values

Return Value	Description
<code>replies</code>	Reply of the command (see REPLY , REPLIES Record Types).

MAIL Function and Procedure

This function/procedure initiates a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (
  c          IN OUT NOCOPY  connection,
  sender     IN             VARCHAR2,
  parameters IN             VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (
  c          IN OUT NOCOPY  connection,
  sender     IN             VARCHAR2,
  parameters IN             VARCHAR2 DEFAULT NULL);
```

Parameters

Table 216–21 MAIL Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
sender	The e-mail address of the user sending the message.
parameters	The additional parameters to MAIL command as defined in Section 6 of [RFC1869]. It should follow the format of "XXX=XXX (XXX=XXX ...)".

Return Values

Table 216–22 MAIL Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY , REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.

NOOP Function and Procedure

The null command.

Syntax

```
UTL_SMTP.NOOP (
  c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
  c IN OUT NOCOPY connection);
```

Parameter

Table 216–23 NOOP Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 216–24 NOOP Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with `OPEN_CONNECTION`. The `NOOP` command can be used to verify that the server is still connected and is listening properly.

This command will always reply with a single line beginning with status code 250.

OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
  host          IN  VARCHAR2,
  port          IN  PLS_INTEGER DEFAULT 25,
  c             OUT connection,
  tx_timeout   IN  PLS_INTEGER DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (
  host          IN  VARCHAR2,
  port          IN  PLS_INTEGER DEFAULT 25,
  tx_timeout   IN  PLS_INTEGER DEFAULT NULL)
RETURN connection;
```

Parameters

Table 216–25 OPEN_CONNECTION Functions Parameters

Parameter	Description
host	The name of the SMTP server host
port	The port number on which SMTP server is listening (usually 25).
c	The SMTP connection.
tx_timeout	The time in seconds that the UTL_SMTP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.

Return Values

Table 216–26 OPEN_CONNECTION Functions Return Values

Return Value	Description
reply	Reply of the command (see REPLY , REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN_CONNECTION that returns UTL_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If a user is interested in examining the reply, he or she can invoke the version of OPEN_CONNECTION that returns REPLY.

- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

OPEN_DATA Function and Procedure

OPEN_DATA sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (
    c      IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
    c      IN OUT NOCOPY connection);
```

Parameters

Table 216–27 OPEN_DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Return Values

Table 216–28 OPEN_DATA Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

OPEN_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

QUIT Function and Procedure

This function terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (
  c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
  c IN OUT NOCOPY connection);
```

Parameter

Table 216–29 QUIT Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 216–30 QUIT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The `QUIT` command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by `OPEN_CONNECTION` which must have been called before executing this command. If a mail transaction is in progress when `QUIT` is issued, it is abandoned in the same manner as `RSET`.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields `REMOTE_HOST` and `REMOTE_PORT` of `c` are reset.

Related Functions

`RSET`

RCPT Function

This function/procedure specifies the recipient of an e-mail message.

Syntax

```

UTL_SMTP.RCPT (
  c          IN OUT NOCOPY   connection,
  recipient  IN              VARCHAR2,
  parameters IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
  c          IN OUT NOCOPY   connection,
  recipient  IN              VARCHAR2,
  parameters IN              VARCHAR2 DEFAULT NULL);

```

Table 216–31 RCPT Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
recipient	The e-mail address of the user to which the message is being sent.
parameters	The additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It should follow the format of "XXX=XXX (XXX=XXX ...)".

Return Values

Table 216–32 RCPT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

RSET Function and Procedure

This function terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
    c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
    c IN OUT NOCOPY connection);
```

Parameters

Table 216–33 RSET Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 216–34 RSET Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command allows the client to abandon a mail message it was in the process of composing. No mail will be sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the email data has been sent, it will be too late to prevent the email from being sent.

The server will always respond to RSET with a message beginning with status code 250.

Related Functions

QUIT

VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (  
    c          IN OUT NOCOPY connection  
    recipient  IN VARCHAR2)  
RETURN reply;
```

Parameters

Table 216–35 VRFY Function Parameters

Parameter	Description
c	The SMTP connection.
recipient	The e-mail address to be verified.

Return Values

Table 216–36 VRFY Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHL0` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

WRITE_DATA Procedure

Use `WRITE_DATA` to write a portion of the e-mail message. A repeat call to `WRITE_DATA` appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
  c      IN OUT NOCOPY connection,
  data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 216–37 *WRITE_DATA Procedure Parameters*

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Usage Notes

The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other APIs will result in an `INVALID_OPERATION` exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine will terminate the message with a `<CR><LF>` . `<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of `<CR><LF>` . `<CR><LF>` (single period) in the body to `<CR><LF>` . . `<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('.' || chr(13) || chr(10));
```

Since the sequence `<CR><LF>` . `<CR><LF>` is split between two calls to `WRITE_DATA`, the implementation of `WRITE_DATA` will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

`WRITE_DATA` should be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of `WRITE_DATA` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA`.

Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension

is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

WRITE_RAW_DATA Procedure

Use `WRITE_RAW_DATA` to write a portion of the e-mail message. A repeat call to `WRITE_RAW_DATA` appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
  c      IN OUT NOCOPY connection
  data  IN RAW);
```

Parameters

Table 216–38 *WRITE_RAW_DATA Procedure Parameters*

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Usage Notes

The calls to `OPEN_DATA`, `WRITE_DATA`, `WRITE_RAW_DATA` and `CLOSE_DATA` must be made in the right order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other APIs will result in an `INVALID_OPERATION` exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine will terminate the message with a `<CR><LF> . <CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of `<CR><LF> . <CR><LF>` (single period) in the body to `<CR><LF> . . <CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('.' || chr(13) || chr(10));
```

Since the sequence `<CR><LF> . <CR><LF>` is split between two calls to `WRITE_DATA`, the implementation of `WRITE_DATA` will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

`XXX_DATA` should be called only after `OPEN_CONNECTION`, `HELO` or `EHLO`, `MAIL`, and `RCPT` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of `WRITE_DATA` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA`.

Text (`VARCHAR2`) data sent using `WRITE_DATA` is converted to `US7ASCII` before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to `US7ASCII` is replaced by a '?' character. If `8BITMIME` extension

is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

The UTL_SPADV package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

See Also: *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor

This chapter contains the following topic:

- [Summary of UTL_SPADV Subprograms](#)

Summary of UTL_SPADV Subprograms

Table 217–1 DBMS_STREAMS Package Subprograms

Subprogram	Description
COLLECT_STATS Procedure on page 217-3	Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.
SHOW_STATS Procedure on page 217-5	Generates output that includes the statistics gathered by the COLLECT_STATS procedure.

COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also: *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.COLLECT_STATS (
    interval                IN NUMBER    DEFAULT 60,
    num_runs                IN NUMBER    DEFAULT 10,
    comp_stat_table        IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
    path_stat_table        IN VARCHAR2   DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    top_event_threshold    IN NUMBER    DEFAULT 15,
    bottleneck_idle_threshold IN NUMBER  DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER DEFAULT 50);
```

Parameters

Table 217-2 COLLECT_STATS Procedure Parameters

Parameter	Description
interval	The time period, in seconds, between two consecutive Oracle Streams Performance Advisor runs.
num_runs	The number of times that the Oracle Streams Performance Advisor is run by the procedure.
comp_stat_table	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as <i>[schema_name.]object_name</i> . If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS\$_ADVISOR_COMP_STAT. See "Usage Notes" on page 217-4 for more information about this parameter.
path_stat_table	The name of the table that stores the statistics collected for stream paths. Specify the table name as <i>[schema_name.]object_name</i> . If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS\$_ADVISOR_PATH_STAT. See "Usage Notes" on page 217-4 for more information about this parameter.

Table 217-2 (Cont.) COLLECT_STATS Procedure Parameters

Parameter	Description
<code>top_event_threshold</code>	<p>A percentage that determines whether or not a top wait event statistic is collected.</p> <p>The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</p>
<code>bottleneck_idle_threshold</code>	<p>A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its <code>IDLE</code> percentage.</p> <p>The <code>IDLE</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</p>
<code>bottleneck_flowctrl_threshold</code>	<p>A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its <code>FLOW CONTROL</code> percentage.</p> <p>The <code>FLOW CONTROL</code> percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</p>

Usage Notes

The table specified in the `path_stat_table` parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the `comp_stat_table` parameter. The `SHOW_STATS` procedure in this package shows only the statistics stored in the table specified in the `path_stat_table` parameter.

SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS procedure.

The output is formatted so that it can be imported into a spreadsheet for analysis.

Note: This procedure does not commit.

See Also: *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.SHOW_STATS (
  path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
  path_id         IN NUMBER    DEFAULT NULL,
  bgn_run_id      IN NUMBER    DEFAULT -1,
  end_run_id      IN NUMBER    DEFAULT -10,
  show_path_id    IN BOOLEAN   DEFAULT TRUE,
  show_run_id     IN BOOLEAN   DEFAULT TRUE,
  show_run_time   IN BOOLEAN   DEFAULT TRUE,
  show_cca_mode   IN BOOLEAN   DEFAULT TRUE,
  show_setting    IN BOOLEAN   DEFAULT FALSE,
  show_stat       IN BOOLEAN   DEFAULT TRUE,
  show_sess       IN BOOLEAN   DEFAULT FALSE,
  show_legend     IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 217-3 SHOW_STATS Procedure Parameters

Parameter	Description
path_stat_table	The name of the table that contains the stream path statistics. This table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. Specify the table name as <i>[schema_name].[object_name]</i> . If the schema is not specified, then the current user is the default.
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 217-6 for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 217-6 for more information about this parameter.

Table 217-3 (Cont.) SHOW_STATS Procedure Parameters

Parameter	Description
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output. If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Streams Performance Advisor run time is included in the output. If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.
show_cca_mode	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

Usage Notes

Use the `bgn_run_id` and `end_run_id` together to specify the range of Oracle Streams Performance Advisor runs that you want to display. Positive numbers show statistics from the an earlier run forward. Negative numbers show statistics from the a later run backward.

For example, if `bgn_run_id` is set to 1 and `end_run_id` is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to -1 and `end_run_id` is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

See Also: *Oracle Streams Concepts and Administration* for information about the combined capture and apply optimization

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- [Using UTL_TCP](#)
 - Overview
 - Security Model
 - Types
 - Exceptions
 - Rules and Limits
 - Examples
- [Summary of UTL_TCP Subprograms](#)

Using UTL_TCP

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

Overview

The `UTL_TCP` package provides TCP/IP client-side access functionality in PL/SQL.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see [Managing Fine-grained Access to External Network Services](#) in [Oracle Database Security Guide](#)

Types

- [CONNECTION Type](#)
- [CRLF](#)

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```
TYPE connection IS RECORD (
  remote_host    VARCHAR2(255) ,
  remote_port    PLS_INTEGER,
  local_host     VARCHAR2(255) ,
  local_port     PLS_INTEGER,
  charset        VARCHAR2(30) ,
  newline        VARCHAR2(2) ,
  tx_timeout     PLS_INTEGER,
  private_sd     PLS_INTEGER);
```

Fields

Table 218–1 Connection Record Type Fields

Field	Description
remote_host	The name of the remote host when connection is established. NULL when no connection is established.
remote_port	The port number of the remote host connected. NULL when no connection is established.
local_host	The name of the local host used to establish the connection. NULL when no connection is established.
local_port	The port number of the local host used to establish the connection. NULL when no connection is established.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network.
newline	The newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.
tx_timeout	A time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields

has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields will not be set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the `UTL_TCP` package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

Exceptions

The exceptions raised by the TCP/IP package are listed in [Table 218-2](#).

Table 218-2 TCP/IP Exceptions

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead.
END_OF_INPUT	Raised when no more data is available to read from the connection.
NETWORK_ERROR	Generic network error.
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size).
TRANSFER_TIMEOUT	No data is read and a read time out occurred.
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input.

Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```

DECLARE
  c utl_tcp.connection; -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                              remote_port => 80,
                              charset => 'US7ASCII'); -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0'); -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE)); -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;

```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```

PROCEDURE send_mail (sender IN VARCHAR2,
                    recipient IN VARCHAR2,
                    message IN VARCHAR2)
IS
  mailhost VARCHAR2(30) := 'mailhost.mydomain.com';
  smtp_error EXCEPTION;
  mail_conn utl_tcp.connection;
  PROCEDURE smtp_command(command IN VARCHAR2,
                        ok IN VARCHAR2 DEFAULT '250')
  IS
    response varchar2(3);
    len pls_integer;
  BEGIN
    len := utl_tcp.write_line(mail_conn, command);
    response := substr(utl_tcp.get_line(mail_conn), 1, 3);
    IF (response <> ok) THEN
      RAISE smtp_error;
    END IF;
  END;
END;

BEGIN
  mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                      remote_port => 25,
                                      charset => 'US7ASCII');

  smtp_command('HELO ' || mailhost);
  smtp_command('MAIL FROM: ' || sender);
  smtp_command('RCPT TO: ' || recipient);
  smtp_command('DATA', '354');
  smtp_command(message);

```

```
smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);
EXCEPTION
  WHEN OTHERS THEN
    -- Handle the error
END;
```

Summary of UTL_TCP Subprograms

Table 218–3 UTL_TCP Package Subprograms

Subprogram	Description
AVAILABLE Function on page 218-12	Determines the number of bytes available for reading from a TCP/IP connection
CLOSE_ALL_CONNECTIONS Procedure on page 218-14	Closes all open TCP/IP connections
CLOSE_CONNECTION Procedure on page 218-15	Closes an open TCP/IP connection
FLUSH Procedure on page 218-16	Transmits all data in the output buffer, if a buffer is used, to the server immediately
GET_LINE Function on page 218-17	Returns the line of data read
GET_LINE_NCHAR Function on page 218-18	Returns the line of data read in NCHAR form
GET_RAW Function on page 218-19	Return the data read instead of the amount of data read
GET_TEXT Function on page 218-20	Returns the text data read
GET_TEXT_NCHAR Function on page 218-21	Returns the text data read in NCHAR form
OPEN_CONNECTION Function on page 218-22	Opens a TCP/IP connection to a specified service
READ_LINE Function on page 218-24	Receives a text line from a service on an open connection
READ_RAW Function on page 218-26	Receives binary data from a service on an open connection
READ_TEXT Function on page 218-27	Receives text data from a service on an open connection
WRITE_LINE Function on page 218-29	Transmits a text line to a service on an open connection
WRITE_RAW Function on page 218-30	Transmits a binary message to a service on an open connection
WRITE_TEXT Function on page 218-31	Transmits a text message to a service on an open connection

AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (
  c          IN OUT NOCOPY connection,
  timeout   IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

Parameters

Table 218–4 AVAILABLE Function Parameters

Parameter	Description
c	The TCP connection to determine the amount of data that is available to be read from.
timeout	A time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Users may use this API to determine if data is available to be read before calling the read API so that the program will not be blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read will result in the `END_OF_INPUT` exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
  c    utl_tcp.connection
  data VARCHAR2(256);
  len  PLS_INTEGER;
BEGIN
  c := utl_tcp.open_connection(...);
  LOOP
    IF (utl_tcp.available(c) > 0) THEN
      len := utl_tcp.read_text(c, data, 256);
    ELSE
      ---do some other things
      . . .
    END IF
```

```
    END LOOP;  
END;
```

CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program avoid dangling connections.

CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (  
    c IN OUT NOCOPY connection);
```

Parameters

Table 218–5 *CLOSE_CONNECTION Procedure Parameters*

Parameter	Description
c	The TCP connection to close.

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host`, `remote_port`, `local_host`, `local_port` and `charset` of `c` will be reset after the connection is closed.

An open connection must be closed explicitly. An open connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

FLUSH Procedure

This procedure transmits all data in the output buffer, if a buffer is used, to the server immediately.

Syntax

```
UTL_TCP.FLUSH (  
    c IN OUT NOCOPY connection);
```

Parameters

Table 218–6 *FLUSH Procedure Parameters*

Parameter	Description
c	The TCP connection to send data to.

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`.

GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 218–7 GET_LINE Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
  c          IN OUT NOCOPY connection,
  remove_crlf IN          BOOLEAN DEFAULT FALSE,
  peek       IN          BOOLEAN DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters

Table 218–8 GET_LINE_NCHAR Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN RAW;
```

Parameters

Table 218–9 GET_RAW Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN     DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

Table 218–10 GET_TEXT Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
  c      IN OUT NOCOPY connection,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN     DEFAULT FALSE)
RETURN NVARCHAR2;
```

Parameters

Table 218–11 GET_TEXT_NCHAR Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION (
    remote_host      IN VARCHAR2,
    remote_port     IN PLS_INTEGER,
    local_host      IN VARCHAR2 DEFAULT NULL,
    local_port      IN PLS_INTEGER DEFAULT NULL,
    in_buffer_size  IN PLS_INTEGER DEFAULT NULL,
    out_buffer_size IN PLS_INTEGER DEFAULT NULL,
    charset         IN VARCHAR2 DEFAULT NULL,
    newline         IN VARCHAR2 DEFAULT CRLF,
    tx_timeout      IN PLS_INTEGER DEFAULT NULL)
RETURN connection;
```

Parameters

Table 218–12 OPEN_CONNECTION Function Parameters

Parameter	Description
remote_host	The name of the host providing the service. When remote_host is NULL, it connects to the local host.
remote_port	The port number on which the service is listening for connections.
local_host	The name of the host providing the service. NULL means don't care.
local_port	The port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.

Table 218–12 (Cont.) OPEN_CONNECTION Function Parameters

Parameter	Description
<code>newline</code>	The newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.
<code>tx_timeout</code>	A time in seconds that the <code>UTL_TCP</code> package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this `UTL_TCP` package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields will not be set in the connection record returned by the function.
- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

READ_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
  c          IN OUT NOCOPY connection,
  data      IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  peek      IN          BOOLEAN DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 218–13 READ_LINE Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data	The data received.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and

read time out occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
  c      IN OUT NOCOPY connection,
  data   IN OUT NOCOPY RAW,
  len    IN          PLS_INTEGER DEFAULT 1,
  peek   IN          BOOLEAN      DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 218–14 READ_RAW Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data (IN OUT COPY)	The data received.
len	The number of bytes of data to receive.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (
  c      IN OUT NOCOPY connection,
  data  IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  len   IN          PLS_INTEGER DEFAULT 1,
  peek  IN          BOOLEAN      DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 218–15 READ_TEXT Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data	The data received.
len	The number of characters of data to receive.
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to <code>TRUE</code> and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a `VARCHAR2` buffer is specified in terms of bytes, while the parameter `len` refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the `VARCHAR2` buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence will be appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (  
    c      IN OUT NOCOPY connection,  
    data IN          VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

Parameters

Table 218–16 *WRITE_LINE Function Parameters*

Parameter	Description
<code>c</code>	The TCP connection to send data to.
<code>data</code>	The buffer containing the data to be sent.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (  
  c      IN OUT NOCOPY connection,  
  data IN          RAW,  
  len IN          PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

Parameters

Table 218–17 WRITE_RAW Function Parameters

Parameter	Description
c	The TCP connection to send data to.
data	The buffer containing the data to be sent.
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (
  c      IN OUT NOCOPY connection,
  data IN          VARCHAR2 CHARACTER SET ANY_CS,
  len IN          PLS_INTEGER DEFAULT NULL)
RETURN num_chars PLS_INTEGER;
```

Parameters

Table 218–18 *WRITE_TEXT Function Parameters*

Parameter	Description
c	The TCP connection to send data to.
data	The buffer containing the data to be sent.
len	The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

The UTL_URL package has two functions: ESCAPE and UNESCAPE.

- [Summary of UTL_URL Subprograms](#)

Using UTL_URL

- [Overview](#)
- [Exceptions](#)
- [Examples](#)

Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign (\$), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ((), right parenthesis ())

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), percentage sign (%), and comma (,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used to fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

Exceptions

[Table 219–1](#) lists the exceptions that can be raised when the `UTL_URL` package API is invoked.

Table 219–1 *UTL_URL Exceptions*

Exception	Error Code	Reason
<code>BAD_URL</code>	29262	The URL contains badly formed escape code sequences
<code>BAD_FIXED_WIDTH_CHARSET</code>	29274	Fixed-width multibyte character set is not allowed as a URL character set.

Examples

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode` scheme, the following function implements the decoding scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
    data    IN VARCHAR2,
    charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.unescape(
        replace(data, '+', ' '),
        charset);
END;
```

Summary of UTL_URL Subprograms

Table 219–2 UTL_URL Package Subprograms

Subprogram	Description
ESCAPE Function on page 219-7	Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format
UNESCAPE Function on page 219-9	Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters

ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```
UTL_URL.ESCAPE (
  url          IN VARCHAR2 CHARACTER SET ANY_CS,
  escape_reserved_chars IN BOOLEAN DEFAULT FALSE,
  url_charset  IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 219–3 ESCAPE Function Parameters

Parameter	Description
url	The original URL
escape_reserved_chars	Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.
url_charset	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis ((), right parenthesis ())

The reserved characters consist of:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign (\$), and comma (,)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair \$logon=scott/tiger into the query string of a URL, escape the \$ and / separately as %24logon=scott%2Ftiger and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://foo.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape  
( 'Is the use of the "$" sign okay?', TRUE );
```

This expression escapes the question mark (?), dollar sign (\$), and space characters in 'Is the use of the "\$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the `url_charset` as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the %XX escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
  url          IN VARCHAR2 CHARACTER SET ANY_CS,
  url_charset  IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```

Parameters

Table 219–4 UNESCAPE Function Parameters

Parameter	Description
url	The URL to unescape
url_charset	After a character is unescaped, the character is assumed to be in the source_charset character set and it will be converted from the source_charset to the database character set before the URL is returned. If source_charset is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the UTL_HTTP package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using US7ASCII so that %20 is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

WPG_DOCLOAD

The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILES.

See Also: For more information about implementation of this package:

- *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- [Using WPG_DOCLOAD](#)
 - Constants
- [Summary of WPG_DOCLOAD Subprograms](#)

Using WPG_DOCLOAD

- [Constants](#)

Constants

- [NAME_COL_LEN](#)
- [MIMET_COL_LEN](#)
- [MAX_DOCTABLE_NAME_LEN](#)

NAME_COL_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

Summary of WPG_DOCLOAD Subprograms

Table 220–1 WPG_DOCLOAD Package Subprograms

Subprogram	Description
DOWNLOAD_FILE Procedures on page 220-5	Downloads files, BLOBS and BFILES

DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_filename      IN          VARCHAR2,
  p_bcaching      IN          BOOLEAN DEFAULT TRUE);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_blob          IN OUT NOCOPY BLOB);
```

```
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_bfile         IN OUT          BFILE);
```

Parameters

Table 220–2 *DOWNLOAD_FILE Procedure Parameters*

Parameter	Description
<code>p_filename</code>	The file to download from the document table.
<code>p_blob</code>	The BLOB to download.
<code>p_bfile</code>	The BFILE to download (see Usage Notes).
<code>p_bcaching</code>	Whether browser caching is enabled (see Usage Notes).

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to `FALSE` to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

ANYDATA TYPE

An `ANYDATA TYPE` contains an instance of a given type, plus a description of the type. In this sense, an `ANYDATA` is self-describing. An `ANYDATA` can be persistently stored in the database.

This chapter contains the following topics:

- [Using ANYDATA TYPE](#)
 - Restrictions
 - Operational Notes
- [Summary of ANYDATA Subprograms](#)

Using ANYDATA TYPE

- [Restrictions](#)
- [Operational Notes](#)

Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILES is not currently supported.

Operational Notes

- [Construction](#)
- [Access](#)

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,  
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,  
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,  
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,  
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,  
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,  
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,  
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,  
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,  
STATIC FUNCTION ConvertIntervalYM(inv IN INTERVAL YEAR TO MONTH) return ANYDATA,  
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,  
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,  
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,  
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,  
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,  
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,  
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,  
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,  
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,  
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return  
ANYDATA,  
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,  
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,  
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The [BEGINCREATE Static Procedure](#) call begins the construction process and [ENDCREATE Member Procedure](#) call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the [PIECEWISE Member Procedure](#) should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of

these functions returns the value of a specified datatype inside a SYS . ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
    DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
    DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
    TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
    TIMEZONE,
MEMBER FUNCTION AccessUrowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

Summary of ANYDATA Subprograms

Table 221–1 ANYDATA Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 221-7	Begins creation process on a new ANYDATA
ENDCREATE Member Procedure on page 221-8	Ends creation of an ANYDATA
GET* Member Functions on page 221-9	Gets the current data value (which should be of appropriate type)
GETTYPE Member Function on page 221-12	Gets the Type of the ANYDATA
GETTYPENAME Member Function on page 221-13	Get the fully qualified type name for the ANYDATA
PIECEWISE Member Procedure on page 221-14	Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT)
SET* Member Procedures on page 221-15	Sets the current data value.

BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
  dtype          IN OUT NOCOPY AnyType,
  adata         OUT NOCOPY ANYDATA);
```

Parameters

Table 221–2 BEGINCREATE Procedure Parameters

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call `PIECEWISE` immediately after this call. The construction process begins in a piece-wise manner automatically.

ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(  
    self          IN OUT NOCOPY ANYDATA);
```

Parameters

Table 221–3 *ENDCREATE Procedure Parameter*

Parameter	Description
self	An ANYDATA.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the `PIECEWISE` call).

If `PIECEWISE` has NOT been called, we are accessing the `ANYDATA` in its entirety and the type of the data value should match the type of the `ANYDATA`.

If `PIECEWISE` has been called, we are accessing the `ANYDATA` piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
    self      IN ANYDATA,
    dbl       OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
    self      IN ANYDATA,
    b         OUT NOCOPY BFILE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
    self      IN ANYDATA,
    fl        OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
    self      IN ANYDATA,
    b         OUT NOCOPY BLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetChar(
    self      IN ANYDATA,
    c         OUT NOCOPY CHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetClob(
    self      IN ANYDATA,
    c         OUT NOCOPY CLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetCollection(
    self      IN ANYDATA,
    col       OUT NOCOPY "<collection_type>")
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetDate(
    self      IN ANYDATA,
    dat       OUT NOCOPY DATE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetIntervals(
    self      IN ANYDATA,
    inv       OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN      PLS_INTEGER;
```

```
MEMBER FUNCTION GetIntervalYM(
    self      IN ANYDATA,
    inv       OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetNchar(
    self      IN ANYDATA,
    nc        OUT NOCOPY NCHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetNClob(
    self      IN ANYDATA,
    nc        OUT NOCOPY NCLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetNumber(
    self      IN ANYDATA,
    num       OUT NOCOPY NUMBER)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetNvarchar2(
    self      IN ANYDATA,
    nc        OUT NOCOPY NVARCHAR2)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetObject(
    self      IN ANYDATA,
    obj       OUT NOCOPY "<object_type>")
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetRaw(
    self      IN ANYDATA,
    r         OUT NOCOPY RAW)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetRef(
    self      IN ANYDATA,
    rf        OUT NOCOPY REF "<object_type>")
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
    self      IN ANYDATA,
    ts        OUT NOCOPY TIMESTAMP)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
    self      IN ANYDATA,
    ts        OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
    self      IN ANYDATA,
    ts        OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self      IN ANYDATA,
    c         OUT NOCOPY VARCHAR)
RETURN      PLS_INTEGER;
```

```
MEMBER FUNCTION GetVarchar2(
  self      IN ANYDATA,
  c         OUT NOCOPY VARCHAR2)
RETURN     PLS_INTEGER;
```

Parameters

Table 221–4 *GET* Function Parameter*

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

Exceptions

`DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

`DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.

GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATA,  
    typ           OUT NOCOPY AnyType)  
RETURN          PLS_INTEGER;
```

Parameters

Table 221–5 *GETTYPE Function Parameter*

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name.type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETYPENAME (  
    self          IN ANYDATA)  
RETURN          VARCHAR2;
```

Parameters

Table 221–6 GETYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

Return Values

Type name of the ANYDATA.

PIECEWISE Member Procedure

This procedure sets the **MODE** of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the **MODE** of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to `SET*` and `GET*` will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(  
    self          IN OUT NOCOPY ANYDATA);
```

Parameters

Table 221–7 *PIECEWISE Procedure Parameters*

Parameter	Description
<code>self</code>	The current data value.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`
- `DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

Usage Notes

The current data value must be of an `OBJECT` or `COLLECTION` type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
    self      IN OUT NOCOPY ANYDATA,
    dbl       IN BINARY_DOUBLE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self      IN OUT NOCOPY ANYDATA,
    b         IN BFILE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self      IN OUT NOCOPY ANYDATA,
    fl        IN          BINARY_FLOAT,
    last_elem IN          boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self      IN OUT NOCOPY ANYDATA,
    b         IN BLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self      IN OUT NOCOPY ANYDATA,
    c         IN CHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self      IN OUT NOCOPY ANYDATA,
    c         IN CLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self      IN OUT NOCOPY ANYDATA,
    col       IN "<collection_type>",
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self      IN OUT NOCOPY ANYDATA,
    dat       IN DATE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self      IN OUT NOCOPY ANYDATA,
    inv       IN INTERVAL DAY TO SECOND,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self      IN OUT NOCOPY ANYDATA,
    inv       IN INTERVAL YEAR TO MONTH,
    last_elem IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETNCHAR(  
    self          IN OUT NOCOPY ANYDATA,  
    nc            IN NCHAR,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNCLOB(  
    self          IN OUT NOCOPY ANYDATA,  
    nc            IN NClob,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNUMBER(  
    self          IN OUT NOCOPY ANYDATA,  
    num          IN NUMBER,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETNVARCHAR2(  
    self          IN OUT NOCOPY ANYDATA,  
    nc            IN NVarchar2,  
    last_elem    IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETOBJECT(  
    self          IN OUT NOCOPY ANYDATA,  
    obj          IN "<object_type>",  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETRAW(  
    self          IN OUT NOCOPY ANYDATA,  
    r            IN RAW,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETREF(  
    self          IN OUT NOCOPY ANYDATA,  
    rf           IN REF "<object_type>",  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMP(  
    self          IN OUT NOCOPY ANYDATA,  
    ts           IN TIMESTAMP,  
    last_elem    IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMPPTZ(self IN OUT NOCOPY ANYDATA,  
    ts           IN TIMESTAMP WITH TIME ZONE,  
    last_elem    IN BOOLEAN DEFAULT FALSE);  
  
MEMBER PROCEDURE SETTIMESTAMPPLTZ(  
    self IN OUT NOCOPY ANYDATA,  
    ts IN TIMESTAMP WITH LOCAL TIME ZONE,  
    last_elem IN boolean DEFAULT FALSE),  
  
MEMBER PROCEDURE SETVARCHAR(  
    self          IN OUT NOCOPY ANYDATA,  
    c            IN VARCHAR,  
    last_elem    IN boolean DEFAULT FALSE);  
  
MEMBER PROCEDURE SETVARCHAR2(  
    self          IN OUT NOCOPY ANYDATA,  
    c            IN VARCHAR2,  
    last_elem    IN boolean DEFAULT FALSE);
```

Parameters

Table 221–8 SET* Procedure Parameters

Parameter	Description
<code>self</code>	An ANYDATA.
<code>num</code>	The number, and associated information, that is to be set.
<code>last_elem</code>	Relevant only if ANYDATA represents a collection. Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the ANYDATA is a standalone collection, the `SET*` call will set the successive collection elements.

ANYDATASET TYPE

An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- [Construction](#)
- [Summary of ANYDATASET TYPE Subprograms](#)

Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The MODE of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

Summary of ANYDATASET TYPE Subprograms

Table 222–1 ANYDATASET Type Subprograms

Subprogram	Description
ADDINSTANCE Member Procedure on page 222-4	Adds a new data instance to an ANYDATASET.
BEGINCREATE Static Procedure on page 222-5	Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.
ENDCREATE Member Procedure on page 222-6	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
GET* Member Functions on page 222-7	Gets the current data value (which should be of appropriate type).
GETCOUNT Member Function on page 222-10	Gets the number of data instances in an ANYDATASET.
GETINSTANCE Member Function on page 222-11	Gets the next instance in an ANYDATASET.
GETTYPE Member Function on page 222-12	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
GETTYPENAME Member Function on page 222-13	Gets the AnyType describing the type of the data instances in an ANYDATASET.
PIECEWISE Member Procedure on page 222-14	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
SET* Member Procedures on page 222-15	Sets the current data value.

ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(  
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 222–2 ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.

BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE .

Syntax

```
STATIC PROCEDURE BeginCreate(
  typecode      IN PLS_INTEGER,
  rtype         IN OUT NOCOPY AnyType,
  aset         OUT NOCOPY ANYDATASET);
```

Parameters

Table 222-3 BEGINCREATE Procedure Parameter

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

ENDCREATE Member Procedure

This procedure ends Creation of a `ANYDATASET`. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(  
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 222–4 *ENDCREATE Procedure Parameter*

Parameter	Description
<code>self</code>	The <code>ANYDATASET</code> being constructed.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the `MODE` with which you are accessing it (depending on how we have invoked the `PIECEWISE` call). If `PIECEWISE` has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the `ANYDATASET`.

If `PIECEWISE` has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(
    self      IN ANYDATASET,
    dbl       OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
    self      IN ANYDATASET,
    fl        OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
    self      IN ANYDATASET,
    b         OUT NOCOPY BFILE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
    self      IN ANYDATASET,
    b         OUT NOCOPY BLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
    self      IN ANYDATASET,
    c         OUT NOCOPY CHAR)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
    self      IN ANYDATASET,
    c         OUT NOCOPY CLOB)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
    self      IN ANYDATASET,
    col       OUT NOCOPY "<collection_type>")
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
    self      IN ANYDATASET,
    dat       OUT NOCOPY DATE)
RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
    self      IN ANYDATASET,
    inv       IN OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(  
    self          IN ANYDATASET,  
    inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNCHAR(  
    self          IN ANYDATASET,  
    nc           OUT NOCOPY NCHAR)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNCLOB(  
    self          IN ANYDATASET,  
    nc           OUT NOCOPY NCLOB)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETNUMBER(  
    self          IN ANYDATASET,  
    num          OUT NOCOPY NUMBER)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETNVARCHAR2(  
    self          IN ANYDATASET,  
    nc           OUT NOCOPY NVARCHAR2)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETOBJECT(  
    self          IN ANYDATASET,  
    obj          OUT NOCOPY "<object_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETRAW(  
    self          IN ANYDATASET,  
    r            OUT NOCOPY RAW)  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETREF(  
    self          IN ANYDATASET,  
    rf           OUT NOCOPY REF "<object_type>")  
RETURN          PLS_INTEGER;  
  
MEMBER FUNCTION GETTIMESTAMP(  
    self          IN ANYDATASET,  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETTIMESTAMPPLTZ(  
    self          IN ANYDATASET,  
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)  
RETURN PLS_INTEGER;  
  
MEMBER FUNCTION GETTIMESTAMPPTZ(  
    self          IN ANYDATASET,  
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)  
RETURN PLS_INTEGER,  
  
MEMBER FUNCTION GETUROWID(  
    self          IN ANYDATASET,  
    rid          OUT NOCOPY UROWID)  
RETURN PLS_INTEGER
```

```
MEMBER FUNCTION GETVARCHAR (
  self      IN ANYDATASET,
  c         OUT NOCOPY VARCHAR)
RETURN     PLS_INTEGER;
```

```
MEMBER FUNCTION GETVARCHAR2 (
  self      IN ANYDATASET,
  c         OUT NOCOPY VARCHAR2)
RETURN     PLS_INTEGER;
```

Parameters

Table 222–5 *GET* Procedure Parameters*

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

Return Values

DBMS_TYPES . SUCCESS or DBMS_TYPES . NO_DATA

The return value is relevant only if `PIECEWISE` has been already called (for a collection). In such a case, `DBMS_TYPES.NO_DATA` signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES . INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES . INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount (  
    self          IN ANYDATASET)  
    RETURN        PLS_INTEGER;
```

Parameter

Table 222–6 *GETCOUNT Function Parameter*

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

The number of data instances.

GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE(  
  self          IN OUT NOCOPY ANYDATASET)  
  RETURN       PLS_INTEGER;
```

Parameters

Table 222–7 *GETINSTANCE Function Parameter*

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GETTYPE (  
    self          IN ANYDATASET,  
    typ           OUT NOCOPY AnyType)  
RETURN          PLS_INTEGER;
```

Parameters

Table 222–8 *GETTYPE Function Parameter*

Parameter	Description
self	The ANYDATASET.
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema_name.type_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETYPENAME(  
    self          IN ANYDATASET)  
    RETURN        VARCHAR2;
```

Parameter

Table 222–9 *GETYPENAME Function Parameter*

Parameter	Description
self	The ANYDATASET being constructed.

Return Values

Type name of the ANYDATASET.

PIECEWISE Member Procedure

This procedure sets the `MODE` of construction, access of the data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`).

It sets the `MODE` of construction, access of the data value to be a collection element at a time (if the data value is of a collection `TYPE`). Once this call has been made, subsequent `SET*` and `GET*` calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(  
    self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 222–10 *PIECEWISE Procedure Parameter*

Parameter	Description
<code>self</code>	The ANYDATASET being constructed.

Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters.

`DBMS_TYPES.INCORRECT_USAGE`: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the `MODE` with which we are constructing (depending on how we have invoked the `PIECEWISE` call). The type of the current data should be the type of the `ANYDATASET` if `PIECEWISE` has NOT been called. The type should be the type of the attribute at the current position if `PIECEWISE` has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
    self          IN OUT NOCOPY ANYDATASET,
    dbl           IN BINARY_DOUBLE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self          IN OUT NOCOPY ANYDATASET,
    fl           IN BINARY_FLOAT,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self          IN OUT NOCOPY ANYDATASET,
    b            IN BFILE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self          IN OUT NOCOPY ANYDATASET,
    b            IN BLOB,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    c            IN CHAR,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self          IN OUT NOCOPY ANYDATASET,
    c            IN CLOB,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self          IN OUT NOCOPY ANYDATASET,
    col          IN "<collection_type>",
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self          IN OUT NOCOPY ANYDATASET,
    dat          IN DATE,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self          IN OUT NOCOPY ANYDATASET,
    inv          IN INTERVAL DAY TO SECOND,
    last_elem     IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self          IN OUT NOCOPY ANYDATASET,
```

```
        inv          IN INTERVAL YEAR TO MONTH,
        last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    nc            IN NCHAR,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(

s
    self          IN OUT NOCOPY ANYDATASET,
    nc            IN NClob,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self          IN OUT NOCOPY ANYDATASET,
    num          IN NUMBER,
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self          IN OUT NOCOPY ANYDATASET,
    nc            IN NVarchar2,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self          IN OUT NOCOPY ANYDATASET,
    obj          IN "<object_type>",
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self          IN OUT NOCOPY ANYDATASET,
    r            IN RAW,
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self          IN OUT NOCOPY ANYDATASET,
    rf           IN REF "<object_type>",
    last_elem    BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self          IN OUT NOCOPY ANYDATASET,
    ts           IN TIMESTAMP,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPLTZ(
    self          IN OUT NOCOPY ANYDATASET,
    ts           IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPPTZ(
    self          IN OUT NOCOPY ANYDATASET,
    ts           IN TIMESTAMP WITH TIME ZONE,
    last_elem    IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
    self          IN OUT NOCOPY ANYDATASET,
    rid          IN UROWID,
    last_elem    IN BOOLEAN DEFAULT FALSE);
```

```

MEMBER PROCEDURE SETVARCHAR(
    self          IN OUT NOCOPY ANYDATASET,
    c             IN VARCHAR,
    last_elem     BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self          IN OUT NOCOPY ANYDATASET,
    c             IN VARCHAR2,
    last_elem     BOOLEAN DEFAULT FALSE);

```

Parameters

Table 222–11 *SET* Procedure Parameters*

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if <code>PIECEWISE</code> has been already called (for a collection). Set to <code>TRUE</code> if it is the last element of the collection, <code>FALSE</code> otherwise.

Exceptions

- `DBMS_TYPES.INVALID_PARAMETERS`: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage.
- `DBMS_TYPES.TYPE_MISMATCH`: When the expected type is different from the passed in type.

ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

This chapter discusses the following:

- [Summary of ANYTYPE Subprograms](#)

Summary of ANYTYPE Subprograms

Table 223–1 ANYTYPE Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 223-3	Creates a new instance of ANYTYPE which can be used to create a transient type description.
SETINFO Member Procedure on page 223-4	Sets any additional information required for constructing a COLLECTION or builtin type.
ADDATTR Member Procedure on page 223-6	Adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).
ENDCREATE Member Procedure on page 223-7	Ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.
GETPERSISTENT Static Function on page 223-8	Returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.
GETINFO Member Function on page 223-9	Gets the type information for the ANYTYPE.
GETATTRELEMINFO Member Function on page 223-10	Gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the <i>self</i> parameter is of a collection type.

BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE (
  typecode      IN      PLS_INTEGER,
  atype         OUT NOCOPY ANYTYPE);
```

Parameters

Table 223–2 *BEGINCREATE Procedure Parameters*

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: <ul style="list-style-type: none"> ▪ DBMS_TYPES.TYPECODE_OBJECT ▪ DBMS_TYPES.TYPECODE_VARRAY or ▪ DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: <ul style="list-style-type: none"> ▪ DBMS_TYPES.TYPECODE_NUMBER, and similar types.
atype	ANYTYPE for a transient type

SETINFO Member Procedure

This procedure sets any additional information required for constructing a `COLLECTION` or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO (
  self          IN OUT NOCOPY ANYTYPE,
  prec          IN PLS_INTEGER,
  scale        IN PLS_INTEGER,
  len          IN PLS_INTEGER,
  csid         IN PLS_INTEGER,
  csfrm        IN PLS_INTEGER,
  atype        IN ANYTYPE DEFAULT NULL,
  elem_tc      IN PLS_INTEGER DEFAULT NULL,
  elem_count   IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 223–3 SETINFO Procedure Parameters

Parameter	Description
<code>self</code>	The transient <code>ANYTYPE</code> that is being constructed.
<code>prec</code>	Optional. Required if typecode represents a <code>NUMBER</code> . Give precision and scale. Ignored otherwise.
<code>scale</code>	Optional. Required if typecode represents a <code>NUMBER</code> . Give precision and scale. Ignored otherwise.
<code>len</code>	Optional. Required if typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Gives length.
<code>csid</code>	Required if typecode represents types requiring character information such as <code>CHAR</code> , <code>VARCHAR</code> , <code>VARCHAR2</code> , or <code>CFILE</code> .
<code>csfrm</code>	Required if typecode represents types requiring character information such as <code>CHAR</code> , <code>VARCHAR</code> , <code>VARCHAR2</code> , or <code>CFILE</code> .
<code>atype</code>	Optional. Required if collection element typecode is a user-defined type such as <code>TYPECODE_OBJECT</code> , and similar others.. It is also required for a built-in type that needs user-defined type information such as <code>TYPECODE_REF</code> . This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

Table 223–4 SETINFO Procedure Parameters - Collection Types

Parameter	Description
<code>elem_tc</code>	Must be of the collection element's typecode (from <code>DBMS_TYPES</code> package).
<code>elem_count</code>	Pass 0 for <code>elem_count</code> if the <code>self</code> represents a nested table (<code>TYPECODE_TABLE</code>). Otherwise pass the collection count if <code>self</code> represents a <code>VARRAY</code> .

Exceptions

- `DBMS_TYPES.INVALID_PARAMETER`: Invalid Parameters (typecode, typeinfo)

- `DBMS_TYPES.INCORRECT_USAGE`: Incorrect usage (cannot call after calling `ENDCREATE`, and similar actions.)

Usage Notes

It is an error to call this function on an `ANYTYPE` that represents a persistent user defined type.

ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR (
    self          IN OUT NOCOPY ANYTYPE,
    aname         IN VARCHAR2,
    typecode      IN PLS_INTEGER,
    prec          IN PLS_INTEGER,
    scale         IN PLS_INTEGER,
    len           IN PLS_INTEGER,
    csid          IN PLS_INTEGER,
    csfrm         IN PLS_INTEGER,
    attr_type     IN ANYTYPE DEFAULT NULL);
```

Parameters

Table 223–5 ADDATTR Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(  
    self          IN OUT NOCOPY ANYTYPE);
```

Parameter

Table 223–6 *ENDCREATE Procedure Parameter*

Parameter	Description
self	The transient ANYTYPE that is being constructed.

GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

```
STATIC FUNCTION GETPERSISTENT(  
    schema_name    IN VARCHAR2,  
    type_name      IN VARCHAR2,  
    version        IN VARCHAR2 DEFAULT NULL)  
    RETURN         ANYTYPE;
```

Parameters

Table 223–7 GETPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.
version	Type version.

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (
  self      IN ANYTYPE,
  prec      OUT PLS_INTEGER,
  scale     OUT PLS_INTEGER,
  len       OUT PLS_INTEGER,
  csid      OUT PLS_INTEGER,
  csfrm     OUT PLS_INTEGER,
  schema_name OUT VARCHAR2,
  type_name OUT VARCHAR2,
  version   OUT varchar2,
  count     OUT PLS_INTEGER)
RETURN     PLS_INTEGER;
```

Parameters

Table 223–8 GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
count	If <i>self</i> is a VARRAY, this gives the VARRAY count. If <i>self</i> is of TYPECODE_OBJECT, this gives the number of attributes.

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
    self          IN ANYTYPE,
    pos           IN PLS_INTEGER,
    prec         OUT PLS_INTEGER,
    scale        OUT PLS_INTEGER,
    len          OUT PLS_INTEGER,
    csid         OUT PLS_INTEGER,
    csfrm        OUT PLS_INTEGER,
    attr_elt_type OUT ANYTYPE
    aname        OUT VARCHAR2)
RETURN          PLS_INTEGER;
```

Parameters

Table 223–9 GETATTRELEMINFO Function Parameters

Parameter	Description
<code>self</code>	The <code>ANYTYPE</code> .
<code>pos</code>	If <code>self</code> is of <code>TYPECODE_OBJECT</code> , this gives the attribute position (starting at 1). It is ignored otherwise.
<code>prec</code>	If attribute/collection element typecode represents a <code>NUMBER</code> . Gives precision and scale. Ignored otherwise.
<code>scale</code>	If attribute/collection element typecode represents a <code>NUMBER</code> . Gives precision and scale. Ignored otherwise.
<code>len</code>	If typecode represents a <code>RAW</code> , <code>CHAR</code> , <code>VARCHAR</code> , or <code>VARCHAR2</code> type. Gives length.
<code>csid</code> , <code>csfrm</code>	If typecode represents a type requiring character information such as: <code>CHAR</code> , <code>VARCHAR</code> , <code>VARCHAR2</code> , <code>CFILE</code> . Gives character set ID, character set form.
<code>attr_elt_type</code>	If attribute/collection element typecode represents a user-defined type, this returns the <code>ANYTYPE</code> corresponding to it. User can subsequently describe the <i>attr_elt_type</i> .
<code>aname</code>	Attribute name (if it is an attribute of an object type, <code>NULL</code> otherwise).

Return Values

The typecode of the attribute or collection element.

Exceptions

`DBMS_TYPES.INVALID_PARAMETERS`: Invalid Parameters (position is beyond bounds or the `ANYTYPE` is not properly constructed).

Oracle Streams AQ TYPEs

This chapter describes the types used with Oracle Streams Advanced Queuing (AQ) packages for PL/SQL, DBMS_AQ, and DBMS_AQADM.

See Also: *Oracle Streams Advanced Queuing User's Guide* for information about using Oracle Streams AQ.

This chapter contains the following topics:

- [Summary of Types](#)

Summary of Types

- [AQ\\$_AGENT](#) Type
- [AQ\\$_AGENT_LIST_T](#) Type
- [AQ\\$_DESCRIPTOR](#) Type
- [AQ\\$_NTFN_DESCRIPTOR](#) Type
- [AQ\\$_POST_INFO](#) Type
- [AQ\\$_POST_INFO_LIST](#) Type
- [AQ\\$_PURGE_OPTIONS_T](#) Type
- [AQ\\$_RECIPIENT_LIST_T](#) Type
- [AQ\\$_REG_INFO](#) Type
- [AQ\\$_REG_INFO_LIST](#) Type
- [AQ\\$_SUBSCRIBER_LIST_T](#) Type
- [DEQUEUE_OPTIONS_T](#) Type
- [ENQUEUE_OPTIONS_T](#) Type
- [SYS.MSG_PROP_T](#) Type
- [MESSAGE_PROPERTIES_T](#) Type
- [MESSAGE_PROPERTIES_ARRAY_T](#) Type
- [MSGID_ARRAY_T](#) Type

AQ\$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
  name      VARCHAR2(30),
  address   VARCHAR2(1024),
  protocol  NUMBER DEFAULT 0);
```

Attributes

Table 224–1 AQ\$_AGENT Attributes

Attribute	Description
name	Name of a producer or consumer of a message. The name must follow object name guidelines in the <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
address	Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code> . For example, a queue named <code>emp_messages</code> in the HR queue at the site <code>db1.net</code> has the address: <code>hr.emp_messages@db1.net</code>
protocol	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Streams AQ.

AQ\$_AGENT_LIST_T Type

This type identifies the list of agents for which DBMS_AQ.LISTEN listens.

See Also: ["AQ\\$_AGENT Type"](#) on page 224-3

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

AQ\$_DESCRIPTOR Type

This type specifies the Oracle Streams AQ descriptor received by the AQ PL/SQL callbacks upon notification.

See Also: ["MESSAGE_PROPERTIES_T Type"](#) on page 224-24

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
  queue_name      VARCHAR2(61),
  consumer_name   VARCHAR2(30),
  msg_id          RAW(16),
  msg_prop        MSG_PROP_T,
  gen_desc        AQ$_NTFN_DESCRIPTOR,
  msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
  ntfnsRecdInGrp NUMBER);
```

Attributes

Table 224–2 AQ\$_DESCRIPTOR Attributes

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

AQ\$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(  
    ntfn_flags NUMBER)
```

Attributes

Table 224–3 AQ\$_DESCRIPTOR Attributes

Attribute	Description
ntfn_flags	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

AQ\$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2^{30} which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY  
  AS VARRAY(1073741824) OF RAW(16);
```

AQ\$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (  
    name          VARCHAR2(128),  
    namespace     NUMBER,  
    payload       RAW(2000) DEFAULT NULL);
```

Attributes

Table 224–4 AQ\$_POST_INFO Attributes

Attribute	Description
name	Name of the anonymous subscription to which you want to post
namespace	To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code>
payload	The payload to be posted to the anonymous subscription

AQ\$_POST_INFO_LIST Type

Identifies the list of anonymous subscriptions to which you want to post messages.

See Also: [AQ\\$_POST_INFO Type](#) on page 224-8

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

AQ\$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

See Also: [PURGE_QUEUE_TABLE Procedure](#) on page 22-42.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T IS RECORD (
    block          BOOLEAN          DEFAULT FALSE
    delivery_mode  PLS_INTEGER     DEFAULT PERSISTENT);
```

Table 224–5 AQ\$_PURGE_OPTIONS_T Type Attributes

Attribute	Description
block	<p>TRUE/FALSE.</p> <ul style="list-style-type: none"> ▪ If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>. ▪ The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.
delivery_mode	Kind of messages to purge, either <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code>

AQ\$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

See Also: ["AQ\\$_AGENT Type"](#) on page 224-3

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

AQ\$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
    name                VARCHAR2(128),
    namespace           NUMBER,
    callback            VARCHAR2(4000),
    context             RAW(2000) DEFAULT NULL,
    qosflags           NUMBER,
    timeout            NUMBER,
    ntfn_grouping_class NUMBER,
    ntfn_grouping_value NUMBER DEFAULT 600,
    ntfn_grouping_type NUMBER,
    ntfn_grouping_start_time  TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count NUMBER);
```

Attributes

Table 224–6 AQ\$_REG_INFO Type Attributes

Attribute	Description
name	Specifies the name of the subscription. The subscription name is of the form <i>schema.queue</i> if the registration is for a single consumer queue or <i>schema.queue:consumer_name</i> if the registration is for a multiconsumer queues.
namespace	Specifies the namespace of the subscription. To receive notification from Oracle Streams AQ queues, the namespace must be <code>DBMS_AQ.NAMESPACE_AQ</code> . To receive notifications from other applications through <code>DBMS_AQ.POST</code> or <code>OCISubscriptionPost()</code> , the namespace must be <code>DBMS_AQ.NAMESPACE_ANONYMOUS</code> .
callback	Specifies the action to be performed on message notification. For HTTP notifications, use <code>http://www.company.com:8080</code> . For e-mail notifications, use <code>mailto://xyz@company.com</code> . For raw message payload for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=0</code> . For user-defined type message payload converted to XML for the <code>PLSQLCALLBACK</code> procedure, use <code>plsql://schema.procedure?PR=1</code> .
context	Specifies the context that is to be passed to the callback function
qosflags	Can be set to one or more of the following values to specify the notification quality of service: <ul style="list-style-type: none"> ▪ <code>NTFN_QOS_RELIABLE</code>- This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts. ▪ <code>NTFN_QOS_PAYLOAD</code> - This value specifies that payload delivery is required. It is supported only for client notification and only for RAW queues. ▪ <code>NTFN_QOS_PURGE_ON_NTFN</code> - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.

Table 224–6 (Cont.) AQ\$_REG_INFO Type Attributes

Attribute	Description
<code>ntfn_grouping_class</code>	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If <code>ntfn_grouping_class</code> is 0, all other notification grouping attributes must be 0. <ul style="list-style-type: none"> NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.
<code>ntfn_grouping_value</code>	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until <code>ntfn_grouping_repeat_count</code> is exhausted.
<code>ntfn_grouping_type</code>	<ul style="list-style-type: none"> NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default) NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.
<code>ntfn_grouping_start_time</code>	Notification grouping start time. Notification grouping can start from a user-specified time that should be a valid timestamp with time zone. If <code>ntfn_grouping_start_time</code> is not specified when using grouping, the default is to current timestamp with time zone
<code>ntfn_grouping_repeat_count</code>	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The <code>ntfn_grouping_repeat_count</code> , if not specified, will default to <ul style="list-style-type: none"> NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

[Table 224–7](#) shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. [Table 224–8](#) shows the actions performed when XML presentation is specified.

Table 224–7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

Table 224–8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
Oracle object type	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

AQ\$ REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also: ["AQ\\$ REG_INFO Type"](#) on page 224-12

Syntax

```
TYPE SYS.AQ$ REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$ REG_INFO;
```

AQ\$_SUBSCRIBER_LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

See Also: ["AQ\\$_AGENT Type"](#) on page 224-3

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT  
INDEX BY BINARY_INTEGER;
```

DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
  consumer_name      VARCHAR2(30)      DEFAULT NULL,
  dequeue_mode       BINARY_INTEGER    DEFAULT REMOVE,
  navigation         BINARY_INTEGER    DEFAULT NEXT_MESSAGE,
  visibility         BINARY_INTEGER    DEFAULT ON_COMMIT,
  wait              BINARY_INTEGER    DEFAULT FOREVER,
  msgid             RAW(16)           DEFAULT NULL,
  correlation        VARCHAR2(128)     DEFAULT NULL,
  deq_condition      VARCHAR2(4000)    DEFAULT NULL,
  signature          aq$_sig_prop      DEFAULT NULL,
  transformation     VARCHAR2(61)     DEFAULT NULL,
  delivery_mode      PLS_INTEGER       DEFAULT PERSISTENT);
```

Attributes

Table 224–9 DEQUEUE_OPTIONS_T Attributes

Attribute	Description
consumer_name	<p>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL.</p> <p>For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call.</p>
dequeue_mode	<p>Specifies the locking behavior associated with the dequeue. Possible settings are:</p> <p>BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.</p> <p>LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.</p> <p>REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p>REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.</p>

Table 224–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
navigation	<p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:</p> <p>NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p>NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.</p> <p>FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p>FIRST_MESSAGE_MULTI_GROUP: indicates that a call to <code>DBMS_AQ.DEQUEUE_ARRAY</code> will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the <code>ARRAY_SIZE</code> limit. Refer to the <code>TRANSACTION_GROUP</code> attribute for the message to distinguish between transaction groups.</p> <p>NEXT_MESSAGE_MULTI_GROUP: indicates that a call to <code>DBMS_AQ.DEQUEUE_ARRAY</code> will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the <code>ARRAY_SIZE</code> limit. Refer to the <code>TRANSACTION_GROUP</code> attribute for the message to distinguish between transaction groups.</p>
visibility	<p>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the <code>BROWSE</code> dequeue mode. Possible settings are:</p> <p>ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default.</p> <p>IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</p>
wait	<p>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</p> <p>FOREVER: Wait forever. This setting is the default.</p> <p>NO_WAIT: Do not wait.</p> <p>number: Wait time in seconds.</p>
msgid	<p>Specifies the message identifier of the message to be dequeued.</p>
correlation	<p>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</p>

Table 224–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
deq_condition	<p>A conditional expression based on the message properties, the message data properties, and PL/SQL functions.</p> <p>A <code>deq_condition</code> is specified as a Boolean expression using syntax similar to the <code>WHERE</code> clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the <code>WHERE</code> clause of a SQL query). Message properties include <code>priority</code>, <code>corrid</code> and other columns in the queue table.</p> <p>To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The <code>deq_condition</code> parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</p>
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be <code>BUFFERED</code> or <code>PERSISTENT</code> or <code>PERSISTENT_OR_BUFFERED</code> . The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

ENQUEUE_OPTIONS_T Type

Specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
  visibility          BINARY_INTEGER  DEFAULT ON_COMMIT,
  relative_msgid     RAW(16)          DEFAULT NULL,
  sequence_deviation BINARY_INTEGER  DEFAULT NULL,
  transformation     VARCHAR2(61)    DEFAULT NULL,
  delivery_mode      PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 224–10 ENQUEUE_OPTIONS_T Attributes

Attribute	Description
visibility	Specifies the transactional behavior of the enqueue request. Possible settings are: ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueueing to a non-persistent queue.
relative_msgid	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.
sequence_deviation	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: BEFORE: The message is enqueued ahead of the message specified by relative_msgid. TOP: The message is enqueued ahead of any other messages.
transformation	Specifies a transformation that will be applied before enqueueing the message. The return type of the transformation function must match the type of the queue.
delivery_mode	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the dequeue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
  priority          NUMBER,
  delay             NUMBER,
  expiration        NUMBER,
  correlation       VARCHAR2(128),
  attempts          NUMBER,
  exception_queue   VARCHAR2(51),
  enqueue_time     DATE,
  state            NUMBER,
  sender_id         aq$_agent,
  original_msgid    RAW(16),
  delivery_mode     NUMBER);
```

Parameters

Table 224–11 SYS.MSG_PROP_T Type Attributes

Parameter	Description
<code>priority</code>	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
<code>delay</code>	<p>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with <code>delay</code> set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message.</p> <p>The possible settings follow:</p> <p><code>NO_DELAY</code>: The message is available for immediate dequeuing</p> <p><code>number</code>: The number of seconds to delay the message</p>
<code>expiration</code>	<p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p><code>NEVER</code>: The message does not expire</p> <p><code>number</code>: The number of seconds message remains in <code>READY</code> state. If the message is not dequeued before it expires, then it is moved to the exception queue in the <code>EXPIRED</code> state.</p>
<code>correlation</code>	Returns the identifier supplied by the producer of the message at enqueue time.
<code>attempts</code>	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 224–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
exception_queue	<p>Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p>Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</p> <ul style="list-style-type: none"> ■ <code>RETRY_COUNT</code>, the number of unsuccessful dequeue attempts, has exceeded the specification for the <code>MAX_RETRIES</code> parameter in the <code>DBMS_AQADM.CREATE_QUEUE</code> procedure during queue creation. <p>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the <code>MAX_RETRIES</code> parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than <code>MAX_RETRIES</code>. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</p> <p>If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <ul style="list-style-type: none"> ■ A message was not dequeued before the expiration time elapsed. ■ Message propagation to the specified destination queue failed with one of the following errors: <ul style="list-style-type: none"> * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. <p>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p>
enqueue_time	<p>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul style="list-style-type: none"> ■ <code>DBMS_AQ.READY</code>: The message is ready to be processed. ■ <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached. ■ <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained. ■ <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue.

Table 224–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
sender_id	<p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</p>
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also: [AQ\\$_RECIPIENT_LIST_T Type](#) on page 224-11

Syntax

```

TYPE message_properties_t IS RECORD (
  priority          BINARY_INTEGER NOT NULL DEFAULT 1,
  delay            BINARY_INTEGER NOT NULL DEFAULT NO_DELAY,
  expiration       BINARY_INTEGER NOT NULL DEFAULT NEVER,
  correlation      VARCHAR2(128)   DEFAULT NULL,
  attempts         BINARY_INTEGER,
  recipient_list   AQ$_RECIPIENT_LIST_T,
  exception_queue  VARCHAR2(61)   DEFAULT NULL,
  enqueue_time    DATE,
  state           BINARY_INTEGER,
  sender_id       SYS.AQ$_AGENT   DEFAULT NULL,
  original_msgid  RAW(16)         DEFAULT NULL,
  signature       aq$_sig_prop    DEFAULT NULL,
  transaction_group VARCHAR2(30)  DEFAULT NULL,
  user_property   SYS.ANYDATA     DEFAULT NULL,
  delivery_mode   PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);

```

Attributes

Table 224–12 MESSAGE_PROPERTIES_T Attributes

Attribute	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by <code>msgid</code> overrides the delay specification. A message enqueued with delay set is in the <code>WAITING</code> state, and when the delay expires, the message goes to the <code>READY</code> state. <code>DELAY</code> processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: <code>NO_DELAY</code> : The message is available for immediate dequeuing number: The number of seconds to delay the message

Table 224–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
expiration	<p>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed.</p> <p>The possible settings follow:</p> <p>NEVER: The message does not expire</p> <p>number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</p>
correlation	Returns the identifier supplied by the producer of the message at enqueue time.
attempts	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
recipient_list	<p>This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time.</p> <p>For type definition, see the "AQ\$_AGENT Type" on page 224-3.</p>

Table 224–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
exception_queue	<p data-bbox="626 262 1317 317">Specifies the name of the queue into which the message is moved if it cannot be processed successfully.</p> <p data-bbox="626 327 1287 407">Messages are moved automatically into the exception queue. You can view <code>MAX_RETRIES</code> for a queue in the <code>ALL_QUEUES</code> data dictionary view.</p> <p data-bbox="675 766 1317 871">If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented.</p> <ul data-bbox="626 886 1333 1220" style="list-style-type: none"> <li data-bbox="626 886 1268 940">■ A message was not dequeued before the expiration time elapsed. <li data-bbox="626 955 1333 1220">■ Message propagation to the specified destination queue failed with one of the following errors: <ul data-bbox="675 1018 1317 1220" style="list-style-type: none"> <li data-bbox="675 1018 1317 1073">* There were no recipients for the multiconsumer destination queue. <li data-bbox="675 1087 1317 1142">* Recipients were specified for a single-consumer destination queue. <li data-bbox="675 1157 1138 1182">* Destination queue was an exception queue <li data-bbox="675 1197 1219 1220">* There was an error when applying transformation. <p data-bbox="626 1234 1333 1388">The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a <code>NULL</code> value at dequeue time.</p>
enqueue_time	<p data-bbox="626 1409 1333 1484">Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</p>
state	<p data-bbox="626 1505 1317 1585">Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</p> <ul data-bbox="626 1600 1333 1820" style="list-style-type: none"> <li data-bbox="626 1600 1252 1625">■ <code>DBMS_AQ.READY</code>: The message is ready to be processed. <li data-bbox="626 1640 1268 1694">■ <code>DBMS_AQ.WAITING</code>: The message delay has not yet been reached. <li data-bbox="626 1709 1333 1764">■ <code>DBMS_AQ.PROCESSED</code>: The message has been processed and is retained. <li data-bbox="626 1778 1252 1820">■ <code>DBMSAQ.EXPIRED</code>: The message has been moved to the exception queue.

Table 224–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
sender_id	<p>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq\$_agent.</p> <p>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.</p> <p>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</p>
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
signature	Currently not implemented
transaction_group	<p>Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.</p>
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	<p>The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.</p>

MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties. Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T` VARRAY.

See Also: ["MESSAGE_PROPERTIES_T Type"](#) on page 224-24

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
  OF MESSAGE_PROPERTIES_T;
```

MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- [Summary of URITYPE Supertype Subprograms](#)
- [Summary of HTTPURITYPE Subtype Subprograms](#)
- [Summary of DBURITYPE Subtype Subprograms](#)

Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 225–1 URITYPE Type Subprograms

Method	Description
GETBLOB on page 225-3	Returns the BLOB located at the address specified by the URL.
GETCLOB on page 225-4	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE on page 225-5	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
GETEXTERNALURL on page 225-6	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
GETURL on page 225-7	Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance.
GETXML on page 225-8	Returns the <code>XMLType</code> located at the address specified by the URL.

GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL and the content type.
<pre>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getClob() RETURN clob;</pre>	This function returns the CLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</pre>	This function returns the CLOB located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getXML() RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the `UriType` that provides support for the HTTP protocol. This uses the `UTL_HTTP` package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 225–2 HTTPURITYPE Type Subprograms

Method	Description
CREATEURI on page 225-10	Creates an instance of HTTPURITYPE from the given URI.
GETBLOB on page 225-11	Returns the BLOB located at the address specified by the URL.
GETCLOB on page 225-12	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE on page 225-13	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 225-14	Returns the URL, in escaped format, stored inside the <code>UriType</code> instance.
GETURL on page 225-7	Returns the URL, in non-escaped format, stored inside the <code>UriType</code> instance.
GETXML on page 225-16	Returns the XMLType located at the address specified by the URL
HTTPURITYPE on page 225-17	Creates an instance of HTTPURITYPE from the given URI.

CREATEURI

This static function constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN HTTPURITYPE;
```

Parameter	IN / OUT	Description
-----------	----------	-------------

<code>url</code>	(IN)	The URL string containing a valid HTTP URL; escaped format.
------------------	------	---

GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN blob;</pre>	This function returns the BLOB located at the address specified by the HTTP URL.
<pre>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;</pre>	This function returns the BLOB located at the address specified by the HTTP URL and the content type.
<pre>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	Returns the CLOB located at the address specified by the HTTP URL.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	Returns the CLOB located at the address specified by the HTTP URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function. The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

Syntax	Description
<pre>MEMBER FUNCTION getXML() RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

HTTPURITYPE

This constructs a `HTTPURITYPE` instance. The `HTTPURITYPE` instance does not contain the prefix `http://` in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(  
    url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

Summary of DBURITYPE Subtype Subprograms

The `DBURITYPE` is a subtype of the `UriType` that provides support for `DBUri`-refs. A `DBUri`-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

Table 225–3 *DBURITYPE Type Subprograms*

Method	Description
CREATEURI on page 225-19	Constructs a <code>DBURITYPE</code> instance.
DBURITYPE on page 225-20	Creates an instance of <code>DBURITYPE</code> from the given URI.
GETBLOB on page 225-21	Returns the <code>BLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
GETCLOB on page 225-22	Returns the <code>CLOB</code> located at the address specified by the <code>DBURITYPE</code> instance.
GETCONTENTTYPE on page 225-23	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 225-24	Returns the URL, in escaped format, stored inside the <code>DBURITYPE</code> instance.
GETURL on page 225-25	Returns the URL, in non-escaped format, stored inside the <code>DBURITYPE</code> instance.
GETXML on page 225-26	Returns the <code>XMLType</code> located at the address specified by the URL.

CREATEURI

This static function constructs a `DBURITYPE` instance. Parses the URL given and creates a `DBURITYPE` instance.

Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN DBURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid <code>DBURITYPE</code> .

DBURITYPE

This constructs a `DBURITYPE` instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(  
    url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid <code>DBURITYPE</code> . The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

GETBLOB

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL and the content type.
<pre>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the `DBURITYPE` instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the `DBUri-ref` identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getClob() RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>DBURITYPE</code> instance.
<pre>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>DBURITYPE</code> instance and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getXML() RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URITYPE. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URITYPE column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 225–4 XDBURITYPE Type Subprograms

Method	Description
CREATEURI on page 225-28	Returns the <code>UriType</code> corresponding to the specified URL.
GETBLOB on page 225-29	Returns the <code>BLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
GETCLOB on page 225-22	Returns the <code>CLOB</code> corresponding to the contents of the document specified by the <code>XDBURITYPE</code> instance.
GETCONTENTTYPE on page 225-31	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 225-24	Returns the URL, in escaped format, stored inside the <code>XDBURITYPE</code> instance.
GETURL on page 225-25	Returns the URL, in non-escaped format, stored inside the <code>XDBURITYPE</code> instance.
GETXML on page 225-34	Returns the <code>XMLType</code> corresponding to the contents of the document specified by the URL.
XDBURITYPE on page 225-35	Creates an instance of <code>XDBURITYPE</code> from the given URI.

CREATEURI

This static function constructs a `XDBURITYPE` instance. Parses the URL given and creates a `XDBURITYPE` instance.

Syntax

```
STATIC FUNCTION createUri(  
    url IN varchar2)  
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid <code>XDBURITYPE</code> .

GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getBlob() RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL.
<pre>MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;</pre>	This function returns the BLOB located at the address specified by the URL and the content type.
<pre>FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;</pre>	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the `XDBURITYPE` instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getClob() RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>XDBUirType</code> instance.
<pre>MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;</pre>	Returns the CLOB located at the address specified by the <code>XDBUirType</code> instance and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()  
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()  
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()  
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION getXML() RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL.
<pre>MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;</pre>	This function returns the <code>XMLType</code> located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
<code>content</code>	(OUT)	Content type of the document to which URI is pointing.

XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
    url      IN  VARCHAR2,
    flags    IN  RAW := NULL)
RETURN self AS RESULT;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBurType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: <ul style="list-style-type: none"> ■ 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. ■ 2 - Indicates that any errors during document retrieval should be suppressed ■ 3 - Both flag bits (1, 2) are enabled

Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 225–5 URIFACTORY Type Subprograms

Method	Description
GETURI on page 225-37	Returns the correct URL handler for the given URL string.
ESCAPEURI on page 225-38	Returns a URL in escaped format.
UNESCAPEURI on page 225-39	Returns a URL in unescaped format.
REGISTERURLHANDLER on page 225-40	Registers a particular type name for handling a particular URL.
UNREGISTERURLHANDLER on page 225-41	Unregisters a URL handler.

GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the [REGISTERURLHANDLER](#) function. If the prefix matches, [GETURI](#) would then use that subtype.

Syntax

```
FUNCTION getUri(  
    url IN Varchar2)  
RETURN UriType;
```

Parameter	IN / OUT	Description
uri	(IN)	The URL string, in escaped format, containing a valid HTTP URL.

ESCAPEURI

This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the [GETEXTERNALURL](#) function or the [GETURI](#) function to get to the URL value instead of using the attribute present in the `UriType`.

Syntax

```
MEMBER FUNCTION escapeUri()  
RETURN varchar2;
```

Parameter	IN / OUT	Description
<code>url</code>	(IN)	The URL string to be returned in escaped format.

UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the [ESCAPEURI](#) function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()  
RETURN varchar2;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in unescaped format.

REGISTERURLHANDLER

Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUrl` static member function. This function is called by the [GETURI](#) function to generate an instance of the type. The `striprefix` parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(  
    prefix IN varchar2,  
    schemaName IN varchar2,  
    typename IN varchar2,  
    ignoreCase IN boolean := true,  
    striprefix IN boolean := true);
```

Parameter	IN / OUT	Description
<code>prefix</code>	(IN)	The prefix to handle; for example, <code>http://</code> .
<code>schemaName</code>	(IN)	Name of the schema where the type resides; case sensitive.
<code>typename</code>	(IN)	The name of the type to handle the URL; case sensitive.
<code>ignoreCase</code>	(IN)	Ignore case when matching prefixes.
<code>striprefix</code>	(IN)	Strip prefix before generating the instance of the type.

UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

Syntax

```
PROCEDURE unregisterUrlHandler(  
    prefix IN varchar2);
```

Parameter	IN / OUT	Description
prefix	(IN)	The prefix to be unregistered.

Expression Filter Types

The Expression Filter feature is supplied with a set of predefined types and public synonyms for these types. Most of these types are used for configuring index parameters with the Expression Filter procedural APIs. The `EXF$TABLE_ALIAS` type is used to support expressions defined on one or more database tables.

See Also: *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- [Summary of Expression Filter Types](#)

Summary of Expression Filter Types

Table 226–1 describes the Expression Filter object types.

All the values and names passed to the types defined in this chapter are not case sensitive. To preserve the case, you use double quotation marks around the values.

Table 226–1 Expression Filter Object Types

Object Type Name	Description
EXF\$ATTRIBUTE	Specifies the stored and indexed attributes for the Expression Filter indexes
EXF\$ATTRIBUTE_LIST	Specifies a list of stored and indexed attributes when configuring index parameters
EXF\$INDEXOPER	Specifies a list of common operators in predicates with a stored or an indexed attribute
EXF\$TABLE_ALIAS	Indicates a special form of elementary attribute used to manage expressions defined on one or more database tables
EXF\$TEXT	Associates preferences to a text attribute in an attribute set or an event structure
EXF\$XPATH_TAG	Configures an XML element or an XML attribute for indexing a set of XPath predicates
EXF\$XPATH_TAGS	Specifies a list of XML tags when configuring the Expression Filter index parameters

EXF\$ATTRIBUTE

The EXF\$ATTRIBUTE type is used to handle stored and indexed attributes for the Expression Filter indexes.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE AS OBJECT attr_name    VARCHAR2(350),
                                                attr_oper    EXF$INDEXOPER,
                                                attr_indexed VARCHAR2(5);
```

Attributes

Table 226–2 EXF\$ATTRIBUTE Attributes

Attribute	Description
attr_name	The arithmetic expression that constitutes the stored or indexed attribute
attr_oper	The list of common operators in the predicates with the attribute. Default value: EXF\$INDEXOPER('all')
attr_indexed	TRUE if the attribute is indexed, else FALSE. Default value: FALSE.

Usage Notes

- The EXF\$ATTRIBUTE type is used to specify the stored and indexed attributes for an Expression Filter index using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS procedure. When values for attr_oper and attr_indexed fields are omitted during EXF\$ATTRIBUTE instantiation, it is considered a stored attribute with a default value for common operators (EXF\$INDEXOPER('all')).

Examples

A stored attribute with no preference on the list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)')
```

An indexed attribute is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
              attr_indexed => 'TRUE')
```

An indexed attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
              attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
              attr_indexed => 'TRUE')
```

EXF\$ATTRIBUTE_LIST

The EXF\$ATTRIBUTE_LIST type is used to specify a list of stored and indexed attributes while configuring the index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE_LIST as VARRAY(490) of exf$attribute;
```

Attributes

None.

Usage Notes

- Also see the ["DEFAULT_INDEX_PARAMETERS Procedure"](#) for more information

Examples

A list of stored and indexed attributes can be represented as follows:

```
exf$attribute_list (  
    exf$attribute (attr_name => 'Model',  
                  attr_oper => exf$indexoper('='),  
                  attr_indexed => 'TRUE'),  
    exf$attribute (attr_name => 'Price',  
                  attr_oper => exf$indexoper('all'),  
                  attr_indexed => 'TRUE'),  
    exf$attribute (attr_name => 'HorsePower(Model, Year)',  
                  attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),  
                  attr_indexed => 'FALSE')  
)
```

EXF\$INDEXOPER

The EXF\$INDEXOPER type is used to specify the list of common operators in predicates with a stored or an indexed attribute.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$INDEXOPER as VARRAY(20) of VARCHAR2(15);
```

The values for the EXF\$INDEXOPER array are expected to be from the list in the following table:

Value	Predicate Description
=	Equality predicates
>	Greater than predicates
<	Less than predicates
>=	Greater than or equal to predicates
<=	Less than or equal to predicates
!= or <> or ^=	Not equal to predicates
IS NULL	IS NULL predicates
IS NOT NULL	IS NOT NULL predicates
ALL	All the operators listed in this table starting with the equality predicate through the IS NOT NULL predicate
NVL	Predicates with NVL (equality) operator
LIKE	Predicates with LIKE operator
BETWEEN	BETWEEN predicates

Attributes

None.

Usage Notes

- A value of ALL for one of the EXF\$INDEXOPER items implies that all the simple operators (=,>,<,>=,<=,!=, IS NULL, IS NOT NULL) are common in the predicates with an attribute. This value can be used along with one or more complex operators (NVL, LIKE and BETWEEN).
- A predicate with a BETWEEN operator is treated as two predicates with binary operators, one with '>=' operator and another with '<=' operator. By default, only one of these operators is indexed, and the other operator is evaluated by value substitution. However, if predicates with the BETWEEN operator are common for an attribute (stored or indexed), both the binary operators resulting from the BETWEEN operator can be indexed by specifying BETWEEN in the EXF\$INDEXOPER VARRAY. However, because this uses additional space in the predicate table, this operator should be used only when majority of predicates with an attribute use the BETWEEN operator.
- When the LIKE operator is chosen as one of the common operators for an attribute, LIKE predicates on that attributes are indexed. Indexing a LIKE operator is beneficial only if the VARCHAR2 constant on the right-hand side of the

predicate does not lead with a wild-card character. For example, indexing a LIKE operator will filter the following predicates efficiently:

```
company LIKE 'General%'  
company LIKE 'Proctor%'
```

But, the following predicates are evaluated as sparse predicates in the last stage:

```
company LIKE '%Electric'  
company LIKE "%Gamble'
```

Examples

An attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',  
              attr_oper => exf$indexoper('=', '<', '>', '>=', '<=', 'between'),  
              attr_indexed => 'TRUE')
```

EXF\$TABLE_ALIAS

A EXF\$TABLE_ALIAS type is a special form of elementary attribute that can be included in the attribute set. These attributes are used to manage expressions defined on one or more database tables.

Syntax

```
CREATE or REPLACE TYPE EXF$TABLE_ALIAS AS OBJECT table_name VARCHAR2(70);
```

Attributes

Table 226–3 EXF\$TABLE_ALIAS Attribute

Attribute	Description
table_name	Name of the table with a possible schema extension

Usage Notes

- The concept of a table alias attribute is captured in the Expression Filter dictionary and the corresponding attribute in the attribute set's object type is created with a VARCHAR2 datatype. (Also see Appendix A in Oracle Database Rules Manager and Expression Filter Developer's Guide and "[ADD_ELEMENTARY_ATTRIBUTE Procedures](#)".)

Examples

For a set of expressions defined on database tables, the corresponding table alias attributes are configured as follows:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'HRAttrSet',
    attr_name => 'EMP',
    tab_alias => exf$table_alias('SCOTT.EMP'));
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set => 'HRAttrSet',
    attr_name => 'DEPT',
    tab_alias => exf$table_alias('DEPT'));
END;
/
```

The Expression column using the previous attribute set can store expressions of form EMP.JOB = 'Clerk' and EMP.NAME = 'Joe', where JOB and NAME are the names of the columns in the SCOTT.EMP table.

EXF\$TEXT

A EXF\$TEXT type is used to associate preferences to a text attribute in an attribute set or an event structure.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$TEXT AS OBJECT(preferences VARCHAR2(1000));
```

Attributes

Table 226–4 EXF\$TEXT Attribute

Attribute	Description
preferences	Text preference specification, such as LEXER, CLASSIFIER, and WORDLIST

Usage Notes

- The EXF\$TEXT attribute is used to specify the preferences for a text attribute at the time of creation. The preferences specified through the instance of EXF\$TEXT type are used in creation of the CTXRULE index for the text predicates. The syntax for the text preference specification is similar to the PARAMETERS clause specified for a CTXRULE Indextype. [See CREATE INDEX syntax for CTXRULE Indextype in *Oracle Text Reference*, Release 10g Release 2.]

Examples

A text predicate with a LEXER and WORDLIST preferences can be created using the following instance of EXF\$TEXT object as follows:

```
EXF$TEXT ('LEXER insrpt_lexer WORDLIST insrpt_wordlist');
```

EXF\$XPATH_TAG

The EXF\$XPATH_TAG type is used to configure an XML element or an XML attribute for indexing a set of XPath predicates.

Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAG AS OBJECT tag_name    VARCHAR2(350),
                                                tag_indexed  VARCHAR2(5),
                                                tag_type    VARCHAR2(30);
```

Attributes

Table 226–5 EXF\$XPATH_TAG Attributes

Attribute	Description
tag_name	Name of the XML element or attribute. The name for an XML attribute is formatted as: <ElementName>@<AttributeName>. Optionally, the element name can be prefixed with its namespace URL as in <Namespace URL>:<ElementName>@<AttributeName>.
tag_indexed	TRUE if XML tag is indexed; otherwise FALSE. Default: TRUE if the tag is a positional filter. FALSE if the tag is a value filter.
tag_type	Datatype for the value in the case of value filter. NULL for positional filters.

Usage Notes

- EXF\$XPATH_TAG type is used to configure an XML element or an attribute as a positional or a value filter for an Expression Filter index (see "Index Tuning for XPath Predicates" in Oracle Database Rules Manager and Expression Filter Developer's Guide). An instance of the EXF\$XPATH_TAG type with NULL value for tag_type configures the XML tag as a positional filter. In the current release, the only other possible values for the tag_type attribute are strings (CHAR or VARCHAR) and such tags are configured as value filters. By default, all positional filters are indexed and the value filters are not indexed. This behavior can be overridden by setting a TRUE or FALSE value for the tag_indexed attribute accordingly.

Examples

An XML element can be configured as a positional filter and be indexed using the following instance of the EXF\$XPATH_TAG type.

```
exf$xpath_tag(tag_name    => 'stereo',      --- XML element
              tag_indexed => 'TRUE',      --- indexed predicate group
              tag_type    => null)      --- positional filter
```

An XML attribute can be configured as a value filter and be indexed using the following type instance.

```
exf$xpath_tag(tag_name    => 'stereo@make', --- XML attribute
              tag_indexed => 'TRUE',      --- indexed predicate group
              tag_type    => 'VARCHAR(15)') --- value filter
```

The following commands configure the two filters shown previously using the namespace URL for the corresponding elements.

```
exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo',
              tag_indexed => 'TRUE', --- indexed predicate group
              tag_type => null)      --- positional filter

exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo@make'
              tag_indexed => 'TRUE', --- indexed predicate group
              tag_type => 'VARCHAR(15)') --- value filter
```

EXF\$XPATH_TAGS

The EXF\$XPATH_TAGS type is used to specify a list of XML tags while configuring the Expression Filter index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAGS as VARRAY(490) of EXF$XPATH_TAG;
```

Attributes

None.

Usage Notes

- EXF\$XPATH_TAGS type is used to specify a list of XML tags while configuring the Expression Filter index parameters. (See ["DEFAULT_INDEX_PARAMETERS Procedure"](#).)

Examples

A list of XML tags configured as positional and value filters can be represented as follows:

```
exf$xpath_tags(
    exf$xpath_tag(tag_name    => 'stereo@make', --- XML attribute
                  tag_indexed => 'TRUE',
                  tag_type    => 'VARCHAR(15)'), --- value filter
    exf$xpath_tag(tag_name    => 'stereo',      --- XML element
                  tag_indexed => 'FALSE',
                  tag_type    => null),         --- positional filter
    exf$xpath_tag(tag_name    => 'memory',     --- XML element
                  tag_indexed => 'TRUE',
                  tag_type    => 'VARCHAR(10)') --- value filter
)
```

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueueing or to interpret a dequeued JMS message.

Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Streams AQ offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Streams AQ offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Streams AQ rules

Java Versus PL/SQL Data Types

Data types do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

See Also: JMS specification 3.11.3, Conversion Provided by `StreamMessage` and `MapMessage`

New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any data type that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionalities that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses these common functionalities.

This section contains these topics:

- [Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages](#)
- [Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages](#)
- [Differences Between Bytes and Stream Messages](#)
- [Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes](#)

Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

Note: It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the `Jserv` static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the `Jserv` side. This collection is called the message store. Each `map`, `bytes`, or `stream` message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.
This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.
For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using `Java ObjectOutputStream` and bytes messages are encoded using `Java DataOutputStream`. In stream messages each primitive type is written and read as a `Java Object`, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read `Java` objects, and there are no `Java` objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

Note: All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either RAW or BLOB in the database. In this release Oracle Streams AQ provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Streams AQ queue. Oracle Streams AQ supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

JMS Types Error Reporting

Table 227–1 lists Oracle JMS types related errors.

Table 227–1 Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the <code>get_text</code> procedure with a <code>VARCHAR2</code> parameter of <code>aq\$_jms_text_message</code> or <code>get_bytes</code> procedure with a <code>RAW</code> parameter of <code>aq\$_jms_bytes_message</code> .
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example <code>set_byte_property</code> , <code>set_short_property</code> of <code>aq\$_jms_head</code> ADT; <code>set_byte</code> and <code>set_short</code> of <code>aq\$_jms_map_message</code> ADT; <code>write_byte</code> and <code>write_short</code> of <code>aq\$_jms_stream_message</code> and <code>aq\$_jms_bytes_message</code> ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the <code>aq\$_jms_namearray</code> ADT capacity. The current size limit is 1024. You can use the <code>get_names</code> function with <code>offset</code> and <code>length</code> parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the <code>get_exception</code> static procedure of <code>aq\$_jms_map_message</code> , <code>aq\$_jms_bytes_message</code> , and <code>aq\$_jms_stream_message</code> to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT <code>aq\$_jms_exception</code> is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the <code>clean</code> procedure after using one message. The <code>clean</code> procedure frees the message slot for use by other messages attempting access.

Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

DBMS_AQ Package Constants

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE     CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE  CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the `get_mode` function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Streams AQ queue. They are useful during the conversion of JMS selectors to Oracle Streams AQ rules:

```
DESTPLOAD_JMSTYPE  CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT  CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA  CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a `aq$_jms_value` type. They are useful when interpreting the `aq$_jms_value` returned by the `get_object` method of `AQ$_JMS_MAP_MESSAGE` or `read_object` method of `AQ$_JMS_STREAM_MESSAGE`:

```
DATA_TYPE_BYTE          CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT         CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER       CONSTANT PLS_INTEGER;
DATA_TYPE_LONG          CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT         CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE        CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN       CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER     CONSTANT PLS_INTEGER;
DATA_TYPE_STRING        CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES         CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW    CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST  CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL   CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE     CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH    CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE    CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE       CONSTANT PLS_INTEGER := -24196;
```

```
ERROR_JAVA_EXCEPTION CONSTANT PLS_INTEGER := -24197;  
ERROR_INVALID_ID     CONSTANT PLS_INTEGER := -24198;  
ERROR_STORE_OVERFLOW CONSTANT PLS_INTEGER := -24199;
```

CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Streams AQ rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type`

parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(  
    selector          IN  VARCHAR2,  
    dest_pload_type  IN  PLS_INTEGER,  
    compliant         IN  BOOLEAN )
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Summary of JMS Types

- [SYS.AQ\\$_JMS_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_TEXT_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_BYTES_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_MAP_MESSAGE](#) Type
- [SYS.AQ\\$_JMS_STREAM_MESSAGE](#) Type

SYS.AQ\$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

```

CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq\$_jms_message

Creates an instance of `aq$_jms_message`, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created `aq$_jms_message` instance depends on the `mtype` parameter passed to the `construct` method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The `mtype` parameter must be one of the following constants described in "[Oracle JMS Type Constants](#)" on page 227-11:

```

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE

```

STATIC FUNCTION construct (text_msg IN aq\$_jms_text_message) RETURN aq\$_jms_message

Creates an `aq$_jms_message` from an `aq$_jms_text_message`.

STATIC FUNCTION construct (bytes_msg IN aq\$_jms_bytes_message) RETURN

aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq\$_jms_stream_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq\$_jms_map_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq\$_jms_object_message) RETURN aq\$_jms_message;

Creates an aq\$_jms_message from an aq\$_jms_object_message.

Cast Methods**cast_to_bytes_msg RETURN aq\$_jms_bytes_message**

Casts an aq\$_jms_message to an aq\$_jms_bytes_message. Returns an aq\$_jms_bytes_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq\$_jms_map_message

Casts an aq\$_jms_message to an aq\$_jms_map_message. Returns an aq\$_jms_map_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq\$_jms_object_message

Casts an aq\$_jms_message to an aq\$_jms_object_message. Returns an aq\$_jms_object_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq\$_jms_stream_message

Casts an aq\$_jms_message to an aq\$_jms_stream_message. Returns an aq\$_jms_stream_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq\$_jms_text_message

Casts an aq\$_jms_message to an aq\$_jms_text_message. Returns an aq\$_jms_text_message or null if the message_type attribute of the aq\$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq\$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods**set_replyto (replyto IN sys.aq\$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo.

get_replyto RETURN sys.aq\$_agent

Returns `replyto`, which corresponds to `JMSReplyTo`.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text and corresponds to `JMSType`.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods**set_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods**clear_properties**

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception `ORA-24191` if the property name exists, `ORA-24192` if the property name is null, or `ORA-24193` if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception `ORA-24191` if the property name exists or `ORA-24192` if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)

Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB),

Sets the payload, a CLOB value, to an internal representation.

set_bytes (payload IN RAW)

Sets the payload, a RAW value, to an internal representation.

set_bytes (payload IN BLOB)

Sets the payload, a BLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)

Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)

Puts the internal representation of the payload into a CLOB variable payload.

get_bytes (payload OUT RAW)

Puts the internal representation of the payload into a RAW variable payload.

get_bytes (payload OUT BLOB)

Puts the internal representation of the payload into a BLOB variable payload.

SYS.AQ\$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Streams AQ queue.

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq\$_jms_text_message

Creates an empty aq\$_jms_text_message.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR

Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR

Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR

Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN INT

Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the `property_value` exists or ORA-24192 if the `property_name` is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_short_property property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding `property_name` passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)

Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)

Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)

Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)

Puts the internal representation of the payload into a `CLOB` variable payload.

SYS.AQ\$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a BytesMessage in an Oracle Streams AQ queue.

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq\$_jms_bytes_message

Creates an empty aq\$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods**set_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods**clear_properties**

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `Long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)

Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)

Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)

Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)

Puts the internal representation of the payload into a `BLOB` variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_bytes_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)

Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session

memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER

Reads length of the bytes from bytes message stream into `value` and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR

Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION

Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT

Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT

Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER

Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)

Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)

Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)

Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ\$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a MapMessage in an Oracle Streams AQ queue.

This section contains these topics:

- [CONSTRUCT Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```

TYPE aq$_jms_map_message AS object(
  header      aq$_jms_header,

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq\$_jms_map_message

Creates an empty aq\$_jms_map_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)

Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)

Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)

Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)

Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR

Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR

Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR

Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER

Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the `property_value` exists or ORA-24192 if the `property_name` is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding `property_name` passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)

Sets the internal payload as a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `RAW` variable without interpreting it.

set_bytes (payload IN BLOB)

Sets the internal payload as a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

get_bytes (payload OUT RAW)

Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions `ORA-24190` if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)

Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)

Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the BYTE value with the specified name in the map. Because there is no BYTE type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW)

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT,

length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a `Java IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)

Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)

Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset ... offset+length`] exceeds the boundary of the byte array value, then a `Java IndexOutOfBoundsException` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)

Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)

Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)

This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)

Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)

Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB)

Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN

Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the BYTE value with the specified name. If there is no item by this name, then null is returned. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to represent a byte. Although the PL/SQL users get an PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a set_byte function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)

Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL RAW type, a BLOB is always returned here. The BLOB returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR

Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION

Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT

Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the INT value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type

of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER

Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER

Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)

Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq\$_jms_namearray

Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq\$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER

Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where `size` is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ\$_JMS_VALUE)

Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See

the map in the AQ\$_JMS_VALUE ADT for the correspondence among `dbms_jms_` `plssql` package constants, Java data type and AQ\$_JMS_VALUE attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the data type of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER

Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN

Indicates that an item exists in this map message by returning `TRUE`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

SYS.AQ\$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- [CONSTRUCT Function](#)
- [JMS Header Methods](#)
- [System Properties Methods](#)
- [User Properties Methods](#)
- [Payload Methods](#)

Syntax

```

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq\$_jms_stream_message

Creates an empty aq\$_jms_stream_message object.

JMS Header Methods

set_replyto (replyto IN sys.aq\$_agent)

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq\$_agent

Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR

Returns `type`, which corresponds to `JMSType`.

System Properties Methods**set_userid (userid IN VARCHAR)**

Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)

Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)

Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)

Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR

Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR

Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR

Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER

Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods**clear_properties**

Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the `property_name` exists, ORA-24192 if the `property_name` is null, or ORA-24193 if the `property_value` exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the `property_name` exists or ORA-24192 if the `property_name` is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)

Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)

Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN

If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION

If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT

If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER

If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT

If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR

If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods**get_bytes (payload OUT RAW)**

Puts the internal payload into a `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception `ORA-24190` if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)

Puts the internal payload into a `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

set_bytes (payload IN RAW)

Sets the internal payload as the `RAW` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)

Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER

Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in `Jserv` session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an `ORA-24196` error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises `ORA-24197` if the Java stored procedure throws an exception during execution, `ORA-24198` if the operation ID is invalid, or `ORA-24199` if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)

Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

flush (id IN PLS_INTEGER)

Takes the static variable in `Jserv` and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)

Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB

Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)

Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR

Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION

Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT

Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER

Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected

type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB

Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)

Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ\$_JMS_VALUE)

Returns a general value ADT AQ\$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See [Table 227-2](#) on page 227-57 for the correspondence among `dbms_jms_plsql` package constants, Java data type and AQ\$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)

Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)

Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [`offset`, `offset+length`] exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)

Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)

Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)

Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)

Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)

Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)

Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)

Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)

Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ\$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Streams AQ queue.

Syntax

```
TYPE aq$_jms_object_message AS object(  
    header    aq$_jms_header,  
    bytes_len int,  
    bytes_raw raw(2000),  
    bytes_lob blob);
```

SYS.AQ\$_JMS_NAMESARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMESARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,  
    offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

SYS.AQ\$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The `type` field in this ADT is used to decide which type of data this object is really holding. Table 227-2 lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object (
  type      number(2),
  num_val   number,
  char_val  char(1),
  text_val  clob,
  bytes_val blob);
```

Table 227-2 *AQ\$_JMS_VALUE Type Fields and Java Fields*

Type	Java Type	aq\$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

SYS.AQ\$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (  
    id          number, -- Reserved and not used. Right now always return 0.  
    exp_name    varchar(200),  
    err_msg     varchar(500),  
    stack       varchar(4000));
```

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types. In Oracle Streams, LCRs are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueueing, and dequeuing LCRs manually.

See Also: *Oracle Streams Concepts and Administration* for more information about LCRs

This chapter contains these topics:

- [Summary of Logical Change Record Types](#)
- [Common Subprograms for LCR\\$_DDL_RECORD and LCR\\$_ROW_RECORD](#)

Summary of Logical Change Record Types

Table 228–1 Logical Change Record (LCR) Types

Type	Description
"LCR\$_DDL_RECORD Type" on page 228-3	Represents a data definition language (DDL) change to a database object
"LCR\$_ROW_RECORD Type" on page 228-11	Represents a data manipulation language (DML) change to a database object
"LCR\$_ROW_LIST Type" on page 228-36	Identifies a list of column values for a row in a table
"LCR\$_ROW_UNIT Type" on page 228-37	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

LCR\$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- [LCR\\$_DDL_RECORD Constructor](#)
- [Summary of LCR\\$_DDL_RECORD Subprograms](#), which also include the subprograms described in "Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD" on page 228-28

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
 - The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.
-
-

LCR\$_DDL_RECORD Constructor

Creates a SYS.LCR\$_DDL_RECORD object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
  source_database_name IN VARCHAR2,
  command_type         IN VARCHAR2,
  object_owner         IN VARCHAR2,
  object_name          IN VARCHAR2,
  object_type          IN VARCHAR2,
  ddl_text             IN CLOB,
  logon_user           IN VARCHAR2,
  current_schema       IN VARCHAR2,
  base_table_owner     IN VARCHAR2,
  base_table_name      IN VARCHAR2,
  tag                  IN RAW          DEFAULT NULL,
  transaction_id       IN VARCHAR2    DEFAULT NULL,
  scn                  IN NUMBER      DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

LCR\$_DDL_RECORD Constructor Function Parameters

Table 228–2 Constructor Function Parameters for LCR\$_DDL_RECORD

Parameter	Description
source_database_name	The database where the DDL statement occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the function specifies DBS1.NET automatically. This parameter should be set to a non-NULL value.
command_type	<p>The type of command executed in the DDL statement. This parameter should be set to a non-NULL value.</p> <p>See Also: The "SQL Command Codes" table in the <i>Oracle Call Interface Programmer's Guide</i> for a complete list of command types</p> <p>The following command types <i>are not supported</i> in DDL LCRs:</p> <pre>ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME</pre> <p>The snapshot equivalents of the materialized view command types are also not supported.</p>
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed
object_type	<p>The type of object on which the DDL statement was executed. The following are valid object types:</p> <pre>CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW</pre> <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>

Table 228–2 (Cont.) Constructor Function Parameters for LCR\$_DDL_RECORD

Parameter	Description
ddl_text	The text of the DDL statement. This parameter should be set to a non-NULL value.
logon_user	The user whose session executed the DDL statement
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text. If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text. This parameter should be set to a non-NULL value.
base_table_owner	If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.
base_table_name	If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.
tag	A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log. The SCN value is meaningless for a user-created LCR.

Summary of LCR\$_DDL_RECORD Subprograms

Table 228–3 LCR\$_DDL_RECORD Type Subprograms

Subprogram	Description
"EXECUTE Member Procedure" on page 228-6	Executes the LCR under the security domain of the current user
"GET_BASE_TABLE_NAME Member Function" on page 228-6	Returns the base (dependent) table name
"GET_BASE_TABLE_OWNER Member Function" on page 228-6	Returns the base (dependent) table owner
"GET_CURRENT_SCHEMA Member Function" on page 228-6	Returns the default schema (user) name
"GET_DDL_TEXT Member Procedure" on page 228-7	Gets the DDL text in a CLOB
"GET_LOGON_USER Member Function" on page 228-7	Returns the logon user name
"GET_OBJECT_TYPE Member Function" on page 228-7	Returns the type of the object involved for the DDL
"SET_BASE_TABLE_NAME Member Procedure" on page 228-8	Sets the base (dependent) table name

Table 228-3 (Cont.) LCR\$_DDL_RECORD Type Subprograms

Subprogram	Description
"SET_BASE_TABLE_OWNER Member Procedure" on page 228-8	Sets the base (dependent) table owner
"SET_CURRENT_SCHEMA Member Procedure" on page 228-8	Sets the default schema (user) name
"SET_DDL_TEXT Member Procedure" on page 228-8	Sets the DDL text
"SET_LOGON_USER Member Procedure" on page 228-9	Sets the logon user name
"SET_OBJECT_TYPE Member Procedure" on page 228-9	Sets the object type
Common Subprograms	See "Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD" on page 228-28 for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Any apply process handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

Note: The EXECUTE member procedure can be invoked only in an apply handler for an apply process.

Syntax

```
MEMBER PROCEDURE EXECUTE ();
```

GET_BASE_TABLE_NAME Member Function

Returns the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME ()
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Returns the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER ()
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Returns the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

The following is an example of a PL/SQL procedure that uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
  ddl_text  CLOB;
BEGIN
  DBMS_OUTPUT.PUT_LINE( ' -----' );
  DBMS_OUTPUT.PUT_LINE( ' Displaying DDL text in a DDL LCR: ' );
  DBMS_OUTPUT.PUT_LINE( ' -----' );
  DBMS_LOB.CREATETEMPORARY(ddl_text, true);
  ddl_lcr.GET_DDL_TEXT(ddl_text);
  DBMS_OUTPUT.PUT_LINE('DDL text: ' || ddl_text);
  DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

Note: GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT
  ddl_text IN/OUT CLOB);
```

Parameter

Table 228–4 GET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text in the DDL LCR

GET_LOGON_USER Member Function

Returns the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Returns the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
```

```
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(  
    base_table_name IN VARCHAR2);
```

Parameter

Table 228–5 SET_BASE_TABLE_NAME Procedure Parameter

Parameter	Description
base_table_name	The name of the base table

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(  
    base_table_owner IN VARCHAR2);
```

Parameter

Table 228–6 SET_BASE_TABLE_OWNER Procedure Parameter

Parameter	Description
base_table_owner	The name of the base owner

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(  
    current_schema IN VARCHAR2);
```

Parameter

Table 228–7 SET_CURRENT_SCHEMA Procedure Parameter

Parameter	Description
current_schema	The name of the schema to set as the current schema. This parameter should be set to a non-NULL value.

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
    ddl_text IN CLOB);
```

Parameter**Table 228–8 SET_DDL_TEXT Procedure Parameter**

Parameter	Description
ddl_text	The DDL text. This parameter should be set to a non-NULL value.

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
    logon_user IN VARCHAR2);
```

Parameter**Table 228–9 SET_LOGON_USER Procedure Parameter**

Parameter	Description
logon_user	The name of the schema to set as the logon user

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
    object_type IN VARCHAR2);
```

Parameter

Table 228–10 *SET_OBJECT_TYPE Procedure Parameter*

Parameter	Description
object_type	<p>The object type.</p> <p>The following are valid object types:</p> <ul style="list-style-type: none">CLUSTERFUNCTIONINDEXLINKOUTLINEPACKAGEPACKAGE BODYPROCEDURESEQUENCESYNONYMTABLETRIGGERTYPEUSERVIEW <p>LINK represents a database link.</p> <p>NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.</p>

LCR\$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the `LCR$_ROW_LIST` type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- [LCR\\$_ROW_RECORD Constructor](#)
- [Summary of LCR\\$_ROW_RECORD Subprograms](#), which also include the subprograms described in [Common Subprograms for LCR\\$_DDL_RECORD and LCR\\$_ROW_RECORD](#) on page 228-28

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
 - The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.
-
-

See Also: ["LCR\\$_ROW_LIST Type"](#) on page 228-36

LCR\$_ROW_RECORD Constructor

Creates a `SYS.LCR$_ROW_RECORD` object with the specified information.

```

STATIC FUNCTION CONSTRUCT(
  source_database_name IN VARCHAR2,
  command_type         IN VARCHAR2,
  object_owner        IN VARCHAR2,
  object_name         IN VARCHAR2,
  tag                 IN RAW           DEFAULT NULL,
  transaction_id      IN VARCHAR2    DEFAULT NULL,
  scn                 IN NUMBER      DEFAULT NULL,
  old_values          IN SYS.LCR$_ROW_LIST DEFAULT NULL,
  new_values          IN SYS.LCR$_ROW_LIST DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

LCR\$_ROW_RECORD Constructor Function Parameters

Table 228–11 Constructor Function Parameters for LCR\$_ROW_RECORD

Parameter	Description
source_database_name	The database where the row change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the function specifies DBS1.NET automatically. This parameter should be set to a non-NULL value.
command_type	<p>The type of command executed in the DML statement. This parameter should be set to a non-NULL value.</p> <p>Valid values are the following:</p> <p>INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM</p> <p>If INSERT, then an LCR should have a new_values collection that is not empty and an empty or NULL old_values collection.</p> <p>If UPDATE, then an LCR should have a new_values collection that is not empty and an old_values collection that is not empty.</p> <p>If DELETE, then an LCR should have a NULL or empty new_values collection and an old_values collection that is not empty.</p> <p>If LOB ERASE, LOB WRITE, or LOB TRIM, then an LCR should have a new_values collection that is not empty and an empty or NULL old_values collection.</p>
object_owner	The user who owns the table on which the row change occurred. This parameter should be set to a non-NULL value.
object_name	The table on which the DML statement was executed. This parameter should be set to a non-NULL value.
tag	<p>A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record was written to the redo log. The SCN value is meaningless for a user-created LCR.
old_values	The column values for the row before the DML change. If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.

Table 228–11 (Cont.) Constructor Function Parameters for LCR\$_ROW_RECORD

Parameter	Description
new_values	The column values for the row after the DML change. If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.

Summary of LCR\$_ROW_RECORD Subprograms

Table 228–12 LCR\$_ROW_RECORD Type Subprograms

Subprogram	Description
"ADD_COLUMN Member Procedure" on page 228-14	Adds the value as old or new, depending on the value type specified, for the column
"CONVERT_LONG_TO_LOB_CHUNK Member Procedure" on page 228-15	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
"DELETE_COLUMN Member Procedure" on page 228-15	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
"EXECUTE Member Procedure" on page 228-16	Executes the LCR under the security domain of the current user
"GET_LOB_INFORMATION Member Function" on page 228-17	Gets the LOB information for the column
"GET_LOB_OFFSET Member Function" on page 228-18	Returns the LOB offset for the specified column
"GET_LOB_OPERATION_SIZE Member Function" on page 228-18	Gets the operation size for the LOB column
"GET_LONG_INFORMATION Member Function" on page 228-19	Gets the LONG information for the column
"GET_VALUE Member Function" on page 228-20	Returns the old or new value for the specified column, depending on the value type specified
"GET_VALUES Member Function" on page 228-20	Returns a list of old or new values, depending on the value type specified
"GET_XML_INFORMATION Member Function" on page 228-21	Returns the XML information for the specified column
"RENAME_COLUMN Member Procedure" on page 228-21	Renames a column in an LCR
"SET_LOB_INFORMATION Member Procedure" on page 228-22	Sets LOB information for the column
"SET_LOB_OFFSET Member Procedure" on page 228-23	Sets the LOB offset for the specified column
"SET_LOB_OPERATION_SIZE Member Procedure" on page 228-23	Sets the operation size for the LOB column
"SET_VALUE Member Procedure" on page 228-24	Overwrites the value of the specified column

Table 228–12 (Cont.) LCR\$_ROW_RECORD Type Subprograms

Subprogram	Description
"SET_VALUES Member Procedure" on page 228-25	Replaces the existing old or new values for the LCR, depending on the value type specified
"SET_XML_INFORMATION Member Procedure" on page 228-27	Sets the XML information for the column
Common Subprograms	See Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD on page 228-28 for a list of subprograms common to the SYS.LCR\$_ROW_RECORD and SYS.LCR\$_DDL_RECORD types

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

Note: To set a column value that already exists, run SET_VALUE.

See Also: ["SET_VALUE Member Procedure"](#) on page 228-24

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
 - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
 - When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.
-

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  column_value IN  ANYDATA);
```

Parameters

Table 228–13 ADD_COLUMN Procedure Parameters

Parameter	Description
value_type	The type of value to add for the column. Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.
column_name	The column name. This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
column_value	The value of the column. If <code>NULL</code> , then this procedure raises an error. If the member procedure is used in a DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A <code>NULL</code> column value can be specified by encapsulating the <code>NULL</code> value in an <code>ANYDATA</code> wrapper.

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.
- `LOB` to `LONG` conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK();
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
    column_name IN VARCHAR2,
    value_type  IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 228–14 *DELETE_COLUMN Procedure Parameters*

Parameter	Description
column_name	The column name. An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column. Specify <code>old</code> to delete the old value of the column. Specify <code>new</code> to delete the new value of the column. If <code>*</code> is specified, then the procedure deletes both the old and new values.

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply process handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by an apply process, an application, or a user.
- The LCR has been constructed using the LCR\$_ROW_RECORD constructor function but has not been enqueued.
- The LCR is in the error queue.

Note: A custom rule-based transformation should not run this member procedure on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lob` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` datatypes. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lob` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.

- A DML or error handler configured with `assemble_lob` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` datatypes.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
    conflict_resolution IN BOOLEAN);
```

Parameters

Table 228–15 EXECUTE Procedure Parameters

Parameter	Description
<code>conflict_resolution</code>	<p>If <code>TRUE</code>, then any conflict resolution defined for the table using the <code>SET_UPDATE_CONFLICT_HANDLER</code> procedure in the <code>DBMS_APPLY_ADM</code> package is used to resolve conflicts resulting from the execution of the LCR.</p> <p>If <code>FALSE</code>, then conflict resolution is not used.</p> <p>An error is raised if this parameter is not specified or is set to <code>NULL</code>.</p>

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB          CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 228–16 GET_LOB_INFORMATION Function Parameters

Parameter	Description
<code>value_type</code>	The type of value to return for the column, either <code>old</code> or <code>new</code>
<code>column_name</code>	The name of the column

Table 228–16 (Cont.) GET_LOB_INFORMATION Function Parameters

Parameter	Description
use_old	<p>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p>

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

Syntax

```
GET_LOB_OFFSET(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 228–17 GET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to return for the column. Currently, only new can be specified.
column_name	The name of the LOB column

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
  value_type  IN  VARCHAR2,
  column_name IN  VARCHAR2)
RETURN NUMBER,
```

Parameters

Table 228–18 *GET_LOB_OPERATION_SIZE Function Parameters*

Parameter	Description
value_type	The type of value to return for the column. Currently, only new can be specified.
column_name	The name of the LOB column

GET_LONG_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG      CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG      CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG    CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK     CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
  value_type  IN  VARCHAR2,
  column_name IN  VARCHAR2,
  use_old     IN  VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 228–19 *GET_LONG_INFORMATION Function Parameters*

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_VALUE Member Function

Returns the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the `use_old` parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 228–20 GET_VALUE Function Parameters

Parameter	Description
<code>value_type</code>	The type of value to return for the column. Specify <code>old</code> to get the old value for the column. Specify <code>new</code> to get the new value for the column.
<code>column_name</code>	The column name. If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
<code>use_old</code>	If Y and <code>value_type</code> is <code>new</code> , and no new value exists, then the function returns the corresponding old value. If N and <code>value_type</code> is <code>new</code> , then the function returns NULL if no new value exists. If <code>value_type</code> is <code>old</code> or if the <code>command_type</code> of the row LCR is not UPDATE, then the function ignores the value of the <code>use_old</code> parameter. NULL is not a valid specification for the <code>use_old</code> parameter.

GET_VALUES Member Function

Returns a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the `use_old` parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
    value_type IN VARCHAR2,
    use_old IN VARCHAR2 DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 228–21 GET_VALUES Function Parameters

Parameter	Description
<code>value_type</code>	The type of values to return. Specify <code>old</code> to return a list of old values. Specify <code>new</code> to return a list of new values.

Table 228–21 (Cont.) GET_VALUES Function Parameters

Parameter	Description
use_old	<p>If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and old values for the new values that do not exist.</p> <p>If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values.</p> <p>If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter.</p> <p>NULL is not a valid specification for the use_old parameter.</p>

GET_XML_INFORMATION Member Function

Returns the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML    CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC   CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;
```

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
    column_name IN VARCHAR2)
RETURN NUMBER,
```

Parameter

Table 228–22 GET_XML_INFORMATION Function Parameter

Parameter	Description
column_name	The column name

RENAME_COLUMN Member Procedure

Renames a column in an LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
    from_column_name IN VARCHAR2,
    to_column_name   IN VARCHAR2,
    value_type       IN VARCHAR2 DEFAULT '*');
```

Parameters

Table 228–23 *RENAME_COLUMN Procedure Parameters*

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name. An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column. Specify <code>old</code> to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify <code>new</code> to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If <code>*</code> is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note: When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
    value_type      IN VARCHAR2,
    column_name     IN VARCHAR2,
    lob_information IN NUMBER);
```

Parameters

Table 228–24 *SET_LOB_INFORMATION Procedure Parameters*

Parameter	Description												
value_type	The type of value to set for the column, either <code>old</code> or <code>new</code> . Specify <code>old</code> only if <code>lob_information</code> is set to <code>DBMS_LCR.NOT_A_LOB</code> .												
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.												
lob_information	Specify one of the following values: <table style="margin-left: 40px; border: none;"> <tr> <td><code>DBMS_LCR.NOT_A_LOB</code></td> <td><code>CONSTANT NUMBER := 1;</code></td> </tr> <tr> <td><code>DBMS_LCR.NULL_LOB</code></td> <td><code>CONSTANT NUMBER := 2;</code></td> </tr> <tr> <td><code>DBMS_LCR.INLINE_LOB</code></td> <td><code>CONSTANT NUMBER := 3;</code></td> </tr> <tr> <td><code>DBMS_LCR.EMPTY_LOB</code></td> <td><code>CONSTANT NUMBER := 4;</code></td> </tr> <tr> <td><code>DBMS_LCR.LOB_CHUNK</code></td> <td><code>CONSTANT NUMBER := 5;</code></td> </tr> <tr> <td><code>DBMS_LCR.LAST_LOB_CHUNK</code></td> <td><code>CONSTANT NUMBER := 6;</code></td> </tr> </table>	<code>DBMS_LCR.NOT_A_LOB</code>	<code>CONSTANT NUMBER := 1;</code>	<code>DBMS_LCR.NULL_LOB</code>	<code>CONSTANT NUMBER := 2;</code>	<code>DBMS_LCR.INLINE_LOB</code>	<code>CONSTANT NUMBER := 3;</code>	<code>DBMS_LCR.EMPTY_LOB</code>	<code>CONSTANT NUMBER := 4;</code>	<code>DBMS_LCR.LOB_CHUNK</code>	<code>CONSTANT NUMBER := 5;</code>	<code>DBMS_LCR.LAST_LOB_CHUNK</code>	<code>CONSTANT NUMBER := 6;</code>
<code>DBMS_LCR.NOT_A_LOB</code>	<code>CONSTANT NUMBER := 1;</code>												
<code>DBMS_LCR.NULL_LOB</code>	<code>CONSTANT NUMBER := 2;</code>												
<code>DBMS_LCR.INLINE_LOB</code>	<code>CONSTANT NUMBER := 3;</code>												
<code>DBMS_LCR.EMPTY_LOB</code>	<code>CONSTANT NUMBER := 4;</code>												
<code>DBMS_LCR.LOB_CHUNK</code>	<code>CONSTANT NUMBER := 5;</code>												
<code>DBMS_LCR.LAST_LOB_CHUNK</code>	<code>CONSTANT NUMBER := 6;</code>												

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
  value_type  IN  VARCHAR2,
  column_name IN  VARCHAR2,
  lob_offset  IN  NUMBER);
```

Parameters

Table 228–25 SET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column. Currently, only new can be specified.
column_name	The column name. An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

Note: When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type      IN  VARCHAR2,
  column_name     IN  VARCHAR2,
  lob_operation_size IN NUMBER);
```

Parameters

Table 228–26 SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column. Currently, only new can be specified.
column_name	The name of the LOB column. An exception is raised if the column value does not exist in the LCR.

Table 228–26 (Cont.) SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
lob_operation_size	If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

Note: To add a column to a row LCR, run `ADD_COLUMN`.

See Also: ["ADD_COLUMN Member Procedure"](#) on page 228-14

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler, and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
 - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
 - When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.
-
-

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a DML handler or error handler, any XMLType columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value an XMLType column, specify the XMLType for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType column is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
 - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.
-
-

Syntax

```
MEMBER PROCEDURE SET_VALUE(
  value_type   IN VARCHAR2,
  column_name  IN VARCHAR2,
  column_value IN ANYDATA);
```

Parameters

Table 228–27 SET_VALUE Procedure Parameters

Parameter	Description
<code>value_type</code>	The type of value to set. Specify <code>old</code> to set the old value of the column. Specify <code>new</code> to set the new value of the column.
<code>column_name</code>	The column name. An error is raised if the specified <code>column_value</code> does not exist in the LCR for the specified <code>column_type</code> .
<code>column_value</code>	The new value of the column. If <code>NULL</code> is specified, then this procedure raises an error. To set the value to <code>NULL</code> , encapsulate the <code>NULL</code> in an ANYDATA instance. If the member procedure is used in a DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a DML handler or error handler and the handler is using LOB assembly (the `assemble_lob` parameter is set to `TRUE` for the handler), you can use this member procedure in the handler procedure on a row LCR that contains one or more LOB columns. If `assemble_lob` is set to `FALSE` for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
 - When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
 - When you are processing a row LCR with a rule-based transformation, DML handler, or error handler, you cannot use this member procedure on `LONG` or `LONG RAW` columns.
-
-

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a DML handler or error handler, any `XMLType` and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value of one or more `XMLType` columns in a row LCR, specify an `XMLType` for each `XMLType` column in the `value_list` parameter. The `SET_VALUES` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(
  value_type IN VARCHAR2,
  value_list IN SYS.LCR$_ROW_LIST);
```

Parameters**Table 228–28 SET_VALUES Procedure Parameters**

Parameter	Description
value_type	The type of values to replace. Specify old to replace the old values. Specify new to replace the new values.
value_list	List of values to replace the existing list. Use a NULL or an empty list to remove all values. If the member procedure is used in a DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
  column_name IN VARCHAR2,
  xml_information IN NUMBER);
```

Parameters**Table 228–29 SET_XML_INFORMATION Procedure Parameters**

Parameter	Description
column_name	The name of the column. An exception is raised if the column value does not exist in the LCR.
xml_information	Specify one of the following values: <ul style="list-style-type: none"> DBMS_LCR.NOT_XML CONSTANT NUMBER := 1; DBMS_LCR.XML_DOC CONSTANT NUMBER := 2; DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3; DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Common Subprograms for LCR\$_DDL_RECORD and LCR\$_ROW_RECORD

The following functions and procedures are common to both the LCR\$_DDL_RECORD and LCR\$_ROW_RECORD type.

See Also: For descriptions of the subprograms for these types that are exclusive to each type:

- ["Summary of LCR\\$_DDL_RECORD Subprograms"](#) on page 228-5
- ["Summary of LCR\\$_ROW_RECORD Subprograms"](#) on page 228-13

Table 228–30 Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
"GET_COMMAND_TYPE Member Function" on page 228-29	Returns the command type of the logical change record (LCR)
"GET_COMMIT_SCN Member Function" on page 228-29	Returns the commit system change number (SCN) of the transaction to which the current LCR belongs
"GET_COMPATIBLE Member Function" on page 228-29	Returns the minimal database compatibility required to support the LCR
"GET_EXTRA_ATTRIBUTE Member Function" on page 228-30	Returns the value for the specified extra attribute in the LCR
"GET_OBJECT_NAME Member Function" on page 228-31	Returns the name of the object that is changed by the LCR
"GET_OBJECT_OWNER Member Function" on page 228-31	Returns the owner of the object that is changed by the LCR
"GET_SCN Member Function" on page 228-31	Returns the system change number (SCN) of the LCR
"GET_SOURCE_DATABASE_NAME Member Function" on page 228-32	Returns the source database name.
"GET_SOURCE_TIME Member Function" on page 228-32	Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.
"GET_TAG Member Function" on page 228-32	Returns the tag for the LCR
"GET_TRANSACTION_ID Member Function" on page 228-32	Returns the transaction identifier of the LCR
"IS_NULL_TAG Member Function" on page 228-32	Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL
"SET_COMMAND_TYPE Member Procedure" on page 228-33	Sets the command type in the LCR
"SET_EXTRA_ATTRIBUTE Member Procedure" on page 228-33	Sets the value for the specified extra attribute in the LCR
"SET_OBJECT_NAME Member Procedure" on page 228-34	Sets the name of the object that is changed by the LCR
"SET_OBJECT_OWNER Member Procedure" on page 228-35	Sets the owner of the object that is changed by the LCR

Table 228–30 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
"SET_SOURCE_DATABASE_NAME Member Procedure" on page 228-35	Sets the source database name of the object that is changed by the LCR
"SET_TAG Member Procedure" on page 228-35	Sets the tag for the LCR

GET_COMMAND_TYPE Member Function

Returns the command type of the LCR.

See Also: The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE ()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Returns the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a DML handler, DDL handler, or error handler. Such a handler can use the SCN obtained by this procedure to flashback to the transaction commit time for an LCR. In this case, the flashback must be performed at the source database for the LCR.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns NULL.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN ()
RETURN NUMBER;
```

GET_COMPATIBLE Member Function

Returns the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0

DDL LCRs always return DBMS_STREAMS.COMPATIBLE_9_2.

You can use the following functions for constant compatibility return values:

- The `DBMS_STREAMS.COMPATIBLE_9_2` function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.
- The `DBMS_STREAMS.COMPATIBLE_10_1` function returns `DBMS_STREAMS.COMPATIBLE_10_1` constant.
- The `DBMS_STREAMS.COMPATIBLE_10_2` function returns `DBMS_STREAMS.COMPATIBLE_10_2` constant.
- The `DBMS_STREAMS.COMPATIBLE_11_1` function returns `DBMS_STREAMS.COMPATIBLE_11_1` constant.

You can use these functions with the `GET_COMPATIBLE` member function for an LCR in rule conditions and apply handlers.

Note: You can determine which database objects in a database are not supported by Oracle Streams by querying the `DBA_STREAMS_UNSUPPORTED` data dictionary view.

See Also:

- *Oracle Streams Concepts and Administration* for examples of rules that discard changes that are not supported by Oracle Streams
- [Chapter 128, "DBMS_STREAMS"](#) and [Chapter 129, "DBMS_STREAMS_ADM"](#)
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()  
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Returns the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an `ANYDATA` instance. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also: ["INCLUDE_EXTRA_ATTRIBUTE Procedure"](#) on page 28-30

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(  
    attribute_name IN VARCHAR2)  
RETURN ANYDATA;
```

Parameters

Table 228–31 *GET_EXTRA_ATTRIBUTE Function Parameter*

Parameter	Description
<code>attribute_name</code>	<p>The name of the extra attribute to return. Valid names are:</p> <ul style="list-style-type: none"> ■ <code>row_id</code> The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is <code>UROWID</code>. ■ <code>serial#</code> The serial number of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>. ■ <code>session#</code> The identifier of the session that performed the change captured in the LCR. The type is <code>NUMBER</code>. ■ <code>thread#</code> The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is <code>NUMBER</code>. ■ <code>tx_name</code> The name of the transaction that includes the LCR. The type is <code>VARCHAR2</code>. ■ <code>username</code> The name of the current user who performed the change captured in the LCR. The type is <code>VARCHAR2</code>. <p>An error is raised if the specified <code>attribute_name</code> is not valid.</p> <p>If no value exists for the specified extra attribute, then the function returns a <code>NULL</code>.</p> <p>See Also: <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>

GET_OBJECT_NAME Member Function

Returns the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()  
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Returns the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()  
RETURN VARCHAR2;
```

GET_SCN Member Function

Returns the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()  
RETURN NUMBER;
```

GET_SOURCE_DATABASE_NAME Member Function

Returns the global name of the source database name. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()  
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()  
RETURN DATE;
```

GET_TAG Member Function

Returns the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION GET_TAG()  
RETURN RAW;
```

GET_TRANSACTION_ID Member Function

Returns the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()  
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns Y if the tag for the LCR is NULL, or returns N if the tag for the LCR is not NULL.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()  
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

See Also:

- The description of the `command_type` parameter in "[LCR\\$_DDL_RECORD Constructor Function Parameters](#)" on page 228-4
- The description of the `command_type` parameter in "[LCR\\$_ROW_RECORD Type](#)" on page 228-11
- The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type IN VARCHAR2);
```

Parameter

Table 228–32 SET_COMMAND_TYPE Procedure Parameter

Parameter	Description
<code>command_type</code>	The command type. This parameter should be set to a non-NULL value.

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the `INCLUDE_EXTRA_ATTRIBUTE` procedure in the `DBMS_CAPTURE_ADM` package to instruct a capture process to capture one or more extra attributes.

See Also: "[INCLUDE_EXTRA_ATTRIBUTE Procedure](#)" on page 28-30

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name IN VARCHAR2,
    attribute_value IN ANYDATA);
```

Parameters

Table 228–33 *SET_EXTRA_ATTRIBUTE Procedure Parameter*

Parameter	Description
attribute_name	<p>The name of the extra attribute to set. Valid names are:</p> <ul style="list-style-type: none"> ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. <p>An error is raised if the specified attribute_name is not valid.</p> <p>See Also: <i>Oracle Database PL/SQL Language Reference</i> for more information about the current user</p>
attribute_value	<p>The value to which the specified extra attribute is set. If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.</p>

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME (
    object_name IN VARCHAR2);
```

Parameter

Table 228–34 *SET_OBJECT_NAME Procedure Parameter*

Parameter	Description
object_name	The name of the object

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(  
    object_owner IN VARCHAR2);
```

Parameter

Table 228–35 SET_OBJECT_OWNER Procedure Parameter

Parameter	Description
object_owner	The schema that contains the object

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(  
    source_database_name IN VARCHAR2);
```

Parameter

Table 228–36 SET_SOURCE_DATABASE_NAME Procedure Parameter

Parameter	Description
source_database_name	The source database of the change. If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the procedure specifies DBS1.NET automatically. This parameter should be set to a non-NULL value.

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER PROCEDURE SET_TAG(  
    tag IN RAW);
```

Parameter

Table 228–37 SET_TAG Procedure Parameter

Parameter	Description
tag	The binary tag for the LCR. The size limit for a tag value is two kilobytes.

LCR\$_ROW_LIST Type

Identifies a list of column values for a row in a table.

This type uses the LCR\$_ROW_UNIT type and is used in the LCR\$_ROW_RECORD type.

See Also:

- ["LCR\\$_ROW_UNIT Type"](#) on page 228-37
- ["LCR\\$_ROW_RECORD Type"](#) on page 228-11

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT  
/
```

LCR\$_ROW_UNIT Type

Identifies the value for a column in a row.

This type is used in the LCR\$_ROW_LIST type.

See Also: "LCR\$_ROW_LIST Type" on page 228-36

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name      VARCHAR2(4000),
  data             ANYDATA,
  lob_information  NUMBER,
  lob_offset       NUMBER,
  lob_operation_size NUMBER,
  long_information NUMBER);
/
```

Attributes

Table 228–38 LCR\$_ROW_UNIT Attributes

Attribute	Description												
column_name	The name of the column												
data	The data contained in the column												
lob_information	Contains the LOB information for the column and contains one of the following values: <table border="0" style="margin-left: 40px;"> <tr> <td>DBMS_LCR.NOT_A_LOB</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.NULL_LOB</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.INLINE_LOB</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.EMPTY_LOB</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.LOB_CHUNK</td> <td>CONSTANT NUMBER := 5;</td> </tr> <tr> <td>DBMS_LCR.LAST_LOB_CHUNK</td> <td>CONSTANT NUMBER := 6;</td> </tr> </table>	DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;	DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;	DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;	DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;	DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;	DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;
DBMS_LCR.NOT_A_LOB	CONSTANT NUMBER := 1;												
DBMS_LCR.NULL_LOB	CONSTANT NUMBER := 2;												
DBMS_LCR.INLINE_LOB	CONSTANT NUMBER := 3;												
DBMS_LCR.EMPTY_LOB	CONSTANT NUMBER := 4;												
DBMS_LCR.LOB_CHUNK	CONSTANT NUMBER := 5;												
DBMS_LCR.LAST_LOB_CHUNK	CONSTANT NUMBER := 6;												
lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.												
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.												
long_information	Contains the LONG information for the column and contains one of the following values: <table border="0" style="margin-left: 40px;"> <tr> <td>DBMS_LCR.not_a_long</td> <td>CONSTANT NUMBER := 1;</td> </tr> <tr> <td>DBMS_LCR.null_long</td> <td>CONSTANT NUMBER := 2;</td> </tr> <tr> <td>DBMS_LCR.inline_long</td> <td>CONSTANT NUMBER := 3;</td> </tr> <tr> <td>DBMS_LCR.long_chunk</td> <td>CONSTANT NUMBER := 4;</td> </tr> <tr> <td>DBMS_LCR.last_long_chunk</td> <td>CONSTANT NUMBER := 5;</td> </tr> </table>	DBMS_LCR.not_a_long	CONSTANT NUMBER := 1;	DBMS_LCR.null_long	CONSTANT NUMBER := 2;	DBMS_LCR.inline_long	CONSTANT NUMBER := 3;	DBMS_LCR.long_chunk	CONSTANT NUMBER := 4;	DBMS_LCR.last_long_chunk	CONSTANT NUMBER := 5;		
DBMS_LCR.not_a_long	CONSTANT NUMBER := 1;												
DBMS_LCR.null_long	CONSTANT NUMBER := 2;												
DBMS_LCR.inline_long	CONSTANT NUMBER := 3;												
DBMS_LCR.long_chunk	CONSTANT NUMBER := 4;												
DBMS_LCR.last_long_chunk	CONSTANT NUMBER := 5;												

Oracle Multimedia ORDAudio TYPE

The Oracle Multimedia ORDAudio object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. Oracle Multimedia ORDAudio can store and retrieve audio data of any data format. Oracle Multimedia ORDAudio can automatically extract metadata from audio data of a variety of popular audio formats. Oracle Multimedia ORDAudio can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- [Documentation of ORDAudio](#)

Documentation of ORDAudio

For a complete description of this package within the context of Oracle Multimedia, see `ORDAudio` in the *Oracle Multimedia Reference*.

Oracle Multimedia ORDDicom TYPE

The Oracle Multimedia ORDDicom object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

Oracle Multimedia ORDDicom provides methods to extract standard and private DICOM metadata from DICOM binary data into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. Oracle Multimedia ORDDicom also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- [Documentation of ORDDicom](#)

Documentation of ORDDicom

For a complete description of this package within the context of Oracle Multimedia, see `ORDDicom` in the *Oracle Multimedia DICOM Developer's Guide*.

Oracle Multimedia ORDDoc TYPE

The Oracle Multimedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle Multimedia can store and retrieve media data of any data format. Oracle Multimedia ORDDoc data type can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. Note that you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- [Documentation of ORDDoc](#)

Documentation of ORDDoc

For a complete description of this package within the context of Oracle Multimedia, see ORDDoc in the *Oracle Multimedia Reference*.

Oracle Multimedia ORDIImage TYPE

The Oracle Multimedia ORDIImage object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle Multimedia ORDIImage can store and retrieve image data of any data format. Oracle Multimedia ORDIImage can process (cut, scale, and generate thumbnails) of images, convert the format of images, and automatically extract properties of images of a variety of popular data formats.

- [Documentation of ORDIImage](#)

Documentation of ORDImage

For a complete description of this package within the context of Oracle Multimedia, see `ORDImage` in the *Oracle Multimedia Reference*.

Oracle Multimedia SQL/MM Still Image TYPE

Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support: `SI_StillImage`, `SI_AverageColor`, `SI_Color`, `SI_ColorHistogram`, `SI_FeatureList`, `SI_PositionalColor`, and `SI_Texture`.

- [Documentation of SQL/MM Still Image](#)

Documentation of SQL/MM Still Image

For a complete description of this package within the context of Oracle Multimedia, see `SQL/MM Still Image` in the *Oracle Multimedia Reference*.

Oracle Multimedia ORDVideo TYPE

The Oracle `Multimedia` `ORDVideo` object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so forth, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle `Multimedia` `ORDVideo` can store and retrieve video data of any data format. Oracle `Multimedia` `ORDVideo` can automatically extract metadata from video data of a variety of popular video formats. Oracle `Multimedia` `ORDVideo` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

Documentation of ORDVideo

For a complete description of this package within the context of Oracle Multimedia, see `ORDVideo` in the *Oracle Multimedia Reference*.

MGD_ID Package Types

The MGD_ID Package provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The MGD_ID Package is supplied with several predefined types.

See Also: *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter contains the following topics:

- [Summary of Types](#)
- [Summary of MGD_ID Subprograms](#)

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Summary of Types

Table 235–1 describes the MGD_ID Package object types.

Table 235–1 MGD_ID Package Object Types

Object Type Name	Description
MGD_ID_COMPONENT Object Type	Datatype that specifies the name and value pair attributes that define a component
MGD_ID_COMPONENT_VARRAY Object Type	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
MGD_ID Object Type	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

MGD_ID_COMPONENT Object Type

The `MGD_ID_COMPONENT` type is a datatype used to specify the name and value pair attributes that define a component.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT as object (name VARCHAR2(256),  
                                                    value VARCHAR2(1024));
```

Attributes

Table 235–2 *MGD_ID_COMPONENT Attributes*

Attribute	Description
<code>name</code>	Name of component
<code>value</code>	Value of the component as a character

Usage Notes

None.

Examples

See the [MGD_ID Constructor Function](#) for an example.

MGD_ID_COMPONENT_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype used to specify a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_
COMPONENT;
```

Attributes

None.

Usage Notes

None.

Examples

See the [MGD_ID Constructor Function](#) for an example.

MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID as object (category_id VARCHAR2(256),
                                         components MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 235–3 MGD_ID Object Type Attributes

Attribute	Description
category_id	Category identifier for the code category of this code
components	List of components as name-value attributes

Methods

[Table 235–5](#) describes the methods of the MGD_ID object type.

Table 235–4 MGD_ID Methods

Method	Description
MGD_ID constructor function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT function	Returns the string representation of the MGD_ID in the specified format
GET_COMPONENT function	Returns the string value of the specified MGD_ID component
TO_STRING function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE function	Returns the result of the conversion of the identifier from one format to the specified format

Usage Notes

None.

Examples

See the [Summary of MGD_ID Subprograms](#) section and [Using the Identity Code Package](#) section for examples.

Summary of MGD_ID Subprograms

Table 235–5 describes the subprograms in the MGD_ID object type.

All the values and names passed to the procedures defined in the MGD_ID object type are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 235–5 MGD_ID Object Type Subprograms

Subprogram	Description
MGD_ID Constructor Function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT Function	Returns the string representation of the MGD_ID object in the specified format
GET_COMPONENT Function	Returns the string value of the specified MGD_ID component
TO_STRING Function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE Function	Returns the result of the conversion of the identifier from one format to the specified format

MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```
constructor function MGD_ID (
    category_id      IN VARCHAR2,
    components       IN MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
    category_id      VARCHAR2,
    identifier       VARCHAR2,
    parameter_list   VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```
constructor function MGD_ID (
    category_name    VARCHAR2,
    category_version VARCHAR2,
    components       MGD_ID_COMPONENT_VARRAY)
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
    category_name    VARCHAR2,
    category_version VARCHAR2,
    identifier       VARCHAR2,
    parameter_list   VARCHAR2)
RETURN SELF AS RESULT DETERMINISTIC;
```

Parameters

Table 235–6 MGD_ID Constructor Function Parameters

Parameter	Description
category_id	Category identifier
components	List of component name value pairs
category_name	Category name, such as 'EPC'
category_version	Category version. If NULL, the latest version for the specified category name will be used.

Table 235–6 (Cont.) MGD_ID Constructor Function Parameters

Parameter	Description
identifier	<p>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY.</p> <p>It is expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters '0' and '1', a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</p>
parameter_list	<p>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows:</p> <p><code>filter=3;companyprefixlength=7;taglength=96</code></p>

Usage Notes

- Use `MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is null, the `bit_length` is 8* the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

Examples

The following examples construct identity code type objects.

Construct an `MGD_ID` object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
    MGD_ID_COMPONENT_VARRAY (
        MGD_ID_COMPONENT('companyprefix','0037000'),
        MGD_ID_COMPONENT('itemref','030241'),
        MGD_ID_COMPONENT('serial','1041970'),
        MGD_ID_COMPONENT('schemes','SGTIN-64')
    )
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY (MGD_ID_COMPONENT('companyprefix', '0037000'),
    MGD_ID_COMPONENT('itemref', '030241'),
    MGD_ID_COMPONENT('serial', '1041970'),
    MGD_ID_COMPONENT('schemes', 'SGTIN-64'))
.
.
```

.

.

Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
            'urn:epc:id:sgtin:0037000.030241.1041970',
            'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor22.sql
```

.

.

.

```
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241')))
```

.

.

.

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if null, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
            MGD_ID_COMPONENT_VARRAY(
                MGD_ID_COMPONENT('companyprefix', '0037000'),
                MGD_ID_COMPONENT('itemref', '030241'),
                MGD_ID_COMPONENT('serial', '1041970'),
                MGD_ID_COMPONENT('schemes', 'SGTIN-64')
            )
            ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor33.sql
```

.

.

.

```
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('itemref', '030241'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
```

.

.

.

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
             'urn:epc:id:sgtin:0037000.030241.1041970',
             'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @constructor4.sql
```

```
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                     MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('companyprefixlength', '7'),
                                     MGD_ID_COMPONENT('companyprefix', '0037000'),
                                     MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                     MGD_ID_COMPONENT('serial', '1041970'),
                                     MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```
function FORMAT (parameter_list IN VARCHAR2,
                 output_format  IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 235–7 *FORMAT Function Parameters*

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: <ul style="list-style-type: none"> ▪ BINARY ▪ LEGACY ▪ TAG_ENCODING ▪ PURE_IDENTITY ▪ ONS_HOSTNAME

Usage Notes

None.

Examples

See the example for the [GET_COMPONENT Function](#).

GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
function GET_COMPONENT (
            component_name IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 235–8 GET_COMPONENT Function Parameter

Parameter	Description
component_name	Name of component

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  -----
  --PURE_IDENTIT
  -----
  dbms_output.put_line('..Testing constructor with pure identity');
  -----
  -- PURE_IDENTITY representation can be translated to BINARY and
  -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
  -----
  id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
'scheme=SGTIN-64;filter=3');
  dbms_output.put_line(id.to_string);
  dbms_output.put_line('filter          = ' || id.get_component('filter'));
  dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
  dbms_output.put_line('itemref       = ' || id.get_component('itemref'));
  dbms_output.put_line('serial        = ' || id.get_component('serial'));
  dbms_output.put_line('BINARY format = ' || id.format(NULL, 'BINARY'));
  dbms_output.put_line('PURE_IDENTITY format = ' || id.format(NULL, 'PURE_IDENTITY'));
  dbms_output.put_line('TAG_ENCODING format = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```
SQL> @get_component.sql
.
.
.
..Testing constructor with pure identity
category_id =1;filter = 3;schemes = SGTIN-64;companyprefixlength =
7;companyprefix = 0037000;scheme = SGTIN-64;serial = 1041970;itemref = 030241
filter          = 3
company prefix = 0037000
itemref         = 030241
serial         = 1041970
BINARY format  =1001100000000000001000001110110001000010000011111110011000110010
PURE_IDENTITY format = urn:epc:id:sgtin:0037000.030241.1041970
TAG_ENCODING format = urn:epc:tag:sgtin-64:3.0037000.030241.1041970
PL/SQL procedure successfully completed.
.
.
.
```

TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

```
function TO_STRING  
    RETURN VARCHAR2;
```

Parameters

None.

Usage Notes

None.

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of tostring3.sql file  
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');  
DECLARE  
id          MGD_ID;  
BEGIN  
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));  
    dbms_output.put_line('..Testing to_string');  
    id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');  
    DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');  
    DBMS_OUTPUT.PUT_LINE(id.to_string);  
END;  
/  
SHOW ERRORS;  
call DBMS_MGD_ID_UTL.remove_proxy();  
connect / as sysdba;  
drop user mgduser cascade;  
  
SQL> @tostring3.sql  
. .  
..Testing to_string  
mgd_id object as a string  
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =  
0037000;scheme = GID-96;l = 1;serial = 1041970  
PL/SQL procedure successfully completed.  
. .
```

TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
    category_name    IN VARCHAR2,
    identifier       IN VARCHAR2,
    parameter_list   IN VARCHAR2,
    output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
    category_name    IN VARCHAR2,
    category_version IN VARCHAR2,
    identifier       IN VARCHAR2,
    parameter_list   IN VARCHAR2,
    output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 235–9 TRANSLATE Function Parameters

Parameter	Description
category_name	Name of category
category_version	Category version. If NULL, the latest version of the specified category name will be used.
identifier	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters '0' and '1', a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Table 235–9 (Cont.) TRANSLATE Function Parameters

Parameter	Description
output_format	One of the supported output formats into which an MGD_ID component shall be converted: <ul style="list-style-type: none"> ▪ BINARY ▪ LEGACY ▪ TAG_ENCODING ▪ PURE_IDENTITY ▪ ONS_HOSTNAME

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the `parameter_list` parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '00110101000000000000100100001000100000000000011101100010000100000000000000011111110011000110
010'
, NULL, 'BINARY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '00110101000000000000100100001000100000000000011101100010000100000000000000011111110011000110
010'
, NULL, 'PURE_IDENTITY'));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is TAG_ENCODING');
  dbms_output.put_line(
    mgd_id.translate('EPC',
NULL, '00110101000000000000100100001000100000000000011101100010000100000000000000011111110011000110
010'
, NULL, 'TAG_ENCODING'));
  dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is BINARY');
  dbms_output.put_line(
    mgd_id.translate('EPC', NULL,
'urn:epc:tag:gid-96:0037000.30241.1041970',
NULL, 'BINARY'));
  dbms_output.put_line('Category ID is EPC, Identifier is TAG_ENCODING, Output format is
PURE_IDENTITY');
  dbms_output.put_line(
    mgd_id.translate('EPC', NULL,
'urn:epc:tag:gid-96:0037000.30241.1041970',
NULL, 'PURE_IDENTITY'));

- [Chapter 112, "DBMS_RULE_ADM"](#)

This chapter contains the following topic:

- [Summary of Rule Types](#)

Summary of Rule Types

Table 236–1 Rule Types

Type	Description
"RE\$ATTRIBUTE_VALUE Type" on page 236-4	Specifies the value of a variable attribute
"RE\$ATTRIBUTE_VALUE_LIST Type" on page 236-5	Identifies a list of attribute values
"RE\$COLUMN_VALUE Type" on page 236-6	Specifies the value of a table column
"RE\$COLUMN_VALUE_LIST Type" on page 236-7	Identifies a list of column values
"RE\$NAME_ARRAY Type" on page 236-8	Identifies a list of names
"RE\$NAME_ARRAY Type" on page 236-8	Identifies a list of name-value pairs
"RE\$NV_LIST Type" on page 236-10	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
"RE\$NV_NODE Type" on page 236-12	Identifies a name-value pair
"RE\$RULE_HIT Type" on page 236-13	Specifies a rule found as a result of evaluation
"RE\$RULE_HIT_LIST Type" on page 236-14	Identifies a list of rules found as a result of evaluation
"RE\$TABLE_ALIAS Type" on page 236-15	Provides the table corresponding to an alias used in a rule evaluation context
"RE\$TABLE_ALIAS_LIST Type" on page 236-16	Identifies a list of table aliases used in a rule evaluation context
"RE\$TABLE_VALUE Type" on page 236-17	Specifies the value of a table row using a ROWID
"RE\$TABLE_VALUE_LIST Type" on page 236-18	Identifies a list of table values
"RE\$VARIABLE_TYPE Type" on page 236-19	Provides the type of a variable used in a rule evaluation context
"RE\$VARIABLE_TYPE_LIST Type" on page 236-21	Identifies a list of variables and their types used in a rule evaluation context
"RE\$VARIABLE_VALUE Type" on page 236-22	Specifies the value of a variable
"RE\$VARIABLE_VALUE_LIST Type" on page 236-23	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS_RULE
- DBMS_RULE_ADM

You can use the `DBMS_RULE_ADM` package to create and administer rules, rule sets, and evaluation contexts, and you can use the `DBMS_RULE` package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- `DBMS_APPLY_ADM`
- `DBMS_CAPTURE_ADM`
- `DBMS_PROPAGATION_ADM`
- `DBMS_STREAMS`
- `DBMS_STREAMS_ADM`
- `DBMS_STREAMS_AUTH`

See Also: *Oracle Streams Concepts and Administration*

RE\$ATTRIBUTE_VALUE Type

Specifies the value of a variable attribute.

Note: Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (  
    variable_name    VARCHAR2(32),  
    attribute_name   VARCHAR2(4000),  
    attribute_value  ANYDATA);
```

Attributes

Table 236–2 RE\$ATTRIBUTE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable used in a rule
attribute_name	Specifies the attribute name. The attribute name can be a multi-component name, such as a1 . b2 . c3.
attribute_value	Specifies the attribute value

RE\$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

RE\$COLUMN_VALUE Type

Specifies the value of a table column.

Note: Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (  
    table_alias  VARCHAR2(32),  
    column_name  VARCHAR2(4000),  
    column_value ANYDATA);
```

Attributes

Table 236–3 RE\$COLUMN_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
column_name	Specifies the column name
column_value	Specifies the column value

RE\$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

RE\$NAME_ARRAY Type

Identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

RE\$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

RE\$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
    actx_list SYS.RE$NV_ARRAY);
```

Attributes

Table 236–4 RE\$NV_LIST Attributes

Attribute	Description
actx_list	The list of name-value pairs

RE\$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE\$NV_LIST type:

- [ADD_PAIR Member Procedure](#)
- [GET_ALL_NAMES Member Function](#)
- [GET_VALUE Member Function](#)
- [REMOVE_PAIR Member Procedure](#)

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

Note: Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
    name IN VARCHAR2,
    value IN ANYDATA);
```

Parameters

Table 236–5 ADD_PAIR Procedure Parameters

Parameter	Description
name	The name in the name-value pair being added to the list. If the name already exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

Note: Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE(
    name IN VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 236–6 *GET_VALUE Procedure Parameters*

Parameter	Description
name	The name whose value to return

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

Note: Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(
    name IN VARCHAR2);
```

Parameters

Table 236–7 *REMOVE_PAIR Procedure Parameters*

Parameter	Description
name	The name of the pair to remove

RE\$NV_NODE Type

Identifies a name-value pair.

Note: Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (  
    nvn_name    VARCHAR2(30),  
    nvn_value   ANYDATA);
```

Attributes

Table 236–8 RE\$NV_NODE Attributes

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

RE\$RULE_HIT Type

Specifies a rule found as a result of an evaluation.

See Also:

- ["CREATE_RULE Procedure"](#) on page 112-14
- ["ALTER_RULE Procedure"](#) on page 112-10

Syntax

```
TYPE SYS.RE$RULE_HIT (
  rule_name          VARCHAR2 (65) ,
  rule_action_context RE$NV_LIST);
```

Attributes

Table 236–9 RE\$RULE_HIT Attributes

Attribute	Description
rule_name	The rule name in the form <i>schema_name.rule_name</i> . For example, a rule named <i>employee_rule</i> in the <i>hr</i> schema is returned in the form "hr"."employee_rule".
rule_action_context	The rule action context as specified in the <i>CREATE_RULE</i> or <i>ALTER_RULE</i> procedure of the <i>DBMS_RULE_ADM</i> package

RE\$RULE_HIT_LIST Type

Identifies a list of rules found as a result of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

RE\$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

Note: Enclose the table name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
  table_alias VARCHAR2(32),
  table_name  VARCHAR2(194));
```

Attributes

Table 236–10 RE\$TABLE_ALIAS Attributes

Attribute	Description
table_alias	The alias used for the table in a rule
table_name	<p>The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema.</p> <p>The format is one of the following:</p> <p><i>schema_name.table_name</i></p> <p><i>table_name</i></p> <p>For example, if the <i>schema_name</i> is <i>hr</i> and the <i>table_name</i> is <i>employees</i>, then enter the following:</p> <p><i>hr.employees</i></p>

RE\$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

RE\$TABLE_VALUE Type

Specifies the value of a table row using a ROWID.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(  
    table_alias VARCHAR2(32),  
    table_rowid VARCHAR2(18));
```

Attributes

Table 236-11 RE\$TABLE_VALUE Attributes

Attribute	Description
table_alias	Specifies the alias used for the table in a rule
table_rowid	Specifies the rowid for the table row

RE\$TABLE_VALUE_LIST Type

Identifies a list of table values.

Note: Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

RE\$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

Note: Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
  variable_name          VARCHAR2(32),
  variable_type          VARCHAR2(4000),
  variable_value_function VARCHAR2(228),
  variable_method_function VARCHAR2(228));
```

Attributes

Table 236–12 RE\$VARIABLE_TYPE Attributes

Attribute	Description
variable_name	The variable name used in a rule
variable_type	The type that is resolved in the evaluation context schema. Any valid Oracle built-in data type, user-defined type, or Oracle-supplied type can be specified. See the <i>Oracle Database SQL Language Reference</i> for more information about these types.
variable_value_function	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the " Usage Notes " for more information.
variable_method_function	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the " Usage Notes " for more information.

Usage Notes

The functions for both the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: *schema_name*, *package_name*, and *@dblink*.

For example, if the *schema_name* is *hr*, the *package_name* is *var_pac*, the *function_name* is *func_value*, and the *dblink* is *dbs1.net*, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for *variable_value_function*

The function must have the following signature:

```
FUNCTION variable_value_function_name(  
    evaluation_context_schema IN VARCHAR2,  
    evaluation_context_name   IN VARCHAR2,  
    variable_name              IN VARCHAR2,  
    event_context              IN SYS.RE$NV_LIST )  
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for *variable_method_function*

This function must have the following signature:

```
FUNCTION variable_method_function_name(  
    evaluation_context_schema IN VARCHAR2,  
    evaluation_context_name   IN VARCHAR2,  
    variable_value            IN SYS.RE$VARIABLE_VALUE,  
    method_name               IN VARCHAR2,  
    event_context             IN SYS.RE$NV_LIST)  
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

RE\$VARIABLE_TYPE_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

RE\$VARIABLE_VALUE Type

Specifies the value of a variable.

Note: Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (  
    variable_name VARCHAR2(32),  
    variable_data ANYDATA);
```

Attributes

Table 236–13 RE\$VARIABLE_VALUE Attributes

Attribute	Description
variable_name	Specifies the variable name used in a rule
variable_data	Specifies the data for the variable value

RE\$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

Rules Manager Types

Rules Manager is supplied with one predefined type and a public synonym for this type.

See Also: *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- [Summary of Rule Manager Types](#)

Summary of Rule Manager Types

[Table 237-1](#) describes the Rules Manager object type.

Table 237-1 Rules Manager Object Types

Object Type Name	Description
RLM\$EVENTIDS Object Type	Specifies a list of event identifiers to the CONSUME_PRIM_EVENTS procedure

RLM\$EVENTIDS Object Type

The RLM\$EVENTIDS type is defined as a table of VARCHAR2 values as follows:

Syntax

```
CREATE OR REPLACE TYPE RLM$EVENTIDS is table of VARCHAR2(38);
```

Attributes

None.

Usage Notes

- RLM\$EVENTIDS type is used to pass a list of event identifiers to the CONSUME_PRIM_EVENTS procedure. These event identifiers are ROWIDS for the corresponding events in the database and their values are available through the arguments of the action callback procedure and rule class results view columns, when the rule class is configured for RULE consumption policy

Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of RLM\$EVENTDIDS type to consume the events before executing the action for the matched rules.

```
CREATE OR REPLACE PROCEDURE PromoAction (
    Flt          AddFlight,
    Flt_EvtId   ROWID,    --- rowid for the fligt primitive event
    Car          AddRentalCar,
    Car_EvtId   ROWID,
    rlm$rule    TravelPromotions%ROWTYPE) is
    evtcnsmd   NUMBER;
BEGIN
    evtcnsmd := dbms_rlmgr.consume_prim_events(
        rule_class => 'TravelPromotions',
        event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));

    IF (evtcnsmd = 1) THEN
        -- consume operation was successful; perform the action ---
        OfferPromotion (Flt.CustID, rlm$rule.PromoType, rlm$rule.OfferedBy);
    END IF;
END;
/
```

UTL Streams Types

UTL Streams Types describes abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'SYS' schema. The streams may be referenced by PUBLIC and are described in the following sections.

See Also: For more information, see A.

This chapter contains the following topics:

- [Summary of UTL Binary Streams Types](#)

Summary of UTL Binary Streams Types

Table 238–1 UTL Binary Streams Types

Type	Description
UTL_BINARYINPUTSTREAM Type on page 238-3	Reads bytes and closes a stream.
UTL_BINARYOUTPUTSTREAM Type on page 238-4	Writes bytes and closes a stream.
UTL_CHARACTERINPUTSTREAM Type on page 238-5	Reads chars and closes a stream.
UTL_CHARACTEROUTPUTSTREAM Type on page 238-6	Writes chars and closes a stream.

UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (

    MEMBER FUNCTION available (
        self      IN OUT NOCOPY Utl_BinaryInputStream)
    RETURN INTEGER,

    MEMBER FUNCTION read (
        self      IN OUT NOCOPY Utl_BinaryInputStream,
        numBytes IN              INTEGER DEFAULT 1)
    RETURN RAW,

    MEMBER PROCEDURE read (
        self      IN OUT NOCOPY Utl_BinaryInputStream,
        bytes     IN OUT NOCOPY RAW,
        numBytes  IN OUT        INTEGER),

    MEMBER PROCEDURE read (
        self      IN OUT NOCOPY Utl_BinaryInputStream,
        bytes     IN OUT NOCOPY RAW,
        offset    IN INTEGER,
        numBytes  IN OUT        INTEGER),

    member function close (
        self      In Out Nocopy Utl_BinaryInputStream)

) NOT FINAL;
```

Attributes

Table 238–2 UTL_BINARYINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> ■ #1 - Reads the number of bytes specified by <code>numBytes</code> (default is 1) and returns the bytes as a <code>RAW</code>. If there are no remaining bytes a value of <code>NULL</code> is returned. ■ #2 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>. Additionally, the actual number of bytes read is returned in parameter <code>numBytes</code>. If this parameter is set to 0 then there are no more bytes to be read. ■ #3 - Reads the number of bytes specified in <code>numBytes</code> into the parameter <code>bytes</code>, beginning at the <code>offset</code> specified by parameter <code>offset</code>. The actual number of bytes read is returned in parameter <code>numBytes</code>. If this value is 0, then there are no additional bytes to be read.
CLOSE	Releases all resources held on the node to support the stream

UTL_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

    MEMBER FUNCTION write (                                     -- #1
        self          IN OUT NOCOPY sys.utl_BinaryOutputStream,
        bytes         IN           RAW,
        numBytes      IN           INTEGER DEFAULT 1)
    RETURN INTEGER,

    MEMBER PROCEDURE write (                                   -- #2
        self          IN OUT NOCOPY sys.utl_BinaryOutputStream,
        bytes         IN NOCOPY    RAW,
        numBytes      IN OUT      INTEGER),

    MEMBER PROCEDURE write (                                   -- #3
        self          IN OUT NOCOPY utl_BinaryOutputStream,
        bytes         IN NOCOPY    RAW,
        offset        IN           INTEGER,
        numBytes      IN OUT      INTEGER),

    MEMBER PROCEDURE flush (
        self          IN OUT NOCOPY utl_BinaryOutputStream),

    MEMBER PROCEDURE close (
        self          IN OUT NOCOPY utl_BinaryOutputStream)

) NOT FINAL;
```

Attributes

Table 238–3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> ■ #1 - Writes the number of bytes specified by <code>numBytes</code> (default is 1) from RAW into the stream. The actual number of bytes written is returned. ■ #2 - Writes the number of bytes specified in parameter <code>numBytes</code> from parameter bytes to the stream. The actual number of bytes written is returned in parameter <code>numBytes</code>. ■ #3 - Writes the number of bytes specified by <code>numBytes</code> to the stream, beginning at the offset specified by parameter <code>offset</code>. The actual number of bytes written is returned in parameter <code>numBytes</code>.
FLUSH	Insures that any buffered bytes are copied to the node destination
CLOSE	Frees all resources associated with the stream

UTL_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

    MEMBER FUNCTION available (
        self          IN OUT NOCOPY  utl_CharacterInputStream)
    RETURN INTEGER,

    MEMBER FUNCTION read (
        self          IN OUT NOCOPY  utl_CharacterInputStream,
        numChars     IN              INTEGER DEFAULT 1,
        lineFeed     IN              BOOLEAN DEFAULT FALSE)
    RETURN VARCHAR2,

    MEMBER PROCEDURE read (
        self          IN OUT NOCOPY  utl_CharacterInputStream,
        chars        IN OUT NOCOPY  VARCHAR2,
        numChars     IN OUT         INTEGER,
        lineFeed     IN BOOLEAN DEFAULT FALSE),

    MEMBER PROCEDURE read (
        self          IN OUT NOCOPY  utl_CharacterInputStream,
        chars        IN OUT NOCOPY  VARCHAR2,
        offset       IN              INTEGER,
        numChars     IN OUT         INTEGER,
        lineFeed     IN              BOOLEAN DEFAULT FALSE),

    MEMBER PROCEDURE close (
        self          IN OUT NOCOPY  utl_CharacterInputStream)

) NOT FINAL;
```

Attributes

Table 238–4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	<ul style="list-style-type: none"> ■ #1 - Returns the number of characters remaining to be read ■ #2 - Reads the number of characters specified by <code>numChars</code> (default value is 1) and returns the characters as a <code>VARCHAR2</code>. If the value of <code>lineFeed</code> is true (default value is <code>FALSE</code>) then the reading stops if a linefeed character is found. If there are no remaining characters a value of <code>NULL</code> is returned. ■ #3 - Reads reads the number of characters specified by parameter <code>numChars</code> into the parameter <code>chars</code>. Additionally, the actual number of characters read is returned in parameter <code>numChars</code>. If this value is 0, then there are no more characters to be read. If the value of <code>lineFeed</code> is <code>TRUE</code> (default is <code>FALSE</code>), then reading stops if a linefeed character is encountered.
CLOSE	Releases all resources held by the stream

UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (`chars`) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

  MEMBER FUNCTION write (                                     -- #1
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN             VARCHAR2,
    numChars  IN             INTEGER DEFAULT 1,
    lineFeed  IN             BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,

  MEMBER PROCEDURE write (                                   -- #2
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN OUT NOCOPY VARCHAR2,
    numChars  IN OUT        INTEGER,
    lineFeed  IN             BOOLEAN DEFAULT FALSE),

  member procedure write (                                  -- #3
    self      IN OUT NOCOPY utl_CharacterOutputStream,
    chars     IN NOCOPY     varchar2,
    offset    IN            integer,
    numChars  IN OUT        integer,
    lineFeed  IN            boolean default false),

  MEMBER PROCEDURE flush (
    self      IN OUT NOCOPY utl_CharacterOutputStream),

  MEMBER PROCEDURE close (
    self      IN OUT NOCOPY utl_CharacterOutputStream)

) NOT FINAL;
```

Attributes

Table 238–5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
WRITE	<ul style="list-style-type: none"> ■ #1 - Writes the number of characters specified by <code>numChars</code> (default is 1) from parameter <code>chars</code> into the stream and returns the actual number of characters written. If the value of <code>lineFeed</code> is <code>TRUE</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character. ■ #2 - writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code> into the stream. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is <code>true</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character. ■ #3 - Writes the number of characters specified by parameter <code>numChars</code>, from parameter <code>chars</code>, beginning at <code>offset</code> specified by parameter <code>offset</code>. The actual number of characters written is returned in parameter <code>numChars</code>. If the value of <code>lineFeed</code> is <code>true</code> (default is <code>FALSE</code>) a <code>lineFeed</code> character is inserted after the last character .
FLUSH	Copies all characters that may be contained within buffers to the node value

Table 238-5 (Cont.) UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
CLOSE	Releases all resources held by the stream

`XMLType` is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLGEN` and `SYS_XMLAGG` SQL functions.

This chapter contains the following topics:

- [Summary of XMLType Subprograms](#)

- *Oracle XML DB Developer's Guide*

Summary of XMLType Subprograms

Table 239–1 summarizes functions and procedures of the XMLType.

Table 239–1 XMLTYPE Subprograms

Method	Description
CREATENONSCHEMABASEDXML on page 239-4	Creates a non schema based XML from the input schema based instance.
CREATESCHEMABASEDXML on page 239-5	Creates a schema based XMLType instance from the non-schema based instance using the input schema URL.
CREATEXML on page 6	Static function for creating and returning an XMLType instance.
EXISTSNODE on page 239-8	Takes a XMLType instance and a XPath and returns 1 or 0 indicating if applying the XPath returns a non-empty set of nodes.
EXTRACT on page 239-9	Takes a XMLType instance and an XPath, applies the XPath expression and returns the results as an XMLType.
GETBLOBVAL on page 239-10	Returns the value of the XMLType instance as a BLOB
GETCLOBVAL on page 239-11	Returns the value of the XMLType instance as a CLOB.
GETNAMESPACE on page 239-12	Returns the namespace for the top level element in a schema based document.
GETNUMBERVAL on page 239-13	Returns the value of the XMLType instance as a NUMBER. This is only valid if the input XMLType instance contains a simple text node and is convertible to a number.
GETROOTELEMENT on page 239-14	Returns the root element of the input instance. Returns NULL if the instance is a fragment
GETSCHEMAURL on page 239-15	Returns the XML schema URL if the input is an XML Schema based.
GETSTRINGVAL on page 239-16	Returns the value of the XMLType instance as a string.
ISFRAGMENT on page 239-17	Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
ISSCHEMABASED on page 239-18	Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.
ISSCHEMAVALID on page 239-19	Checks if the input instance is schema valid according to the given schema URL.
ISSCHEMAVALIDATED on page 239-20	Checks if the instance has been validated against the schema.
SCHEMAVALIDATE on page 239-21	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
SETSCHEMAVALIDATED on page 239-22	Sets the schema valid flag to avoid costly schema validation.
TOOBJECT on page 239-23	Converts the XMLType instance to an object type.
TRANSFORM on page 239-24	Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.

Table 239-1 (Cont.) XMLTYPE Subprograms

Method	Description
XMLTYPE on page 239-25	Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.

CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML  
return XMLType deterministic;
```

CREATESCHEMABASEDXML

Member function. Creates a schema based XMLType instance from a non-schema based XMLType value. It uses either the supplied SCHEMA URL, or the SCHEMALOCATION attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(  
schema IN varchar2 := NULL)  
return XMLType deterministic;
```

Parameter	Description
schema	Optional XMLSchema URL used to convert the value to the specified schema..

CREATEXML

Static function for creating and returning an `XMLType` instance. The string and clob parameters used to pass in the data must contain well-formed and valid XML documents. The options are described in the following table.

Syntax	Description
<pre> STATIC FUNCTION createXML(xmlData IN varchar2) RETURN XMLType deterministic; </pre>	Creates the <code>XMLType</code> instance from a string.
<pre> STATIC FUNCTION createXML(xmlData IN clob) RETURN XMLType deterministic; </pre>	Creates the <code>XMLType</code> instance from a CLOB.
<pre> STATIC FUNCTION createXML (xmlData IN clob, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic; </pre>	This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (xmlData IN varchar2, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic; </pre>	This static function creates a schema-based <code>XMLType</code> instance using the specified schema and xml data parameters.
<pre> STATIC FUNCTION createXML (xmlData IN "<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN NUMBER := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from an instance of an user-defined type.
<pre> STATIC FUNCTION createXML (xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN XMLType deterministic; </pre>	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.

Syntax	Description
<pre> STATIC FUNCTION createXML (xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) RETURN sys.XMLType deterministic parallel_enable </pre>	<p>Creates an XML instance from ANYDATA.</p> <p>If the ANYDATAinstance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATAcontains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>
<pre> STATIC FUNCTION createXML (xmlData IN blob, csid IN number, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic </pre>	<p>Creates an XML instance from a BLOB.</p>
<pre> STATIC FUNCTION createXML (xmlData IN bfile, csid IN number, Schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic </pre>	<p>Creates an XML instance from a BFILE.</p>

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema.
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)
CSID	The character set id of input XML data.

EXISTSNODE

Member function. Checks if the node exists. If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION existsNode(xpath IN varchar2) RETURN number deterministic;</pre>	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.
<pre>MEMBER FUNCTION existsNode(xpath in varchar2, nsmap in varchar2) RETURN number deterministic;</pre>	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Parameter	Description
xpath	The XPath expression to test.
nsmap	Optional namespace mapping.

EXTRACT

Member function. Extracts an XMLType fragment and returns an XMLType instance containing the result node(s). If the XPath does not result in any nodes, then returns NULL. The options are described in the following table.

Syntax	Description
<pre>MEMBER FUNCTION extract(xpath IN varchar2) RETURN XMLType deterministic;</pre>	Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType.
<pre>MEMBER FUNCTION extract(xpath IN varchar2, nsmmap IN varchar2) RETURN XMLType deterministic;</pre>	This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.

Parameter	Description
xpath	The XPath expression to apply.
nsmmap	Optional prefix to namespace mapping information.

GETBLOBVAL

Member function. Returns a BLOB containing the serialized XML representation; if the returns is a temporary BLOB, then it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal()  
RETURN Blob deterministic;
```

GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the returns is a temporary CLOB, then it must be freed after use.

Syntax

```
MEMBER FUNCTION getClobVal()  
RETURN clob deterministic;
```

GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns `NULL` if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace  
return varchar2 deterministic;
```

GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value. The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()  
RETURN number deterministic;
```

GETROOTELEMENT

Member function. Gets the root element of the `XMLType` instance. Returns `NULL` if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement  
return varchar2 deterministic;
```

GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise returns `NULL`.

Syntax

```
MEMBER FUNCTION getSchemaURL  
return varchar2 deterministic;
```

GETSTRINGVAL

Member function. Returns the document as a string. Returns a string containing the serialized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the `VARCHAR2`, which is 4000, then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()  
RETURN varchar2 deterministic;
```

ISFRAGMENT

Determines if the `XMLType` instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the `XMLType` instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()  
RETURN number deterministic;
```

ISSCHEMABASED

Member function. Determines whether the `XMLType` instance is schema-based or not. Returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased  
return number deterministic;
```

ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance's own schema.

Syntax

```
member function isSchemaValid(  
schurl IN VARCHAR2 := NULL,  
elem IN VARCHAR2 := NULL)  
return NUMBER deterministic;
```

Parameter	IN / OUT	Description
schurl	(IN)	The URL of the XML Schema against which to check conformance.
elem	(IN)	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

ISSCHEMAVALIDATED

Member function. Returns the validation status of the `XMLType` instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated  
return NUMBER deterministic;
```

SCHEMAVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn't already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(  
    self IF OUT NOCOPY XMLType);
```

Parameter	IN / OUT	Description
self	(OUT)	XML instance being validated against the schema.

SETSCHEMAVALIDATED

Member function. Sets the `VALIDATION` state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(  
self IF OUT NOCOPY XMLType,  
    flag IN BINARY_INTEGER := 1);
```

Parameter	IN / OUT	Description
self	(OUT)	XML instance.
flag	(IN)	0 - NOT VALIDATED; 1 - VALIDATED (Default)

TOOBJECT

Member procedure. Converts the XML value to an object type using the `XMLSCHEMA` mapping, if available. If a `SCHEMA` is not supplied or the input is a non-schema based XML, the procedure uses canonical mapping between elements and object type attributes.

See Also:

- An in-depth discussion of this topic inside *Oracle XML DB Developer's Guide*

Syntax

```
MEMBER PROCEDURE toObject(
  SELF in XMLType,
  object OUT "<ADT_1>",
  schema in varchar2 := NULL,
  element in varchar2 := NULL);
```

Parameter	IN / OUT	Description
<code>SELF</code>	(IN)	Instance to be converted. Implicit if used as a member procedure.
<code>object</code>	(IN)	Converted object. An object instance of the required type may be passed in to this function
<code>schema</code>	(IN)	Schema URL. The mapping of the <code>XMLType</code> instance to the converted object instance may be specified using a schema.
<code>element</code>	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter.

TRANSFORM

Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is NULL, then a NULL is returned.

Syntax

```
MEMBER FUNCTION transform(  
xsl IN XMLType,  
parammap in varchar2 := NULL)  
RETURN XMLType deterministic;
```

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

XMLTYPE

XMLType constructor. The options are described in the following table.

Syntax	Description
<pre> constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.</p>
<pre> constructor function XMLType (xmlData IN "w<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.</p>
<pre> constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic; </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.</p>
<pre> constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter.</p> <p>If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.</p>

Syntax	Description
<pre> constructor function XMLType(xmlData IN blob, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BLOB parameter.</p>
<pre> constructor function XMLType(xmlData IN bfile, csid IN number, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic </pre>	<p>This constructor function creates an optionally schema-based XMLType instance from the specified BFILE parameter.</p>

Parameter	Description
xmlData	The data in the form of a BFILE, BLOB, CLOB, REFS, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema.
validated	Indicates that the instance is valid to the given XML Schema.
wellformed	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)
CSID	The character set id of input XML data.
