Primary Author: Denis Raphaely

Contributing Author: Lance Ashdown, Donna Carver, Beethoven Cheng, Rhonda Day, Steve Fogel, Bryn Llewellyn, Paul Lane, Tony Morales, Chuck Murray, Sue Pelski, Kathy Rich, Antonio Romero, Vivian Schupmann, Cathy Shea, Margaret Taft, Kathy Taylor, Randy Urbano, Rodney Ward

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

What's New in PL/SQL Packages and Types Reference?	xcv
Oracle Database 11g Release 1 (11.1)	xcv
1 Introduction to Oracle Supplied PL/SQL Packages & Types	
Package Overview	1-2
Package Components	1-3
Using Oracle Supplied Packages	1-4
Creating New Packages	1-5
Referencing Package Contents	1-8
Summary of Oracle Supplied PL/SQL Packages and Types	1-9
2 APEX_CUSTOM_AUTH	
Documentation of APEX_CUSTOM_AUTH	2-2
3 APEX_APPLICATION	
Documentation of APEX_APPLICATION	3-2
4 APEX_ITEM	
Documentation of APEX_ITEM	4-2
5 APEX_UTIL	
Documentation of APEX_UTIL	5-2
6 CTX_ADM	
Documentation of CTX_ADM	6-2

7	CTX_CLS	
	Documentation of CTX_CLS.....	7-2
8	CTX_DDL	
	Documentation of CTX_DDL	8-2
9	CTX_DOC	
	Documentation of CTX_DOC.....	9-2
10	CTX_OUTPUT	
	Documentation of CTX_OUTPUT	10-2
11	CTX_QUERY	
	Documentation of CTX_QUERY	11-2
12	CTX_REPORT	
	Documentation of CTX_REPORT	12-2
13	CTX_THES	
	Documentation of CTX_THES.....	13-2
14	CTX_ULEXER	
	Documentation of CTX_ULEXER	14-2
15	DBMS_ADDM	
	Using DBMS_ADDM.....	15-2
	Security Model.....	15-3
	Summary of DBMS_ADDM Subprograms	15-4
	ANALYZE_DB Procedure	15-5
	ANALYZE_INST Procedure	15-6
	ANALYZE_PARTIAL Procedure	15-7
	DELETE Procedure	15-8
	DELETE_FINDING_DIRECTIVE Procedure.....	15-9
	DELETE_PARAMETER_DIRECTIVE Procedure	15-10
	DELETE_SEGMENT_DIRECTIVE Procedure	15-11
	DELETE_SQL_DIRECTIVE Procedure	15-12
	GET_REPORT Function	15-13
	INSERT_FINDING_DIRECTIVE Procedure.....	15-14
	INSERT_PARAMETER_DIRECTIVE Procedure	15-15
	INSERT_SEGMENT_DIRECTIVE Procedure.....	15-16
	INSERT_SQL_DIRECTIVE Procedure.....	15-18

16 DBMS_ADVANCED_REWRITE

Using DBMS_ADVANCED_REWRITE.....	16-2
Security Model.....	16-3
Summary of DBMS_ADVANCED_REWRITE Subprograms	16-4
ALTER_REWRITE_EQUIVALENCE Procedure.....	16-5
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure.....	16-6
DECLARE_REWRITE_EQUIVALENCE Procedures	16-7
DROP_REWRITE_EQUIVALENCE Procedure.....	16-9
VALIDATE_REWRITE_EQUIVALENCE Procedure	16-10

17 DBMS_ADVISOR

Using DBMS_ADVISOR.....	17-2
Security Model.....	17-3
Summary of DBMS_ADVISOR Subprograms	17-4
ADD_SQLWKLD_REF Procedure.....	17-7
ADD_SQLWKLD_STATEMENT Procedure	17-8
ADD_STS_REF Procedure	17-10
CANCEL_TASK Procedure.....	17-11
COPY_SQLWKLD_TO_STS Procedure	17-12
CREATE_FILE Procedure	17-13
CREATE_OBJECT Procedure.....	17-14
CREATE_SQLWKLD Procedure	17-16
CREATE_TASK Procedures	17-17
DELETE_SQLWKLD Procedure.....	17-19
DELETE_SQLWKLD_REF Procedure.....	17-20
DELETE_SQLWKLD_STATEMENT Procedures.....	17-21
DELETE_STS_REF Procedure	17-22
DELETE_TASK Procedure.....	17-23
EXECUTE_TASK Procedure	17-24
GET_REC_ATTRIBUTES Procedure.....	17-26
GET_TASK_REPORT Function.....	17-27
GET_TASK_SCRIPT Function.....	17-28
IMPLEMENT_TASK Procedure	17-30
IMPORT_SQLWKLD_SCHEMA Procedure.....	17-31
IMPORT_SQLWKLD_SQLCACHE Procedure	17-33
IMPORT_SQLWKLD_STS Procedure.....	17-35
IMPORT_SQLWKLD_SUMADV Procedure	17-37
IMPORT_SQLWKLD_USER Procedure	17-39
INTERRUPT_TASK Procedure.....	17-41
MARK_RECOMMENDATION Procedure	17-42
QUICK_TUNE Procedure.....	17-44
RESET_SQLWKLD Procedure	17-45
RESET_TASK Procedure.....	17-46
SET_DEFAULT_SQLWKLD_PARAMETER Procedures.....	17-47
SET_DEFAULT_TASK_PARAMETER Procedures	17-48
SET_SQLWKLD_PARAMETER Procedures.....	17-49
SET_TASK_PARAMETER Procedure.....	17-50

TUNE_MVIEW Procedure.....	17-63
UPDATE_OBJECT Procedure	17-65
UPDATE_REC_ATTRIBUTES Procedure	17-67
UPDATE_SQLWKLD_ATTRIBUTES Procedure	17-69
UPDATE_SQLWKLD_STATEMENT Procedure	17-70
UPDATE_TASK_ATTRIBUTES Procedure.....	17-72
18 DBMS_ALERT	
Using DBMS_ALERT	18-2
Overview	18-3
Security Model.....	18-4
Constants	18-5
Restrictions.....	18-6
Exceptions	18-7
Operational Notes	18-8
Examples	18-10
Summary of DBMS_ALERT Subprograms.....	18-11
REGISTER Procedure	18-12
REMOVE Procedure	18-13
REMOVEALL Procedure	18-14
SET_DEFAULTS Procedure	18-15
SIGNAL Procedure	18-16
WAITANY Procedure	18-17
WAITONE Procedure	18-18
19 DBMS_APPLICATION_INFO	
Using DBMS_APPLICATION_INFO.....	19-2
Overview	19-3
Security Model.....	19-4
Operational Notes	19-5
Summary of DBMS_APPLICATION_INFO Subprograms	19-6
READ_CLIENT_INFO Procedure	19-7
READ_MODULE Procedure	19-8
SET_ACTION Procedure	19-9
SET_CLIENT_INFO Procedure.....	19-10
SET_MODULE Procedure	19-11
SET_SESSION_LONGOPS Procedure	19-12
20 DBMS_APPLY_ADM	
Summary of DBMS_APPLY_ADM Subprograms	20-2
ALTER_APPLY Procedure	20-4
COMPARE_OLD_VALUES Procedure	20-9
CREATE_APPLY Procedure	20-11
CREATE_OBJECT_DEPENDENCY Procedure.....	20-18
DELETE_ALL_ERRORS Procedure	20-19
DELETE_ERROR Procedure.....	20-20

DROP_APPLY Procedure	20-21
DROP_OBJECT_DEPENDENCY Procedure	20-22
EXECUTE_ALL_ERRORS Procedure	20-23
EXECUTE_ERROR Procedure	20-24
GET_ERROR_MESSAGE Function	20-27
SET_DML_HANDLER Procedure.....	20-28
SET_ENQUEUE_DESTINATION Procedure	20-33
SET_EXECUTE Procedure	20-35
SET_GLOBAL_INSTANTIATION_SCN Procedure.....	20-37
SET_KEY_COLUMNS Procedures	20-39
SET_PARAMETER Procedure	20-41
SET_SCHEMA_INSTANTIATION_SCN Procedure.....	20-48
SET_TABLE_INSTANTIATION_SCN Procedure	20-50
SET_UPDATE_CONFLICT_HANDLER Procedure.....	20-52
SET_VALUE_DEPENDENCY Procedure	20-55
START_APPLY Procedure.....	20-56
STOP_APPLY Procedure	20-57

21 DBMS_AQ

Using DBMS_AQ	21-2
Constants	21-3
Data Structures	21-5
Operational Notes	21-8
Summary of DBMS_AQ Subprograms.....	21-9
BIND_AGENT Procedure.....	21-10
DEQUEUE Procedure.....	21-11
DEQUEUE_ARRAY Function.....	21-14
ENQUEUE Procedure	21-16
ENQUEUE_ARRAY Function.....	21-18
LISTEN Procedures.....	21-19
POST Procedure	21-21
REGISTER Procedure	21-22
UNBIND_AGENT Procedure	21-23
UNREGISTER Procedure.....	21-24

22 DBMS_AQADM

Using DBMS_AQADM.....	22-2
Constants	22-3
Subprogram Groups	22-4
Queue Table Subprograms	22-5
Privilege Subprograms	22-6
Queue Subprograms	22-7
Subscriber Subprograms	22-8
Notification Subprograms.....	22-9
Propagation Subprograms.....	22-10
Oracle Streams AQ Agent Subprograms.....	22-11
Alias Subprograms.....	22-12

Summary of DBMS_AQADM Subprograms	22-13
ADD_ALIAS_TO_LDAP Procedure	22-15
ADD_SUBSCRIBER Procedure	22-16
ALTER_AQ_AGENT Procedure	22-17
ALTER_PROPAGATION_SCHEDULE Procedure	22-18
ALTER_QUEUE Procedure	22-19
ALTER_QUEUE_TABLE Procedure	22-20
ALTER_SUBSCRIBER Procedure	22-21
CREATE_AQ_AGENT Procedure	22-22
CREATE_NP_QUEUE Procedure	22-23
CREATE_QUEUE Procedure	22-24
CREATE_QUEUE_TABLE Procedure	22-26
DEL_ALIAS_FROM_LDAP Procedure	22-29
DISABLE_DB_ACCESS Procedure	22-30
DISABLE_PROPAGATION_SCHEDULE Procedure	22-31
DROP_AQ_AGENT Procedure	22-32
DROP_QUEUE Procedure	22-33
DROP_QUEUE_TABLE Procedure	22-34
ENABLE_DB_ACCESS Procedure	22-35
ENABLE_JMS_TYPES Procedure	22-36
ENABLE_PROPAGATION_SCHEDULE Procedure	22-37
GET_WATERMARK Procedure	22-38
GRANT_QUEUE_PRIVILEGE Procedure	22-39
GRANT_SYSTEM_PRIVILEGE Procedure	22-40
MIGRATE_QUEUE_TABLE Procedure	22-41
PURGE_QUEUE_TABLE Procedure	22-42
QUEUE_SUBSCRIBERS Function	22-44
REMOVE_SUBSCRIBER Procedure	22-45
REVOKE_QUEUE_PRIVILEGE Procedure	22-46
REVOKE_SYSTEM_PRIVILEGE Procedure	22-47
SCHEDULE_PROPAGATION Procedure	22-48
SET_WATERMARK Procedure	22-50
START_QUEUE Procedure	22-51
STOP_QUEUE Procedure	22-52
UNSCHEDULE_PROPAGATION Procedure	22-53
VERIFY_QUEUE_TYPES Procedure	22-54

23 DBMS_AQELM

Summary of DBMS_AQELM Subprograms	23-2
SET_MAILHOST Procedure	23-3
SET_MAILPORT Procedure	23-4
SET_SENDFROM Procedure	23-5

24 DBMS_AQIN

Using DBMS_AQIN	24-2
Overview	24-3

25 DBMS_ASSERT

Using DBMS_ASSERT	25-2
Operational Notes	25-3
Summary of DBMS_ASSERT Subprograms	25-4
ENQUOTE_LITERAL Function	25-5
ENQUOTE_NAME Function	25-6
NOOP Functions	25-7
QUALIFIED_SQL_NAME Function	25-8
SCHEMA_NAME Function.....	25-9
SIMPLE_SQL_NAME Function	25-10
SQL_OBJECT_NAME Function.....	25-11

26 DBMS_AUTO_TASK_ADMIN

Using DBMS_AUTO_TASK_ADMIN	26-2
Constants	26-3
Summary of DBMS_AUTO_TASK_ADMIN Subprograms	26-4
DISABLE Procedures.....	26-5
ENABLE Procedures.....	26-6
GET_CLIENT_ATTRIBUTES Procedure	26-7
GET_P1_RESOURCES Procedure.....	26-8
OVERRIDE_PRIORITY Procedures	26-9
SET_CLIENT_SERVICE Procedure.....	26-10
SET_P1_RESOURCES Procedure.....	26-11

27 DBMS_AW_STATS

Using DBMS_AW_STATS	27-2
Summary of DBMS_AW_STATS Subprograms	27-3
ANALYZE Procedure.....	27-4

28 DBMS_CAPTURE_ADM

Summary of DBMS_CAPTURE_ADM Subprograms	28-2
ABORT_GLOBAL_INSTANTIATION Procedure	28-4
ABORT_SCHEMA_INSTANTIATION Procedure	28-5
ABORT_SYNC_INSTANTIATION Procedure.....	28-6
ABORT_TABLE_INSTANTIATION Procedure.....	28-7
ALTER_CAPTURE Procedure	28-8
ALTER_SYNC_CAPTURE Procedure	28-13
BUILD Procedure	28-15
CREATE_CAPTURE Procedure	28-16
CREATE_SYNC_CAPTURE Procedure.....	28-26
DROP_CAPTURE Procedure	28-28
INCLUDE_EXTRA_ATTRIBUTE Procedure	28-30
PREPARE_GLOBAL_INSTANTIATION Procedure.....	28-32
PREPARE_SCHEMA_INSTANTIATION Procedure.....	28-33
PREPARE_SYNC_INSTANTIATION Function.....	28-34
PREPARE_TABLE_INSTANTIATION Procedure.....	28-35

SET_PARAMETER Procedure	28-36
START_CAPTURE Procedure.....	28-40
STOP_CAPTURE Procedure	28-41

29 DBMS_CDC_PUBLISH

Using DBMS_CDC_PUBLISH	29-2
Overview	29-3
Deprecated Subprograms	29-4
Security Model.....	29-5
Views.....	29-6
Summary of DBMS_CDC_PUBLISH Subprograms	29-7
ALTER_AUTOLOG_CHANGE_SOURCE Procedure	29-8
ALTER_CHANGE_SET Procedure	29-10
ALTER_CHANGE_TABLE Procedure	29-13
ALTER_HOTLOG_CHANGE_SOURCE Procedure	29-16
CREATE_AUTOLOG_CHANGE_SOURCE Procedure.....	29-18
CREATE_CHANGE_SET Procedure	29-20
CREATE_CHANGE_TABLE Procedure.....	29-23
CREATE_HOTLOG_CHANGE_SOURCE Procedure.....	29-27
DROP_CHANGE_SET Procedure	29-29
DROP_CHANGE_SOURCE Procedure.....	29-30
DROP_CHANGE_TABLE Procedure	29-31
DROP_SUBSCRIPTION Procedure	29-32
GET_DDLOPER Function.....	29-33
PURGE Procedure.....	29-34
PURGE_CHANGE_SET Procedure.....	29-35
PURGE_CHANGE_TABLE Procedure.....	29-36

30 DBMS_CDC_SUBSCRIBE

Using DBMS_CDC_SUBSCRIBE	30-2
Overview	30-3
Deprecated Subprograms	30-5
Security Model.....	30-6
Views.....	30-7
Summary of DBMS_CDC_SUBSCRIBE Subprograms	30-8
ACTIVATE_SUBSCRIPTION Procedure.....	30-9
CREATE_SUBSCRIPTION Procedure	30-10
DROP_SUBSCRIPTION Procedure	30-12
EXTEND_WINDOW Procedure	30-13
PURGE_WINDOW Procedure.....	30-15
SUBSCRIBE Procedure	30-16

31 DBMS_COMPARISON

Using DBMS_COMPARISON.....	31-2
Overview	31-3
Security Model.....	31-5

Constants	31-6
Views.....	31-8
Operational Notes	31-9
Data Structures.....	31-13
COMPARISON_TYPE Record Type	31-14
Summary of DBMS_COMPARISON Subprograms	31-15
COMPARE Function.....	31-16
CONVERGE Procedure.....	31-18
CREATE_COMPARISON Procedure.....	31-20
DROP_COMPARISON Procedure	31-24
PURGE_COMPARISON Procedure	31-25
RECHECK Function	31-26
32 DBMS_CONNECTION_POOL	
Summary of DBMS_CONNECTION_POOL Subprograms.....	32-2
ALTER_PARAM Procedure	32-3
CONFIGURE_POOL Procedure	32-4
START_POOL Procedure.....	32-6
STOP_POOL Procedure	32-7
RESTORE_DEFAULTS Procedure.....	32-8
33 DBMS_CQ_NOTIFICATION	
Using DBMS_CQ_NOTIFICATION	33-2
Overview	33-3
Security Model.....	33-4
Constants	33-5
Operational Notes	33-7
Examples	33-8
Data Structures.....	33-15
CQ_NOTIFICATION\$_DESCRIPTOR Object Type	33-16
CQ_NOTIFICATION\$_QUERY Object Type	33-17
CQ_NOTIFICATION\$_QUERY_ARRAY Object (Array) Type	33-18
CQ_NOTIFICATION\$_TABLE Object Type	33-19
CQ_NOTIFICATION\$_TABLE_ARRAY Object (Array) Type	33-20
CQ_NOTIFICATION\$_ROW Object Type.....	33-21
CQ_NOTIFICATION\$_ROW_ARRAY Object (Array) Type	33-22
CQ_NOTIFICATION\$_REG_INFO Object Type	33-23
Summary of DBMS_CQ_NOTIFICATION Subprograms.....	33-26
CQ_NOTIFICATION_QUERYID Function	33-27
DEREGISTER Procedure.....	33-28
ENABLE_REG Procedure	33-29
NEW_REG_START Function	33-30
REG_END Procedure	33-31
34 DBMS_CRYPTO	
Using the DBMS_CRYPTO Subprograms.....	34-2

Overview	34-3
Security Model.....	34-4
Types	34-5
Algorithms	34-6
Restrictions	34-8
Exceptions	34-9
Operational Notes	34-10
Examples	34-12
Summary of DBMS_CRYPTO Subprograms.....	34-13
DECRYPT Function	34-14
DECRYPT Procedures	34-15
ENCRYPT Function	34-16
ENCRYPT Procedures.....	34-17
HASH Function	34-18
MAC Function	34-19
RANDOMBYTES Function.....	34-20
RANDOMINTEGER Function	34-21
RANDOMNUMBER Function	34-22
35 DBMS_CSX_ADMIN	
Using DBMS_CSX_ADMIN	35-2
Overview	35-3
Constants	35-4
Examples	35-5
Summary of DBMS_CSX_ADMIN.....	35-6
COPYDEFAULTTOKENTABLESET Procedure	35-7
GETTOKENTABLEINFO Procedure & Function	35-8
GETTOKENTABLEINFOBYTABLESPACE Procedure	35-9
NAMESPACEIDTABLE Function	35-10
PATHIDTABLE Function	35-11
QNAMEIDTABLE Function.....	35-12
REGISTERTOKENTABLESET Procedure	35-13
36 DBMS_CUBE	
Using DBMS_CUBE	36-2
Summary of DBMS_CUBE Subprograms	36-3
BUILD Procedure	36-4
IMPORT_XML Procedure.....	36-11
VALIDATE_XML Procedure.....	36-13
37 DBMS_CUBE_ADVISE	
Summary of DBMS_CUBE_ADVISE Subprograms	37-2
MV_CUBE_ADVICE Function.....	37-3
SET_CNS_EXCEPTION_LOG Procedure	37-6
TRACE Procedure	37-7

38 DBMS_DATA_MINING

Using DBMS_DATA_MINING	38-2
Overview	38-3
Mining Model Objects	38-5
Deprecated Subprograms	38-7
Mining Functions	38-8
Model Settings	38-9
Data Types.....	38-18
Summary of DBMS_DATA_MINING Subprograms.....	38-21
ADD_COST_MATRIX Procedure.....	38-23
ALTER_REVERSE_EXPRESSION Procedure	38-25
APPLY Procedure	38-27
COMPUTE_CONFUSION_MATRIX Procedure.....	38-31
COMPUTE_LIFT Procedure.....	38-37
COMPUTE_ROC Procedure.....	38-42
CREATE_MODEL Procedure.....	38-47
DROP_MODEL Procedure	38-51
EXPORT_MODEL Procedure.....	38-52
GET_ASSOCIATION_RULES Function	38-55
GET_DEFAULT_SETTINGS Function.....	38-58
GET_FREQUENT_ITEMSETS Function	38-59
GET_MODEL_COST_MATRIX Function.....	38-61
GET_MODEL_DETAILS_ABN Function	38-63
GET_MODEL_DETAILS_AI Function.....	38-65
GET_MODEL_DETAILS_GLM Function.....	38-66
GET_MODEL_DETAILS_GLOBAL Function	38-69
GET_MODEL_DETAILS_KM Function	38-72
GET_MODEL_DETAILS_NB Function	38-75
GET_MODEL_DETAILS_NMF Function.....	38-77
GET_MODEL_DETAILS_OC Function	38-78
GET_MODEL_DETAILS_SVM Function	38-81
GET_MODEL_DETAILS_XML Function	38-83
GET_MODEL_SETTINGS Function.....	38-84
GET_MODEL_SIGNATURE Function	38-85
GET_MODEL_TRANSFORMATIONS Function	38-87
GET_TRANSFORM_LIST Procedure.....	38-88
IMPORT_MODEL Procedure.....	38-89
RANK_APPLY Procedure	38-92
REMOVE_COST_MATRIX Procedure.....	38-95
RENAME_MODEL Procedure.....	38-96

39 DBMS_DATA_MINING_TRANSFORM

Using DBMS_DATA_MINING_TRANSFORM	39-2
Data Transformation with Oracle Data Mining.....	39-3
Types of Transformations	39-4
The DBMS_DATA_MINING_TRANSFORM Framework.....	39-6
Data Types.....	39-7

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms	39-9
CREATE_BIN_CAT Procedure.....	39-11
CREATE_BIN_NUM Procedure.....	39-12
CREATE_CLIP Procedure.....	39-13
CREATE_COL_REM Procedure.....	39-14
CREATE_MISS_CAT Procedure.....	39-15
CREATE_MISS_NUM Procedure.....	39-16
CREATE_NORM_LIN Procedure.....	39-17
DESCRIBE_STACK Procedure.....	39-18
GET_EXPRESSION Function.....	39-19
INSERT_AUTOBIN_NUM_EQWIDTH Procedure.....	39-20
INSERT_BIN_CAT_FREQ Procedure.....	39-22
INSERT_BIN_NUM_EQWIDTH Procedure.....	39-24
INSERT_BIN_NUM_QTILE Procedure.....	39-26
INSERT_BIN_SUPER Procedure.....	39-28
INSERT_CLIP_TRIM_TAIL Procedure.....	39-29
INSERT_CLIP_WINSOR_TAIL Procedure.....	39-31
INSERT_MISS_CAT_MODE Procedure.....	39-33
INSERT_MISS_NUM_MEAN Procedure.....	39-34
INSERT_NORM_LIN_MINMAX Procedure.....	39-35
INSERT_NORM_LIN_SCALE Procedure.....	39-36
INSERT_NORM_LIN_ZSCORE Procedure.....	39-37
SET_EXPRESSION Procedure.....	39-38
SET_TRANSFORM Procedure.....	39-39
STACK_BIN_CAT Procedure.....	39-40
STACK_BIN_NUM Procedure.....	39-43
STACK_CLIP Procedure.....	39-46
STACK_COL_REM Procedure.....	39-48
STACK_MISS_CAT Procedure.....	39-49
STACK_MISS_NUM Procedure.....	39-51
STACK_NORM_LIN Procedure.....	39-53
XFORM_BIN_CAT Procedure.....	39-55
XFORM_BIN_NUM Procedure.....	39-57
XFORM_CLIP Procedure.....	39-60
XFORM_COL_REM Procedure.....	39-62
XFORM_EXPR_NUM Procedure.....	39-63
XFORM_EXPR_STR Procedure.....	39-65
XFORM_MISS_CAT Procedure.....	39-66
XFORM_MISS_NUM Procedure.....	39-67
XFORM_NORM_LIN Procedure.....	39-68
XFORM_STACK Procedure.....	39-70

40 DBMS_DATAPUMP

Using DBMS_DATAPUMP	40-2
Overview.....	40-3
Security Model.....	40-4
Constants.....	40-5

Data Structures	40-6
Data Structures - Object Types.....	40-7
Summary of DBMS_DATAPUMP Subprograms	40-12
ADD_FILE Procedure.....	40-13
ATTACH Function.....	40-16
DATA_FILTER Procedures	40-18
DATA_REMAP Procedure	40-21
DETACH Procedure	40-23
GET_DUMPFILE_INFO Procedure.....	40-24
GET_STATUS Procedure	40-26
LOG_ENTRY Procedure	40-29
METADATA_FILTER Procedure	40-30
METADATA_REMAP Procedure	40-33
METADATA_TRANSFORM Procedure	40-36
OPEN Function.....	40-39
SET_PARALLEL Procedure	40-42
SET_PARAMETER Procedures.....	40-44
START_JOB Procedure.....	40-53
STOP_JOB Procedure	40-55
WAIT_FOR_JOB Procedure.....	40-57
41 DBMS_DB_VERSION	
Using DBMS_DB_VERSION	41-2
Overview	41-3
Constants	41-4
Examples	41-5
42 DBMS_DDL	
Using DBMS_DDL	42-2
Deprecated Subprograms	42-3
Security Model.....	42-4
Operational Notes	42-5
Summary of DBMS_DDL Subprograms	42-6
ALTER_COMPILE Procedure	42-7
ALTER_TABLE_NOT_REFERENCEABLE Procedure.....	42-8
ALTER_TABLE_REFERENCEABLE Procedure	42-9
CREATE_WRAPPED Procedures.....	42-10
IS_TRIGGER_FIRE_ONCE Function	42-12
SET_TRIGGER_FIRING_PROPERTY Procedure.....	42-13
WRAP Functions	42-15
43 DBMS_DEBUG	
Using DBMS_DEBUG.....	43-2
Overview	43-3
Constants	43-4
Variables	43-5

Exceptions	43-6
Operational Notes	43-8
Data Structures	43-14
BREAKPOINT_INFO Record Type.....	43-15
PROGRAM_INFO Record Type	43-16
RUNTIME_INFO Record Type.....	43-17
BACKTRACE_TABLE Table Type	43-18
BREAKPOINT_TABLE Table Type.....	43-19
INDEX_TABLE Table Type	43-20
VC2_TABLE Table Type	43-21
Summary of DBMS_DEBUG Subprograms	43-22
ATTACH_SESSION Procedure.....	43-24
CONTINUE Function	43-25
DEBUG_OFF Procedure.....	43-26
DEBUG_ON Procedure.....	43-27
DELETE_BREAKPOINT Function	43-28
DELETE_OER_BREAKPOINT Function	43-29
DETACH_SESSION Procedure.....	43-30
DISABLE_BREAKPOINT Function.....	43-31

SET_EXPIRES Procedure	170-9

SET_NOT_MODIFIED Procedure	170-10
SET_SURROGATE_CONTROL Procedure.....	170-11
171 OWA_COOKIE	
Using OWA_COOKIE	171-2
Overview	171-3
Types.....	171-4
Rules and Limits.....	171-5
Summary of OWA_COOKIE Subprograms	171-6
GET Function.....	171-7
GET_ALL Procedure.....	171-8
REMOVE Procedure	171-9
SEND procedure.....	171-10
172 OWA_CUSTOM	
Using OWA_CUSTOM	172-2
Constants.....	172-3
Summary of OWA_CUSTOM Subprograms	172-4
AUTHORIZE Function.....	172-5
173 OWA_IMAGE	
Using OWA_IMAGE	173-2
Overview	173-3
Types.....	173-4
Variables.....	173-5
Examples	173-6
Summary of OWA_IMAGE Subprograms	173-7
GET_X Function	173-8
GET_Y Function	173-9
174 OWA_OPT_LOCK	
Using OWA_OPT_LOCK.....	174-2
Overview	174-3
Types.....	174-4
Summary of OWA_OPT_LOCK Subprograms	174-5
CHECKSUM Functions.....	174-6
GET_ROWID Function.....	174-7
STORE_VALUES Procedure.....	174-8
VERIFY_VALUES Function.....	174-9
175 OWA_PATTERN	
Using OWA_PATTERN.....	175-2
Types.....	175-3
Operational Notes	175-4
Summary of OWA_PATTERN Subprograms	175-6

AMATCH Function	175-7
CHANGE Functions and Procedures	175-9
GETPAT Procedure.....	175-11
MATCH Function	175-12
176 OWA_SEC	
Using OWA_SEC	176-2
Operational Notes	176-3
Summary of OWA_SEC Subprograms	176-4
GET_CLIENT_HOSTNAME Function	176-5
GET_CLIENT_IP Function	176-6
GET_PASSWORD Function	176-7
GET_USER_ID Function	176-8
SET_AUTHORIZATION Procedure	176-9
SET_PROTECTION_REALM Procedure.....	176-10
177 OWA_TEXT	
Using OWA_TEXT	177-2
Types.....	177-3
Summary of OWA_TEXT Subprograms	177-4
ADD2MULTI Procedure	177-5
NEW_ROW_LIST Function and Procedure	177-6
PRINT_MULTI Procedure	177-7
PRINT_ROW_LIST Procedure	177-8
STREAM2MULTI Procedure.....	177-9
178 OWA_UTIL	
Using OWA_UTIL	178-2
Overview	178-3
Types.....	178-4
Summary of OWA_UTIL Subprograms	178-5
BIND_VARIABLES Function	178-6

Index

Preface

This Preface contains these topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming:

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, 7 days a week. For TTY support, call 800.446.2398. Outside the United States, call +1.407.458.2479.

Related Documents

For more information, see the following documents:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

<http://oraclestore.oracle.com/>

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

<http://otn.oracle.com/membership/>

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

<http://otn.oracle.com/documentation/>

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- [Conventions in Text](#)
- [Conventions in Code Examples](#)

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an index-organized table .
<i>Italics</i>	Italic typeface indicates book titles or emphasis.	<i>Oracle Database Concepts</i> Ensure that the recovery catalog and target database do <i>not</i> reside on the same disk.

Convention	Meaning	Example
UPPERCASE monospace (fixed-width) font	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width) font	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. <i>Note:</i> Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Set the QUERY_REWRITE_ENABLED initialization parameter to true. The JRepUtil class implements these methods.
lowercase italic monospace (fixed-width) font	Lowercase italic monospace font represents placeholders or variables.	You can specify the <i>parallel_clause</i> . Run <i>old_release.SQL</i> where <i>old_release</i> refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[]	Anything enclosed in brackets is optional.	DECIMAL (<i>digits</i> [, <i>precision</i>])
{ }	Braces are used for grouping items.	{ENABLE DISABLE}
	A vertical bar represents a choice of two options.	{ENABLE DISABLE} [COMPRESS NOCOMPRESS]
...	Ellipsis points mean repetition in syntax descriptions. In addition, ellipsis points can mean an omission in code examples or text.	CREATE TABLE ... AS <i>subquery</i> ; SELECT <i>col1</i> , <i>col2</i> , ... , <i>coln</i> FROM employees;
Other symbols	You must use symbols other than brackets ([]), braces ({ }), vertical bars (), and ellipsis points (...) exactly as shown.	acctbal NUMBER(11,2); acct CONSTANT NUMBER(4) := 3;
<i>Italics</i>	Italicized text indicates placeholders or variables for which you must supply particular values.	enter <i>password</i> DB_NAME = <i>database_name</i>

Convention	Meaning	Example
UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	<pre>SELECT last_name, employee_id FROM employees; SELECT * FROM USER_TABLES; DROP TABLE hr.employees;</pre>
lowercase	<p>Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.</p> <p>Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</p>	<pre>SELECT last_name, employee_id FROM employees; sqlplus hr/hr CREATE USER mjjones IDENTIFIED BY ty3MU9;</pre>

What's New in PL/SQL Packages and Types Reference?

Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN (
  'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
  'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
  'ORDPLUGINS', 'OEM_MONITOR', 'WKSYS', 'WKPROXY',
  'WK_TEST', 'WKUSER', 'MDSYS', 'LBACSYS', 'DMSYS',
  'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
  'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
  'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- [Package Overview](#)
- [Summary of Oracle Supplied PL/SQL Packages and Types](#)

See Also: *Oracle Database Advanced Application Developer's Guide*
for information on how to create your own packages

Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Packages have many advantages over standalone procedures and functions. For example, they:

- Let you organize your application development more efficiently.
- Let you grant privileges more efficiently.
- Let you modify package objects without recompiling dependent schema objects.
- Enable Oracle to read multiple package objects into memory at once.
- Let you *overload* procedures or functions. Overloading means creating multiple procedures with the same name in the same package, each taking arguments of different number or datatype.
- Can contain global variables and cursors that are available to all procedures and functions in the package.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];
```

```
CREATE PACKAGE BODY name AS -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
[BEGIN
    -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

Note: It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE` just overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

You can declare and define program objects in the package body.

- You must define public objects declared in the package specification.
- You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

See Also:

- *Oracle Database PL/SQL Language Reference*
- *Oracle Database Advanced Application Developer's Guide* for more information on creating new packages
- *Oracle Database Concepts*

for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named `EMPLOYEE_MANAGEMENT`. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
    mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
    deptno NUMBER) RETURN NUMBER;
  PROCEDURE fire_emp (emp_id NUMBER);
  PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
    mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
    deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
    new_empno    NUMBER(10);

  BEGIN
    SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
    INSERT INTO emp VALUES (new_empno, name, job, mgr,
      hiredate, sal, comm, deptno);
    RETURN (new_empno);
  END hire_emp;

  PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument `emp_id`. If no employee is found, then an exception is raised.

```
  BEGIN
    DELETE FROM emp WHERE empno = emp_id;
    IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
        Number: ' || TO_CHAR(emp_id));
    END IF;
  END fire_emp;

  PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. `Emp_id` is a number that corresponds to an employee number. `Sal_incr` is the amount by which to increase the employee's salary.

```
  BEGIN

    -- If employee exists, then update salary with increase.

    UPDATE emp
      SET sal = sal + sal_incr
      WHERE empno = emp_id;
    IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
```

```
        Number: ' || TO_CHAR(emp_id));  
    END IF;  
END sal_raise;  
END employee_management;
```

Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence  
      > START WITH 8000 INCREMENT BY 10;
```

Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name  
package_name.item_name  
package_name.subprogram_name
```

Summary of Oracle Supplied PL/SQL Packages and Types

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
 - Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.
-
-

Table 1–1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
APEX_CUSTOM_AUTH	Provides an interface for authentication and session management
APEX_APPLICATION	Enables users to take advantage of global variables
APEX_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page
APEX_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users
CTX_ADM	Lets you administer servers and the data dictionary
CTX_CLS	Lets you generate CTXRULE rules for a set of documents
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes
CTX_DOC	Lets you request document services
CTX_OUTPUT	Lets you manage the index log
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions
CTX_REPORT	Lets you create various index reports
CTX_THES	Lets you to manage and browse thesauri
CTX_ULEXER	For use with the user-lexer
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements
DBMS_ALERT	Provides support for the asynchronous notification of database events

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces
DBMS_ASSERT	Provides an interface to validate properties of the input value
DBMS_AUTO_TASK_ADMIN	Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls
DBMS_AW_STATS	Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams
DBMS_CDC_PUBLISH	Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application
DBMS_CDC_SUBSCRIBE	Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package
DBMS_COMPARISON	Provides interfaces to compare and converge database objects at different databases
DBMS_CONNECTION_POOL	Provides an interface to manage the Database Resident Connection Pool
DBMS_CQ_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms
DBMS_CSX_ADMIN	Provides an interface to customize the setup when transporting a tablespace containing binary XML data
DBMS_CUBE	Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying
DBMS_CUBE_ADVISE	Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_DATA_MINING	Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models
DBMS_DATA_MINING_TRANSFORM	Provides subroutines that can be used to prepare data for Oracle Data Mining
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DBMS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking
DBMS_DG	Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter
DBMS_FGA	Provides fine-grained security functions
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting
DBMS_HM	Contains constants and procedure declarations for health check management
DBMS_HPROF	Provides an interface for profiling the execution of PL/SQL applications
DBMS_HS_PARALLEL	Enables parallel processing for heterogeneous targets access
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Schedules and manages jobs in the job queue
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILES (read-only)
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services
DBMS_LOGMNR	Provides functions to initialize and run the log reader
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary
DBMS_MGD_ID_UTL	Provides a set of utility subprograms
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing
DBMS_MGWMSG	Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_NETWORK_ACL_ADMIN	Provides the interface to administer the network Access Control List (ACL)
DBMS_NETWORK_UTL	Provides the interface to administer the network Access Control List (ACL)
DBMS_OBFUSCATION_TOOLKIT	Provides procedures for Data Encryption Standards
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function
DBMS_OFFLINE_OG	Provides a public interface for offline instantiation of master groups
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG
DBMS_OUTLN_EDIT	Lets you edit an invoker's rights package
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions
DBMS_PREDICTIVE_ANALYTICS	Provides subroutines that implement automatic data mining operations for predict, explain, and profile
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue
DBMS_RANDOM	Provides a built-in random number generator
DBMS_RECTIFIER_DIFF	Provides an interface to detect and resolve data inconsistencies between two replicated sites
DBMS_REDEFINITION	Lets you perform an online reorganization of tables
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option
DBMS_REPAIR	Provides data corruption repair procedures
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_REPCAT_INSTANTIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESCONFIG	Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups
DBMS_RESULT_CACHE	Provides an interface to operate on the Result Cache
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager
DBMS_RLS	Provides row level security administrative interface
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents
DBMS_RULE	Describes the EVALUATE procedure used in Streams
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism
DBMS_SPACE	Provides segment space information not available through standard SQL
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL
DBMS_SPM	Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements
DBMS_SQL	Lets you use dynamic SQL to access the database

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_SQLDIAG	Provides an interface to the SQL Diagnosability functionality
DBMS_SQLTUNE	Provides the interface to tune SQL statements
DBMS_STAT_FUNCS	Provides statistical functions
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations
DBMS_STREAMS	Describes the interface to convert <code>SYS.AnyData</code> objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators
DBMS_STREAMS_ADVISOR_ADM	Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a <code>SYS.AnyData</code> queue
DBMS_STREAMS_TABLESPACE_ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another
DBMS_TDB	Reports whether a database can be transported between platforms using the <code>RMAN CONVERT DATABASE</code> command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing
DBMS_TTS	Checks if the transportable set is self-contained
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types
DBMS_UTILITY	Provides various utility routines
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions
DBMS_WORKLOAD_CAPTURE	Configures the Workload Capture system and produce the workload capture data.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_WORKLOAD_REPLAY	Provides an interface to replay and report on a record of a workload on a production or test system
DBMS_WORKLOAD_REPOSITORY	Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines
DBMS_XA	Contains the XA/Open interface for applications to call XA interface in PL/SQL
DBMS_XDB	Describes Resource Management and Access Control interface for PL/SQL
DBMS_XDB_ADMIN	Provides an interface to implement XMLIndex administration operation
DBMS_XDBRESOURCE	Provides an interface to operate on the XDB resource's metadata and contents
DBMS_XDB_VERSION	Describes the versioning interface
DBMS_XDBT	Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)
DBMS_XEVENT	Provides event-related types and supporting subprograms
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format
DBMS_XMLINDEX	Provides an interface to implement asynchronous indexing and apply node referencing
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents
DBMS_XMLQUERY	Provides database-to-XMLType functionality
DBMS_XMLSAVE	Provides XML-to-database-type functionality
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables
DBMS_XMLTRANSLATIONS	Provides an interface to perform translations so that strings can be searched or displayed in various languages
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process
HTF	Hypertext functions generate HTML tags
HTP	Hypertext procedures generate HTML tags
ORD_DICOM	Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILES rather than in an ORDDi.com object type

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
ORD_DICOM_ADMIN	Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string
OWA_SEC	Provides an interface for custom authentication
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table
SDO_CS	Provides functions for coordinate system transformation
SDO_CSW_PROCESS	Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses
SDO_GEOM	Provides functions implementing geometric operations on spatial objects
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata
SDO_GEOR_ADMIN	Contains subprograms for administrative operations related to GeoRaster.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data
SDO_LRS	Provides functions for linear referencing system support
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_OLS	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_PC_PKG	Contains subprograms to support the use of point clouds in Spatial
SDO_SAM	Contains functions and procedures for spatial analysis and data mining
SDO_TIN_PKG	Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial
SDO_TOPO	Provides procedures for creating and managing Spatial topologies
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object)
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial
SDO_WFS_LOCK	Contains subprograms for WFS support for registering and unregistering feature tables
SDO_WFS_PROC	Provides utility functions and procedures for Oracle Spatial
SEM_APIS	Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.
SEM_PERF	Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update
UTL_COMPRESS	Provides a set of data compression utilities
UTL_DBWS	Provides database web services
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications
UTL_INADDR	Provides a procedure to support internet addressing

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_LMS	Retrieves and formats error messages in different languages
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for manipulating RAW datatypes
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object
UTL_SMTP	Provides PL/SQL functionality to send emails
UTL_SPADV	Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world
UTL_URL	Provides escape and unescape mechanisms for URL characters
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Streams AQ Types	Describes the types used in Advanced Queuing
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
Expression Filter Types	Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
Oracle Multimedia ORDAudio TYPE	Supports the storage and management of audio data
Oracle Multimedia ORDDicom Type	Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data
Oracle Multimedia ORDDoc TYPE	Supports the storage and management of heterogeneous media data including image, audio, and video
Oracle Multimedia ORDImage TYPE	Supports the storage, management, and manipulation of image data

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
Oracle Multimedia SQL/MM Still Image TYPE	Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates
Oracle Multimedia ORDVideo TYPE	Supports the storage and management of video data
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams
MG_ID Package Types	Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types
RULES TYPES	Describes the types used with rules, rule sets, and evaluation contexts
RULES Manager Types	Rules Manager is supplied with one predefined type and a public synonym
UTL Streams Types	Describes describes abstract streams types used with Oracle XML functionality
XMLType	Describes the types and functions used for native XML support in the server

APEX_CUSTOM_AUTH

The APEX_CUSTOM_AUTH package provides an interface for authentication and session management.

- [Documentation of APEX_CUSTOM_AUTH](#)

Documentation of APEX_CUSTOM_AUTH

For a complete description of this package within the context of APEX, see APEX_CUSTOM_AUTH in the *Oracle Database Application Express User's Guide*.

APEX_APPLICATION

The APEX_APPLICATION package enables users to take advantage of global variables.

- [Documentation of APEX_APPLICATION](#)

Documentation of APEX_APPLICATION

For a complete description of this package within the context of APEX, see APEX_APPLICATION in the *Oracle Database Application Express User's Guide*.

APEX_ITEM

The APEX_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- [Documentation of APEX_ITEM](#)

Documentation of APEX_ITEM

For a complete description of this package within the context of APEX, see `APEX_ITEM` in the *Oracle Database Application Express User's Guide*.

The APEX_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- [Documentation of APEX_UTIL](#)

Documentation of APEX_UTIL

For a complete description of this package within the context of APEX, see `APEX_UTIL` in the *Oracle Database Application Express User's Guide*.

This Oracle Text package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

- [Documentation of CTX_ADM](#)

Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see CTX_ADM in the *Oracle Text Reference*.

This Oracle Text package enables generation of CTXRULE rules for a set of documents.

- [Documentation of CTX_CLS](#)

Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see CTX_CLS in the *Oracle Text Reference*.

This Oracle Text package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- [Documentation of CTX_DDL](#)

Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see CTX_DDL in the *Oracle Text Reference*.

This Oracle Text package lets you request document services. Note that you must install this package in order to use it.

- [Documentation of CTX_DOC](#)

Documentation of CTX_DOC

For a complete description of this package within the context of Oracle Text, see CTX_DOC in the *Oracle Text Reference*.

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- [Documentation of CTX_OUTPUT](#)

Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see CTX_OUTPUT in the *Oracle Text Reference*.

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- [Documentation of CTX_QUERY](#)

Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see CTX_QUERY in the *Oracle Text Reference*.

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- [Documentation of CTX_REPORT](#)

Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see CTX_REPORT in the *Oracle Text Reference*.

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- [Documentation of CTX_THES](#)

Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see CTX_THES in the *Oracle Text Reference*.

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- [Documentation of CTX_ULEXER](#)

Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see CTX_ULEXER in the *Oracle Text Reference*.

The DBMS_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

This chapter contains the following topics:

- [Using DBMS_ADDM](#)
 - Security Model
- [Summary of DBMS_ADDM Subprograms](#)

Using DBMS_ADDM

- [Security Model](#)

Security Model

The DBMS_ADDM package runs with the caller's permission, not the definer's, and then applies the security constraints required by the DBMS_ADVISOR package.

See Also: The [DBMS_ADVISOR](#) package for more information about "Security Model".

Summary of DBMS_ADDM Subprograms

Table 15–1 DBMS_ADDM Package Subprograms

Subprogram	Description
ANALYZE_DB Procedure on page 15-5	Creates an ADDM task for analyzing in database analysis mode and executes it
ANALYZE_INST Procedure on page 15-6	Creates an ADDM task for analyzing in instance analysis mode and executes it.
ANALYZE_PARTIAL Procedure on page 15-7	Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it
DELETE Procedure on page 15-8	Deletes an already created ADDM task (of any kind)
DELETE_FINDING_DIRECTIVE Procedure on page 15-9	Deletes a finding directive
DELETE_PARAMETER_DIRECTIVE Procedure on page 15-10	Deletes a parameter directive
DELETE_SEGMENT_DIRECTIVE Procedure on page 15-11	Deletes a segment directive
DELETE_SQL_DIRECTIVE Procedure on page 15-12	Deletes a SQL directive
GET_REPORT Function on page 15-13	Retrieves the default text report of an executed ADDM task
INSERT_FINDING_DIRECTIVE Procedure on page 15-14	Creates a directive to limit reporting of a specific finding type.
INSERT_PARAMETER_DIRECTIVE Procedure on page 15-15	Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter
INSERT_SEGMENT_DIRECTIVE Procedure on page 15-16	Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments
INSERT_SQL_DIRECTIVE Procedure on page 15-18	Creates a directive to limit reporting of actions on specific SQL

ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (
  task_name          IN OUT VARCHAR2,
  begin_snapshot     IN      NUMBER,
  end_snapshot       IN      NUMBER,
  db_id              IN      NUMBER := NULL);
```

Parameters

Table 15–2 ANALYZE_DB Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_INST (
  task_name          IN OUT VARCHAR2,
  begin_snapshot     IN      NUMBER,
  end_snapshot       IN      NUMBER,
  instance_number    IN      NUMBER := NULL,
  db_id              IN      NUMBER := NULL);
```

Parameters

Table 15–3 ANALYZE_INST Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
instance_number	Number of the instance to analyze. By default it is the instance currently connected
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (i.e., not using RAC) the resulting task is identical to using the `ANALYZE_DB` procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (
  task_name          IN OUT VARCHAR2,
  instance_numbers  IN    VARCHAR2,
  begin_snapshot    IN    NUMBER,
  end_snapshot      IN    NUMBER,
  db_id             IN    NUMBER := NULL);
```

Parameters

Table 15–4 ANALYZE_PARTIAL Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
instance_numbers	Comma separated list of instance numbers to analyze
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this will delete the local tasks associated with the main task.

Syntax

```
DBMS_ADDM.DELETE (  
    task_name          IN VARCHAR2);
```

Parameters

Table 15–5 *DELETE Procedure Parameters*

Parameter	Description
task_name	Name of the task to be deleted

Examples

```
BEGIN  
    DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');  
END
```

DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

Parameters

Table 15–6 *DELETE_FINDING_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks will not be affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

Parameters

Table 15–7 *DELETE_PARAMETER_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

Examples

```
BEGIN  
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL, 'my Parameter directive');  
END;
```

DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

Parameters

Table 15–8 *DELETE_SEGMENT_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (  
    task_name          IN VARCHAR2,  
    dir_name           IN VARCHAR2);
```

Parameters

Table 15–9 *DELETE_SQL_DIRECTIVE Procedure Parameters*

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```
DBMS_ADDM.GET_REPORT (  
    task_name          IN VARCHAR2  
    RETURN CLOB);
```

Parameters

Table 15–10 *GET_REPORT Function Parameters*

Parameter	Description
task_name	Name of the task to be reported on

Examples

```
Set long 1000000  
Set pagesize 50000  
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  finding_name       IN VARCHAR2,
  min_active_sessions IN NUMBER := 0,
  min_perc_impact    IN NUMBER := 0);
```

Parameters

Table 15–11 *INSERT_FINDING_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>task_name</code>	Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.
<code>dir_name</code>	Name of the directive. All directives must be given unique names.
<code>finding_name</code>	Name of an ADDM finding to which this directive applies. All valid findings names appear in the <code>NAME</code> column of view <code>DBA_ADVISOR_FINDING_NAMES</code> .
<code>min_active_sessions</code>	Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.
<code>min_perc_impact</code>	Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of `GET_REPORT` will only show an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
    NULL,
    'Undersized SGA directive',
    'Undersized SGA',
    2,
    10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  parameter_name     IN VARCHAR2);
```

Parameters

Table 15–12 *INSERT_PARAMETER_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>task_name</code>	Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.
<code>dir_name</code>	Name of the directive. All directives must be given unique names.
<code>parameter_name</code>	Specifies the parameter to use. Valid parameter names appear in <code>V\$PARAMETER</code> .

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter `'sga_target'`. The result of `GET_REPORT` will not show actions these actions.

```
var tname varchar2(60);
BEGIN
  DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
    NULL,
    'my Parameter directive',
    'sga_target');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  owner_name         IN VARCHAR2,
  object_name        IN VARCHAR2 := NULL,
  sub_object_name    IN VARCHAR2 := NULL);
```

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  object_number      IN NUMBER);
```

Parameters

Table 15–13 *INSERT_SEGMENT_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>task_name</code>	Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.
<code>dir_name</code>	Name of the directive. All directives must be given unique names.
<code>owner_name</code>	Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for "like" constraints.
<code>object_name</code>	Name of the main object to be filtered. Again, wildcards are allowed. The default value of <code>NULL</code> is equivalent to a value of <code>'%'</code> .
<code>sub_object_name</code>	Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a <code>'.'</code>). Again, wildcards are allowed. The default value of <code>NULL</code> is equivalent to a value of <code>'%'</code> .
<code>object_number</code>	Object number of the <code>SEGMENT</code> that this directive is to filter, found in views <code>DBA_OBJECTS</code> or <code>DBA_SEGMENTS</code>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user `SCOTT`. The result of `GET_REPORT` will not show actions for running Segment advisor for segments that belong to `SCOTT`.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                     'my Segment directive',
                                     'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
  task_name          IN VARCHAR2,
  dir_name           IN VARCHAR2,
  sql_id             IN VARCHAR2,
  min_active_sessions IN NUMBER := 0,
  min_response_time  IN NUMBER := 0);
```

Parameters

Table 15–14 *INSERT_SQL_DIRECTIVE Procedure Parameters*

Parameter	Description
<code>task_name</code>	Name of the task this directive applies to. If the value is <code>NULL</code> , it applies to all subsequently created ADDM Tasks.
<code>dir_name</code>	Name of the directive. All directives must be given unique names.
<code>sql_id</code>	Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.
<code>min_active_sessions</code>	Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.
<code>min_response_time</code>	Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of `GET_REPORT` will only show actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE (
    NULL,
    'my SQL directive',
    'abcd123456789',
    2,
    1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also: *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- [Using DBMS_ADVANCED_REWRITE](#)
 - Security Model
- [Summary of DBMS_ADVANCED_REWRITE Subprograms](#)

Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the DBMS_ADVANCED_REWRITE package.

- [Security Model](#)

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user `er` can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user `er` can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists all the package subprograms in alphabetical order.

Table 16–1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure on page 16-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure on page 16-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures on page 16-7	Creates a declaration indicating that <code>source_stmt</code> is functionally equivalent to <code>destination_stmt</code> for as long as the equivalence declaration remains enabled, and that <code>destination_stmt</code> is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure on page 16-9	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure on page 16-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the <code>validate</code> parameter

ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name          VARCHAR2,
    rewrite_mode  VARCHAR2);
```

Parameters

Table 16–2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration to alter. The name can be of the form <code>owner . name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
rewrite_mode	The following modes are supported, in increasing order of power: <ul style="list-style-type: none"> <code>disabled</code>: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. <code>text_match</code>: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. <code>general</code>: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified <code>destination_query</code>. <code>recursive</code>: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified <code>destination_query</code> for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in `QUERY_REWRITE_INTEGRITY = trusted` and `stale_tolerated` modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in `trusted` and `stale_tolerated` integrity modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name                VARCHAR2,
    source_stmt         VARCHAR2,
    destination_stmt    VARCHAR2,
    validate            BOOLEAN    := TRUE,
    rewrite_mode        VARCHAR2  := 'TEXT_MATCH');
```

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
    name                VARCHAR2,
    source_stmt         CLOB,
    destination_stmt    CLOB,
    validate            BOOLEAN    := TRUE,
    rewrite_mode        VARCHAR2  := 'TEXT_MATCH');
```

Parameters

Table 16–3 *DECLARE_REWRITE_EQUIVALENCE Procedure Parameters*

Parameter	Description
<code>name</code>	A name for the equivalence declaration. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate <code>CREATE MATERIALIZED VIEW</code> privileges to alter an equivalence declaration.
<code>source_stmt</code>	A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format. This is the query statement that is the target of optimization.
<code>destination_stmt</code>	A sub- <code>SELECT</code> expression in either <code>VARCHAR2</code> or <code>CLOB</code> format.
<code>validate</code>	A Boolean indicating whether to validate that the specified <code>source_stmt</code> is functionally equivalent to the specified <code>destination_stmt</code> . If <code>validate</code> is specified as <code>TRUE</code> , <code>DECLARE_REWRITE_EQUIVALENCE</code> evaluates the two sub- <code>SELECT</code> s and compares their results. If the results are not the same, <code>DECLARE_REWRITE_EQUIVALENCE</code> does not create the rewrite equivalence and returns an error condition. If <code>FALSE</code> , <code>DECLARE_REWRITE_EQUIVALENCE</code> does not validate the equivalence.

Table 16–3 (Cont.) DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
rewrite_mode	<p>The following modes are supported, in increasing order of power:</p> <ul style="list-style-type: none"> ▪ disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. ▪ text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. ▪ general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. ▪ recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. <p>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</p>

Exceptions

Table 16–4 DECLARE_REWRITE_EQUIVALENCE Procedure Exceptions

Exception	Description
ORA-30388	Name of the rewrite equivalence is not specified
ORA-30391	The specified rewrite equivalence does not exist
ORA-30392	The checksum analysis for the rewrite equivalence failed
ORA-30393	A query block in the statement did not write
ORA-30396	Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the unrewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.

DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (  
    name          VARCHAR2);
```

Parameters

Table 16–5 *DROP_REWRITE_EQUIVALENCE Procedure Parameters*

Parameter	Description
name	A name for the equivalence declaration to drop. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "[VALIDATE_REWRITE_EQUIVALENCE Procedure](#)" on page 16-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (  
    name          VARCHAR2);
```

Parameters

Table 16–6 *VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters*

Parameter	Description
name	A name for the equivalence declaration to validate. The name can be of the form <code>owner.name</code> , where <code>owner</code> complies with the rules for a schema name, and <code>name</code> complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the <code>source_stmt</code> and <code>destination_stmt</code> of the specified equivalence declaration.

DBMS_ADVISOR

DBMS_ADVISOR is part of the Server Manageability suite of Advisors, a set of expert systems that identifies and helps resolve performance problems relating to the various database server components.

See Also:

- *Oracle Database Administrator's Guide* for information regarding the Segment Advisor
- *Oracle Database 2 Day + Performance Tuning Guide* for information regarding how to use various Advisors in Enterprise Manager
- *Oracle Database Performance Tuning Guide* for information regarding the SQL Tuning Advisor and SQL Access Advisor
- *Oracle Database 2 Day DBA* and *Oracle Database Administrator's Guide* for information regarding the Undo Advisor

This chapter contains the following topics:

- [Using DBMS_ADVISOR](#)
 - Security Model
- [Summary of DBMS_ADVISOR Subprograms](#)

Using DBMS_ADVISOR

This section contains topics which relate to using the DBMS_ADVISOR package.

- [Security Model](#)

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package. In addition, there is an `ADVISOR` privilege, which is required by `DBMS_ADVISOR` procedures.

Summary of DBMS_ADVISOR Subprograms

Table 17–1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure on page 17-7	Adds a workload reference to an Advisor task	SQL Access Advisor only
ADD_SQLWKLD_STATEMENT Procedure on page 17-8	Adds a single statement to a workload	SQL Access Advisor only
ADD_STS_REF Procedure on page 17-10	Establishes a link between the current SQL Access Advisor task and a SQL Tuning Set	SQL Access Advisor only
CANCEL_TASK Procedure on page 17-11	Cancels a currently executing task operation	All Advisors
COPY_SQLWKLD_TO_STS Procedure on page 17-12	Copies the contents of a SQL workload object to a SQL Tuning Set	SQL Access Advisor
CREATE_FILE Procedure on page 17-13	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	All Advisors
CREATE_OBJECT Procedure on page 17-14	Creates a new task object	All Advisors
CREATE_SQLWKLD Procedure on page 17-16	Creates a new workload object	SQL Access Advisor only
CREATE_TASK Procedures on page 17-17	Creates a new Advisor task in the repository	All Advisors
DELETE_SQLWKLD Procedure on page 17-19	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_REF Procedure on page 17-20	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_STATEMENT Procedures on page 17-21	Deletes one or more statements from a workload	SQL Access Advisor only
DELETE_STS_REF Procedure on page 17-22	Removes a link between the current SQL Access Advisor task and a SQL Tuning Set object	SQL Access Advisor only
DELETE_TASK Procedure on page 17-23	Deletes the specified task from the repository	All Advisors
EXECUTE_TASK Procedure on page 17-24	Executes the specified task	All Advisors
GET_REC_ATTRIBUTES Procedure on page 17-26	Retrieves specific recommendation attributes from a task	All Advisors
GET_TASK_REPORT Function on page 17-27	Creates and returns a report for the specified task	All Advisors
GET_TASK_SCRIPT Function on page 17-28	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	All Advisors
IMPLEMENT_TASK Procedure on page 17-30	Implements the recommendations for a task	All Advisors

Table 17-1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
IMPORT_SQLWKLD_SCHEMA Procedure on page 17-31	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_SQLCACHE Procedure on page 17-33	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_STS Procedure on page 17-35	Imports data into a workload from a SQL Tuning Set into a SQL workload data object	SQL Access Advisor only
IMPORT_SQLWKLD_SUMADV Procedure on page 17-37	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_USER Procedure on page 17-39	Imports data into a workload from the current SQL cache	SQL Access Advisor only
INTERRUPT_TASK Procedure on page 17-41	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	All Advisors
MARK_RECOMMENDATION Procedure on page 17-42	Sets the <code>annotation_status</code> for a particular recommendation	All Advisors
QUICK_TUNE Procedure on page 17-44	Performs an analysis on a single SQL statement	All Advisors
RESET_TASK Procedure on page 17-46	Resets a task to its initial state	All Advisors
SET_DEFAULT_SQLWKLD_PARAMETER Procedures on page 17-47	Imports data into a workload from schema evidence	SQL Access Advisor only
SET_DEFAULT_TASK_PARAMETER Procedures on page 17-48	Modifies a default task parameter	All Advisors
SET_SQLWKLD_PARAMETER Procedures on page 17-49	Sets the value of a workload parameter	SQL Access Advisor only
SET_TASK_PARAMETER Procedure on page 17-50	Sets the specified task parameter value	All Advisors
TUNE_MVIEW Procedure on page 17-63	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor only
UPDATE_OBJECT Procedure on page 17-65	Updates a task object	All Advisors
UPDATE_REC_ATTRIBUTES Procedure on page 17-67	Updates an existing recommendation for the specified task	All Advisors
UPDATE_SQLWKLD_ATTRIBUTES Procedure on page 17-69	Updates a workload object	SQL Access Advisor only

Table 17-1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
UPDATE_SQLWKLD_STATEMENT Procedure on page 17-70	Updates one or more SQL statements in a workload	SQL Access Advisor only
UPDATE_TASK_ATTRIBUTES Procedure on page 17-72	Updates a task's attributes	All Advisors

ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use ADD_STS_REF instead of ADD_SQLWKLD_REF for all SQL Tuning Set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
  task_name          IN VARCHAR2,
  workload_name     IN VARCHAR2,
  is_sts             IN NUMBER :=0);
```

Parameters

Table 17-2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.
is_sts	Indicates the type of workload source. Possible values are: <ul style="list-style-type: none"> ■ 0 - SQL workload object ■ 1 - SQL Tuning Set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/
```

ADD_SQLWKLD_STATEMENT Procedure

This procedure has been deprecated.

This procedure adds a single statement to the specified workload.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  module             IN VARCHAR2,
  action             IN VARCHAR2,
  cpu_time           IN NUMBER := 0,
  elapsed_time       IN NUMBER := 0,
  disk_reads         IN NUMBER := 0,
  buffer_gets        IN NUMBER := 0,
  rows_processed     IN NUMBER := 0,
  optimizer_cost     IN NUMBER := 0,
  executions         IN NUMBER := 1,
  priority           IN NUMBER := 2,
  last_execution_date IN DATE := 'SYSDATE',
  stat_period        IN NUMBER := 0,
  username           IN VARCHAR2,
  sql_text           IN CLOB);
```

Parameters

Table 17-3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.

Table 17-3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
stat_ period	Time interval in seconds from which statement statistics were calculated.
username	The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 17-46 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. `cpu_time`, `elapsed_time`, `disk_reads`, `buffer_gets`, and `optimizer_cost` are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the `order_list` task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter `order_list`. The `order_list` parameter accepts any combination of the keys: `buffer_gets`, `optimizer_cost`, `cpu_time`, `disk_reads`, `elapsed_time`, `executions`, and `priority`. A typical setting of `priority`, `optimizer_cost` would indicate the SQL Access Advisor will sort the workload data by `priority` and `optimizer_cost` and process the highest cost statements first. Any statements added to the workload would need to include appropriate `priority` and `optimizer_cost` values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the `order_list` task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
END;
/
```

ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Tuning Set. The link allows an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Tuning Set is made, the STS is protected from removal or modification.

Users should use ADD_STS_REF for any STS-based advisor runs. The older method using ADD_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the ADD_STS_REF function accepts a SQL Tuning Set owner name, whereas ADD_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
  task_name  IN VARCHAR2 NOT NULL,
  sts_owner  IN VARCHAR2,
  sts_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17–4 ADD_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL Tuning Set. The value of this parameter may be NULL, in which case the advisor assumes the SQL Tuning Set to be owned by the currently logged-in user.
sts_name	The name of the SQL Tuning Set object to be linked. Once a SQL Tuning Set has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to SQL Tuning Sets. To remove the link to the SQL Tuning Set, use the procedure DBMS_ADVISOR.DELETE_STS_REF.

Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My STS');
```

CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
    task_name      IN  VARCHAR2);
```

Parameters

Table 17–5 CANCEL_TASK Procedure Parameter

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command effective restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL Tuning Set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL Tuning Set.

Parameters

Table 17-6 COPY_SQLWKLD_TO_STS Procedure Parameter

Parameter	Description
workload_name	The SQL Workload object name to copy.
sts_name	The SQL Tuning Set name into which the SQL Workload object will be copied.
import_mode	Specifies the handling of the target SQL Tuning Set. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Causes SQL Workload data to be appended to the target SQL Tuning Set. ▪ NEW Indicates the SQL Tuning Set can only contain the copied contents. If the SQL Tuning Set exists and has data, an error will be reported. ▪ REPLACE Causes any existing data in the target SQL Tuning Set to be purged prior to the workload copy. In all cases, if the specified SQL Tuning Set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL Tuning Set.

Examples

```
BEGIN
  DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
    buffer      IN  CLOB,
    location    IN  VARCHAR2,
    filename    IN  VARCHAR2);
```

Parameters

Table 17-7 CREATE_FILE Procedure Parameters

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100,400,5041,103,640445,680000,2,
                                         1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                         FROM sh.sales');

    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
                             'MY_DIR','script.sql');

END;
/
```

CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
  task_name          IN VARCHAR2,
  object_type        IN VARCHAR2,
  attr1              IN VARCHAR2 := NULL,
  attr2              IN VARCHAR2 := NULL,
  attr3              IN VARCHAR2 := NULL,
  attr4              IN CLOB      := NULL,
  object_id          OUT NUMBER);
```

```
DBMS_ADVISOR.CREATE_OBJECT (
  task_name          IN VARCHAR2,
  object_type        IN VARCHAR2,
  attr1              IN VARCHAR2 := NULL,
  attr2              IN VARCHAR2 := NULL,
  attr3              IN VARCHAR2 := NULL,
  attr4              IN CLOB      := NULL,
  attr5              IN VARCHAR2 := NULL,
  object_id          OUT NUMBER);
```

Parameters

Table 17–8 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or

LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                               'SELECT * FROM SH.SALES', obj_id);

END;
/
```

CREATE_SQLWKLD Procedure

This procedure has been deprecated.

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
    workload_name          IN OUT VARCHAR2,
    description            IN VARCHAR2 := NULL,
    template               IN VARCHAR2 := NULL,
    is_template            IN VARCHAR2 := 'FALSE');
```

Parameters

Table 17-9 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
description	Specifies an optional workload description. Descriptions can be up to 256 characters.
template	An optional SQL Workload name of an existing workload data object or data object template.
is_template	An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

Once a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_id           OUT NUMBER,
  task_name         IN OUT VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.CREATE_TASK (
  advisor_name      IN VARCHAR2,
  task_name         IN VARCHAR2,
  task_desc         IN VARCHAR2 := NULL,
  template          IN VARCHAR2 := NULL,
  is_template       IN VARCHAR2 := 'FALSE',
  how_created       IN VARCHAR2 := NULL);
```

Parameters

Table 17–10 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`
Parameters are preset to favor an OLTP application environment.
- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`
Parameters are preset to favor a data warehouse application environment.
- `DBMS_ADVISOR.SQLACCESS_GENERAL`
Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

DELETE_SQLWKLD Procedure

This procedure has been deprecated.

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name      IN VARCHAR2);
```

Parameters

Table 17–11 *DELETE_SQLWKLD Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "[RESET_TASK Procedure](#)" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

DELETE_SQLWKLD_REF Procedure

This procedure has been deprecated.

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Users should use DELETE_STS_REF instead of DELETE_SQLWKLD_REF for all SQL Tuning Set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
  task_name          IN VARCHAR2,
  workload_name      IN VARCHAR2,
  is_sts             IN NUMBER :=0);
```

Parameters

Table 17–12 DELETE_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.
is_sts	Indicates the type of workload source. Possible values are: <ul style="list-style-type: none"> ■ 0 - SQL workload object ■ 1 - SQL Tuning Set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

DELETE_SQLWKLD_STATEMENT Procedures

This procedure has been deprecated.

This procedure deletes one or more statements from a workload.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  sql_id             IN NUMBER);
```

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
  workload_name      IN VARCHAR2,
  search             IN VARCHAR2,
  deleted            OUT NUMBER);
```

Parameters

Table 17–13 *DELETE_SQLWKLD_STATEMENT Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>ADVISOR_ALL</code> .
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "[RESET_TASK Procedure](#)" on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL Tuning Set object.

Users should use DELETE_STS_REF for any STS-based advisor runs. The older method using DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas DELETE_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.DELETE_STS_REF (
  task_name  IN VARCHAR2 NOT NULL,
  sts_owner  IN VARCHAR2,
  sts_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17-14 DELETE_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL Tuning Set. The value of this parameter may be NULL, in which case the advisor assumes the SQL Tuning Set to be owned by the currently logged-in user.
sts_name	The name of the SQL Tuning Set to be unlinked. The wildcard % is supported as a STS_NAME. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL Tuning Set objects, use the wildcard % as the STS_NAME.

Examples

```
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My STS');
```

DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 17–15 *DELETE_TASK Procedure Parameters*

Parameter	Description
task_name	<p>A single Advisor task name that will be deleted from the repository.</p> <p>The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME.</p> <p>If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.</p>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
    task_name          IN VARCHAR2,
    execution_type     IN VARCHAR2          := NULL,
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL,
    RETURN VARCHAR2;
```

Parameters

Table 17–16 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
execution_type	The type of action to be performed by the function. If NULL, it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. As an example, the SQL Performance Analyzer accepts the following possible values: <ul style="list-style-type: none"> EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an <code>EXPLAIN PLAN</code> command. The resulting plans will be stored in the advisor framework in association with the task. TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework. ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.
execution_params	A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following: <code>DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'foo')</code>
execution_desc	A 256-length string describing the execution.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name     IN VARCHAR2,
  value             OUT VARCHAR2,
  owner_name        IN VARCHAR2 := NULL);
```

Parameters

Table 17–17 GET_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
```

GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (
  task_name      IN VARCHAR2,
  type           IN VARCHAR2 := 'TEXT',
  level         IN VARCHAR2 := 'TYPICAL',
  section       IN VARCHAR2 := 'ALL',
  owner_name    IN VARCHAR2 := NULL,
  execution_name IN VARCHAR2 := NULL,
  object_id     IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17–18 *GET_TASK_REPORT Function Parameters*

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the buffer receiving the script.

GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
    task_name          IN VARCHAR2
    type               IN VARCHAR2 := 'IMPLEMENTATION',
    rec_id             IN NUMBER   := NULL,
    act_id             IN NUMBER   := NULL,
    owner_name        IN VARCHAR2 := NULL,
    execution_name     IN VARCHAR2 := NULL,
    object_id         IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17–19 GET_TASK_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	An optional task owner name.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
    task_id NUMBER;
```

```
task_name VARCHAR2(30);
workload_name VARCHAR2(30);
buf CLOB;
BEGIN
task_name := 'My Task';
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                   100,400,5041,103,640445,680000,2,
                                   1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                   FROM sh.sales');
DBMS_ADVISOR.EXECUTE_TASK(task_name);
buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (  
    task_name          IN VARCHAR2,  
    rec_id             IN NUMBER := NULL,  
    exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 17-20 *IMPLEMENT_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

IMPORT_SQLWKLD_SCHEMA Procedure

This procedure has been deprecated.

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority            IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 17–21 *IMPORT_SQLWKLD_SCHEMA Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
    failed);
END;
/
```

IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure has been deprecated.

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority            IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 17-22 *IMPORT_SQLWKLD_SQLCACHE Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
saved_rows	Returns the number of rows saved as output parameters.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
```

```
failed NUMBER;
BEGIN
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
failed);
END;
/
```

IMPORT_SQLWKLD_STS Procedure

This procedure has been deprecated.

This procedure loads a SQL workload from an existing SQL Tuning Set. A SQL Tuning Set is typically created from the server workload repository using various time and data filters.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
  workload_name      IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
  workload_name      IN VARCHAR2,
  sts_owner          IN VARCHAR2,
  sts_name           IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 17-23 *IMPORT_SQLWKLD_STS Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sts_owner	The optional owner of the SQL Tuning Set.
sts_name	The name of an existing SQL Tuning Set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
        saved, failed);
END;
/
```

IMPORT_SQLWKLD_SUMADV Procedure

This procedure has been deprecated.

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  priority           IN NUMBER := 2,
  sumadv_id          IN NUMBER,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 17–24 *IMPORT_SQLWKLD_SUMADV Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
sumadv_id	Specifies the Summary Advisor workload identifier number.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
    sumadv_id NUMBER;
BEGIN
    workload_name := 'My Workload';
    sumadv_id := 394;

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
        saved, failed);
END;
/
```

IMPORT_SQLWKLD_USER Procedure

This procedure has been deprecated.

This procedure collects a SQL workload from a specified user table.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
  workload_name      IN VARCHAR2,
  import_mode        IN VARCHAR2 := 'NEW',
  owner_name         IN VARCHAR2,
  table_name         IN VARCHAR2,
  saved_rows         OUT NUMBER,
  failed_rows        OUT NUMBER);
```

Parameters

Table 17–25 *IMPORT_SQLWKLD_USER Procedure Parameters*

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: <ul style="list-style-type: none"> ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
owner_name	Specifies the owner name of the table or view from which workload data will be collected.
table_name	Specifies the name of the table or view from which workload data will be collected.
saved_rows	Returns the number of rows actually saved in the workload object.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
```

```
saved NUMBER;
failed NUMBER;
BEGIN
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
'USER_WORKLOAD', saved, failed);
END;
/
```

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
    task_name          IN VARCHAR2);
```

Parameters

Table 17–26 *INTERRUPT_TASK Procedure Parameters*

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
    DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
  task_name      IN VARCHAR2
  id             IN NUMBER,
  action        IN VARCHAR2);
```

Parameters

Table 17–27 MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: <ul style="list-style-type: none"> ▪ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. ▪ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. ▪ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
```

/

QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
    advisor_name      IN VARCHAR2,
    task_name         IN VARCHAR2,
    attr1             IN CLOB,
    attr2             IN VARCHAR2 := NULL,
    attr3             IN NUMBER := NULL,
    task_or_template  IN VARCHAR2 := NULL);
```

Parameters

Table 17–28 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of `SQLACCESS_GENERAL`. The workload will only contain the specified statement, and all task parameters will be defaulted.

`attr1` must be the single SQL statement to tune. For the SQL Access Advisor, `attr2` is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
        'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

RESET_SQLWKLD Procedure

This procedure has been deprecated.

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
    workload_name          IN VARCHAR2);
```

Parameters

Table 17–29 RESET_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                        100,400,5041,103,640445,680000,2,
                                        1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                        FROM sh.sales WHERE promo_id = 10');

    DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to `INITIAL`.

Syntax

```
DBMS_ADVISOR.RESET_TASK (  
    task_name          IN VARCHAR2);
```

Parameters

Table 17–30 *RESET_TASK Procedure Parameters*

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

Examples

```
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
    DBMS_ADVISOR.EXECUTE_TASK(task_name);  
    DBMS_ADVISOR.RESET_TASK(task_name);  
END;  
/
```

SET_DEFAULT_SQLWKLD_PARAMETER Procedures

This procedure has been deprecated.

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

Parameters

Table 17–31 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
  advisor_name      IN VARCHAR2
  parameter         IN VARCHAR2,
  value            IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
  advisor_name      IN VARCHAR2
  parameter         IN VARCHAR2,
  value            IN NUMBER);
```

Parameters

Table 17–32 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (DBMS_ADVISOR.SQLACCESS_ADVISOR,
    'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_SQLWKLD_PARAMETER Procedures

This procedure has been deprecated.

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
  workload_name      IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
  workload_name      IN VARCHAR2,
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

Parameters

Table 17–33 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
  task_name          IN VARCHAR2
  parameter          IN VARCHAR2,
  value              IN VARCHAR2);
```

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
  task_name          IN VARCHAR2
  parameter          IN VARCHAR2,
  value              IN NUMBER);
```

Parameters

Table 17–34 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is <code>DEFAULT</code> , the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See "[RESET_TASK Procedure](#)" on page 17-46 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

[Table 17–35](#) lists SQL Access Advisor task parameters.

Table 17–35 SQL Access Advisor Task Parameters

Parameter	Description
ANALYSIS_ SCOPE	<p>A comma-separated list that specifies the tuning artifacts to consider during analysis.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION. ▪ EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone. ▪ INDEX Allows the SQL Access Advisor to recommend index structure changes. ▪ MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes. ▪ PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options. ▪ TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning. <p>Using the new keywords, the following combinations are valid:</p> <ul style="list-style-type: none"> ▪ INDEX ▪ MVIEW ▪ INDEX, PARTITION ▪ INDEX, MVIEW, PARTITION ▪ INDEX, TABLE, PARTITION ▪ MVIEW, PARTITION ▪ MVIEW, TABLE, PARTITION ▪ INDEX, MVIEW, TABLE, PARTITION ▪ TABLE, PARTITION ▪ EVALUATION <p>The default value is INDEX. The datatype is STRINGLIST.</p>
CREATION_COST	<p>When set to <code>true</code> (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to <code>false</code>, the cost of creation is ignored. The datatype is STRING.</p>
DAYS_TO_ EXPIRE	<p>Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation.</p> <p>Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The datatype is NUMBER.</p> <p>Once the task expires, it becomes a candidate for removal by an automatic purge operation.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ an integer in the range of 0 to 2147483647 ▪ ADVISOR_UNLIMITED ▪ ADVISOR_UNUSED <p>The default value is 30.</p>
DEF_EM_ TEMPLATE	<p>Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values.</p> <p>The default value is SQLACCESS_EMTASK. The datatype is STRING.</p>
DEF_INDEX_ OWNER	<p>Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ Existing schema name. Quoted identifiers are supported. ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
DEF_INDEX_TABLESPACE	<p>Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Existing tablespace name. Quoted identifiers are supported. ADVISOR_UNUSED No tablespace clause will be present in the script for indexes. <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>
DEF_MVIEW_OWNER	<p>Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Existing schema name. Quoted identifiers are supported. ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>
DEF_MVIEW_TABLESPACE	<p>Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Existing tablespace name. Quoted identifiers are supported. ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>
DEF_MVLOG_TABLESPACE	<p>Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Existing tablespace name. Quoted identifiers are supported. ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>
DEF_PARTITION_TABLESPACE	<p>Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Existing tablespace name. Quoted identifiers are supported. ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views. <p>The default value is ADVISOR_UNUSED. The datatype is STRING.</p>
DML_VOLATILITY	<p>When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, it may favor a Btree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is STRING.</p> <p>See the related parameter <code>refresh_mode</code>.</p>
END_TIME	<p>Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> DD is the numeric date MM is the numeric month YYYY is the numeric year HH is the hour in 24 hour format MI is the minute SS is the second <p>The datatype is STRING.</p>

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
EVALUATION_ONLY	<p>This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter.</p> <p>If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ FALSE ▪ TRUE <p>The default value is FALSE. The datatype is STRING.</p>
EXECUTION_TYPE	<p>This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter.</p> <p>The translated values are:</p> <ul style="list-style-type: none"> ▪ FULL => FULL ▪ INDEX_ONLY => INDEX ▪ MVIEW_ONLY => MVIEW ▪ MVIEW_LOG_ONLY => MVIEW_LOG_ONLY <p>The type of recommendations that is desired. Possible values:</p> <ul style="list-style-type: none"> ▪ FULL All supported recommendation types will be considered. ▪ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. ▪ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. ▪ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. <p>The default value is FULL. The datatype is STRINGLIST.</p>
IMPLEMENT_EXIT_ON_ERROR	<p>When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ TRUE ▪ FALSE <p>The default value is TRUE. The datatype is STRING.</p>
INDEX_NAME_TEMPLATE	<p>Specifies the method by which new index names are formed.</p> <p>If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. Once formatted, the maximum size of a name is 30 characters.</p> <p>Valid keywords are:</p> <ul style="list-style-type: none"> ▪ Any literal value up to 22 characters. ▪ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. ▪ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. ▪ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. <p>The default template is <TABLE>_IDX\$\$<TASK_ID><SEQ>. The datatype is STRING.</p>
INVALID_ACTION_LIST	<p>Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
INVALID_ MODULE_LIST	<p>Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single application ▪ comma-delimited module list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
INVALID_ SQLSTRING_ LIST	<p>Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single string ▪ comma-delimited string list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
INVALID_ USERNAME_LIST	<p>Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
JOURNALING	<p>Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ▪ UNUSED: no journal messages ▪ FATAL: explanation of fatal conditions ▪ ERROR: explanation of errors ▪ WARNING: explanation of warnings ▪ INFORMATION: information message ▪ INFORMATION2: common information ▪ INFORMATION3: common information ▪ INFORMATION4: common information ▪ INFORMATION5: common information ▪ INFORMATION6: common information <p>Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository.</p> <p>INFORMATION6 represents the most thorough message recording and UNUSED is the least.</p> <p>The default value is INFORMATION. The datatype is NUMBER.</p>

Table 17-35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
LIMITED_PARTITION_SCHEMES	<p>User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ An integer in the range of 1 to 10 ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is NUMBER.</p>
MAX_NUMBER_PARTITIONS	<p>Limits the number of partitions the advisor will recommend for any base table, index, or materialized view.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ An integer in the range of 1 to 4294967295 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED <p>The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.</p>
MODE	<p>Specifies the mode by which Access Advisor will operate during an analysis.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> ■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. ■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. <p>The default value is COMPREHENSIVE. The datatype is STRING.</p>
MVIEW_NAME_TEMPLATE	<p>Specifies the method by which new materialized view names are formed.</p> <p>If the <i>TASK_ID</i> is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the <i>TASK_ID</i> in the template.</p> <p>The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> ■ Any literal value up to 22 characters. ■ <i>TASK_ID</i> Causes the current task identifier number to be inserted in hexadecimal form. ■ <i>SEQ</i> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. <p>The default template is: <code>MV\$\$\$_<TASK_ID><SEQ></code>. The datatype is STRING.</p>
ORDER_LIST	<p>This parameter has been deprecated.</p> <p>Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using <i>ORDER_LIST</i> values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's CPU time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's execution frequency value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ I/O Sets the order using the SQL statement's I/O count value. ■ PRIORITY Sets the order using the user-supplied business priority value. <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.</p>

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
PARTITION_ NAME_TEMPLATE	<p>Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters.</p> <p>Valid tokens are:</p> <ul style="list-style-type: none"> ■ Any literal value up to 22 characters. ■ <TABLE> Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit. ■ <TASK_ID> Causes the current task identifier number to be inserted in hexadecimal form. ■ <SEQ> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. <p>The default template is PTN\$\$<TABLE>_<TASK_ID><SEQ>. The datatype is <i>STRING</i>.</p>
PARTITIONING_ GOAL	<p>Specifies the approach used to make partitioning recommendations. One possible value is <i>PERFORMANCE</i>, which is the default. The datatype is <i>STRING</i>.</p>
PARTITIONING_ TYPES	<p>Specifies the type of partitioning used. Possible values are <i>RANGE</i> and <i>HASH</i>. The datatype is <i>STRING</i>.</p>
RANKING_ MEASURE	<p>Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using <i>RANKING_MEASURE</i> values. A comma must separate multiple order keys.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ <i>BUFFER_GETS</i> Sets the order using the SQL statement's buffer-get count value. ■ <i>CPU_TIME</i> Sets the order using the SQL statement's cpu time value. ■ <i>DISK_READS</i> Sets the order using the SQL statement's disk-read count value. ■ <i>ELAPSED_TIME</i> Sets the order using the SQL statement's elapsed time value. ■ <i>EXECUTIONS</i> Sets the order using the SQL statement's elapsed time value. ■ <i>OPTIMIZER_COST</i> Sets the order using the SQL statement's optimizer cost value. ■ <i>PRIORITY</i> Sets the order using the user-supplied business priority value. <p>All values are accessed in descending order, where a high value is considered more interesting than a low value.</p> <p>The default value is <i>PRIORITY, OPTIMIZER_COST</i>. The datatype is <i>STRINGLIST</i>.</p>
RECOMMEND_MV_ EXACT_TEXT_ MATCH	<p>When considering candidate materialized views, exact text match solutions will only be included if this parameter contains <i>TRUE</i>.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ■ <i>TRUE</i> ■ <i>FALSE</i> <p>The default value is <i>TRUE</i>. The datatype is <i>STRING</i>.</p>
RECOMMENDED_ TABLESPACES	<p>Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ <i>TRUE</i> ■ <i>FALSE</i> (the default) <p>The datatype is <i>STRING</i>.</p>
REFRESH_MODE	<p>Specifies whether materialized views are refreshed <i>ON_DEMAND</i> or <i>ON_COMMIT</i>. This will be used to weigh the impact of materialized view refresh when the parameter <i>dml_volatility</i> is set to <i>TRUE</i>.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> ■ <i>ON_DEMAND</i> ■ <i>ON_COMMIT</i> <p>The default value is <i>ON_DEMAND</i>. The datatype is <i>STRING</i>.</p>
REPORT_DATE_ FORMAT	<p>This is the default date and time formatting template. The default format is <i>DD/MM/YYYYHH24:MI</i>. The datatype is <i>STRING</i>.</p>

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
SHOW_RETAINS	<p>Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ TRUE ▪ FALSE <p>The default value is TRUE. The datatype is STRING.</p>
SQL_LIMIT	<p>Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements.</p> <p>When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ an integer in the range of 1 to 2147483647 ▪ ADVISOR_UNLIMITED ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is NUMBER.</p>
START_TIME	<p>Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed.</p> <p>Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where:</p> <ul style="list-style-type: none"> ▪ DD is the numeric date ▪ MM is the numeric month ▪ YYYY is the numeric year ▪ HH is the hour in 24 hour format ▪ MI is the minute ▪ SS is the second <p>The datatype is STRING.</p>
STORAGE_CHANGE	<p>Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL.</p> <p>When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand.</p> <p>Possible values:</p> <ul style="list-style-type: none"> ▪ Any valid integer including negative values, zero and positive values. <p>The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.</p>
TIME_LIMIT	<p>Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time.</p> <p>Possible values:</p> <ul style="list-style-type: none"> ▪ An integer in the range of 1 to 10,000 ▪ ADVISOR_UNLIMITED <p>The default value is 720 (12 hours). The datatype is NUMBER.</p> <p>Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.</p>

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_ACTION_LIST	<p>Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single action ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
VALID_MODULE_LIST	<p>Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single application ▪ comma-delimited module list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
VALID_SQLSTRING_LIST	<p>Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</p> <p>During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single string ▪ comma-delimited string list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_TABLE_LIST	<p>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters.</p> <p>When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid.</p> <p>The valid syntax for a table reference is:</p> <ul style="list-style-type: none"> ▪ schema . table ▪ schema ▪ schema . % (equivalent to schema) ▪ comma-delimited action list ▪ ADVISOR_UNUSED <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single table reference ▪ comma-delimited reference list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is TABLELIST.</p>
VALID_USERNAME_LIST	<p>Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</p> <p>During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted.</p> <p>The possible values are:</p> <ul style="list-style-type: none"> ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED <p>The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.</p>
WORKLOAD_SCOPE	<p>Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL.</p> <p>FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables.</p> <p>PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.</p> <p>The datatype is STRING.</p>

Segment Advisor Parameters

Table 17–36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 17–36 Segment Advisor Task Parameters

Parameter	Description
MODE	<p>The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are:</p> <ul style="list-style-type: none"> ▪ LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository ▪ COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics
TIME_LIST	<p>The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.</p>

Table 17–36 (Cont.) Segment Advisor Task Parameters

Parameter	Description
RECOMMEND_ALL	Whether to generate recommendations for all segments. The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.

Examples

```

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
    'SH.%, SCOTT.EMP');
END;
/

```

Undo Advisor Task Parameters

Table 17–37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 17–37 Undo Advisor Task Parameters

Parameter	Description
TARGET_OBJECTS	The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.
END_TIME_SEC	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.

Examples

```

DECLARE
  tname VARCHAR2(30);
  oid NUMBER;
BEGIN
  DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
  DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);

```

```

DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 17–38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure. See *Oracle Database Performance Tuning Guide* for more information on using these parameters.

Table 17–38 ADDM Task Parameters

Parameter	Description
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
DB_ID	The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.
INSTANCE	The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.
INSTANCES	If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed.
DBIO_EXPECTED	The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or a RAC database.

```

DECLARE
  tid      NUMBER;
  tname   VARCHAR2(30) := 'ADDM_TEST';
BEGIN
  DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

```

- [DBMS_ADDM](#) for details on how to create and execute ADDM tasks

SQL Tuning Advisor Task Parameters

See the [DBMS_SQLTUNE](#) package on page 124-1 and *Oracle Database Performance Tuning Guide* for more information.

TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
  task_name IN OUT VARCHAR2,
  mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 17–39 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

See Also: *Oracle Database Performance Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

Table 17–40 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: <ul style="list-style-type: none"> ■ CREATE MATERIALIZED VIEW LOG ■ ALTER MATERIALIZED VIEW LOG FORCE ■ [CREATE DROP] MATERIALIZED VIEW

Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS '/myscript_dir' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_
task'), -
'/homes/tune', 'my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.

UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
  task_name      IN VARCHAR2
  object_id      IN NUMBER,
  attr1         IN VARCHAR2 := NULL,
  attr2         IN VARCHAR2 := NULL,
  attr3         IN VARCHAR2 := NULL,
  attr4         IN CLOB := NULL,
  attr5         IN VARCHAR2 := NULL);
```

Parameters

Table 17–41 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
```

```
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name, 'SQL', NULL, NULL, NULL,
                              'SELECT * FROM SH.SALES', obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id, NULL, NULL, NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
  task_name          IN VARCHAR2
  rec_id             IN NUMBER,
  action_id          IN NUMBER,
  attribute_name     IN VARCHAR2,
  value              IN VARCHAR2);
```

Parameters

Table 17-42 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Name of the attribute to be changed. The valid values are: <ul style="list-style-type: none"> ▪ owner The new owner of the object. ▪ name The new name of the object. ▪ tablespace The new tablespace for the object.
value	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
    100,400,5041,103,640445,680000,2,
    1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
    FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  attribute := 'SH';
```

```
    DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);  
END;  
/
```

UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure has been deprecated.

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
  workload_name      IN VARCHAR2,
  new_name           IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  read_only          IN VARCHAR2 := NULL,
  is_template        IN VARCHAR2 := NULL,
  how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 17-43 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

UPDATE_SQLWKLD_STATEMENT Procedure

This procedure has been deprecated.

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name    IN VARCHAR2,
    sql_id           IN NUMBER,
    application      IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL,
    priority         IN NUMBER := NULL,
    username        IN VARCHAR2 := NULL);
```

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name    IN VARCHAR2,
    search           IN VARCHAR2,
    updated          OUT NUMBER,
    application      IN VARCHAR2 := NULL,
    action          IN VARCHAR2 := NULL,
    priority         IN NUMBER := NULL,
    username        IN VARCHAR2 := NULL);
```

Parameters

Table 17–44 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant <code>DBMS_ADVISOR.ADVISOR_ALL</code> .
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is <code>NULL</code> or contains the value <code>ADVISOR_UNUSED</code> , then the column will not be updated in the repository. Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user <code>SCOTT</code> is the executing user, then you must provide the user identifier <code>SCOTT</code> in all uppercase letters. It will not recognize the user <code>scott</code> as a match for <code>SCOTT</code> .
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See ["RESET_TASK Procedure"](#) on page 17-46 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
  WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
  task_name          IN VARCHAR2
  new_name           IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  read_only          IN VARCHAR2 := NULL,
  is_template        IN VARCHAR2 := NULL,
  how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 17–45 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name, 'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name', NULL, 'New description');
END;
/
```

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- [Using DBMS_ALERT](#)
 - Overview
 - Security Model
 - Constants
 - Restrictions
 - Exceptions
 - Operational Notes
 - Examples
- [Summary of DBMS_ALERT Subprograms](#)

Using DBMS_ALERT

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

Constants

The DBMS_ALERT package uses the constants shown in [Table 18-1](#):

Table 18-1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. [Table 18-2](#) shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

See Also: [Chapter 88, "DBMS_PIPE"](#)

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
 - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
 - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 18-2 *DBMS_ALERT Error Messages*

Error Message	Procedure
ORU-10001 lock request error, status: N	SIGNAL
ORU-10015 error: N waiting for pipe status	WAITANY
ORU-10016 error: N sending on pipe 'X'	SIGNAL
ORU-10017 error: N receiving on pipe 'X'	SIGNAL
ORU-10019 error: N on lock request	WAIT
ORU-10020 error: N on lock request	WAITANY

Table 18-2 (Cont.) DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
<<readagain>>:
/* ... read the emp table and graph it */
DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
if status = 0 then goto <<readagain>>; else
/* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
BEGIN
    DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

Summary of DBMS_ALERT Subprograms

Table 18-3 *DBMS_ALERT Package Subprograms*

Subprogram	Description
REGISTER Procedure on page 18-12	Receives messages from an alert
REMOVE Procedure on page 18-13	Disables notification from an alert
REMOVEALL Procedure on page 18-14	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure on page 18-15	Sets the polling interval
SIGNAL Procedure on page 18-16	Signals an alert (send message to registered sessions)
WAITANY Procedure on page 18-17	Waits <code>timeout</code> seconds to receive alert message from an alert registered for session
WAITONE Procedure on page 18-18	Waits <code>timeout</code> seconds to receive message from named alert

REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (  
    name IN VARCHAR2);
```

Parameters

Table 18–4 REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested.

Caution: Alert names beginning with 'ORA\$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (  
    name IN VARCHAR2);
```

Parameters

Table 18–5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (  
    sensitivity IN NUMBER);
```

Parameters

Table 18–6 SET_DEFAULTS Procedure Parameters

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
    name      IN  VARCHAR2,
    message   IN  VARCHAR2);
```

Parameters

Table 18–7 *SIGNAL Procedure Parameters*

Parameter	Description
name	Name of the alert to signal.
message	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
  name      OUT  VARCHAR2,
  message   OUT  VARCHAR2,
  status    OUT  INTEGER,
  timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 18–8 *WAITANY Procedure Parameters*

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert. This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITANY</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If no alert occurs before <code>timeout</code> seconds, this returns a status of 1.

Usage Notes

An implicit `COMMIT` is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

Exceptions

-20000, ORU-10024: there are no alerts registered.

WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit `COMMIT` is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
    name      IN   VARCHAR2,
    message   OUT  VARCHAR2,
    status    OUT  INTEGER,
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 18–9 WAITONE Procedure Parameters

Parameter	Description
<code>name</code>	Name of the alert to wait for.
<code>message</code>	Returns the message associated with the alert. This is the message provided by the <code>SIGNAL</code> call. If multiple signals on this alert occurred before <code>WAITONE</code> , the message corresponds to the most recent <code>SIGNAL</code> call. Messages from prior <code>SIGNAL</code> calls are discarded.
<code>status</code>	Values returned: 0 - alert occurred 1 - timeout occurred
<code>timeout</code>	Maximum time to wait for an alert. If the named alert does not occurs before <code>timeout</code> seconds, this returns a status of 1.

DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- [Using DBMS_APPLICATION_INFO](#)
 - Overview
 - Security Model
 - Operational Notes
- [Summary of DBMS_APPLICATION_INFO Subprograms](#)

Using DBMS_APPLICATION_INFO

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V\$SESSION and V\$SQLAREA views.

Security Model

Note: The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The `DBMSAPIN.SQL` script is already run as a part of standard database creation .

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the *SYS* version of the package. The public synonym for *DBMS_APPLICATION_INFO* can then be changed to point to the *DBA*'s version of the package.

Summary of DBMS_APPLICATION_INFO Subprograms

Table 19–1 *DBMS_APPLICATION_INFO Package Subprograms*

Subprogram	Description
READ_CLIENT_INFO Procedure on page 19-7	Reads the value of the <code>client_info</code> field of the current session
READ_MODULE Procedure on page 19-8	Reads the values of the module and action fields of the current session
SET_ACTION Procedure on page 19-9	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure on page 19-10	Sets the <code>client_info</code> field of the session
SET_MODULE Procedure on page 19-11	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure on page 19-12	Sets a row in the <code>V\$SESSION_LONGOPS</code> table

READ_CLIENT_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (  
    client_info OUT VARCHAR2);
```

Parameters

Table 19–2 *READ_CLIENT_INFO Procedure Parameters*

Parameter	Description
<code>client_info</code>	Last client information value supplied to the <code>SET_CLIENT_INFO</code> procedure.

READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
    module_name OUT VARCHAR2,
    action_name OUT VARCHAR2);
```

Parameters

Table 19-3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V\$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V\$SESSION view, or by calling the [READ_CLIENT_INFO Procedure](#).

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V\$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
-----
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
    action_name IN VARCHAR2);
```

Parameters

Table 19–4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
        WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
        WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (  
    client_info IN VARCHAR2);
```

Parameters

Table 19–5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
client_info	Supplies any additional information about the client application. This information is stored in the V\$SESSION view. Information exceeding 64 bytes is truncated.

Note: CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
  module_name IN VARCHAR2,
  action_name IN VARCHAR2);
```

Parameters

Table 19–6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
  VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
    commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

SET_SESSION_LONGOPS Procedure

This procedure sets a row in the `V$SESSION_LONGOPS` view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
  rindex      IN OUT BINARY_INTEGER,
  slno        IN OUT BINARY_INTEGER,
  op_name     IN      VARCHAR2      DEFAULT NULL,
  target      IN      BINARY_INTEGER DEFAULT 0,
  context     IN      BINARY_INTEGER DEFAULT 0,
  sofar       IN      NUMBER         DEFAULT 0,
  totalwork   IN      NUMBER         DEFAULT 0,
  target_desc IN      VARCHAR2      DEFAULT 'unknown target',
  units       IN      VARCHAR2      DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 19–7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
<code>rindex</code>	A token which represents the <code>v\$session_longops</code> row to update. Set this to <code>set_session_longops_nohint</code> to start a new row. Use the returned value from the prior call to reuse a row.
<code>slno</code>	Saves information across calls to <code>set_session_longops</code> : It is for internal use and should not be modified by the caller.
<code>op_name</code>	Specifies the name of the long running task. It appears as the <code>OPNAME</code> column of <code>v\$session_longops</code> . The maximum length is 64 bytes.
<code>target</code>	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the <code>TARGET</code> column of <code>v\$session_longops</code> .
<code>context</code>	Any number the client wants to store. It appears in the <code>CONTEXT</code> column of <code>v\$session_longops</code> .
<code>sofar</code>	Any number the client wants to store. It appears in the <code>SOFAR</code> column of <code>v\$session_longops</code> . This is typically the amount of work which has been done so far.
<code>totalwork</code>	Any number the client wants to store. It appears in the <code>TOTALWORK</code> column of <code>v\$session_longops</code> . This is typically an estimate of the total amount of work needed to be done in this long running operation.

Table 19–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the <code>target</code> parameter. This value appears in the <code>TARGET_DESC</code> field of <code>v\$session_longops</code> . The maximum length is 32 bytes.
units	Specifies the units in which <code>sofar</code> and <code>totalwork</code> are being represented. It appears as the <code>UNITS</code> field of <code>v\$session_longops</code> . The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates `V$SESSION_LONGOPS` on the procedure's progress.

```

DECLARE
    rindex    BINARY_INTEGER;
    slno      BINARY_INTEGER;
    totalwork number;
    sofar     number;
    obj       BINARY_INTEGER;

BEGIN
    rindex := dbms_application_info.set_session_longops_nohint;
    sofar := 0;
    totalwork := 10;

    WHILE sofar < 10 LOOP
        -- update obj based on sofar
        -- perform task on object target

        sofar := sofar + 1;
        dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
    END LOOP;
END;
```

DBMS_APPLY_ADM

The DBMS_APPLY_ADM package, one of a set of Oracle Streams packages, provides subprograms to start, stop, and configure an apply process. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes

This chapter contains the following topic:

- [Summary of DBMS_APPLY_ADM Subprograms](#)

Summary of DBMS_APPLY_ADM Subprograms

Table 20–1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ALTER_APPLY Procedure on page 20-4	Alters an apply process
COMPARE_OLD_VALUES Procedure on page 20-9	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure on page 20-11	Creates an apply process
CREATE_OBJECT_DEPENDENCY Procedure on page 20-18	Creates an object dependency
DELETE_ALL_ERRORS Procedure on page 20-19	Deletes all the error transactions for the specified apply process
DELETE_ERROR Procedure on page 20-20	Deletes the specified error transaction
DROP_APPLY Procedure on page 20-21	Drops an apply process
DROP_OBJECT_DEPENDENCY Procedure on page 20-22	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure on page 20-23	Reexecutes the error transactions for the specified apply process.
EXECUTE_ERROR Procedure on page 20-24	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function on page 20-27	Returns the message payload from the error queue for the specified message number and transaction identifier
SET_DML_HANDLER Procedure on page 20-28	Alters operation options for a specified object with a specified apply process
SET_ENQUEUE_DESTINATION Procedure on page 20-33	Sets the queue where the apply process automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure on page 20-35	Specifies whether a message that satisfies the specified rule is executed by an apply process
SET_GLOBAL_INSTANTIATION_SCN Procedure on page 20-37	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures on page 20-39	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure on page 20-41	Sets an apply parameter to the specified value
SET_SCHEMA_INSTANTIATION_SCN Procedure on page 20-48	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database

Table 20–1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_TABLE_INSTANTIATION_SCN Procedure on page 20-50	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure on page 20-52	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure on page 20-55	Sets or removes a value dependency
START_APPLY Procedure on page 20-56	Directs the apply process to start applying messages
STOP_APPLY Procedure on page 20-57	Stops the apply process from applying any messages and rolls back any unfinished transactions being applied

Note: All procedures commit unless specified otherwise. However, the GET_ERROR_MESSAGE function does not commit.

ALTER_APPLY Procedure

This procedure alters an apply process.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY (
  apply_name          IN  VARCHAR2,
  rule_set_name       IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set    IN  BOOLEAN   DEFAULT FALSE,
  message_handler    IN  VARCHAR2  DEFAULT NULL,
  remove_message_handler IN  BOOLEAN  DEFAULT FALSE,
  ddl_handler        IN  VARCHAR2  DEFAULT NULL,
  remove_ddl_handler IN  BOOLEAN   DEFAULT FALSE,
  apply_user         IN  VARCHAR2  DEFAULT NULL,
  apply_tag          IN  RAW        DEFAULT NULL,
  remove_apply_tag   IN  BOOLEAN   DEFAULT FALSE,
  precommit_handler  IN  VARCHAR2  DEFAULT NULL,
  remove_precommit_handler IN  BOOLEAN  DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–2 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being altered. You must specify an existing apply process name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages.</p> <p>If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</p> <p>If you specify NULL and the <code>remove_rule_set</code> parameter is set to FALSE, then this procedure retains any existing positive rule set. If you specify NULL and the <code>remove_rule_set</code> parameter is set to TRUE, then this procedure removes any existing positive rule set.</p>

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_rule_set	<p>If TRUE, then the procedure removes the positive rule set for the specified apply process. If you remove the positive rule set for an apply process, and the apply process does not have a negative rule set, then the apply process dequeues all messages in its queue.</p> <p>If you remove the positive rule set for an apply process, and a negative rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the negative rule set.</p> <p>If FALSE, then the procedure retains the positive rule set for the specified apply process.</p> <p>If the <code>rule_set_name</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
message_handler	<p>A user-defined procedure that processes non-LCR messages in the queue for the apply process.</p> <p>See "Usage Notes" on page 20-16 in the CREATE_APPLY Procedure for more information about a message handler procedure.</p>
remove_message_handler	<p>If TRUE, then the procedure removes the message handler for the specified apply process.</p> <p>If FALSE, then the procedure retains any message handler for the specified apply process.</p> <p>If the <code>message_handler</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
ddl_handler	<p>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply process.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" on page 20-16 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.</p>
remove_ddl_handler	<p>If TRUE, then the procedure removes the DDL handler for the specified apply process.</p> <p>If FALSE, then the procedure retains any DDL handler for the specified apply process.</p> <p>If the <code>ddl_handler</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	<p>The user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. If NULL, then the apply user is not changed.</p> <p>If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted DBA role. Only the SYS user can set the apply_user to SYS.</p> <p>If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process <p>These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>By default, this parameter is set to the user who created the apply process by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the apply_user for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.</p>
apply_tag	<p>A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter.</p> <p>If NULL, the default, then the apply tag for the apply process is not changed.</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW ('17')</pre> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	<p>If TRUE, then the procedure sets the apply tag for the specified apply process to NULL, and the apply process generates redo entries with NULL tags.</p> <p>If FALSE, then the procedure retains any apply tag for the specified apply process.</p> <p>If the <code>apply_tag</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
precommit_handler	<p>A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. <p>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply process.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" on page 20-16 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.</p>
remove_precommit_handler	<p>If TRUE, then the procedure removes the precommit handler for the specified apply process.</p> <p>If FALSE, then the procedure retains any precommit handler for the specified apply process.</p> <p>If the <code>precommit_handler</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>

Table 20–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages.</p> <p>If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified apply process. If you remove the negative rule set for an apply process, and the apply process does not have a positive rule set, then the apply process dequeues all messages in its queue.</p> <p>If you remove the negative rule set for an apply process, and a positive rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified apply process.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

Usage Notes

An apply process is stopped and restarted automatically when you change the value of one or more of the following `ALTER_APPLY` procedure parameters:

- `message_handler`
- `ddl_handler`
- `apply_user`
- `apply_tag`
- `precommit_handler`

COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES (
  object_name      IN VARCHAR2,
  column_list      IN VARCHAR2,
  operation        IN VARCHAR2 DEFAULT 'UPDATE' ,
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES (
  object_name      IN VARCHAR2,
  column_table     IN DBMS_UTILITY.LNAME_ARRAY,
  operation        IN VARCHAR2 DEFAULT 'UPDATE' ,
  compare          IN BOOLEAN  DEFAULT TRUE,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20-3 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
<code>object_name</code>	The name of the source table specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>column_list</code>	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify <code>*</code> to include all nonkey columns.
<code>column_table</code>	A PL/SQL index-by table of type <code>DBMS_UTILITY.LNAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.
<code>operation</code>	The name of the operation, which can be specified as: <ul style="list-style-type: none"> ■ <code>UPDATE</code> for UPDATE operations ■ <code>DELETE</code> for DELETE operations ■ <code>*</code> for both UPDATE and DELETE operations
<code>compare</code>	If <code>compare</code> is <code>TRUE</code> , the old values of the specified columns are compared during apply. If <code>compare</code> is <code>FALSE</code> , the old values of the specified columns are not compared during apply.

Table 20–3 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

By default, an apply process uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you use a time column for conflict detection, then an apply process does not need to check old values for non-key and nontime columns.

Note: An apply process always compares old values for key columns when they are present in a row LCR. This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

CREATE_APPLY Procedure

This procedure creates an apply process.

Note: The user who invokes this procedure must be granted DBA role.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY (
  queue_name          IN VARCHAR2,
  apply_name          IN VARCHAR2,
  rule_set_name       IN VARCHAR2 DEFAULT NULL,
  message_handler     IN VARCHAR2 DEFAULT NULL,
  ddl_handler         IN VARCHAR2 DEFAULT NULL,
  apply_user          IN VARCHAR2 DEFAULT NULL,
  apply_database_link IN VARCHAR2 DEFAULT NULL,
  apply_tag           IN RAW        DEFAULT '00',
  apply_captured      IN BOOLEAN   DEFAULT FALSE,
  precommit_handler  IN VARCHAR2 DEFAULT NULL,
  negative_rule_set_name IN VARCHAR2 DEFAULT NULL,
  source_database     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20–4 CREATE_APPLY Procedure Parameters

Parameter	Description
queue_name	The name of the queue from which the apply process dequeues messages. You must specify an existing queue in the form [<i>schema_name</i> .] <i>queue_name</i> . For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. Note: The queue_name setting cannot be altered after the apply process is created.
apply_name	The name of the apply process being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply process or messaging client. Note: The apply_name setting cannot be altered after the apply process is created.

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages.</p> <p>If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>job_apply_rules</code>, enter <code>hr.job_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no negative rule set is specified, then the apply process applies either all captured messages or all messages in the persistent queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p>
message_handler	<p>A user-defined procedure that processes non-LCR messages in the queue for the apply process.</p> <p>See "Usage Notes" on page 20-16 for more information about a message handler procedure.</p>
ddl_handler	<p>A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply process.</p> <p>All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the <code>EXECUTE</code> member procedure of a DDL LCR, then a commit is performed automatically.</p> <p>See "Usage Notes" on page 20-16 for more information about a DDL handler procedure.</p>

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_user	<p>The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.</p> <p>Only a user who is granted DBA role can set an apply user. Only the SYS user can set the apply_user to SYS.</p> <p>The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.</p> <p>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</p> <ul style="list-style-type: none"> ▪ The necessary privileges to perform DML and DDL changes on the apply objects ▪ EXECUTE privilege on the rule sets used by the apply process ▪ EXECUTE privilege on all rule-based transformation functions used in the rule set ▪ EXECUTE privilege on all apply handler procedures ▪ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process <p>These privileges must be granted directly to the apply user. They cannot be granted through roles.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the apply_user setting for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.</p>
apply_database_link	<p>The database at which the apply process applies messages. This parameter is used by an apply process when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply process applies messages at the local database.</p> <p>Note: The apply_database_link setting cannot be altered after the apply process is created.</p>

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_tag	<p>A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs.</p> <p>The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter.</p> <p>By default, the tag for an apply process is the hexadecimal equivalent of '00' (double zero).</p> <p>The following is an example of a tag with a hexadecimal value of 17:</p> <pre>HEXTORAW('17')</pre> <p>If NULL, then the apply process generates redo entries with NULL tags.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
apply_captured	<p>Either TRUE or FALSE.</p> <p>If TRUE, then the apply process applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process.</p> <p>If FALSE, then the apply process applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages.</p> <p>To apply both captured LCRs and messages in a persistent queue, you must create at least two apply processes.</p> <p>Note: The apply_captured setting cannot be altered after the apply process is created.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about processing messages with an apply process</p>

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
<code>precommit_handler</code>	<p>A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process.</p> <p>An internal commit directive is enqueued in the following ways:</p> <ul style="list-style-type: none"> When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction. When a user or application enqueues messages and then issues a <code>COMMIT</code> statement, the commit directive is enqueued automatically. <p>For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For message enqueued by a user or application, the commit SCN is generated by the apply process.</p> <p>The precommit handler procedure must conform to the following restrictions:</p> <ul style="list-style-type: none"> Any work that commits must be an autonomous transaction. Any rollback must be to a named savepoint created in the procedure. <p>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</p> <p>See "Usage Notes" on page 20-16 for more information about a precommit handler procedure.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages.</p> <p>If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_apply_rules</code>, enter <code>hr.neg_apply_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the apply process applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the <code>apply_captured</code> parameter.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.</p>

Table 20–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>If NULL, then the source database name of the first LCR received by the apply process is used for the source database.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p> <p>The rules in the apply process rule sets determine which messages are dequeued by the apply process. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.</p>

Usage Notes

The following sections describe usage notes for this procedure:

Handler Procedure Names

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

The user who invokes the `CREATE_APPLY` procedure must have `EXECUTE` privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the `CREATE_APPLY` procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
    parameter_name IN ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a `ANYDATA` encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a `ANYDATA` encapsulation of a DDL LCR.

See Also: [Chapter 228, "Logical Change Record TYPES"](#) for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (  
    parameter_name IN NUMBER);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply process schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply process uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply process does not use column values in the LCRs to detect dependencies.

Note: An error is raised if NULL is specified for either of the procedure parameters.

See Also:

- ["DROP_OBJECT_DEPENDENCY Procedure"](#) on page 20-22
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY (
  object_name          IN  VARCHAR2,
  parent_object_name  IN  VARCHAR2);
```

Parameters

Table 20-5 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
object_name	The name of the child database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
parent_object_name	The name of the parent database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.departments. If the schema is not specified, then the current user is the default.

DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply process.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS (  
    apply_name IN VARCHAR2 DEFAULT NULL);
```

Parameter

Table 20–6 *DELETE_ALL_ERRORS Procedure Parameter*

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are deleted.

DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(  
    local_transaction_id IN VARCHAR2);
```

Parameter

Table 20–7 *DELETE_ERROR Procedure Parameter*

Parameter	Description
local_transaction_id	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

DROP_APPLY Procedure

This procedure drops an apply process.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–8 *DROP_APPLY Procedure Parameters*

Parameter	Description
apply_name	The name of the apply process being dropped. You must specify an existing apply process name. Do not specify an owner.
drop_unused_rule_sets	<p>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.</p> <p>If FALSE, then the procedure does not drop the rule sets used by the specified apply process, and the rule sets retain their rules.</p>

Usage Notes

When you use this procedure to drop an apply process, information about rules created for the apply process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply process. The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
 - An error is raised if NULL is specified for either of the procedure parameters.
-
-

See Also:

- ["CREATE_OBJECT_DEPENDENCY Procedure"](#) on page 20-18
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY (
  object_name          IN  VARCHAR2,
  parent_object_name  IN  VARCHAR2);
```

Parameters

Table 20–9 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
object_name	The name of the child database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
parent_object_name	The name of the parent database object, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.departments. If the schema is not specified, then the current user is the default.

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply process.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

See Also: *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS (
  apply_name      IN  VARCHAR2  DEFAULT NULL,
  execute_as_user IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–10 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are reexecuted.
execute_as_user	If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.

EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

See Also: *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
    local_transaction_id IN VARCHAR2,
    execute_as_user      IN BOOLEAN   DEFAULT FALSE,
    user_procedure       IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–11 EXECUTE_ERROR Procedure Parameters

Parameter	Description
<code>local_transaction_id</code>	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
<code>execute_as_user</code>	<p>If TRUE, then the procedure reexecutes the transaction in the security context of the current user.</p> <p>If FALSE, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The <code>DBA_APPLY_ERROR</code> data dictionary view lists the original receiver for each error transaction.</p> <p>The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.</p>
<code>user_procedure</code>	<p>A user-defined procedure that modifies the error transaction so that it can be successfully executed.</p> <p>Specify NULL to execute the error transaction without running a user procedure.</p> <p>See Also: "Usage Notes" on page 20-24 for more information about the user procedure</p>

Usage Notes

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the `schema_name`.

- `fix_errors` is the *package_name*.
- `fix_hr_errors` is the *procedure_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    in_anydata           IN      ANYDATA,
    error_record         IN      DBA_APPLY_ERROR%ROWTYPE,
    error_message_number IN      NUMBER,
    messaging_default_processing IN OUT BOOLEAN,
    out_anydata          OUT     ANYDATA);
```

The user procedure has the following parameters:

- `in_anydata`: The ANYDATA encapsulation of a message that the apply process passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- `error_record`: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- `error_message_number`: The message number of the ANYDATA object in the `in_anydata` parameter, starting at 1
- `messaging_default_processing`: If TRUE, then the apply process continues processing the message in the `in_anydata` parameter, which can include executing DML or DDL statements and invoking apply handlers.
If FALSE, then the apply process skips processing the message in the `in_anydata` parameter and moves on to the next message in the `in_anydata` parameter.
- `out_anydata`: The ANYDATA object processed by the user procedure and used by the apply process if `messaging_default_processing` is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the `messaging_default_processing` parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the `in_anydata` parameter is a row LCR, then the `out_anydata` parameter must be row LCR if the `messaging_default_processing` parameter is set to TRUE.

- If the ANYDATA object in the `in_anydata` parameter is a DDL LCR, then the `out_anydata` parameter must be DDL LCR if the `messaging_default_processing` parameter is set to `TRUE`.
- The user who runs the user procedure must have `SELECT` privilege on the `DBA_APPLY_ERROR` data dictionary view.

Note: LCRs containing transactional directives, such as `COMMIT` and `ROLLBACK`, are not passed to the user procedure.

GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether or not the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

See Also:

- ["SET_ENQUEUE_DESTINATION Procedure"](#) on page 20-33
- ["SET_EXECUTE Procedure"](#) on page 20-35

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
  message_number      IN   NUMBER,
  local_transaction_id IN  VARCHAR2,
  destination_queue_name OUT VARCHAR2,
  execute             OUT  BOOLEAN)
RETURN ANYDATA;
```

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE (
  message_number      IN   NUMBER,
  local_transaction_id IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 20–12 *GET_ERROR_MESSAGE Function Parameters*

Parameter	Description
<code>message_number</code>	The identification number of the message. This number identifies the position of the message in the transaction. Query the <code>DBA_APPLY_ERROR</code> data dictionary view to view the message number of each apply error.
<code>local_transaction_id</code>	Identifier of the error transaction for which to return a message
<code>destination_queue_name</code>	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains <code>NULL</code> .
<code>execute</code>	Contains <code>TRUE</code> if the message should be executed Contains <code>FALSE</code> if the message should not be executed

SET_DML_HANDLER Procedure

This procedure sets a user procedure as a DML handler for a specified operation on a specified object. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER (
  object_name      IN  VARCHAR2,
  object_type      IN  VARCHAR2,
  operation_name   IN  VARCHAR2,
  error_handler    IN  BOOLEAN   DEFAULT FALSE,
  user_procedure   IN  VARCHAR2,
  apply_database_link IN VARCHAR2 DEFAULT NULL,
  apply_name       IN  VARCHAR2 DEFAULT NULL,
  assemble_lob     IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–13 SET_DML_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, <code>TABLE</code> is the only possible source object type.
operation_name	The name of the operation, which can be specified as: <ul style="list-style-type: none"> ▪ <code>INSERT</code> ▪ <code>UPDATE</code> ▪ <code>DELETE</code> ▪ <code>LOB_UPDATE</code> ▪ <code>DEFAULT</code> <p>For example, suppose you run this procedure twice for the <code>hr.employees</code> table. In one call, you set <code>operation_name</code> to <code>UPDATE</code> and <code>user_procedure</code> to <code>employees_update</code>. In another call, you set <code>operation_name</code> to <code>INSERT</code> and <code>user_procedure</code> to <code>employees_insert</code>. Both times, you set <code>error_handler</code> to <code>FALSE</code>. In this case, the <code>employees_update</code> procedure is run for <code>UPDATE</code> operations on the <code>hr.employees</code> table, and the <code>employees_insert</code> procedure is run for <code>INSERT</code> operations on the <code>hr.employees</code> table.</p> <p>Specify <code>DEFAULT</code> to set the procedure as the default DML handler for the database object. In this case, the DML handler is used for any <code>INSERT</code>, <code>UPDATE</code>, <code>DELETE</code>, and <code>LOB_WRITE</code> on the database object, if another DML handler is not specifically set for the operation on the database object.</p>

Table 20–13 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
<code>error_handler</code>	<p>If <code>TRUE</code>, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply process error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions.</p> <p>If <code>FALSE</code>, then the handler being set is run for all row LCRs involving the specified operation on the specified object.</p>
<code>user_procedure</code>	<p>A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when the apply process encounters an error.</p> <p>Specify <code>NULL</code> to unset a DML handler that is set for the specified operation on the specified object.</p>
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
<code>apply_name</code>	<p>The name of the apply process that uses the DML handler or error handler.</p> <p>If <code>NULL</code>, then the procedure sets the DML handler or error handler as a general handler for all apply processes in the database.</p> <p>If the <code>user_procedure</code> parameter is set to <code>NULL</code> to unset a handler, and the handler being unset is set for a specific apply process, then use the <code>apply_name</code> parameter to specify the apply process to unset the handler.</p>
<code>assemble_lob</code>	<p>If <code>TRUE</code>, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly.</p> <p>If <code>FALSE</code>, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</p>

Usage Notes

Run this procedure at the destination database. The `SET_DML_HANDLER` procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

If the `error_handler` parameter is set to `TRUE`, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply process error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the `error_handler` parameter is set to `FALSE`, then the user procedure is a DML handler, not an error handler, and a DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a DML handler or an error handler for a particular operation on an object. It cannot set both a DML handler and an error handler for the same object and operation.

If the `apply_name` parameter is non-NULL, then the DML handler or error handler is set for the specified apply process. In this case, this handler is not invoked for other apply processes at the local destination database. If the `apply_name` parameter is NULL, the default, then the handler is set as a general handler for all apply processes at the destination database. When a handler is set for a specific apply process, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A DML handler named `handler_hr` is specified for an apply process named `apply_hr` for UPDATE operations on the `hr.employees` table.
- A general DML handler named `handler_gen` also exists for UPDATE operations on the `hr.employees` table.

In this case, the `apply_hr` apply process uses the `handler_hr` DML handler for UPDATE operations on the `hr.employees` table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Attention: Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with DML handlers, error handlers, or custom rule-based transformation functions. DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

Note: Currently, setting an error handler for an apply process that is applying changes to a non-Oracle database is not supported.

The `SET_DML_HANDLER` procedure can be used to set either a DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the `SET_DML_HANDLER` procedure must have EXECUTE privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `SET_DML_HANDLER` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `hr` is the `schema_name`.
- `apply_pkg` is the `package_name`.
- `employees_default` is the `procedure_name`.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

See Also: *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding DML handlers and LOB, LONG, and LONG RAW data types

Signature of a DML Handler Procedure

The procedure specified in the `user_procedure` parameter must have the following signature:

```
PROCEDURE user_procedure (
    parameter_name IN ANYDATA);
```

Here, `user_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

See Also: [Chapter 228, "Logical Change Record TYPES"](#) for more information about LCRs

Signature of an Error Handler Procedure

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
    message           IN ANYDATA,
    error_stack_depth IN NUMBER,
    error_numbers     IN DBMS_UTILITY.NUMBER_ARRAY,
    error_messages    IN emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
 - The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.
-

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply process.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply process automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an Oracle Streams apply process. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_ENQUEUE`.
- The value is a `ANYDATA` instance containing the queue name specified as a `VARCHAR2`.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name           IN VARCHAR2,
    destination_queue_name IN VARCHAR2);
```

Parameters

Table 20–14 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.] rule_name</code> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>destination_queue_name</code>	<p>The name of the queue into which the apply process should enqueue the message. Specify the queue in the form <code>[schema_name.] queue_name</code>. Only local queues can be specified.</p> <p>For example, to specify a queue in the <code>hr</code> schema named <code>streams_queue</code>, enter <code>hr.streams_queue</code>. If the schema is not specified, then the current user is the default.</p> <p>If <code>NULL</code>, then an existing name-value pair with the name <code>APPLY\$_ENQUEUE</code> is removed. If no name-value pair exists with the name <code>APPLY\$_ENQUEUE</code> for the rule, then no action is taken.</p> <p>If non-<code>NULL</code> and a name-value pair already exists for the rule with the name <code>APPLY\$_ENQUEUE</code>, then it is removed, and a new name-value pair with the value specified by this parameter is added.</p>

Usage Notes

If an apply handler, such as a DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply process tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply processes using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply process. If the rule is in the negative rule set for an apply process, then the apply process does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply process rule sets.

SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply process.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an Oracle Streams apply process. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_EXECUTE`.
- The value is a `ANYDATA` instance that contains `NO` as a `VARCHAR2`. When the value is `NO`, then an apply process does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE (
  rule_name IN VARCHAR2,
  execute   IN BOOLEAN);
```

Parameters

Table 20–15 SET_EXECUTE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.] rule_name</code> . For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>execute</code>	<p>If <code>TRUE</code>, then the procedure removes the name-value pair with the name <code>APPLY\$_EXECUTE</code> for the specified rule. Removing the name-value pair means that the apply process executes messages that satisfy the rule. If no name-value pair with name <code>APPLY\$_EXECUTE</code> exists for the rule, then no action is taken.</p> <p>If <code>FALSE</code>, then the procedure adds a name-value pair to the rule's action context. The name is <code>APPLY\$_EXECUTE</code> and the value is <code>NO</code>. An apply process does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair already exists for the rule with the name <code>APPLY\$_EXECUTE</code>, then it is removed, and a new one with the value <code>NO</code> is added.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>

Usage Notes

If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

Note:

- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
 - The specified rule must be in the positive rule set for an apply process for the apply process to follow the execution directive. If the rule is in the negative rule set for an apply process, then the apply process ignores the execution directive for the rule.
-
-

SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name IN VARCHAR2,
  instantiation_scn    IN NUMBER,
  apply_database_link IN VARCHAR2 DEFAULT NULL,
  recursive            IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–16 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables. Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Note:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
 - The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS (
  object_name          IN  VARCHAR2,
  column_list          IN  VARCHAR2,
  apply_database_link IN  VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS (
  object_name          IN  VARCHAR2,
  column_table         IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20–17 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
<code>object_name</code>	The name of the table specified as [<i>schema_name.</i>] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. If the apply process is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
<code>column_list</code>	A comma-delimited list of the columns in the table that you want to use as the substitute primary key, with no spaces between the column names. If the <code>column_list</code> parameter is empty or <code>NULL</code> , then the current set of key columns is removed.
<code>column_table</code>	A PL/SQL index-by table of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table that you want to use as the substitute primary key. The index for <code>column_table</code> must be 1-based, increasing, dense, and terminated by a <code>NULL</code> . If the <code>column_table</code> parameter is empty or <code>NULL</code> , then the current set of key columns is removed.
<code>apply_database_link</code>	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

When not empty, this set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object already has primary key columns and you want to use those primary key columns as the key.

Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

Note:

- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
 - You should not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
 - If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
-

SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
  apply_name IN VARCHAR2,
  parameter  IN VARCHAR2,
  value      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20–18 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply process name. Do not specify an owner.
parameter	The name of the parameter you are setting. See " Apply Process Parameters " on page 20-41 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Apply Process Parameters

The following table lists the parameters for the apply process.

Table 20–19 Apply Process Parameters

Parameter Name	Possible Values	Default	Description
<code>allow_duplicate_rows</code>	Y or N	N	<p>If Y and more than one row is changed by a single row logical change record (row LCR) with an <code>UPDATE</code> or <code>DELETE</code> command type, then the apply process only updates or deletes one of the rows.</p> <p>If N, then the apply process raises an error when it encounters a single row LCR with an <code>UPDATE</code> or <code>DELETE</code> command type that changes more than one row in a table.</p> <p>Note: Regardless of the setting for this parameter, apply processes do not allow changes to duplicate rows for tables with <code>LOB</code>, <code>LONG</code>, or <code>LONG RAW</code> columns.</p> <p>See Also: "Duplicate Rows and Substitute Primary Key Columns" on page 20-46</p>
<code>commit_serialization</code>	full or none	full	<p>The order in which applied transactions are committed.</p> <p>Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database.</p> <p>You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the <code>commit_serialization</code> apply parameter. This parameter has the following settings:</p> <ul style="list-style-type: none"> ▪ <code>full</code> - The apply process commits applied transactions in the order in which they were committed at the source database. ▪ <code>none</code> - The apply process can commit transactions in any order. Performance is best if you specify <code>none</code>. <p>Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies.</p> <p>Logical standby environments typically specify <code>full</code>.</p> <p>If you specify <code>none</code>, then it is possible that a destination database commits changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:</p> <ol style="list-style-type: none"> 1. Transaction A 2. Transaction B <p>At the destination database, these transactions might be committed in the opposite order:</p> <ol style="list-style-type: none"> 1. Transaction B 2. Transaction A
<code>disable_on_error</code>	Y or N	Y	<p>If Y, then the apply process is disabled on the first unresolved error, even if the error is not fatal.</p> <p>If N, then the apply process continues regardless of unresolved errors.</p>

Table 20–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
<code>disable_on_limit</code>	Y or N	N	<p>If Y, then the apply process is disabled if the apply process terminates because it reached a value specified by the <code>time_limit</code> parameter or <code>transaction_limit</code> parameter.</p> <p>If N, then the apply process is restarted immediately after stopping because it reached a limit.</p> <p>When an apply process is restarted, it gets a new session identifier, and the processes associated with the apply process also get new session identifiers. However, the coordinator process number (<i>APnn</i>) remains the same.</p>
<code>maximum_scn</code>	A valid SCN or infinite	infinite	<p>The apply process is disabled before applying a transaction with a commit SCN greater than or equal to the value specified.</p> <p>If <i>infinite</i>, then the apply process runs regardless of the SCN value.</p>
<code>parallelism</code>	A positive integer	1	<p>The number of apply servers that can concurrently apply transactions. For example, if <code>parallelism</code> is set to 5, then an apply process uses a total of five apply servers. The reader server is a process. So, if <code>parallelism</code> is set to 5, then an apply process uses a total of six processes. An apply process always uses two or more processes.</p> <p>Setting the <code>parallelism</code> parameter to a number higher than the number of available parallel execution servers can disable the apply process. Make sure the <code>PROCESSES</code> and <code>PARALLEL_MAX_SERVERS</code> initialization parameters are set appropriately when you set the <code>parallelism</code> apply process parameter.</p> <p>Note: When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.</p>
<code>preserve_encryption</code>	Y or N	Y	<p>Whether to preserve encryption for columns encrypted using transparent data encryption.</p> <p>If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply process tries to apply the row LCRs.</p> <p>If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply process applies the changes in the row LCRs.</p> <p>Note: When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.</p>

Table 20–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
<code>rtrim_on_implicit_conversion</code>	Y or N	Y	<p>Whether to remove blank padding from the right end of a column when automatic data type conversion is performed during apply.</p> <p>If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table.</p> <p>If N, then blank padding is preserved in the column.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for information about automatic data type conversion during apply</p>
<code>startup_seconds</code>	0, a positive integer, or infinite	0	<p>The maximum number of seconds to wait for another instantiation of the same apply process to finish. If the other instantiation of the same apply process does not finish within this time, then the apply process does not start.</p> <p>If infinite, then an apply process does not start until another instantiation of the same apply process finishes.</p>
<code>time_limit</code>	A positive integer or infinite	infinite	<p>The apply process stops as soon as possible after the specified number of seconds since it started.</p> <p>If infinite, then the apply process continues to run until it is stopped explicitly.</p>
<code>trace_level</code>	0 or a positive integer	0	<p>Set this parameter only under the guidance of Oracle Support Services.</p>

Table 20–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
transaction_limit	A positive integer or infinite	infinite	<p>The apply process stops after applying the specified number of transactions.</p> <p>If <i>infinite</i>, then the apply process continues to run regardless of the number of transactions applied.</p>
txn_lcr_spill_threshold	A positive integer or infinite	10000	<p>The apply process begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less.</p> <p>If the reader server of an apply process has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way:</p> <ol style="list-style-type: none"> 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory <p>The apply process applies the first 10,100 messages from the hard disk and the last 100 messages from memory.</p> <p>When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table.</p> <p>Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply process is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages.</p> <p>If <i>infinite</i>, then the apply process does not spill messages to the hard disk.</p> <p>Query the <code>DBA_APPLY_SPILL_TXN</code> data dictionary view for information about transactions spilled by an apply process.</p> <p>Note: When the value of this parameter is changed for a running apply process, the new setting does not take effect until the apply process is restarted.</p>
write_alert_log	Y or N	Y	<p>If <i>Y</i>, then the apply process writes a message to the alert log on exit.</p> <p>If <i>N</i>, then the apply process does not write a message to the alert log on exit.</p> <p>The message specifies the reason why the apply process stopped.</p>

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `infinite` for larger values.
 - For parameters that require an SCN setting, any valid SCN value can be specified.
-

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when the all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that updates at the source database always update at least one of the columns specified as a substitute key column at the destination database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

If a table does not have a primary key, a unique index that has at least one NOT NULL column, or a substitute key, then the key consists of all non LOB, non LONG, and non LONG RAW columns. When there is no key for a table and the `allow_duplicate_rows` apply process parameter is set to `Y`, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can

update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply process ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply process determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply process always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply process does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply process raises an error regardless of the setting for the `allow_duplicate_rows` apply process parameter.

See Also: ["SET_KEY_COLUMNS Procedures"](#) on page 20-39

SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name  IN  VARCHAR2,
  source_database_name IN  VARCHAR2,
  instantiation_scn   IN  NUMBER,
  apply_database_link IN  VARCHAR2  DEFAULT NULL,
  recursive           IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–20 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables. Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-NULL `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

Note: Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
  source_object_name  IN  VARCHAR2,
  source_database_name IN  VARCHAR2,
  instantiation_scn   IN  NUMBER,
  apply_database_link IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–21 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.

Usage Notes

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply process at the destination database disregards the LCR. Otherwise, the apply process applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL *base_table_owner* and *base_table_name* specified, except for DDL LCRs with a *command_type* of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a *command_type* of ALTER TABLE or CREATE TRIGGER.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
  object_name      IN  VARCHAR2,
  method_name      IN  VARCHAR2,
  resolution_column IN  VARCHAR2,
  column_list      IN  DBMS_UTILITY.NAME_ARRAY,
  apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20–22 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
object_name	<p>The schema and name of the table, specified as [<i>schema_name</i>.] <i>object_name</i>, for which an update conflict handler is being added, modified, or removed.</p> <p>For example, if an update conflict handler is being added for table <code>employees</code> owned by user <code>hr</code>, then specify <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>
method_name	<p>Type of update conflict handler to create.</p> <p>You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:</p> <ul style="list-style-type: none"> ■ MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. ■ MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. ■ OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. ■ DISCARD: Retains the column list from the destination database, discarding the column list from the source database. <p>If <code>NULL</code>, then the procedure removes any existing update conflict handler with the same <code>object_name</code>, <code>resolution_column</code>, and <code>column_list</code>. If non-<code>NULL</code>, then the procedure replaces any existing update conflict handler with the same <code>object_name</code> and <code>resolution_column</code>.</p>

Table 20–22 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
resolution_column	<p>Name of the column used to uniquely identify an update conflict handler. For the <code>MAXIMUM</code> and <code>MINIMUM</code> prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the <code>column_list</code> parameter.</p> <p><code>NULL</code> is not allowed for this parameter. For the <code>OVERWRITE</code> and <code>DISCARD</code> prebuilt methods, you can specify any column in the column list.</p>
column_list	<p>List of columns for which the conflict handler is called.</p> <p>If a conflict occurs for one or more of the columns in the list when an apply process tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list.</p> <p>Note: Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, and user-defined type columns. Therefore, you should not include these types of columns in the <code>column_list</code> parameter.</p>
apply_database_link	<p>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</p> <p>Note: Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</p>

Usage Notes

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply process, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

Note: Currently, setting an update conflict handler for an apply process that is applying to a non-Oracle database is not supported.

See Also:

- ["Signature of an Error Handler Procedure"](#) on page 20-31 for information about setting an error handler
- ["SET_DML_HANDLER Procedure"](#) on page 20-28
- *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name      => 'hr.employees',
    method_name      => 'MAXIMUM',
    resolution_column => 'salary',
    column_list      => cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply process uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY (
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_list  IN VARCHAR2);
```

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY (
  dependency_name IN VARCHAR2,
  object_name     IN VARCHAR2,
  attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 20–23 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
<code>dependency_name</code>	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If NULL, an error is raised.
<code>object_name</code>	The name of the table, specified as [<i>schema_name</i> .] <i>table_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default. If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised. If NULL, then <code>attribute_list</code> and <code>attribute_table</code> also must be NULL.
<code>attribute_list</code>	A comma-delimited list of column names in the table. There must be no spaces between entries.
<code>attribute_table</code>	A PL/SQL index-by table of type <code>DBMS_UTILITY.NAME_ARRAY</code> that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.

START_APPLY Procedure

This procedure directs the apply process to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(  
    apply_name IN VARCHAR2);
```

Parameter

Table 20–24 *START_APPLY Procedure Parameter*

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is `ENABLED`, then the apply process is started upon database instance startup. An apply process (*an_{nn}*) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply process.

STOP_APPLY Procedure

This procedure stops the apply process from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY (
  apply_name  IN  VARCHAR2,
  force       IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–25 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply process as soon as possible. If FALSE, then the procedure stops the apply process after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply process depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply process parameter. See " Usage Notes " for more information.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply process.

The following table describes apply process behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply process parameter. In all cases, the apply process rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Process Behavior
TRUE	full	The apply process stops immediately and does not apply any unfinished transactions.
TRUE	none	When the apply process stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	full	The apply process stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	none	Before stopping, the apply process applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the `commit_serialization` apply process parameter is set to `none` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply process has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply process stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply process stops.

A different scenario would result if the `commit_serialization` apply process parameter is set to `full`. For example, assume that the `commit_serialization` apply process parameter is set to `full` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply process has applied transaction A and is in the process of applying transactions B and C when the `STOP_APPLY` procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply process stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply process stops, and transaction C is rolled back.

See Also: ["SET_PARAMETER Procedure"](#) on page 20-41 for more information about the `commit_serialization` apply process parameter

The `DBMS_AQ` package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- *Oracle Streams Advanced Queuing User's Guide*
- [Oracle Streams AQ TYPES](#) for information about TYPES to use with `DBMS_AQ`.

This chapter contains the following topics:

 - Operational Notes
- [Summary of DBMS_AQ Subprograms](#)

Using DBMS_AQ

- [Constants](#)
- [Data Structures](#)
- [Operational Notes](#)

Constants

The DBMS_AQ package uses the constants shown in [Table 21–1](#).

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

Note: The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

Table 21–1 Enumerated Constants

Parameter	Options	Type	Description
VISIBILITY	IMMEDIATE		
.	ON_COMMIT		
DEQUEUE_MODE	BROWSE		
.	LOCKED		
.	REMOVE		
.	REMOVE_NODATA		
NAVIGATION	FIRST_MESSAGE		
.	NEXT_MESSAGE		
STATE	WAITING		
.	READY		
.	PROCESSED		
.	EXPIRED		
SEQUENCE_DEVIATION	BEFORE		
.	TOP		
WAIT	FOREVER	BINARY_INTEGER	
.	NO_WAIT	BINARY_INTEGER	
DELAY	NO_DELAY		
EXPIRATION	NEVER		
NAMESPACE	NAMESPACE_AQ		
.	NAMESPACE_ANONYMOUS		
NTFN_GROUPING_CLASS	NTFN_GROUPING_CLASS_TIME	NUMBER	
NTFN_GROUPING_TYPE	NTFN_GROUPING_TYPE_SUMMARY	NUMBER	

Table 21–1 (Cont.) Enumerated Constants

Parameter	Options	Type	Description
.	NTFN_GROUPING_TYPE_ LAST	NUMBER	
NTFN_GROUPING_ REPEAT_COUNT	NTFN_GROUPING_ FOREVER	NUMBER	

Data Structures

Table 21–2 DBMS_AQ Data Structures

Data Structures	Description
Object Name on page 21-5	Names database objects
Type Name on page 21-5	Defines queue types
Oracle Streams AQ PL/SQL Callback on page 21-6	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 21–3 Type Name Attributes

Attribute	Description
<code>object_type</code>	Maximum number of attributes in the object type is limited to 900.

Table 21–3 (Cont.) Type Name Attributes

Attribute	Description
"RAW"	<p>To store payload of type RAW, Oracle Streams AQ creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Streams AQ. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases.</p> <p>Because LOB columns are used for storing RAW payload, the Oracle Streams AQ administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the <code>storage_clause</code> parameter during queue table creation time.</p>

Oracle Streams AQ PL/SQL Callback

The `plsqlcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
  payload IN RAW,
  payloadl IN NUMBER);
```

Attributes

Table 21–4 Oracle Streams AQ PL/SQL Callback Attributes

Attribute	Description
<code>context</code>	Specifies the context for the callback function that was passed by <code>dbms_aq.register</code> . See AQ\$_REG_INFO Type on page 224-12.
<code>reginfo</code>	See AQ\$_REG_INFO Type on page 224-12.
<code>descr</code>	See AQ\$_DESCRIPTOR Type on page 224-5
<code>payload</code>	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
<code>payloadl</code>	Specifies the length of <code>payload</code> . If <code>payload</code> is null, <code>payloadl</code> = 0.

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context IN RAW,
  reginfo IN SYS.AQ$_REG_INFO,
  descr   IN SYS.AQ$_DESCRIPTOR,
```

```
payload IN VARCHAR2,  
payload1 IN NUMBER);
```

Operational Notes

- [DBMS_AQ and DBMS_AQADM Java Classes](#)

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for DBMS_AQ and DBMS_AQADM. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have EXECUTE privileges on the DBMS_AQIN package to use these interfaces.

Summary of DBMS_AQ Subprograms

Table 21–5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure on page 21-10	Creates an entry for an Oracle Streams AQ agent in the LDAP directory
DEQUEUE Procedure on page 21-11	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function on page 21-14	Dequeues an array of messages from the specified queue
ENQUEUE Procedure on page 21-16	Adds a message to the specified queue
ENQUEUE_ARRAY Function on page 21-18	Adds an array of messages to the specified queue
LISTEN Procedures on page 21-19	Listen to one or more queues on behalf of a list of agents
POST Procedure on page 21-21	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure on page 21-22	Registers for message notifications
UNBIND_AGENT Procedure on page 21-23	Removes an entry for an Oracle Streams AQ agent from the LDAP directory
UNREGISTER Procedure on page 21-24	Unregisters a subscription which turns off notification

Note: DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.

BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT (
    agent          IN SYS.AQ$_AGENT,
    certificate     IN VARCHAR2 default NULL);
```

Parameters

Table 21–6 *BIND_AGENT Procedure Parameters*

Parameter	Description
agent	Agent that is to be registered in LDAP server.
certificate	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute <code>usercertificate</code>) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a <code>OrganizationalPerson</code> OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
  queue_name          IN      VARCHAR2,
  dequeue_options    IN      dequeue_options_t,
  message_properties  OUT     message_properties_t,
  payload            OUT     "<ADT_1>"
  msgid             OUT     RAW);
```

Parameters

Table 21-7 DEQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue.
dequeue_options	See DEQUEUE_OPTIONS_T Type on page 224-17.
message_properties	See MESSAGE_PROPERTIES_T Type on page 224-24.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of <i>type_name</i> refer to Type Name on page 21-5.
msgid	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

`Msgid` uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless `msgid` is specified.

- `correlation`

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.

- `deq_condition`

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the `where` clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note: It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See [DEQUEUE_OPTIONS_T Type](#) on page 224-17 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE_AQ_AGENT Procedure](#) on page 22-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE_DB_ACCESS Procedure](#) on page 22-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
    queue_name          IN   VARCHAR2,
    dequeue_options    IN   dequeue_options_t,
    array_size         IN   pls_integer,
    message_properties_array OUT message_properties_array_t,
    payload_array      OUT  "<COLLECTION_1>",
    msgid_array        OUT  msgid_array_t,
    error_array        OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 21-8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 224-28.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 224-29.
error_array	Currently not implemented

Usage Notes

A nonzero wait time, as specified in `dequeue_options`, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the `DEQUEUE_ARRAY` function will dequeue up to `array_size` messages and return immediately.

Dequeue by `message_id` is not supported. See [DEQUEUE Procedure](#) on page 21-11 for more information on the `navigation` parameter. Existing `NAVIGATION` modes are supported. In addition, two new `NAVIGATION` modes are supported for queues enabled for message grouping:

- `FIRST_MESSAGE_MULTI_GROUP`
- `NEXT_MESSAGE_MULTI_GROUP`

See Also: [ENQUEUE_OPTIONS_T Type](#) on page 224-20

For transaction grouped queues and `ONE_GROUP` navigation, messages are dequeued from a single transaction group only, subject to the `array_size` limit. In `MULTI_GROUP` navigation, messages are dequeued across multiple transaction groups, still subject to the `array_size` limit. `ORA-25235` is returned to indicate the end of a transaction group.

`DEQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
  queue_name          IN      VARCHAR2,
  enqueue_options     IN      enqueue_options_t,
  message_properties  IN      message_properties_t,
  payload             IN      "<ADT_1>",
  msgid               OUT     RAW);
```

Parameters

Table 21–9 ENQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 224-20.
message_properties	See MESSAGE_PROPERTIES_T Type on page 224-24.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of <i>type_name</i> refer to Type Name on page 21-5.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

Note: The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to `TRANSACTIONAL`. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error `ORA_24033` is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See [MESSAGE_PROPERTIES_T Type](#) on page 224-24 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See [CREATE_AQ_AGENT Procedure](#) on page 22-22.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See [ENABLE_DB_ACCESS Procedure](#) on page 22-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
  queue_name          IN   VARCHAR2,
  enqueue_options     IN   enqueue_options_t,
  array_size          IN   pls_integer,
  message_properties_array IN message_properties_array_t,
  payload_array       IN   "<COLLECTION_1>",
  msgid_array         OUT  msgid_array_t,
  error_array         OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 21-10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 224-20.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate <code>array_size</code> elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 224-28.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, <code>VARRAY</code> , or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 224-29.
error_array	Currently not implemented

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.

LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
  agent_list      IN    AQ$_AGENT_LIST_T,
  wait           IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
  agent          OUT   SYS.AQ$_AGENT);
```

```
DBMS_AQ.LISTEN (
  agent_list      IN    AQ$_AGENT_LIST_T,
  wait           IN    BINARY_INTEGER DEFAULT FOREVER,
  listen_delivery_mode IN PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
  agent          OUT   SYS.AQ$_AGENT,
  message_delivery_mode OUT PLS_INTEGER);
```

```
TYPE aq$_agent_list_t IS TABLE OF aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE OF aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 21–11 LISTEN Procedure Parameters

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the `LISTEN` call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note: You cannot call `LISTEN` on nonpersistent queues.

POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (
  post_list      IN SYS.AQ$_POST_INFO_LIST,
  post_count     IN NUMBER);
```

Parameters

Table 21–12 *POST Procedure Parameters*

Parameter	Description
post_list	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ\$_POST_INFO_LIST Type.
post_count	Specifies the number of entries in the post_list.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
  reg_list      IN  SYS.AQ$_REG_INFO_LIST,
  count         IN  NUMBER);
```

Parameters

Table 21–13 REGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ\$_REG_INFO Type .
count	Specifies the number of entries in the reg_list.

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
 - Class – grouping criterion (currently only `TIME` criterion is supported)
 - Value – the value of the grouping criterion (currently only time in seconds for criterion `TIME`)
 - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
 - Repeat count – how many times to perform grouping (Default is `FOREVER`)
 - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also: [Chapter 23, "DBMS_AQELM"](#) for more information on e-mail and HTTP notifications

UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT (  
    agent      IN SYS.AQ$_AGENT);
```

Parameters

Table 21–14 *BIND_AGENT Procedure Parameters*

Parameter	Description
agent	Agent that is to be removed from the LDAP server

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (  
    reg_list      IN  SYS.AQ$_REG_INFO_LIST,  
    reg_count     IN  NUMBER);
```

Parameters

Table 21–15 UNREGISTER Procedure Parameters

Parameter	Description
reg_list	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ\$_REG_INFO Type .
reg_count	Specifies the number of entries in the reg_list.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

- [Summary of DBMS_AQADM Subprograms](#)

Using DBMS_AQADM

This section contains the following topics.

- [Constants](#)

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 22-1 *Enumerated Types in the Administrative Interface*

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the [DBMS_AQ](#) package.

Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

- [Queue Table Subprograms](#) on page 22-5
- [Privilege Subprograms](#) on page 22-6
- [Queue Subprograms](#) on page 22-7
- [Subscriber Subprograms](#) on page 22-8
- [Notification Subprograms](#) on page 22-9
- [Propagation Subprograms](#) on page 22-10
- [Oracle Streams AQ Agent Subprograms](#) on page 22-11
- [Alias Subprograms](#) on page 22-12

Queue Table Subprograms

Table 22–2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure on page 22-20	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure on page 22-26	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure on page 22-34	Drops an existing queue table
ENABLE_JMS_TYPES Procedure on page 22-36	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure on page 22-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 22-42	Purges messages from queue tables

Privilege Subprograms

Table 22–3 *Privilege Subprograms*

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure on page 22-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 22-40	Grants Oracle Streams AQ system privileges to users and roles
REVOKE_QUEUE_PRIVILEGE Procedure on page 22-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 22-47	Revokes Oracle Streams AQ system privileges from users and roles

Queue Subprograms

Table 22–4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure on page 22-19	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure on page 22-23	Creates a nonpersistent RAW queue
CREATE_QUEUE Procedure on page 22-24	Creates a queue in the specified queue table
DROP_QUEUE Procedure on page 22-33	Drops an existing queue
QUEUE_SUBSCRIBERS Function on page 22-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type <code>DBMS_AQADM.AQ\$_subscriber_list_t</code>
START_QUEUE Procedure on page 22-51	Enables the specified queue for enqueueing or dequeuing
STOP_QUEUE Procedure on page 22-52	Disables enqueueing or dequeuing on the specified queue

Subscriber Subprograms

Table 22–5 *Subscriber Subprograms*

Subprograms	Description
ADD_SUBSCRIBER Procedure on page 22-16	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure on page 22-21	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure on page 22-45	Removes a default subscriber from a queue

Notification Subprograms

Table 22–6 Notification Subprograms

Subprograms	Description
GET_WATERMARK Procedure on page 22-38	Retrieves the value of watermark set by the SET_WATERMARK Procedure
SET_WATERMARK Procedure on page 22-50	Used for Oracle Streams AQ notification to specify and limit memory use

Propagation Subprograms

Table 22–7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure on page 22-18	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure on page 22-31	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 22-37	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure on page 22-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure on page 22-53	Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 22-54	Verifies that the source and destination queues have identical types

Oracle Streams AQ Agent Subprograms

Table 22–8 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure on page 22-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
CREATE_AQ_AGENT Procedure on page 22-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
DISABLE_DB_ACCESS Procedure on page 22-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DROP_AQ_AGENT Procedure on page 22-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
ENABLE_DB_ACCESS Procedure on page 22-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user

Alias Subprograms

Table 22–9 *Alias Subprograms*

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 22-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure on page 22-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

Summary of DBMS_AQADM Subprograms

Table 22–10 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 22-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure on page 22-16	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure on page 22-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
ALTER_PROPAGATION_SCHEDULE Procedure on page 22-18	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure on page 22-19	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure on page 22-20	Alters the existing properties of a queue table
ALTER_SUBSCRIBER Procedure on page 22-21	Alters existing properties of a subscriber to a specified queue
CREATE_AQ_AGENT Procedure on page 22-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
CREATE_NP_QUEUE Procedure on page 22-23	Creates a nonpersistent RAW queue
CREATE_QUEUE Procedure on page 22-24	Creates a queue in the specified queue table
CREATE_QUEUE_TABLE Procedure on page 22-26	Creates a queue table for messages of a predefined type
DEL_ALIAS_FROM_LDAP Procedure on page 22-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure on page 22-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DISABLE_PROPAGATION_SCHEDULE Procedure on page 22-31	Disables a propagation schedule
DROP_AQ_AGENT Procedure on page 22-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
DROP_QUEUE Procedure on page 22-33	Drops an existing queue
DROP_QUEUE_TABLE Procedure on page 22-34	Drops an existing queue table
ENABLE_DB_ACCESS Procedure on page 22-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user
ENABLE_JMS_TYPES Procedure on page 22-36	A precondition for the enqueue of JMS types and XML types

Table 22-10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
ENABLE_PROPAGATION_SCHEDULE Procedure on page 22-37	Enables a previously disabled propagation schedule
GET_WATERMARK Procedure on page 22-38	Retrieves the value of watermark set by the SET_WATERMARK Procedure
GRANT_QUEUE_PRIVILEGE Procedure on page 22-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 22-40	Grants Oracle Streams AQ system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure on page 22-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 22-42	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function on page 22-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type <code>DBMS_AQADM.AQ\$_subscriber_list_t</code>
REMOVE_SUBSCRIBER Procedure on page 22-45	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure on page 22-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 22-47	Revokes Oracle Streams AQ system privileges from users and roles
SCHEDULE_PROPAGATION Procedure on page 22-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_WATERMARK Procedure on page 22-50	Used for Oracle Streams AQ notification to specify and limit memory use
START_QUEUE Procedure on page 22-51	Enables the specified queue for enqueueing or dequeuing
STOP_QUEUE Procedure on page 22-52	Disables enqueueing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure on page 22-53	Unscheduled previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 22-54	Verifies that the source and destination queues have identical types

ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP (
  alias          IN VARCHAR2,
  obj_location  IN VARCHAR2);
```

Parameters

Table 22–11 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
alias	Name of the alias. Example: west_shipping.
obj_location	The distinguished name of the object (queue, agent or connection factory) to which alias refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.

ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
  queue_name      IN      VARCHAR2,
  subscriber      IN      sys.aq$_agent,
  rule            IN      VARCHAR2 DEFAULT NULL,
  transformation  IN      VARCHAR2 DEFAULT NULL,
  queue_to_queue  IN      BOOLEAN DEFAULT FALSE,
  delivery_mode   IN      PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 22–12 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are <code>priority</code> and <code>corrid</code> . To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with <code>tab.user_data</code> as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of <code>DBMS_AQADM.PERSISTENT</code> , <code>DBMS_AQADM.BUFFERED</code> , or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by <code>ALTER_SUBSCRIBER</code> .

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule => 'PRIORITY <= 3 AND CORRID = ''FROM JAPAN'''
```

Note that these are all single quotation marks.

ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name          IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http        IN BOOLEAN DEFAULT FALSE,
  enable_smtp        IN BOOLEAN DEFAULT FALSE,
  enable_anyp        IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22–13 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
  queue_name          IN    VARCHAR2,
  destination         IN    VARCHAR2 DEFAULT NULL,
  duration            IN    NUMBER  DEFAULT NULL,
  next_time           IN    VARCHAR2 DEFAULT NULL,
  latency             IN    NUMBER  DEFAULT 60,
  destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–14 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as <code>SYSDATE + 1 - duration/86400</code> .
latency	<p>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value.</p> <p>For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.</p>
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
    queue_name      IN      VARCHAR2,
    max_retries     IN      NUMBER   DEFAULT NULL,
    retry_delay     IN      NUMBER   DEFAULT NULL,
    retention_time  IN      NUMBER   DEFAULT NULL,
    auto_commit     IN      BOOLEAN  DEFAULT TRUE,
    comment         IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–15 ALTER_QUEUE Procedure Parameters

Parameter	Description
<code>queue_name</code>	Name of the queue that is to be altered
<code>max_retries</code>	Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31}-1$. A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code> . <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then <code>RETRY_COUNT</code> is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
<code>retry_delay</code>	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
<code>retention_time</code>	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.
<code>auto_commit</code>	TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
<code>comment</code>	User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.

ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
  queue_table      IN  VARCHAR2,
  comment          IN  VARCHAR2      DEFAULT NULL,
  primary_instance IN  BINARY_INTEGER DEFAULT NULL,
  secondary_instance IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 22–16 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
  queue_name      IN      VARCHAR2,
  subscriber      IN      sys.aq$_agent,
  rule            IN      VARCHAR2
  transformation  IN      VARCHAR2);
```

Parameters

Table 22–17 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being altered. See " AQ\$_AGENT Type " on page 224-3.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the `schema.AQ$queue_table_R` and `schema.AQ$queue_table_S` views.

CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name          IN VARCHAR2,
  certificate_location IN VARCHAR2 DEFAULT NULL,
  enable_http        IN BOOLEAN DEFAULT FALSE,
  enable_smtp        IN BOOLEAN DEFAULT FALSE,
  enable_anyp        IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22–18 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

Usage Notes

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents.

CREATE_NP_QUEUE Procedure

Note: nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
  queue_name          IN          VARCHAR2,
  multiple_consumers IN          BOOLEAN DEFAULT FALSE,
  comment             IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–19 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Language Reference</i> .
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
comment	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ\$_MEM_SC or AQ\$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with `CREATE_NP_QUEUE`, it can be enabled by calling `START_QUEUE`. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the `LISTEN` call on a nonpersistent queue.

CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
  queue_name      IN      VARCHAR2,
  queue_table     IN      VARCHAR2,
  queue_type      IN      BINARY_INTEGER DEFAULT NORMAL_QUEUE,
  max_retries     IN      NUMBER         DEFAULT NULL,
  retry_delay     IN      NUMBER         DEFAULT 0,
  retention_time  IN      NUMBER         DEFAULT 0,
  dependency_tracking IN    BOOLEAN      DEFAULT FALSE,
  comment         IN      VARCHAR2      DEFAULT NULL,
  auto_commit     IN      BOOLEAN      DEFAULT TRUE);
```

Parameters

Table 22–20 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in <i>Oracle Database SQL Language Reference</i> with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. <code>NORMAL_QUEUE</code> means the queue is a normal queue. This is the default. <code>EXCEPTION_QUEUE</code> means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the <code>REMOVE</code> mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31} - 1$. A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code> . <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including <code>ALTER SYSTEM KILL SESSION</code>) or <code>SHUTDOWN ABORT</code> on the instance, then <code>RETRY_COUNT</code> is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if <code>max_retries</code> is set to 0. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. <code>INFINITE</code> means the message is retained forever. <code>NUMBER</code> is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 22–20 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
  queue_table           IN      VARCHAR2,
  queue_payload_type   IN      VARCHAR2,
  storage_clause       IN      VARCHAR2          DEFAULT NULL,
  sort_list            IN      VARCHAR2          DEFAULT NULL,
  multiple_consumers  IN      BOOLEAN           DEFAULT FALSE,
  message_grouping    IN      BINARY_INTEGER   DEFAULT NONE,
  comment              IN      VARCHAR2          DEFAULT NULL,
  auto_commit          IN      BOOLEAN           DEFAULT TRUE,
  primary_instance     IN      BINARY_INTEGER   DEFAULT 0,
  secondary_instance  IN      BINARY_INTEGER   DEFAULT 0,
  compatible          IN      VARCHAR2          DEFAULT NULL,
  secure              IN      BOOLEAN           DEFAULT FALSE);
```

Parameters

Table 22–21 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name on page 21-5 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITTRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See <i>Oracle Database SQL Language Reference</i> for the usage of these parameters.

Table 22–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
sort_list	<p>The columns to be used as the sort key in ascending order. This parameter has the following format:</p> <p><i>'sort_column_1, sort_column_2'</i></p> <p>The allowed column names are <code>priority</code> and <code>enq_time</code>. If both columns are specified, then <code>sort_column_1</code> defines the most significant order.</p> <p>After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created.</p> <p>If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order.</p> <p>Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its <code>msgid</code> or <code>correlation.msgid</code>, <code>correlation</code>, and <code>sequence_deviation</code> take precedence over the default dequeuing order, if they are specified.</p>
multiple_consumers	<p><code>FALSE</code> means queues created in the table can only have one consumer for each message. This is the default. <code>TRUE</code> means queues created in the table can have multiple consumers for each message.</p>
message_grouping	<p>Message grouping behavior for queues created in the table. <code>NONE</code> means each message is treated individually. <code>TRANSACTIONAL</code> means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</p>
comment	<p>User-specified description of the queue table. This user comment is added to the queue catalog.</p>
auto_commit	<p><code>TRUE</code> causes the current transaction, if any, to commit before the <code>CREATE_QUEUE_TABLE</code> operation is carried out. The <code>CREATE_QUEUE_TABLE</code> operation becomes persistent when the call returns. This is the default. <code>FALSE</code> means the operation is part of the current transaction and becomes persistent only when the caller enters a commit.</p> <p>Note: This parameter has been deprecated.</p>
primary_instance	<p>The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance.</p> <p>The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.</p>
secondary_instance	<p>The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.</p>
compatible	<p>The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.</p>

Table 22–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
<code>secure</code>	This parameter must be set to <code>TRUE</code> if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$queue_table_name`, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- `aq$_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$_queue_table_name_s`, a table for storing information about the subscribers
- `aq$_queue_table_name_r`, a table for storing information about rules on subscriptions

`aq$_queue_table_name_h`, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8i release 8.1.5 or later. See the *Oracle Streams Advanced Queuing User's Guide* for more information.

The default value of the `compatible` parameter depends on the database compatibility mode in the `init.ora`. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(  
    alias IN VARCHAR2);
```

Parameters

Table 22–22 *DEL_ALIAS_FROM_LDAP Procedure Parameters*

Parameter	Description
alias	The alias to be removed.

DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (  
  agent_name          IN VARCHAR2,  
  db_username         IN VARCHAR2)
```

Parameters

Table 22–23 *DISABLE_DB_ACCESS Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the [ENABLE_DB_ACCESS Procedure](#).

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
    queue_name          IN  VARCHAR2,
    destination         IN  VARCHAR2 DEFAULT NULL,
    destination_queue   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–24 *DISABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code> .

DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (  
    agent_name          IN VARCHAR2)
```

Parameters

Table 22–25 *DROP_AQ_AGENT Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent

DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
  queue_name      IN    VARCHAR2,
  auto_commit     IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–26 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueueing and dequeuing. All the queue data is deleted as part of the drop operation.

DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (  
    queue_table      IN    VARCHAR2,  
    force            IN    BOOLEAN DEFAULT FALSE,  
    auto_commit      IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–27 *DROP_QUEUE_TABLE Procedure Parameters*

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name          IN VARCHAR2,
  db_username        IN VARCHAR2)
```

Parameters

Table 22–28 *ENABLE_DB_ACCESS Procedure Parameters*

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the [CREATE_AQ_AGENT Procedure](#).

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.

ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams Sys.Anydata queues unless you call this procedure after DBMS_STREAMS_ADM.SET_UP_QUEUE. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (  
    queue_table IN VARCHAR2);
```

Parameters

Table 22–29 *ENABLE_JMS_TYPES Procedure Parameters*

Parameter	Description
queue_table	Specifies name of the queue table to be enabled for JMS and XML types.

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
    queue_name          IN   VARCHAR2,
    destination         IN   VARCHAR2 DEFAULT NULL,
    destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 22–30 *ENABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

Syntax

```
DBMS_AQADM.GET_WATERMARK (  
    wmvalue      OUT      NUMBER);
```

Parameters

Table 22–31 GET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
  privilege      IN   VARCHAR2,
  queue_name     IN   VARCHAR2,
  grantee        IN   VARCHAR2,
  grant_option   IN   BOOLEAN := FALSE);
```

Parameters

Table 22–32 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
  privilege      IN   VARCHAR2,
  grantee        IN   VARCHAR2,
  admin_option   IN   BOOLEAN := FALSE);
```

Parameters

Table 22–33 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
admin_option	Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.

MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (  
    queue_table IN VARCHAR2,  
    compatible  IN VARCHAR2);
```

Parameters

Table 22-34 *MIGRATE_QUEUE_TABLE Procedure Parameters*

Parameter	Description
queue_table	Specifies name of the queue table to be migrated.
compatible	Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.

PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE (
  queue_table      IN  VARCHAR2,
  purge_condition  IN  VARCHAR2,
  purge_options    IN  aq$_purge_options_t);
```

where type `aq$_purge_options_t` is described in [Chapter 224, "Oracle Streams AQ TYPES"](#).

Parameters

Table 22–35 *PURGE_QUEUE_TABLE Procedure Parameters*

Parameter	Description
<code>queue_table</code>	Specifies the name of the queue table to be purged.
<code>purge_condition</code>	<p>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL <code>WHERE</code> clause, and it is case-sensitive. The condition is based on the columns of <code>aq\$queue_table_name</code> view.</p> <p>When specifying the <code>purge_condition</code>, qualify the column names in <code>aq\$queue_table_name</code> view with <code>qtview</code>.</p> <p>To purge all queues in a queue table, set <code>purge_condition</code> to either <code>NULL</code> (a bare null word, no quotes) or <code>' '</code> (two single quotes).</p>
<code>purge_options</code>	<p>Type <code>aq\$_purge_options_t</code> contains a <code>block</code> parameter and a <code>delivery_mode</code> parameter.</p> <ul style="list-style-type: none"> ■ If <code>block</code> is <code>TRUE</code>, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueueers and dequeuers to block while the queue table is purged. The purge call always succeeds if <code>block</code> is <code>TRUE</code>. The default for <code>block</code> is <code>FALSE</code>. This will not block enqueueers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. ■ <code>delivery_mode</code> is used to specify whether <code>DBMS_AQADM.PERSISTENT</code>, <code>DBMS_AQADM.BUFFERED</code> or <code>DBMS_AQADM.PERSISTENT_OR_BUFFERED</code> types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You can purge selected messages from the queue table by specifying a `purge_condition`. [Table 22–35](#) describes these parameters. Messages can be enqueued and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$queue_table_name_S` view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
    queue_name          IN          VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 22–36 *QUEUE_SUBSCRIBERS Function Parameters*

Parameter	Description
queue_name	Specifies the queue whose subscribers are to be printed.

REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (  
    queue_name      IN      VARCHAR2,  
    subscriber      IN      sys.aq$_agent);
```

Parameters

Table 22-37 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ\$_AGENT Type on page 224-3.

REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (  
  privilege      IN      VARCHAR2,  
  queue_name     IN      VARCHAR2,  
  grantee        IN      VARCHAR2);
```

Parameters

Table 22-38 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
  privilege      IN  VARCHAR2,
  grantee        IN  VARCHAR2);
```

Parameters

Table 22-39 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
  queue_name      IN    VARCHAR2,
  destination     IN    VARCHAR2 DEFAULT NULL,
  start_time     IN    DATE      DEFAULT SYSDATE,
  duration       IN    NUMBER    DEFAULT NULL,
  next_time      IN    VARCHAR2 DEFAULT NULL,
  latency        IN    NUMBER    DEFAULT 60,
  destination_queue IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–40 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

SET_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (  
    wmvalue      IN      NUMBER);
```

Parameters

Table 22–41 SET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

START_QUEUE Procedure

This procedure enables the specified queue for enqueueing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
    queue_name      IN      VARCHAR2,
    enqueue         IN      BOOLEAN DEFAULT TRUE,
    dequeue         IN      BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–42 *START_QUEUE Procedure Parameters*

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use `START_QUEUE` to enable the queue. The default is to enable it for both `ENQUEUE` and `DEQUEUE`. Only `dequeue` operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

STOP_QUEUE Procedure

This procedure disables enqueueing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
  queue_name      IN   VARCHAR2,
  enqueue         IN   BOOLEAN DEFAULT TRUE,
  dequeue        IN   BOOLEAN DEFAULT TRUE,
  wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–43 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
  queue_name      IN  VARCHAR2,
  destination     IN  VARCHAR2 DEFAULT NULL
  destination_queue IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–44 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code>

VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
    src_queue_name    IN    VARCHAR2,
    dest_queue_name   IN    VARCHAR2,
    destination       IN    VARCHAR2 DEFAULT NULL,
    rc                OUT   BINARY_INTEGER);
```

Parameters

Table 22-45 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
<code>src_queue_name</code>	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
<code>dest_queue_name</code>	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
<code>destination</code>	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code> , then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
<code>rc</code>	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in <code>rc</code> .

The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

See Also: *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS_AQELM

This chapter contains the following topic:

- [Summary of DBMS_AQELM Subprograms](#)

Summary of DBMS_AQELM Subprograms

Table 23–1 *DBMS_ALERT Package Subprograms*

Subprogram	Description
SET_MAILHOST Procedure on page 23-3	Sets the host name for the SMTP server that the database will use to send out e-mail notifications
SET_MAILPORT Procedure on page 23-4	Sets the port number for the SMTP server
SET_SENDFROM Procedure on page 23-5	Sets the sent-from e-mail address

SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (  
    mailhost IN VARCHAR2);
```

Parameters

Table 23–2 *SET_MAILHOST Procedure Parameters*

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (  
    mailport IN NUMBER);
```

Parameters

Table 23–3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (  
    sendfrom IN VARCHAR2);
```

Parameters

Table 23–4 SET_SENDFROM Procedure Parameters

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

See Also: *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS_AQIN

This chapter contains the following topic:

- [Using DBMS_AQIN](#)
 - Over view

Using DBMS_AQIN

This section contains topics which relate to using the DBMS_AQIN package.

- [Overview](#)

Overview

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINISTRATOR_ROLE.

The DBMS_ASSERT package provides an interface to validate properties of the input value.

See Also: *Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- [Using DBMS_ASSERT](#)
 - Operational Notes
- [Summary of DBMS_ASSERT Subprograms](#)

Using DBMS_ASSERT

- [Operational Notes](#)

Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned via return value. Most functions return the value unchanged, however, several functions modify the value.

Summary of DBMS_ASSERT Subprograms

Table 25–1 *DBMS_APPLICATION_INFO Package Subprograms*

Subprogram	Description
ENQUOTE_LITERAL Function on page 25-5	Enquotes a string literal
ENQUOTE_NAME Function on page 25-6	Encloses a name in double quotes
NOOP Functions on page 25-7	Returns the value without any checking
QUALIFIED_SQL_NAME Function on page 25-8	Verifies that the input string is a qualified SQL name
SCHEMA_NAME Function on page 25-9	Verifies that the input string is an existing schema name
SIMPLE_SQL_NAME Function on page 25-10	Verifies that the input string is a simple SQL name
SQL_OBJECT_NAME Function on page 25-11	Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object

ENQUOTE_LITERAL Function

This function enquotes a string literal.

Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (  
    str          VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 25–2 ENQUOTE_LITERAL Function Parameters

Parameter	Description
str	String to enquote

Usage Notes

- Add leading and trailing single quotes to a string literal.
- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.

ENQUOTE_NAME Function

This function encloses a name in double quotes.

Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (  
    str          VARCHAR2,  
    capitalize   BOOLEAN DEFAULT TRUE)  
RETURN VARCHAR2;
```

Parameters

Table 25-3 ENQUOTE_NAME Function Parameters

Parameter	Description
<code>str</code>	String to enquote
<code>capitalize</code>	If TRUE or defaulted, alphabetic characters of <code>str</code> which was not in quotes are translated to upper case

NOOP Functions

This function returns the value without any checking.

Syntax

```
DBMS_ASSERT.NOOP (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

```
DBMS_ASSERT.NOOP (  
    str      CLOB CHARACTER SET ANY_CS)  
RETURN      CLOB CHARACTER SET str%CHARSET;
```

Parameters

Table 25–4 NOOP Function Parameters

Parameter	Description
str	Input value

QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–5 *QUALIFIED_SQL_NAME Function Parameters*

Parameter	Description
str	Input value

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> { '.' <simple name> }  
<database link name> ::= <local qualified name> [ '@' <connection string> ]  
<connection string> ::= <simple name>  
<qualified name> ::= <local qualified name> [ '@' <database link name> ]
```

SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```
DBMS_ASSERT.SCHEMA_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–6 SCHEMA_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (  
    str          VARCHAR2 CHARACTER SET ANY_CS)  
RETURN          VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–7 SIMPLE_SQL_NAME Procedure Parameters

Parameter	Description
str	Input value

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must meet the following conditions:
 - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters `_`, `$`, and `#` in the second and subsequent character positions.
 - Quoted SQL names are also allowed.
 - Quoted names must be enclosed in double quotes.
 - Quoted names allow any characters between the quotes.
 - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
 - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (  
    str      VARCHAR2 CHARACTER SET ANY_CS)  
RETURN      VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–8 *SQL_OBJECT_NAME Function Parameters*

Parameter	Description
str	Input value

Exceptions

ORA44002: Invalid object name

DBMS_AUTO_TASK_ADMIN

The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

See Also: *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- [Using DBMS_AUTO_TASK_ADMIN](#)
 - Constants
- [Summary of DBMS_AUTO_TASK_ADMIN Subprograms](#)

Using DBMS_AUTO_TASK_ADMIN

- [Constants](#)

Constants

The DBMS_AUTO_TASK_ADMIN package uses the constants shown in [Table 26-1](#):

Table 26-1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
TASK_PRIORITY_MEDIUM	INTEGER	1	Task with this priority should be executed as time permits.
TASK_PRIORITY_HIGH	INTEGER	2	Task with this priority should be executed within the current Maintenance Window.
TASK_PRIORITY_URGENT	INTEGER	3	Task with this is to be executed at the earliest opportunity.

Summary of DBMS_AUTO_TASK_ADMIN Subprograms

Table 26–2 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLE Procedures on page 26-5	Prevents AUTOTASK from executing any requests from a specified client or operation.
ENABLE Procedures on page 26-6	Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control
GET_CLIENT_ATTRIBUTES Procedure on page 26-7	Returns values of select client attributes
GET_P1_RESOURCES Procedure on page 26-8	Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups
OVERRIDE_PRIORITY Procedures on page 26-9	Manually overrides task priority.
SET_CLIENT_SERVICE Procedure on page 26-10	Associates an AUTOTASK Client with a specified Service
SET_P1_RESOURCES Procedure on page 26-11	Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients

DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  window_name     IN   VARCHAR2);
```

Parameters

Table 26–3 *DISABLE Procedure Parameters*

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be disabled

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.

ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  window_name     IN   VARCHAR2);
```

Parameters

Table 26–4 *DISABLE Procedure Parameters*

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be enabled

Usage Notes

- If operation and window_name are both NULL, the client is enabled.
- If operation is not NULL, window_name is ignored and the specified operation is enabled
- If operation is NULL and window_name is not NULL, the client is enabled in the specified window.

GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES (  
  client_name      IN   VARCHAR2,  
  service_name     OUT  VARCHAR2,  
  window_group     OUT  VARCHAR2);
```

Parameters

Table 26-5 GET_CLIENT_ATTRIBUTES Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL
window_group	Name of the window group in which the client is active

GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES (  
  stats_group_pct      OUT  NUMBER,  
  seg_group_pct        OUT  NUMBER,  
  tune_group_pct       OUT  NUMBER,  
  health_group_pct     OUT  NUMBER);
```

Parameters

Table 26–6 GET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seg_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values will add up to 100%.

OVERRIDE_PRIORITY Procedures

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment will be honored during the next maintenance window in which the named client is active. Specifically, setting the priority to `URGENT` will cause a high priority job to be generated at the start of the maintenance window. Setting `priority` to `CLEAR` removes the override.

Syntax

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
  client_name      IN   VARCHAR2,
  operation        IN   VARCHAR2,
  task_target_type IN   VARCHAR2,
  task_target_name IN   VARCHAR2,
  priority         IN   VARCHAR2);
```

Parameters

Table 26–7 *OVERRIDE_PRIORITY Procedure Parameters*

Parameter	Description
<code>client_name</code>	Name of the client, as found in <code>DBA_AUTOTASK_CLIENT</code> View
<code>priority</code>	<code>URGENT</code> , <code>HIGH</code> , <code>MEDIUM</code> or <code>LOW</code>
<code>operation</code>	Name of the operation as specified in <code>DBA_AUTOTASK_OPERATION</code> View
<code>task_target_type</code>	Type of target to be affected, as found in <code>V\$AUTOTASK_TARGET_TYPE</code> View
<code>task_target_name</code>	Name of the specific target to be affected

SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(  
  client_name      IN   VARCHAR2,  
  service_name     IN   VARCHAR2);
```

Parameters

Table 26–8 SET_CLIENT_SERVICE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL

Usage Notes

All work performed on behalf of the Client will take place only on instances where the service is enabled.

SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES (
  stats_group_pct    OUT  NUMBER,
  seq_group_pct     OUT  NUMBER,
  tune_group_pct    OUT  NUMBER,
  health_group_pct  OUT  NUMBER);
```

Parameters

Table 26–9 SET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.

DBMS_AW_STATS

DBMS_AW_STATS contains a subprogram that generates and stores optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

See Also: *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- [Using DBMS_AW_STATS](#)
- [Summary of DBMS_AW_STATS Subprograms](#)

Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

Summary of DBMS_AW_STATS Subprograms

Table 27-1 DBMS_AW_STATS Package Subprograms

Subprogram	Description
ANALYZE Procedure on page 27-4	Generates optimizer statistics on OLAP cubes and dimensions.

ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a dimension.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

```
DBMS_AW_STATS.ANALYZE
    (object          IN VARCHAR2);
```

Parameters

Table 27–2 ANALYZE Procedure Parameters

Parameter	Description
object	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is <i>owner.cube_name</i> . For a dimension, the format is <i>owner.dimension_name</i> .

Example

This sample script generates optimizer statistics on UNITS_CUBE and its dimensions.

```
BEGIN
    DBMS_AW_STATS.ANALYZE('units_cube');
    DBMS_AW_STATS.ANALYZE('time');
    DBMS_AW_STATS.ANALYZE('customer');
    DBMS_AW_STATS.ANALYZE('product');
    DBMS_AW_STATS.ANALYZE('channel');
END;
/
```

The optimizer statistics enable Oracle Database to generate an execution plan for queries against UNITS_CUBE, as shown here:

```
SQL> EXPLAIN PLAN FOR SELECT * from units_cube_view;
```

```
Explained.
```

```
SQL> SELECT plan_table_output FROM TABLE(dbms_xplan.display());
```

```
PLAN_TABLE_OUTPUT
```

```
-----  
Plan hash value: 3488499021
```

```
-----  
| Id | Operation | Name | Rows | Bytes | Cost (%CPU) | Time |  
-----  
| 0 | SELECT STATEMENT | | 4475K | 93M | 661 (85) | 00:00:08 |  
| 1 | CUBE SCAN PARTIAL OUTER | UNITS_CUBE | 4475K | 93M | 661 (85) | 00:00:08 |  
-----
```

```
8 rows selected.
```

DBMS_CAPTURE_ADM

The DBMS_CAPTURE_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topic:

- [Summary of DBMS_CAPTURE_ADM Subprograms](#)

Summary of DBMS_CAPTURE_ADM Subprograms

Table 28–1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure on page 28-4	Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SCHEMA_INSTANTIATION Procedure on page 28-5	Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SYNC_INSTANTIATION Procedure on page 28-6	Reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure
ABORT_TABLE_INSTANTIATION Procedure on page 28-7	Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure
ALTER_CAPTURE Procedure on page 28-8	Alters a capture process
ALTER_SYNC_CAPTURE Procedure on page 28-13	Alters a synchronous capture
BUILD Procedure on page 28-15	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure on page 28-16	Creates a capture process
CREATE_SYNC_CAPTURE Procedure on page 28-26	Creates a synchronous capture
DROP_CAPTURE Procedure on page 28-28	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure on page 28-30	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture
PREPARE_GLOBAL_INSTANTIATION Procedure on page 28-32	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure on page 28-33	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SYNC_INSTANTIATION Function on page 28-34	Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN
PREPARE_TABLE_INSTANTIATION Procedure on page 28-35	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure on page 28-36	Sets a capture process parameter to the specified value

Table 28–1 (Cont.) DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
START_CAPTURE Procedure on page 28-40	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure on page 28-41	Stops the capture process from mining redo logs

Note: All subprograms commit unless specified otherwise.

ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION();
```

ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SCHEMA_INSTANTIATION` procedure. It also reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the `PREPARE_SCHEMA_INSTANTIATION` procedure
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(  
    schema_name IN VARCHAR2);
```

Parameter

Table 28–2 *ABORT_SCHEMA_INSTANTIATION Procedure Parameter*

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation

ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SYNC_INSTANTIATION` procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN VARCHAR2);
```

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY);
```

Parameters

Table 28–3 *ABORT_SYNC_INSTANTIATION Procedure Parameter*

Parameter	Description
<code>table_names</code>	<p>When the <code>table_names</code> parameter is <code>VARCHAR2</code> datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries.</p> <p>When the <code>table_names</code> parameter is <code>DBMS_UTILITY.UNCL_ARRAY</code> datatype, specify a PL/SQL index-by table of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name should be at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.</p> <p>In either version of the procedure, specify the name of each table in the form <code>[schema_name.] table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>

ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name IN VARCHAR2);
```

Parameter

Table 28–4 *ABORT_TABLE_INSTANTIATION Procedure Parameter*

Parameter	Description
table_name	The name of the table for which to abort the effects of preparing instantiation, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.

ALTER_CAPTURE Procedure

This procedure alters a capture process.

See Also: *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE (
  capture_name          IN  VARCHAR2,
  rule_set_name        IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  start_scn            IN  NUMBER    DEFAULT NULL,
  use_database_link    IN  BOOLEAN   DEFAULT NULL,
  first_scn            IN  NUMBER    DEFAULT NULL,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN  BOOLEAN  DEFAULT FALSE,
  capture_user         IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN  NUMBER  DEFAULT NULL);
```

Parameters

Table 28–5 ALTER_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>To change the positive rule set for the capture process, specify an existing rule set in the form [<i>schema_name.</i>] <i>rule_set_name</i>. For example, to specify a positive rule set in the hr schema named <i>job_capture_rules</i>, enter <i>hr.job_capture_rules</i>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a capture process</p>

Table 28-5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
<code>remove_rule_set</code>	<p>If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <i>SYS</i> and <i>SYSTEM</i> schemas.</p> <p>If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set.</p> <p>If FALSE, then the procedure retains the positive rule set for the specified capture process.</p> <p>If the <code>rule_set_name</code> parameter is non-NULL, then this parameter should be set to FALSE.</p>
<code>start_scn</code>	<p>A valid SCN for the database from which the capture process should start capturing changes. The SCN value be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN.</p> <p>An error is returned if an invalid SCN is specified or if the capture process is enabled.</p>
<code>use_database_link</code>	<p>If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database.</p> <p>If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects.</p> <p>If NULL, then the current value of this parameter for the capture process is not changed.</p>

Table 28–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
<code>first_scn</code>	<p>Specifies the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:</p> <ul style="list-style-type: none"> ■ It must be greater than the current first SCN for the capture process. ■ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. ■ It must be less than or equal to the required checkpoint SCN for the capture process. <p>An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 28-12 for information about determining an SCN value that meets all of these conditions.</p> <p>When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure on page 28-15 for more information about a LogMiner data dictionary.</p> <p>If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.</p>
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>To change the negative rule set for the capture process, specify an existing rule set in the form [<i>schema_name.</i>] <i>rule_set_name</i>. For example, to specify a negative rule set in the hr schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p>

Table 28-5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_negative_rule_set	<p>If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.</p> <p>If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>If FALSE, then the procedure retains the negative rule set for the specified capture process.</p> <p>If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</p>
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges:</p> <ul style="list-style-type: none"> ■ EXECUTE privilege on the rule sets used by the capture process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process <p>These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>The capture process is stopped and restarted automatically when you change the value of this parameter.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.</p>

Table 28–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	<p>Either the number of days that a capture process should retain checkpoints before purging them automatically, or <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically. If <code>NULL</code>, then the checkpoint retention time is not changed.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about checkpoint retention time</p>

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the `first_scn` parameter. The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```

ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

See Also: *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE (
  capture_name  IN  VARCHAR2,
  rule_set_name IN  VARCHAR2  DEFAULT NULL,
  capture_user  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 28–6 ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes.</p> <p>To change the rule set for the synchronous capture, specify an existing rule set in the form [<i>schema_name</i>.] <i>rule_set_name</i>. For example, to specify a positive rule set in the strmadm schema named sync_cap_rules, enter strmadm.sync_cap_rules. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You should only specify a rule set that was created using the DBMS_STREAMS_ADM package.</p> <p>If NULL, then the rule set is not changed.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a synchronous capture</p>

Table 28–6 (Cont.) ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	<p>The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed.</p> <p>To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS.</p> <p>If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:</p> <ul style="list-style-type: none"> ▪ EXECUTE privilege on the rule sets used by the synchronous capture ▪ EXECUTE privilege on all rule-based transformation functions used in the rule set ▪ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process <p>These privileges must be granted directly to the capture user. They cannot be granted through roles.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the synchronous capture is set to NULL automatically. You must specify a capture user before the synchronous capture can capture changes.</p>

BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the OUT parameter `first_scn`, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(  
    first_scn OUT NUMBER);
```

```
DBMS_CAPTURE_ADM.BUILD();
```

Parameters

Table 28–7 BUILD Procedure Parameter

Parameter	Description
<code>first_scn</code>	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

If there are any in-flight transactions, then this procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during the data dictionary build.

You can run this procedure multiple times at a source database.

If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.

A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.

After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Concepts and Administration* for more information about creating a capture process
- [Chapter 112, "DBMS_RULE_ADM"](#) for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
  queue_name          IN  VARCHAR2,
  capture_name       IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2  DEFAULT NULL,
  start_scn          IN  NUMBER    DEFAULT NULL,
  source_database    IN  VARCHAR2  DEFAULT NULL,
  use_database_link  IN  BOOLEAN   DEFAULT FALSE,
  first_scn          IN  NUMBER    DEFAULT NULL,
  logfile_assignment IN  VARCHAR2  DEFAULT 'implicit',
  negative_rule_set_name IN VARCHAR2  DEFAULT NULL,
  capture_user       IN  VARCHAR2  DEFAULT NULL,
  checkpoint_retention_time IN NUMBER    DEFAULT 60);
```

Parameters

Table 28–8 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	<p>The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [<i>schema_name</i>.] <i>queue_name</i>. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default.</p> <p>Note: The queue_name setting cannot be altered after the capture process is created.</p>
capture_name	<p>The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>Note: The capture_name setting cannot be altered after the capture process is created.</p>

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</p> <p>If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the hr schema named <code>job_capture_rules</code>, enter <code>hr.job_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a capture process</p>
start_scn	<p>A valid SCN for the database from which the capture process should start capturing changes.</p> <p>An error is returned if an invalid SCN is specified.</p> <p>See Also: "Usage Notes" on page 28-20 for more information setting the <code>start_scn</code> parameter</p>
source_database	<p>The global name of the source database. The source database is where the changes to be captured originated.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>If <code>NULL</code>, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for <code>use_database_link</code> and <code>first_scn</code> can be specified.</p>

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
<code>use_database_link</code>	<p>If <code>TRUE</code>, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. The capture process uses the database link to prepare database objects for instantiation at the source database and run the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure at the source database, if necessary.</p> <p>During the creation of a downstream capture process, if the <code>first_scn</code> parameter is set to <code>NULL</code>, then the <code>use_database_link</code> parameter must be set to <code>TRUE</code>. Otherwise, an error is returned.</p> <p>If <code>FALSE</code>, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:</p> <ul style="list-style-type: none"> ■ Run the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. ■ Prepare source database objects for instantiation.
<code>first_scn</code>	<p>Specifies the lowest SCN in the redo log from which a capture process can capture changes. A non-<code>NULL</code> value for this parameter is valid only if the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure has been run at least once at the source database.</p> <p>You can query the <code>FIRST_CHANGE#</code> column of the <code>V\$ARCHIVED_LOG</code> dynamic performance view where the <code>DICTIONARY_BEGIN</code> column is <code>YES</code> to determine whether the <code>DBMS_CAPTURE_ADM.BUILD</code> procedure has been run on a source database. Any of the values returned by such a query can be used as a <code>first_scn</code> value if the redo log containing that SCN value is still available.</p> <p>See Also: "Usage Notes" on page 28-20 for more information setting the <code>first_scn</code> parameter</p>

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
logfile_assignment	<p>If <code>implicit</code>, the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database.</p> <p>If <code>explicit</code>, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the <code>FOR logminer_session_name</code> clause when the redo log file is added manually to the downstream database. If <code>explicit</code>, then redo transport services cannot be used to add redo log files to the capture process being created.</p> <p>If you specify <code>explicit</code> for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log.</p> <p>See Also: "Usage Notes" on page 28-20 for information about adding redo log files manually</p>
negative_rule_set_name	<p>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</p> <p>If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>If you specify <code>NULL</code>, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</p>

Table 28–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
capture_user	<p>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used.</p> <p>Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.</p> <p>See Also: "Usage Notes" on page 28-20 for more information about this parameter.</p>
checkpoint_retention_time	<p>Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically.</p> <p>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours.</p> <p>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about checkpoint retention time</p>

Usage Notes

Consider the following usage notes when you run this procedure:

- [DBA Role Required for User Who Invokes the CREATE_CAPTURE Procedure](#)
- [Capture User Requirements](#)
- [First SCN and Start SCN Settings](#)
- [Explicit Log File Assignment](#)

DBA Role Required for User Who Invokes the CREATE_CAPTURE Procedure

The user who invokes this procedure must be granted DBA role.

Capture User Requirements

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process

- EXECUTE privilege on all rule-based transformation functions used in the positive rule set
- EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process

These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
 - Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.
-
-

First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

first_scn Setting	start_scn Setting	Capture Process Type	Description
Non-NULL	NULL	Local or Downstream	<p>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the <code>first_scn</code> parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN.</p> <p>The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised when the capture process is started.</p> <p>Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</p>
Non-NULL	Non-NULL	Local or Downstream	<p>If the specified value for the <code>start_scn</code> parameter is greater than or equal to the specified value for the <code>first_scn</code> parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the <code>start_scn</code> parameter is less than the specified value for the <code>first_scn</code> parameter, then an error is raised.</p> <p>The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been called at least once before on the source database, and the specified <code>first_scn</code> must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised.</p> <p>Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</p>

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Local	<p>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</p> <ul style="list-style-type: none"> ■ There is no existing capture process for the local source database, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database. ■ There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the <code>start_scn</code> parameter is greater than or equal to the current SCN for the database. <p>In either of these cases, the <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the <code>BUILD</code> procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.</p> <p>However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.</p> <p>If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.</p>

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Downstream	<p>When the CREATE_CAPTURE procedure creates a downstream capture process, the use_database_link parameter must be set to TRUE when the first_scn parameter is set to NULL. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database.</p> <p>The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:</p> <ul style="list-style-type: none"> There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. <p>In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing.</p> <p>However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.</p> <p>If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified start_scn parameter value is less than the current SCN for the source database, then an error is raised.</p>
NULL	NULL	Local or Downstream	<p>The behavior is the same as setting the first_scn parameter to NULL and setting the start_scn parameter to the current SCN of the source database.</p>

Note: When you create a capture process using the DBMS_STREAMS_ADM package, both the first SCN and the start SCN are set to NULL during capture process creation.

See Also: [BUILD Procedure](#) on page 28-15 for more information about the BUILD procedure and the LogMiner data dictionary

Explicit Log File Assignment

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE  
    file_name FOR capture_process;
```

Here, *file_name* is the name of the redo log file being added and *capture_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture_process* is equivalent to the *logminer_session_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

See Also: *Oracle Database SQL Language Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

See Also: *Oracle Streams Concepts and Administration* for more information about creating a synchronous capture

Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
  queue_name      IN  VARCHAR2,
  capture_name    IN  VARCHAR2,
  rule_set_name   IN  VARCHAR2,
  capture_user    IN  VARCHAR2  DEFAULT NUL);
```

Parameters

Table 28–9 CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
queue_name	<p>The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [<i>schema_name</i>.] <i>queue_name</i>. For example, to specify a queue in the <i>strmadmin</i> schema named <i>streams_queue</i>, enter <i>strmadmin.streams_queue</i>. If the schema is not specified, then the current user is the default.</p> <p>Note: The <i>queue_name</i> setting cannot be altered after the synchronous capture is created.</p>
capture_name	<p>The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner.</p> <p>Note: The <i>capture_name</i> setting cannot be altered after the synchronous capture is created.</p>
rule_set_name	<p>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes.</p> <p>Specify an existing rule set in the form [<i>schema_name</i>.] <i>rule_set_name</i>. For example, to specify a positive rule set in the <i>strmadmin</i> schema named <i>sync_cap_rules</i>, enter <i>strmadmin.sync_cap_rules</i>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You should only specify a rule set that was created using the <i>DBMS_STREAMS_ADM</i> package.</p> <p>If NULL, then an error is returned.</p> <p>Note: Synchronous capture rules must be added to the synchronous capture rule set using the <i>ADD_TABLE_RULES</i> or <i>ADD_SUBSET_RULES</i> procedure in the <i>DBMS_STREAMS_ADM</i> package. A synchronous capture ignores rules added to the rule set with other procedures.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about the changes that can be captured by a synchronous capture</p>

Table 28–9 (Cont.) CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	<p>The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used.</p> <p>Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS.</p> <p>Note: If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the synchronous capture is set to NULL automatically. You must specify a capture user before the synchronous capture can capture changes.</p> <p>See Also: "Usage Notes" on page 28-27 for more information about this parameter.</p>

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture

These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note: A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

DROP_CAPTURE Procedure

This procedure drops a capture process.

Note: A capture process must be stopped before it can be dropped.

See Also: ["STOP_CAPTURE Procedure"](#) on page 28-41

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name          IN  VARCHAR2,
    drop_unused_rule_sets IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 28–10 *DROP_CAPTURE Procedure Parameters*

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
  capture_name  IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  include       IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 28–11 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings: <ul style="list-style-type: none"> ▪ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. ▪ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ▪ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ▪ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ▪ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ▪ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture. If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want

to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure should be used to prepare the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
    supplemental_logging IN VARCHAR2 DEFAULT 'keys');
```

Parameter

Table 28–12 *PREPARE_GLOBAL_INSTANTIATION Procedure Parameter*

Parameter	Description
supplemental_logging	<p>Either none, keys, or all.</p> <p>If none is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If keys is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying keys does not enable supplemental logging of bitmap join index columns.</p> <p>If all is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</p>

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure should be used to prepare the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
  schema_name      IN  VARCHAR2,
  supplemental_logging IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 28–13 *PREPARE_SCHEMA_INSTANTIATION Procedure Parameters*

Parameter	Description
schema_name	The name of the schema. For example, hr.
supplemental_logging	<p>Either none, keys, or all.</p> <p>If none is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.</p> <p>If keys is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying keys does not enable supplemental logging of bitmap join index columns.</p> <p>If all is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</p>

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function should be used to prepare one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is `VARCHAR2` datatype in one version and `DBMS_UTILITY.UNCL_ARRAY` datatype in the other version.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

Table 28–14 *PREPARE_SYNC_INSTANTIATION Function Parameter*

Parameter	Description
<code>table_names</code>	<p>When the <code>table_names</code> parameter is <code>VARCHAR2</code> datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries.</p> <p>When the <code>table_names</code> parameter is <code>DBMS_UTILITY.UNCL_ARRAY</code> datatype, specify a PL/SQL index-by table of this type that contains the names of the tables to prepare for instantiation. The first table name should be at position 1, the second at position 2, and so on. The table does not need to be <code>NULL</code> terminated.</p> <p>In either version of the function, specify the name of each table in the form <code>[schema_name.] table_name</code>. For example, <code>hr.employees</code>. If the schema is not specified, then the current user is the default.</p>

PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure should be used to prepare the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
  table_name          IN  VARCHAR2,
  supplemental_logging IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 28–15 *PREPARE_TABLE_INSTANTIATION Procedure Parameters*

Parameter	Description
table_name	The name of the table specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.
supplemental_logging	Either <i>none</i> , <i>keys</i> , or <i>all</i> . If <i>none</i> is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table. If <i>keys</i> is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying <i>keys</i> does not enable supplemental logging of bitmap join index columns. If <i>all</i> is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(  
    capture_name IN VARCHAR2,  
    parameter    IN VARCHAR2,  
    value        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 28–16 SET_PARAMETER Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner.
parameter	The name of the parameter you are setting. See " Capture Process Parameters " on page 28-36 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 28–17 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
<code>disable_on_limit</code>	Y or N	N	<p>If Y, then the capture process is disabled because it reached a value specified by the <code>time_limit</code> parameter or <code>message_limit</code> parameter.</p> <p>If N, then the capture process is restarted immediately after stopping because it reached a limit.</p> <p>When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (<code>CPnn</code>) remains the same.</p>
<code>downstream_real_time_mine</code>	Y or N	Y for local capture processes N for downstream capture processes	<p>If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement <code>ALTER SYSTEM ARCHIVE LOG CURRENT</code> to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See <i>Oracle Streams Concepts and Administration</i> for information about creating a real-time downstream capture process.</p> <p>If N, then the capture process is an archived-log downstream capture process.</p> <p>This parameter is ignored for local capture processes.</p>
<code>maximum_scn</code>	A valid SCN or infinite	infinite	<p>The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified.</p> <p>If infinite, then the capture process runs regardless of the SCN value.</p>
<code>message_limit</code>	A positive integer or infinite	infinite	<p>The capture process stops after capturing the specified number of messages.</p> <p>If infinite, then the capture process continues to run regardless of the number of messages captured.</p>
<code>message_tracking_frequency</code>	0 or a positive integer	2000000	<p>The frequency at which messages captured by the capture process are tracked automatically.</p> <p>For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically.</p> <p>The tracking label used for automatic message tracking is <code>capture_process_name:AUTOTRACK</code>, where <code>capture_process_name</code> is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes.</p> <p>If 0 (zero), then no messages are tracked automatically.</p> <p>See <i>Oracle Streams Replication Administrator's Guide</i> for more information about message tracking.</p>

Table 28–17 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
parallelism	A positive integer	1	<p>The number of preparer servers that can concurrently mine the redo log for the capture process.</p> <p>A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the <code>parallelism</code> capture process parameter. So, if <code>parallelism</code> is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server.</p> <p>Setting the <code>parallelism</code> parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the <code>PROCESSES</code> and <code>PARALLEL_MAX_SERVERS</code> initialization parameters are set appropriately when you set the <code>parallelism</code> capture process parameter.</p> <p>Note: When you change the value of this parameter, the capture process is stopped and restarted automatically.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about capture process components</p>
skip_autofiltered_table_ddl	Y or N	Y	<p>If <code>Y</code>, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process.</p> <p>If <code>N</code>, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets.</p> <p>The <code>AUTO_FILTERED</code> column in the <code>DBA_STREAMS_UNSUPPORTED</code> data dictionary view shows which tables are automatically filtered by capture processes.</p>
startup_seconds	0, a positive integer, or infinite	0	<p>The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually.</p> <p>If <code>infinite</code>, then the capture process does not start until another instantiation of the same capture process finishes.</p>
time_limit	A positive integer or infinite	infinite	<p>The capture process stops as soon as possible after the specified number of seconds since it started.</p> <p>If <code>infinite</code>, then the capture process continues to run until it is stopped explicitly.</p>
trace_level	0 or a positive integer	0	<p>Set this parameter only under the guidance of Oracle Support Services.</p>
write_alert_log	Y or N	Y	<p>If <code>Y</code>, then the capture process writes a message to the alert log on exit.</p> <p>If <code>N</code>, then the capture process does not write a message to the alert log on exit.</p> <p>The message specifies the reason the capture process stopped.</p>

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify `infinite` for larger values.
 - For parameters that require an SCN setting, any valid SCN value can be specified.
-
-

START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by `c`.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of a capture process.

See Also: [Chapter 129, "DBMS_STREAMS_ADM"](#)

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(  
    capture_name IN VARCHAR2);
```

Parameters

Table 28–18 *START_CAPTURE Procedure Parameter*

Parameter	Description
<code>capture_name</code>	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A <code>NULL</code> setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is `ENABLED`, then the capture process is started upon database instance startup. A capture process (`cnnn`) is an Oracle background process.

STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

The stop status is persistently recorded. Hence, if the status is `DISABLED`, then the capture process is not started upon database instance startup.

The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the stop status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
  capture_name IN VARCHAR2,
  force       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 28–19 STOP_CAPTURE Procedure Parameters

Parameter	Description
<code>capture_name</code>	The name of the capture process. A <code>NULL</code> setting is not allowed. Do not specify an owner.
<code>force</code>	This parameter is reserved for future use. Currently, valid <code>BOOLEAN</code> settings are ignored.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the capture process is not started upon database instance startup. A capture process (`cnnn`) is an Oracle background process.

DBMS_CDC_PUBLISH

The `DBMS_CDC_PUBLISH` package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one **publisher** who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the `DBMS_CDC_SUBSCRIBE` package.

See Also: *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture

This chapter contains the following topics:

- [Using DBMS_CDC_PUBLISH](#)
 - Overview
 - Deprecated Subprograms
 - Security Model
 - Views
- [Summary of DBMS_CDC_PUBLISH Subprograms](#)

Using DBMS_CDC_PUBLISH

This section contains the following topics, which relate to using the DBMS_CDC_PUBLISH package:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Views](#)

Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

See Also: [Chapter 30, "DBMS_CDC_SUBSCRIBE"](#) for information on the package used to subscribe to published change data

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g:

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION` with a subscription handle
When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.
- `DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW`
Dropping a subscriber view is now performed automatically by Change Data Capture.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_CDC_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in *Oracle Database Data Warehousing Guide* for details.

Views

The `DBMS_CDC_PUBLISH` package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_PUBLISH Subprograms

Table 29–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

Table 29–1 DBMS_CDC_PUBLISH Package Subprograms

Subprogram	Mode	Description
ALTER_AUTOLOG_CHANGE_SOURCE Procedure on page 29-8	Asynchronous AutoLog	Changes one or more properties of an existing AutoLog change source
ALTER_CHANGE_SET Procedure on page 29-10	All	Changes one or more of the properties of an existing change set
ALTER_CHANGE_TABLE Procedure on page 29-13	All	Adds or drops columns for an existing change table, or changes the properties of an existing change table
ALTER_HOTLOG_CHANGE_SOURCE Procedure on page 29-16	Asynchronous Distributed HotLog	Changes one or more properties of an existing Distributed HotLog change source
CREATE_AUTOLOG_CHANGE_SOURCE Procedure on page 29-18	Asynchronous AutoLog	Creates an AutoLog change source
CREATE_CHANGE_SET Procedure on page 29-20	All	Creates a change set
CREATE_CHANGE_TABLE Procedure on page 29-23	All	Creates a change table in a specified schema
CREATE_HOTLOG_CHANGE_SOURCE Procedure on page 29-27	Asynchronous Distributed HotLog	Creates a Distributed HotLog change source
DROP_CHANGE_SET Procedure on page 29-29	All	Drops an existing change set
DROP_CHANGE_SOURCE Procedure on page 29-30	Asynchronous Autolog and Asynchronous Distributed Hotlog	Drops an existing AutoLog or Distributed HotLog change source
DROP_CHANGE_TABLE Procedure on page 29-31	All	Drops an existing change table
DROP_SUBSCRIPTION Procedure on page 29-32	All	Allows a publisher to drop a subscription that was created by a subscriber
GET_DDLOPER Function on page 29-33	All	Converts a binary integer into a user friendly string that describes the DDL operation that actually took place
PURGE Procedure on page 29-34	All	Removes unneeded rows from all change tables in the staging database
PURGE_CHANGE_SET Procedure on page 29-35	All	Removes unneeded rows from all change tables in a specified change set
PURGE_CHANGE_TABLE Procedure on page 29-36	All	Removes unneeded rows from a specified change table

ALTER_AUTOLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description IN CHAR DEFAULT 'N',
    first_scn          IN NUMBER DEFAULT NULL);
```

Parameters

Table 29–2 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
first_scn	New first SCN.

Exceptions

Table 29–3 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31455	Nothing to ALTER
ORA-31497	Invalid value specified for first_scn
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31501	Specified change source is not an AutoLog change source
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

See Also: The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

ALTER_CHANGE_SET Procedure

This procedure changes the properties of an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_SET (
    change_set_name      IN VARCHAR2,
    description          IN VARCHAR2 DEFAULT NULL,
    remove_description  IN CHAR DEFAULT 'N',
    enable_capture       IN CHAR DEFAULT NULL,
    recover_after_error IN CHAR DEFAULT NULL,
    remove_ddl          IN CHAR DEFAULT NULL,
    stop_on_ddl         IN CHAR DEFAULT NULL);
```

Parameters

Table 29–4 ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
description	New description of the change set. Specify using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_capture	A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled. Asynchronous change sets are created with change data capture disabled.
recover_after_error	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.
remove_ddl	A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.

Table 29–4 (Cont.) ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
stop_on_ddl	<p>A value of 'Y' or 'N'.</p> <p>If the value is 'Y', then Change Data Capture stops when a DDL event is detected.</p> <p>If the value is 'N', then Change Data Capture continues when a DDL event is detected.</p> <p>See the Usage Notes for additional information about this parameter.</p>

Exceptions

Table 29–5 ALTER_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31455	Invalid lock handle while acquiring lock
ORA-31468	Cannot process DDL change record
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31485	Invalid database link
ORA-31498	The <code>description</code> and <code>remove_description</code> parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, `SYNC_SET`, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: `enable_capture`, `recover_after_error`, `remove_ddl`, and `stop_on_ddl`.
- Properties supplied to this procedure with a `NULL` value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the `stop_on_ddl` parameter is as follows:
 - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity

to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

- * ANALYZE TABLE
- * LOCK TABLE
- * GRANT privileges to access a table
- * REVOKE privileges to access a table
- * COMMENT on a table
- * COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying 'Y' for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:
 - The `stop_on_ddl` parameter is set to 'Y' and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify 'Y' for the `remove_ddl` parameter.
 - The `stop_on_ddl` parameter is set to 'N' and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
 - A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table *string.string* partition *string* by *string* in tablespace *string*).

See Also: *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.

ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE (
    owner                IN VARCHAR2,
    change_table_name    IN VARCHAR2,
    operation            IN VARCHAR2,
    column_list          IN VARCHAR2,
    rs_id                IN CHAR,
    row_id               IN CHAR,
    user_id              IN CHAR,
    timestamp            IN CHAR,
    object_id            IN CHAR,
    source_colmap        IN CHAR,
    target_colmap        IN CHAR,
    ddl_markers          IN CHAR DEFAULT NULL);
```

Parameters

Table 29–6 ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	The schema that owns the change table.
change_table_name	The change table that is being altered. Change table names follow the Oracle schema object naming rules.
operation	Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.
column_list	User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.

Table 29–6 (Cont.) ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
rs_id	Each listed parameter specifies a particular control column, as follows:
row_id	
user_id	<ul style="list-style-type: none"> ▪ The rs_id parameter specifies the RSID\$ control column.
timestamp	<ul style="list-style-type: none"> ▪ The row_id parameter specifies the ROW_ID\$ control column.
object_id	<ul style="list-style-type: none"> ▪ The user_id parameter specifies the USERNAME\$ control column.
source_colmap	<ul style="list-style-type: none"> ▪ The timestamp parameter specifies the TIMESTAMP\$ control column.
target_colmap	<ul style="list-style-type: none"> ▪ The object_id parameter specifies the SYS_NC_OID\$ control column.
ddl_markers	<ul style="list-style-type: none"> ▪ The source_colmap parameter specifies the SOURCE_COLMAP\$ control column. ▪ The target_colmap parameter specifies the TARGET_COLMAP\$ control column. ▪ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. These are the three additional control columns you get when ddl_markers is enabled. There are three values: DDLOPER\$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER (ddloper\$) to get the name of the DDL operation.) DDLDESC\$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN\$ is not used in this release. <p>Each parameter must have a value of either 'Y' or 'N', where:</p> <ul style="list-style-type: none"> ▪ 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter. ▪ 'N': Neither adds the specified control column, nor drops it from the change table.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns.

Exceptions

Table 29–7 ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31403	Specified change table already contains the specified column
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column <i>control-column-name</i>
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31423	Specified change table does not contain the specified column
ORA-31454	Invalid value specified for operation parameter, expecting ADD or DROP

Table 29–7 (Cont.) ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31455	Nothing to alter
ORA-31456	Error executing a procedure in the DBMS_CDC_UTILITY package
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER_CHANGE_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

See Also: *Oracle Database Data Warehousing Guide* for information about the impact on subscriptions when a publisher adds a column to a change table.

ALTER_HOTLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    remove_description IN CHAR DEFAULT 'N',
    enable_source      IN CHAR DEFAULT NULL);
```

Parameters

Table 29–8 ALTER_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_source	A value of 'Y' or 'N'. If the value is 'Y', then the change source is enabled. If the value is 'N', then the change source is disabled.

Exceptions

Table 29–9 ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Change source is not an existing change source
ORA-31455	Nothing to ALTER
ORA-31480	Staging database and source database cannot be the same
ORA-31481	Change source is not a HotLog change source
ORA-31482	Invalid option for non-distributed HotLog change source
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Parameter value longer than maximum length
ORA-31532	Cannot enable change source

Table 29–9 (Cont.) ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, `HOTLOG_SOURCE`, which cannot be altered.

CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on of a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE (
    change_source_name IN VARCHAR2,
    description         IN VARCHAR2 DEFAULT NULL,
    source_database    IN VARCHAR2,
    first_scn          IN NUMBER,
    online_log         IN CHAR DEFAULT 'N');
```

Parameters

Table 29–10 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source. Change source names follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	Global name of the change source's source database instance.
first_scn	The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.
online_log	A value of 'Y' or 'N'. If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with <code>online_log='Y'</code> on a given staging database. If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with <code>online_log='N'</code> on a given staging database.

Exceptions

Table 29–11 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source specified
ORA-31497	Invalid value specified for <code>first_scn</code>
ORA-31499	Null value specified for required parameter
ORA-31507	Specified parameter value is longer than the maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31535	Cannot support change source in this configuration

Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the `source_database` parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the `GLOBAL_NAME` column in the `GLOBAL_NAME` view at the source database for the `source_database` parameter value.
- The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The `CREATE_AUTOLOG_CHANGE_SOURCE first_scn` parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the `first_scn` parameter using either of the following methods:

- Direct `DBMS_CAPTURE_ADM.BUILD` to return the value when the dictionary is built:

```
SET SERVEROUTPUT ON
VARIABLE FSCN NUMBER;
BEGIN
  :FSCN := 0;
  DBMS_CAPTURE_ADM.BUILD(:FSCN);
  DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
END;
/
The first_scn value is 207722
```

- Make the following query on the source database. If this query returns multiple distinct values for `first_change#`, then the data dictionary has been extracted more than once and the publisher should choose the `first_change#` value that is the most appropriate to the change source.

```
SELECT DISTINCT FIRST_CHANGE#, NAME
FROM V$ARCHIVED_LOG
WHERE DICTIONARY_BEGIN = 'YES';
```

See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

See Also: *Oracle Database Data Warehousing Guide* for information about supplemental logging.

CREATE_CHANGE_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
    change_set_name      IN VARCHAR2,
    description          IN VARCHAR2 DEFAULT NULL,
    change_source_name  IN VARCHAR2,
    stop_on_ddl         IN CHAR DEFAULT 'N',
    begin_date          IN DATE DEFAULT NULL,
    end_date            IN DATE DEFAULT NULL);
```

Parameters

Table 29–12 CREATE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set. Change set names follow the Oracle schema object naming rules.
description	Description of the change set. Specify using 255 or fewer characters.
change_source_name	Name of the existing change source to contain this change set.
stop_on_ddl	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.
begin_date	Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.
end_date	Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.

Exceptions

Table 29–13 CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31407	The end_date must be greater than the begin_date
ORA-31408	Invalid value specified for begin_scn or end_scn
ORA-31437	Duplicate change set specified
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31483	Cannot have spaces in the parameter
ORA-31485	Invalid database link

Table 29–13 (Cont.) CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31487	Cannot support begin dates or end dates in this configuration
ORA-31488	Cannot support change set in this configuration
ORA-31499	Null value specified for required parameter
ORA-31503	Invalid date supplied for <code>begin_date</code> or <code>end_date</code>
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: `begin_date`, `end_date`, and `stop_on_ddl`. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: `begin_date` and `end_date`.
- When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the `CHANGE_PROPAGATION` and `CHANGE_PROPAGATION_SETS` views on the staging database.
- An AutoLog online change source (created with `online_log='Y'`) can only contain one change set.
- The `begin_date` and `end_date` parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
 - When a `begin_date` is specified, changes from transactions that begin on or after that date are captured.
 - When a `begin_date` is not specified, capture starts with the earliest available change data.
 - When an `end_date` is specified, changes from transactions that are committed on or before that date are captured.
 - When an `end_date` is not specified, Change Data Capture continues indefinitely.
- The effect of the `stop_on_ddl` parameter is as follows:
 - When the `stop_on_ddl` parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to 'Y' and any of the following statements is encountered:

 - * ANALYZE TABLE
 - * LOCK TABLE
 - * GRANT privileges to access a table

- * REVOKE privileges to access a table
- * COMMENT on a table
- * COMMENT on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

- When the `stop_on_ddl` parameter is set to 'N', Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

Note: Oracle recommends that the publisher be certain that the source table that will be referenced in a CREATE_CHANGE_TABLE procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the stop_on_ddl parameter set to 'Y'.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
  owner                IN VARCHAR2,
  change_table_name    IN VARCHAR2,
  change_set_name      IN VARCHAR2,
  source_schema        IN VARCHAR2,
  source_table         IN VARCHAR2,
  column_type_list     IN VARCHAR2,
  capture_values       IN VARCHAR2,
  rs_id                IN CHAR,
  row_id               IN CHAR,
  user_id              IN CHAR,
  timestamp            IN CHAR,
  object_id            IN CHAR,
  source_colmap        IN CHAR,
  target_colmap        IN CHAR,
  options_string       IN VARCHAR2,
  ddl_markers          IN CHAR DEFAULT 'Y');
```

Parameters

Table 29–14 CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.
change_set_name	Name of the change set in which this change table resides.
source_schema	The schema where the source table is located.
source_table	The source table from which the change records are captured.
column_type_list	The user columns and datatypes that are being tracked. Specify using a comma-delimited list.
capture_values	One of the following capture values for update operations: <ul style="list-style-type: none"> ■ OLD: Captures the original values from the source table. ■ NEW: Captures the changed values from the source table. ■ BOTH: Captures the original and changed values from the source table.

Table 29–14 (Cont.) CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description	
rs_id	<p>Each listed parameter specifies a particular control column as follows:</p> <ul style="list-style-type: none"> ■ The rs_id parameter specifies the RSID\$ control column. ■ The row_id parameter specifies the ROW_ID\$ control column. ■ The user_id parameter specifies the USERNAME\$ control column. ■ The timestamp parameter specifies the TIMESTAMP\$ control column. ■ The object_id parameter specifies the SYS_NC_OID\$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP\$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP\$ control column. ■ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. There are three values: DDLOPER\$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper\$) to get the name of the DDL operation.) DDLDESC\$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN\$ is not used in this release. <p>Each parameter can have a value of 'Y' or 'N', where:</p> <ul style="list-style-type: none"> ■ 'Y': Adds the specified control column to the change table. ■ 'N': Does not add the specified control column to the change table. 	
row_id		
user_id		
timestamp		
object_id		
source_colmap		
target_colmap		
ddl_markers		
options_string		The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns

Exceptions

Table 29–15 CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31402	Unrecognized parameter specified
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column <i>control-column-name</i>
ORA-31418	Specified source schema does not exist
ORA-31419	Specified source table does not exist
ORA-31420	Unable to submit the purge job

Table 29–15 (Cont.) CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Owner schema does not exist
ORA-31438	Duplicate change table
ORA-31447	Cannot create change tables in the SYS schema
ORA-31450	Invalid value for <code>change_table_name</code>
ORA-31451	Invalid value for <code>capture_values</code> , expecting: OLD, NEW, or BOTH
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31467	No column found in the source table
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
- A change table is a database table that contains two types of columns:
 - User columns, which are copies of actual columns of source tables that reside in the change table.
 - Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.
- If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher's Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher's database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.
- The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.
- When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the `source_colmap` and `object_id` parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify 'N' for the `row_id` and `username` parameters when the change source is 9.2 or 10.1.

- When the publisher specifies the `rs_id` parameter, the `RSID$` column is added to the change table. The `RSID$` column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the `RSID$` column value by itself to order committed operations across transactions; it must be used in conjunction with the `CSCN$` column value.
- The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the `options_string` parameter. With the `options_string` parameter, the publisher can set any option that is valid for the `CREATE TABLE DDL` statement (except for partitioning properties).

Note: How the publisher defines the `options_string` parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses `NOT NULL` constraints and a particular column is not changed in an incoming change row, then the constraint can cause the `INSERT` operation to fail and the transaction that contains the `INSERT` operation to be rolled back.

- Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system tablespace or if the publisher specifies a tablespace in the `options_string` parameter. If a tablespace is not specified by the publisher, and the publisher's default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

See Also: *Oracle Database Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.

CREATE_HOTLOG_CHANGE_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE (
    change_source_name    IN VARCHAR2,
    description           IN VARCHAR2 DEFAULT NULL,
    source_database       IN VARCHAR2);
```

Parameters

Table 29–16 CREATE_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameters	Description
change_source_name	Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	The name of the database link defined from the staging database to the source database, where the source database is Oracle9i Database, Database 10g Release 1, Oracle Database 10g Release 2, or Oracle Database 11g Release 1. See <i>Oracle Database Data Warehousing Guide</i> for information on creating database links for the Distributed HotLog mode of Change Data Capture.

Exceptions

Table 29–17 CREATE_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source
ORA-31480	Staging database and source database cannot be the same
ORA-31483	Cannot have spaces in the parameter
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31507	Parameter value longer than the maximum length
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the

predefined change source, `HOTLOG_SOURCE`, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.
- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.
- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
 - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
 - Inserts a row into the `CHANGE_SOURCES` view on the staging database where the `SOURCE_TYPE` column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.
- Note that the database link indicated by the `source_database` parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.

DROP_CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SET (
    change_set_name    IN VARCHAR2);
```

Parameters

Table 29–18 DROP_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 29–19 DROP_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31411	Specified change set is referenced by a change table
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value is longer than maximum length

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.

DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE_HOTLOG_CHANGE_SOURCE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE (
    change_source_name    IN VARCHAR2);
```

Parameters

Table 29–20 DROP_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.

Exceptions

Table 29–21 DROP_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31406	Specified change source is referenced by a change set
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.

DROP_CHANGE_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE (
    owner           IN VARCHAR2,
    change_table_name IN VARCHAR2,
    force_flag      IN CHAR);
```

Parameters

Table 29–22 DROP_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.
force_flag	Drops the change table, depending on whether or not there are subscriptions to it, as follows: <ul style="list-style-type: none"> ▪ 'Y': Drops the change table even if there are subscriptions to it. ▪ 'N': Drops the change table only if there are no subscriptions to it.

Exceptions

Table 29–23 DROP_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31424	Change table has active subscriptions
ORA-31441	Table is not a change table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP_CHANGE_TABLE procedure using the force_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.

DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the `DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION` procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
    subscription_name IN VARCHAR2);
```

Parameters

Table 29–24 *DROP_SUBSCRIPTION Procedure Parameters*

Parameter	Description
subscription_name	Name of the subscription that was specified by a previous call to the <code>DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION</code> procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 29–25 *DROP_SUBSCRIPTION Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31432	Invalid source table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure and the publisher need not use the `DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION` procedure.

GET_DDLOPER Function

This function converts a binary integer into a user friendly string that describes the DDL operation that actually took place.

Syntax

```
DBMS_CDC_PUBLISH.GET_DDLOPER (ddloper IN BINARY_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 29–26 Function Parameters

Parameter	Description
ddloper	An integer value representing what DDL operation actually occurred. This value is obtained from the ddloper\$ column in the subscriber's view.

Example

The following illustrates how to use change markers. First, you execute a DDL statement and then verify that it has been captured.

```
ALTER TABLE cdc_psales DROP PARTITION Dec_06;

SELECT ddloper$, DECODE(ddloper$, NULL, 'NULL',
    DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$))
    AS DDL_OPER
FROM cdc_psales_act
WHERE DDLOPER$ IS NOT NULL
ORDER BY cscn$;

ddloper$          DDL_OPER
-----
512                Drop Partition
1 row selected.

SELECT ddldesc$
FROM cdc_psales_act
WHERE ddloper$
IS NOT NULL
ORDER BY cscn$;

DDLDESC$
-----
alter table cdc_psales drop partition Dec_06
1 row selected.
```

Usage Notes

- If an invalid value for ddloper is given, then 'Invalid value for DDLOPR\$' will be returned by this function.
- This function only works for asynchronous Change Data Capture.

PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

Syntax

```
DBMS_CDC_PUBLISH.PURGE;
```

Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
 - The publisher can run this procedure manually from the command line to purge data from change tables.
 - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET (
    change_set_name IN VARCHAR2,
    force           IN CHAR DEFAULT 'Y',
    purge_date     IN DATE DEFAULT NULL);
```

Parameters

Table 29–27 PURGE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

Exceptions

Table 29–28 PURGE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Change set is not an existing change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE (
  owner          IN VARCHAR2,
  change_table_name IN VARCHAR2,
  force          IN CHAR DEFAULT 'Y',
  purge_date     IN DATE DEFAULT NULL);
```

Parameters

Table 29–29 PURGE_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the named change table.
change_table_name	Name of an existing change table. Change table names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

Exceptions

Table 29–30 PURGE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

DBMS_CDC_SUBSCRIBE

The DBMS_CDC_SUBSCRIBE package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The **subscribers** (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

See Also: *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

- [Using DBMS_CDC_SUBSCRIBE](#)
 - Overview
 - Deprecated Subprograms
 - Security Model
 - Views
- [Summary of DBMS_CDC_SUBSCRIBE Subprograms](#)

Using DBMS_CDC_SUBSCRIBE

This section contains the following topics, which relate to using the DBMS_CDC_SUBSCRIBE package:

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Views](#)

Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

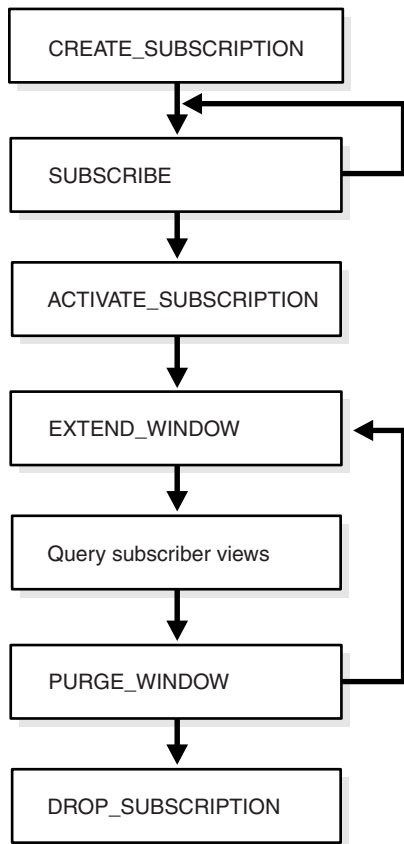

1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL `SELECT` statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 30-1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS_CDC_SUBSCRIBE package (which are listed in Table 30-1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

Note: If a subscriber uses the `PURGE_WINDOW` procedure immediately after using an `EXTEND_WINDOW` procedure, then change data may be lost without ever being processed.

See Also: [Chapter 29, "DBMS_CDC_PUBLISH"](#) for information on the package for publishing change data.

Figure 30-1 Subscription Flow

Deprecated Subprograms

The following subprograms are deprecated with Oracle Database 11g:

- `DROP_SUBSCRIBER_VIEW`

Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

- `GET_SUBSCRIPTION_HANDLE`

Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.

- `PREPARE_SUBSCRIBER_VIEW`

Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

Security Model

Change Data Capture grants EXECUTE privileges to PUBLIC on the DBMS_CDC_
SUBSCRIBE package.

Views

The DBMS_CDC_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_SUBSCRIBE Subprograms

Table 30–1 DBMS_CDC_SUBSCRIBE Package Subprograms

Subprogram	Description
ACTIVATE_SUBSCRIPTION Procedure on page 30-9	Indicates that a subscription is ready to start accessing change data
CREATE_SUBSCRIPTION Procedure on page 30-10	Creates a subscription and associates it with one change set
DROP_SUBSCRIPTION Procedure on page 30-12	Drops a subscription that was created with a prior call to the <code>CREATE_SUBSCRIPTION</code> procedure
EXTEND_WINDOW Procedure on page 30-13	Sets a subscription window high boundary so that new change data can be seen
PURGE_WINDOW Procedure on page 30-15	Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data
SUBSCRIBE Procedure on page 30-16	Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table

ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
    subscription_name IN VARCHAR2);
```

Parameters

Table 30–2 ACTIVATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 30–3 ACTIVATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
 - No additional source tables can be added to the subscription.
 - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
 - The subscriber must use the EXTEND_WINDOW procedure to see the initial set of change data.
 - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end_date parameter value.

CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated `GET_SUBSCRIPTION_HANDLE` procedure.

Syntax

```
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (
    change_set_name      IN  VARCHAR2,
    description          IN  VARCHAR2,
    subscription_name    IN  VARCHAR2);
```

Parameters

Table 30–4 CREATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
<code>change_set_name</code>	The name of an existing change set to which the subscriber subscribes
<code>description</code>	A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.
<code>subscription_name</code>	A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of <code>CDC\$</code> . Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 30–5 CREATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31449	Invalid value for <code>change_set_name</code>
ORA-31457	Maximum length of description field exceeded
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31506	Duplicate subscription name specified
ORA-31510	Name uses reserved prefix <code>CDC\$</code>
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The `CREATE_SUBSCRIPTION` procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.

- Subscriptions cannot be created if the underlying change set has reached its end_date parameter value.

DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (  
    subscription_name IN VARCHAR2);
```

Parameters

Table 30–6 *DROP_SUBSCRIPTION Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 30–7 *DROP_SUBSCRIPTION Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.

EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (
    subscription_name IN VARCHAR2,
    upper_bound       IN DATE DEFAULT NULL);
```

Parameters

Table 30–8 *EXTEND_WINDOW Procedure Parameters*

Parameter	Description
subscription_name	The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
upper_bound	A date/timestamp to move the upper bound of the subscription window to.

Exceptions

Table 30–9 *EXTEND_WINDOW Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31509	Publication does not exist
ORA-31514	Change set disabled due to capture error

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
 - The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
 - Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.

- When the underlying change set for a subscription has reached its `end_date` parameter value, subsequent calls to the `EXTEND_WINDOW` procedure will not raise the high boundary.

PURGE_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
    subscription_name  IN VARCHAR2,
    lower_bound        IN DATE DEFAULT NULL);
```

Parameters

Table 30–10 *PURGE_WINDOW Procedure Parameters*

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
lower_bound	A date/timestamp to move the lower bound of the subscription window to.

Exceptions

Table 30–11 *PURGE_WINDOW Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
 - Informs Change Data Capture that the subscriber is finished with the current set of change data.
 - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.

- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the PURGE_WINDOW procedure will not move the low boundary.

SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table

When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified `source_table` and `column_list`. If such a publication cannot be found, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
    subscription_name    IN VARCHAR2,
    source_schema        IN VARCHAR2,
    source_table         IN VARCHAR2,
    column_list          IN VARCHAR2,
    subscriber_view     IN VARCHAR2);
```

- Using publication IDs

When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the `column_list` parameter are not in the identified change table, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
    subscription_name    IN VARCHAR2,
    publication_id       IN NUMBER,
    column_list          IN VARCHAR2,
    subscriber_view     IN VARCHAR2);
```

Parameters

Table 30–12 SUBSCRIBE Procedure Parameters

Parameter	Description
<code>subscription_name</code>	The name of a subscription that was specified for, or returned by, a previous call to the <code>CREATE_SUBSCRIPTION</code> procedure. Subscription names follow the Oracle schema object naming rules.
<code>source_schema</code>	The name of the schema where the source table resides
<code>source_table</code>	The name of a published source table
<code>column_list</code>	A comma-delimited list of columns from the published source table or publication
<code>subscriber_view</code>	Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of <code>CDC\$</code> . Subscriber view names follow the Oracle schema object naming rules.
<code>publication_id</code>	A valid <code>publication_id</code> , which the subscriber can obtain from the <code>ALL_PUBLISHED_COLUMNS</code> view.

Exceptions

Table 30–13 *SUBSCRIBE Procedure Exceptions*

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31427	Specified source table already subscribed
ORA-31428	No publication contains all the specified columns
ORA-31432	Invalid source table
ORA-31466	No publications found
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31510	Name uses reserved prefix CDC\$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The `SUBSCRIBE` procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the `SUBSCRIBE` procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the `SUBSCRIBE` procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the `SUBSCRIBE` procedure using the `source_schema` and `source_table` parameters or using the `publication_id` parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the `SUBSCRIBE` procedure using the `publication_id` parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the `ALL_PUBLISHED_COLUMNS` view.
- A subscriber can query the `ALL_PUBLISHED_COLUMNS` view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the `SUBSCRIBE` procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the `SUBSCRIBE` procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.

DBMS_COMPARISON

The DBMS_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- [Using DBMS_COMPARISON](#)
 - Overview
 - Security Model
 - Constants
 - Views
 - Operational Notes
- [Data Structures](#)
- [Summary of DBMS_COMPARISON Subprograms](#)

See Also:

- *Oracle Streams Replication Administrator's Guide* for information about using the advanced features of this package

Using DBMS_COMPARISON

This section contains topics which relate to using the DBMS_COMPARISON package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

Overview

The DBMS_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the DBMS_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE_COMPARE procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
 - DBA_COMPARISON_SCAN
 - USER_COMPARISON_SCAN
 - DBA_COMPARISON_SCAN_SUMMARY
 - USER_COMPARISON_SCAN_SUMMARY
 - DBA_COMPARISON_SCAN_VALUES
 - USER_COMPARISON_SCAN_VALUES
 - DBA_COMPARISON_ROW_DIF
 - USER_COMPARISON_ROW_DIF
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE_COMPARISON procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the `COMPARE` function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows in comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans

Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a `comparison_name` parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have SELECT privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

Constants

The `DBMS_COMPARISON` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_COMPARISON.CMP_SCAN_MODE_FULL`.

[Table 31-1](#) lists the parameters and enumerated constants.

Table 31-1 *DBMS_COMPARISON Parameters with Enumerated Constants*

Parameter	Option	Type	Description
<code>comparison_mode</code>	<ul style="list-style-type: none"> ■ <code>CMP_COMPARE_MODE_OBJECT</code> 	<code>VARCHAR2 (30)</code>	<code>CMP_COMPARE_MODE_OBJECT</code> is a database object. This constant can be specified as <code>'OBJECT'</code> .
<code>scan_mode</code>	<ul style="list-style-type: none"> ■ <code>CMP_SCAN_MODE_FULL</code> ■ <code>CMP_SCAN_MODE_RANDOM</code> ■ <code>CMP_SCAN_MODE_CYCLIC</code> ■ <code>CMP_SCAN_MODE_CUSTOM</code> 	<code>VARCHAR2 (30)</code>	<p><code>CMP_SCAN_MODE_FULL</code> indicates that the entire database object is compared. This constant can be specified as <code>'FULL'</code>.</p> <p><code>CMP_SCAN_MODE_RANDOM</code> indicates that a random portion of the database object is compared. This constant can be specified as <code>'RANDOM'</code>.</p> <p><code>CMP_SCAN_MODE_CYCLIC</code> indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as <code>'CYCLIC'</code>.</p> <p><code>CMP_SCAN_MODE_CUSTOM</code> indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as <code>'CUSTOM'</code>.</p>
<code>converge_options</code>	<ul style="list-style-type: none"> ■ <code>CMP_CONVERGE_LOCAL_WINS</code> ■ <code>CMP_CONVERGE_REMOTE_WINS</code> 	<code>VARCHAR2 (30)</code>	<p><code>CMP_CONVERGE_LOCAL_WINS</code> indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as <code>'LOCAL'</code>.</p> <p><code>CMP_CONVERGE_REMOTE_WINS</code> indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as <code>'REMOTE'</code>.</p>

Table 31-1 (Cont.) DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
null_value	<ul style="list-style-type: none"> ■ CMP_NULL_VALUE_DEF 	VARCHAR2(100)	CMP_NULL_VALUE_DEF indicates that ORA\$STREAMS\$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA\$STREAMS\$NV'.
max_num_buckets	<ul style="list-style-type: none"> ■ CMP_MAX_NUM_BUCKETS 	INTEGER	CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.
min_rows_in_bucket	<ul style="list-style-type: none"> ■ CMP_MIN_ROWS_IN_BUCKET 	INTEGER	CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.

Views

The DBMS_COMPARISON package uses the following views:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_SUMMARY
- USER_COMPARISON_SCAN_SUMMARY
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

See Also: *Oracle Database Reference*

Operational Notes

This section contains the following operational notes for the DBMS_COMPARISON package:

- [Oracle Database Release Requirements for the DBMS_COMPARISON Package](#)
- [Database Character Set Requirements for the DBMS_COMPARISON Package](#)
- [Database Object Requirements for the DBMS_COMPARISON Package](#)
- [Index Column Requirements for the DBMS_COMPARISON Package](#)
- [Datatype Requirements for the DBMS_COMPARISON Package](#)
- [Only Converge Rows That Are Not Being Updated](#)

Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11g Release 1 (11.1) database.
- The remote database must be an Oracle Database 10g Release 1 (10.1) or later database. Oracle databases prior to this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

See Also: *Oracle Database Globalization Support Guide* for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the `column_list` parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.

See Also: [CREATE_COMPARISON Procedure](#) on page 31-20

Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- Number columns are of the following datatypes: NUMBER, FLOAT, BINARY_FLOAT, and BINARY_DOUBLE.
- Timestamp columns are of the following datatypes: TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE
- Interval columns are of the following datatypes: INTERVAL YEAR TO MONTH and INTERVAL DAY TO SECOND.

For all scan modes to be supported by the DBMS_COMPARISON package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or DATE datatype column
- A composite index that only includes number, timestamp, interval, or DATE datatype columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

For the scan modes CMP_SCAN_MODE_FULL and CMP_SCAN_MODE_CUSTOM to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, DATE, VARCHAR2, or CHAR datatype column
- A composite index that only includes number, timestamp, interval, DATE, VARCHAR2, or CHAR columns. Each column in the composite index must either have a NOT NULL constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the DBMS_COMPARISON package does not support the database objects. For example, if the database objects only have a single index on an NVARCHAR2 column, then the DBMS_COMPARISON package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a NUMBER column and an NCHAR column, then the DBMS_COMPARISON package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-NULL columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.

The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the `column_list` parameter when the comparison is created with the `CREATE_COMPARISON` procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
INDEX_COLUMN = 'Y';
```

If there is more than one index column, then the index column with 1 for the COLUMN_POSITION is the lead index column in the composite index.

See Also:

- ["Constants"](#) on page 31-6 for information about scan modes
- [CREATE_COMPARISON Procedure](#) on page 31-20 for information about specifying an index for a comparison

Datatype Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare data in columns of the following datatypes:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY_FLOAT
- BINARY_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with datatype `TIMESTAMP WITH LOCAL TIME ZONE` is compared, then the two databases must use the same time zone. Also, if a column with datatype `NVARCHAR2` or `NCHAR` is compared, then the two databases must use the same national character set.

The DBMS_COMPARISON package cannot compare data in columns of the following datatypes:

- LONG
- LONG RAW
- ROWID
- UROWID
- CLOB

- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFS, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the `column_list` parameter in the `CREATE_COMPARISON` procedure to list only the supported columns in a shared database object.

See Also:

- [CREATE_COMPARISON Procedure](#) on page 31-20
- *Oracle Database SQL Language Reference* for more information about data types
- *Oracle Database Globalization Support Guide* for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have already been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

Attention: If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the `CONVERGE` procedure is run.

See Also: *Oracle Streams Replication Administrator's Guide* for information about the `DBMS_COMPARISON` package in an Oracle Streams replication environment

Data Structures

The DBMS_COMPARISON package defines a RECORD type.

RECORD Types

- [COMPARISON_TYPE Record Type](#)

COMPARISON_TYPE Record Type

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

Note: The COMPARE function only returns a value for the scan_id field.

Syntax

```
TYPE COMPARISON_TYPE IS RECORD(  
    scan_id          NUMBER,  
    loc_rows_merged  NUMBER,  
    rmt_rows_merged  NUMBER,  
    loc_rows_deleted NUMBER,  
    rmt_rows_deleted NUMBER);
```

Fields

Table 31-2 COMPARISON_TYPE Attributes

Field	Description
scan_id	The scan ID of the scan
loc_rows_merged	The number of rows in the local database object updated with information from the database object at the remote site
rmt_rows_merged	The number of rows in the database object updated at the remote site with information from the database object at the local site
loc_rows_deleted	The number of rows deleted from the local database object
rmt_rows_deleted	The number of rows deleted from the remote database object

Summary of DBMS_COMPARISON Subprograms

Table 31-3 DBMS_COMPARISON Package Subprograms

Subprogram	Description
COMPARE Function on page 31-16	Performs the specified comparison
CONVERGE Procedure on page 31-18	Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan
CREATE_COMPARISON Procedure on page 31-20	Creates a comparison
DROP_COMPARISON Procedure on page 31-24	Drops a comparison
PURGE_COMPARISON Procedure on page 31-25	Purges the comparison results, or a subset of the comparison results, for a comparison
RECHECK Function on page 31-26	Rechecks the differences in a specified scan for a comparison

COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the `CREATE_COMPARISON` procedure.

See Also:

- ["Overview"](#) on page 31-3
- [CREATE_COMPARISON Procedure](#) on page 31-20

Syntax

```
DBMS_COMPARISON.COMPARE(
    comparison_name IN  VARCHAR2,
    scan_info       OUT COMPARISON_TYPE,
    min_value       IN   VARCHAR2  DEFAULT NULL,
    max_value       IN   VARCHAR2  DEFAULT NULL,
    perform_row_dif IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 31–4 COMPARE Function Parameters

Parameter	Description
<code>comparison_name</code>	The name of the comparison.
<code>scan_info</code>	Information about the compare operation returned in the <code>COMPARISON_TYPE</code> datatype. See COMPARISON_TYPE Record Type on page 31-14.
<code>min_value</code>	When the scan mode for the comparison is set to <code>CMP_SCAN_MODE_CUSTOM</code> , specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the <code>DBA_COMPARISON_COLUMNS</code> data dictionary view. For a composite index, specify a value for the column with <code>column_position</code> equal to 1 in the <code>DBA_COMPARISON_COLUMNS</code> view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10. If the scan mode is set to a value other than <code>CMP_SCAN_MODE_CUSTOM</code> , then this parameter must be set to <code>NULL</code> . If <code>NULL</code> and the <code>scan_mode</code> parameter is set to <code>CMP_SCAN_MODE_CUSTOM</code> , then an error is raised. To determine the scan mode for the comparison, query the <code>DBA_COMPARISON</code> data dictionary view. See Constants on page 31-6 for information about scan modes.

Table 31-4 (Cont.) COMPARE Function Parameters

Parameter	Description
max_value	<p>When the scan mode for the comparison is set to <code>CMP_SCAN_MODE_CUSTOM</code>, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the <code>DBA_COMPARISON_COLUMNS</code> data dictionary view. For a composite index, specify a value for the column with <code>column_position</code> equal to 1 in the <code>DBA_COMPARISON_COLUMNS</code> view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10.</p> <p>If the scan mode is set to a value other than <code>CMP_SCAN_MODE_CUSTOM</code>, then this parameter must be set to <code>NULL</code>.</p> <p>If <code>NULL</code> and the <code>scan_mode</code> parameter is set to <code>CMP_SCAN_MODE_CUSTOM</code>, then an error is raised.</p> <p>To determine the scan mode for the comparison, query the <code>DBA_COMPARISON</code> data dictionary view.</p> <p>See Constants on page 31-6 for information about scan modes.</p>
perform_row_dif	<p>If <code>TRUE</code>, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison.</p> <p>If <code>FALSE</code>, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket.</p> <p>See "Overview" on page 31-3 for information about buckets.</p>

Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```
DBMS_COMPARISON.CONVERGE (
  comparison_name      IN   VARCHAR2,
  scan_id              IN   NUMBER,
  scan_info            OUT  COMPARISON_TYPE,
  converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
  perform_commit       IN   BOOLEAN   DEFAULT TRUE,
  local_converge_tag   IN   RAW        DEFAULT NULL,
  remote_converge_tag  IN   RAW        DEFAULT NULL);
```

Parameters

Table 31–5 CONVERGE Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The identifier for the scan that contains the differences between the database objects being converged. See "Overview" on page 31-3 for more information about specifying a scan ID in this parameter.
scan_info	Information about the converge operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type on page 31-14.
converge_options	Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant. See "Constants" on page 31-6 for information about these constants.
perform_commit	If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.

Table 31-5 (Cont.) CONVERGE Procedure Parameters

Parameter	Description
remote_converge_tag	<p>The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged.</p> <p>If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison.</p> <p>If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.</p> <p>See the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.</p>

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
  comparison_name      IN  VARCHAR2,
  schema_name         IN  VARCHAR2,
  object_name         IN  VARCHAR2,
  dblink_name         IN  VARCHAR2,
  index_schema_name   IN  VARCHAR2  DEFAULT NULL,
  index_name          IN  VARCHAR2  DEFAULT NULL,
  remote_schema_name  IN  VARCHAR2  DEFAULT NULL,
  remote_object_name  IN  VARCHAR2  DEFAULT NULL,
  comparison_mode     IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
  column_list         IN  VARCHAR2  DEFAULT '*',
  scan_mode           IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
  scan_percent        IN  NUMBER     DEFAULT NULL,
  null_value          IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
  local_converge_tag  IN  RAW         DEFAULT NULL,
  remote_converge_tag IN  RAW         DEFAULT NULL,
  max_num_buckets    IN  NUMBER     DEFAULT CMP_MAX_NUM_BUCKETS,
  min_rows_in_bucket IN  NUMBER     DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

Table 31–6 CREATE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
schema_name	The name of the schema that contains the local database object to compare.
object_name	The name of the local database object to compare.
dblink_name	Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.
index_schema_name	The name of the schema that contains the index. If NULL, then the schema specified in the schema_name parameter is used.
index_name	The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised. See Also: "Usage Notes" on page 31-22 for more information about specifying an index

Table 31-6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
remote_schema_name	<p>The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases.</p> <p>If NULL, then the schema specified in the schema_name parameter is used.</p>
remote_object_name	<p>The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases.</p> <p>If NULL, then the database object specified in the object_name parameter is used.</p>
comparison_mode	<p>Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.</p>
column_list	<p>Specify '*' to include all of the columns in the database objects being compared.</p> <p>To compare a subset of columns in the database objects, specify a comma-separated list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence.</p> <p>See "Usage Notes" on page 31-22 for information about columns that are required in the column_list parameter.</p>
scan_mode	<p>Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM.</p> <p>If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function.</p> <p>See "Constants" on page 31-6 for information about these constants.</p>
scan_percent	<p>The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required.</p> <p>If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison.</p> <p>If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run.</p> <p>If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored.</p> <p>Note: When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 31-10 for more information about the lead index column.</p>

Table 31–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
<code>null_value</code>	<p>The value to substitute for each NULL in the database objects being compared. Specify a value or use the <code>CMP_NULL_VALUE_DEF</code> constant.</p> <p>If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found.</p> <p>See "Constants" on page 31-6 for information about this constant.</p>
<code>local_converge_tag</code>	<p>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared.</p> <p>If the <code>local_converge_tag</code> parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 31-18 for more information.</p> <p>See the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.</p>
<code>remote_converge_tag</code>	<p>The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared.</p> <p>If the <code>remote_converge_tag</code> parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 31-18 for more information.</p> <p>See the <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags.</p>
<code>max_num_buckets</code>	<p>Specify the maximum number of buckets to use. Specify a value or use the <code>CMP_MAX_NUM_BUCKETS</code> constant. See "Constants" on page 31-6 for information about this constant.</p> <p>See "Overview" on page 31-3 for information about buckets.</p> <p>Note: If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the <code>max_num_buckets</code> parameter.</p>
<code>min_rows_in_bucket</code>	<p>Specify the minimum number of rows in each bucket. Specify a value or use the <code>CMP_MIN_ROWS_IN_BUCKET</code> constant. See "Constants" on page 31-6 for information about this constant.</p> <p>See "Overview" on page 31-3 for information about buckets.</p>

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the `index_schema_name` and `index_name` Parameters

When you specify an index for a comparison with the `index_schema_name` and `index_name` parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether or not to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in `column_list` parameter might or might not be used.

The columns in the specified index must meet the requirements described in "[Index Column Requirements for the DBMS_COMPARISON Package](#)" on page 31-10. If the index columns do not meet these requirements, then an error is raised.

Usage Notes for the `column_list` Parameter

When the `column_list` parameter is set to a value other than `'*'`, the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the DBMS_COMPARISON package. If the `index_name` parameter is non-NULL, then the columns in the specified index must be in the column list. If the `index_name` parameter is NULL, then see "[Index Column Requirements for the DBMS_COMPARISON Package](#)" on page 31-10.
- If you plan to use the CONVERGE procedure to make changes to a database object based on the comparison, then any columns in this database object that have a NOT NULL constraint but no default value must be included in the column list. If these columns are not included, then the CONVERGE procedure returns an error. See [CONVERGE Procedure](#) on page 31-18.

DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(  
    comparison_name IN VARCHAR2);
```

Parameters

Table 31–7 *DROP_COMPARISON Procedure Parameters*

Parameter	Description
comparison_name	The name of the comparison.

PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

Note: At least one of the following parameters must be set to NULL: `scan_id` or `purge_time`. If both the `scan_id` and `purge_time` parameters are NULL, then this procedure purges all comparison results for the comparison.

Syntax

```
DBMS_COMPARISON.PURGE_COMPARISON(
  comparison_name IN VARCHAR2,
  scan_id         IN NUMBER     DEFAULT NULL,
  purge_time     IN TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 31–8 *PURGE_COMPARISON Procedure Parameters*

Parameter	Description
<code>comparison_name</code>	The name of the comparison.
<code>scan_id</code>	The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If NULL, then no scan ID is considered when purging comparison results for the comparison. See "Overview" on page 31-3 for information about scans.
<code>purge_time</code>	The date before which results are purged. If NULL, then no date is considered when purging comparison results for the comparison.

RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function will continue to check the database object from the point where the previous scan ended.

Note: This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the `COMPARE` function.

See Also:

- *Oracle Streams Replication Administrator's Guide*
- [COMPARE Function](#) on page 31-16

Syntax

```
DBMS_COMPARISON.RECHECK(
  comparison_name IN VARCHAR2,
  scan_id         IN NUMBER,
  perform_row_dif IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 31–9 RECHECK Function Parameters

Parameter	Description
<code>comparison_name</code>	The name of the comparison.
<code>scan_id</code>	The scan ID of the scan to recheck. See " Overview " on page 31-3 for more information about specifying a scan ID in this parameter.
<code>perform_row_dif</code>	If <code>TRUE</code> , then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If <code>FALSE</code> , then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See " Overview " on page 31-3 for information about buckets.

Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

DBMS_CONNECTION_POOL

The DBMS_CONNECTION_POOL package provides an interface to manage Database Resident Connection Pool.

See Also: *Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- [Summary of DBMS_CONNECTION_POOL Subprograms](#)

Summary of DBMS_CONNECTION_POOL Subprograms

Table 32–1 DBMS_CONNECTION_POOL Package Subprograms

Subprogram	Description
ALTER_PARAM Procedure on page 32-3	Alters a specific configuration parameter as a standalone unit and does not affect other parameters
CONFIGURE_POOL Procedure on page 32-4	Configures the pool with advanced options
START_POOL Procedure on page 32-6	Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions
STOP_POOL Procedure on page 32-7	Stops the pool and makes it unavailable for the registered connection clients
RESTORE_DEFAULTS Procedure on page 32-8	Restores the pool to default settings

ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

Syntax

```
DBMS_CONNECTION_POOL.ALTER_PARAM (
  pool_name      IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
  param_name     IN  VARCHAR2,
  param_value    IN  VARCHAR2);
```

Parameters

Table 32–2 ALTER_PARAM Procedure Parameters

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
param_name	Any parameter name from CONFIGURE_POOL
param_value	Parameter value for param_name.

Exceptions

Table 32–3 ALTER_PARAM Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56504	Invalid connection pool configuration parameter name
ORA-56505	Invalid connection pool configuration parameter value
ORA-56507	Connection pool alter configuration failed

Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
  'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (
  pool_name          IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
  minsize            IN NUMBER   DEFAULT 4,
  maxsize            IN NUMBER   DEFAULT 40,
  incrsz            IN NUMBER   DEFAULT 2,
  session_cached_cursors IN NUMBER DEFAULT 20,
  inactivity_timeout IN NUMBER   DEFAULT 300,
  max_think_time     IN NUMBER   DEFAULT 120,
  max_use_session    IN NUMBER   DEFAULT 500000,
  max_lifetime_session IN NUMBER   DEFAULT 86400);
```

Parameters

Table 32–4 CONFIGURE_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
minsize	Minimum number of pooled servers in the pool
maxsize	Maximum allowed pooled servers in the pool
incrsz	Pool would increment by this number of pooled server when pooled server are unavailable at application request time
session_cached_cursors	Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.
max_think_time	Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxxx error. The freed up server may or may not be returned to the pool.
max_use_session	Maximum number of times a connection can be taken and released to the pool
max_lifetime_session	TTL (Time to live) for a pooled session

Exceptions

Table 32–5 CONFIGURE_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- `minsize` should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- `maxsize` should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- `session_cached_cursors` is typically set to the number of most frequently used statements. It occupies cursor resource on the server
- In doubt, do not set the `increment` and `inactivity_timeout`. The pool will have reasonable defaults.
- `max_use_session` and `max_lifetime_session` allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.

START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```
DBMS_CONNECTION_POOL.START_POOL (  
    pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 32–6 *START_POOL Procedure Parameters*

Parameter	Description
pool_name	Pool to be started. Currently only the default pool name is supported.

Exceptions

Table 32–7 *START_POOL Procedure Exceptions*

Exception	Description
ORA-56500	Connection pool not found
ORA-56501	Connection pool startup failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```
DBMS_CONNECTION_POOL.STOP_POOL (
    pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 32–8 STOP_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be stopped. Currently only the default pool name is supported.

Exceptions

Table 32–9 STOP_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56506	Connection pool shutdown failed

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (  
    pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 32–10 *RESTORE_DEFAULTS Procedure Parameters*

Parameter	Description
pool_name	Pool to be restored. Currently only the default pool name is supported.

Exceptions

Table 32–11 *RESTORE_DEFAULTS Procedure Exceptions*

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

DBMS_CQ_NOTIFICATION

The `DBMS_CQ_NOTIFICATION` package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

See Also: *Oracle Database Advanced Application Developer's Guide* regarding implementing database change notification.

This chapter contains the following topics:

- [Using DBMS_CQ_NOTIFICATION](#)
 - Overview
 - Security Model
 - Constants
 - Operational Notes
 - Examples
- [Data Structures](#)
 - OBJECT Types
- [Summary of DBMS_CQ_NOTIFICATION Subprograms](#)

Using DBMS_CQ_NOTIFICATION

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Examples](#)

Overview

The `DBMS_CQ_NOTIFICATION` package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and `|COMMIT|s`, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a `BEGIN-END` block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the `BEGIN` phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by `ENDING` the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

Security Model

The `DBMS_CQ_NOTIFICATION` package requires that the user have the `CHANGE NOTIFICATION` system privilege in order to receive notifications, and be granted `EXECUTE` privilege on the `DBMS_CQ_NOTIFICATION` package.

In addition the user is required to have `SELECT` privileges on all objects to be registered. Note that if the `SELECT` privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

Constants

The DBMS_CQ_NOTIFICATION package uses the constants shown in [Table 33–1](#). The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CQ_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDS describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 33–1 DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running RAC
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
EVENT_QUERYCHANGE	BINARY_INTEGER	7	Notification for query result set change
CONSTANT			
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows
QOS_QUERY	BINARY_INTEGER	8	Register at query granularity
QOS_BEST_EFFORT	BINARY_INTEGER	16	Best effort evaluation

Table 33–1 (Cont.) DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
NTFN_GROUPING_ CLASS_TIME	BINARY_INTEGER	1	Group notifications by time
NTFN_GROUPING_ TYPE_SUMMARY	BINARY_INTEGER	1	Summary grouping of notifications
NTFN_GROUPING_ TYPE_LAST	BINARY_INTEGER	2	Last notification in the group
NTFN_GROUPING_ FOREVER	BINARY_INTEGER	-1	Repeat notifications forever

Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and `COMMITs`.
- All objects referenced in the queries executed inside the registration block starting from the previous `NEW_REG_START` or `ENABLE_REG` to `REG_END` are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and `COMMITs`.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the `job_queue_processes` parameter set to a non-zero value? This parameter needs to be configured to a non-zero value in order to receive PL/SQL notifications via the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you `COMMITting` the transaction? Please note that the notifications are transactional and will be generated when the transaction `COMMITs`.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the `JOBQ` process that attempts to execute the procedure. The trace file would be usually named `<ORACLE_SID>_j*_<PID>.trc.`

For example, if the `ORACLE_SID` is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.

Suppose a registration is created with `chnf_callback` as the notification handler and with `registration_id` 100. Let us suppose the user forgets to define the `chnf_callback` procedure. Then the `JOBQ` trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
Error in PLSQL notification of msgid:
Queue :
Consumer Name :
PLSQL function :chnf_callback
Exception Occured, Error msg:
ORA-00604: error occurred at recursive SQL level 2
ORA-06550: line 1, column 7:
PLS-00201: identifier 'CHNF_CALLBACK' must be declared
ORA-06550: line 1, column 7:
PL/SQL: Statement ignored
```

See Also: For more information about troubleshooting Database Change Notification, see *Oracle Database Advanced Application Developer's Guide*.

Examples

Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                             table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                           row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
    regid          NUMBER;
    tbname         VARCHAR2(60);
    event_type     NUMBER;
    numtables      NUMBER;
    operation_type NUMBER;
    numrows       NUMBER;
    row_id         VARCHAR2(20);
BEGIN
    regid          := ntfnds.registration_id;
    numtables     := ntfnds.numtables;
    event_type    := ntfnds.event_type;

    INSERT INTO nfevents VALUES(regid, event_type);
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
        FOR i IN 1..numtables LOOP
            tbname           := ntfnds.table_desc_array(i).table_name;
            operation_type  := ntfnds.table_desc_array(i).Opflags;
            INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
```

```

        /* Send the table name and operation_type to client side listener using UTL_
HTTP */
        /* If interested in the rowids, obtain them as follows */
        IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
            numrows := ntfnds.table_desc_array(i).numrows;
        ELSE
            numrows :=0;    /* ROWID INFO NOT AVAILABLE */
        END IF;

        /* The body of the loop is not executed when numrows is ZERO */
        FOR j IN 1..numrows LOOP
            Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
            INSERT INTO nflowchanges VALUES(regid, tname, Row_id);
            /* optionally Send out row_ids to client side listener using UTL_HTTP; */
        END LOOP;

    END LOOP;
END IF;
COMMIT;
END;
/

```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (`chnf_callback`) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```

Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
    REGDS          SYS.CHNF$_REG_INFO;
    regid          NUMBER;
    mgr_id         NUMBER;
    dept_id        NUMBER;
    qosflags       NUMBER;
BEGIN
    qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
                DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
    REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
    SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

```

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;

```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nflowchanges` tables.

```
SQL> SELECT * FROM nfevents;
```

```

      REGID      EVENT_TYPE
-----
      20045          6

```

```
SQL> SELECT * FROM nftablechanges;
```

REGID	TABLE_NAME	TABLE_OPERATION
20045	HR.EMPLOYEES	4

```
SQL> select * from nfrowchanges;
```

REGID	TABLE_NAME	ROW_ID
20045	HR.EMPLOYEES	AAAKB/AABAAAJ8zAAF

Notes

1. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS)
2. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g. EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.
3. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

Query Result Change Registration Example

1. Creating a Callback

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
```

```

CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
    qid            NUMBER,
    table_name     VARCHAR2(100),
    table_operation NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
    qid            NUMBER,
    table_name     VARCHAR2(100),
    row_id         VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
    (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
    regid          NUMBER;
    tbname         VARCHAR2(60);
    event_type     NUMBER;
    numtables      NUMBER;
    operation_type NUMBER;
    numrows        NUMBER;
    row_id         VARCHAR2(2000);
    numqueries     NUMBER;
    qid NUMBER;
    qop NUMBER;

BEGIN
    regid := ntfnds.registration_id;
    event_type := ntfnds.event_type;
    INSERT INTO nfevents VALUES(regid, event_type);
    numqueries :=0;
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
        numqueries := ntfnds.query_desc_array.count;
        FOR i in 1..numqueries LOOP
            qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
            qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
            INSERT INTO nfqueries VALUES(qid, qop);
            numtables := 0;
            numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
            FOR j IN 1..numtables LOOP
                tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
                operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_
array(j).Opflags;
                INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
                IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
                THEN
                    numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
                ELSE
                    numrows :=0; /* ROWID INFO NOT AVAILABLE */
                END IF;

                /* The body of the loop is not executed when numrows is ZERO */
                FOR k IN 1..numrows LOOP
                    Row_id := ntfnds.query_desc_array(i).table_desc_array(j).row_
desc_array(k).row_id;
                    INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);

```

```

        END LOOP; /* loop over rows */
    END LOOP; /* loop over tables */
END LOOP; /* loop over queries */
END IF;
COMMIT;
END;
/

```

2. Creates a query registration

```

DECLARE
    reginfo    cq_notification$_reg_info;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    v_cursor   SYS_REFCURSOR;
    regid      NUMBER;
BEGIN
    /* Register two queries for result-set-change notifications: */
    /* 1. Construct registration information.
       'chnf_callback' is name of notification handler.
       QOS_QUERY specifies result-set-change notifications. */

    reginfo := cq_notification$_reg_info('chnf_callback',
        DBMS_CQ_NOTIFICATION.QOS_QUERY,0, 0, 0);

    /* 2. Create registration */

    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

    OPEN v_cursor FOR
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
        FROM HR.employees
        WHERE employee_id = 7902;
    CLOSE v_cursor;

    OPEN v_cursor for
        SELECT dbms_cq_notification.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
    CLOSE v_cursor;

    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

```

3. After creating the query registrations, the output from USER_CQ_NOTIFICATION_QUERIES would appear as follows.

```

SQL> SELECT queryid, regid, to_char(querytext)
       FROM user_cq_notification_queries;

   QUERYID      REGID
-----
TO_CHAR (QUERYTEXT)
-----
-
          22          41
SELECT HR.DEPARTMENTS.DEPARTMENT_ID FROM HR.DEPARTMENTS WHERE
HR.DEPARTMENTS.
DEPARTMENT_NAME = 'IT'

```

```

                21          41
SELECT HR.EMPLOYEES.MANAGER_ID FROM HR.EMPLOYEES WHERE
HR.EMPLOYEES.EMPLOYEE_
ID = 7902

```

Now, let us perform an UPDATE that changes the result of the query with queryid 22 by renaming the department with name 'IT' to FINANCE.

```
SQL> update departments set department_name = 'FINANCE' where department_name
= 'IT';
```

1 row updated.

```
SQL> commit;
```

Commit complete.

Now we can query the notifications that we recorded in the callback.

```
SQL> select * from nfevents;
```

```

          REGID EVENT_TYPE
-----
          61          7

```

Event type 7 corresponds to EVENT_QUERYCHANGE

```
SQL> select * from nfqueries;
```

```

          QID          QOP
-----
          42          7

```

Event type 7 corresponds to EVENT_QUERYCHANGE

```
SQL> select * from nftablechanges;
```

```
SQL> select * from nftablechanges;
```

```

          REGID
-----
TABLE_NAME
-----
-
TABLE_OPERATION
-----
          42
HR.DEPARTMENTS
          4

```

TABLE_OPERATION 4 corresponds to UPDATEOP

```
SQL> select * from nfrowchanges;
```

```

          REGID
-----
TABLE_NAME

```

```
-----  
-  
ROW_ID  
-----  
-  
          61  
HR.DEPARTMENTS  
AAANKdAABAAALinAAF
```

Data Structures

The DBMS_CQ_NOTIFICATION package defines the following OBJECT types.

OBJECT Types

- CQ_NOTIFICATION\$_DESCRIPTOR Object Type
- CQ_NOTIFICATION\$_QUERY Object Type
- CQ_NOTIFICATION\$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION\$_TABLE Object Type
- CQ_NOTIFICATION\$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION\$_ROW Object Type
- CQ_NOTIFICATION\$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION\$_REG_INFO Object Type

CQ_NOTIFICATION\$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF\$_DESC type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
  registration_id    NUMBER,
  transaction_id    RAW(8),
  dbname            VARCHAR2(30),
  event_type        NUMBER,
  numtables         NUMBER,
  table_desc_array  CQ_NOTIFICATION$_TABLE_ARRAY,
  query_desc_array  CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

Table 33–2 CQ_NOTIFICATION\$_DESCRIPTOR Object Type

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.
query_desc_array	Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE

CQ_NOTIFICATION\$_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of CQ_NOTIFICATION\$_QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATION\$_DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF\$_QDESC.

Syntax

```
TYPE SYS.CHNF$_QDESC IS OBJECT (
  queryid          NUMBER,
  queryop         NUMBER,
  table_desc_array CQ_NOTIFICATION$_TABLE_ARRAY);
```

Attributes

Table 33-3 TYPE SYS.CQ_NOTIFICATION\$_QUERY Object Type

Attribute	Description
queryid	QueryId of the changed query
queryop	Operation describing change to the query
table_desc_array	Array of table changes which contributed to the query Result Set change

CQ_NOTIFICATION\$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION\$_QUERY objects. It is a synonym for the SYS.CHNF\$_QUERY_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```

CQ_NOTIFICATION\$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type `EVENT_OBJCHANGE`. For query result set changes (event type will be set to `EVENT_QUERYCHANGE`), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named `SYS.CHNF$_TDESC`.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags          NUMBER,
  table_name       VARCHAR2(2*M_IDEN+1),
  numrows          NUMBER,
  row_desc_array   CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

Table 33-4 TYPE SYS.CQ_NOTIFICATION\$_TABLE Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

CQ_NOTIFICATION\$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION\$_TABLE objects. It is a synonym for the SYS.CHNF\$_TDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```

CQ_NOTIFICATION\$_ROW Object Type

An array of CQ_NOTIFICATION\$_ROW is embedded inside a CQ_NOTIFICATION\$_TABLE (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF\$_RDESC.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT (
  opflags          NUMBER,
  row_id           VARCAHR2 (2000));
```

Attributes

Table 33-5 TYPE SYS.CQ_NOTIFICATION\$_ROW Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

CQ_NOTIFICATION\$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of CQ_NOTIFICATION\$_ROW objects and is embedded inside the CQ_NOTIFICATION\$_TABLE if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF\$_RDESC_ARRAY type.

Syntax

```
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
```

CQ_NOTIFICATION\$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named `SYS.CHNF$_REG_INFO`.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                VARCHAR2(20) ,
  quosflags                NUMBER,
  timeout                 NUMBER,
  operations_filter       NUMBER,
  transaction_lag         NUMBER,
  ntfn_grouping_class     NUMBER,
  ntfn_grouping_value     NUMBER,
  ntfn_grouping_type      NUMBER,
  ntfn_grouping_start_time  TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count NUMBER);
```

Attributes

Table 33–6 TYPE CQ_NOTIFICATION\$_REG_INFO Object Type

Attribute	Description
callback	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is <code><call_backname>(ntfnds IN SYS.chnf\$_desc)</code>
quosflags	Quality of service flags. Can be set to an OR of the following values: <ul style="list-style-type: none"> ▪ <code>QOS_RELIABLE (0x1)</code>: Notifications are reliable (persistent) and survive instance death. This means that on an instance death in a RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. ▪ <code>QOS_DEREG_NFY (0x2)</code>: The registration will be expunged on the first notification ▪ <code>QOS_ROWIDS (0x4)</code>: The notification needs to include information about the rowids that were modified ▪ <code>QOS_QUERY (0x8)</code>: specifies query result change notification as opposed to object change notification ▪ <code>QOS_BEST_EFFORT (0x16)</code>: can register simplified versions of queries and minimizes evaluation with some false positives.

Table 33–6 (Cont.) TYPE CQ_NOTIFICATIONS\$ REG_INFO Object Type

Attribute	Description
timeout	If set to a non-zero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the <code>timeout</code> option can be combined with the <code>purge on notification (QOS_DEREG_NFY)</code> option as well.
operations_filter	<p>if non-zero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:</p> <ul style="list-style-type: none"> ▪ 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS) ▪ 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP) ▪ 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP) ▪ 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP) <p>A combination of operations can be specified by using a bitwise OR.</p> <p>Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.</p>
transaction_lag	<p>Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated.</p> <p>Caution: This parameter will be honored for object level registrations but ignored for query result change notification registrations.</p>
ntfn_grouping_class	When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is <code>DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME</code> by which notifications are grouped by time.
ntfn_grouping_value	The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.
ntfn_grouping_type	<p>The type of grouping desired. It can be one of two allowed values</p> <ul style="list-style-type: none"> ▪ <code>DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY</code> - all notifications in the group are summarized into a single notification ▪ <code>DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST</code> - only the last notification in the group is published and the earlier ones discarded
ntfn_grouping_start_time	When to start generating notifications. If specified as NULL, it defaults to the current system generated time.

Table 33-6 (Cont.) TYPE CQ_NOTIFICATION\$_REG_INFO Object Type

Attribute	Description
ntfn_grouping_repeat_count	How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a non-zero value if only a certain number of notifications are desired for the life time of the registration.

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback          VARCHAR2(20) ,
  quosflags         NUMBER,
  timeout           NUMBER);
```

The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback          VARCHAR2(20) ,
  quosflags         NUMBER,
  timeout           NUMBER,
  operations_filter NUMBER,
  transaction_lag   NUMBER);
```

The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback          VARCHAR2(20) ,
  quosflags         NUMBER,
  timeout           NUMBER,
  operations_filter NUMBER,
  ntfn_grouping_class      NUMBER,
  ntfn_grouping_value      NUMBER,
  ntfn_grouping_type       NUMBER,
  ntfn_grouping_start_time TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

CHNF\$_DESC describes the change notification descriptor.

- The `init.ora` parameter `job_queue_processes` must be set to a non-zero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

Summary of DBMS_CQ_NOTIFICATION Subprograms

Table 33–7 *DBMS_CQ_NOTIFICATION Package Subprograms*

Subprogram	Description
CQ_NOTIFICATION_QUERYID Function on page 33-27	Returns the queryid of the most recent query that was attempted to be registered in a registration block
DEREGISTER Procedure on page 33-28	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure on page 33-29	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function on page 33-30	Begins a new registration block
REG_END Procedure on page 33-31	Ends the registration boundary

CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID  
RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.

DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (  
    regid IN NUMBER);
```

Parameters

Table 33–8 *DEREGISTER Procedure Parameters*

Parameter	Description
regid	Client registration ID

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.

ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). This subprogram is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the [REG_END Procedure](#).

Syntax

```
DBMS_CQ_NOTIFICATION.ENABLE_REG (  
    regid IN NUMBER);
```

Parameters

Table 33–9 *ENABLE_REG Procedure Parameters*

Parameter	Description
<code>regid</code>	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
RETURN NUMBER;
```

Parameters

Table 33–10 NEW_REG_START Function Parameters

Parameter	Description
sys.chnf\$_reg_info	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE_NOTIFICATION system privilege and SELECT privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```

DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also: *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

- [Algorithms](#)
- [Restrictions](#)
- [Exceptions](#)
- [Operational Notes](#)

Overview

DBMS_CRYPT0 contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPT0 package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPT0. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 34–1 lists the DBMS_CRYPT0 package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLKIT.

Table 34–1 DBMS_CRYPT0 and DBMS_OBFUSCATION_TOOLKIT Feature Comparison

Package Feature	DBMS_CRYPT0	DBMS_OBFUSCATION_TOOLKIT
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY	DES, 3DES
Padding forms	PKCS5, zeroes	none supported
Block cipher chaining modes	CBC, CFB, ECB, OFB	CBC
Cryptographic hash algorithms	MD5, SHA-1, MD4	MD5
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1	none supported
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER	RAW, VARCHAR2
Database types	RAW, CLOB, BLOB	RAW, VARCHAR2

DBMS_CRYPT0 is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

Types

Parameters for the DBMS_CRYPT0 subprograms use these datatypes:

Table 34–2 *DBMS_CRYPT0 Datatypes*

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

Table 34–3 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA). Produces a 160-bit hash.

Table 34–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5 ¹	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1 ¹	Same as SHA hash function, except it requires a secret key to verify the hash value.

¹ Complies with IETF RFC 2104 standard

Table 34–5 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

Table 34–6 DBMS_CRYPTO Block Cipher Suites

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES ¹ + CHAIN_CBC ² + PAD_PKCS5 ³
DES3_CBC_PKCS5	ENCRYPT_3DES ¹ + CHAIN_CBC ² + PAD_PKCS5 ³

¹ See Table 34–5, "DBMS_CRYPTO Encryption Algorithms"

² See Table 34–7, "DBMS_CRYPTO Block Cipher Chaining Modifiers"

³ See Table 34–8, "DBMS_CRYPTO Block Cipher Padding Modifiers"

Table 34–7 DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that <i>n</i> bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

Table 34–8 DBMS_CRYPTO Block Cipher Padding Modifiers

Name	Description
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes.

Restrictions

The `VARCHAR2` datatype is not directly supported by `DBMS_CCRYPTO`. Before you can perform cryptographic operations on data of the type `VARCHAR2`, you must convert it to the uniform database character set `AL32UTF8`, and then convert it to the `RAW` datatype. After performing these conversions, you can then encrypt it with the `DBMS_CCRYPTO` package.

See Also: ["Conversion Rules"](#) on page 34-11 for information about converting datatypes.

Exceptions

Table 34–9 lists exceptions that have been defined for DBMS_CRYPT0.

Table 34–9 DBMS_CRYPT0 Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

Operational Notes

- [When to Use Encrypt and Decrypt Procedures or Functions](#)
- [When to Use Hash or Message Authentication Code \(MAC\) Functions](#)
- [About Generating and Storing Encryption Keys](#)
- [Conversion Rules](#)

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt LOB datatypes (overloaded for CLOB and BLOB datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt RAW datatypes. Data of type `VARCHAR2` must be converted to RAW before you can use `DBMS_CRYPTO` functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. When she retrieves the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either RAW or LOB data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS_OBFUSCATION_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:

- *Oracle Database Advanced Security Administrator's Guide* for information about configuring network encryption and SSL.
- ["Key Management"](#) on page 82-5 for a full discussion about securely storing encryption keys
- ["RANDOMBYTES Function"](#) on page 34-20

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:
 1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
 2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

Syntax example:

```
UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:
 1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
 2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

Syntax example:

```
UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
```

See Also: [Chapter 208, "UTL_I18N"](#) for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
    input_string      VARCHAR2 (200) := 'Secret Message';
    output_string     VARCHAR2 (200);
    encrypted_raw     RAW (2000);           -- stores encrypted binary text
    decrypted_raw     RAW (2000);           -- stores decrypted binary text
    num_key_bytes     NUMBER := 256/8;     -- key length 256 bits (32 bytes)
    key_bytes_raw     RAW (32);            -- stores 256-bit encryption key
    encryption_type   PLS_INTEGER :=      -- total encryption type
        DBMS_CRYPTO.ENCRYPT_AES256
        + DBMS_CRYPTO.CHAIN_CBC
        + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
    DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
    key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
    encrypted_raw := DBMS_CRYPTO.ENCRYPT
    (
        src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
        typ => encryption_type,
        key => key_bytes_raw
    );
    -- The encrypted value "encrypted_raw" can be used here

    decrypted_raw := DBMS_CRYPTO.DECRYPT
    (
        src => encrypted_raw,
        typ => encryption_type,
        key => key_bytes_raw
    );
    output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

    DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

Summary of DBMS_CRYPTO Subprograms

Table 34–10 DBMS_CRYPTO Package Subprograms

Subprogram	Description
DECRYPT Function on page 34-14	Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures on page 34-15	Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Function on page 34-16	Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures on page 34-17	Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV
HASH Function on page 34-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data
MAC Function on page 34-19	Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection
RANDOMBYTES Function on page 34-20	Returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function on page 34-21	Returns a random BINARY_INTEGER
RANDOMNUMBER Function on page 34-22	Returns a random 128-bit integer of the NUMBER datatype

DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT (
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (decrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34–11 DECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

See Also: ["Usage Notes"](#) for the ENCRYPT function on page 34-16 for additional information about the ciphers and modifiers available with this package.
- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

See Also: ["Conversion Rules"](#) on page 34-11 for a discussion of the VARCHAR2 to RAW conversion process.

DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPT0.DECRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN           BLOB,
  typ IN           PLS_INTEGER,
  key IN           RAW,
  iv IN           RAW           DEFAULT NULL);
```

```
DBMS_CRYPT.DECRYPT (
  dst IN OUT NOCOPY CLOB           CHARACTER SET ANY_CS,
  src IN           BLOB,
  typ IN           PLS_INTEGER,
  key IN           RAW,
  iv IN           RAW           DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (decrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34–12 *DECRYPT Procedure Parameters*

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT (
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (encrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34–13 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See [Table 34–7](#) and [Table 34–8](#) on page 34-7 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

```
DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                       + DBMS_CRYPTO.CHAIN_CBC
                                       + DBMS_CRYPTO.PAD_NONE;
```

See [Table 34–6](#) on page 34-6 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

See Also: ["Conversion Rules"](#) on page 34-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPT0.ENCRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          BLOB,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN          RAW          DEFAULT NULL);
```

```
DBMS_CRYPT0.ENCRYPT (
  dst IN OUT NOCOPY BLOB,
  src IN          CLOB          CHARACTER SET ANY_CS,
  typ IN          PLS_INTEGER,
  key IN          RAW,
  iv IN          RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (encrypt, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34–14 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

See "[Conversion Rules](#)" on page 34-11 for usage notes about using the ENCRYPT procedure.

HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to ["When to Use Hash or Message Authentication Code \(MAC\) Functions"](#) on page 34-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in [Table 34-3](#) on page 34-6.

Syntax

```
DBMS_CRYPTO.Hash (
    src IN RAW,
    typ IN PLS_INTEGER)
RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN BLOB,
    typ IN PLS_INTEGER)
RETURN RAW;

DBMS_CRYPTO.Hash (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (hash, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34-15 HASH Function Parameters

Parameter Name	Description
src	The source data to be hashed.
typ	The hash algorithm to be used.

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, `HASH_SH1`, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "[HASH Function](#)" on page 34-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "[When to Use Hash or Message Authentication Code \(MAC\) Functions](#)" on page 34-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See [Table 34-4](#) on page 34-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPT0.MAC (
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW)
RETURN RAW;

DBMS_CRYPT0.MAC (
    src IN BLOB,
    typ IN PLS_INTEGER
    key IN RAW)
RETURN RAW;

DBMS_CRYPT0.MAC (
    src IN CLOB CHARACTER SET ANY_CS,
    typ IN PLS_INTEGER
    key IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references (mac, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34-16 MAC Function Parameters

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator), and it draws its entropy (seed) from the `sqlnet.ora` file parameter `SQLNET.CRYPTO_SEED`.

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (  
    number_bytes IN POSITIVE)  
RETURN RAW;
```

Pragmas

```
pragma restrict_references (randombytes, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 34–17 RANDOMBYTES Function Parameter

Parameter Name	Description
<code>number_bytes</code>	The number of pseudo-random bytes to be generated.

Usage Note

- The `number_bytes` value should not exceed the maximum length of a RAW variable.
- The `SQLNET.CRYPTO_SEED` parameter can be set by entering 10 to 70 random characters with the following syntax in the `sqlnet.ora` file:

```
SQLNET.CRYPTO_SEED = <10 to 70 random characters>
```

See Also: *Oracle Database Advanced Security Administrator's Guide* for more information about the `SQLNET.CRYPTO_SEED` parameter and its use.

RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

Syntax

```
DBMS_CRYPT0.RANDOMINTEGER  
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references (randominteger, WNDS, RNDS, WNPS, RNPS);
```

RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of $[0..2^{128}-1]$.

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER  
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references (randomnumber, WNDS, RNDS, WNPS, RNPS);
```

DBMS_CSX_ADMIN

The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- [Using DBMS_CSX_ADMIN](#)
 - Overview
 - Constants
- [Summary of DBMS_CSX_ADMIN](#)

Using DBMS_CSX_ADMIN

- [Overview](#)
- [Constants](#)

Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

Constants

The DBMS_CSX_ADMIN package uses the constants shown in [Table 35–1](#):

Table 35–1 DBMS_CSX_ADMIN Constants

Name	Type	Value	Description
DEFAULT_LEVEL	BINARY_INTEGER	0	Default token table
TAB_LEVEL	BINARY_INTEGER	1	Token table set associated with tables, not tablespaces
TBS_LEVEL	BINARY_INTEGER	2	Token table set associated with a tablespace
NO_CREATE	BINARY_INTEGER	0	Token tables already exist, associate them with the given table/tablespace
NO_INDEXES	BINARY_INTEGER	1	Do not create indexes on the new set of token tables
WITH_INDEXES	BINARY_INTEGER	2	Create indexes on the token tables
DEFAULT_TOKS	BINARY_INTEGER	0	Prepopulate the token tables with default token mappings
NO_DEFAULT_TOKS	BINARY_INTEGER	1	Do not prepopulate the token tables with default token mappings

Examples

Example 1: Register a New Set of Token Tables for the Tablespace

To prepare a tablespace CSXTS for export, the DBA can register a new set of token tables for the tablespace with the following PL/SQL:

```
DECLARE
    tsno    number;
    stmt    varchar2(2000);
BEGIN
    stmt := 'SELECT ts# FROM ts$ WHERE (name = '' || 'CSXTS' || '' )';
    EXECUTE IMMEDIATE stmt INTO tsno;
    DBMS_CSX_ADMIN.REGISTER_TOKENTABLESET(
        tstabno => tsno,
        guid    => NULL,
        flags   => DBMS_CSX_ADMIN.TBS_LEVEL,
        tocreate => DBMS_CSX_ADMIN.WITH_INDEXES,
        defaulttoks => DBMS_CSX_ADMIN.DEFAULT_TOKS);
    COMMIT;
END;
/
```

In this example, the new token tables are indexed, populated with default token mappings, and associated with all tables in the CSXTS tablespace. All subsequent loads of binary XML data in CSXTS will make use of the new set of token tables. The advantage is that no loading of binary XML data in other tablespaces will affect the size of the token tables used by CSXTS and exported during a tablespace export of CSXTS. This setup is suited to the case in which the tablespace does not yet contain binary XML data.

Example 2: Copying the Default Token Tables in a New Set

If binary XML data already exists in the tablespace to be exported, the DBA has the option of copying the default token tables in a new set.

```
DECLARE
    tsno    number;
    stmt    varchar2(2000);
    qntab   varchar2(34);
    nmtab   varchar2(34);
    pttab   varchar2(34);
BEGIN
    stmt := 'select ts# from ts$ where (name = '' || 'CSXTS' || '' )';
    EXECUTE IMMEDIATE stmt INTO tsno;
    DBMS_CSX_ADMIN.COPYDEFAULT_TOKENTABLESET(
        tstabno => tsno, qntab, nmtab, pttab);
    COMMIT;
END;
/
```

This setup is suited to the case in which the DBA wishes to optimize the export of a tablespace that already contains binary XML data, and does not have associated a token table set. After cloning the default token table set, all subsequent loads of binary XML data in CSXTS will make use of the new set of token tables.

Summary of DBMS_CSX_ADMIN

Table 35–2 DBMS_CSX_ADMIN Package Subprograms

Subprogram	Description
COPYDEFAULTTOKENTABLESET Procedure on page 35-7	Creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables
GETTOKENTABLEINFO Procedure & Function on page 35-8	Returns the GUID of the token table set where token mappings for this table
GETTOKENTABLEINFOBYTABLESPACE Procedure on page 35-9	Returns the GUID and the token table names for this tablespace
NAMESPACEIDTABLE Function on page 35-10	Returns default namespace-ID token table
PATHIDTABLE Function on page 35-11	Returns the default path-ID token table
QNAMEIDTABLE Function on page 35-12	Returns the default qname-ID token table.
REGISTERTOKENTABLESET Procedure on page 35-13	Registers a new token table set, creates (if required) the token tables (with the corresponding indexes)

COPYDEFAULTTOKENTABLESET Procedure

This procedure creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables.

Syntax

```
DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET (
  tsno          IN    NUMBER,
  qnametable    OUT   VARCHAR2,
  nmspctable    OUT   VARCHAR2,
  ptable        OUT   VARCHAR2);
```

Parameters

Table 35-3 *COPYDEFAULTTOKENTABLESET Procedure Parameters*

Parameter	Description
tsno	Tablespace number the new set of token tables will be associated with
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
pttable	Name of the path-id table in the new set

GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO (
  ownername      IN  VARCHAR2,
  tablename      IN  VARCHAR2,
  guid           OUT RAW,
  qnametable     OUT  VARCHAR2,
  nmspctable    OUT  VARCHAR2,
  level         OUT  NUMBER,
  tabno         OUT  NUMBER);
```

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO (
  tabno          IN  NUMBER,
  guid           OUT RAW);
RETURN BOOLEAN;
```

Parameters

Table 35–4 GETTOKENTABLEINFO Procedure & Function Parameters

Parameter	Description
ownername	Owner of the table
tablename	Name of the table
guid	GUID of the token table set used by the given table
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
level	DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise
tabno	Table object number

GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE (
  tsname          IN  VARCHAR2,
  tablespaceno    IN  NUMBER,
  guid            OUT RAW,
  qnametable      OUT VARCHAR2,
  nmspctable     OUT VARCHAR2,
  isdefault      OUT BOOLEAN,
  containTokTab  OUT BOOLEAN);
```

Parameters

Table 35–5 GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

Parameter	Description
tsname	Tablespace name
tablespaceno	Tablespace number
guid	GUID of the token table set associated with this tablespace (if any)
qnametable	Name of the qname-ID table
nmspctable	Name of the namespace-ID table
isdefault	TRUE if the token table is the default one
containTokTab	TRUE if the tablespace contains its own token table set

NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE  
RETURN VARCHAR2;
```

PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

Syntax

```
DBMS_CSX_ADMIN.PATHIDTABLE  
RETURN VARCHAR2;
```

QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE  
RETURN VARCHAR2;
```

REGISTERTOKENTABLESET Procedure

This procedure registers a new token table set, creates (if required) the token tables (with the corresponding indexes).

Syntax

```
DBMS_CSX_ADMIN.REGISTERTOKENTABLESET (
  tstabno      IN NUMBER DEFAULT NULL,
  guid         IN RAW     DEFAULT NULL,
  flags        IN NUMBER DEFAULT TBS_LEVEL,
  tocreate     IN NUMBER DEFAULT WITH_INDEXES,
  defaulttoks IN NUMBER DEFAULT DEFAULT_TOKS);
```

Parameters

Table 35–6 *REGISTERTOKENTABLESET Procedure Parameters*

Parameter	Description
tstabno	Tablespace/table number of the tablespace/table using the set of token table we register
guid	GUID of the token table set. If NULL, a new identifier is created, provided the user is SYS.
flags	TAB_LEVEL for table level, TBS_LEVEL for tablespace level
tocreate	Possible values: <ul style="list-style-type: none"> ■ NO_CREATE if no token tables are created ■ NO_INDEXES if token tables are created, but no indexes ■ WITH_INDEXES if token tables and corresponding indexes are created
defaulttoks	If DEFAULT_TOKS, insert default token mappings

DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

See Also: *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- [Using DBMS_CUBE](#)
- [Summary of DBMS_CUBE Subprograms](#)

Using DBMS_CUBE

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

The metadata for cubes and dimensions is defined in XML templates, which you can generate interactively using a graphical tool named Analytic Workspace Manager.

The `IMPORT_XML` procedure creates an analytic workspace with its cubes and dimensions. The `BUILD` procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying. You can also use Analytic Workspace Manager to create analytic workspaces from XML and initiate a data load. The two methods are completely interchangeable.

Summary of DBMS_CUBE Subprograms

Table 36-1 DBMS_CUBE Subprograms

Subprogram	Description
BUILD Procedure on page 36-4	Loads data into one or more cubes and dimensions, and prepares the data for querying.
IMPORT_XML Procedure on page 36-11	Creates an analytic workspace, or adds objects to an existing analytic workspace, from an XML template.
VALIDATE_XML Procedure on page 36-13	Checks the XML to assure that it is valid, without committing the results to the database.

BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```
DBMS_CUBE.BUILD (
    SCRIPT                IN  VARCHAR2,
    METHOD                IN  VARCHAR2      DEFAULT NULL,
    REFRESH_AFTER_ERRORS IN  BOOLEAN      DEFAULT FALSE,
    PARALLELISM          IN  BINARY_INTEGER DEFAULT 0,
    ATOMIC_REFRESH       IN  BOOLEAN      DEFAULT FALSE,
    AUTOMATIC_ORDER      IN  BOOLEAN      DEFAULT TRUE,
    ADD_DIMENSIONS       IN  BOOLEAN      DEFAULT TRUE,
    SCHEDULER_JOB        IN  VARCHAR2      DEFAULT NULL);
```

Parameters

Table 36–2 BUILD Procedure Parameters

Parameter	Description
SCRIPT	A list of cubes and dimensions and their build options (see "SCRIPT Parameter" on page 36-5).
METHOD	<p>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated.</p> <p>You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes.</p> <ul style="list-style-type: none"> ■ C: Complete refresh clears all dimension values before loading. (Default) ■ F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. ■ ?: Fast refresh if possible, and otherwise a complete refresh. ■ P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. ■ S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. <p>See the "Usage Notes" on page 36-8 for additional details.</p> <p>Methods do not apply to dimensions.</p>
REFRESH_AFTER_ERRORS	<p>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</p> <p>FALSE to roll back all objects in the build.</p>
PARALLELISM	Number of parallel processes to allocate to this job (see Usage Notes).

Table 36–2 (Cont.) BUILD Procedure Parameters

Parameter	Description
ATOMIC_REFRESH	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
AUTOMATIC_ORDER	TRUE enables optimization of the build order. Dimensions are loaded before cubes. FALSE builds objects in the order you list them in the script.
ADD_DIMENSIONS	TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.
SCHEDULER_JOB	Any text identifier for the job, which will appear in the log table.

SCRIPT Parameter

The `SCRIPT` parameter identifies the objects that will be included in the build, and specifies the type of processing that will be performed on each one. The parameter has this syntax:

```
object [ USING ( commands ) ] [, ...]
```

Where:

`object` is the fully qualified name of a cube or a dimension in the form `aw_name.object`, such as `GLOBAL.TIME`.

SCRIPT Parameter: USING Clause

The `USING` clause specifies the processing options. It consists of one or more commands separated by commas.

Note: A cube with a rewrite materialized view cannot have a `USING` clause, except for the `ANALYZE` command. It uses the default build options.

The `commands` can be any of the following.

- `CLEAR [VALUES | LEAVES | AGGREGATES]`

Prepares the cube for a data refresh. It can also be used on dimensions, but `CLEAR` removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

The optional arguments control the refresh method:

- `VALUES`: Clears all data in the cube. This option supports the `COMPLETE` refresh method. (Default for the `C` and `F` methods)

- LEAVES: Clears the detail data and retains the aggregates. This option supports the FAST refresh method. (Default for the ? method)
- AGGREGATES: Clears the aggregates and retains the detail data.
- LOAD [SYNCH | NO SYNCH]

Loads data into the dimension or cube. The optional arguments apply only to dimensions:

 - SYNCH matches the dimension keys to the relational data source. (Default)
 - NO SYNCH loads new dimension keys but does not delete old keys.
- SOLVE

Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)
- COMPILE

Creates the supporting structures for the dimension. (Dimensions only)
- ANALYZE

Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.
- EXECUTE OLAP DML string

Executes an OLAP DML command or program in the analytic workspace.
- EXECUTE PLSQL string

Executes a PL/SQL command or script in the database.
- MODEL model_name

Executes a model previously created for the cube.
- AGGREGATE USING [MEASURE]

Generates aggregate values using the syntax described in "[SCRIPT Parameter: USING Clause: AGGREGATE command](#)".

SCRIPT Parameter: USING Clause: AGGREGATE command

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

Note: The AGGREGATE command is available only for uncompressed cubes.

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
  WHEN measure1 THEN operator1
  WHEN measure2 THEN operator2...
  ELSE default_operator
|
[AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

USING MEASURE Clause

This clause enables you to specify different aggregation operators for different measures in the cube.

Operator Clause

The `operator_clause` has this syntax:

```
operator (WEIGHTBY expression | SCALEBY expression)
```

`WEIGHTBY` multiplies each data value by an expression before aggregation.

`SCALEBY` adds the value of an expression to each data value before aggregation.

Table 36–3 Aggregation Operators

Operator	Option	Description
AVG	WEIGHTBY	Adds data values, then divides the sum by the number of data values that were added together.
FIRST	WEIGHTBY	The first real data value.
HIER_AVG	WEIGHTBY	Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike <code>AVERAGE</code> , which counts only non-NA children, <code>HVERAGE</code> counts all of the logical children of a parent, regardless of whether each child does or does not have a value.
HIER_FIRST	WEIGHTBY	The first data value in the hierarchy, even when that value is NA.
HIER_LAST	WEIGHTBY	The last data value in the hierarchy, even when that value is NA.
LAST	WEIGHTBY	The last real data value.
MAX	WEIGHTBY	The largest data value among the children of each parent.
MIN	WEIGHTBY	The smallest data value among the children of each parent.
SUM	SCALEBY WEIGHTBY	Adds data values. (Default)

Processing Options

You can specify these processing options for aggregation:

- `(ALLOW | DISALLOW) OVERFLOW`

Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.

 - `ALLOW`: A calculation that generates overflow executes without error and produces null results. (Default)
 - `DISALLOW`: A calculation involving overflow stops executing and generates an error message.
- `(ALLOW | DISALLOW) DIVISION BY ZERO`

Specifies whether to allow division by zero.

 - `ALLOW`: A calculation involving division by zero executes without error but returns a null value. (Default)

- DISALLOW: A calculation involving division by zero stops executing and generates an error message.
- (CONSIDER | IGNORE) NULLS
Specifies whether nulls are included in the calculations.
 - CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
 - IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)
- MAINTAIN COUNT
Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

Usage Notes

Build Methods

The C, S, and ? methods always succeed and can be used on any cube.

The F and P methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually used by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the PARALLELISM argument of the BUILD procedure.
- Setting of the JOB_QUEUE_PROCESSES database initialization parameter.

Suppose UNITS_CUBE has 12 partitions, PARALLELISM is set to 10, and JOB_QUEUE_PROCESSES is set to 4. The build will use four processes, which will appear as slave processes in the build log.

Build Log

The build log is stored as a table named CUBE_BUILD_LOG in the owner's schema. It is updated dynamically, so that you can monitor the progress of a build. Analytic Workspace Manager creates this log automatically. Otherwise, you can create the log file by running `$ORACLE_HOME/olap/admin/utl_olaplog.sql`.

The following is an example of some columns from the default build of a cube named UNITS_CUBE.

```
SQL> SELECT command, status, build_object, build_object_type type
       FROM cube_build_log WHERE build_id='1';
```

COMMAND	STATUS	BUILD_OBJECT	TYPE
BUILD	STARTED		BUILD
LOAD SYNCH	STARTED	TIME	DIMENSION
LOAD SYNCH	COMPLETED	TIME	DIMENSION
COMPILE	STARTED	TIME	DIMENSION

COMPILE	COMPLETED	TIME	DIMENSION
UPDATE	STARTED	TIME	DIMENSION
UPDATE	COMPLETED	TIME	DIMENSION
COMMIT	STARTED	TIME	DIMENSION
COMMIT	COMPLETED	TIME	DIMENSION
LOAD SYNCH	STARTED	PRODUCT	DIMENSION
LOAD SYNCH	COMPLETED	PRODUCT	DIMENSION
COMPILE	STARTED	PRODUCT	DIMENSION
COMPILE	COMPLETED	PRODUCT	DIMENSION
UPDATE	STARTED	PRODUCT	DIMENSION
UPDATE	COMPLETED	PRODUCT	DIMENSION

COMMIT	COMPLETED	UNITS_CUBE	CUBE
BUILD	COMPLETED		BUILD

42 rows selected.

Examples

This example uses the default parameters to build UNITS_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```

The next example builds UNITS_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL.

```
BEGIN
  DBMS_CUBE.BUILD(
    'GLOBAL.TIME USING (LOAD NO SYNCH, COMPILE),
    GLOBAL.CHANNEL,
    GLOBAL.UNITS_CUBE USING (CLEAR LEAVES, LOAD, SOLVE, ANALYZE)
    ',
    '?',          -- solve
    false,        -- refresh after errors
    2,            -- parallelism
    false,        -- atomic refresh
    true,         -- automatic order
  );
END;
```

```
                false,          -- add dimensions
                'Units Cube'    -- identify job
            );
END;
/
```

IMPORT_XML Procedure

This procedure creates an analytic workspace from an XML template.

Syntax

```
DBMS_CUBE.IMPORT_XML
  (DIRNAME          IN      VARCHAR2,
   FILENAME         IN      VARCHAR2;

DBMS_CUBE.IMPORT_XML
  (IN_XML          IN      CLOB;

DBMS_CUBE.IMPORT_XML
  (IN_XML          IN      CLOB,
   OUT_XML         IN/OUT CLOB );
```

Parameters

Table 36–4 *IMPORT_XML Procedure Parameters*

Parameter	Description
DIRNAME	The case-sensitive name of a database directory.
FILENAME	The name of a file containing an XML template.
IN_XML	The name of a CLOB containing an XML template.
OUT_XML	An XML file generated by DBMS_CUBE that shows changes DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.

Usage Notes

The XML can define an entire analytic workspace, a single cube, or a single dimension. When re-creating just a cube or dimension, you must provide the context of an existing analytic workspace.

Example

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

```
SQL> EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example is a SQL script that creates the GLOBAL analytic workspace from an XML template stored in a CLOB. The file is named GLOBAL.XML, and it is located in a database directory named XML_DIR. The previous example shows a more direct method for using an XML file.

```
DEFINE xml_file = 'GLOBAL.XML';
SET ECHO ON;
SET SERVEROUT ON;

DECLARE
  xml_file      BFILE := bfilename('XML_DIR', '&xml_file');
  in_xml        CLOB;
  out_xml       CLOB := NULL;
  dest_offset   INTEGER := 1;
  src_offset    INTEGER := 1;
```

```
lang_context INTEGER := 0;
warning      INTEGER;
BEGIN
  -- Setup the clob from a file
  DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
  DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
  DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
  DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
    dest_offset, src_offset, 0, lang_context, warning);

  -- Import the xml
  DBMS_CUBE.IMPORT_XML(in_xml);
END;
/
```

VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
    (IN_XML          IN CLOB );
```

Parameters

Table 36–5 VALIDATE_XML Procedure Parameters

Parameter	Description
IN_XML	The name of a CLOB containing an XML template.

Usage Notes

The XML template must be loaded into a CLOB (see Example).

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
    xml_file      BFILE := bfilename('XML_DIR', '&xml_file');
    in_xml        CLOB;
    out_xml       CLOB := NULL;
    dest_offset   INTEGER := 1;
    src_offset    INTEGER := 1;
    lang_context  INTEGER := 0;
    warning       INTEGER;
BEGIN
    -- Setup the clob from a file
    DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
    DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
    DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
    DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

    -- Validate the xml
    DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
```

DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topic:

- [Summary of DBMS_CUBE_ADVISE Subprograms](#)

See Also: *Oracle OLAP User's Guide* for information about cube materialized views.

Summary of DBMS_CUBE_ADVISE Subprograms

Table 37–1 Summary of DBMS_CUBE_ADVISE Subprograms

Subprogram	Description
MV_CUBE_ADVICE Function on page 37-3	Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.
SET_CNS_EXCEPTION_LOG Procedure on page 37-6	Identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.
TRACE Procedure on page 37-7	Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.

MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

Syntax

```
DBMS_CUBE_ADVICE.MV_CUBE_ADVICE (
    owner          IN  VARCHAR2  DEFAULT USER,
    mvname         IN  VARCHAR2,
    reqtype        IN  VARCHAR2  DEFAULT '0',
    validate       IN  NUMBER    DEFAULT 0)
RETURN COAD_ADVICE_T PIPELINED;
```

Parameters

Table 37–2 MV_CUBE_ADVICE Function Parameters

Parameter	Description
owner	Owner of the cube materialized view
mvname	Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB\$UNITS_CUBE
reqtype	Type of advice to generate: <ul style="list-style-type: none"> ■ 0: All applicable advice types ■ 1: Column NOT NULL constraints ■ 2: Primary key constraints ■ 3: Foreign key constraints ■ 4: Relational dimension objects ■ 5: Cube materialized view logs with primary key
validate	Validation option: <ul style="list-style-type: none"> ■ 0: Validate the constraints ■ 1: Do not validate the constraints

Returns

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. [Table 37–3](#) describes the columns.

Table 37–3 MV_CUBE_ADVICE Return Values

Column	Data Type	Description
OWNER	VARCHAR2 (30)	Owner of the dimensional object identified in APIOBJECT.
APIOBJECT	VARCHAR2 (30)	Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.
SQLOBJOWN	VARCHAR2 (30)	Owner of the relational object identified in SQLOBJECT.
SQLOBJECT	VARCHAR2 (65)	Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB\$UNITS_CUBE.

Table 37-3 (Cont.) MV_CUBE_ADVICE Return Values

Column	Data Type	Description
ADVICETYPE	NUMBER(38,0)	Type of recommendation: <ul style="list-style-type: none"> ■ 1: Create NOT NULL constraints on the foreign key columns ■ 2: Create primary key constraints on the master table ■ 3: Create primary key constraints on the master view ■ 4: Create foreign key constraints on the master table ■ 5: Create foreign key constraints on the master view ■ 6: Create relational dimensions on the master dimension tables ■ 7: Create a materialized view log ■ 8: Compile the materialized view
DISPOSITION	CLOB	Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.
SQLTEXT	CLOB	SQL statement that implements the recommendation.
DROPTTEXT	CLOB	SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV_CUBE_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by MV_CUBE_ADVICE. UNITS_FACT is the master table for UNITS_CUBE, and MV_CUBE_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB\$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
       FROM TABLE(dbms_cube_advise.mv_cube_advise('GLOBAL', 'CB$UNITS_CUBE'));
```

```
APIOBJECT      SQLOBJECT      SQLTEXT
-----
UNITS_CUBE    UNITS_FACT     alter table "GLOBAL"."UNITS_FACT" add constra
```

```
int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID"  
 , "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely d  
isable novalidate  
  
UNITS_CUBE    CB$UNITS_CUBE    alter materialized view "GLOBAL"."CB$UNITS_CU  
BE" compile
```

SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

```
DBMS_CUBE_ADVICE.SET_CNS_EXCEPTION_LOG (
    exceptlogtab    IN    VARCHAR2 DEFAULT user.EXCEPTIONS);
```

Parameters

Table 37–4 SET_CNS_EXCEPTION_LOG Procedure Parameters

Parameter	Description
exceptlogtab	The name of an existing exception log.

Usage Notes

To create an exception log, use the `utlexcpt.sql` or the `utlexpt1.sql` script before executing `SET_CNS_EXCEPTION_LOG`.

The `validate` parameter of `MV_CUBE_ADVICE` must be set to 1.

Examples

The `utlexcpt.sql` script creates a table named `EXCEPTIONS`, and the `SET_CNS_EXCEPTION_LOG` procedure identifies it as the exception log for `MV_CUBE_ADVICE`. The `ALTER TABLE` statement now includes the clause `VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS"`.

```
SQL> @utlexcpt
Table created.
```

```
SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.
```

```
SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
       FROM TABLE(
           dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));
```

APIOBJECT	SQLOBJECT	TYPE	SQLTEXT
UNITS_CUBE	UNITS_FACT	2	alter table "GLOBAL"."UNITS_FACT" add constraint "COAD_PK000219" PRIMARY KEY ("CHANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") norely enable validate exceptions into "GLOBAL"."EXCEPTIONS"
UNITS_CUBE	CB\$UNITS_CUBE	8	alter materialized view "GLOBAL"."CB\$UNITS_CUBE" compile

TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV_CUBE_ADVISE function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (
    diaglevel          IN BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 37–5 TRACE Procedure Parameters

Parameter	Description
diaglevel	0 to turn tracing off, or 1 to turn tracing on.

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]
```

PL/SQL procedure successfully completed.

```
SQL> SELECT sqlobject, sqltext, droptext
       FROM TABLE(
         dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
       WHERE apiobject='UNITS_CUBE';
```

SQLOBJECT	SQLTEXT	DROPTEXT
UNITS_FACT	alter table "GLOBAL"."UNITS_FACT" add constraint "COAD_PK000222" PRIMARY KEY ("HANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely disable novalidate	alter table "GLOBAL"."UNITS_FACT" drop constraint "COAD_PK000222" cascade
CB\$UNITS_CUBE	alter materialized view "GLOBAL"."CB\$UNITS_CUBE" compile	alter materialized view "GLOBAL"."CB\$UNITS_CUBE" compile

```

DBMS_DATA_MINING

Oracle Data Mining is an analytical technology for deriving actionable information from data. You can use Oracle Data Mining to evaluate the probability of future events and discover unsuspected associations and groupings within your data.

The `DBMS_DATA_MINING` package is the primary interface to Oracle Data Mining. A Java API is layered on the PL/SQL API. Oracle Data Mining also supports a family of SQL functions for deploying data mining models.

Oracle Data Miner, a graphical interface to Oracle Data Mining, is available for download from the Oracle Technology Network. Go to:

<http://www.oracle.com/technology/products/bi/odm/index.html>.

See Also:

- [Chapter 39, "DBMS_DATA_MINING_TRANSFORM"](#). This package supports data pre-processing for data mining models.
- [Chapter 89, "DBMS_PREDICTIVE_ANALYTICS"](#). This package supports several routines that perform automated data mining.
- *Oracle Database SQL Language Reference* for information about the SQL Data Mining functions.
- *Oracle Data Mining Concepts* for an introduction to Oracle Data Mining.
- *Oracle Data Mining Concepts* for new features in 11g Release 1 (11.1).

This chapter contains the following topics:

- [Using DBMS_DATA_MINING](#)
 - [Overview](#)
 - [Mining Model Objects](#)
 - [Deprecated Subprograms](#)
 - [Mining Functions](#)
 - [Model Settings](#)
 - [Data Types](#)
- [Summary of DBMS_DATA_MINING Subprograms](#)

Using DBMS_DATA_MINING

This section contains topics that relate to using the DBMS_DATA_MINING package.

- [Overview](#)
- [Mining Model Objects](#)
- [Deprecated Subprograms](#)
- [Mining Functions](#)
- [Model Settings](#)
- [Data Types](#)

Overview

Oracle Data Mining supports both **supervised** and **unsupervised** data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target.

See Also: *Oracle Data Mining Concepts* for background information on supervised and unsupervised data mining, and for additional information about Data Mining functions and algorithms

A data mining **function** refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. See "[Mining Functions](#)" on page 38-8.

Note on Terminology: In data mining terminology, a *function* is a general type of problem to be solved by a given approach to data mining. In SQL language terminology, a *function* is an operator that returns a value.

In Oracle Data Mining documentation, the term *function*, or *mining function* refers to a data mining function; the term *SQL function* or *SQL Data Mining function* refers to a SQL function for scoring (deploying) data mining models. The SQL Data Mining functions are documented in *Oracle Database SQL Language Reference*.

Supervised data mining functions include:

- Classification
- Regression
- Attribute Importance

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection (one-class classification)

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in [Table 38-1](#).

Table 38-1 Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Adaptive Bayes Network (deprecated)	ABN	Classification
Apriori	AP	Association
Decision Tree	DT	Classification
Generalized Linear Model	GLM	Classification and Regression
<i>k</i> -Means (default clustering algorithm)	KM	Clustering

Table 38–1 (Cont.) Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Minimal Descriptor Length	MDL	Attribute Importance
Naive Bayes (default classification algorithm)	NB	Classification
Non-Negative Matrix Factorization	NMF	Feature Extraction
Orthogonal Partitioning Clustering	O-Cluster	Clustering
Support Vector Machine (default regression algorithm)	SVM	Classification and regression (and anomaly detection through one-class classification)

Mining Model Objects

Mining models are Oracle Database schema objects. They support the standard security features of Oracle Database. Mining models are also supported by SQL COMMENT and SQL AUDIT.

See Also:

- *Oracle Data Mining Administrator's Guide* for information about mining model objects, SQL COMMENT, and SQL AUDIT
- *Oracle Data Mining Administrator's Guide* for information about mining model security
- *Oracle Data Mining Administrator's Guide* for information about the sample Data Mining programs

ALL_MINING_MODELS

You can query the data dictionary view ALL_MINING_MODELS to obtain a list of accessible mining models.

Example 38–1 ALL_MINING_MODELS

```
SQL> describe all_mining_models
```

Name	Null?	Type
OWNER	NOT NULL	VARCHAR2 (30)
MODEL_NAME	NOT NULL	VARCHAR2 (30)
MINING_FUNCTION		VARCHAR2 (30)
ALGORITHM		VARCHAR2 (30)
CREATION_DATE	NOT NULL	DATE
BUILD_DURATION		NUMBER
MODEL_SIZE		NUMBER
COMMENTS		VARCHAR2 (4000)

See Also: *Oracle Data Mining Application Developer's Guide* for more information about ALL_MINING_MODELS and related views

Mining Model Naming Restrictions

The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign (\$), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in *Oracle Database SQL Language Reference*.

ALL_MINING_MODEL_ATTRIBUTES

You can query the data dictionary view ALL_MINING_MODEL_ATTRIBUTES to obtain a list of the **data attributes** for each accessible mining model. Data attributes are the

columns of data used by an algorithm to build a model. Some or all of these columns must be present in the data to which the model is applied.

Data attributes are referred to as the **model signature**. The `ALL_MINING_MODEL_ATTRIBUTES` view lists the data attributes in the model signature, including the target if the model is supervised.

An algorithm builds an internal representation of the data attributes and uses them as either **categoricals** (data that classifies or categorizes) or as **numericals** (continuous data). These internal **model attributes** can be viewed using the `GET_MODEL_DETAILS` functions.

Example 38–2 ALL_MINING_MODEL_ATTRIBUTES

```
SQL> describe all_mining_model_attributes
```

Name	Null?	Type
OWNER	NOT NULL	VARCHAR2 (30)
MODEL_NAME	NOT NULL	VARCHAR2 (30)
ATTRIBUTE_NAME	NOT NULL	VARCHAR2 (30)
ATTRIBUTE_TYPE		VARCHAR2 (11)
DATA_TYPE		VARCHAR2 (12)
DATA_LENGTH		NUMBER
DATA_PRECISION		NUMBER
DATA_SCALE		NUMBER
USAGE_TYPE		VARCHAR2 (8)
TARGET		VARCHAR2 (3)

See Also: *Oracle Data Mining Application Developer's Guide* for more information about attributes and `ALL_MINING_MODEL_ATTRIBUTES`

ALL_MINING_MODEL_SETTINGS

The view `ALL_MINING_MODEL_SETTINGS` returns the **settings** for each accessible mining model. Settings control various characteristics of mining models.

All settings have default values. The values of some settings are generated by the algorithm by default. You can override the default value of a setting by specifying its value in a settings table for the model. All settings, both default and user-specified, are listed in `ALL_MINING_MODEL_SETTINGS`.

Example 38–3 ALL_MINING_MODEL_SETTINGS

```
SQL> describe all_mining_model_settings
```

Name	Null?	Type
OWNER	NOT NULL	VARCHAR2 (30)
MODEL_NAME	NOT NULL	VARCHAR2 (30)
SETTING_NAME	NOT NULL	VARCHAR2 (30)
SETTING_VALUE		VARCHAR2 (4000)
SETTING_TYPE		VARCHAR2 (7)

See Also:

- [Model Settings](#) on page 38-9
- *Oracle Data Mining Application Developer's Guide* for more information about `ALL_MINING_MODEL_SETTINGS`

Deprecated Subprograms

The following subprograms are deprecated in 11g Release 1 (11.1.).

- GET_DEFAULT_SETTINGS
Replaced with data dictionary views: USER/ALL/DBA_MINING_MODEL_SETTINGS
- GET_MODEL_SETTINGS
Replaced with data dictionary views: USER/ALL/DBA_MINING_MODEL_SETTINGS
- GET_MODEL_SIGNATURE
Replaced with data dictionary views: USER/ALL/DBA_MINING_MODEL_ATTRIBUTES

The following view is deprecated in 11g Release 1 (11.1.).

- DM_USER_MODELS
Replaced with data dictionary views: USER/ALL/DBA_MINING_MODELS

The Adaptive Bayes Network algorithm is deprecated in 11g Release 1 (11.1.).

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The DMSYS schema no longer exists in 11g Release 1 (11.1.). Oracle Data Mining metadata is now in SYS.

Mining Functions

The constants that specify the mining function of a model are listed in [Table 38–2](#). The concept of a "mining function" is introduced in "[Overview](#)" on page 38-3.

All models are created with a mining function. The mining function is a required argument to the [CREATE_MODEL Procedure](#).

Table 38–2 Mining Functions

Value	Description
ASSOCIATION	<p>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set.</p> <p>Association models use the Apriori algorithm.</p>
ATTRIBUTE_IMPORTANCE	<p>Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome.</p> <p>Attribute Importance models use the Minimal Descriptor Length algorithm.</p>
CLASSIFICATION	<p>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target.</p> <p>Classification models can use: Naive Bayes, Adaptive Bayes Network (deprecated), Decision Tree, Logistic Regression, or Support Vector Machine algorithms. The default is Naive Bayes.</p> <p>The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</p>
CLUSTERING	<p>Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set.</p> <p>Clustering models can use: <i>k</i>-Means or O-Cluster algorithms. The default is <i>k</i>-Means.</p>
FEATURE_EXTRACTION	<p>Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model.</p> <p>Feature extraction models use the Non-Negative Matrix Factorization algorithm.</p>
REGRESSION	<p>Regression is a predictive mining function. A regression model uses historical data to predict a numerical target.</p> <p>Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.</p>

Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and data types shown in [Table 38-3](#).

Table 38-3 Required Columns in the Model Settings Table

Column Name	Data Type
SETTING_NAME	VARCHAR2 (30)
SETTING_VALUE	VARCHAR2 (4000)

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the [CREATE_MODEL Procedure](#).

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified. See "[ALL_MINING_MODEL_SETTINGS](#)" on page 38-6.

Algorithm Names

The **ALGO_NAME** setting specifies the model algorithm. The values for the ALGO_NAME setting are listed in [Table 38-4](#).

Table 38-4 Algorithm Names

ALGO_NAME Value	Description	Mining Function
ALGO_ADAPTIVE_BAYES_NETWORK	Adaptive Bayes Network (deprecated)	Classification
ALGO_DECISION_TREE	Decision Tree	Classification
ALGO_NAIVE_BAYES	Naive Bayes	Classification
ALGO_GENERALIZED_LINEAR_MODEL	Generalized Linear Model	Classification and Regression
ALGO_SUPPORT_VECTOR_MACHINES	Support Vector Machine	Classification and Regression
ALGO_KMEANS	Enhanced <i>k</i> -Means	Clustering
ALGO_O_CLUSTER	O-Cluster	Clustering
ALGO_AI_MDL	Minimum Description Length	Attribute Importance
ALGO_APRIORI_ASSOCIATION_RULES	Apriori	Association Rules
ALGO_NONNEGATIVE_MATRIX_FACTOR	Non-Negative Matrix Factorization	Feature Extraction

Oracle Data Mining supports more than one algorithm for the classification, regression, and clustering mining functions. Each of these mining functions has a default algorithm, as shown in [Table 38-5](#).

Table 38–5 Default Algorithms

Mining Function	Default Algorithm
Classification	Naive Bayes
Regression	Support Vector Machine
Clustering	<i>k</i> -Means

Automatic Data Preparation

The **PREP_AUTO** setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details.

You can choose to supplement automatic data preparations by specifying additional transformations in the `xform_list` parameter when you build the model. (See "[CREATE_MODEL Procedure](#)" on page 38-47.)

If you do not use ADP (default) *and* do not specify transformations in the `xform_list` parameter to `CREATE_MODEL` (also the default), you will continue to operate in 10.2 mode. This means that you must implement your own transformations separately in the build, test, and scoring data; you must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you *do* specify transformations in the `xform_list` parameter to `CREATE_MODEL`, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data. Because of automatic and embedded data preparation, mining models are known as **supermodels**.

The values for the `PREP_AUTO` setting are described in [Table 38–6](#).

Table 38–6 PREP_AUTO Setting

PREP_AUTO Value	Description
PREP_AUTO_OFF	Disable Automatic Data Preparation (default).
PREP_AUTO_ON	Enable Automatic Data Preparation.

See Also: *Oracle Data Mining Concepts* for information about data preparation

Mining Function Settings

The settings described in [Table 38–7](#) apply to a mining function.

Table 38–7 Mining Function Settings

Mining Function	Setting Name	Setting Value	Description
Association	ASSO_MAX_RULE_LENGTH	TO_CHAR(2<= numeric_ expr <=20)	Maximum rule length for association rules. Default is 4.
Association	ASSO_MIN_CONFIDENCE	TO_CHAR(0<= numeric_ expr <=1)	Minimum confidence for association rules. Default is 0.1.
Association	ASSO_MIN_SUPPORT	TO_CHAR(0<= numeric_ expr <=1)	Minimum support for association rules. Default is 0.1.
Classification	CLAS_COST_TABLE_NAME	table_name	(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See " ADD_COST_MATRIX Procedure " on page 38-23 for the column requirements. See <i>Oracle Data Mining Concepts</i> for information about costs.
Classification	CLAS_PRIORS_TABLE_NAME	table_name	(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See <i>Oracle Data Mining Application Developer's Guide</i> for the column requirements. See <i>Oracle Data Mining Concepts</i> for additional information about priors. SVM classification uses the priors table for class weights.
Classification	CLAS_WEIGHTS_TABLE_NAME	table_name	(GLM only) Name of a table that stores weighting information for individual target values in logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See <i>Oracle Data Mining Application Developer's Guide</i> for the column requirements. See <i>Oracle Data Mining Concepts</i> for additional information about class weights for logistic regression.
Clustering	CLUS_NUM_CLUSTERS	TO_CHAR(numeric_ expr >=1)	Number of clusters generated by a clustering algorithm. Default is 10.
Feature Extraction	FEAT_NUM_FEATURES	TO_CHAR(numeric_ expr >=1)	Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about mining functions

Global Settings

The settings in [Table 38–8](#) are applicable to any type of model, but are currently only implemented for GLM.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_MINING_MODEL_SETTINGS`.

Table 38–8 Global Settings

Setting Name	Setting Value	Description
ODMS_MISSING_VALUE_TREATMENT	ODMS_MISSING_VALUE_MEAN_MODE	(GLM only) How to treat missing values in the training data. This setting does not affect the scoring data.
	ODMS_MISSING_VALUE_DELETE_ROW	Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set ODMS_MISSING_VALUE_TREATMENT to ODMS_MISSING_VALUE_DELETE_ROW to override this behavior in the training data. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. For instructions, see <i>Oracle Data Mining Concepts</i> . The value ODMS_MISSING_VALUE_DELETE_ROW is only valid for tables without nested columns. If this value is used with nested data, an exception is raised.
ODMS_ROW_WEIGHT_COLUMN_NAME	<i>column_name</i>	(GLM only) Name of a column in the training data that contains a weighting factor for the rows. Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.

See Also: *Oracle Data Mining Concepts* for information about GLM.

Algorithm Settings: Adaptive Bayes Network (deprecated)

These settings affect the behavior of the Adaptive Bayes Network algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

Table 38–9 ABN Settings

Setting	Value	Description
ABNS_MAX_BUILD_MINUTES	TO_CHAR(<i>numeric_expr</i> >=0)	Maximum time to complete an ABN model build. Default is 0, which implies no time limit.
ABNS_MAX_NB_PREDICTORS	TO_CHAR(<i>numeric_expr</i> >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type <code>abns_naive_bayes</code> . Default is 10.
ABNS_MAX_PREDICTORS	TO_CHAR(<i>numeric_expr</i> >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type <code>abns_single_feature</code> or <code>abns_multi_feature</code> . Default is 25.
ABNS_MODEL_TYPE	ABNS_MULTI_FEATURE ABNS_NAIVE_BAYES ABNS_SINGLE_FEATURE	Type of ABN model. The default is <code>multi_feature</code> .

Algorithm Settings: Decision Tree

These settings affect the behavior of the Decision Tree algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

Table 38–10 Decision Tree Settings

Setting	Value	Description
TREE_IMPURITY_METRIC	TREE_IMPURITY_ENTROPY TREE_IMPURITY_GINI	Tree impurity metric for Decision Tree. Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses gini.
TREE_TERM_MAX_DEPTH	TO_CHAR(2<= numeric_expr <=20)	Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node). Default is 7.
TREE_TERM_MINPCT_MODE	TO_CHAR(0<= numeric_expr <=10)	No child shall have fewer records than this number, which is expressed as a percentage of the training rows. Default is 0.05, indicating 0.05%.
TREE_TERM_MINPCT_SPLIT	TO_CHAR(0 <= numeric_expr <=20)	Criteria for splits: minimum number of records in a parent node expressed as a percent of the total number of records used to train the model. No split is attempted if number of records is below this value. Default is 0.1, indicating 0.1%.
TREE_TERM_MINREC_NODE	TO_CHAR(numeric_expr >=0)	No child shall have fewer records than this number. Default is 10.
TREE_TERM_MINREC_SPLIT	TO_CHAR(numeric_expr >=0)	Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if number of records is below this value. Default is 20.

Algorithm Settings: Generalized Linear Models

These settings affect the behavior of GLM models. GLM can be used for classification (logistic regression) or regression (linear regression).

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

Table 38–11 GLM Settings

Setting Name	Setting Value	Description
GLMS_CONF_LEVEL	TO_CHAR (0 < numeric_ expr <1)	The confidence level for coefficient confidence intervals. The default confidence level is 0.95.
GLMS_DIAGNOSTICS_TABLE_NAME	table_name	The name of a table to contain row-level diagnostic information for a GLM model. The table is created during model build. If you want to create a diagnostics table, you must specify a case ID when you build the model. (See the CREATE_MODEL Procedure .) If you specify a diagnostics table but do not provide a case ID, an exception is raised. For information on GLM diagnostics, see <i>Oracle Data Mining Concepts</i> .
GLMS_REFERENCE_CLASS_NAME	target_value	The target value to be used as the reference value in a logistic regression model. Probabilities will be produced for the other (non-reference) class. By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.
GLMS_RIDGE_REGRESSION	GLMS_RIDGE_REG_ENABLE GLMS_RIDGE_REG_DISABLE	Whether or not ridge regression will be enabled. By default, the algorithm determines whether or not to use ridge. You can explicitly enable ridge by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE. Ridge applies to both regression and classification mining functions. When ridge is enabled, no prediction bounds are produced by the PREDICTION_BOUNDS SQL operator.
GLMS_RIDGE_VALUE	TO_CHAR (0 < numeric_ expr)	The value for the ridge parameter used by the algorithm. This setting is only used when you explicitly enable ridge regression by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE. If ridge regression is enabled internally by the algorithm, the ridge parameter is determined by the algorithm.
GLMS_VIF_FOR_RIDGE	GLMS_VIF_RIDGE_ENABLE GLMS_VIF_RIDGE_DISABLE	(Linear regression only) Whether or not to produce Variance Inflation Factor (VIF) statistics when ridge is being used. By default, VIF is not produced when ridge is enabled. When you explicitly enable ridge regression by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE, you can request VIF statistics by setting GLMS_VIF_FOR_RIDGE to GLMS_VIF_RIDGE_ENABLE; the algorithm will produce VIF if enough system resources are available.

See Also: *Oracle Data Mining Concepts* for information about GLM.

Algorithm Settings: *k*-Means

These settings affect the behavior of the *k*-Means algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–12 *k*-Means Settings

Setting Name	Setting Value	Description
KMNS_BLOCK_GROWTH	TO_CHAR(1< numeric_ expr <=5)	Growth factor for memory allocated to hold cluster data Default value is 2
KMNS_CONV_TOLERANCE	TO_CHAR(0< numeric_ expr <=0.5)	Convergence tolerance for <i>k</i> -Means algorithm Default is 0.01
KMNS_DISTANCE	KMNS_COSINE KMNS_EUCLIDEAN KMNS_FAST_COSINE	Distance Function for <i>k</i> -Means Clustering. The default is euclidean.
KMNS_ITERATIONS	TO_CHAR(0< numeric_ expr <=20)	Number of iterations for <i>k</i> -Means algorithm Default is 3
KMNS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0<= numeric_ expr <=1)	The fraction of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster. Setting the parameter value too high in data with missing values can result in very short or even empty rules. Default is 0.1.
KMNS_NUM_BINS	TO_CHAR(numeric_expr >0)	Number of histogram bins. Specifies the number of bins in the attribute histogram produced by <i>k</i> -Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin. Default is 10.
KMNS_SPLIT_CRITERION	KMNS_SIZE KMNS_VARIANCE	Split criterion for <i>k</i> -Means Clustering. The default criterion is the variance.

See Also: *Oracle Data Mining Concepts* for information about *k*-Means.

Algorithm Settings: Naive Bayes

These settings affect the behavior of the Naive Bayes Algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 38–13 *Naive Bayes Settings*

Setting Name	Setting Value	Description
NABS_PAIRWISE_THRESHOLD	TO_CHAR(0<= numeric_ expr <=1)	Value of pairwise threshold for NB algorithm Default is 0.01.
NABS_SINGLETON_THRESHOLD	TO_CHAR(0<= numeric_ expr <=1)	Value of singleton threshold for NB algorithm Default value is 0.01

See Also: *Oracle Data Mining Concepts* for information about Naive Bayes

Algorithm Settings: Non-Negative Matrix Factorization

These settings affect the behavior of the Non-Negative Matrix Factorization algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

Table 38–14 NMF Settings

Setting Name	Setting Value	Description
NMFS_CONV_TOLERANCE	TO_CHAR(0 < numeric_expr <= 0.5)	Convergence tolerance for NMF algorithm Default is 0.05
NMFS_NUM_ITERATIONS	TO_CHAR(1 <= numeric_expr <= 500)	Number of iterations for NMF algorithm Default is 50
NMFS_RANDOM_SEED	TO_CHAR(numeric_expr)	Random seed for NMF algorithm. Default is -1.

See Also: *Oracle Data Mining Concepts* for information about NMF

Algorithm Settings: O-Cluster

These settings affect the behavior of the O-Cluster algorithm.

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

Table 38–15 O-Cluster Settings

Setting Name	Setting Value	Description
OCLT_MAX_BUFFER	TO_CHAR(numeric_expr > 0)	Buffer size for O-Cluster. Default is 50,000.
OCLT_SENSITIVITY	TO_CHAR(0 <= numeric_expr <= 1)	A fraction that specifies the peak density required for separating a new cluster. The fraction is related to the global uniform density. Default is 0.5.

See Also: *Oracle Data Mining Concepts* for information about O-Cluster.

Algorithm Settings: Support Vector Machine

These settings affect the behavior of the Support Vector Machine algorithm. SVM can be used for classification or regression, or for anomaly detection (classification with a null target).

You can query the data dictionary view `*_MINING_MODEL_SETTINGS` (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about `*_ALL_MINING_MODEL_SETTINGS`.

Table 38–16 SVM Settings

Setting Name	Setting Value	Description
SVMS_ACTIVE_LEARNING	SVMS_AL_DISABLE SVMS_AL_ENABLE	Whether active learning is enabled or disabled. By default, active learning is enabled. When active learning is enabled, the SVM algorithm uses active learning to build a reduced size model. When active learning is disabled, the SVM algorithm builds a standard model.
SVMS_COMPLEXITY_FACTOR	TO_CHAR(<i>numeric_</i> <i>expr</i> >0)	Value of complexity factor for SVM algorithm (both classification and regression). Default value estimated from the data by the algorithm.
SVMS_CONV_TOLERANCE	TO_CHAR(<i>numeric_</i> <i>expr</i> >0)	Convergence tolerance for SVM algorithm. Default is 0.001.
SVMS_EPSILON	TO_CHAR(<i>numeric_</i> <i>expr</i> >0)	Value of epsilon factor for SVM regression. Default value estimated from the data by the algorithm.
SVMS_KERNEL_CACHE_SIZE	TO_CHAR(<i>numeric_</i> <i>expr</i> >0)	Value of kernel cache size for SVM algorithm. Applies to Gaussian kernel only. Default is 50000000 bytes.
SVMS_KERNEL_FUNCTION	svm_gaussian svms_linear	Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel. The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.
SVMS_OUTLIER_RATE	TO_CHAR(0< <i>numeric_</i> <i>expr</i> <1)	The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection). Default is .1.
SVMS_STD_DEV	TO_CHAR(<i>numeric_</i> <i>expr</i> >0)	Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about SVM.

Data Types

The `DBMS_DATA_MINING` package uses object data types to store information about model attributes. Most of these types are returned by the table functions `GET_n`, where *n* identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the `GET` functions, see "[Summary of DBMS_DATA_MINING Subprograms](#)" on page 38-21.

Oracle Data Mining also uses object data types for handling transactional data. These types, `DM_NESTED_NUMERICALS` and `DM_NESTED_CATEGORICALS` specify nested tables that can be used for storing a set of mining attributes in a single column. For more information on nested tables, see the *Oracle Data Mining Application Developer's Guide*.

All the table functions use **pipelining**, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference*.

The Data Mining object data types are described in [Table 38-17](#).

Table 38-17 DBMS_DATA_MINING Summary of Data Types

Data Type	Description
<code>DM_ABN_DETAIL</code>	Information about an attribute in an Adaptive Bayes Network model.
<code>DM_ABN_DETAILS</code>	A collection of <code>DM_ABN_DETAIL</code> . Returned by GET_MODEL_DETAILS_ABN Function .
<code>DM_CENTROID</code>	The centroid of a cluster.
<code>DM_CENTROIDS</code>	A collection of <code>DM_CENTROID</code> . A member of <code>DM_CLUSTER</code> .
<code>DM_CHILD</code>	A child node of a cluster.
<code>DM_CHILDREN</code>	A collection of <code>DM_CHILD</code> . A member of <code>DM_CLUSTER</code> .
<code>DM_CLUSTER</code>	A cluster. A cluster includes <code>DM_PREDICATES</code> , <code>DM_CHILDREN</code> , <code>DM_CENTROIDS</code> , and <code>DM_HISTOGRAMS</code> . It also includes a <code>DM_RULE</code> .
<code>DM_CLUSTERS</code>	A collection of <code>DM_CLUSTER</code> . Returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function .
<code>DM_CONDITIONAL</code>	The conditional probability of an attribute in a Naive Bayes model.
<code>DM_CONDITIONALS</code>	A collection of <code>DM_CONDITIONAL</code> . Returned by GET_MODEL_DETAILS_NB Function .
<code>DM_COST_ELEMENT</code>	The actual and predicted values in a cost matrix.
<code>DM_COST_MATRIX</code>	A collection of <code>DM_COST_ELEMENT</code> . Returned by GET_MODEL_COST_MATRIX Function .
<code>DM_GLM_COEFF</code>	The coefficient and associated statistics of an attribute in a Generalized Linear Model.
<code>DM_GLM_COEFF_SET</code>	A collection of <code>DM_GLM_COEFF</code> . Returned by GET_MODEL_DETAILS_GLM Function .
<code>DM_HISTOGRAM_BIN</code>	A histogram associated with a cluster.

Table 38–17 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_HISTOGRAMS	A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER.
DM_ITEM	An item in an association rule.
DM_ITEMS	A collection of DM_ITEM.
DM_ITEMSET	A collection of DM_ITEMS.
DM_ITEMSETS	A collection of DM_ITEMSET. Returned by GET_FREQUENT_ITEMSETS Function .
DM_MODEL_GLOBAL_DETAIL	High-level statistics about a model.
DM_MODEL_GLOBAL_DETAILS	A collection of DM_MODEL_GLOBAL_DETAIL. Returned by GET_MODEL_DETAILS_GLOBAL Function .
DM_MODEL_SETTING	A model setting.
DM_MODEL_SETTINGS	A collection of DM_MODEL_SETTING. Returned by GET_MODEL_SETTINGS Function and GET_DEFAULT_SETTINGS Function .
DM_MODEL_SIGNATURE_ATTRIBUTE	An attribute in the model signature.
DM_MODEL_SIGNATURE	A collection of DM_MODEL_SIGNATURE. Returned by GET_MODEL_SIGNATURE Function .
DM_NB_DETAIL	Information about an attribute in a Naive Bayes model.
DM_NB_DETAILS	A collection of DM_DB_DETAIL. Returned by GET_MODEL_DETAILS_NB Function .
DM_NESTED_CATEGORICAL	The name and value of a categorical attribute.
DM_NESTED_CATEGORICALS	A collection of DM_NESTED_CATEGORICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NESTED_NUMERICAL	The name and value of a numerical attribute.
DM_NESTED_NUMERICALS	A collection of DM_NESTED_NUMERICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NMF_ATTRIBUTE	An attribute in a feature of a Non-Negative Matrix Factorization model.
DM_NMF_ATTRIBUTE_SET	A collection of DM_NMF_ATTRIBUTE. A member of DM_NMF_FEATURE.
DM_NMF_FEATURE	A feature in a Non-Negative Matrix Factorization model.
DM_NMF_FEATURE_SET	A collection of DM_NMF_FEATURE. Returned by GET_MODEL_DETAILS_NMF Function .
DM_PREDICATE	Antecedent and consequent attributes.
DM_PREDICATES	A collection of DM_PREDICATE. A member of DM_RULE, DM_CLUSTER, and DM_ABN_DETAIL.
DM_RANKED_ATTRIBUTE	An attribute ranked by its importance in an Attribute Importance model.
DM_RANKED_ATTRIBUTES	A collection of DM_RANKED_ATTRIBUTE. Returned by GET_MODEL_DETAILS_AI Function .

Table 38–17 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_RULE	<p>A rule that defines a conditional relationship.</p> <p>The rule can be one of the association rules returned by GET_ASSOCIATION_RULES Function, or it can be a rule associated with a cluster in the collection of clusters returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function.</p>
DM_RULES	<p>A collection of DM_RULE. Returned by GET_ASSOCIATION_RULES Function.</p>
DM_SVM_ATTRIBUTE	<p>The name, value, and coefficient of an attribute in a Support Vector Machine model.</p>
DM_SVM_ATTRIBUTE_SET	<p>A collection of DM_SVM_ATTRIBUTE. Returned by GET_MODEL_DETAILS_SVM Function. Also a member of DM_SVM_LINEAR_COEFF.</p>
DM_SVM_LINEAR_COEFF	<p>The linear coefficient of each attribute in a Support Vector Machine model.</p>
DM_SVM_LINEAR_COEFF_SET	<p>A collection of DM_SVM_LINEAR_COEFF. Returned by GET_MODEL_DETAILS_SVM Function for an SVM model built using the linear kernel.</p>
DM_TRANSFORM	<p>The transformation and reverse transformation expressions for an attribute.</p>
DM_TRANSFORMS	<p>A collection of DM_TRANSFORM. Returned by GET_MODEL_TRANSFORMATIONS Function.</p>
TRANSFORM_LIST	<p>A list of user-specified transformations for a model. Accepted as a parameter by the CREATE_MODEL Procedure.</p> <p>This collection type is defined in the DBMS_DATA_MINING_TRANSFORM package.</p>

Summary of DBMS_DATA_MINING Subprograms

Table 38–18 summarizes the subprograms included in the DBMS_DATA_MINING package.

Table 38–18 DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
ADD_COST_MATRIX Procedure on page 38-23	Adds a cost matrix to a classification model
ALTER_REVERSE_EXPRESSION Procedure on page 38-25	Changes the reverse transformation expression to an expression that you specify
APPLY Procedure on page 38-27	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure on page 38-31	Computes the confusion matrix from the APPLY results on test data for a classification model; also provides the accuracy of the model
COMPUTE_LIFT Procedure on page 38-37	Computes lift for a given positive target value from the APPLY results on test data for a classification model
COMPUTE_ROC Procedure on page 38-42	Computes Receiver Operating Characteristic (ROC) for a classification model
CREATE_MODEL Procedure on page 38-47	Creates (builds) a model
DROP_MODEL Procedure on page 38-51	Drops a model
EXPORT_MODEL Procedure on page 38-52	Exports a model to a dump file
GET_ASSOCIATION_RULES Function on page 38-55	Returns the rules from an association model
GET_DEFAULT_SETTINGS Function on page 38-58	Returns all the default settings for all mining functions and algorithms
GET_FREQUENT_ITEMSETS Function on page 38-59	Returns the frequent itemsets for an association model
GET_MODEL_COST_MATRIX Function on page 38-61	Returns the cost matrix for a model
GET_MODEL_DETAILS_ABN Function on page 38-63	Returns the details of an Adaptive Bayes Network model
GET_MODEL_DETAILS_AI Function on page 38-65	Returns the details of an Attribute Importance model
GET_MODEL_DETAILS_GLM Function on page 38-66	Returns the details of a Generalized Linear Model
GET_MODEL_DETAILS_GLOBAL Function on page 38-69	Returns high-level statistics about a model
GET_MODEL_DETAILS_KM Function on page 38-72	Returns the details of a <i>k</i> -Means model
GET_MODEL_DETAILS_NB Function on page 38-75	Returns the details of a Naive Bayes model
GET_MODEL_DETAILS_NMF Function on page 38-77	Returns the details of an NMF model

Table 38–18 (Cont.) DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
GET_MODEL_DETAILS_OC Function on page 38-78	Returns the details of an O-Cluster model
GET_MODEL_DETAILS_SVM Function on page 38-81	Returns the details of an SVM model with a linear kernel
GET_MODEL_DETAILS_XML Function on page 38-83	Returns the details of a Decision Tree model
GET_MODEL_SETTINGS Function on page 38-84	Returns the settings used to build a model
GET_MODEL_SIGNATURE Function on page 38-85	Returns the signature of a model
GET_MODEL_TRANSFORMATIONS Function on page 38-87	Returns the user-specified transformation definitions embedded in the model, as well as many of the ADP transformations
GET_TRANSFORM_LIST Procedure on page 38-88	Converts between two different transformation specification formats
IMPORT_MODEL Procedure on page 38-89	Imports a model into a user schema
RANK_APPLY Procedure on page 38-92	Ranks the predictions from the APPLY results for a classification model
REMOVE_COST_MATRIX Procedure on page 38-95	Removes a cost matrix from a model
RENAME_MODEL Procedure on page 38-96	Renames a model

ADD_COST_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the `GET_MODEL_COST_MATRIX` function. To remove the default scoring matrix from a model, use the `REMOVE_COST_MATRIX` procedure. See "[GET_MODEL_COST_MATRIX Function](#)" on page 38-61 and "[REMOVE_COST_MATRIX Procedure](#)" on page 38-95.

See Also:

- "Biasing a Classification Model" in *Oracle Data Mining Concepts* for more information about costs
- *Oracle Database SQL Language Reference* for syntax of inline cost matrix

Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
    model_name           IN VARCHAR2,
    cost_matrix_table_name IN VARCHAR2,
    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–19 ADD_COST_MATRIX Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is assumed.
cost_matrix_table_name	Name of the cost matrix table (described in Table 38–20).
cost_matrix_schema_name	Schema of the cost matrix table. If no schema is specified, the current schema is used.

Usage Notes

1. If the model is not in your schema, then `ADD_COST_MATRIX` requires the `ALTER ANY MINING MODEL` system privilege or the `ALTER` object privilege for the mining model.
2. The cost matrix table must have the columns shown in [Table 38–20](#). Note that the actual and predicted target values must have the same data type.

Table 38–20 Required Columns in a Cost Matrix Table

Column Name	Data Type
ACTUAL_TARGET_VALUE	VARCHAR2 (4000) for categorical targets NUMBER for numeric targets

Table 38–20 (Cont.) Required Columns in a Cost Matrix Table

Column Name	Data Type
PREDICTED_TARGET_VALUE	VARCHAR2 (4000) for categorical targets NUMBER for numeric targets
COST	NUMBER

- Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the `costs` column of the cost matrix table.
- All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the `CLAS_COST_TABLE_NAME` setting in the settings table for the model. See [Table 38–7, "Mining Function Settings"](#).

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the `REMOVE_COST_MATRIX` procedure to remove the cost matrix and the `ADD_COST_MATRIX` procedure to add a new one.

Example

This example creates a cost matrix table called `COSTS_NB` and adds it to a Naive Bayes model called `NB_SH_CLAS_SAMPLE`. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```
CREATE TABLE costs_nb (
  actual_target_value      NUMBER,
  predicted_target_value   NUMBER,
  cost                     NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;

EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(nb_sh_clas_sample COST MODEL
  USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

C	CNT	AVG_AGE
F	72	39
M	555	44

ALTER_REVERSE_EXPRESSION Procedure

This procedure changes a reverse transformation expression to an expression that you specify.

A transformation expression specifies how an attribute will be changed before it is used to create a model. The reverse transformation expression specifies how the attribute will be returned to its original form (or some approximation of its original form) for purposes of model transparency.

The GET_MODEL_DETAILS functions apply reverse transformations before returning information about a model's attributes. When the target is transformed, its reverse transformation is applied to the results of scoring. See the Usage Notes.

You can use ALTER_REVERSE_EXPRESSION to associate a name/description with a cluster or feature; the descriptor that you specify will be displayed when the model is scored. You can use the CLUSTER_ID, CLUSTER_PROBABILITY, and CLUSTER_SET functions to score clustering models. You can use the FEATURE_ID, FEATURE_SET, or FEATURE_VALUE functions to score feature extraction models. See the example and *Oracle Database SQL Language Reference*.

You can use ALTER_REVERSE_EXPRESSION to associate a name/description with the results of an anomaly detection model. These models use One-Class SVM to predict either 1 or 0 for each record, indicating whether or not the record is anomalous. With ALTER_REVERSE_EXPRESSION, you can replace the zeros and ones with labels that are more meaningful.

Syntax

```
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION (
    model_name          VARCHAR2,
    expression          CLOB,
    attribute_name      VARCHAR2 DEFAULT NULL,
    attribute_subname   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–21 ALTER_REVERSE_EXPRESSION Procedure Parameters

Parameter	Description
model_name	Name of the model in the form <i>[schema_name.]model_name</i> . If you do not specify a schema, your own schema is used.
expression	A SQL expression.
attribute_name	Name of the attribute. Specify NULL if you wish to apply <i>expression</i> to a cluster, feature, or One-Class SVM prediction.
attribute_subname	Name of the nested attribute if <i>attribute_name</i> is a nested column, otherwise NULL.

Usage Notes

If you are using automatic data preparation, the transformations and reverse transformations are performed automatically by the system. When you create the model, you can specify transformations and reverse transformations to be applied in addition to the system-generated expressions. If you are not using automatic data preparation, the transformations and reverse transformations that you specify are the only ones that are applied.

Example

This example specifies labels for the clusters that result from the `sh_clus` model. The labels consist of the word "Cluster" and the internal numeric identifier for the cluster.

```
SQL> begin
  2   dbms_data_mining.alter_reverse_expression(
  3     'sh_clus', ''Cluster '||value');
  4 end;
  5 /

SQL> select cust_id, cluster_id(sh_clus using *) cluster_id
  2   from sh_aprep_num
  3   where cust_id < 100011
  4   order by cust_id;
```

```
CUST_ID CLUSTER_ID
-----
100001 Cluster 18
100002 Cluster 14
100003 Cluster 14
100004 Cluster 18
100005 Cluster 19
100006 Cluster 7
100007 Cluster 18
100008 Cluster 14
100009 Cluster 8
100010 Cluster 8
```

APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

In Oracle Data Mining, the apply operation is not applicable to association models and attribute importance models.

Note: Scoring can also be performed directly in SQL using the Data Mining functions. See "Scoring and Deployment" in *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.APPLY (
    model_name           IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–22 APPLY Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.
data_table_name	Name of table or view representing data to be scored
case_id_column_name	Name of the case identifier column
result_table_name	Name of the table to store apply results
data_schema_name	Name of the schema containing the data to be scored

Usage Notes

1. The data provided for APPLY must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "[Automatic Data Preparation](#)" on page 38-10.)
2. APPLY creates a table in the user's schema to hold the results. The columns are algorithm-specific.

The columns in the results table are listed in [Table 38–23](#) through [Table 38–27](#). The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in APPLY output.

Note: Make sure that the case ID column does not have the same name as one of the columns that will be created by APPLY. For example, when applying a classification model, the case ID in the scoring data must not be 'PREDICTION' or 'PROBABILITY' (See [Table 38–23](#)).

3. The data type for the 'PREDICTION', 'CLUSTER_ID', and 'FEATURE_ID' output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "[ALTER_REVERSE_EXPRESSION Procedure](#)" on page 38-25.

Classification

The results table for classification has the columns described in [Table 38–23](#). If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 data type. If the target is numerical, the PREDICTION column will have a NUMBER data type.

Table 38–23 APPLY Results Table for Classification

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
PREDICTION	VARCHAR2 or NUMBER
PROBABILITY	NUMBER

One-Class SVM (Anomaly Detection)

The results table for anomaly detection has the columns described in [Table 38–24](#).

Table 38–24 APPLY Results Table for Anomaly Detection

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
PREDICTION	NUMBER
PROBABILITY	NUMBER

Values in the PREDICTION column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression using SVM or GLM

The results table for regression has the columns described in [Table 38–25](#).

Table 38–25 APPLY Results Table for Regression

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
PREDICTION	NUMBER

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in [Table 38–26](#).

Table 38–26 *APPLY Results Table for Clustering*

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
CLUSTER_ID	NUMBER
PROBABILITY	NUMBER

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in [Table 38–27](#).

Table 38–27 *APPLY Results Table for Feature Extraction*

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
FEATURE_ID	NUMBER
MATCH_QUALITY	NUMBER

Examples

This example applies the GLM regression model `GLMR_SH_REGR_SAMPLE` to the data in the `MINING_DATA_APPLY_V` view. The apply results are output to the table `REGRESSION_APPLY_RESULT`.

```
SQL> BEGIN
      DBMS_DATA_MINING.APPLY (
        model_name      => 'glmr_sh_regr_sample',
        data_table_name => 'mining_data_apply_v',
        case_id_column_name => 'cust_id',
        result_table_name => 'regression_apply_result');
      END;
      /

SQL> SELECT * FROM regression_apply_result WHERE cust_id > 101485;

CUST_ID PREDICTION
-----
101486 22.8048824
101487 25.0261101
101488 48.6146619
101489  51.82595
101490 22.6220714
101491 61.3856816
101492 24.1400748
101493 58.034631
101494 45.7253149
101495 26.9763318
```

```
101496 48.1433425
101497 32.0573434
101498 49.8965531
101499 56.270656
101500 21.1153047
```

COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The matrix is n -by- n , where n is the number of classes. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE_CONFUSION_MATRIX accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
 - Case ID column
 - Prediction column
 - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
 - Case ID column
 - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

Oracle Data Mining Concepts for more details about confusion matrixes and other test metrics for classification

["COMPUTE_LIFT Procedure"](#) on page 38-37

["COMPUTE_ROC Procedure"](#) on page 38-42

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
  accuracy                OUT NUMBER,
  apply_result_table_name IN  VARCHAR2,
  target_table_name       IN  VARCHAR2,
  case_id_column_name     IN  VARCHAR2,
  target_column_name      IN  VARCHAR2,
  confusion_matrix_table_name IN VARCHAR2,
  score_column_name       IN  VARCHAR2 DEFAULT 'PREDICTION',
  score_criterion_column_name IN VARCHAR2 DEFAULT 'PROBABILITY',
  cost_matrix_table_name  IN  VARCHAR2 DEFAULT NULL,
  apply_result_schema_name IN  VARCHAR2 DEFAULT NULL,
  target_schema_name     IN  VARCHAR2 DEFAULT NULL,
  cost_matrix_schema_name IN  VARCHAR2 DEFAULT NULL,
  score_criterion_type    IN  VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 38–28 *COMPUTE_CONFUSION_MATRIX Procedure Parameters*

Parameter	Description
<code>accuracy</code>	Output parameter containing the overall percentage accuracy of the predictions.
<code>apply_result_table_name</code>	Table containing the predictions.
<code>target_table_name</code>	Table containing the known target values from the test data.
<code>case_id_column_name</code>	Case ID column in the apply results table. Must match the case identifier in the targets table.
<code>target_column_name</code>	Target column in the targets table. Contains the known target values from the test data.
<code>confusion_matrix_table_name</code>	Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.
<code>score_column_name</code>	Column containing the predictions in the apply results table. The default column name is <code>PREDICTION</code> , which is the default name created by the <code>APPLY</code> procedure (See " APPLY Procedure " on page 38-27).
<code>score_criterion_column_name</code>	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The <code>score_criterion_type</code> parameter indicates whether probabilities or costs will be used for scoring. The default column name is <code>'PROBABILITY'</code> , which is the default name created by the <code>APPLY</code> procedure (See " APPLY Procedure " on page 38-27). See the Usage Notes for additional information.
<code>cost_matrix_table_name</code>	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the <code>score_criterion_type</code> parameter is set to <code>'COSTS'</code> , the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
<code>apply_result_schema_name</code>	Schema of the apply results table. If null, the user's schema is assumed.
<code>target_schema_name</code>	Schema of the table containing the known targets. If null, the user's schema is assumed.
<code>cost_matrix_schema_name</code>	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.

Table 38–28 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
score_criterion_type	<p>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter.</p> <p>The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'.</p> <p>If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring.</p> <p>See the Usage Notes and the Examples.</p>

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to COMPUTE_CONFUSION_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_CONFUSION_MATRIX are in a table or view specified in apply_result_table_name.

```
CREATE TABLE apply_result_table_name AS (
    case_id_column_name          VARCHAR2,
    score_column_name            VARCHAR2,
    score_criterion_column_name  VARCHAR2);
```

- A cost matrix must have the columns described in [Table 38–29](#).

Table 38–29 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2
predicted_target_value	NUMBER or VARCHAR2
cost	NUMBER

See Also: *Oracle Data Mining Concepts* for more information about cost matrixes

- The confusion matrix created by COMPUTE_CONFUSION_MATRIX has the columns described in [Table 38–30](#).

Table 38–30 Columns in a Confusion Matrix

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2

Table 38–30 (Cont.) Columns in a Confusion Matrix

Column Name	Data Type
predicted_target_value	NUMBER or VARCHAR2
value	NUMBER

See Also: *Oracle Data Mining Concepts* for more information about confusion matrixes

Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample USING *) prediction,
         PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
  FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
  v_accuracy    NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847

SQL>SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE  PREDICTED_TARGET_VALUE  VALUE
-----
                1                0         60
                0                0        891
                1                1        286
                0                1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      COST
-----
                0                0          0
                0                1          .75
                1                0          .25
                1                1           0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name      => 'nb_sh_clas_sample',
    data_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name => 'nb_apply_results');
END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy  NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy              => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name     => 'mining_data_test_v',
    case_id_column_name   => 'cust_id',
    target_column_name    => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name     => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    cost_matrix_table_name => 'nb_cost_matrix',
    apply_result_schema_name => null,
    target_schema_name    => null,
    cost_matrix_schema_name => null,
    score_criterion_type  => 'COST');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798
```

```
SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
-----
                1                0          91
```

```

0          0          942
1          1          255
0          1          212

```

Compute a Confusion Matrix Based on Embedded Costs

You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```

BEGIN
  DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;
/

```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```

CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
         PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
  FROM mining_data_test_v;

```

You can compute the confusion matrix using the embedded costs.

```

DECLARE
  v_accuracy          NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy           => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name  => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name  => 'PREDICTION',
    score_criterion_column_name => 'COST',
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name  => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'COST');
END;
/

```

The results are:

```

**** MODEL ACCURACY ****: .798

```

```

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE VALUE
-----
1                   0                   91
0                   0                   942
1                   1                   255
0                   1                   212

```

COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. `COMPUTE_LIFT` compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

`COMPUTE_LIFT` calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, `COMPUTE_LIFT` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
 - Case ID column
 - Prediction column
 - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
 - Case ID column
 - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

  score_criterion_type        IN VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 38–31 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
lift_table_name	Table containing the lift statistics. The table will be created by the procedure in the user's schema. The columns in the lift table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate lift. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 38-27).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 38-27). See the Usage Notes for additional information.
num_quantiles	Number of quantiles to be used in calculating lift. The default is 10.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COSTS', the costs will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Table 38–31 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.
- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
    case_id_column_name          VARCHAR2,
    score_column_name            VARCHAR2,
    score_criterion_column_name  VARCHAR2);
```

- A cost matrix must have the columns described in [Table 38–32](#).

Table 38–32 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2
predicted_target_value	NUMBER or VARCHAR2
cost	NUMBER

See Also: *Oracle Data Mining Concepts* for more information about cost matrixes

- The table created by COMPUTE_LIFT has the columns described in [Table 38–33](#)

Table 38–33 Columns in a Lift Table

Column Name	Data Type
quantile_number	NUMBER
probability_threshold	NUMBER
gain_cumulative	NUMBER
quantile_total_count	NUMBER
quantile_target_count	NUMBER
percent_records_cumulative	NUMBER
lift_cumulative	NUMBER
target_density_cumulative	NUMBER
targets_cumulative	NUMBER
non_targets_cumulative	NUMBER
lift_quantile	NUMBER
target_density	NUMBER

See Also: *Oracle Data Mining Concepts* for details about the information in the lift table

- When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "[COMPUTE_CONFUSION_MATRIX Procedure](#)" on page 38-31.

Compute Lift Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample USING *) prediction,
         PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
  FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```
BEGIN
  DBMS_DATA_MINING.COMPUTE_LIFT (
    apply_result_table_name => 'nb_apply_results',
    target_table_name       => 'mining_data_test_v',
    case_id_column_name    => 'cust_id',
    target_column_name     => 'affinity_card',
    lift_table_name        => 'nb_lift',
    positive_target_value  => to_char(1),
    score_column_name      => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
```

```

num_quantiles           => 10,
cost_matrix_table_name  => null,
apply_result_schema_name => null,
target_schema_name     => null,
cost_matrix_schema_name => null,
score_criterion_type    => 'PROBABILITY');
END;
/

```

This query displays some of the statistics from the resulting lift table.

```

SQL>SELECT quantile_number, probability_threshold, gain_cumulative,
quantile_total_count
FROM nb_lift;

```

QUANTILE_NUMBER	PROBABILITY_THRESHOLD	GAIN_CUMULATIVE	QUANTILE_TOTAL_COUNT

COMPUTE_ROC Procedure

This procedure computes receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE_ROC compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

COMPUTE_ROC accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
 - Case ID column
 - Prediction column
 - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
 - Case ID column
 - Target column containing the known target values

See Also:

Oracle Data Mining Concepts for more details about ROC and test metrics for classification

["COMPUTE_CONFUSION_MATRIX Procedure"](#) on page 38-31

["COMPUTE_LIFT Procedure"](#) on page 38-37

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
    roc_area_under_curve          OUT NUMBER,
    apply_result_table_name      IN  VARCHAR2,
    target_table_name            IN  VARCHAR2,
    case_id_column_name          IN  VARCHAR2,
    target_column_name           IN  VARCHAR2,
    roc_table_name               IN  VARCHAR2,
    positive_target_value        IN  VARCHAR2,
    score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
    apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
    target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–34 COMPUTE_ROC Procedure Parameters

Parameter	Description
roc_area_under_the_curve	Output parameter containing the area under the ROC curve (AUC). The AUC measures the likelihood that an actual positive will be predicted as positive. The greater the AUC, the greater the flexibility of the model in accommodating trade-offs between positive and negative class predictions. AUC can be especially important when one target class is rarer or more important to identify than another.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
roc_table_name	Table containing the ROC output. The table will be created by the procedure in the user's schema. The columns in the ROC table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate ROC. If the target column is a NUMBER, you can use the TO_CHAR () operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 38-27).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 38-27).
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
    case_id_column_name          VARCHAR2,
    score_column_name            VARCHAR2,
    score_criterion_column_name  VARCHAR2);
```

- The table created by COMPUTE_ROC has the columns shown in [Table 38–35](#).

Table 38–35 COMPUTE_ROC Output

Column	Data Type
probability	NUMBER
true_positives	NUMBER
false_negatives	NUMBER
false_positives	NUMBER
true_negatives	NUMBER
true_positive_fraction	NUMBER
false_positive_fraction	NUMBER

See Also: *Oracle Data Mining Concepts* for details about the output of COMPUTE_ROC

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
       FROM apply_result_table_name
       WHERE probability > probability_threshold
       ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (
    SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
    GROUP BY probability_threshold),
minCost AS (
    SELECT min(cost) minCost
    FROM cost)
SELECT max(probability_threshold) probability_threshold
FROM cost, minCost
WHERE cost = minCost;
```

If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
       ORDER BY probability_threshold;
```

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample USING *) prediction,
         PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
  FROM mining_data_test_v;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
  v_area_under_curve NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_ROC (
    roc_area_under_curve      => v_area_under_curve,
    apply_result_table_name   => 'nb_apply_results',
    target_table_name         => 'mining_data_test_v',
    case_id_column_name       => 'cust_id',
    target_column_name        => 'affinity_card',
    roc_table_name            => 'nb_roc',
    positive_target_value     => '1',
    score_column_name         => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
    ROUND(v_area_under_curve,4));
END;
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212
```

```
SQL> SELECT probability, true_positive_fraction, false_positive_fraction
       FROM nb_roc;
```

PROBABILITY	TRUE_POSITIVE_FRACTION	FALSE_POSITIVE_FRACTION
.00000	1	1
.50018	.826589595	.227902946

CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an `xform_list` to `CREATE_MODEL`, you can specify a list of transformations to be performed on the input data. If the `PREP_AUTO` setting is on, the transformations are used in addition to the automatic transformations. If the `PREP_AUTO` setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model and executed automatically whenever the model is applied. See ["Automatic Data Preparation"](#) on page 38-10.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
    model_name           IN VARCHAR2,
    mining_function      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    target_column_name   IN VARCHAR2 DEFAULT NULL,
    settings_table_name  IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    settings_schema_name IN VARCHAR2 DEFAULT NULL,
    xform_list           IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 38–36 CREATE_MODEL Procedure Parameters

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used. See also "Mining Model Naming Restrictions" on page 38-5.
<code>mining_function</code>	The mining function. Values are listed in Table 38–2, "Mining Functions" .
<code>data_table_name</code>	Table or view containing the build data.
<code>case_id_column_name</code>	Case identifier column in the build data.
<code>target_column_name</code>	For supervised models, the target column in the build data. <code>NULL</code> for unsupervised models.
<code>settings_table_name</code>	Table containing build settings for the model. <code>NULL</code> if there is no settings table (only default settings are used).
<code>data_schema_name</code>	Schema hosting the build data. If <code>NULL</code> , the user's schema is assumed.
<code>settings_schema_name</code>	Schema hosting the settings table. If <code>NULL</code> , the user's schema is assumed.

Table 38–36 (Cont.) CREATE_MODEL Procedure Parameters

Parameter	Description
xform_list	<p>A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation" on page 38-10.)</p> <p>The data type is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC.</p> <pre> TYPE TRANSFORM_REC IS RECORD (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), expression EXPRESSION_REC, reverse_expression EXPRESSION_REC, attribute_spec VARCHAR2(4000)); </pre> <p>Each TRANSFORM_REC describes the transformation and reverse transformation for an attribute. EXPRESSION_REC stores a SQL expression.</p> <p>The SQL expression stored in EXPRESSION_REC can be manipulated using routines in the DBMS_DATA_MINING_TRANSFORM package. Examples are: SET_EXPRESSION, GET_EXPRESSION, and SET_TRANSFORM.</p> <p>You can use ATTRIBUTE_SPEC to disable Automatic Data Preparation (ADP) for an individual attribute. Specify 'NOPREP' to prevent automatic preparation of this attribute when ADP is on. When ADP is off, the 'NOPREP' value is ignored.</p> <p>The 'NOPREP' value cannot be used for an individual subname of a nested attribute. If 'NOPREP' is specified for an individual subname when ADP is on, an error is generated.</p>

Usage Notes

You can obtain information about a model by querying these data dictionary views.

```

ALL_MINING_MODELS
ALL_MINING_MODEL_ATTRIBUTES
ALL_MINING_MODEL_SETTINGS

```

Specify the USER prefix instead of ALL to obtain information about models in your own schema only.

See Also: *Oracle Data Mining Application Developer's Guide* for information on the data dictionary views

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```

-- Create the settings table
CREATE TABLE svm_model_settings (
  setting_name VARCHAR2(30),
  setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN

```

```

INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
    (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
    (dbms_data_mining.prep_auto, dbms_data_mining.prep_auto_on);
COMMIT;
END;
/
-- Create the model using the specified settings
BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name          => 'svm_model',
        mining_function     => dbms_data_mining.classification,
        data_table_name     => 'mining_data_build_v',
        case_id_column_name => 'cust_id',
        target_column_name  => 'affinity_card',
        settings_table_name => 'svm_model_settings');
END;
/

```

You can display the model settings with the following query.

```

SELECT * FROM user_mining_model_settings
    WHERE model_name IN 'SVM_MODEL';

```

MODEL_NAME	SETTING_NAME	SETTING_VALUE	SETTING
SVM_MODEL	ALGO_NAME	ALGO_SUPPORT_VECTOR_MACHINES	INPUT
SVM_MODEL	SVMS_KERNEL_CACHE_SIZE	50000000	DEFAULT
SVM_MODEL	SVMS_ACTIVE_LEARNING	SVMS_AL_ENABLE	DEFAULT
SVM_MODEL	SVMS_STD_DEV	3.004524	DEFAULT
SVM_MODEL	PREP_AUTO	ON	INPUT
SVM_MODEL	SVMS_COMPLEXITY_FACTOR	1.887389	DEFAULT
SVM_MODEL	SVMS_KERNEL_FUNCTION	SVMS_GAUSSIAN	DEFAULT
SVM_MODEL	SVMS_CONV_TOLERANCE	.001	DEFAULT

The second example creates an anomaly detection model. Anomaly detection uses SVM classification without a target. This example uses the same settings table created for the SVM classification model in the first example.

```

BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name          => 'anomaly_detect_model',
        mining_function     => dbms_data_mining.classification,
        data_table_name     => 'mining_data_build_v',
        case_id_column_name => 'cust_id',
        target_column_name  => null,
        settings_table_name => 'svm_model_settings');
END;
/

```

This query shows that the models created in these examples are the only ones in your schema.

```

SELECT model_name, mining_function, algorithm FROM user_mining_models;

```

MODEL_NAME	MINING_FUNCTION	ALGORITHM
SVM_MODEL	CLASSIFICATION	SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL	CLASSIFICATION	SUPPORT_VECTOR_MACHINES

This query shows that only the SVM classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
       FROM user_mining_model_attributes
       WHERE target = 'YES';
```

MODEL_NAME	ATTRIBUTE_NAME	ATTRIBUTE_TYPE	TARGET
-----	-----	-----	-----
SVM_MODEL	AFFINITY_CARD	CATEGORICAL	YES

DROP_MODEL Procedure

This procedure drops an existing mining model.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2);
```

Parameters

Table 38–37 *DROP_MODEL Procedure Parameters*

Parameter	Description
model_name	Name of the model in the form [<i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.

Usage Notes

If an APPLY operation is using a model, and you attempt to drop the model during that time, the DROP will succeed and APPLY will return indeterminate results.

Examples

Assume the existence of a model `census_model`. The following example shows how to drop this model.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'census_model');
END;
/
```

EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. You can import from the dump file set using the `IMPORT_MODEL` procedure. Both `EXPORT_MODEL` and `IMPORT_MODEL` use Oracle Data Pump technology.

See Also: *Oracle Data Mining Administrator's Guide* for more information on model export and import

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
  filename          IN VARCHAR2,
  directory         IN VARCHAR2,
  model_filter      IN VARCHAR2 DEFAULT NULL,
  filesize          IN VARCHAR2 DEFAULT NULL,
  operation         IN VARCHAR2 DEFAULT NULL,
  remote_link      IN VARCHAR2 DEFAULT NULL,
  jobname          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–38 EXPORT_MODEL Procedure Parameters

Parameter	Description
<code>filename</code>	<p>Name of the dump file set to which the models should be exported. The name must be unique within the schema.</p> <p>The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the <code>filesize</code> parameter, or you can use the <code>operation</code> parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created.</p> <p>When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</p>
<code>directory</code>	<p>Name of a pre-defined directory object that specifies where the dump file set should be created.</p> <p>You must have read/write privileges on the directory object and on the file system directory that it identifies.</p>
<code>model_filter</code>	<p>Optional parameter that specifies which model or models to export. If you do not specify a value for <code>model_filter</code>, all models in the schema are exported. You can also specify <code>NULL</code> (the default) or <code>'ALL'</code> to export all models.</p> <p>You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 38–39.</p>
<code>filesize</code>	<p>Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB.</p> <p>If the size of the models to export is larger than <code>filesize</code>, one or more additional files are created within the dump set. See the description of the <code>filename</code> parameter for more information.</p>

Table 38–38 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the <code>filesize</code> parameter determines the size of the files. You can specify either of the following values for <code>operation</code> : <ul style="list-style-type: none"> ■ 'EXPORT' — Export all or the specified models. (Default) ■ 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter not used in this release. Set to NULL.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form <code>username_exp_nnnn</code> , where <code>nnnn</code> is a number. For example, a job name in the SCOTT schema might be <code>SCOTT_exp_134</code> . If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named <code>jobname.log</code> , is created in the same directory as the dump file set.

Usage Notes

The `model_filter` parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the `USER_MINING_MODELS` view to list the models in your schema.

```
SQL> describe user_mining_models
```

Name	Null?	Type
MODEL_NAME	NOT NULL	VARCHAR2 (30)
MINING_FUNCTION		VARCHAR2 (30)
ALGORITHM		VARCHAR2 (30)
CREATION_DATE	NOT NULL	DATE
BUILD_DURATION		NUMBER
MODEL_SIZE		NUMBER
COMMENTS		VARCHAR2 (4000)

For more information on data dictionary views of mining models, see "[Mining Model Objects](#)" on page 38-5.

Examples of model filters are provided in [Table 38–39](#).

Table 38–39 Sample Values for the Model Filter Parameter

Sample Value	Meaning
'mymodel'	Export the model named <code>mymodel</code>
'name= 'mymodel''	Export the model named <code>mymodel</code>
'name IN ('mymodel2','mymodel3)'	Export the models named <code>mymodel2</code> and <code>mymodel3</code>
'ALGORITHM_NAME = 'NAIVE_BAYES''	Export all Naive Bayes models. See Table 38–4 for a list of algorithm names.
'FUNCTION_NAME = 'CLASSIFICATION''	Export all classification models. See Table 38–2 for a list of mining functions.

Examples

The following statement exports all the models in the DMUSER3 schema to a dump file set called `models_out` in the directory `$ORACLE_HOME/rdbms/log`. This directory is mapped to a directory object called `DATA_PUMP_DIR`. The DMUSER3 user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL*Plus and list the resulting dump file and log file.

```
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

The following example uses the same directory object and is executed by the same user. It exports the models called `NMF_SH_SAMPLE` and `SVMR_SH_REGR_SAMPLE` to a different dump file set in the same directory.

```
SQL>execute dbms_data_mining.export_model ('models2_out', 'DATA_PUMP_DIR',
      'name in ('NMF_SH_SAMPLE', 'SVMR_SH_REGR_SAMPLE')');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
   DMUSER3_exp_924.log  models2_out01.dmp
```

GET_ASSOCIATION_RULES Function

This table function returns the rules from an association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the `topn` parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
  model_name          IN VARCHAR2,
  topn                IN NUMBER DEFAULT NULL,
  rule_id             IN INTEGER DEFAULT NULL,
  min_confidence      IN NUMBER DEFAULT NULL,
  min_support         IN NUMBER DEFAULT NULL,
  max_rule_length     IN INTEGER DEFAULT NULL,
  min_rule_length     IN INTEGER DEFAULT NULL,
  sort_order          IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
  antecedent_items    IN DM_ITEMS DEFAULT NULL,
  consequent_items    IN DM_ITEMS DEFAULT NULL,
  min_lift            IN NUMBER DEFAULT NULL)
RETURN DM_RULES PIPELINED;
```

Parameters

Table 38–40 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
<code>topn</code>	Return the <i>n</i> top rules ordered by confidence and then support, both descending. If you specify a sort order, the top <i>n</i> rules are derived after the sort is performed. If <code>topn</code> is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are <code>RULE_CONFIDENCE</code> and <code>RULE_SUPPORT</code> . If <code>topn</code> is specified and a maximum or minimum rule length is specified, then <code>RULE_CONFIDENCE</code> , <code>RULE_SUPPORT</code> , and <code>NUMBER_OF_ITEMS</code> are allowed in the sort order.
<code>rule_id</code>	Identifier of the rule to return. If you specify a value for <code>rule_id</code> , do not specify values for the other filtering parameters.
<code>min_confidence</code>	Return the rules with confidence greater than or equal to this number
<code>min_support</code>	Return the rules with support greater than or equal to this number
<code>max_rule_length</code>	Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See <code>NUMBER_OF_ITEMS</code> in Table 38–41). For example, in the rule <code>A=>B</code> (if A, then B), the number of items is 2. If <code>max_rule_length</code> is specified, then the <code>NUMBER_OF_ITEMS</code> column is permitted in the sort order.

Table 38–40 (Cont.) GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify: <code>ORA_MINING_VARCHAR2_NT ('NUMBER_OF_ITEMS DESC' , 'RULE_CONFIDENCE DESC')</code> If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by confidence in descending order, then by support in descending order. See the examples.
antecedent_items	Return the rules with these items in the antecedent. See the examples.
consequent_items	Return the rules with this item in the consequent. See the examples.
min_lift	Return the rules with lift greater than or equal to this number.

Return Values

Table 38–41 GET_ASSOCIATION_RULES Function Return Values

Return Value	Description																																
DM_RULES	Represents a set of rows of type DM_RULE. The rows have the following columns: <table border="0"> <tr> <td>(rule_id</td> <td>INTEGER,</td> </tr> <tr> <td>antecedent</td> <td>DM_PREDICATES,</td> </tr> <tr> <td>consequent</td> <td>DM_PREDICATES,</td> </tr> <tr> <td>rule_support</td> <td>NUMBER,</td> </tr> <tr> <td>rule_confidence</td> <td>NUMBER,</td> </tr> <tr> <td>rule_lift</td> <td>NUMBER,</td> </tr> <tr> <td>antecedent_support</td> <td>NUMBER,</td> </tr> <tr> <td>consequent_support</td> <td>NUMBER,</td> </tr> <tr> <td>number_of_items</td> <td>INTEGER)</td> </tr> </table> The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns: <table border="0"> <tr> <td>(attribute_name</td> <td>VARCHAR2 (4000) ,</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2 (4000) ,</td> </tr> <tr> <td>conditional_operator</td> <td>CHAR (2) / * = , < > , < , > , < = , > = * / ,</td> </tr> <tr> <td>attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>attribute_str_value</td> <td>VARCHAR2 (4000) ,</td> </tr> <tr> <td>attribute_support</td> <td>NUMBER,</td> </tr> <tr> <td>attribute_confidence</td> <td>NUMBER)</td> </tr> </table>	(rule_id	INTEGER,	antecedent	DM_PREDICATES,	consequent	DM_PREDICATES,	rule_support	NUMBER,	rule_confidence	NUMBER,	rule_lift	NUMBER,	antecedent_support	NUMBER,	consequent_support	NUMBER,	number_of_items	INTEGER)	(attribute_name	VARCHAR2 (4000) ,	attribute_subname	VARCHAR2 (4000) ,	conditional_operator	CHAR (2) / * = , < > , < , > , < = , > = * / ,	attribute_num_value	NUMBER,	attribute_str_value	VARCHAR2 (4000) ,	attribute_support	NUMBER,	attribute_confidence	NUMBER)
(rule_id	INTEGER,																																
antecedent	DM_PREDICATES,																																
consequent	DM_PREDICATES,																																
rule_support	NUMBER,																																
rule_confidence	NUMBER,																																
rule_lift	NUMBER,																																
antecedent_support	NUMBER,																																
consequent_support	NUMBER,																																
number_of_items	INTEGER)																																
(attribute_name	VARCHAR2 (4000) ,																																
attribute_subname	VARCHAR2 (4000) ,																																
conditional_operator	CHAR (2) / * = , < > , < , > , < = , > = * / ,																																
attribute_num_value	NUMBER,																																
attribute_str_value	VARCHAR2 (4000) ,																																
attribute_support	NUMBER,																																
attribute_confidence	NUMBER)																																

Usage Notes

This table function pipes out rows of type DM_RULES. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

The ORA_MINING_VARCHAR2_NT type is defined as a table of VARCHAR2 (4000).

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
  SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following example returns all the rules which have 'AQUATIC' or 'EGGS' in the antecedent, and has 'VENOMOUS' as the consequent. The rules are sorted first by NUMBER_OF_ITEMS in descending order, then by RULE_CONFIDENCE in descending order, and finally by RULE_SUPPORT in descending order.

```
SELECT * FROM TABLE
(
  DBMS_DATA_MINING.GET_ASSOCIATION_RULES
    ('AR_Model_31', 120, NULL, 1, .51, 7,
    ORA_MINING_VARCHAR2_NT
      ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
    ORA_MINING_VARCHAR2_NT('AQUATIC', 'EGGS'),
    ORA_MINING_VARCHAR2_NT('VENOMOUS')));
```

GET_DEFAULT_SETTINGS Function

The GET_DEFAULT_SETTINGS function is deprecated in 11g Release 1 (11.1.). It is replaced with the data dictionary view, *_MINING_MODEL_SETTINGS. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Note: See ["Deprecated Subprograms"](#) on page 38-7

This table function returns the default settings for all mining functions and algorithms supported in the DBMS_DATA_MINING package.

Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
  RETURN DM_MODEL_SETTINGS PIPELINED;
```

Return Values

Table 38–42 GET_DEFAULT_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

This table function pipes out rows of type DM_MODEL_SETTING. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

Examples

For example, if you want to override some or all of *k*-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
  CREATE TABLE mysettings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
  WHERE setting_name LIKE 'KMNS%';
  -- now update individual settings as required
  UPDATE mysettings
     SET setting_value = 0.02
     WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
  model_name          IN VARCHAR2,
  topn                IN NUMBER DEFAULT NULL,
  max_itemset_length IN NUMBER DEFAULT NULL)
RETURN DM_ITEMSETS PIPELINED;
```

Parameters

Table 38–43 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.
topn	When not NULL, return the top <i>n</i> rows ordered by support in descending order
max_itemset_length	Maximum length of an item set.

Return Values

Table 38–44 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description
DM_ITEMSETS	Represents a set of rows of type DM_ITEMSET. The rows have the following columns: <pre>(itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER)</pre> The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM: <pre>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000))</pre>

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
```

```
        SELECT *
        FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
        WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
   WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name          => 'market_model',
  function            => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name     => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name  => NULL,
  settings_table_name => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
   FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
   FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

GET_MODEL_COST_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the `ADD_COST_MATRIX` procedure. If you wish to obtain the cost matrix used to create a model, specify `cost_matrix_type_create` as the `matrix_type`. See [Table 38–45](#).

See also [ADD_COST_MATRIX Procedure](#).

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
    model_name          IN VARCHAR2,
    matrix_type        IN VARCHAR2 DEFAULT cost_matrix_type_score)
RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

Table 38–45 *GET_MODEL_COST_MATRIX Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.
<code>matrix_type</code>	The type of cost matrix. <code>COST_MATRIX_TYPE_SCORE</code> — cost matrix used for scoring. (Default.) <code>COST_MATRIX_TYPE_CREATE</code> — cost matrix used to create the model (Decision Tree only).

Return Values

Table 38–46 *GET_MODEL_COST_MATRIX Function Return Values*

Return Value	Description						
<code>DM_COST_MATRIX</code>	Represents a set of rows of type <code>DM_COST_ELEMENT</code> . The rows have the following columns: <table border="1" data-bbox="760 1415 1143 1505"> <tbody> <tr> <td><code>actual</code></td> <td><code>VARCHAR2(4000)</code>,</td> </tr> <tr> <td><code>predicted</code></td> <td><code>VARCHAR2(4000)</code>,</td> </tr> <tr> <td><code>cost</code></td> <td><code>NUMBER</code>)</td> </tr> </tbody> </table>	<code>actual</code>	<code>VARCHAR2(4000)</code> ,	<code>predicted</code>	<code>VARCHAR2(4000)</code> ,	<code>cost</code>	<code>NUMBER</code>)
<code>actual</code>	<code>VARCHAR2(4000)</code> ,						
<code>predicted</code>	<code>VARCHAR2(4000)</code> ,						
<code>cost</code>	<code>NUMBER</code>)						

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the `CLAS_COST_TABLE_NAME` setting in the settings table for the model. See [Table 38–7](#), "Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the `REMOVE_COST_MATRIX` procedure to remove the cost matrix and the `ADD_COST_MATRIX` procedure to add a new one

Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```
column actual format a10
column predicted format a10
SELECT *
   FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
   ORDER BY predicted, actual;
```

ACTUAL	PREDICTED	COST
0	0	.00
1	0	.75
0	1	.25
1	1	.00

GET_MODEL_DETAILS_ABN Function

The Adaptive Bayes Network algorithm ABN algorithm is deprecated in 11g Release 1 (11.1.1).

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Note: See ["Deprecated Subprograms"](#) on page 38-7

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (
    model_name          IN VARCHAR2)
RETURN DM_ABN_DETAILS PIPELINED;
```

Parameters

Table 38-47 GET_MODEL_DETAILS_ABN Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

Return Values

Table 38-48 GET_MODEL_DETAILS_ABN Function Return Values

Return Value	Description
DM_ABN_DETAILS	<p>Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns:</p> <pre>(rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER)</pre> <p>The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</p> <pre>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2), /*=, <>, <, >, <=, >= */ attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)</pre>

Usage Notes

This table function pipes out rows of type DM_ABN_DETAIL. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

This function returns details only for a single feature ABN model.

Examples

The following example demonstrates an ABN model build followed by an invocation of GET_MODEL_DETAILS_ABN table function from Oracle SQL.

```
BEGIN
  -- prepare a settings table to override default algorithm and model type
  CREATE TABLE abn_settings (setting_name VARCHAR2(30),
    setting_value
  VARCHAR2(128));
  INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
    DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
  INSERT INTO abn_settings VALUES
    (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
    DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
  COMMIT;
  -- create a model
  DBMS_DATA_MINING.CREATE_MODEL (
    model_name          => 'abn_model',
    function            => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name    => 'abn_build',
    case_id_column_name => 'id',
    target_column_name => NULL,
    settings_table_name => 'abn_settings');
END;
/
-- View the (unformatted) results from SQL*Plus
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
```

GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
    model_name          IN VARCHAR2)
RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

Table 38–49 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
model_name	Name of the model in the form [<i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–50 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description								
DM_RANKED_ATTRIBUTES	Represents a set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: <table data-bbox="730 1008 1234 1134" style="margin-left: 20px;"> <tbody> <tr> <td>attribute_name</td> <td>VARCHAR2(4000,</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>importance_value</td> <td>NUMBER,</td> </tr> <tr> <td>rank</td> <td>NUMBER(38)</td> </tr> </tbody> </table>	attribute_name	VARCHAR2(4000,	attribute_subname	VARCHAR2(4000),	importance_value	NUMBER,	rank	NUMBER(38)
attribute_name	VARCHAR2(4000,								
attribute_subname	VARCHAR2(4000),								
importance_value	NUMBER,								
rank	NUMBER(38)								

GET_MODEL_DETAILS_GLM Function

This table function returns the coefficient statistics for a Generalized Linear Model.

The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (
    model_name          VARCHAR2)
RETURN DM_GLM_COEFF_SET PIPELINED;
```

Parameters

Table 38–51 GET_MODEL_DETAILS_GLM Function Parameters

Parameter	Description
model_name	Name of the model in the form [<i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–52 GET_MODEL_DETAILS_GLM Return Values

Return Value	Description																														
DM_GLM_COEFF_SET	Represents a set of rows of type DM_GLM_COEFF. The rows have the following columns: <table border="0" style="margin-left: 20px;"> <tr> <td>class</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_name</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>coefficient</td> <td>NUMBER,</td> </tr> <tr> <td>std_error</td> <td>NUMBER,</td> </tr> <tr> <td>test_statistic</td> <td>NUMBER,</td> </tr> <tr> <td>p_value</td> <td>NUMBER,</td> </tr> <tr> <td>VIF</td> <td>NUMBER,</td> </tr> <tr> <td>std_coefficient</td> <td>NUMBER,</td> </tr> <tr> <td>lower_coeff_limit</td> <td>NUMBER,</td> </tr> <tr> <td>upper_coeff_limit</td> <td>NUMBER,</td> </tr> <tr> <td>exp_coefficient</td> <td>BINARY_DOUBLE,</td> </tr> <tr> <td>exp_lower_coeff_limit</td> <td>BINARY_DOUBLE,</td> </tr> <tr> <td>exp_upper_coeff_limit</td> <td>BINARY_DOUBLE)</td> </tr> </table>	class	VARCHAR2(4000),	attribute_name	VARCHAR2(4000),	attribute_subname	VARCHAR2(4000),	attribute_value	VARCHAR2(4000),	coefficient	NUMBER,	std_error	NUMBER,	test_statistic	NUMBER,	p_value	NUMBER,	VIF	NUMBER,	std_coefficient	NUMBER,	lower_coeff_limit	NUMBER,	upper_coeff_limit	NUMBER,	exp_coefficient	BINARY_DOUBLE,	exp_lower_coeff_limit	BINARY_DOUBLE,	exp_upper_coeff_limit	BINARY_DOUBLE)
class	VARCHAR2(4000),																														
attribute_name	VARCHAR2(4000),																														
attribute_subname	VARCHAR2(4000),																														
attribute_value	VARCHAR2(4000),																														
coefficient	NUMBER,																														
std_error	NUMBER,																														
test_statistic	NUMBER,																														
p_value	NUMBER,																														
VIF	NUMBER,																														
std_coefficient	NUMBER,																														
lower_coeff_limit	NUMBER,																														
upper_coeff_limit	NUMBER,																														
exp_coefficient	BINARY_DOUBLE,																														
exp_lower_coeff_limit	BINARY_DOUBLE,																														
exp_upper_coeff_limit	BINARY_DOUBLE)																														

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF data type. The statistics are described in [Table 38–53](#).

Table 38–53 DM_GLM_COEFF Data Type Description

Column	Description
class	<p>The non-reference target class for logistic regression. The model is built to predict the probability of this class.</p> <p>The other class (the reference class) is specified in the model setting <code>GLMS_REFERENCE_CLASS_NAME</code>. See Table 38–11, "GLM Settings".</p> <p>For linear regression, <code>class</code> is null.</p>
attribute_name	<p>The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of <code>attribute_name</code> is also the name of the column in the case table that is the source for this attribute.</p> <p>For the intercept, <code>attribute_name</code> is null. Intercepts are equivalent to the bias term in SVM models.</p>
attribute_subname	<p>The name of an attribute in a nested table. The full name of a nested attribute has the form:</p> <p><i>attribute_name.attribute_subname</i></p> <p>where <i>attribute_name</i> is the name of the nested column in the case table that is the source for this attribute.</p> <p>If the attribute is not nested, <code>attribute_subname</code> is null. If the attribute is an intercept, both the <code>attribute_name</code> and the <code>attribute_subname</code> are null.</p>
attribute_value	<p>The value of the attribute (categorical attribute only).</p> <p>For numerical attributes, <code>attribute_value</code> is null.</p>
coefficient	The linear coefficient estimate.
std_error	Standard error of the coefficient estimate.
test_statistic	<p>For linear regression, the t-value of the coefficient estimate.</p> <p>For logistic regression, the Wald chi-square value of the coefficient estimate.</p>
p-value	Probability of the <code>test_statistic</code> . Used to analyze the significance of specific attributes in the model.
VIF	Variance Inflation Factor. The value is zero for the intercept. For logistic regression, <code>VIF</code> is null.
std_coefficient	Standardized estimate of the coefficient.
lower_coeff_limit	Lower confidence bound of the coefficient.
upper_coeff_limit	Upper confidence bound of the coefficient.
exp_coefficient	Exponentiated coefficient for logistic regression. For linear regression, <code>exp_coefficient</code> is null.
exp_lower_coeff_limit	Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, <code>exp_lower_coeff_limit</code> is null.
exp_upper_coeff_limit	Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, <code>exp_lower_coeff_limit</code> is null.

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, `exp_coefficient` does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see [Table 38–11, "GLM Settings"](#).)
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

GET_MODEL_DETAILS_GLOBAL Function

This table function returns statistics about the model as a whole. Global details are available for GLM and for association rules.

Separate global details are returned for linear and logistic regression. When ridge regression is enabled, fewer global details are returned. For information about ridge, see [Table 38–11, "GLM Settings"](#).

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLOBAL (
    model_name      IN VARCHAR2)
RETURN DM_MODEL_GLOBAL_DETAILS PIPELINED;
```

Parameters

Table 38–54 GET_MODEL_DETAILS_GLOBAL Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

Return Values

Table 38–55 GET_MODEL_DETAILS_GLOBAL Function Return Values

Return Value	Description
DM_MODEL_GLOBAL_DETAILS	A collection of rows of type DM_MODEL_GLOBAL_DETAIL. The rows have the following columns: (global_detail_name VARCHAR2(30), global_detail_value NUMBER)

Global Details for GLM: Linear Regression

Table 38–56 Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
MODEL_DF	Model degrees of freedom
MODEL_SUM_SQUARES	Model sum of squares
MODEL_MEAN_SQUARE	Model mean square
F_VALUE	Model <i>F</i> value statistic
MODEL_F_P_VALUE	Model <i>F</i> value probability
ERROR_DF	Error degrees of freedom
ERROR_SUM_SQUARES	Error sum of squares
ERROR_MEAN_SQUARE	Error mean square
CORRECTED_TOTAL_DF	Corrected total degrees of freedom
CORRECTED_TOT_SS	Corrected total sum of squares
ROOT_MEAN_SQ	Root mean square error
DEPENDENT_MEAN	Dependent mean

Table 38–56 (Cont.) Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
COEFF_VAR	Coefficient of variation
R_SQ	R-Square
ADJUSTED_R_SQUARE	Adjusted R-Square
AIC	Akaike's information criterion
SBIC	Schwarz's Bayesian information criterion
GMSEP	Estimated mean square error of the prediction, assuming multivariate normality
HOCKING_SP	Hocking Sp statistic
J_P	JP statistic (the final prediction error)
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if it was not computed

Global Details for GLM: Logistic Regression

Table 38–57 Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
AIC_INTERCEPT	Akaike's criterion for the fit of the intercept only model
AIC_MODEL	Akaike's criterion for the fit of the intercept and the covariates (predictors) mode
SC_INTERCEPT	Schwarz's Criterion for the fit of the intercept only model
SC_MODEL	Schwarz's Criterion for the fit of the intercept and the covariates (predictors) model
NEG2_LL_INTERCEPT	-2 log likelihood of the intercept only model
NEG2_LL_MODEL	-2 log likelihood of the model
LR_DF	Likelihood ratio degrees of freedom
LR_CHI_SQ	Likelihood ratio chi-square value
LR_CHI_SQ_P_VALUE	Likelihood ratio chi-square probability value
PSEUDO_R_SQ_CS	Pseudo R-square Cox and Snell
PSEUDO_R_SQ_N	Pseudo R-square Nagelkerke
DEPENDENT_MEAN	Dependent mean
PCT_CORRECT	Percent of correct predictions
PCT_INCORRECT	Percent of incorrectly predicted rows
PCT_TIED	Percent of cases where probability for both cases is the same
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows

Table 38–57 (Cont.) Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge.
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if the covariance matrix not computed

Global Detail for Association Rules

A single global detail is produced by an Association model.

Table 38–58 Global Detail for Association Rules

GLOBAL_DETAIL_NAME	Description
RULE_COUNT	The number of association rules in the model.

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to `GET_MODEL_DETAILS_KM` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_KM` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
    model_name          VARCHAR2,
    cluster_id         NUMBER   DEFAULT NULL,
    attribute           VARCHAR2 DEFAULT NULL,
    centroid            NUMBER   DEFAULT 1,
    histogram           NUMBER   DEFAULT 1,
    rules               NUMBER   DEFAULT 2,
    attribute_subname  VARCHAR2  DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 38–59 *GET_MODEL_DETAILS_KM Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.
<code>cluster_id</code>	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
<code>attribute</code>	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned.
<code>centroid</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
<code>histogram</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
<code>rules</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 38–60 GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description																						
DM_CLUSTERS	<p>Represents a set of rows of type DM_CLUSTER. The rows have the following columns:</p> <table> <tr><td>id</td><td>NUMBER,</td></tr> <tr><td>cluster_id</td><td>VARCHAR2(4000),</td></tr> <tr><td>record_count</td><td>NUMBER,</td></tr> <tr><td>parent</td><td>NUMBER,</td></tr> <tr><td>tree_level</td><td>NUMBER,</td></tr> <tr><td>dispersion</td><td>NUMBER,</td></tr> <tr><td>split_predicate</td><td>DM_PREDICATES,</td></tr> <tr><td>child</td><td>DM_CHILDREN,</td></tr> <tr><td>centroid</td><td>DM_CENTROIDS,</td></tr> <tr><td>histogram</td><td>DM_HISTOGRAMS,</td></tr> <tr><td>rule</td><td>DM_RULE)</td></tr> </table>	id	NUMBER,	cluster_id	VARCHAR2(4000),	record_count	NUMBER,	parent	NUMBER,	tree_level	NUMBER,	dispersion	NUMBER,	split_predicate	DM_PREDICATES,	child	DM_CHILDREN,	centroid	DM_CENTROIDS,	histogram	DM_HISTOGRAMS,	rule	DM_RULE)
id	NUMBER,																						
cluster_id	VARCHAR2(4000),																						
record_count	NUMBER,																						
parent	NUMBER,																						
tree_level	NUMBER,																						
dispersion	NUMBER,																						
split_predicate	DM_PREDICATES,																						
child	DM_CHILDREN,																						
centroid	DM_CENTROIDS,																						
histogram	DM_HISTOGRAMS,																						
rule	DM_RULE)																						

The `split_predicate` column of `DM_CLUSTER` returns a nested table of type `DM_PREDICATES`. Each row, of type `DM_PREDICATE`, has the following columns:

attribute_name	VARCHAR2(4000),
attribute_subname	VARCHAR2(4000),
conditional_operator	CHAR(2) /*=, <>, <, >, <=, >= */,
attribute_num_value	NUMBER,
attribute_str_value	VARCHAR2(4000),
attribute_support	NUMBER,
attribute_confidence	NUMBER)

The `child` column of `DM_CLUSTER` returns a nested table of type `DM_CHILDREN`. The rows, of type `DM_CHILD`, have a single column of type `NUMBER`, which contains the identifiers of each child.

The `centroid` column of `DM_CLUSTER` returns a nested table of type `DM_CENTROIDS`. The rows, of type `DM_CENTROID`, have the following columns:

attribute_name	VARCHAR2(4000),
attribute_subname	VARCHAR2(4000),
mean	NUMBER,
mode_value	VARCHAR2(4000),
variance	NUMBER)

The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:

attribute_name	VARCHAR2(4000),
attribute_subname	VARCHAR2(4000),
bin_id	NUMBER,
lower_bound	NUMBER,
upper_bound	NUMBER,
label	VARCHAR2(4000),
count	NUMBER)

Table 38–60 (Cont.) GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description
	The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are:
	(rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER)
	The antecedent and consequent columns of DM_RULE each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

The table function pipes out rows of type DM_CLUSTERS. For information on Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

Examples

The following example demonstrates a *k*-Means clustering model build followed by an invocation of GET_MODEL_DETAILS_KM table function from Oracle SQL.

```
BEGIN
-- create a settings table
UPDATE cluster_settings
   SET setting_value = 3
 WHERE setting_name = DBMS_DATA_MINING.KMEANS_BLOCK_GROWTH;

/* build a k-Means clustering model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name          => 'eight_clouds',
  function            => DBMS_DATA_MINING.CLUSTERING,
  data_table_name     => 'eight_clouds_build',
  case_id_column_name => 'id',
  target_column_name  => NULL,
  settings_table_name => 'cluster_settings');
END;
/

-- View the (unformatted) rules from SQL*Plus
SELECT id, record_count, parent, tree_level, dispersion,
       child, centroid, histogram, rule
FROM TABLE(DBMS_DATA_MINING_GET_MODEL_DETAILS_KM('eight_clouds'));
```

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
    model_name      IN      VARCHAR2)
RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

Table 38–61 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
model_name	Name of the model in the form [<i>schema_name</i>]. <i>model_name</i> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–62 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description																				
DM_NB_DETAILS	<p>Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns:</p> <table> <tbody> <tr> <td>target_attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>target_attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>target_attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>prior_probability</td> <td>NUMBER,</td> </tr> <tr> <td>conditionals</td> <td>DM_CONDITIONALS)</td> </tr> </tbody> </table> <p>The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns:</p> <table> <tbody> <tr> <td>attribute_name</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_str_value</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_num_value</td> <td>NUMBER,</td> </tr> <tr> <td>conditional_probability</td> <td>NUMBER)</td> </tr> </tbody> </table>	target_attribute_name	VARCHAR2(30),	target_attribute_str_value	VARCHAR2(4000),	target_attribute_num_value	NUMBER,	prior_probability	NUMBER,	conditionals	DM_CONDITIONALS)	attribute_name	VARCHAR2(4000),	attribute_subname	VARCHAR2(4000),	attribute_str_value	VARCHAR2(4000),	attribute_num_value	NUMBER,	conditional_probability	NUMBER)
target_attribute_name	VARCHAR2(30),																				
target_attribute_str_value	VARCHAR2(4000),																				
target_attribute_num_value	NUMBER,																				
prior_probability	NUMBER,																				
conditionals	DM_CONDITIONALS)																				
attribute_name	VARCHAR2(4000),																				
attribute_subname	VARCHAR2(4000),																				
attribute_str_value	VARCHAR2(4000),																				
attribute_num_value	NUMBER,																				
conditional_probability	NUMBER)																				

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details as shown in this example.

```
-- You can view the Naive Bayes model details in many ways
-- Consult the Oracle Application Developer's Guide -
-- Object-Relational Features for different ways of
-- accessing Oracle Objects.
```

```
-- View the (unformatted) details from SQL*Plus
SELECT attribute_name, attribute_num_value, attribute_str_value,
       prior_probability, conditionals,
       FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('census_model'));
```

See `nbdemo.sql` for generation of formatted rules.

GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
    model_name      IN      VARCHAR2)
RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

Table 38–63 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
model_name	Name of the model in the form [<i>schema_name</i>]. <i>model_name</i> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–64 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description
DM_NMF_FEATURE_SET	Represents a set of rows of DM_NMF_FEATURE. The rows have the following columns: (feature_id NUMBER, mapped_feature_id VARCHAR2(4000), attribute_set DM_NMF_ATTRIBUTE_SET) The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER)

Usage Notes

The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

Examples

Assume you have built an NMF model called my_nmf_model. You can retrieve model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT feature_id, attribute_set
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF(
    'my_nmf_model'));
```

GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to `GET_MODEL_DETAILS_OC` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_OC` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
    model_name          VARCHAR2,
    cluster_id         NUMBER   DEFAULT NULL,
    attribute           VARCHAR2 DEFAULT NULL,
    centroid            NUMBER   DEFAULT 1,
    histogram           NUMBER   DEFAULT 1,
    rules              NUMBER   DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 38–65 *GET_MODEL_DETAILS_OC Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.
<code>cluster_id</code>	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
<code>attribute</code>	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned.
<code>centroid</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
<code>histogram</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
<code>rules</code>	This parameter accepts the following values: <ul style="list-style-type: none"> ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 38–66 *GET_MODEL_DETAILS_OC Function Return Values*

Return Value	Description
DM_CLUSTERS	<p>Represents a set of rows of type DM_CLUSTER. The rows have the following columns:</p> <pre>(id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE)</pre>

The `split_predicate` column of `DM_CLUSTER` returns a nested table of type `DM_PREDICATES`. Each row, of type `DM_PREDICATE`, has the following columns:

```
(attribute_name  VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 conditional_operator CHAR(2) /*=, <>, <, >, <=, >=*/,
 attribute_num_value NUMBER,
 attribute_str_value VARCHAR2(4000),
 attribute_support NUMBER,
 attribute_confidence NUMBER)
```

The `child` column of `DM_CLUSTER` returns a nested table of type `DM_CHILDREN`. The rows, of type `DM_CHILD`, have a single column of type `NUMBER`, which contains the identifiers of each child.

The `centroid` column of `DM_CLUSTER` returns a nested table of type `DM_CENTROIDS`. The rows, of type `DM_CENTROID`, have the following columns:

```
(attribute_name  VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 mean            NUMBER,
 mode_value      VARCHAR2(4000),
 variance        NUMBER)
```

The `histogram` column of `DM_CLUSTER` returns a nested table of type `DM_HISTOGRAMS`. The rows, of type `DM_HISTOGRAM_BIN`, have the following columns:

```
(attribute_name  VARCHAR2(4000),
 attribute_subname VARCHAR2(4000),
 bin_id          NUMBER,
 lower_bound     NUMBER,
 upper_bound     NUMBER,
 label           VARCHAR2(4000),
 count           NUMBER)
```

Table 38–66 (Cont.) GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
	The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are:
	(rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER)
	The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

The table function pipes out rows of type DM_CLUSTER. For information about Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

Examples

Assume you have built an OC model called my_oc_model. You can retrieve information from the model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT T.id                clu_id,
       T.record_count     rec_cnt,
       T.parent            parent,
       T.tree_level       tree_level
FROM (SELECT *
      FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                  'my_oc_model'))
      ORDER BY id) T
WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a Support Vector Machine model. This is applicable only for classification or regression models built using a linear kernel. For any other kernel, the table function returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODEL_DETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
  model_name      IN      VARCHAR2)
RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

Table 38–67 GET_MODEL_DETAILS_SVM Function Parameters

Parameter	Description
model_name	Name of the model in the form <i>[schema_name.]model_name</i> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–68 GET_MODEL_DETAILS_SVM Function Return Values

Return Value	Description
DM_SVM_LINEAR_COEFF_SET	<p>Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:</p> <pre>(class VARCHAR2(4000), attribute_set DM_SVM_ATTRIBUTE_SET)</pre> <p>The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:</p> <pre>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER)</pre> <p>See Usage Notes.</p>

Usage Notes

The table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 38-18.

The class column of DM_SVM_LINEAR_COEFF represents classification target values. For regression targets, class is null. For each classification target value for classification models, a set of coefficients is returned. For binary classification, one-class classifier, and regression models, only a single set of coefficients is returned.

The attribute_value column in the nested table DM_SVM_ATTRIBUTE_SET is used for categorical attributes. The coefficient column is the linear coefficient value.

Examples

The following example demonstrates an SVM model build followed by an invocation of GET_MODEL_DETAILS_SVM table function from Oracle SQL:

```
-- Create SVM model
BEGIN
  dbms_data_mining.create_model(
    model_name          => 'SVM_Clas_sample',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'svmc_sample_build_prepared',
    case_id_column_name => 'id',
    target_column_name  => 'affinity_card',
    settings_table_name => 'svmc_sample_settings');
END;
/
-- Display model details
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVM_Clas_sample'))
 ORDER BY class;
```

GET_MODEL_DETAILS_XML Function

This table function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
    model_name      IN      VARCHAR2)
RETURN XMLTYPE;
```

Parameters

Table 38–69 GET_MODEL_DETAILS_XML Function Parameters

Parameter	Description
model_name	Name of the model in the form [<i>schema_name</i> .] <i>model_name</i> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–70 GET_MODEL_DETAILS_XML Function Return Value

Return Value	Description
XMLTYPE	The PMML 2.1 XML definition for the decision tree model.

Usage Notes

The function returns the XML representing the decision tree; the definition is the one specified in the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at <http://www.dmg.org>.

GET_MODEL_SETTINGS Function

The `GET_MODEL_SETTINGS` function is deprecated in 11g Release 1 (11.1.). It is replaced with the data dictionary view, `*_MINING_MODEL_SETTINGS`. `USER_`, `ALL_`, and `DBA_` versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Note: See ["Deprecated Subprograms"](#) on page 38-7

This table function returns the list of settings that were used to build the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SETTINGS (
    model_name          IN VARCHAR2)
RETURN DM_MODEL_SETTINGS PIPELINED;
```

Parameters

Table 38–71 *GET_MODEL_SETTINGS Function Parameters*

Parameter	Description
<code>model_name</code>	Name of the model in the form <code>[schema_name.]model_name</code> . If you do not specify a schema, your own schema is used.

Return Values

Table 38–72 *GET_MODEL_SETTINGS Function Return Values*

Return Value	Description
<code>DM_MODEL_SETTINGS</code>	Represents a set of rows of type <code>DM_MODEL_SETTING</code> . The rows have the following columns: (<code>setting_name</code> <code>VARCHAR2(30)</code> , <code>setting_value</code> <code>VARCHAR2(128)</code>)

Usage Notes

The table function pipes out rows of type `DM_MODEL_SETTING`. For information about Data Mining data types and piped output from table functions, see ["Data Types"](#) on page 38-18.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```
SELECT setting_name, setting_value
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```

GET_MODEL_SIGNATURE Function

The GET_MODEL_SIGNATURE function is deprecated in 11g Release 1 (11.1.). It is replaced with the data dictionary view, *_MINING_MODEL_ATTRIBUTES. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Note: See "[Deprecated Subprograms](#)" on page 38-7

This table function returns the model signature, which lists the column attributes used to build the model and which should be present in the scoring data.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

See Also: Instead of using the GET_MODEL_SIGNATURE function, you can query the data dictionary view, ALL_MINING_MODEL_ATTRIBUTES. See the *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SIGNATURE (
    model_name          IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

Parameters

Table 38-73 GET_MODEL_SIGNATURE Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

Return Values

Table 38-74 GET_MODEL_SIGNATURE Function Return Values

Return Value	Description				
DM_MODEL_SIGNATURE	Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns: <table border="0" style="margin-left: 20px;"> <tr> <td>(attribute_name</td> <td>VARCHAR2(30),</td> </tr> <tr> <td>attribute_type</td> <td>VARCHAR2(106))</td> </tr> </table>	(attribute_name	VARCHAR2(30),	attribute_type	VARCHAR2(106))
(attribute_name	VARCHAR2(30),				
attribute_type	VARCHAR2(106))				

Usage Notes

This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on Data Mining data types and piped output from table functions, see "[Data Types](#)" on page 38-18.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```
SELECT attribute_name, attribute_type
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model'));
```

GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation definitions associated with a model.

The data is transformed and the transformation definitions are embedded in the model during the model training (create) process. The transformations can be automatically generated, user-specified, or both.

See Also: ["CREATE_MODEL Procedure"](#) on page 38-47 and ["Automatic Data Preparation"](#) on page 38-10.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
    model_name      IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

Parameters

Table 38-75 GET_MODEL_TRANSFORMATIONS Function Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

Return Values

Table 38-76 GET_MODEL_TRANSFORMATIONS Function Return Values

Return Value	Description								
DM_TRANSFORMS	Represents a set of rows of type DM_TRANSFORM. The rows have the following columns: <table border="0" style="margin-left: 20px;"> <tr> <td>(attribute_name</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>attribute_subname</td> <td>VARCHAR2(4000),</td> </tr> <tr> <td>expression</td> <td>CLOB,</td> </tr> <tr> <td>reverse_expression</td> <td>CLOB)</td> </tr> </table>	(attribute_name	VARCHAR2(4000),	attribute_subname	VARCHAR2(4000),	expression	CLOB,	reverse_expression	CLOB)
(attribute_name	VARCHAR2(4000),								
attribute_subname	VARCHAR2(4000),								
expression	CLOB,								
reverse_expression	CLOB)								

In addition to the transformation definitions, GET_MODEL_TRANSFORMATIONS returns the reverse transformation definitions. The reverse transformations are applied to the model attributes returned by the GET_MODEL_DETAILS functions. They are also applied to the target when a predictive model is applied. Reverse transformations enable model transparency, meaning that attribute information generated by the model is in its original, untransformed state, to the extent that it is possible.

GET_TRANSFORM_LIST Procedure

This function is used to convert a transformation specification from type `DM_TRANSFORMS` to type `TRANSFORM_LIST`.

`DM_TRANSFORMS` is used to output model transforms that are returned from the `GET_MODEL_TRANSFORMATIONS` function.

`CREATE_MODEL` and functions in the `DBMS_DATA_MINING_TRANSFORM` package accept `TRANSFORM_LIST`. To use them on the output of `GET_MODEL_TRANSFORMATIONS`, you must first call `GET_TRANSFORM_LIST` to convert to `TRANSFORM_LIST` type.

Syntax

```
DBMS_DATA_MINING.GET_TRANSFORM_LIST (
    xform_list          OUT NOCOPY TRANSFORM_LIST,
    model_xforms       IN  DM_TRANSFORMS);
```

Parameters

Table 38–77 *GET_TRANSFORM_LIST Procedure Parameters*

Parameter	Description
<code>xform_list</code>	The transformation specification converted from <code>model_xforms</code> to type <code>TRANSFORM_LIST</code> .
<code>model_xforms</code>	A transformation specification returned by <code>GET_MODEL_TRANSFORMATIONS</code>

IMPORT_MODEL Procedure

This procedure imports the specified data mining models from a dump file set that was created with EXPORT_MODEL or with the expdp export utility. Both IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology.

See Also: *Oracle Data Mining Administrator's Guide* for more information on model export and import

Syntax

```
DBMS_DATA_MINING.IMPORT_MODEL (
  filename          IN  VARCHAR2,
  directory         IN  VARCHAR2,
  model_filter      IN  VARCHAR2 DEFAULT NULL,
  operation         IN  VARCHAR2 DEFAULT NULL,
  remote_link      IN  VARCHAR2 DEFAULT NULL,
  jobname          IN  VARCHAR2 DEFAULT NULL,
  schema_remap     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38-78 *IMPORT_MODEL Procedure Parameters*

Parameter	Description
filename	Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to " EXPORT_MODEL Procedure " on page 38-52 for details.) If the dump file set contains multiple files, you can specify 'filename%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.
directory	Name of a pre-defined directory object that specifies where the dump file set is located. You must have read/write privileges on the directory object and on the file system directory that it identifies.
model_filter	Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. The value of model_filter can be one or more model names. The following are valid filters. 'mymodel1' 'name IN ('mymodel2','mymodel3')' The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3.
operation	Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation: <ul style="list-style-type: none"> ▪ 'IMPORT' — Import the models (Default) ▪ 'SQL_FILE' — Write the SQL DDL for creating the models to a text file. The text file is named job_name.sql and is located in the dump set directory.

Table 38–78 (Cont.) IMPORT_MODEL Procedure Parameters

Parameter	Description
remote_link	Optional parameter not used in this release. Set to NULL
jobname	Optional parameter that specifies the name of the import job. By default, the name has the form <i>username_imp_nnnn</i> , where <i>nnnn</i> is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named <i>jobname.log</i> , is created in the same directory as the dump file set.
schema_remap	Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form <i>export_user:import_user</i> . For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. NOTE: In some cases, you may need to have the IMPORT_FULL_DATABASE privilege or the SYS role to import a model from a different schema.

Examples

This example shows a model being exported and imported within the schema `dmuser2`. Then the same model is imported into the `dmuser3` schema. The `dmuser3` user has the `IMPORT_FULL_DATABASE` privilege.

```
SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;

MODEL_NAME
-----
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out', 'DATA_PUMP_DIR',
                                           'name = 'NMF_SH_SAMPLE');
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                                           'DATA_PUMP_DIR', 'name = 'NMF_SH_SAMPLE');

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                                           'DATA_PUMP_DIR', 'name = 'NMF_SH_SAMPLE'',
                                           'IMPORT', NULL, 'nmf_imp_job', 'dmuser2:dmuser3');
```

The following example shows user `MARY` importing all models from a dump file, `model_exp_001.dmp`, which was created by user `SCOTT`. The dump file is located in the file system directory mapped to a directory object called `DM_DUMP`. If user `MARY` does not have `IMPORT_FULL_DATABASE` privileges, `IMPORT_MODEL` will raise an error.

```
-- import all models
DECLARE
    file_name      VARCHAR2(40);
BEGIN
    file_name := 'model_exp_001.dmp';
    DBMS_DATA_MINING.IMPORT_MODEL(
        filename=>file_name,
        directory=>'DM_DUMP',
        schema_remap=>'SCOTT:MARY');
    DBMS_OUTPUT.PUT_LINE(
'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

RANK_APPLY Procedure

This procedure ranks the results of an `APPLY` operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
    apply_result_table_name      IN VARCHAR2,
    case_id_column_name         IN VARCHAR2,
    score_column_name           IN VARCHAR2,
    score_criterion_column_name IN VARCHAR2,
    ranked_apply_table_name     IN VARCHAR2,
    top_N                        IN INTEGER DEFAULT 1,
    cost_matrix_table_name      IN VARCHAR2 DEFAULT NULL,
    apply_result_schema_name    IN VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 38–79 RANK_APPLY Procedure Parameters

Parameter	Description
<code>apply_result_table_name</code>	Name of the table or view containing the results of an <code>APPLY</code> operation on the test dataset (see Usage Notes)
<code>case_id_column_name</code>	Name of the case identifier column. This must be the same as the one used for generating <code>APPLY</code> results.
<code>score_column_name</code>	Name of the prediction column in the apply results table
<code>score_criterion_column_name</code>	Name of the probability column in the apply results table
<code>ranked_apply_result_tab_name</code>	Name of the table containing the ranked apply results
<code>top_N</code>	Top N predictions to be considered from the <code>APPLY</code> results for precision recall computation
<code>cost_matrix_table_name</code>	Name of the cost matrix table
<code>apply_result_schema_name</code>	Name of the schema hosting the <code>APPLY</code> results table
<code>cost_matrix_schema_name</code>	Name of the schema hosting the cost matrix table

Usage Notes

You can use `RANK_APPLY` to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of `RANK_APPLY` is similar to that of `APPLY` with respect to other DDL-like operations such as `CREATE_MODEL`, `DROP_MODEL`, and `RENAME_MODEL`. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from `APPLY`.

The main intended use of `RANK_APPLY` is for the generation of the final `APPLY` results against the scoring data in a production setting. You can apply the model against test

data using `APPLY`, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for `RANK_APPLY`.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The `case_id` column will be the same case identifier column as that of the apply results.

Classification Models — NB, ABN, SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id      VARCHAR2/NUMBER,
prediction    NUMBER,
probability   NUMBER,
cost         NUMBER,
rank         INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id      VARCHAR2/NUMBER,
prediction    VARCHAR2,
probability   NUMBER,
cost         NUMBER,
rank         INTEGER)
```

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id      VARCHAR2/NUMBER,
cluster_id    NUMBER,
probability   NUMBER,
rank         INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id      VARCHAR2/NUMBER,
feature_id    NUMBER,
match_quality NUMBER,
rank         INTEGER)
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
*/

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name      => 'census_apply_result',
  case_id_column_name         => 'person_id',
  score_column_name           => 'prediction',
  score_criterion_column_name => 'probability',
  ranked_apply_result_tab_name => 'census_ranked_apply_result',
  top_N                       => 3,
  cost_matrix_table_name      => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

REMOVE_COST_MATRIX Procedure

Removes the default scoring matrix from a classification model.

See Also:

- ["ADD_COST_MATRIX Procedure"](#) on page 38-23
- ["REMOVE_COST_MATRIX Procedure"](#) on page 38-95

Syntax

```
DBMS_DATA_MINING.REMOVE_COST_MATRIX (
    model_name IN VARCHAR2);
```

Parameters

Table 38–80 Remove_Cost_Matrix Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;
```

ACTUAL	PREDICTED	COST
0	0	0
1	0	.75
0	1	.25
1	1	0

You can remove the cost matrix with REMOVE_COST_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');
```

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;
```

no rows selected

RENAME_MODEL Procedure

This procedure renames a mining model to a new name that you specify.

The model name is in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
    model_name          IN VARCHAR2,
    new_model_name      IN VARCHAR2);
```

Parameters

Table 38–81 *RENAME_MODEL Procedure Parameters*

Parameter	Description
model_name	Old name of the model
new_model_name	New name of the model.

Usage Notes

If an APPLY operation is using a model, and you attempt to rename the model during that time, the RENAME will succeed and APPLY will return indeterminate results.

Examples

Assume the existence of a model `census_model`. The following example shows how to rename this model.

```
BEGIN
    DBMS_DATA_MINING.RENAME_MODEL(
        model_name      => 'census_model',
        new_model_name  => 'census_new_model');
END;
/
```

DBMS_DATA_MINING_TRANSFORM

The `DBMS_DATA_MINING_TRANSFORM` package contains transformation routines that can be used to prepare data for mining.

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics that relate to using the DBMS_DATA_MINING_TRANSFORM package.

- [Data Transformation with Oracle Data Mining](#)
- [Types of Transformations](#)
- [The DBMS_DATA_MINING_TRANSFORM Framework](#)
- [Data Types](#)

Data Transformation with Oracle Data Mining

A **transformation** is a SQL expression that modifies one or more of the columns used in data mining.

Most data mining algorithms require some form of data transformation. Some transformations may be needed for categorical attributes, for numerical attributes, or for both. Data sets used for creating, testing, and scoring the model must all undergo the same transformations. To replicate these changes in each data set can be very time consuming.

Oracle Data Mining embeds transformation expressions in the model. The transformations used to create the model are automatically performed on any data sets to which the model is applied. This ability to deploy a model together with its transformations significantly enhances the model's usability while simplifying the process of model management.

Oracle Data Mining further simplifies the data transformation process by offering an **Automatic Data Preparation** mode (ADP). When you create a model using ADP, the training data is automatically transformed according to the requirements of the algorithm; the automatic transformations are embedded in the model. To enable ADP, set the `PREP_AUTO` setting to `PREP_AUTO_ON` in the settings table for the model.

See Also: [Table 38–6 in Chapter 38, "DBMS_DATA_MINING"](#) for information about the `PREP_AUTO` setting

You can supplement automatic transformations by passing a list of transformation expressions to `DBMS_DATA_MINING.CREATE_MODEL`. Your transformations are embedded in the model along with the automatic transformations. If ADP is turned off, only the transformations that you pass to `CREATE_MODEL` are embedded.

See Also: ["CREATE_MODEL Procedure" in Chapter 38, "DBMS_DATA_MINING"](#) for information about the transformation list parameter

The routines in `DBMS_DATA_MINING_TRANSFORM` are convenience routines to assist you in creating your own transformations. If these routines do not suit your needs, you can write SQL to modify them, or you can write your own routines.

Note on Notation:

This chapter uses standard interval notation for number sets:

- $[a,b]$ is the set of all real numbers greater than or equal to **a** and less than or equal to **b**
- $[a,b)$ is the set of all real numbers greater than or equal to **a** and less than **b**.

(**b** is in the set $[a,b]$; **b** is not in the set $[a,b)$.)

Types of Transformations

The `DBMS_DATA_MINING_TRANSFORM` package supports transformations that are typically used in data mining: binning, normalization, outlier treatment, missing value treatment, and column removal.

Binning

Binning involves mapping both continuous and discrete values to discrete values of reduced cardinality. For example, the age of persons could be binned into discrete numeric bins: 1-20 to 1, 21-40 to 2, and so on. Popular car manufacturers such as Ford, Chrysler, BMW, Volkswagen could be binned into discrete categorical bins: {Ford, Chrysler} to `US_Car_Makers`, and {BMW, Volkswagen} to `European_Car_Makers`.

`DBMS_DATA_MINING_TRANSFORM` supports binning for both categorical and numerical attributes.

Supervised Binning (Categorical and Numerical)

The bin contents are groupings calculated by a Decision Tree model.

Top-N Frequency Categorical Binning

The bin contents are based on the frequency of each value in the column. The number of bins is user-specified. The first bin contains the most frequent values, the second bin contains the second-most frequent values, and so on. The final bin contains all the remaining values.

Equi-Width Numerical Binning

Each bin contains the same number of values. The number of bins is user-specified or estimated from the data. The first bin contains the highest values, the second bin contains the next highest values, and so on.

Quantile Numerical Binning

Each bin contains the numbers in a quantile that is computed using the `SQL NTILE` function. Quantiles are partitions of a data distribution.

Normalization

Normalization is the process of scaling continuous values down to a specific range, typically between zero and one. Normalization applies only to numerical attributes.

Normalization transforms each number by subtracting a given number (**shift**) and dividing the result by the **scale**. For example:

```
x_new = (x_old-shift)/scale
```

Min-Max Normalization

Min-max normalization is computed based on the minimum and maximum values of the data. The values for shift and scale are:

```
shift = min  
scale = max-min
```

Scale Normalization

Scale normalization is computed based on the minimum and maximum values of the data. The values for shift and scale are:

```
shift = 0  
scale = max{abs(max), abs(min)}
```

Z-Score Normalization

Z-score normalization is computed based on the values for mean and standard deviation that are computed from the data. The values for shift and scale are:

```
shift = mean
scale = standard_deviation
```

Outlier Treatment

Some computations can be significantly affected by extreme values. One approach to achieving a more robust computation is to winsorize or trim (clip) the data as a preprocessing step.

Winsorizing involves setting the tail values to some specified value. For example, for a 90% winsorization, the bottom 5% could be set to the minimum value in the 6th percentile, while the upper 5% could be set to the maximum value in the 95th percentile.

Trimming sets the tail values to NULL.

Missing Value Treatment

Oracle Data Mining distinguishes between **sparse data** and data that contains **random missing values**. The latter means that some attribute values are unknown. Sparse data, on the other hand, contains values that are assumed to be known, although they are not represented in the data.

NULLs in columns with simple data types (not nested) are assumed to represent random missing values. Values that are not present in nested columns indicate sparsity. Oracle Data Mining automatically replaces numerical data that is missing at random with the mean and categorical data that is missing at random with the mode. Missing numerical values in sparse data are replaced with zeros. Missing categorical values in sparse data are replaced with a zero vector or a special value DM\$SPARSE, depending on the algorithm.

DBMS_DATA_MINING_TRANSFORM provides routines for handling missing values. These routines are available for anyone who wishes to manage missing value treatment explicitly, instead of relying on the default treatment.

See Also: *Oracle Data Mining Application Developer's Guide* for more information about missing value treatment by Oracle Data Mining

The DBMS_DATA_MINING_TRANSFORM Framework

DBMS_DATA_MINING_TRANSFORM provides a framework for transforming columns of data for mining. The framework is composed of CREATE, INSERT, STACK, and XFORM operations. You can modify the output or implement your own version of any of these operations.

The DBMS_DATA_MINING_TRANSFORM framework consists of the following operations:

1. CREATE — Create a transformation table.

A transformation table has the columns needed for specifying one of the following transformations:

- Binning
- Column removal
- Normalization
- Outlier treatment
- Missing value treatment

For example, the binning transformation table has columns for listing the original column values with their bin assignments.

The columns of the transformation table are empty until they are populated by an INSERT routine.

2. INSERT — Populate a transformation table for a given data source.

For example, you could use an INSERT routine to populate a transformation table with bin assignments for the categorical attributes in a specified data source. Bin assignments could be calculated using supervised binning or top-n frequency binning.

You can invoke CREATE and INSERT routines several times until the transformation tables fully represent all the data attributes for a given mining problem.

3. STACK — Add the transformation instructions to a list (stack) of transformation instructions.

For example, you could use a STACK routine to add the transformation instructions that populated the binning transformation table to a list of transformation instructions. With STACK routines, you can assemble all the transformation instructions for a given data source into a single list.

The list of transformation instructions can be passed to CREATE_MODEL or to other STACK routines. (See "[CREATE_MODEL Procedure](#)" on page 38-47.)

4. XFORM — Create a view of the data table that includes the transformed columns.

For example, you could use an XFORM routine to create a view that includes the binned columns from the binning transformation table.

The view created by an XFORM routine includes the transformed values for the columns in the transformation table and the original values for all other columns. The view can be used for creating, testing, or scoring a model.

Data Types

DBMS_DATA_MINING_TRANSFORM defines the data types described in this section.

COLUMN LIST Collection Type

This type is used to store quoted and non-quoted identifiers for column names.

```
TYPE
    COLUMN_LIST                IS VARRAY(1000) OF VARCHAR2(32);
```

DESCRIBE LIST Collection Type

This type holds the results of describe operations.

```
SUBTYPE
    DESCRIBE_LIST              IS dbms_sql.DESC_TAB2;
```

EXPRESSION Record Type

This type is used for storing transformation expressions.

```
TYPE
    EXPRESSION_REC             IS RECORD (
        .....);
```

Unlike VARCHAR2, EXPRESSION_REC can be used for expressions that can grow larger than 32K.

Use SET_EXPRESSION to write to an EXPRESSION_REC. Use GET_EXPRESSION to retrieve the contents of an EXPRESSION_REC.

TRANSFORMATION Record Type

This type is used for storing the in-memory transformation stack definition for a single attribute.

```
TYPE
    TRANSFORM_REC              IS RECORD (
        attribute_name          VARCHAR2(30),
        attribute_subname       VARCHAR2(4000),
        expression              EXPRESSION_REC,
        reverse_expression       EXPRESSION_REC,
        attribute_spec           VARCHAR2(4000));
```

The attribute_spec field is used to specify additional information and actions for an attribute. You can specify the value NOPREP for attribute_spec.

NOPREP disables ADP for an individual attribute. NOPREP can be used in the transformation list passed to DBMS_DATA_MINING.CREATE_MODEL. (See "[CREATE_MODEL Procedure](#)" on page 38-47.)

TRANSFORMATION LIST Collection Type

This type is used for storing the in-memory stack definition.

```
TYPE
    TRANSFORM_LIST             IS TABLE OF TRANSFORM_REC;
```

NESTED COLUMN Constants

These constants are used for specifying data types of nested columns.

NEST_NUM_COL_TYPE	CONSTANT NUMBER := 100001;
NEST_CAT_COL_TAYPE	CONSTANT NUMBER := 100002;

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 39–1 DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
CREATE_BIN_CAT Procedure on page 39-11	Creates a categorical bin definition table
CREATE_BIN_NUM Procedure on page 39-12	Creates a numerical bin definition table
CREATE_CLIP Procedure on page 39-13	Creates a clipping definition table
CREATE_COL_REM Procedure on page 39-14	Creates a column removal definition table
CREATE_MISS_CAT Procedure on page 39-15	Creates a categorical missing value treatment definition table
CREATE_MISS_NUM Procedure on page 39-16	Creates a numerical missing value treatment definition table
CREATE_NORM_LIN Procedure on page 39-17	Creates a normalization definition table
DESCRIBE_STACK Procedure on page 39-18	Describes the stack definition
GET_EXPRESSION Function on page 39-19	Returns a transformation expression
INSERT_AUTOBIN_NUM_EQWIDTH Procedure on page 39-20	Populates the numerical bin definition table, using the number of bins estimated from the data
INSERT_BIN_CAT_FREQ Procedure on page 39-22	Populates the categorical bin definition table, applying frequency-based binning to the categorical input data
INSERT_BIN_NUM_EQWIDTH Procedure on page 39-24	Populates the numerical bin definition table, applying equi-width binning to the numerical input data
INSERT_BIN_NUM_QTILE Procedure on page 39-26	Populates the numerical bin definition table, applying quantile binning to the numerical input data
INSERT_BIN_SUPER Procedure on page 39-28	Populates a binning definition table, applying supervised binning to both numerical and categorical data
INSERT_CLIP_TRIM_TAIL Procedure on page 39-29	Populates the clipping definition table, applying trimming based on tail fraction to the numerical input data
INSERT_CLIP_WINSOR_TAIL Procedure on page 39-31	Populates the clipping definition table, applying Winsorizing based on tail fraction to the numerical input data
INSERT_MISS_CAT_MODE Procedure on page 39-33	Populates the categorical missing value treatment definition table, applying the mode to each missing value
INSERT_MISS_NUM_MEAN Procedure on page 39-34	Populates the numerical missing value treatment definition table, applying the mean to each missing value
INSERT_NORM_LIN_MINMAX Procedure on page 39-35	Populates the normalization definition table, applying min-max normalization to the numerical input data

Table 39–1 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
INSERT_NORM_LIN_SCALE Procedure on page 39-36	Populates the normalization definition table, applying scale normalization to the numerical input data
INSERT_NORM_LIN_ZSCORE Procedure on page 39-37	Populates the normalization definition table applying z-score normalization to the numerical input data
SET_EXPRESSION Procedure	Appends to a transformation expression
SET_TRANSFORM Procedure on page 39-39	Specifies a transformation expression
STACK_BIN_CAT Procedure on page 39-40	Add categorical binning expressions to the transformation list
STACK_BIN_NUM Procedure on page 39-43	Add numerical binning expressions to the transformation list
STACK_CLIP Procedure on page 39-46	Add clipping expressions to the transformation list
STACK_COL_REM Procedure on page 39-48	Add column removal expressions to the transformation list
STACK_MISS_CAT Procedure on page 39-49	Add categorical missing value treatment expressions to the transformation list
STACK_MISS_NUM Procedure on page 39-51	Add numerical missing value treatment expressions to the transformation list
STACK_NORM_LIN Procedure on page 39-53	Add linear normalization expressions to the transformation list
XFORM_BIN_CAT Procedure on page 39-55	Creates a view that applies a categorical binning transformation to the data
XFORM_BIN_NUM Procedure on page 39-57	Creates a view that applies a numerical binning transformation to the data
XFORM_CLIP Procedure on page 39-60	Creates a view that applies a clipping transformation to the data
XFORM_COL_REM Procedure on page 39-62	Creates a view that removes the specified columns from the data
XFORM_EXPR_NUM Procedure on page 39-63	Creates a view that applies a transformation expression to a numerical column in the data
XFORM_EXPR_STR Procedure on page 39-65	Creates a view that applies a transformation expression to a character column in the data
XFORM_MISS_CAT Procedure on page 39-66	Creates a view that performs missing value treatment on the categorical attributes in the data
XFORM_MISS_NUM Procedure on page 39-67	Creates a view that performs missing value treatment on the numerical attributes in the data
XFORM_NORM_LIN Procedure on page 39-68	Creates a view that performs linear normalization to numerical attributes in the data
XFORM_STACK Procedure on page 39-70	Creates a view that transforms the data as specified by the stack definition (transformation list)

CREATE_BIN_CAT Procedure

This procedure creates a categorical binning transformation table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
    bin_table_name      IN VARCHAR2,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–2 CREATE_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the binning transformation table
bin_schema_name	Name of the schema hosting the binning transformation table

Usage Notes

The table created by this procedure can be used to store bin assignments for categorical attributes. The following INSERT routines are available for populating the table:

- [INSERT_BIN_CAT_FREQ Procedure](#) for frequency-based binning
- [INSERT_BIN_SUPER Procedure](#) for supervised binning

The columns in the categorical bin definition table are described in [Table 39–3](#).

Table 39–3 Categorical Binning Definition Table

Column	Data Type	Description
col	VARCHAR2 (30)	Column containing the categorical values to be binned
att	VARCHAR2 (4000)	Attribute name if the column is nested
val	VARCHAR2 (4000)	A value in the column to be binned
bin	VARCHAR2 (4000)	The bin that contains the value

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('build_bin_cat_table');
END;
/
```

```
DESCRIBE build_bin_cat_table
```

```
Name                                         Null?    Type
-----
COL                                         VARCHAR2(30)
ATT                                         VARCHAR2(4000)
VAL                                         VARCHAR2(4000)
BIN                                         VARCHAR2(4000)
```

CREATE_BIN_NUM Procedure

This procedure creates a numerical binning transformation table. This table is used as input to the `INSERT_BIN_NUM_EQWIDTH`, `INSERT_BIN_NUM_QTILE`, `INSERT_AUTOBIN_NUM_EQWIDTH`, and `XFORM_BIN_NUM` procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
    bin_table_name    IN VARCHAR2,
    bin_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–4 CREATE_BIN_NUM Procedure Parameters

Parameter	Description
<code>bin_table_name</code>	Name of the bin definition table
<code>bin_schema_name</code>	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
<code>col</code>	<code>VARCHAR2(30)</code>
<code>att</code>	<code>VARCHAR2(4000)</code>
<code>val</code>	<code>NUMBER</code>
<code>bin</code>	<code>VARCHAR2(4000)</code>

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('build_bin_num_table');
END;
/
```

```
DESCRIBE build_bin_num_table
```

Name	Null?	Type
COL		VARCHAR2(30)
ATT		VARCHAR2(4000)
VAL		NUMBER
BIN		VARCHAR2(4000)

CREATE_CLIP Procedure

This procedure creates a clipping definition table. This table is used as input to the INSERT_CLIP_WINSOR_TAIL, INSERT_CLIP_TRIM_TAIL, and XFORM_CLIP procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
    clip_table_name    IN VARCHAR2,
    clip_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–5 CREATE_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table
clip_schema_name	Name of the schema hosting the clipping definition table

Usage Notes

The generated clipping definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2 (30)
att	VARCHAR2 (4000)
lcut	NUMBER
lval	NUMBER
rcut	NUMBER
rval	NUMBER

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('build_clip_table');
END;
/
```

```
DESCRIBE build_clip_table
```

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)
LCUT		NUMBER
LVAL		NUMBER
RCUT		NUMBER
RVAL		NUMBER

CREATE_COL_REM Procedure

This procedure creates a column removal definition table. This table is used by the `STACK_COL_REM`, `XFORM_COL_REM`, `INSERT_BIN_SUPER`, and `INSERT_AUTOBIN_NUM_EQWIDTH` procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (
    rem_table_name          VARCHAR2,
    rem_schema_name        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–6 CREATE_COL_REM Procedure Parameters

Parameter	Description
<code>rem_table_name</code>	Name of the column removal definition table.
<code>rem_schema_name</code>	Schema of the column removal definition table.

Usage Notes

The generated column removal definition table has the following columns.

Column Name	Data Type
<code>col</code>	<code>VARCHAR2(30)</code>
<code>att</code>	<code>VARCHAR2(4000)</code>

The column removal definition table lists the column names and the associated attribute names to remove from the data source. The `col` column is case sensitive, since it generates quoted identifiers. There can be multiple entries in the column removal definition table for the same `col` when it is a nested column.

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('col_rem_tbl');
END;
/
```

```
DESCRIBE col_rem_tbl
Name                               Null?    Type
-----
COL                                VARCHAR2(30)
ATT                                VARCHAR2(4000)
```

CREATE_MISS_CAT Procedure

This procedure creates a categorical missing value treatment definition table. This table is used as input to the INSERT_MISS_CAT_MODE procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39-7 CREATE_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table

Usage Notes

The generated categorical missing value treatment definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2 (30)
att	VARCHAR2 (4000)
val	VARCHAR2 (4000)

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('build_miss_cat_table');
END;
/
```

```
DESCRIBE build_miss_cat_table
```

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)
VAL		VARCHAR2 (4000)

CREATE_MISS_NUM Procedure

This procedure creates a numerical missing value treatment definition table. This table is used as input to the `INSERT_MISS_NUM_MEAN` procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
    miss_table_name      IN VARCHAR2,
    miss_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–8 CREATE_MISS_NUM Procedure Parameters

Parameter	Description
<code>miss_table_name</code>	Name of the numeric missing value treatment definition table
<code>miss_schema_name</code>	Name of the schema hosting the numeric missing value treatment definition table

Usage Notes

The generated numeric missing value definition table will have the following columns.

Column Name	Data Type
<code>col</code>	<code>VARCHAR2(30)</code>
<code>att</code>	<code>VARCHAR(4000)</code>
<code>val</code>	<code>NUMBER</code>

Example

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('build_miss_num_table');
END;
/
```

```
DESCRIBE build_miss_num_table
```

```

Name                                     Null?    Type
-----
COL                                       VARCHAR2(30)
ATT                                       VARCHAR2(4000)
VAL                                       NUMBER
```

CREATE_NORM_LIN Procedure

This procedure creates a linear normalization definition table. This table is used as input to the INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, INSERT_NORM_LIN_ZSCORE, and XFORM_NORM_LIN procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–9 CREATE_NORMALIZE_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table
norm_schema_name	Name of the schema hosting the normalization definition table

Usage Notes

The generated linear normalization definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2 (30)
att	VARCHAR2 (4000)
shift	NUMBER
scale	NUMBER

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('build_norm_table');
END;
/
```

```
DESCRIBE build_norm_table
```

Name	Null?	Type
COL		VARCHAR2 (30)
ATT		VARCHAR2 (4000)
SHIFT		NUMBER
SCALE		NUMBER

DESCRIBE_STACK Procedure

This procedure describes the transformation of the data table specified by the stack definition.

Only the columns that are specified in the stack definition are transformed. The remaining columns do not change.

All columns in the stack definition are applied. Columns with NULL in the expression field are excluded. Columns in the stack definition that do not have a matching column in the data are added to the describe list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (
  xform_list          IN TRANSFORM_LIST,
  data_table_name     IN VARCHAR2,
  describe_list       OUT DESCRIBE_LIST
  data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–10 DESCRIBE_STACK Procedure Parameters

Parameter	Description
xform_list	List of stacked transformations
data_table_name	Table that contains the mining data
describe_list	Descriptions of stacked transformations
data_schema_name	Schema of table that contains the mining data. If you do not specify a schema, your own schema is used.

Usage Notes

For DM_NESTED_NUMERICALS, the value of col_type is nest_num_col_type. For DM_NESTED_CATEGORICALS, the value of col_type is nest_cat_col_type.

GET_EXPRESSION Function

This procedure returns a VARCHAR2 chunk from the expression.

Chunk numbering starts with one. For chunks outside of the range, the return value is NULL. When a chunk number is NULL the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (  
    expression          IN EXPRESSION_REC,  
    chunk_num          IN PLS_INTEGER DEFAULT NULL);  
RETURN VARCHAR2;
```

Parameters

Table 39–11 GET_EXPRESSION Function Parameters

Parameter	Description
expression	Transformation expression
chunk_num	Number of the chunk

INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every numerical column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using `CREATE_BIN_NUM`. Based on the statistical information it collects on the input data, this procedure calculates the number of bins.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table.

N , the number of bins, is computed for each column separately and is based on the number of non-NULL values (`cnt`), the maximum (`max`), the minimum (`min`), the standard deviation (`dev`) and the constant $C=3.49/0.9$ as follows:

$$N = \text{floor}(\text{power}(\text{cnt}, 1/3) * (\text{max} - \text{min}) / (c * \text{dev}))$$

Each of the `bin_num` ($= N$) bins `bin_1, ..., bin_N` span ranges of equal width $\text{inc} = (\text{max} - \text{min}) / N$ where `bin_I = I` when $N > 0$ or `bin_I = N+1-I` when $N < 0$, and `bin_0 = bin_(N+1) = NULL`. The values of the `val` column are rounded to `round_num` significant digits prior to scoring them in the definition table.

The parameter `bin_num` is used to adjust N to be at least `bin_num`. No adjustment is done when `bin_num` is NULL or 0. The parameter `max_bin_num` is used to adjust N to be at most `max_bin_num`. No adjustment is done when `bin_num` is NULL or 0. For columns with all integer values (discrete columns), N is adjusted to be at most the maximum number of distinct values in the observed range $\text{max} - \text{min} + 1$.

The parameter `sample_size` is used to adjust `cnt` to be at most `sample_size`. No adjustment is done when `sample_size` is NULL or 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    bin_num             IN PLS_INTEGER DEFAULT 3,
    max_bin_num        IN PLS_INTEGER DEFAULT 100,
    exclude_list       IN Column_List DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    sample_size        IN PLS_INTEGER DEFAULT 50000,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL,
    rem_table_name     IN VARCHAR2 DEFAULT NULL,
    rem_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–12 INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
<code>bin_table_name</code>	Name of the categorical bin table generated using <code>CREATE_BIN_NUM</code> procedure
<code>data_table_name</code>	Name of the table containing the data
<code>bin_num</code>	Minimum number of bins; default number is 3
<code>max_bin_num</code>	Maximum number of bins that sets the upper limit for estimates of bin numbers; default is 100

Table 39–12 (Cont.) INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
<code>exclude_list</code>	List of columns (attributes) to be excluded from this iteration of the binning process; categorical attributes are automatically excluded
<code>round_num</code>	Number of significant digits; default is 6
<code>sample_size</code>	Size of the data sample; default is 50,000
<code>bin_schema_name</code>	Name of the schema hosting the bin definition table; default is user schema
<code>data_schema_name</code>	Name of the schema hosting the table with data; default is user schema
<code>rem_table_name</code>	Name of the column removal definition table created with <code>CREATE_COL_REM</code> .
<code>rem_schema_name</code>	Schema of the column removal definition table.

Usage Notes

For a given input table, you can call this routine several times with different specifications for number of bins for a given input table. For each call, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. The sign of `bin_num`, `max_bin_num`, and `sample_size` have no effect on the result; absolute values are used. The value adjustment of N is done in the following order: First `bin_num`, next, `max_bin_num`, and, finally, discrete column adjustment.

Examples

The simplest invocation of this routine populates bin definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQUIWIDTH(
    'num_bin_table', 'build_data_table');
END;
/
```

INSERT_BIN_CAT_FREQ Procedure

This procedure finds the categorical binning definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the categorical binning definition table created using CREATE_BIN_CAT.

Definition for each relevant column is computed based on the occurrence frequency of column values that are computed from the data table. Each of the bin_num(N) bins bin_1, ..., bin_N corresponds to the values with top frequencies when $N > 0$ or bottom frequencies when $N < 0$, and bin_(N+1) to all remaining values, where bin_I = I. Ordering ties among identical frequencies are broken by ordering on column values (ASC for $N > 0$ or DESC for $N < 0$). When the number of distinct values $C < N$ only C+1 bins will be created.

The parameter default_num (D) is used for pruning based on the number of values that fall into the default bin. When $D > 0$ only columns that have at least D defaults are kept while others are ignored. When $D < 0$ only columns that have at most D values are kept. No pruning is done when D is NULL or $D = 0$. Parameter bin_support (SUP) is used for restricting bins to frequent ($SUP > 0$) values $frq \geq SUP * tot$, or infrequent ($SUP < 0$) ones $frq \leq -SUP * tot$, where frq is a given value count and tot is a sum of all counts as computed from the data. No support filtering is done when SUP is NULL or when $SUP = 0$.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
    bin_table_name      IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    bin_num             IN PLS_INTEGER DEFAULT 9,
    exclude_list       IN Column_List DEFAULT NULL,
    default_num        IN PLS_INTEGER DEFAULT 2,
    bin_support         NUMBER DEFAULT NULL,
    bin_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–13 INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
default_num	Number of default values
bin_support	Bin support as a fraction
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all NULLs are ignored. No bin definitions are populated when `bin_num = 0`, or `bin_num`, is NULL.

Examples

The simplest invocation of this routine populates bin definitions in the `cat_bin_table` for all the categorical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
    'cat_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table. Each of the bin_num (= N) bins bin₁,..., bin_N span ranges of equal width $inc = (max - min) / N$ where bin_I = I when N > 0 or bin_I = N+1-I when N < 0, and bin₀ = bin_(N+1) = NULL.

The values of the val column in the bin definition table are rounded to round_num significant digits. For more information, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 10,
  exclude_list       IN Column_List DEFAULT NULL,
  round_num          IN PLS_INTEGER DEFAULT 6,
  bin_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–14 INSERT_BIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
round_num	Number of significant digits. See Usage Notes.
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. No bin definitions are populated when bin_num = 0, or bin_num is NULL.

For example, when N=2, col='mycol', min=10, and max = 21, the following three rows are inserted into the definition table (inc = 5.5):

```
COL      VAL  BIN
-----
mycol    10  NULL
```

```
mycol 15.5 1
mycol  21  2
```

The `round_num` parameter specifies how to round the number in the `VAL` column of the definition table. When `round_num` is positive, it specifies the most significant digits to retain. When `round_num` is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. When `round_num` is 0, the value is unchanged.

For example, a value of 308.162 would be rounded as follows.

```
For a value of 308.162:
  when round_num = 1      result is 300
  when round_num = 2      result is 310
  when round_num = 3      result is 308
  when round_num = 0      result is 308.162
  when round_num = -1     result is 308.16
  when round_num = -2     result is 308.2
  when round_num = NULL   result is NULL
```

Examples

The simplest invocation of this routine populates bin definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
    'num_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_QTILE Procedure

This procedure finds a numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the binning definition table that was created using CREATE_BIN_NUM.

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin_1,..., bin_N span the following ranges: bin_1 spans [min_1,min_2]; bin_2,..., bin_i,..., bin_N-1 span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
  bin_table_name      IN VARCHAR2,
  data_table_name     IN VARCHAR2,
  bin_num             IN PLS_INTEGER DEFAULT 10,
  exclude_list       IN Column_List DEFAULT NULL,
  bin_schema_name    IN VARCHAR2 DEFAULT NULL,
  data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–15 INSERT_BIN_NUM_QTILE Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using the CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
bin_schema_name	Name of the schema hosting the numerical binning definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for bin_num for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When N = 4, col='mycol', and data is {1,2,2,2,2,3,4}, the following three rows are inserted into the definition table:

```
COL      VAL      BIN
-----
mycol    1      NULL
mycol    2        1
mycol    4        2
```

Here quantities are {1,2}, {2,2}, {2,3}, {4} and min(1) = 1, min(2) = 2, min(3) = 2, min(4) = 4, max(4) = 4, and ranges are [1,2], (2,2], (2,4], (4,4]. After collapsing [1,2] and (2,4].

Examples

The simplest invocation of this routine populates numerical binning definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
    'num_bin_table', 'build_table');
END;
```

INSERT_BIN_SUPER Procedure

This procedure finds a numerical and categorical binning definition for every NUMBER, FLOAT, VARCHAR2, or CHAR column in the data table that is not in the exclusion list and inserts the definition into the numerical or categorical binning definition table.

The bin boundaries are computed using a technique called **Supervised Binning**. The definition for each relevant column is computed based on the splits found by a Decision Tree model built on a single predictor. Columns that have no interesting splits are inserted into the column removal definition table (if one is specified).

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
    num_table_name      IN VARCHAR2,
    cat_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    target_column_name  IN VARCHAR2,
    max_bin_num         IN PLS_INTEGER DEFAULT 1000,
    exclude_list        IN COLUMN_LIST  DEFAULT NULL,
    num_schema_name     IN VARCHAR2     DEFAULT NULL,
    cat_schema_name     IN VARCHAR2     DEFAULT NULL,
    data_schema_name    IN VARCHAR2     DEFAULT NULL,
    rem_table_name      IN VARCHAR2     DEFAULT NULL,
    rem_schema_name     IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 39–16 INSERT_BIN_SUPER Procedure Parameters

Parameter	Description
num_table_name	Name of the numerical bin definition table generated using the CREATE_BIN_NUM procedure.
cat_table_name	Name of the categorical bin definition table generated using the CREATE_BIN_CAT procedure.
data_table_name	Name of the table containing the data.
target_column_name	Name of the target column.
max_bin_num	The maximum number of bins.
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process.
num_schema_name	Schema of the numerical bin definition table.
cat_schema_name	Schema of the categorical bin definition table.
data_schema_name	Schema of the table containing the data.
rem_table_name	Name of the column removal definition table created with CREATE_COL_REM.
rem_schema_name	Schema of the column removal definition table.

INSERT_CLIP_TRIM_TAIL Procedure

This procedure finds the trimming definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

The definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that $val(1) < val(2) < \dots < val(N)$, where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = NULL
rcut = val(N-floor(*N*q))
rval = NULL
```

where $q = ABS(NVL(tail_frac,0))$. Nothing is done when $q \geq 0.5$.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  tail_frac            IN NUMBER DEFAULT 0.025,
  exclude_list         IN Column_List DEFAULT NULL,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39-17 INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using the CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification.

Example 1. When $q = 0.2$, $col='mycol'$, and data is $\{1,2,2,2,3,4,4\}$, the following row is inserted into the definition table:

```
COL    LCUT    LVAL    RCUT    RVAL
-----
mycol    2     NULL    4     NULL
```

Here $1 + \text{floor}(N*q) = 1 + \text{floor}(7*0.2) = 2$, $lcut = val(2) = 2$.

$N - \text{floor}(N*q) = 7 - \text{floor}(7*0.2) = 6$, $\text{rcut} = \text{val}(6) = 4$.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL(
        'clip_table', 'build_table');
END;
```

INSERT_CLIP_WINSOR_TAIL Procedure

This procedure finds the Winsorizing definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

Definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that $\text{val}(1) < \text{val}(2) < \dots < \text{val}(N)$, where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = lcut
rcut = val(N-floor(N*q))
rval = rcut
```

where $q = \text{ABS}(\text{NVL}(\text{tail_frac}, 0))$. Nothing is done when $q \geq 0.5$.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
  clip_table_name   IN VARCHAR2,
  data_table_name   IN VARCHAR2,
  tail_frac         IN NUMBER DEFAULT 0.025,
  exclude_list      IN Column_List DEFAULT NULL,
  clip_schema_name  IN VARCHAR2 DEFAULT NULL,
  data_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39-18 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attribute (that is, column names using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When $q = 0.2$, $\text{col} = \text{'mycol'}$, and data is $\{1,2,2,2,3,4,4\}$, the following row is inserted into the definition table:

```
COL    LCUT    LVAL    RCUT    RVAL
-----
mycol    2        2        4        4
```

Here $1 + \text{floor}(N*q) = 1 + \text{floor}(7*0.2) = 2$, $\text{lcut} = \text{val}(2) = 2$.

$N - \text{floor}(N*q) = 7 - \text{floor}(7*0.2) = 6$, $\text{rcut} = \text{val}(6) = 4$.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL(
        'clip_table', 'build_table');
END;
```

INSERT_MISS_CAT_MODE Procedure

This procedure finds the categorical missing value treatment definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_CAT.

The definition for each selected column is computed based on the mode value that is computed from the data table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–19 INSERT_MISS_CAT_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the missing value treatment. See "Data Types" on page 39-7 for the definition of COLUMN_LIST.
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the categorical attributes that will receive missing value treatment by using the `exclude_list` parameter. NULL values in all the selected attributes will be replaced with the mode (the most commonly occurring value) for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in `miss_table` for all categorical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
        'miss_table', 'build_table');
END;
```

INSERT_MISS_NUM_MEAN Procedure

This procedure finds the numerical missing value treatment definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_NUM.

The definition for each selected column is computed based on the mean value that is computed from the data table. The value of mean is rounded to round_num significant digits prior to storing it in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–20 INSERT_MISS_NUM_MEAN Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the miss value treatment. See "Data Types" on page 39-7 for the definition of COLUMN_LIST.
round_num	The number of significant digits
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the numerical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mean (average) value for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
        'miss_table', 'build_table');
END;
```

INSERT_NORM_LIN_MINMAX Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the mean and standard deviation that are computed from the data table, such that $\text{shift} = \text{mean}$ and $\text{scale} = \text{standard deviation}$. The values of shift and scale are rounded to `round_num` significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    exclude_list         IN Column_List DEFAULT NULL,
    round_num            IN PLS_INTEGER DEFAULT 6,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–21 INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description
<code>norm_table_name</code>	Name of the normalization table generated using CREATE_NORM_LIN procedure
<code>data_table_name</code>	Name of the table containing the data
<code>exclude_list</code>	List of columns (attributes) to be excluded from this iteration of the normalization process
<code>round_num</code>	Number of significant digits
<code>norm_schema_name</code>	Name of the schema hosting the normalization definition table
<code>data_schema_name</code>	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the `exclude_list` parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the `norm_minmax_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
        'norm_minmax_table', 'build_table');
END;
```

INSERT_NORM_LIN_SCALE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are `shift = 0` and `scale = max{abs(max), abs(min)}`.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    exclude_list         IN Column_List DEFAULT NULL,
    round_num            IN PLS_INTEGER DEFAULT 6,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–22 INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description
<code>norm_table_name</code>	Name of the normalization table generated using CREATE_NORM_LIN procedure
<code>data_table_name</code>	Name of the table containing the data
<code>exclude_list</code>	List of columns (attributes) to be excluded from this iteration of the normalization process
<code>round_num</code>	Number of significant digits
<code>norm_schema_name</code>	Name of the schema hosting the normalization definition table
<code>data_schema_name</code>	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the `exclude_list` parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the `norm_minmax_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE(
        'norm_scale_table', 'build_table');
END;
```

INSERT_NORM_LIN_ZSCORE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on z-score normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table, such that $\text{shift} = \text{min}$ and $\text{scale} = \text{max} - \text{min}$. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN Column_List DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–23 INSERT_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_zscore_table for all the numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
        'norm_zscore_table', 'build_table');
END;
/
```

SET_EXPRESSION Procedure

This procedure appends a VARCHAR2 chunk to the expression. Appending NULL clears the expression.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (  
    expression      IN OUT NOCOPY EXPRESSION_REC,  
    chunk           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–24 SET_EXPRESSION Procedure Parameters

Parameter	Description
expression	Transformation expression
chunk	Chunk to add to the expression

SET_TRANSFORM Procedure

This procedure specifies a transformation expression and a reverse transformation expression for an attribute.

The new transformation specification is appended to the transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
    xform_list           IN OUT NOCOPY TRANSFORM_LIST,
    attribute_name       VARCHAR2,
    attribute_subname    VARCHAR2,
    expression           VARCHAR2,
    reverse_expression   VARCHAR2,
    attribute_spec       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–25 SET_TRANSFORM Procedure Parameters

Parameter	Description
xform_list	The transformation list for the attribute
attribute_name	Name of the attribute
attribute_subname	Name of the nested attribute if <i>attribute_name</i> is a nested column, otherwise NULL.
expression	A SQL expression.
reverse_expression	SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)
attribute_spec	You can specify the value NOPREP for <i>attribute_spec</i> to prevent this attribute from being automatically transformed in DBMS_DATA_MINING.CREATE_MODEL. (See " CREATE_MODEL Procedure " on page 38-47.)

STACK_BIN_CAT Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks a categorical binning expression on top of the existing expression and updates the stack definition.

Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When a reverse expression is NULL, it is treated as an identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, {expr} has the following form after stacking:

```
DECODE({expr}, '{val1}', '{bin1}',
        ...
        '{valN}', '{binN}',
        NULL,      NULL,
        '{bin(N+1)}')
```

and {rexp} has the following form:

```
DECODE("{attr}", '{bin1}',      '{rev1}',
        ...
        '{binN}',      '{revN}',
        NULL,          'NULL',
        '{bin(N+1)}', 'DEFAULT')
```

where {revI} is the result of applying reverse expression to {valI}.

If {binI} and {binJ} are equal, then the corresponding entries of the DECODE function above are merged into:

```
'{binI}', '{revI}, {revJ}'
```

If more than one entry maps to the default bin {bin(N+1)}, they are all merged to

```
'{bin(N+1)}', 'DEFAULT'
```

Note that the reverse expression implicitly maps invalid bins to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
  bin_table_name      IN          VARCHAR2,
  transform_list      IN/OUT     DM_TRANSFORMS,
  literal_flag        IN          BOOLEAN DEFAULT FALSE,
  bin_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39-26 STACK_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
transform_list	List of stacked transformations

Table 39–26 (Cont.) STACK_BIN_CAT Procedure Parameters

Parameter	Description
literal_flag	Literal flag (See the Usage Notes)
bin_schema_name	Schema of the bin definition table

Usage Notes

The Literal flag indicates whether the values in {bin} are valid SQL literals. When the flag is set to TRUE, the value of {bin} is used "as is" in the expression generation, otherwise it is converted into a valid text literal (surrounded by quotes and double the quotes inside). By default the flag is set to FALSE. One example when it can be set to TRUE is in cases when all {bin} are numbers. In that case the transformed column will remain numeric as opposed to textual (default behavior). For example, for the following transform definition:

```
COL   VAL           BIN
-----
mycol Waltham       1
mycol Burlington    1
mycol Redwood Shores 2
```

the following {expr} and {rexp} are generated when the flag is FALSE:

```
expr = DECODE("mycol", 'Waltham',      '1',
                  'Burlington',      '1',
                  'Redwood Shores', '2')
rexp = DECODE("COL1", '1',  ''Waltham'', 'Burlington'',
              '2',  ''Redwood Shores'',
              NULL, 'DEFAULT')
```

and when the flag is set to TRUE:

```
expr = DECODE("mycol", 'Waltham',      1,
                  'Burlington',      1,
                  'Redwood Shores', 2)
rexp = DECODE("COL1", 1,  ''Waltham'', 'Burlington'',
              2,  ''Redwood Shores'',
              NULL, 'DEFAULT')
```

Example

Given transformation definition:

```
{col = COL1, val = waltham,      bin = MA}
{col = COL1, val = burlington,   bin = MA}
{col = COL1, val = redwood shores, bin = CA}
{col = COL2, val = MA,           bin = East}
{col = COL2, val = CA,           bin = West}
{col = COL2, val = NULL,         bin = USA}
```

and stack definition:

```
{attr = COL1, expr = lower(COL1), rexp = initcap(COL1)}
{attr = COL3, expr = upper(COL3), rexp = initcap(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = DECODE(lower(COL1), 'waltham',      'MA',
                  'burlington',      'MA',
```

```
                                'redwood shores', 'CA'),
rexp = DECODE("COL1", 'MA', ''Waltham'', 'Burlington'',
                                'CA', ''Redwood Shores'',
                                NULL, 'DEFAULT'})

{attr = COL3,
  expr = upper(COL3),
  rexp = initcap(COL3)}
{attr = COL2,
  expr = DECODE("COL2", 'MA', 'East',
                                'NY', 'East',
                                'CA', 'West',
                                NULL, NULL,
                                'USA')
  rexp = DECODE("COL2", 'East', ''MA'',
                                'West', ''CA'',
                                NULL, 'NULL',
                                'USA', 'DEFAULT')}
```

STACK_BIN_NUM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks numerical a binning expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added, or remains unchanged, then a corresponding reverse expression is also updated, added, or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, {rexp} has the following form after stacking:

```
CASE WHEN ({expr}) < {val0} THEN '{bin0}'
      WHEN ({expr}) <= {val1} THEN '{bin1}'
      ...
      WHEN ({expr}) <= {valN} THEN '{binN}'
      WHEN ({expr}) IS NOT NULL THEN '{bin(N+1)}'
END
```

and {rexp} has the following form:

```
DECODE("{attr}", '{bin0}',      '({rev0})',
        '{bin1}',      '({rev0}; {rev1})',
        ...
        '{binN}',      '({rev(N-1)}; {revN})',
        '{bin(N+1)}', '({revN}; )',
        NULL,          'NULL')
```

where {revI} is the result of applying reverse expression to {valI}.

If {binI} and {binJ} are equal then the corresponding entries of the DECODE function above are merged into:

```
'{binI}', '({rev(I-1)}; {revI}), ({rev(J-1)}; {revJ})'
```

Note that reverse expression implicitly maps invalid bins to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (
  bin_table_name      IN      VARCHAR2,
  transform_list      IN/OUT  DM_TRANSFORMS,
  literal_flag        IN      BOOLEAN DEFAULT FALSE,
  bin_schema_name     IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–27 STACK_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table.

Table 39–27 (Cont.) STACK_BIN_NUM Procedure Parameters

Parameter	Description
transform_list	Stack definition.
literal_flag	Literal flag (See Usage Notes)
bin_schema_name	Schema of the bin definition table

Usage Notes

Literal flag indicates whether the values in {bin} are valid SQL literals. When the flag is set to TRUE the value of {bin} is used "as is" in the expression generation, otherwise it is converted into a valid text literal (surround by quotes and double the quotes inside). By default the flag is set to FALSE. One example when it can be set to TRUE is in cases when all {bin} are numbers. In that case the transformed column will remain numeric as opposed to textual (default behavior). For example, for the following xform definition:

```
COL      VAL BIN
-----
mycol    10 NULL
mycol    15 1
mycol    20 2
```

the following {expr} and {rexp} are generated when the flag is FALSE:

```
expr = CASE WHEN "mycol" < 10 THEN NULL
           WHEN "mycol" <= 15 THEN '1'
           WHEN "mycol" <= 20 THEN '2' END

rexp = DECODE("mycol", '1', '[10; 15]',
              '2', '[15; 20]',
              NULL, '( ; 10) OR (20; ) OR NULL')
```

and when the flag is set to TRUE:

```
expr = CASE WHEN "mycol" < 10 THEN NULL
           WHEN "mycol" <= 15 THEN 1
           WHEN "mycol" <= 20 THEN 2 END
rexp = DECODE("mycol", 1, '[10; 15]',
              2, '[15; 20]',
              NULL, '( ; 10) OR (20; ) OR NULL')
```

Examples

Given transformation definition:

```
{col = COL1, val = 0, bin = NULL}
{col = COL1, val = 1, bin = A}
{col = COL1, val = 2, bin = B}
{col = COL1, val = 3, bin = A}
{col = COL2, val = 10, bin = NULL}
{col = COL2, val = 15, bin = 1}
{col = COL2, val = 20, bin = 2}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
  expr = CASE WHEN (log(10, COL1)) < 0 THEN NULL
              WHEN (log(10, COL1)) <= 1 THEN 'A'
              WHEN (log(10, COL1)) <= 2 THEN 'B'
              WHEN (log(10, COL1)) <= 3 THEN 'A' END,
  rexp = DECODE("COL1", 'A', '[1; 10)', [100; 1000]',
               'B', '[10; 100)',
               NULL, '( ; 1), (1000; ), NULL')})

{attr = COL3,
  expr = ln(COL3),
  rexp = exp(COL3)}

{attr = COL2,
  expr = CASE WHEN "COL2" < 10 THEN NULL
              WHEN "COL2" <= 15 THEN '1'
              WHEN "COL2" <= 20 THEN '2' END
  rexp = DECODE("COL2", '1', '[10; 15)',
               '2', '[15; 20]',
               NULL, '( ; 10) OR (20; ) OR NULL')})
```

STACK_CLIP Procedure

For every column in the stack definition that has a matching entry in the transformation definition. Stacks clipping expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed.

Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When the reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
CASE WHEN {expr} < {lcut} THEN {lval}
      WHEN {expr} > {rcut} THEN {rval}
      ELSE {expr}
END
```

and {rexp} remains unchanged

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
  clip_table_name      VARCHAR2,
  xform_list           IN OUT NOCOPY TRANSFORM_LIST,
  clip_schema_name     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–28 STACK_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Clipping definition table
xform_list	Stack definition
clip_schema_list	Schema of the clipping definition table. If you do not specify a schema, you own schema is assumed.

Example

Given transformation definition:

```
{col = COL1, lcut = -1.5, lval = -1.5, rcut = 4.5, rval = 4.5}
{col = COL2, lcut = 0, lval = 0, rcut = 1, rval = 1}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
  expr = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
              WHEN log(10, COL1) > 4.5 THEN 4.5
              ELSE log(10, COL1)
          END,
  rexp = power(10, COL1)}
{attr = COL3,
  expr = ln(COL3),
  rexp = exp(COL3)}
{attr = COL2,
  expr = CASE WHEN COL2 < 0 THEN 0
              WHEN COL2 > 1 THEN 1
              ELSE COL2
          END,
  rexp = NULL}
```

STACK_COL_REM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks column removal expression (NULL expression) instead of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (with NULL expression).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as "{attr}" (identity function) or "VALUE" for nested columns.

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} and {rexp} are both changed to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (
    rem_table_name    IN      VARCHAR2,
    transform_list    IN/OUT  DM_TRANSFORMS,
    rem_schema_name   IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–29 STACK_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
transform_list	Stack definition
rem_schema_name	Schema of the column removal definition table.

Examples

Given transformation definition:

```
{col = COL1, att = NULL}
{col = COL2, att = NULL}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1, expr = NULL, rexp = NULL}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
{attr = COL2, expr = NULL, rexp = NULL}
```

STACK_MISS_CAT Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks categorical missing value treatment expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes). Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
NVL({expr}, {val})
```

and {rexp} remains unchanged.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
    miss_table_name      IN      VARCHAR2,
    transform_list       IN/OUT  DM_TRANSFORMS,
    miss_schema_name    IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–30 STACK_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the missing value definition table.
transform_list	Stack definition.
miss_schema_name	Schema of the missing value definition table.

Examples

Given transformation definition:

```
{col = COL1, val = 'ma'}
{col = COL2, val = 'CA'}
```

and stack definition:

```
{attr = COL1, expr = lower(COL1), rexp = initcap(COL1)}
{attr = COL3, expr = upper(COL3), rexp = initcap(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = NVL(lower(COL1), 'ma'),
 rexp = initcap(COL1)}
{attr = COL3,
 expr = upper(COL3),
```

```
    rexp = initcap(COL3)}  
{attr = COL2,  
  expr = NVL(COL2, 'CA'),  
  rexp = NULL}
```

STACK_MISS_NUM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, stacks numerical missing value treatment expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
NVL({expr}, {val})
```

and {rexp} remains unchanged

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (
    miss_table_name      IN          VARCHAR2,
    transform_list       IN/OUT     DM_TRANSFORMS,
    miss_schema_name     IN          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–31 STACK_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the missing value definition table.
transform_list	Stack definition.
miss_schema_name	Schema of the missing value definition table.

Examples

Given transformation definition:

```
{col = COL1, val = 4.5}
{col = COL2, val = 0}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = NVL(log(10, COL1), 4.5),
 rexp = power(10, COL1)}
{attr = COL3,
 expr = ln(COL3),
```

```
    rexp = exp(COL3)}  
{attr = COL2,  
  expr = NVL(COL2, 0),  
  rexp = NULL}
```

STACK_NORM_LIN Procedure

For every column in the stack definition that has a matching entry in the transformation definition, stacks linear normalization expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

$$(\{expr\} - \{shift\}) / \{scale\}$$

and {rexp} maintains the following form with every occurrence of {attr} replaced with:

$$\{attr\} * \{scale\} + \{shift\}$$

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
  norm_table_name      IN      VARCHAR2,
  transform_list       IN/OUT  DM_TRANSFORMS,
  norm_schema_name     IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–32 STACK_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the linear normalization definition table.
transform_list	Stack definition.
norm_schema_name	Schema of the linear normalization definition table.

Examples

Given transformation definition:

```
{col = COL1, shift = -1.5, scale = 20}
{col = COL2, shift = 0, scale = 10}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = (log(10, COL1) - (-1.5)) / 20,
 rexp = power(10, COL1*20 + (-1.5))}
```

```
{attr = COL3,  
  expr = ln(COL3),  
  rexp = exp(COL3)}  
{attr = COL2,  
  expr = (COL2 - 0) / 10,  
  rexp = COL2*10 + 0}
```

XFORM_BIN_CAT Procedure

This procedure creates the view that performs categorical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–33 XFORM_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorized binning definition table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_CAT and populated with bin definitions by INSERT_BIN_CAT_FREQ is used to guide the query generation process to construct categorical binning expressions of the following form:

```
DECODE("col", val_1, bin_1,
        ...
        val_N, bin_N,
        NULL, NULL,
        bin_(N+1)) "col"
```

This expression maps values `val_1, ..., val_N` into `N` bins `bin_1, ..., bin_N`, and other values into `bin_(N+1)`, while `NULL` values remain unchanged. `bin_(N+1)` is optional. If not specified, it defaults to `NULL`. To specify `bin_(N+1)` provide a row with `val` set to `NULL`.

The `literal_flag` parameter indicates whether the values in bin are valid SQL literals. When the flag is set to `TRUE`, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to `FALSE`. One example of when it can be set to `TRUE` is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Set `literal_flag` to `TRUE` when the data is binned for an O-Cluster model build.

The `col` parameter is case-sensitive since it generates quoted identifiers. In cases when there are multiple entries with the same `col, val` combination with different `bin`, the behavior is undefined — any one of the `bin` values might be used.

Examples

Example 1. `bin_cat` contains four rows with `col = 'mycol'`:

```
{col = 'mycol', val = 'Waltham',      bin = 'MA'}
{col = 'mycol', val = 'Burlington',   bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
{col = 'mycol', val = NULL,           bin = 'OTHER'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',      'MA',
              'Burlington',    'MA',
              'Redwood Shores', 'CA',
              NULL,            NULL,
              'OTHER') "mycol"
```

Example 2. `bin_cat` contains three rows with `col = 'mycol'`:

```
{col = 'mycol', val = 'Waltham',      bin = 'MA'}
{col = 'mycol', val = 'Burlington',   bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',      'MA',
              'Burlington',    'MA',
              'Redwood Shores', 'CA') "mycol"
```

Example 3. For the definition:

```
COL  VAL          BIN
-----
mycol Waltham      1
mycol Burlington  1
mycol Redwood Shores 2
```

the following expression is generated when the `literal` flag is set to `FALSE`:

```
DECODE ("mycol", 'Waltham',      '1',
              'Burlington'     '1',
              'Redwood Shores', '2') "mycol"
```

and when the flag is set to `TRUE`:

```
DECODE("mycol", 'Waltham',      1,
              'Burlington',     1,
              'Redwood Shores', 2) "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on bin definitions in the `cat_bin_table`.

```
BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT(
'cat_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_BIN_NUM Procedure

This procedure creates the view that performs numerical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
    bin_table_name      IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    xform_view_name     IN VARCHAR2,
    literal_flag        IN BOOLEAN DEFAULT FALSE,
    bin_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL,
    xform_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–34 XFORM_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_NUM and populated with bin definitions by INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE is used to guide the query generation process to construct numerical binning expressions of the following form:

```
CASE WHEN "col" < val_0 THEN 'bin0_0'
      WHEN "col" <= val_1 THEN 'bin_1'
      ...
      WHEN "col" <= val_N THEN 'bin_N'
      WHEN "col" IS NOT NULL THEN 'bin_(N+1)'
END "col"
```

This expression maps values in the range [val_0;val_N] into N bins bin_1,..., bin_N, values outside of this range into bin_0 or bin_(N+1), such that

```
(-inf; val_0) -> bin_0
[val_0; val_1) -> bin_1
...
(val_(N-1); val_N] -> bin_N
(val_N; +inf) -> bin_(N+1)
```

NULL values remain unchanged. `bin_(N+1)` is optional. If it is not specified, the values ("`col`" > `val_N`) are mapped to NULL. To specify `bin_(N+1)`, provide a row with `val` set to NULL. The order of the WHEN... THEN pairs is based on the ascending order of `val` for a given `col`.

The `literal_flag` parameter indicates whether the values in `bin` are valid SQL literals. When the flag is set to TRUE, the value of `bin` is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all `bin` are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that `col` is case-sensitive since it generates quoted identifiers. In cases where there are multiple entries with the same `col, val` combination with different `bin`, the behavior is undefined — any one of the `bin` values might be used.

Examples

Example 1. `bin_num` contains four rows with `col = 'mycol'`:

```
{col = 'mycol', val = 15.5, bin = 'small'}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
{col = 'mycol', val = NULL, bin = 'huge'}
```

the following expression is generated:

```
CASE WHEN "mycol" < 10      THEN 'tiny'
      WHEN "mycol" <= 15.5 THEN 'small'
      WHEN "mycol" <= 20   THEN 'large'
      WHEN "mycol" IS NOT NULL THEN 'huge'
END "mycol"
```

Example 2. `bin_num` contains three rows with `col = 'mycol'`:

```
{col = 'mycol', val = 15.5, bin = NULL}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
```

the following expression is generated:

```
CASE WHEN "mycol" < 10      THEN NULL
      WHEN "mycol" <= 15.5 THEN 'small'
      WHEN "mycol" <= 20   THEN 'large'
END "mycol"
```

Example 3. For the definition:

```
COL  VAL  BIN
----  -
mycol  10  NULL
mycol  15.5  1
mycol  21  2
```

the following expression is generated when the `literal_flag` is set to FALSE:

```
CASE WHEN "mycol" < 10      THEN NULL
      WHEN "mycol" <= 15.5 THEN '1'
      WHEN "mycol" <= 20   THEN '2'
END "mycol"
```

and when the flag is set to TRUE:

```
CASE WHEN "mycol" < 10 THEN NULL
      WHEN "mycol" <= 15.5 THEN 1
      WHEN "mycol" <= 20 THEN 2
      END "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on transform definitions in bin definitions in the `num_bin_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM(
    'num_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
  clip_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  clip_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2,DEFAULT NULL,
  xform_schema_name    IN VARCHAR2,DEFAULT NULL;
```

Parameters

Table 39–35 XFORM_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```
CASE WHEN "col" < lcut THEN lval
      WHEN "col" > rcut THEN rval
      ELSE "col"
END "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

Example 1 (Winsorizing). When col = 'my_col', lcut = -1.5, lval = -1.5, and rcut = 4.5 and rval = 4.5, the following expression is generated:

```
CASE WHEN "my_col" < -1.5 THEN -1.5
      WHEN "my_col" > 4.5 THEN 4.5
      ELSE "my_col"
END "my_col"
```

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in clipping definitions in the `clip_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP(
    'clip_table', 'build_table', 'build_view');
END;
```

XFORM_COL_REM Procedure

This procedure creates a view that removes columns from the data table. Only the columns that are specified in the transform definition are removed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (  
    rem_table_name    IN      VARCHAR2,  
    data_table_name   IN      VARCHAR2,  
    xform_view_name   IN      VARCHAR2,  
    rem_schema_name   IN      VARCHAR2 DEFAULT NULL,  
    data_schema_name  IN      VARCHAR2 DEFAULT NULL,  
    xform_schema_name IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–36 XFORM_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
rem_schema_name	Schema of the column removal definition table.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transforming view.

XFORM_EXPR_NUM Procedure

Creates a view that applies a given expression for every NUMBER column in the data table that is not in the exclusion list and in the inclusion list. The remaining columns do not change.

Expressions are constructed from the expression pattern by replacing every occurrence of the column pattern with an actual column name.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
    expr_pattern      IN      VARCHAR2,
    data_table_name  IN      VARCHAR2,
    xform_view_name  IN      VARCHAR2,
    exclude_list     IN      COLUMN_LIST DEFAULT NULL,
    include_list     IN      COLUMN_LIST DEFAULT NULL,
    col_pattern      IN      VARCHAR2 DEFAULT ':col',
    data_schema_name IN      VARCHAR2 DEFAULT NULL,
    xform_schema_name IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39-37 XFORM_EXPR_NUM Procedure Parameters

Parameter	Description
expr_pattern	Expression pattern
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
exclude_list	List of columns to exclude.
include_list	List of columns to include.
col_pattern	Column pattern.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

Examples

1. For a table TAB with two NUMBER columns CN1, CN3 and one CHAR columns CC2 and expression pattern TO_CHAR(:col), the following query is generated:

```
SELECT TO_CHAR("CN1") "CN1", "CC2", TO_CHAR("CN3") "CN3"
FROM TAB
```

2. This procedure can be used for clipping (winsorizing) normalized data to a [0..1] range, that is values $x > 1$ become 1 and values $x < 0$ become 0.

For the table in example 1 and pattern

```
CASE WHEN :col < 0 THEN 0 WHEN :col > 1 THEN 1 ELSE :col END
```

the following query is generated:

```
SELECT CASE WHEN "CN1" < 0 THEN 0 WHEN "CN1" > 1 THEN 1
         ELSE "CN1" END "CN1",
       "CC2",
       CASE WHEN "CN3" < 0 THEN 0 WHEN "CN3" > 1 THEN 1
```

```
        ELSE "CN3" END "CN3"  
FROM TAB
```

XFORM_EXPR_STR Procedure

This procedure creates a view that applies a given expression for every VARCHAR2 or CHAR column in the data table that is not in the exclusion list and in the inclusion list. The remaining columns do not change.

Similar to `xform_expr_num`, except that it applies to CHAR and VARCHAR2 columns instead of NUMBER. See "[XFORM_EXPR_NUM Procedure](#)" on page 39-63

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (
    expr_pattern      IN      VARCHAR2,
    data_table_name  IN      VARCHAR2,
    xform_view_name  IN      VARCHAR2,
    exclude_list     IN      COLUMN_LIST DEFAULT NULL,
    include_list     IN      COLUMN_LIST DEFAULT NULL,
    col_pattern      IN      VARCHAR2 DEFAULT ':col',
    data_schema_name IN      VARCHAR2 DEFAULT NULL,
    xform_schema_name IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39-38 XFORM_EXPR_STR Procedure Parameters

Parameter	Description
<code>expr_pattern</code>	Expression pattern
<code>data_table_name</code>	Name of the table containing the data.
<code>xform_view_name</code>	View representing the transformed output.
<code>exclude_list</code>	List of columns to exclude.
<code>include_list</code>	List of columns to include.
<code>col_pattern</code>	Column pattern.
<code>data_schema_name</code>	Schema of the data table.
<code>xform_schema_name</code>	Schema of the transformation view.

XFORM_MISS_CAT Procedure

This procedure creates a view that performs categorical missing value treatment. Only the columns that are specified in the xform definition are treated; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
  miss_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  miss_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 39–39 XFORM_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The data type of the transformed columns is preserved by putting a CAST expression around the NVL function. For example, when col = 'state', val = 'MA' the data type is CHAR(2) the following expression is generated:

```
CAST (NVL("state", 'MA') AS CHAR(2)) "state"
```

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT(
    'miss_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_NUM Procedure

This procedure creates a view that performs numerical missing value treatment of the data table. Only the columns that are specified in the xform definition are treated, the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
  miss_table_name      IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  miss_schema_name     IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 39–40 XFORM_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table generated using CREATE_MISS_NUM
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in missing value definitions in `miss_table`.

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM(
    'miss_table', 'build_table', 'build_view');
END;
```

XFORM_NORM_LIN Procedure

This procedure creates the view that performs linear normalization. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
    norm_table_name      IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    xform_view_name      IN VARCHAR2,
    norm_schema_name     IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL,
    xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–41 XFORM_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The normalization table created by CREATE_NORM_LIN is populated with definitions by either INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX is used to guide the query generation process to construct normalization expressions of the following form:

```
("col" - shift)/scale "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

For example, when col = 'my_col', shift = -1.5, and scale = 20. The following expression is generated:

```
("my_col" - (-1.5))/20 "my_col"
```

Examples

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on normalization definitions in the norm_minmax_table.

```
BEGIN
```

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN(  
    'norm_minmax_table', 'build_table', 'build_view');  
END;
```

XFORM_STACK Procedure

Creates a view that performs transformation of the data table specified by the stack definition. Only the columns that are specified in the stack definition are transformed, the remaining columns do not change.

All columns in the stack definition are applied. Columns with NULL value in the expression field are excluded. Columns in the stack definition that do not have a matching column in the data are added to the view.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (  
    transform_list      IN      DM_TRANSFORMS,  
    data_table_name     IN      VARCHAR2,  
    xform_view_name     IN      VARCHAR2,  
    data_schema_name    IN      VARCHAR2 DEFAULT NULL,  
    xform_schema_name   IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–42 XFORM_STACK Procedure Parameters

Parameter	Description
transform_list	Stack definition.
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

DBMS_DATAPUMP

The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

See Also: *Oracle Database Utilities* for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- [Using DBMS_DATAPUMP](#)
 - Overview
 - Security Model
 - Constants
- [Data Structures](#)
 - Data Structures - Object Types
- [Summary of DBMS_DATAPUMP Subprograms](#)

Using DBMS_DATAPUMP

This section contains topics that relate to using the DBMS_DATAPUMP package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)

Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and datatypes existing in Oracle Database 11g are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The existing EXP_FULL_DATABASE and IMP_FULL_DATABASE roles will be used to allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

EXP_FULL_DATABASE

The EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the EXP_FULL_DATABASE role will also grant access to the SYS schema.

IMP_FULL_DATABASE

The IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the IMP_FULL_DATABASE role will also grant access to the SYS schema.

Constants

There are several public constants defined for use with the `DBMS_DATAPUMP.GET_STATUS` procedure. All such constants are defined as part of the `DBMS_DATAPUMP` package. Any references to these constants must be prefixed by `DBMS_DATAPUMP.` and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_STATUS_WIP` `CONSTANT BINARY_INTEGER := 1;`
- `KU$_STATUS_JOB_DESC` `CONSTANT BINARY_INTEGER := 2;`
- `KU$_STATUS_JOB_STATUS` `CONSTANT BINARY_INTEGER := 4;`
- `KU$_STATUS_JOB_ERROR` `CONSTANT BINARY_INTEGER := 8;`

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the `DBMS_DATAPUMP.GET_STATUS` procedure.

- `KU$_DUMPFILE_TYPE_DISK` `CONSTANT BINARY_INTEGER := 0;`
- `KU$_DUMPFILE_TYPE_TEMPLATE` `CONSTANT BINARY_INTEGER := 3;`

Data Structures

The `DBMS_DATAPUMP` package defines OBJECT types. The types described in this section are defined in the `SYS` schema for use by the `GET_STATUS` function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the `GET_STATUS` procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10g, release 1 (10.1), there is a `sys.ku$_Status1010` type, and in the next Oracle Database release, there could be a `sys.ku$_Status1110` type defined. Both types could be used with the `GET_STATUS` procedure.

Public synonyms have been defined for each of the types used with the `GET_STATUS` procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym `ku$_Status1010` is defined for the `sys.ku$_Status1010` type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10g, release 1, the generic synonym `ku$_Status` is defined as `ku$_Status1010`. In a future release, there might be a `ku$_Status1110` synonym for `sys.ku$Status1110`. Because the `ku$_Status` generic synonym always points to the latest definition, it would now point to `ku$_Status1110` rather than to `ku$_Status1010`.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

Note: Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

See Also: [GET_STATUS Procedure](#) on page 40-26 for additional information about how types are used

Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- [Worker Status Types](#)
- [Log Entry and Error Types](#)
- [Job Status Types](#)
- [Job Description Types](#)
- [Status Types](#)

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The `percent_done` refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$WorkerStatus1010 AS OBJECT (
    worker_number    NUMBER,
    process_name     VARCHAR2(30),
    state            VARCHAR2(30),
    schema           VARCHAR2(30),
    name             VARCHAR2(4000),
    object_type      VARCHAR2(200),
    partition        VARCHAR2(30),
    completed_objects NUMBER,
    total_objects   NUMBER,
    completed_rows  NUMBER,
    completed_bytes NUMBER,
    percent_done    NUMBER)

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1010
FOR sys.ku$WorkerStatus1010;

CREATE TYPE sys.ku$WorkerStatus1020 AS OBJECT (
    worker_number    NUMBER,          -- Worker process identifier
    process_name     VARCHAR2(30),    -- Worker process name
    state            VARCHAR2(30),    -- Worker process state
    schema           VARCHAR2(30),    -- Schema name
    name             VARCHAR2(4000),  -- Object name
    object_type      VARCHAR2(200),  -- Object type
    partition        VARCHAR2(30),    -- Partition name
    completed_objects NUMBER,        -- Completed number of objects
    total_objects   NUMBER,          -- Total number of objects
    completed_rows  NUMBER,          -- Number of rows completed
    completed_bytes NUMBER,          -- Number of bytes completed
    percent_done    NUMBER,          -- Percent done current object
    degree          NUMBER            -- Degree of parallelism)

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus1020
FOR sys.ku$WorkerStatus1020;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatus FOR ku$WorkerStatus1020;

CREATE TYPE sys.ku$WorkerStatusList1010 AS TABLE OF sys.ku$WorkerStatus1010

CREATE TYPE sys.ku$WorkerStatusList1020 AS TABLE OF sys.ku$WorkerStatus1020

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatusList1010
  FOR sys.ku$WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatusList1020
  FOR sys.ku$WorkerStatusList1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$WorkerStatusList
  FOR ku$WorkerStatusList1020;
```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```
CREATE TYPE sys.ku$LogLine1010 AS OBJECT (
    logLineNumber    NUMBER,
    errorNumber      NUMBER,
    LogText          VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$LogLine1010 FOR sys.ku$LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$LogLine1020 FOR sys.ku$LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$LogLine FOR ku$LogLine1010;
CREATE TYPE sys.ku$LogEntry1010 AS TABLE OF sys.ku$LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$LogEntry1010 FOR sys.ku$LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$LogEntry1020 FOR sys.ku$LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$LogEntry FOR ku$LogEntry1010;
```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```
CREATE TYPE sys.ku$DumpFile1010 IS OBJECT (
    file_name        VARCHAR2(4000), -- Fully-qualified name
    file_type        NUMBER,         -- 0=Disk, 1=Pipe, etc.
    file_size        NUMBER,         -- Its length in bytes
    file_bytes_written NUMBER        -- Bytes written so far)

CREATE OR REPLACE PUBLIC SYNONYM ku$DumpFile1010 FOR sys.ku$DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$DumpFile1020 FOR sys.ku$DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$DumpFile FOR ku$DumpFile1010;

CREATE TYPE sys.ku$DumpFileSet1010 AS TABLE OF sys.ku$DumpFile1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$DumpFileSet1010 FOR
  sys.ku$DumpFileSet1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$DumpFileSet1020 FOR
```

```

sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
    job_name          VARCHAR2(30),
    operation         VARCHAR2(30),
    job_mode          VARCHAR2(30),
    bytes_processed   NUMBER,
    percent_done      NUMBER,
    degree            NUMBER,
    error_count       NUMBER,
    state             VARCHAR2(30),
    phase             NUMBER,
    restart_count     NUMBER,
    worker_status_list ku$_WorkerStatusList1010,
    files             ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR
    sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (
    job_name          VARCHAR2(30),           -- Name of the job
    operation         VARCHAR2(30),           -- Current operation
    job_mode          VARCHAR2(30),           -- Current mode
    bytes_processed   NUMBER,                -- Bytes so far
    total_bytes       NUMBER,                -- Total bytes for job
    percent_done      NUMBER,                -- Percent done
    degree            NUMBER,                -- Of job parallelism
    error_count       NUMBER,                -- #errors so far
    state             VARCHAR2(30),           -- Current job state
    phase             NUMBER,                -- Job phase
    restart_count     NUMBER,                -- #Job restarts
    worker_status_list ku$_WorkerStatusList1020, -- job worker processes
    files             ku$_DumpFileSet1010    -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;

```

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```

CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (
    param_name       VARCHAR2(30),
    param_op         VARCHAR2(30),
    param_type       VARCHAR2(30),
    param_length     NUMBER,
    param_value_n    NUMBER,
    param_value_t    VARCHAR2(4000));

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1010 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1020 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue FOR ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;

```

```

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1010 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1020 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues FOR ku$_ParamValues1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT (
  job_name      VARCHAR2(30),
  guid          RAW(16),
  operation     VARCHAR2(30),
  job_mode     VARCHAR2(30),
  remote_link  VARCHAR2(4000),
  owner        VARCHAR2(30),
  instance     VARCHAR2(16),
  db_version   VARCHAR2(30),
  creator_privs VARCHAR2(30),
  start_time   DATE,
  max_degree   NUMBER,
  log_file     VARCHAR2(4000),
  sql_file     VARCHAR2(4000),
  params       ku$_ParamValues1010)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT (
  job_name      VARCHAR2(30),      -- The job name
  guid          RAW(16),          -- The job GUID
  operation     VARCHAR2(30),      -- Current operation
  job_mode     VARCHAR2(30),      -- Current mode
  remote_link  VARCHAR2(4000),    -- DB link, if any

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_JobDesc1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;

```

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the GET_STATUS call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the `ku$_LogEntry` that is returned has already had its log lines ordered for proper output. That is, the original `ku$_LogEntry` objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
  mask NUMBER,          /* Indicates which status types are present*/
  wip ku$_LogEntry1010, /* Work-In-Progress: std. exp/imp msgs */
  job_description ku$_JobDesc1010, /* Complete job description */
  job_status ku$_JobStatus1010, /* Detailed job status + per-worker sts */
  error ku$_LogEntry1010 /* Multi-level contextual errors */
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
(
  mask NUMBER,          -- Status types present
  wip ku$_LogEntry1010, -- Work in progress
  job_description ku$_JobDesc1020, -- Complete job description
  job_status ku$_JobStatus1020, -- Detailed job status
  error ku$_LogEntry1010 -- Multi-level context errors
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```

Summary of DBMS_DATAPUMP Subprograms

Table 40–1 DBMS_DATAPUMP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 40-13	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure
ATTACH Function on page 40-16	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
DATA_FILTER Procedures on page 40-18	Specifies restrictions on the rows that are to be retrieved
DETACH Procedure on page 40-23	Specifies that the user has no further interest in using the handle
GET_DUMPFILE_INFO Procedure on page 40-24	Retrieves information about a specified dump file.
GET_STATUS Procedure on page 40-26	Monitors the status of a job or waits for the completion of a job or for more details on API errors
LOG_ENTRY Procedure on page 40-29	Inserts a message into the log file
METADATA_FILTER Procedure on page 40-30	Provides filters that allow you to restrict the items that are included in a job
METADATA_REMAP Procedure on page 40-33	Specifies a remapping to be applied to objects as they are processed in the specified job
METADATA_TRANSFORM Procedure on page 40-36	Specifies transformations to be applied to objects as they are processed in the specified job
OPEN Function on page 40-39	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures except ATTACH
SET_PARALLEL Procedure on page 40-42	Adjusts the degree of parallelism within a job
SET_PARAMETER Procedures on page 40-44	Specifies job-processing options
START_JOB Procedure on page 40-53	Begins or resumes execution of a job
STOP_JOB Procedure on page 40-55	Terminates a job, but optionally, preserves the state of the job
WAIT_FOR_JOB Procedure on page 40-57	Runs a job until it either completes normally or stops for some other reason.

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
    handle      IN NUMBER,
    filename    IN VARCHAR2,
    directory   IN VARCHAR2,
    filesize    IN VARCHAR2 DEFAULT NULL,
    filetype    IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE),
reusefile     IN NUMBER DEFAULT NULL;
```

Parameters

Table 40–2 ADD_FILE Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
filename	The name of the file being added. <code>filename</code> must be a simple filename without any directory path information. For dump files, the <code>filename</code> can include a substitution variable, <code>%U</code> , which indicates that multiple files may be generated with the specified <code>filename</code> as a template. The <code>%U</code> is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of <code>export%U</code> would cause <code>export01</code> , <code>export02</code> , <code>export03</code> , and so on, to be created depending on how many files are needed to perform the export. For filenames containing the <code>%</code> character, the <code>%</code> must be represented as <code>%%</code> to avoid ambiguity. Any <code>%</code> in a filename must be followed by either a <code>%</code> or a <code>U</code> .
directory	The name of a directory object within the database that is used to locate <code>filename</code> . A <code>directory</code> must be specified. See the Data Pump Export chapter in <i>Oracle Database Utilities</i> for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, <code>filesize</code> will default to an unlimited size. For Import and SQL_FILE operations, <code>filesize</code> is ignored. The minimum value for <code>filesize</code> is ten times the default Data Pump block size, which is 4 kilobytes. <code>filesize</code> may only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by <code>DBMS_DATAPUMP.:</code> <ul style="list-style-type: none"> ▪ <code>KU\$_FILE_TYPE_DUMP_FILE</code> (dump file for a job) ▪ <code>KU\$_FILE_TYPE_LOG_FILE</code> (log file for a job) ▪ <code>KU\$_FILE_TYPE_SQL_FILE</code> (output for SQL_FILE job)

Table 40–2 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
<code>reusefile</code>	If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The <code>reusefile</code> parameter is restricted to export jobs.

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. An invalid value was supplied for an input parameter.
- `INVALID_STATE`. The job is completing, or the job is past the defining state for an import or `SQL_FILE` job or is past the defining state for LOG and SQL files.
- `INVALID_OPERATION`. A dump file was specified for a Network Import or `ESTIMATE_ONLY` export operation.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a `SQL_FILE` operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and `SQL_FILE` operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and `reusefile` is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the `SET_PARALLEL` procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (`%U`) is included in a filename, multiple dump files may be specified through a single call to `ADD_FILE`. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current `SET_PARALLEL` value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple `ADD_FILES` with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if `expa%U`, `expb%U` and `expc%U` were all specified for a job having a parallelism of 6, the initial dump

files created would look like: `expa01`, `expb01`, `expc01`, `expa02`, `expb02`, and `expc02`.

- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, an Import or `SQL_FILE` operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

ATTACH Function

This function gains access to a previously-created job.

Syntax

```
DBMS_DATAPUMP.ATTACH(
  job_name      IN VARCHAR2 DEFAULT NULL,
  job_owner     IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 40–3 *ATTACH Function Parameters*

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the EXP_FULL_DATABASE role (for export operations) or the IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU\$_STATUS_WIP and KU\$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the `ATTACH` fails, use a null handle in a subsequent call to `GET_STATUS` for more information about the failure.

DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN VARCHAR2,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.DATA_FILTER(
    handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN CLOB,
    table_name  IN VARCHAR2 DEFAULT NULL,
    schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–4 DATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle that is returned from the OPEN procedure.
name	The name of the filter.
value	The value of the filter.
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

Exceptions

- **INVALID_ARGVAL.** There can be several reasons for this message:
 - A bad filter name is specified
 - The mode is `TRANSPORTABLE`, which does not support data filters
 - The specified table does not exist
 - The filter has already been set for the specified values of `schema_name` and `table_name`
- **INVALID_STATE.** The user called `DATA_FILTER` when the job was not in the Defining state.

- `INCONSISTENT_ARGS`. The `value` parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- `PRIVILEGE_ERROR`. A schema name was supplied, but the user did not have the `EXP_FULL_DATABASE` or `IMP_FULL_DATABASE` role.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple `SUBQUERY` filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the `INCLUDE_ROWS` filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in [Table 40-5](#).

Table 40-5 Data Filters

Name	Datatype	Operations that Support Filter	Description
<code>INCLUDE_ROWS</code>	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
<code>PARTITION_EXPR</code> <code>PARTITION_LIST</code>	text	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for <code>PARTITION_EXPR</code>) or are included in the list (for <code>PARTITION_LIST</code>). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. <code>PARTITION_EXPR</code> is not supported on jobs across a network link. Default=All partitions are processed.
<code>SAMPLE</code>	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.

Table 40–5 (Cont.) Data Filters

Name	Datatype	Operations that Support Filter	Description
SUBQUERY	text	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```
DBMS_DATAPUMP.DATA_REMAP (
  handle          IN NUMBER,
  name            IN VARCHAR2,
  table_name      IN VARCHAR2,
  column          IN VARCHAR2,
  remap_function  IN VARCHAR2),
  schema         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–6 DATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle of the current job. The current session must have previously attached to the handle through an OPEN call.
name	The name of the remap.
table_name	The table containing the column to be remapped.
column	The name of the column to be remapped.
remap_function	The meaning of remap_function is dependent upon the value of name. See Table 40–7 for a list of possible names.
schema	The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.

Exceptions

- **INVALID_ARGVAL.** The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- **INVALID_OPERATION.** Data remaps are only supported for Export and Import operations.
- **INVALID_STATE.** The DATA_REMAP procedure was called after the job started (that is, it was not in the defining state).
- **NO_SUCH_JOB.** The job handle is no longer valid.

Usage Notes

- The DATA_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is

consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

Note: If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in [Table 40-7](#).

Table 40-7 *Names of Data Remap Functions*

Name	Meaning of remap_ function	Meaning
COLUMN_FUNCTION	String having the format: [schema.]package.func tion	The name parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.

DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(
    handle IN NUMBER);
```

Parameters

Table 40–8 *DETACH Procedure Parameters*

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call.

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.

GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
  filename      IN VARCHAR2,
  directory     IN VARCHAR2,
  info_table    OUT ku$_dumpfile_info,
  filetype      OUT NUMBER);
```

Parameters

Table 40–9 GET_DUMPFILE_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information.
directory	A directory object that specifies where the file can be found.
info_table	A PL/SQL table for storing information about the dump file.
filetype	The type of file (Data Pump dump file, original Export dump file, or unknown).

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of zero will be returned and the dump file info_table will remain empty.

A filetype value of one indicates a Data Pump dump file. A file type value of two indicates an original Export dump file. In both cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
  item_code    NUMBER,          -- Identifies header item
  value        VARCHAR2(2048)  -- Text string value)
/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as follows (prepended with the package name, DBMS_DATAPUMP.):

KU\$DFHDR_FILE_VERSION	CONSTANT NUMBER := 1;
KU\$DFHDR_MASTER_PRESENT	CONSTANT NUMBER := 2;
KU\$DFHDR_GUID	CONSTANT NUMBER := 3;
KU\$DFHDR_FILE_NUMBER	CONSTANT NUMBER := 4;
KU\$DFHDR_CHARSET_ID	CONSTANT NUMBER := 5;
KU\$DFHDR_CREATION_DATE	CONSTANT NUMBER := 6;
KU\$DFHDR_FLAGS	CONSTANT NUMBER := 7;
KU\$DFHDR_JOB_NAME	CONSTANT NUMBER := 8;
KU\$DFHDR_PLATFORM	CONSTANT NUMBER := 9;
KU\$DFHDR_INSTANCE	CONSTANT NUMBER := 10;
KU\$DFHDR_LANGUAGE	CONSTANT NUMBER := 11;
KU\$DFHDR_BLOCKSIZE	CONSTANT NUMBER := 12;
KU\$DFHDR_DIRPATH	CONSTANT NUMBER := 13;
KU\$DFHDR_METADATA_COMPRESSED	CONSTANT NUMBER := 14;
KU\$DFHDR_DB_VERSION	CONSTANT NUMBER := 15;
KU\$DFHDR_MAX_ITEM_CODE	CONSTANT NUMBER := 20;
KU\$DFHDR_MASTER_PIECE_COUNT	CONSTANT NUMBER := 16;
KU\$DFHDR_MASTER_PIECE_NUMBER	CONSTANT NUMBER := 17;
KU\$DFHDR_DATA_COMPRESSED	CONSTANT NUMBER := 18;
KU\$DFHDR_METADATA_ENCRYPTED	CONSTANT NUMBER := 19;
KU\$DFHDR_DATA_ENCRYPTED	CONSTANT NUMBER := 20;

GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS (
  handle      IN NUMBER,
  mask        IN BINARY_INTEGER,
  timeout     IN NUMBER DEFAULT NULL,
  job_state   OUT VARCHAR2,
  status      OUT ku$_Status1010);
```

Parameters

Table 40–10 GET_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. A null handle can be used to retrieve error information after OPEN and ATTACH failures.
mask	A bit mask that indicates which of four types of information to return: <ul style="list-style-type: none"> ▪ KU\$_STATUS_WIP ▪ KU\$_STATUS_JOB_DESC ▪ KU\$_STATUS_JOB_STATUS ▪ KU\$_STATUS_JOB_ERROR Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 40-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU\$_STATUS_WIP or KU\$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku\$_Status structure.
status	A ku\$_Status is returned. The ku\$_Status mask indicates what kind of information is included. This could be none if only KU\$_STATUS_WIP or KU\$_STATUS_JOB_ERROR information is requested and the timeout period expires. This can be a ku\$_Status1010 or ku\$_Status1020 object type.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The `GET_STATUS` procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the `mask` parameter. The `KU$_STATUS_JOB_DESC` and `KU$_STATUS_JOB_STATUS` values are classified as synchronous information because the information resides in the master table. The `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the `job_state` returned by `GET_STATUS` does not indicate a terminating job, it is possible that the job could still terminate before the next call to `GET_STATUS`. This would result in an `INVALID_HANDLE` exception. Alternatively, the job could terminate during the call to `GET_STATUS`, which would result in a `NO_SUCH_JOB` exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the `GET_STATUS` procedure:

- Errors resulting from other procedure calls: For example, the `SET_PARAMETER` procedure may produce an `INCONSISTENT_ARGS` exception. The client should immediately call `GET_STATUS` with `mask=8` (errors) and `timeout=0`. The returned `ku$_Status.error` will contain a `ku$_LogEntry` that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be `Table already exists` when trying to create a table. The `ku$_Status.error` will contain a `ku$_LogEntry` with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to `GET_STATUS` with an infinite timeout (-1) "listening" for `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` messages. If status was requested, then `JOB_STATUS` information will also be in the request.

When the `ku$_Status` is interpreted, the following guidelines should be used:

- `ku$_Status.ku$_JobStatus.percent_done` refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
 - `EXPORT` or `network IMPORT`--(bytes_processed/estimated_bytes) * 100
 - `IMPORT`--(bytes_processed/total_expected_bytes) * 100
 - `SQL_FILE` or `estimate-only EXPORT`--0.00 if not done or 100.00 if done

The effects of the `QUERY` and `PARTITION_EXPR` data filters are not considered in computing `percent_done`.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

```
((SYSDATE - start time) / ku$_Status.ku$_JobStatus.percent_done) * 100
```

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY (
    handle          IN NUMBER,
    message         IN VARCHAR2,
    log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

Table 40–11 LOG_ENTRY Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
message	A text line to be added to the log file.
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU\$STATUS_WIP) messages.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If `log_file_only` is zero (the default), the message is also broadcast as a `KU$STATUS_WIP` message through the `GET_STATUS` procedure to all users attached to the job.

The `LOG_ENTRY` procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports `INCLUDE` and `EXCLUDE` parameters defined by the user. Identifying these values as calls to the underlying `METADATA_FILTER` procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the `INCLUDE` and `EXCLUDE` parameters.

Lines entered in the log stream from `LOG_ENTRY` are prefixed by the string, " ; ; ; "

METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_FILTER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN CLOB,
  object_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–12 METADATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from the OPEN procedure.
name	The name of the filter. See Table 40–13 for descriptions of the available filters.
value	The value of the filter.
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

[Table 40–13](#) describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 40–13 Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
NAME_EXPR	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type.
NAME_LIST		For Table mode, identifies which tables are to be processed.

Table 40–13 (Cont.) Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (' SCOTT ')'). For Schema mode, identifies which users are to be processed.
TABLESPACE_EXPR TABLESPACE_LIST	TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_PATH_EXPR INCLUDE_PATH_LIST EXCLUDE_PATH_EXPR EXCLUDE_PATH_LIST	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
 - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
 - The specified object_path is not supported for the current mode.
 - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter,

grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:

- NAME_EXPR
- SCHEMA_EXPR
- TABLESPACE_EXPR
- INCLUDE_PATH_EXPR
- EXCLUDE_PATH_EXPR

The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:

- NAME_LIST
- SCHEMA_LIST
- TABLESPACE_LIST
- INCLUDE_PATH_LIST
- EXCLUDE_PATH_LIST

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying NAME_EXPR as '!='EMP'' and NAME_EXPR as '!='DEPT'' on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.

METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  old_value   IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–14 METADATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the remap. See Table 40–15 for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value.
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

[Table 40–15](#) describes the remaps provided by the METADATA_REMAP procedure.

Table 40–15 Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	Text	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE 's objects to SCOTT, but SCOTT cannot remap SCOTT 's objects to BLAKE.

Table 40–15 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_ TABLESPACE	Text	TABLE, INDEX, ROLLBACK_ SEGMENT, MATERIALIZED_ VIEW, MATERIALIZED_ VIEW_ LOG, TABLE_ SPACE	Any storage segment in the job that matches the <code>object_type</code> parameter and was located in the <code>old_value</code> tablespace will be relocated to the <code>value</code> tablespace.
REMAP_ DATAFILE	Text	LIBRARY, TABLESPACE, DIRECTORY	Any datafile reference in the job that matches the <code>object_type</code> parameter and referenced the <code>old_value</code> datafile will be redefined to use the <code>value</code> datafile.
REMAP_TABLE	Text	TABLE	Any reference to a table in the job that matches the <code>old_value</code> table name will be replaced with the <code>value</code> table name. The <code>old_value</code> parameter may refer to a partition such as <code>employees.low</code> . This allows names for tables constructed the by <code>PARTITION_OPTIONS=DEPARTITION</code> parameter to be specified by the user.

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_ARGVAL`. This message can indicate any of the following:
 - The job's mode does not include the specified `object_type`.
 - The remap has already been specified for the specified `old_value` and `object_type`.
- `INVALID_OPERATION`. Remaps are only supported for `SQL_FILE` and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- `INVALID_STATE`. The user called `METADATA_REMAP` after the job had started (that is, the job was not in the defining state).
- `INCONSISTENT_ARGS`. There was no `value` supplied or it was of the wrong datatype for the remap.
- `PRIVILEGE_ERROR`. A nonprivileged user attempted to do a `REMAP_SCHEMA` to a different user's schema or a `REMAP_DATAFILE`.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `METADATA_REMAP` procedure is only supported for Import and `SQL_FILE` operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary `SQL_FILE` operation to produce a SQL script corresponding to the dump file set. By editing

the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according to its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER,
  object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 40–16 METADATA_TRANSFORM Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the transformation. See Table 40–17 for descriptions of the available transforms.
value	The value of the parameter for the transform.
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

[Table 40–17](#) describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 40–17 Transforms Provided by the METADATA_TRANSFORM Procedure

Name	Datatype	Object Type	Meaning
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.
SEGMENT_ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters. Defaults to 1.

Table 40–17 (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

Name	Datatype	Object Type	Meaning
STORAGE	NUMBER	TABLE	If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).
OID	NUMBER	TYPE TABLE	If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
 - The mode is transportable, which doesn't support transforms.
 - The job's mode does not include the specified object_type.
 - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique

according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures except ATTACH.

Syntax

```
DBMS_DATAPUMP.OPEN (
  operation      IN VARCHAR2,
  mode           IN VARCHAR2,
  remote_link    IN VARCHAR2 DEFAULT NULL,
  job_name       IN VARCHAR2 DEFAULT NULL,
  version        IN VARCHAR2 DEFAULT 'COMPATIBLE'
)
RETURN NUMBER;
```

Parameters

Table 40–18 OPEN Function Parameters

Parameter	Meaning
operation	The type of operation to be performed. Table 40–19 contains descriptions of valid operation types.
mode	The scope of the operation to be performed. Table 40–20 contains descriptions of valid modes. Specifying NULL generates an error.
remote_link	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
job_name	<p>The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN procedure and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name).</p> <p>The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N".</p> <p>The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.</p>
version	<p>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <ul style="list-style-type: none"> ▪ COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V\$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. ▪ LATEST - the version of the metadata corresponds to the database version. ▪ A specific database version, for example, '10.0.0'. In Oracle Database10g, this value cannot be lower than 10.0.0.

[Table 40–19](#) describes the valid operation types for the OPEN Function.

Table 40–19 Valid Operation Types for the OPEN Function

Operation	Description
EXPORT	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
IMPORT	Restores data and metadata from a dump file set or across a database link.
SQL_FILE	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the <code>ADD_FILE</code> procedure.

Table 40–20 describes the valid modes for the `OPEN` procedure.

Table 40–20 Valid Modes for the OPEN Function

Mode	Description
FULL	Operates on the full database or full dump file set except for the <code>SYS</code> , <code>XDB</code> , <code>ORDSYS</code> , <code>MDSYS</code> , <code>CTXSYS</code> , <code>ORDPLUGINS</code> , and <code>LBACSYS</code> schemas.
SCHEMA	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify <code>SYS</code> , <code>XDB</code> , <code>ORDSYS</code> , <code>MDSYS</code> , <code>CTXSYS</code> , <code>ORDPLUGINS</code> , or <code>LBACSYS</code> schemas for this mode.
TABLE	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.
TABLESPACE	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
TRANSPORTABLE	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: `ADD_FILE`, `CREATE_JOB_VIEW`, `DATA_FILTER`, `DETACH`, `GET_STATUS`, `LOG_ENTRY`, `LOG_ERROR`, `METADATA_FILTER`, `METADATA_REMAP`, `METADATA_TRANSFORM`, `SET_PARALLEL`, `SET_PARAMETER`, `START_JOB`, `STOP_JOB`, and `WAIT_FOR_JOB`

Exceptions

- `INVALID_ARGVAL`. An invalid operation or mode was specified. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `JOB_EXISTS`. A table already exists with the specified job name.
- `PRIVILEGE_ERROR`. The user does not have the necessary privileges or roles to use the specified mode.
- `INTERNAL_ERROR`. The job was created under the wrong schema or the master table was of the wrong format.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.

- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the `ATTACH` procedure.
- If the `OPEN` fails, call `GET_STATUS` with a null handle to retrieve additional information about the failure.

SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
  handle      IN NUMBER,
  degree      IN NUMBER);
```

Parameters

Table 40–21 SET_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

Exceptions

- `INVALID_HANDLE`. The specified handle is not attached to a Data Pump job.
- `INVALID_OPERATION`. The `SET_PARALLEL` procedure is only valid for export and import operations.
- `INVALID_ARGVAL`. An invalid value was supplied for an input parameter.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `SET_PARALLEL` procedure is only available in the Enterprise Edition of the Oracle database.
- The `SET_PARALLEL` procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before `SET_PARALLEL` can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the `PROCESSES` or `SESSIONS` initialization parameters in the `init.ora` file.
- To parallelize an Export job to a degree of n , the user should supply n files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER(
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2);
```

```
DBMS_DATAPUMP.SET_PARAMETER (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER);
```

Parameters

Table 40–22 SET_PARAMETER Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN call.
name	The name of the parameter. Table 40–23 describes the valid parameter names.
value	The value for the specified parameter.

[Table 40–23](#) describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 40–23 Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_COMMAND	Text	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
COMPRESSION	Text	Export	<p>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations.</p> <p>The DATA_ONLY option compresses only user data in the dump file set.</p> <p>The METADATA_ONLY option compresses only metadata in the dump file set.</p> <p>The ALL option compresses both user data and metadata.</p> <p>The NONE option stores the dump file set in an uncompressed format.</p> <p>The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later.</p> <p>Default=METADATA_ONLY</p>
DATA_OPTIONS	Number	Export and Import	<p>A bitmask to supply special options for processing the job. The supported values are as follows:</p> <ul style="list-style-type: none"> ■ KU\$_DATAOPT_SKIP_CONST_ERR CONSTANT NUMBER := 1; ■ KU\$_DATAOPT_XMLTYPE_CLOB CONSTANT NUMBER := 2; <p>Export supports the value KU\$_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file as CLOBs rather than as XML documents.</p> <p>Import supports the value KU\$_DATAOPT_SKIP_CONST_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints.</p> <p>Use of this parameter requires that the version on the OPEN procedure be set to 11.1 or later.</p> <p>Default=0</p>

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION	Text	Export	<p>Specifies what to encrypt in the dump file set, as follows:</p> <p>ALL enables encryption for all data and metadata in the export operation.</p> <p>DATA_ONLY specifies that only data is written to the dump file set in encrypted format.</p> <p>ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format.</p> <p>METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format.</p> <p>NONE specifies that no data is written to the dump file set in encrypted format.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE.</p> <p>To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1.</p> <p>NOTE: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.</p>
ENCRYPTION_ALGORITHM	Text	Export	<p>Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256.</p> <p>The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See <i>Oracle Database Advanced Security Administrator's Guide</i> for information about encryption algorithms.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>Default=AES128</p>

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_MODE	Text	Export	<p>Identifies the types of security used for encryption and decryption. The values are as follows:</p> <p>PASSWORD requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit.</p> <p>TRANSPARENT allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported.</p> <p>DUAL creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported onsite using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available.</p> <p>When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned.</p> <p>To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1.</p> <p>The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.</p>

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_PASSWORD	Text	Export and Import	<p>Specifies a key for re-encrypting encrypted table columns, metadata, or table data so that they are not written as clear text in the dump file set. If the export operation involves encrypted table columns, but an encryption password is not supplied, then the encrypted columns will be written to the dump file set as clear text and a warning will be issued.</p> <p>NOTE: Data Pump encryption functionality has changed as of Oracle Database 11g release 1 (11.1). Prior to release 11.1, the ENCRYPTION_PASSWORD parameter applied only to encrypted columns. However, as of release 11.1, the new ENCRYPTION parameter provides options for encrypting other types of data. This means that if you now specify ENCRYPTION_PASSWORD without also specifying ENCRYPTION and a specific option, then <i>all</i> data written to the dump file will be encrypted (equivalent to specifying ENCRYPTION=ALL). If you want to re-encrypt <i>only</i> encrypted columns, you must now specify ENCRYPTION=ENCRYPTED_COLUMNS_ONLY in addition to ENCRYPTION_PASSWORD.</p> <p>For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL.</p> <p>If ENCRYPTION_PASSWORD is specified but ENCRYPTION_MODE is not specified, then it is not necessary to have Transparent Data Encryption set up since ENCRYPTION_MODE will default to PASSWORD.</p> <p>The ENCRYPTION_PASSWORD parameter is not valid if the requested encryption mode is TRANSPARENT.</p> <p>To use the ENCRYPTION_PASSWORD parameter if ENCRYPTION_MODE is set to DUAL, you must have Transparent Data Encryption set up. See <i>Oracle Database Advanced Security Administrator's Guide</i> for more information about Transparent Data Encryption.</p> <p>For network exports, the ENCRYPTION_PASSWORD parameter in conjunction with ENCRYPTION=ENCRYPTED_COLUMNS_ONLY is not supported with user-defined external tables that have encrypted columns. The table will be skipped and an error message will be displayed, but the job will continue.</p> <p>Encryption attributes for all columns must match between the exported table definition and the target table.</p> <p>This parameter requires a job version of 10.2 or later.</p>

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ESTIMATE	Text	Export and Import	<p>Specifies that the estimate method for the size of the tables should be performed before starting the job.</p> <p>If <code>BLOCKS</code>, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables.</p> <p>If <code>STATISTICS</code>, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using <code>BLOCKS</code>.</p> <p>The <code>ESTIMATE</code> parameter cannot be used in Transportable Tablespace mode.</p> <p>Default=<code>BLOCKS</code>.</p>
ESTIMATE_ONLY	Number	Export	<p>Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.</p>
FLASHBACK_SCN	NUMBER	Export and network Import	<p>System change number (SCN) to serve as transactionally consistent point for reading user data. If neither <code>FLASHBACK_SCN</code> nor <code>FLASHBACK_TIME</code> is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. <code>FLASHBACK_SCN</code> is not supported in Transportable mode.</p>
FLASHBACK_TIME	Text	Export and network Import	<p>Either the date and time used to determine a consistent point for reading user data or a string of the form <code>TO_TIMESTAMP (. . .)</code>.</p> <p>If neither <code>FLASHBACK_SCN</code> nor <code>FLASHBACK_TIME</code> is specified, there will be no transactional consistency between partitions.</p> <p><code>FLASHBACK_SCN</code> and <code>FLASHBACK_TIME</code> cannot both be specified for the same job. <code>FLASHBACK_TIME</code> is not supported in Transportable mode.</p>
INCLUDE_METADATA	NUMBER	Export and Import	<p>If nonzero, metadata for objects will be moved in addition to user table data.</p> <p>If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data.</p> <p><code>INCLUDE_METADATA</code> is not supported in Transportable mode.</p> <p>Default=1.</p>

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
PARTITION_OPTIONS	Text	Import	<p>Specifies how partitioned tables should be handled during an import operation. The options are as follows:</p> <p>NONE means that partitioning is reproduced on the target database as it existed in the source database.</p> <p>DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform.</p> <p>MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS.</p> <p>This parameter requires a job version of 11.1 or later.</p> <p>Default=NONE</p>
SKIP_UNUSABLE_INDEXES	NUMBER	Import	<p>If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode.</p> <p>Default=1</p>
TABLE_EXISTS_ACTION	Text	Import	<p>Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP.</p> <p>If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported.</p> <p>If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import.</p> <p>Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE.</p> <p>If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped.</p> <p>If APPEND, new rows are added to the existing rows in the table.</p> <p>If SKIP, the preexisting table is left unchanged.</p> <p>TABLE_EXISTS_ACTION is not supported in Transportable mode.</p> <p>The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.</p>
TABLESPACE_DATAFILE	Text	Import	<p>Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports.</p> <p>TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.</p>

Table 40–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TRANSPORTABLE	Text	Export	<p>For export operations done in table mode, allows the data to be moved using transportable tablespaces. Storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the PARTITION_OPTIONS=DEPARTITION parameter.</p> <p>Use of the TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. The TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call.</p> <p>The possible values for this parameter are as follows: ALWAYS - data is always moved by moving data files. NEVER - data files are never used for copying user data.</p> <p>This parameter requires a job version of 11.1 or later Default=NEVER</p>
TTS_FULL_CHECK	NUMBER	Export	<p>If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports.</p> <p>Default=0.</p>
USER_METADATA	NUMBER	Export and network Import	<p>For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter.</p> <p>The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode.</p> <p>Default=1 if user has EXP_FULL_DATABASE role; 0 otherwise.</p>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
 - An invalid name was supplied for an input parameter
 - The wrong datatype was used for value
 - A value was not supplied
 - The supplied value was not allowed for the specified parameter name
 - A flashback parameter had been established after a different flashback parameter had already been established
 - A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.

- `INVALID_STATE`. The specified job is not in the Defining state.
- `INCONSISTENT_ARGS`. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- `PRIVILEGE_ERROR`. The user does not have the `EXP_FULL_DATABASE` or `IMP_FULL_DATABASE` role required for the specified parameter.
- `SUCCESS_WITH_INFO`. The procedure succeeded, but further information is available through the `GET_STATUS` procedure.
- `NO_SUCH_JOB`. The specified job does not exist.

Usage Notes

- The `SET_PARAMETER` procedure is used to specify optional features for the current job. See [Table 40-23](#) for a list of supported options.

START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
    handle          IN NUMBER,
    skip_current   IN NUMBER DEFAULT 0);
```

Parameters

Table 40–24 START_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through either the OPEN or ATTACH procedure.
skip_current	<p>If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index.</p> <p>A description of the actions skipped is entered into the log file. skip_current is ignored for the initial START_JOB in a job.</p> <p>If zero, no data or metadata is lost upon a restart.</p>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
 - No files have been defined for an Export, non-network Import, or SQL_FILE job
 - An ADD_FILE procedure has not been called to define the output for a SQL_FILE job
 - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
 - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
 - The dump file set on an Import of SQL_FILE job was either incomplete or missing a master table specification
- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the `SET_PARALLEL` procedure was not called prior to the `START_JOB` procedure, the initial level of parallelism used in the job will be 1. If `SET_PARALLEL` was called prior to the job starting, the degree specified by the last `SET_PARALLEL` call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another `SET_PARALLEL` call.
- To restart a stopped job, an `ATTACH` must be performed prior to executing the `START_JOB` procedure.

STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
  handle      IN NUMBER,
  immediate   IN NUMBER DEFAULT 0,
  keep_master IN NUMBER DEFAULT NULL,
  delay       IN NUMBER DEFAULT 60);
```

Parameters

Table 40–25 STOP_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (
  handle      IN  NUMBER,
  job_state   OUT VARCHAR2);
```

Parameters

Table 40–26 WAIT_FOR_JOB Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing. This will be either Stopped or Completed.

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be Completed. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be Stopped.

DBMS_DB_VERSION

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

See Also: *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- [Using DBMS_DB_VERSION](#)
 - Overview
 - Constants
 - Examples

Using DBMS_DB_VERSION

- [Overview](#)
- [Constants](#)

Overview

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 11g Release 1 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
  VERSION CONSTANT PLS_INTEGER := 11; -- RDBMS version number
  RELEASE CONSTANT PLS_INTEGER := 1; -- RDBMS release number
  ver_le_9_1    CONSTANT BOOLEAN := FALSE;
  ver_le_9_2    CONSTANT BOOLEAN := FALSE;
  ver_le_9      CONSTANT BOOLEAN := FALSE;
  ver_le_10_1   CONSTANT BOOLEAN := FALSE;
  ver_le_10_2   CONSTANT BOOLEAN := FALSE;
  ver_le_10     CONSTANT BOOLEAN := FALSE;
  ver_le_11_1   CONSTANT BOOLEAN := TRUE;
  ver_le_11     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER_LE_9_1 represents version <= 9 and release <= 1
- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
  version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
  version 11 code
$ELSE
  version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS_DB_VERSION.VER_LE_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER_LE_11 is not defined in version 10 database because conditional compilation protects the \$ELSIF from evaluation if DBMS_DB_VERSION.VER_LE_10 is TRUE.

Constants

The `DBMS_DB_VERSION` package contains different constants for different Oracle Database releases. The Oracle Database 11g Release 1 version of the `DBMS_DB_VERSION` package uses the constants shown in [Table 41-1](#).

Table 41-1 *DBMS_DB_VERSION Constants*

Name	Type	Value	Description
<code>VERSION</code>	<code>PLS_INTEGER</code>	10	Current version
<code>RELEASE</code>	<code>PLS_INTEGER</code>	2	Current release
<code>VER_LE_9</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9
<code>VER_LE_9_1</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9 and release <= 1
<code>VER_LE_9_2</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 9 and release <= 2
<code>VER_LE_10</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <= 10
<code>VER_LE_10_1</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 10 and release <= 1
<code>VER_LE_10_2</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <=10 and release <= 2
<code>VER_LE_11</code>	<code>BOOLEAN</code>	<code>FALSE</code>	Version <= 11
<code>VER_LE_11_1</code>	<code>BOOLEAN</code>	<code>TRUE</code>	Version <=11 and release <= 1

Examples

This example uses conditional compilation to guard new features.

```

CREATE OR REPLACE PROCEDURE whetstone IS

  -- Notice that conditional compilation constructs
  -- can interrupt a regular PL/SQL statement.
  -- You can locate a conditional compilation directive anywhere
  -- there is whitespace in the regular statement.

  SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                $ELSE BINARY_DOUBLE
    $END;

  t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                $ELSE 0.499975d
    $END;

  t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                $ELSE 2.0d
    $END;

  x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                $ELSE 1.0d
    $END;

  y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                $ELSE 1.0d
    $END;

  z  MY_REAL;

  PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
    x1 my_real;
    y1 my_real;
  BEGIN
    x1 := x;
    y1 := y;
    x1 := t * (x1 + y1);
    y1 := t * (x1 + y1);
    z := (x1 + y1)/t2;
  END P;
BEGIN
  P(x, y, z);
  DBMS_OUTPUT.PUT_LINE ('z = ' || z);
END whetstone;
/

```

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- [Using DBMS_DDL](#)
 - Deprecated Subprograms
 - Security Model
 - Operational Notes
- [Summary of DBMS_DDL Subprograms](#)

Using DBMS_DDL

This section contains topics which relate to using the DBMS_DDL package.

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Release 10gR2:

- [ALTER_COMPILE Procedure](#)

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

Summary of DBMS_DDL Subprograms

Table 42–1 DBMS_DDL Package Subprograms

Subprogram	Description
ALTER_COMPILE Procedure on page 42-7	Compiles the PL/SQL object
ALTER_TABLE_NOT_REFERENCEABLE Procedure on page 42-8	Reorganizes object tables
ALTER_TABLE_REFERENCEABLE Procedure on page 42-9	Reorganizes object tables
CREATE_WRAPPED Procedures on page 42-10	Takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement
IS_TRIGGER_FIRE_ONCE Function on page 42-12	Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE
SET_TRIGGER_FIRING_PROPERTY Procedure on page 42-13	Sets the specified DML or DDL trigger's firing property
WRAP Functions on page 42-15	Takes as input a CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated

ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

Note: This procedure is deprecated in Release 10gR2. While the procedure remains available in the package, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
    type          VARCHAR2,
    schema        VARCHAR2,
    name          VARCHAR2
    reuse_settings BOOLEAN := FALSE);
```

Parameters

Table 42–2 ALTER_COMPILE Procedure Parameters

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 42–3 ALTER_COMPILE Procedure Exceptions

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
    table_name      IN          VARCHAR2,
    table_schema    IN  DEFAULT NULL,
    affected_schema IN  DEFAULT NULL);
```

Parameters

Table 42–4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

Parameter	Description
<code>table_name</code>	The name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
<code>table_schema</code>	The name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
<code>affected_schema</code>	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is., it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.<table_name>] REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
  table_name      IN  VARCHAR2,
  table_schema    IN  DEFAULT NULL,
  affected_schema IN  DEFAULT NULL);
```

Parameters

Table 42-5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

Parameter	Description
<code>table_name</code>	The name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.
<code>table_schema</code>	The name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.
<code>affected_schema</code>	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same EOID; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it will make the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also: [WRAP Functions](#) on page 42-15

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual [WRAP Functions](#) and DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
    ddl    VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
    ddl    DBMS_SQL.VARCHAR2A,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
    ddl    DBMS_SQL.VARCHAR2S,
    lb     PLS_INTEGER,
    ub     PLS_INTEGER);
```

Parameters

Table 42–6 CREATE_WRAPPED Procedure Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name

DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus `"/` termination character), both the [CREATE_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

IS_TRIGGER_FIRE_ONCE Function

This function returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, it returns `FALSE`.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package
- For changes made by a Logical Standby apply process

Note: Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: ["SET_TRIGGER_FIRING_PROPERTY Procedure"](#) on page 42-13

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
  trig_owner      IN VARCHAR2,
  trig_name       IN VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 42–7 IS_TRIGGER_FIRE_ONCE Function Parameters

Parameter	Description
<code>trig_owner</code>	Schema of trigger
<code>trig_name</code>	Name of trigger

SET_TRIGGER_FIRING_PROPERTY Procedure

This procedure sets the specified DML or DDL trigger's firing property. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package.
- Applied by a Logical Standby apply process

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY
  trig_owner      IN  VARCHAR2,
  trig_name       IN  VARCHAR2,
  fire_once       IN  BOOLEAN);
```

Parameters

Table 42–8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

Parameter	Description
trig_owner	Schema of the trigger to set
trig_name	Name of the trigger to set
fire_once	If TRUE, the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers. If FALSE, the trigger is set to always fire.

Usage Notes

You can specify one of the following settings for a trigger's firing property:

- If the fire_once parameter is set to TRUE for a trigger, then the trigger does not fire for these types of changes.
- If the fire_once parameter is set to FALSE for a trigger, then the trigger fires for these types of changes.

Regardless of the firing property set by this procedure, a trigger continues to fire when changes are made by means other than the apply process or apply error execution. For example, if a user session or an application makes a change, then the trigger continues to fire, regardless of the firing property.

Note:

- If you dequeue an error transaction from the error queue and execute it without using the DBMS_APPLY_ADM package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
 - Only DML and DDL triggers can be fire once. All other types of triggers always fire.
-
-

See Also: *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

See Also: [CREATE_WRAPPED Procedures](#) on page 42-10

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP (
    ddl      VARCHAR2)
RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the [PARSE Procedures](#) in the [DBMS_SQL](#) package and its argument list follows the convention of DBMS_SQL.PARSE:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2S,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the [PARSE Procedures](#) in the [DBMS_SQL](#) package:

```
DBMS_DDL.WRAP (
    ddl      DBMS_SQL.VARCHAR2A,
    lb       PLS_INTEGER,
    ub       PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 42–9 WRAP Function Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name `SYS.DBMS_DDL` to avoid the possibility that the name `DBMS_DDL` is captured by a locally-defined unit or by redefining the `DBMS_DDL` public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL `wrap` utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (`EXECUTE IMMEDIATE` and `DBMS_SQL.PARSE`). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus `"/` termination character), both the [CREATE_WRAPPED Procedures](#) and the [WRAP Functions](#) require input to be a single unit.

Exceptions

ORA-24230: If the input is not a `CREATE OR REPLACE` statement specifying a PL/SQL unit, exception `DBMS_DDL.MALFORMED_WRAP_INPUT` is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

Note: The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

- [Using DBMS_DEBUG](#)
 - Overview
 - Constants
 - Variables
 - Exceptions
 - Operational Notes
- [Data Structures](#)
 - RECORD Types
 - TABLE Types
- [Summary of DBMS_DEBUG Subprograms](#)

Using DBMS_DEBUG

- [Overview](#)
- [Constants](#)
- [Variables](#)
- [Exceptions](#)
- [Operational Notes](#)

Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with `DBMS_DEBUG`. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using `DBMS_DEBUG`: This tells it which target session to supervise. The debug session may then call entry points in `DBMS_DEBUG` to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- [SYNCHRONIZE Function](#)
- [DEBUG_ON Procedure](#)
- [DEBUG_OFF Procedure](#)

`DBMS_DEBUG` does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

Variables

The DBMS_DEBUG uses the variables shown in [Table 43-1](#).

Table 43-1 DBMS_DEBUG Variables

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination.

Statuses returned by GET_VALUE and SET_VALUE:

Status	Description
error_bogus_frame	No such entypoint on the stack.
error_no_debug_info	Program was compiled without debug symbols.
error_no_such_object	No such variable or parameter.
error_unknown_type	Debug information is unreadable.
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided.
error_illegal_index	No such element exists in the collection.
error_nullcollection	Table is atomically null.
error_nullvalue	Value is null.

Statuses returned by SET_VALUE:

Status	Description
error_illegal_value	Constraint violation.
error_illegal_null	Constraint violation.
error_value_malformed	Unable to decipher the given value.
error_other	Some other error.
error_name_incomplete	Name did not resolve to a scalar.

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint.
error_idle_breakpt	Cannot enable or disable an unused breakpoint.
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation).

General error codes (returned by many of the DBMS_DEBUG subprograms):

Status	Description
error_unimplemented	Functionality is not yet implemented.
error_deferred	No program running; operation deferred.
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server.
error_communication	Some error other than a timeout occurred.
error_timeout	Timeout occurred.

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE.

The following exceptions are raised by procedure SELF_CHECK:

Exception	Description
pipe_creation_failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;  
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 43–1 and Figure 43–2 illustrate the flow of operations in the session to be debugged and in the debugging session.

Figure 43–1 Target Session

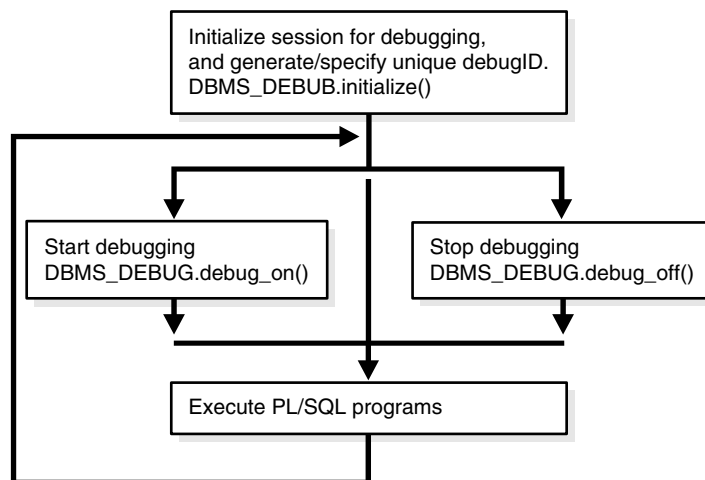

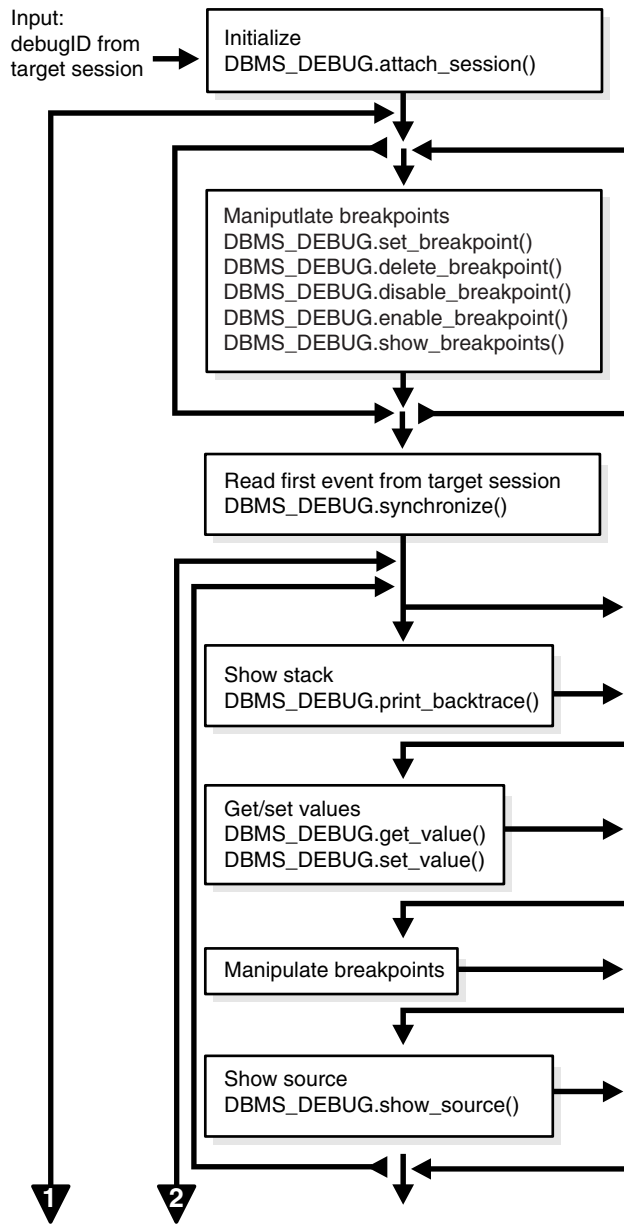

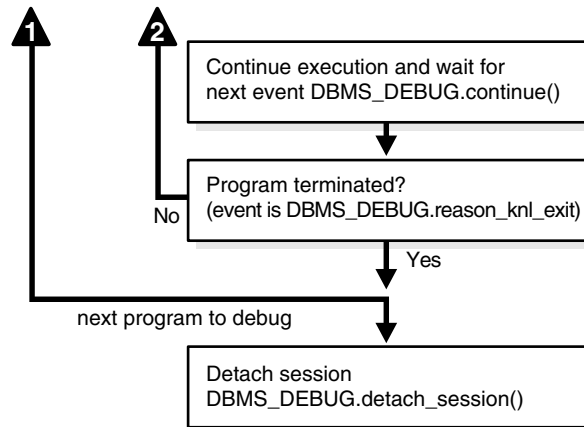

Figure 43-2 Debug Session

Figure 43-3 Debug Session (Cont.)

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common and Debug Session Sections

- [Common Section](#)

- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function
- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function

- [GET_RUNTIME_INFO Function](#)
- [GET_INDEXES Function](#)
- [EXECUTE Procedure](#)

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init`'d to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
 - Package specifications.
 - Procedures and functions that are not nested inside other packages, procedures, or functions.
 - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
<code>break_next_line</code>	Break at next source line (step over calls).

Value	Description
break_any_call	Break at next source line (step into calls).
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine).
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised.
break_handler	Break when an exception handler is executed.
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

Information Flags

These are flags which may be passed as the `info_requested` parameter to `SYNCHRONIZE`, `CONTINUE`, and `GET_RUNTIME_INFO`.

Flag	Description
info_getStackDepth	Get the current depth of the stack.
info_getBreakpoint	Get the breakpoint number.
info_getLineinfo	Get program unit information.

Reasons for Suspension

After `CONTINUE` is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-
reason_interpreter_starting	Interpreter is starting.
reason_breakpoint	Hit a breakpoint.
reason_enter	Procedure entry.
reason_return	Procedure is about to return.
reason_finish	Procedure is finished.
reason_line	Reached a new line.
reason_interrupt	An interrupt occurred.
reason_exception	An exception was raised.
reason_exit	Interpreter is exiting (old form).
reason_knl_exit	Kernel is exiting.
reason_handler	Start exception-handler.
reason_timeout	A timeout occurred.
reason_instantiate	Instantiation block.
reason_abort	Interpreter is aborting.

Data Structures

The DBMS_DEBUG package defines RECORD types and TABLE types.

RECORD Types

- [BREAKPOINT_INFO Record Type](#)
- [PROGRAM_INFO Record Type](#)
- [RUNTIME_INFO Record Type](#)

TABLE Types

- [BACKTRACE_TABLE Table Type](#)
- [BREAKPOINT_TABLE Table Type](#)
- [INDEX_TABLE Table Type](#)
- [VC2_TABLE Table Type](#)

BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
  name      VARCHAR2(30),
  owner     VARCHAR2(30),
  dblink    VARCHAR2(30),
  line#     BINARY_INTEGER,
  libunittype BINARY_INTEGER,
  status    BINARY_INTEGER);
```

Fields

Table 43–2 *RUNTIME_INFO Fields*

Field	Description
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	NULL, unless this is a nested procedure or function
status	See Constants on page 43-4 for values of breakpoint_status_*

PROGRAM_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
  -- The following fields are used when setting a breakpoint
  namespace      BINARY_INTEGER,
  name           VARCHAR2(30),
  owner          VARCHAR2(30),
  dblink         VARCHAR2(30),
  line#          BINARY_INTEGER,
  -- Read-only fields (set by Probe when doing a stack backtrace)
  libunittype    BINARY_INTEGER,
  entrypointname VARCHAR2(30));
```

Fields

Table 43-3 PROGRAM_INFO Fields

Field	Description
namespace	See Namespaces on page 43-12
name	Name of the program unit
owner	Owner of the program unit
dblink	Database link, if remote
line#	Line number
libunittype	A read-only field, NULL, unless this is a nested procedure or function
entrypointname	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the Libunit Types on page 43-12 for more information.

RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
  line#           BINARY_INTEGER,
  terminated      binary_integer,
  breakpoint      binary_integer,
  stackdepth     BINARY_INTEGER,
  interpreterdepth BINARY_INTEGER,
  reason         BINARY_INTEGER,
  program        program_info);
```

Fields

Table 43–4 *RUNTIME_INFO Fields*

Field	Description
line#	Duplicate of program.line#
terminated	Whether the program has terminated
breakpoint	Breakpoint number
stackdepth	Number of frames on the stack
interpreterdepth	[A reserved field]
reason	Reason for suspension
program	Source location

BACKTRACE_TABLE Table Type

This type is used by `PRINT_BACKTRACE`.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Table Type

This type is used by `GET_INDEXES` to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_DEBUG Subprograms

Table 43–5 DBMS_DEBUG Package Subprograms

Subprogram	Description
ATTACH_SESSION Procedure on page 43-24	Notifies the debug session about the target debugID
CONTINUE Function on page 43-25	Continues execution of the target program
DEBUG_OFF Procedure on page 26	Turns debug-mode off
DEBUG_ON Procedure on page 43-27	Turns debug-mode on
DELETE_BREAKPOINT Function on page 43-28	Deletes a breakpoint
DELETE_OER_BREAKPOINT Function on page 43-29	Deletes an OER breakpoint
DETACH_SESSION Procedure on page 43-30	Stops debugging the target program
DISABLE_BREAKPOINT Function on page 43-31	Disables a breakpoint
ENABLE_BREAKPOINT Function on page 43-32	Activates an existing breakpoint
EXECUTE Procedure on page 43-33	Executes SQL or PL/SQL in the target session
GET_INDEXES Function on page 43-35	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure on page 43-36	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function on page 43-37	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function on page 43-38	Returns information about the current program
GET_TIMEOUT_BEHAVIOUR Function on page 43-39	Returns the current timeout behavior
GET_VALUE Function on page 43-40	Gets a value from the currently-running program
INITIALIZE Function on page 43-42	Sets debugID in target session
PING Procedure on page 43-44	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure on page 43-45	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure on page 43-46	Prints a stack backtrace
PROBE_VERSION Procedure on page 43-47	Returns the version number of DBMS_DEBUG on the server

Table 43-5 (Cont.) DBMS_DEBUG Package Subprograms

Subprogram	Description
SELF_CHECK Procedure on page 43-48	Performs an internal consistency check
SET_BREAKPOINT Function on page 43-49	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function on page 43-50	Sets an OER breakpoint
SET_TIMEOUT Function on page 43-51	Sets the timeout value
SET_TIMEOUT_BEHAVIOUR Procedure on page 43-52	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function on page 43-53	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures on page 43-55	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure on page 43-56	Fetches the frame source
SHOW_SOURCE Procedures on page 43-57	Fetches program source
SYNCHRONIZE Function on page 43-59	Waits for program to start running
TARGET_PROGRAM_RUNNING Procedure on page 43-60	Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not

ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (  
    debug_session_id IN VARCHAR2,  
    diagnostics      IN BINARY_INTEGER := 0);
```

Parameters

Table 43–6 *ATTACH_SESSION Procedure Parameters*

Parameter	Description
debug_session_id	Debug ID from a call to INITIALIZE in target session.
diagnostics	Generate diagnostic output if nonzero.

CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not NULL, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
    run_info      IN OUT runtime_info,
    breakflags    IN      BINARY_INTEGER,
    info_requested IN      BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–7 CONTINUE Function Parameters

Parameter	Description
<code>run_info</code>	Information about the state of the program.
<code>breakflags</code>	Mask of events that are of interest. See " Breakflags " on page 43-12.
<code>info_requested</code>	Which information should be returned in <code>run_info</code> when the program stops. See " Information Flags " on page 43-13.

Return Values

Table 43–8 CONTINUE Function Return Values

Return	Description
<code>success</code>	
<code>error_timeout</code>	Timed out before the program started running.
<code>error_communication</code>	Other communication error.

DEBUG_OFF Procedure

Caution: There must be a debug session waiting if immediate is TRUE.

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (  
    no_client_side_plsql_engine BOOLEAN := TRUE,  
    immediate                   BOOLEAN := FALSE);
```

Parameters

Table 43–9 *DEBUG_ON Procedure Parameters*

Parameter	Description
no_client_side_plsql_engine	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine.
immediate	If this is <code>TRUE</code> , then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

Table 43–10 *DELETE_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 43–11 *DELETE_BREAKPOINT Function Return Values*

Return	Description
success	
error_no_such_breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot delete an unused breakpoint.
error_stale_breakpt	The program unit was redefined since the breakpoint was set.

DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (  
    oer IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 43–12 *DELETE_OER_BREAKPOINT Function Parameters*

Parameter	Description
oer	The OER (positive 4-byte number) to delete.

DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–13 *DISABLE_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 43–14 *DISABLE_BREAKPOINT Function Return Values*

Returns	Description
success	
error_no_such_breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot disable an unused breakpoint.

ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (  
    breakpoint IN BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

Table 43–15 *ENABLE_BREAKPOINT Function Parameters*

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 43–16 *ENABLE_BREAKPOINT Function Return Values*

Return	Description
success	Success.
error_no_such_breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot enable an unused breakpoint.

EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to `DBMS_DEBUG.EXECUTE` occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
  what          IN VARCHAR2,
  frame#        IN BINARY_INTEGER,
  bind_results  IN BINARY_INTEGER,
  results       IN OUT NOCOPY dbms_debug_vc2coll,
  errm          IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 43–17 EXECUTE Procedure Parameters

Parameter	Description
<code>what</code>	SQL or PL/SQL source to execute.
<code>frame#</code>	The context in which to execute the code. Only -1 (global context) is supported at this time.
<code>bind_results</code>	Whether the source wants to bind to <code>results</code> in order to return values from the target session. 0 = No 1 = Yes
<code>results</code>	Collection in which to place results, if <code>bind_results</code> is not 0.
<code>errm</code>	Error message, if an error occurred; otherwise, NULL.

Examples

Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
  coll sys.dbms_debug_vc2coll; -- results (unused)
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                    'values(''LJE'', 1, 1)',
                    -1, 0, coll, errm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
```

```

dbms_debug.execute(
  'DECLARE PRAGMA autonomous_transaction; ' ||
  'BEGIN ' ||
  '  insert into emp(ename, empno, deptno) ' ||
  '  values(''LJE'', 1, 1); ' ||
  ' COMMIT; ' ||
  'END;',
  -1, 0, coll, errm);
END;

```

Example 3

This example executes a PL/SQL block, and it returns some results.

```

DECLARE
  coll sys.dbms_debug_vc2coll;
  errm VARCHAR2(100);
BEGIN
  dbms_debug.execute(
    'DECLARE ' ||
    '  pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
    '  x PLS_INTEGER; ' ||
    '  i PLS_INTEGER := 1; ' ||
    'BEGIN ' ||
    '  SELECT COUNT(*) INTO x FROM emp; ' ||
    '  pp.EXTEND(x * 6); ' ||
    '  FOR c IN (SELECT * FROM emp) LOOP ' ||
    '    pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
    '    pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
    '    pp(i) := ''Job: '' || c.job; i := i+1; ' ||
    '    pp(i) := ''Mgr: '' || c.mgr; i := i+1; ' ||
    '    pp(i) := ''Sal: '' || c.sal; i := i+1; ' ||
    '    pp(i) := null; i := i+1; ' ||
    '  END LOOP; ' ||
    '  :1 := pp; ' ||
    'END;',
    -1, 1, coll, errm);
  each := coll.FIRST;
  WHILE (each IS NOT NULL) LOOP
    dosomething(coll(each));
    each := coll.NEXT(each);
  END LOOP;
END;

```

GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES (
    varname   IN  VARCHAR2,
    frame#    IN  BINARY_INTEGER,
    handle    IN  program_info,
    entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–18 *GET_INDEXES Function Parameters*

Parameter	Description
varname	Name of the variable to get index information about.
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable.
handle	Package description, if object is a package variable.
entries	1-based table of the indexes. If non-NULL, then <code>entries(1)</code> contains the first index of the table, <code>entries(2)</code> contains the second index, and so on.

Return Values

Table 43–19 *GET_INDEXES Function Return Values*

Return	Description
<code>error_no_such_object</code>	Either: <ul style="list-style-type: none"> - The package does not exist. - The package is not instantiated. - The user does not have privileges to debug the package. - The object does not exist in the package.

GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the [SHOW_SOURCE Procedures](#) which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (  
    buffer          IN OUT VARCHAR2,  
    buflen         IN BINARY_INTEGER,  
    piece#         IN BINARY_INTEGER);
```

Parameters

Table 43–20 GET_MORE_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer.
buflen	The length of the buffer.
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures .

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
  program          IN  program_info,
  maxline          OUT BINARY_INTEGER,
  number_of_entry_points OUT BINARY_INTEGER,
  linemap          OUT  RAW)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–21 GET_LINE_MAP Function Parameters

Parameter	Description
program	A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.
maxline	The largest source code line number in 'program'.
number_of_entry_points	The number of subprograms in 'program'
linemap	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.

Return Values

Table 43–22 GET_LINE_MAP Function Return Values

Return	Description
success	A successful completion.
error_no_debug_info	The program unit exists, but has no debug info.
error_bad_handle	No such program unit exists.

GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to 0.

Note: This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (  
    info_requested IN BINARY_INTEGER,  
    run_info      OUT runtime_info)  
RETURN BINARY_INTEGER;
```

Parameters

Table 43-23 *GET_RUNTIME_INFO Function Parameters*

Parameter	Description
<code>info_requested</code>	Which information should be returned in <code>run_info</code> when the program stops. See " Information Flags " on page 43-13.
<code>run_info</code>	Information about the state of the program.

GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

Parameters

Table 43–24 GET_TIMEOUT_BEHAVIOUR Function Parameters

Parameter	Description
oer	The OER (a 4-byte positive number).

Return Values

Table 43–25 GET_TIMEOUT_BEHAVIOUR Function Return Values

Return	Description
success	A successful completion.

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
    variable_name IN VARCHAR2,
    frame#        IN BINARY_INTEGER,
    scalar_value  OUT VARCHAR2,
    format       IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–26 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter.
frame#	Frame in which it lives; 0 means the current procedure.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 43–27 GET_VALUE Function Return Values

Return	Description
success	A successful completion.
error_bogus_frame	Frame does not exist.
error_no_debug_info	Entrypoint has no debug information.
error_no_such_object	variable_name does not exist in frame#.
error_unknown_type	The type information in the debug information is illegible.
error_nullvalue	Value is NULL.
error_indexed_table	The object is a table, but no index was provided.

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
    variable_name IN VARCHAR2,
    handle        IN program_info,
    scalar_value  OUT VARCHAR2,
    format       IN VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–28 *GET_VALUE Function Parameters*

Parameter	Description
variable_name	Name of the variable or parameter.
handle	Description of the package containing the variable.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 43–29 *GET_VALUE Function Return Values*

Return	Description
error_no_such_object	Either: <ul style="list-style-type: none"> - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.
error_indexed_table	The object is a table, but no index was provided.

Examples

This example illustrates how to get the value with a given package `PACK` in schema `SCOTT`, containing variable `VAR`:

```

DECLARE
    handle    dbms_debug.program_info;
    resultbuf VARCHAR2(500);
    retval    BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
  debug_session_id IN VARCHAR2      := NULL,
  diagnostics      IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```

Parameters

Table 43–30 INITIALIZE Function Parameters

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile. 0 = (default) no diagnostics 1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use `DBMS_DEBUG` and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to `DBMS_DEBUG` will succeed only if either the caller or the specified debug role carries the `DEBUG CONNECT SESSION` privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The `CREATE ANY PROCEDURE` privilege does not affect the visibility of routines through the debugger. A privilege `DEBUG` for each object has been introduced with a corresponding `DEBUG ANY PROCEDURE` variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for `DEBUG CONNECT SESSION` privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or `PUBLIC` will be used to check for `DEBUG CONNECT SESSION`. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the `DEBUG` privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`.

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call `debug_off`) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
- `abort_on_timeout` - Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;
```

```
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;
```

```
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;
```

```
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (  
    listing IN OUT VARCHAR2);  
  
DBMS_DEBUG.PRINT_BACKTRACE (  
    backtrace OUT backtrace_table);
```

Parameters

Table 43-31 PRINT_BACKTRACE Procedure Parameters

Parameter	Description
listing	A formatted character buffer with embedded newlines.
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
  pkgs   IN OUT NOCOPY backtrace_table,
  flags  IN BINARY_INTEGER);
```

Parameters

Table 43–32 PRINT_INSTANTIATIONS Procedure Parameters

Parameter	Description
pkgs	The instantiated packages
flags	Bitmask of options: <ul style="list-style-type: none"> ■ 1 - show specs ■ 2 - show bodies ■ 4 - show local instantiations ■ 8 - show remote instantiations (NYI) ■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.

Exceptions

`no_target_program` - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: `Namespace`, `Name`, `Owner`, and `LibunitType`.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (  
    major out BINARY_INTEGER,  
    minor out BINARY_INTEGER);
```

Parameters

Table 43–33 *PROBE_VERSION Procedure Parameters*

Parameter	Description
major	Major version number.
minor	Minor version number: increments as functionality is added.

SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pblload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
    timeout IN binary_integer := 60);
```

Parameters

Table 43–34 SELF_CHECK Procedure Parameters

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

Exceptions

Table 43–35 SELF_CHECK Procedure Exceptions

Exception	Description
OER-6516	Probe version is inconsistent.
pipe_creation_failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
  program      IN program_info,
  line#        IN BINARY_INTEGER,
  breakpoint#  OUT BINARY_INTEGER,
  fuzzy        IN BINARY_INTEGER := 0,
  iterations   IN BINARY_INTEGER := 0)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–36 SET_BREAKPOINT Function Parameters

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set.
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint.
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return <code>error_illegal_line</code> . 1 means search forward for an adjacent line at which to place the breakpoint. -1 means search backward for an adjacent line at which to place the breakpoint.
iterations	Number of times to wait before signalling this breakpoint.

Return Values

Note: The `fuzzy` and `iterations` parameters are not yet implemented.

Table 43–37 SET_BREAKPOINT Function Return Values

Return	Description
success	A successful completion.
error_illegal_line	Cannot set a breakpoint at that line.
error_bad_handle	No such program unit exists.

SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (  
    oer IN PLS_INTEGER)  
RETURN PLS_INTEGER;
```

Parameters

Table 43–38 SET_OER_BREAKPOINT Function Parameters

Parameter	Description
oer	The OER (positive 4-byte number) to delete.

Return Values

Table 43–39 SET_OER_BREAKPOINT Function Return Values

Return	Description
success	A successful completion.
error_no_such_ breakpt	No such OER breakpoint exists.

SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (  
    timeout BINARY_INTEGER)  
RETURN BINARY_INTEGER;
```

Parameters

Table 43–40 *SET_TIMEOUT Function Parameters*

Parameter	Description
timeout	The timeout to use for communication between the target and debug sessions.

SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
    behaviour IN PLS_INTEGER);
```

Parameters

Table 43–41 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

Parameter	Description
behaviour	One of the following:
retry_on_timeout	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
continue_on_timeout	Continue execution, using same event flags.
nodebug_on_timeout	Turn debug-mode OFF (in other words, call <code>debug_off</code>) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling <code>debug_on</code> .
abort_on_timeout	Continue execution, using the <code>abort_execution</code> flag, which should cause the program to terminate immediately. The session remains in debug-mode.

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
    frame#           IN binary_integer,
    assignment_statement IN varchar2)
RETURN BINARY_INTEGER;
```

```
DBMS_DEBUG.SET_VALUE (
    handle           IN program_info,
    assignment_statement IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–42 SET_VALUE Function Parameters

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable.
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

Return Values

Table 43–43 SET_VALUE Function Return Values

Return	Description
success	-
error_illegal_value	Not possible to set it to that value.
error_illegal_null	Cannot set to NULL because object type specifies it as 'not null'.
error_value_malformed	Value is not a scalar.
error_name_incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	Either: <ul style="list-style-type: none"> - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that

modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
    handle dbms_debug.program_info;
    retval BINARY_INTEGER;
BEGIN
    handle.Owner      := 'SCOTT';
    handle.Name       := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval            := dbms_debug.set_value(handle, 'var := 6;');
END;
```

SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
    listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
    code_breakpoints  OUT breakpoint_table,
    oer_breakpoints   OUT oer_table);
```

Parameters

Table 43–44 *SHOW_BREAKPOINTS Procedure Parameters*

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints. Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number.
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER.

SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
    first_line IN          BINARY_INTEGER,
    last_line  IN          BINARY_INTEGER,
    source     IN OUT NOCOPY vc2_table,
    frame_num  IN          BINARY_INTEGER);
```

Parameters

Table 43–45 SHOW_FRAME_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#.
frame_num	1-based frame number.

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the [Usage Notes](#) to [SHOW_SOURCE Procedures](#).

SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
  first_line IN BINARY_INTEGER,
  last_line  IN BINARY_INTEGER,
  source     OUT vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
  first_line IN BINARY_INTEGER,
  last_line  IN BINARY_INTEGER,
  window     IN BINARY_INTEGER,
  print_arrow IN BINARY_INTEGER,
  buffer     IN OUT VARCHAR2,
  buflen     IN BINARY_INTEGER,
  pieces     OUT BINARY_INTEGER);
```

Parameters

Table 43–46 SHOW_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#.
window	'Window' of lines (the number of lines around the current source line).
print_arrow	Nonzero means to print an arrow before the current line.
buffer	Buffer in which to place the source listing.
buflen	Length of buffer.
pieces	Set to nonzero if not all the source could be placed into the given buffer.

Return Values

An indexed table of source-lines. The source lines are stored starting at first_line. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
  info DBMS_DEBUG.runtime_info;
BEGIN
  -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
  -- or GET_RUNTIME_INFO to fill in 'info'
  SELECT text INTO <buffer> FROM all_source
```

```
WHERE owner = info.Program.Owner
      AND name = info.Program.Name
      AND line = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in `bufferlength` (`bufLen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not NULL, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
    run_info          OUT runtime_info,
    info_requested IN  BINARY_INTEGER := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 43–47 SYNCHRONIZE Function Parameters

Parameter	Description
<code>run_info</code>	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
<code>info_requested</code>	Optional bit-field in which to request information other than the default (which is <code>info_getStackDepth + info_getLineInfo</code>). 0 means that no information is requested at all. See " Information Flags " on page 43-13.

Return Values

Table 43–48 SYNCHRONIZE Function Return Values

Return	Description
<code>success</code>	A successful completion.
<code>error_timeout</code>	Timed out before the program started execution.
<code>error_communication</code>	Other communication error.

TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING  
RETURN BOOLEAN;
```

DBMS_DEFER

DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

- [Documentation of DBMS_DEFER](#)

Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see DBMS_DEFER in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_DEFER_QUERY

DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- [Documentation of DBMS_DEFER_QUERY](#)

Documentation of DBMS_DEFER_QUERY

For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_DEFER_SYS

DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

- [Documentation of DBMS_DEFER_SYS](#)

Documentation of DBMS_DEFER_SYS

For a complete description of this package within the context of Replication, see DBMS_DEFER_SYS in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_DESCRIBE

You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- [Using DBMS_DESCRIBE](#)
 - Overview
 - Security Model
 - Types
 - Exceptions
 - Examples
- [Summary of DBMS_DESCRIBE Subprograms](#)

Using DBMS_DESCRIBE

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Examples](#)

Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also: *Oracle Call Interface Programmer's Guide*

Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;
```

```
TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 47-1 *DBMS_DESCRIBE Errors*

Error	Description
ORA-20000	ORU-10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person  (person_id number(4), person_nm varchar2(10))

FUNCTION ACCOUNT_UPDATE (account_no  NUMBER,
                        person        person%rowtype,
                        amounts       DBMS_DESCRIBE.NUMBER_TABLE,
                        trans_date    DATE)
                        return        account.balance%type;

FUNCTION ACCOUNT_UPDATE (account_no  NUMBER,
                        person        person%rowtype,
                        amounts       DBMS_DESCRIBE.NUMBER_TABLE,
                        trans_no      NUMBER)
                        return        account.balance%type;
```

This procedure might look similar to the following output:

overload	position	argument	level	datatype	length	prec	scale	rad
1	0		0		2	22	7	2 10
1	1	ACCOUNT	0		2	0	0	0 0
1	2	PERSON	0		250	0	0	0 0
1	1	PERSON_ID	1		2	22	4	0 10
1	2	PERSON_NM	1		1	10	0	0 0
1	3	AMOUNTS	0		251	0	0	0 0
1	1		1		2	22	0	0 0
1	4	TRANS_DATE	0		12	0	0	0 0
2	0		0		2	22	7	2 10
2	1	ACCOUNT_NO	0		2	22	0	0 0
2	2	PERSON	0		2	22	4	0 10
2	3	AMOUNTS	0		251	22	4	0 10
2	1		1		2	0	0	0 0
2	4	TRANS_NO	0		2	0	0	0 0

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
  pvc2    IN    VARCHAR2,
  pvc     OUT   VARCHAR,
  pstr    IN OUT STRING,
  plong   IN    LONG,
  prowid  IN    ROWID,
  pchara  IN    CHARACTER,
  pchar   IN    CHAR,
  praw    IN    RAW,
  plraw   IN    LONG RAW,
  pbinnt  IN    BINARY_INTEGER,
  pplsint IN    PLS_INTEGER,
  pbool   IN    BOOLEAN,
  pnat    IN    NATURAL,
  ppos    IN    POSITIVE,
  pposn   IN    POSITIVEN,
```

```

    pnatn  IN    NATURALN,
    pnum   IN    NUMBER,
    pintgr IN    INTEGER,
    pint   IN    INT,
    psmall IN    SMALLINT,
    pdec   IN    DECIMAL,
    preal  IN    REAL,
    pfloat IN    FLOAT,
    pnumer IN    NUMERIC,
    pdp    IN    DOUBLE PRECISION,
    pdate  IN    DATE,
    pmls   IN    MLSLABEL) AS

```

```

BEGIN
    NULL;
END;

```

If you describe this procedure using the following:

```

CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

    PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
        n INTEGER;
    BEGIN
        n := isize - LENGTHB(val);
        IF n < 0 THEN
            n := 0;
        END IF;
        DBMS_OUTPUT.PUT(val);
        FOR i in 1..n LOOP
            DBMS_OUTPUT.PUT(' ');
        END LOOP;
    END prt_value;

    PROCEDURE desc_proc (name VARCHAR2) IS

        overload    DBMS_DESCRIBE.NUMBER_TABLE;
        position     DBMS_DESCRIBE.NUMBER_TABLE;
        c_level      DBMS_DESCRIBE.NUMBER_TABLE;
        arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
        dtv          DBMS_DESCRIBE.NUMBER_TABLE;
        def_val      DBMS_DESCRIBE.NUMBER_TABLE;
        p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
        length       DBMS_DESCRIBE.NUMBER_TABLE;
        precision    DBMS_DESCRIBE.NUMBER_TABLE;
        scale        DBMS_DESCRIBE.NUMBER_TABLE;
        radix        DBMS_DESCRIBE.NUMBER_TABLE;
        spare        DBMS_DESCRIBE.NUMBER_TABLE;
        idx          INTEGER := 0;

    BEGIN
        DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
            name,
            null,
            null,

```

```

        overload,
        position,
        c_level,
        arg_name,
        dty,
        def_val,
        p_mode,
        length,
        precision,
        scale,
        radix,
        spare);

DBMS_OUTPUT.PUT_LINE('Position      Name          DTY  Mode');
LOOP
    idx := idx + 1;
    prt_value(TO_CHAR(position(idx)), 12);
    prt_value(arg_name(idx), 12);
    prt_value(TO_CHAR(dty(idx)), 5);
    prt_value(TO_CHAR(p_mode(idx)), 5);
    DBMS_OUTPUT.NEW_LINE;
END LOOP;
EXCEPTION
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.NEW_LINE;

END desc_proc;
END describe_it;

```

Then the results list all the numeric codes for the PL/SQL datatypes:

Position	Name	Datatype_Code	Mode
1	PVC2	1	0
2	PVC	1	1
3	PSTR	1	2
4	PLONG	8	0
5	PROWID	11	0

27	PMLS	106	0

Summary of DBMS_DESCRIBE Subprograms

Table 47–2 DBMS_DESCRIBE Package Subprograms

Subprogram	Description
DESCRIBE_PROCEDURE Procedure on page 47-11	Provides a brief description of a PL/SQL stored procedure

DESCRIBE_PROCEDURE Procedure

The procedure `DESCRIBE_PROCEDURE` provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE (
  object_name          IN  VARCHAR2,
  reserved1            IN  VARCHAR2,
  reserved2            IN  VARCHAR2,
  overload             OUT NUMBER_TABLE,
  position             OUT NUMBER_TABLE,
  level                OUT NUMBER_TABLE,
  argument_name        OUT VARCHAR2_TABLE,
  datatype             OUT NUMBER_TABLE,
  default_value        OUT NUMBER_TABLE,
  in_out               OUT NUMBER_TABLE,
  length               OUT NUMBER_TABLE,
  precision            OUT NUMBER_TABLE,
  scale                OUT NUMBER_TABLE,
  radix                OUT NUMBER_TABLE,
  spare                OUT NUMBER_TABLE,
  include_string_constraints OUT BOOLEAN DEFAULT FALSE);
```

Parameters

Table 47-3 DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
<code>object_name</code>	<p>Name of the procedure being described.</p> <p>The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified <code>OBJECT_NAME</code> can result in one of the following exceptions:</p> <p>ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function.</p> <p>ORA-20001 - The procedure or function that you specified does not exist within the given package.</p> <p>ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects.</p> <p>ORA-20003 - The object that you specified is invalid and cannot be described.</p> <p>ORA-20004 - The object was specified with a syntax error.</p>
<code>reserved1</code> <code>reserved2</code>	Reserved for future use -- must be set to <code>NULL</code> or the empty string.
<code>overload</code>	<p>A unique number assigned to the procedure's signature.</p> <p>If a procedure is overloaded, then this field holds a different value for each version of the procedure.</p>
<code>position</code>	<p>Position of the argument in the parameter list.</p> <p>Position 0 returns the values for the return type of a function.</p>

Table 47-3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
level	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the <i>Oracle Call Interface Programmer's Guide</i> for a description of the ODESSP call for an example.
argument_name	Name of the argument associated with the procedure that you are describing.
datatype	Oracle datatype of the argument being described. The datatypes and their numeric type codes are: 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR2, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	Describes the mode of the parameter: 0 IN 1 OUT 2 IN OUT
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned. If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_string_constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96

Return Values

All values from DESCRIBE_PROCEDURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

The `DBMS_DG` package allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

See Also: *Oracle Data Guard Broker* for more information about performing a fast-start failover in a broker configuration

This chapter contains the following topics:

- [Using DBMS_DG](#)
- [Summary of the DBMS_DG Subprogram](#)

Using DBMS_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert the primary database that the application wants a fast-start failover to occur immediately. The primary database then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover.

If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

Summary of the DBMS_DG Subprogram

Table 48–1 DBMS_DG Package Subprogram

Subprogram	Description
INITIATE_FS_FAILOVER Procedure on page 48-4	Enables an application to notify the primary database that a fast-start failover is necessary when the application encounters conditions that warrant a failover.

INITIATE_FS_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request the primary database to immediately invoke a fast-start failover.

Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
    condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 48–2 *INITIATE_FS_FAILOVER Procedure Parameters*

Parameter	Description
condstr	Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the primary database.

Usage Notes

- Requires SYSDBA privilege and must be defined as an invoker's rights package.
- This procedure returns a binary integer.
- Query the V\$FS_FAILOVER_STATS view to see the time of the last fast-start failover and the reason it was performed.

Errors

Table 48–3 *INITIATE_FS_FAILOVER Procedure Errors*

Error	Description
ORA-00000: normal, successful completion	The request to initiate a fast-start failover has been posted to the observer.
ORA-16646: Fast-Start Failover is disabled	Either a broker configuration does not exist or fast-start failover has not been enabled.
ORA-16666: unable to initiate Fast-Start Failover on a standby database	DBMS_DG.INITIATE_FS_FAILOVER was invoked on a standby site.
ORA-16817: unsynchronized Fast-Start Failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.
ORA-16819: Fast-Start Failover observer not started	DBMS_DG.INITIATE_FS_FAILOVER was invoked but an observer had not yet been started.
ORA-16820: Fast-Start Failover observer is no longer observing this database	DBMS_DG.INITIATE_FS_FAILOVER was invoked but the configuration detects that the observer may not be running.

Table 48-3 (Cont.) INITIATE_FS_FAILOVER Procedure Errors

Error	Description
ORA-16829: lagging Fast-Start Failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.

Examples

Connect as user SYS with SYDDBA privileges to use the following example.

```
set serveroutput on
```

```
declare  
status integer;
```

```
begin  
status := dbms_dg.initiate_fs_failover('Failover Requested');
```

```
dbms_output.put_line('FSFO is disabled: Expected status = ORA-16646');  
dbms_output.put_line('          Actual Status = ORA-' || status);
```

```
end;  
/  
exit;
```

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

See Also: *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- [Using DBMS_DIMENSION](#)
 - Security Model
- [Summary of DBMS_DIMENSION Subprograms](#)

Using DBMS_DIMENSION

This section contains topics which relate to using the DBMS_DIMENSION package.

- [Security Model](#)

Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

Summary of DBMS_DIMENSION Subprograms

Table 49–1 *DBMS_DIMENSION Package Subprograms*

Subprogram	Description
DESCRIBE_DIMENSION Procedure on page 49-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
VALIDATE_DIMENSION Procedure on page 49-6	Verifies that the relationships specified in a dimension are correct

DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (  
    dimension IN VARCHAR2);
```

Parameters

Table 49–2 DESCRIBE_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table `DIMENSION_EXCEPTIONS` in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
    dimension          IN VARCHAR2,
    incremental        IN BOOLEAN := TRUE,
    check_nulls        IN BOOLEAN := FALSE,
    statement_id        IN VARCHAR2 := NULL );
```

Parameters

Table 49–3 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
<code>dimension</code>	The owner and name of the dimension in the format of <code>owner.name</code> .
<code>incremental</code>	If <code>TRUE</code> , check only the new rows for tables of this dimension. If <code>FALSE</code> , check all the rows.
<code>check_nulls</code>	If <code>TRUE</code> , then all level columns are verified to be non-null. If <code>FALSE</code> , this check is omitted. Specify <code>FALSE</code> when non-NULLness is guaranteed by other means, such as <code>NOT NULL</code> constraints.
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- [Using DBMS_DISTRIBUTED_TRUST_ADMIN](#)
 - Overview
 - Security Model
 - Examples
- [Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms](#)

Using DBMS_DISTRIBUTED_TRUST_ADMIN

- [Overview](#)
- [Security Model](#)
- [Examples](#)

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute `DBMS_DISTRIBUTED_TRUST_ADMIN`, the `EXECUTE_CATALOG_ROLE` role must be granted to the DBA. To select from the view `TRUSTED_SERVERS`, the `SELECT_CATALOG_ROLE` role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the `ALLOW_SERVER` procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the `DENY_SERVER` procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures `DENY_ALL` and `ALLOW_ALL` delete all entries (in other words, server names) that are explicitly allowed or denied using the `ALLOW_SERVER` procedure or `DENY_SERVER` procedure respectively.

Examples

If you have not yet used the package `DBMS_DISTRIBUTED_TRUST_ADMIN` to change the trust listing, by default you trust all databases in the same enterprise domain if that domain is listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Trusted    All
```

Because all servers are currently trusted, you can execute the [DENY_SERVER Procedure](#) and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Untrusted  SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the [DENY_ALL Procedure](#), you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

```
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
-----
Untrusted  All
```

The [ALLOW_SERVER Procedure](#) can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
        ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.
```

```
SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
-----
Trusted    SALES.US.AMERICAS.ACME_AUTO.COM
```

Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Table 50–1 *DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms*

Subprogram	Description
ALLOW_ALL Procedure on page 50-7	Empties the list and inserts a row indicating that all servers should be trusted
ALLOW_SERVER Procedure on page 50-8	Enables a specific server to be allowed access even though deny all is indicated in the list
DENY_ALL Procedure on page 50-9	Empties the list and inserts a row indicating that all servers should be untrusted
DENY_SERVER Procedure on page 50-10	Enables a specific server to be denied access even though allow all is indicated in the list

ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view `TRUSTED_SERVERS` will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

`ALLOW_ALL` only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (  
    server IN VARCHAR2);
```

Parameters

Table 50–2 ALLOW_SERVER Procedure Parameters

Parameter	Description
server	Unique, fully-qualified name of the server to be trusted.

Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.

DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view `TRUSTED_SERVERS` will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

Syntax

```
DBMS_DISTRICTED_TRUST_ADMIN.DENY_SERVER (  
    server IN VARCHAR2);
```

Parameters

Table 50–3 *DENY_SERVER Procedure Parameters*

Parameter	Description
<code>server</code>	Unique, fully-qualified name of the server to be untrusted.

Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry `"deny all"`, and if there is no `"allow DBx"` entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry `"deny all"`, and if there is an `"allow DBx"` entry, then this procedure causes that entry to be deleted.

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- [Using DBMS_EPG](#)
 - Overview
 - Security Model
 - Exceptions
- [Data Structures](#)
 - [VARCHAR2_TABLE](#) Table Type
- [Subprogram Groups](#)
 - Configuration Subprograms
 - Authorization Subprograms
- [Summary of DBMS_EPG Subprograms](#)

Using DBMS_EPG

- [Overview](#)
- [Security Model](#)
- [Exceptions](#)

Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of `mod_plsql` in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser via HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

Security Model

The XDBADMIN role is required to invoke the configuration interface. It may be invoked by the database user "XDB".

The authorization interface can be invoked by any user.

Exceptions

The following table lists the exceptions raised by the DBMS_EPG package.

Table 51-1 DBMS_EPG Exceptions

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Subprogram Groups

The DBMS_EPG consists of two interfaces:

- [Configuration Subprograms](#)
- [Authorization Subprograms](#)

Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 51–2 Configuration Subprogram Group

Subprogram	Description
CREATE_DAD Procedure on page 51-12	Creates a new DAD
DELETE_DAD_ATTRIBUTE Procedure on page 51-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 51-15	Deletes a global attribute
DROP_DAD Procedure on page 51-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 51-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 51-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 51-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 51-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 51-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 51-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 51-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 51-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 51-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 51-27	Unmaps a DAD from the specified virtual path

Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 51-3 Authorization Subprogram Group

Subprogram	Description
AUTHORIZE_DAD Procedure on page 51-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
DEAUTHORIZE_DAD Procedure on page 51-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

Summary of DBMS_EPG Subprograms

Table 51–4 DBMS_EPG Package Subprograms

Subprogram	Description
AUTHORIZE_DAD Procedure on page 51-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
CREATE_DAD Procedure on page 51-12	Creates a new DAD
DEAUTHORIZE_DAD Procedure on page 51-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
DELETE_DAD_ATTRIBUTE Procedure on page 51-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 51-15	Deletes a global attribute
DROP_DAD Procedure on page 51-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 51-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 51-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 51-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 51-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 51-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 51-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 51-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 51-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 51-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 51-27	Unmaps a DAD from the specified virtual path

AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

See Also: [Authorization Subprograms](#) on page 51-9 for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51-5 *AUTHORIZE_DAD Procedure Parameters*

Parameter	Description
dad_name	The name of the DAD to create
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

CREATE_DAD Procedure

This procedure creates a new DAD.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51–6 CREATE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

See Also: [Authorization Subprograms](#) on page 51-9 for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
  dad_name IN VARCHAR2,
  path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51-7 DEAUTHORIZE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2);
```

Parameters

Table 51-8 *DELETE_DAD_ATTRIBUTE Procedure Parameters*

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

Exceptions

Raises an error if DAD does not exist

DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (  
    attr_name      IN VARCHAR2);
```

Parameters

Table 51–9 *DELETE_GLOBAL_ATTRIBUTE Procedure Parameters*

Parameter	Description
attr_name	The global attribute to delete

DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (  
    dadname IN VARCHAR2);
```

Parameters

Table 51–10 *DROP_DAD Procedure Parameters*

Parameter	Description
dad_name	The DAD to drop

Exceptions

Raises an error if the DAD does not exist.

GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
  dad_name      IN          VARCHAR2,
  attr_names    OUT NOCOPY VARCHAR2_TABLE,
  attr_values   OUT NOCOPY VARCHAR2_TABLE);
```

Parameters

Table 51-11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (  
    dad_name      IN          VARCHAR2,  
    paths         OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51-12 GET_ALL_DAD_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, `paths` will be set to empty arrays.

GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
  attr_names      OUT  NOCOPY  VARCHAR2_TABLE,
  attr_values     OUT  NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51-13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.

GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (  
    dad_name      IN  VARCHAR2,  
    attr_name     IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 51-14 *GET_DAD_ATTRIBUTE Procedure Parameters*

Parameter	Description
dad_names	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (  
    dad_names      OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 51–15 *GET_DAD_LIST Procedure Parameters*

Parameter	Description
dad_names	The list of all DADs

Usage Notes

If no DADs exist then dad_names will be set to an empty array.

GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (  
    attr_name IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 51–16 *GET_GLOBAL_ATTRIBUTE Procedure Parameters*

Parameter	Description
attr_name	The global attribute to retrieve

Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2);
```

Parameters

Table 51–17 MAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

Exceptions

Raises an error if the DAD does not exist.

SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
    dad_name     IN  VARCHAR2,
    attr_name    IN  VARCHAR2,
    attr_value   IN  VARCHAR2);
```

Parameters

Table 51–18 SET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

Table 51–19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

Table 51–19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. `mod_plsql` users should note the following
 - The `PlsqlDatabasePassword` attribute is not needed.
 - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
    attr_name     IN VARCHAR2,
    attr_value    IN VARCHAR2);
```

Parameters

Table 51–20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

Table 51–21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurrences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

See Also: [Configuration Subprograms](#) on page 51-8 for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (  
    dad_name IN VARCHAR2,  
    path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 51–22 UNMAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to unmap
path	The virtual path to unmap

Usage Notes

Raises an error if the DAD does not exist.

DBMS_ERRLOG

The DBMS_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

See Also: *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS_ERRLOG and *Oracle Database SQL Language Reference* for `error_logging_clause` syntax

This chapter contains the following topics:

- [Using DBMS_ERRLOG](#)
 - Security Model
- [Summary of DBMS_ERRLOG Subprograms](#)

Using DBMS_ERRLOG

This section contains topics which relate to using the DBMS_ERRLOG package.

- [Security Model](#)

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

Summary of DBMS_ERRLOG Subprograms

Table 52–1 *DBMS_ERRLOG Package Subprograms*

Subprogram	Description
CREATE_ERROR_LOG Procedure on page 52-5	Creates the error logging table used in DML error logging

CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
    dml_table_name          IN VARCHAR2,
    err_log_table_name      IN VARCHAR2 := NULL,
    err_log_table_owner     IN VARCHAR2 := NULL,
    err_log_table_space     IN VARCHAR2 := NULL,
    skip_unsupported       IN BOOLEAN := FALSE);
```

Parameters

Table 52-2 CREATE_ERROR_LOG Procedure Parameters

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR\$_'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR\$_EMP' dml_table_name: '"Emp2"', err_log_table_name: 'ERR\$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                               Null?      Type
-----
CHANNEL_ID                          NOT NULL   CHAR(1)
```

CHANNEL_DESC	NOT NULL	VARCHAR2 (20)
CHANNEL_CLASS		VARCHAR2 (20)

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                               Null?    Type
-----
ORA_ERR_NUMBER$                   NUMBER
ORA_ERR_MSGG$                     VARCHAR2 (2000)
ORA_ERR_ROWID$                    ROWID
ORA_ERR_OPTYP$                   VARCHAR2 (2)
ORA_ERR_TAG$                      VARCHAR2 (2000)
CHANNEL_ID                        VARCHAR2 (4000)
CHANNEL_DESC                      VARCHAR2 (4000)
CHANNEL_CLASS                     VARCHAR2 (4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

The `DBMS_EXPFIL` package contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.

See Also: *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- [Summary of Expression Filter Subprograms](#)

Summary of Expression Filter Subprograms

Table 53–1 describes the subprograms in the DBMS_EXPFIL package.

All the values and names passed to the procedures defined in the DBMS_EXPFIL package are not case sensitive, unless otherwise mentioned. To preserve the case, you use double quotation marks around the values.

Table 53–1 DBMS_EXPFIL Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the attribute set
ADD_FUNCTIONS Procedure	Adds a function, type, or package to the approved list of functions with an attribute set
ASSIGN_ATTRIBUTE_SET Procedure	Assigns an attribute set to a column storing expressions
BUILD_EXCEPTIONS_TABLE Procedure	Creates an exception table to hold references to invalid expressions
CLEAR_EXPRSET_STATS Procedure	Clears the predicate statistics for an expression set
COPY_ATTRIBUTE_SET Procedure	Makes a copy of the attribute set
CREATE_ATTRIBUTE_SET Procedure	Creates an attribute set
DEFAULT_INDEX_PARAMETERS Procedure	Assigns default index parameters to an attribute set
DEFAULT_XINDEX_PARAMETERS Procedure	Assigns default XPath index parameters to an attribute set
DEFRAG_INDEX Procedure	Rebuilds the bitmap indexes online to reduce fragmentation
DROP_ATTRIBUTE_SET Procedure	Drops an unused attribute set
GET_EXPRSET_STATS Procedure	Collects predicate statistics for an expression set
GRANT_PRIVILEGE Procedure	Grants an expression DML privilege to a user
INDEX_PARAMETERS Procedure	Assigns index parameters to an expression set
MODIFY_OPERATOR_LIST Procedure	Modifies the list of common operators used in predicates with a certain attribute
REVOKE_PRIVILEGE Procedure	Revokes an expression DML privilege from a user
SYNC_TEXT_INDEXES Procedure	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions
UNASSIGN_ATTRIBUTE_SET Procedure	Breaks the association between a column storing expressions and the attribute set
VALIDATE_EXPRESSIONS Procedure	Validates expression metadata and the expressions stored in a column
XINDEX_PARAMETERS Procedure	Assigns XPath index parameters to an expression set

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to the attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_type  IN   VARCHAR2,
  attr_defv1 IN   VARCHAR2 DEFAULT NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  tab_alias  IN   exf$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_type  IN   VARCHAR2,
  text_pref  IN   EXF$TEXT);
```

Parameters

Table 53–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defv1	Default value for the elementary attribute
tab_alias	Type that identifies the database table to which the attribute is aliased
text_pref	Text preferences such as LEXER and WORDLIST specification.

Usage Notes

- This procedure adds an elementary attribute to an attribute set. If the attribute set was originally created from an existing object type, then additional attributes cannot be added.
- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or

more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.

- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- The default value specification for an attribute is similar to a default value specification for a table column. The resulting default values should agree with the datatype of the attribute. For example, valid default values for an attribute of DATE datatype are SYSDATE and `to_date('01-01-2004', 'DD-MM-YYYY')`.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a VARCHAR2 or a CLOB. The preferences specified with this procedure are validated only when an Expression Filter index is created using this attribute set.
- These preferences are used in the creation of the CTXRULE index that processes the predicates involving CONTAINS operator. The valid preferences are those that are valid in the PARAMETERS clause of CTXRULE index creation. See *Oracle Text Application Developer's Guide* for the syntax.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set   => 'HRAttrSet',
    attr_name  => 'HRREP',
    attr_type  => 'VARCHAR2(30)',
    attr_defv1 => 'Betty Smith');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set   => 'HRAttrSet',
    attr_name  => 'DEPT',
    tab_alias  => exf$table_alias('DEPT'));
END;
/
```

The following commands define a CreationTime elementary attribute that takes the database time as the default value.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
    attr_set   => 'PurchaseOrder',
    attr_name  => 'CreationTime',
    attr_type  => 'DATE',
    attr_defv1 => 'SYSDATE');
END;
/
```

Alternately, the following commands initialize the CreationTime attribute to a specific value when it is not explicitly specified in the data item passed to the EVALUATE operator.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
```

```

                                attr_set => 'PurchaseOrder',
                                attr_name => 'CreationTime',
                                attr_type => 'DATE',
                                attr_defvl => 'to_date(''01-01-2004'', ''DD-MM-YYYY'')');
END;
/

```

The following commands create an attribute set with a Model attribute of VARCHAR2 data type and an InsReport attribute configured for text predicates.

```

BEGIN
  DBMS_EXPFIL.CREATE_EVENT_STRUT(event_struct => 'Car4Sale');
  // create scalar attributes
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Model',
    attr_type => 'VARCHAR2(30)');

  //create text attribute
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'InsReport',
    attr_type => 'CLOB',
    attr_type => exf$text(
      'LEXER insrpt_lexer
      WORDLIST insrpt_wordlist'));
END;
/

```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the attribute set.

Syntax

```
DBMS_EXPFIL.ADD_FUNCTIONS (
    attr_set    IN    VARCHAR2,
    funcs_name IN    VARCHAR2);
```

Parameters

Table 53–3 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use by the expression set. If the expression set refers to a user-defined function, the function must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list. The function added to the attribute set, and thus used in the stored expressions, should not perform any DML or DDL (database state changing) operations. Any violations to this rule will only be caught at run-time while evaluating the expressions (this implies that this will not be checked during the ADD_FUNCTIONS procedure call).
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the expression set are considered valid. The expressions in a set can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
    DBMS_EXPFIL.ADD_FUNCTIONS (
        attr_set => 'Car4Sale',
        funcs_name => 'HorsePower');
    DBMS_EXPFIL.ADD_FUNCTIONS (
        attr_set => 'Car4Sale',
        funcs_name => 'Scott.CrashTestRating');
```

```
END;  
/
```

ASSIGN_ATTRIBUTE_SET Procedure

This procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column.

Syntax

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (
  attr_set   IN   VARCHAR2,
  expr_tab   IN   VARCHAR2,
  expr_col   IN   VARCHAR2,
  force      IN   VARCHAR2 DEFAULT 'FALSE');
```

Parameters

Table 53–4 ASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
force	Argument used to trust the existing expressions in a table (and skip validation)

Usage Notes

- The ASSIGN_ATTRIBUTE_SET procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column. The attribute set contains the elementary attribute names and their datatypes and any functions used in the expressions. The attribute set is used by the Expression column to validate changes and additions to the expression set.
- An attribute set can be assigned only to a table column in the same schema as the attribute set. An attribute set can be assigned to one or more table columns. Assigning an attribute set to a column storing expressions implicitly creates methods for the associated object type. For this operation to succeed, the object type cannot have any dependent objects before the attribute set is assigned.
- By default, the column should not have any expressions at the time of association. However, if the values in the column are known to be valid expressions, you can use a value of 'TRUE' for the force argument to assign the attribute set to a column containing expressions.
- See "Defining Expression Columns" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following command assigns the attribute set to a column storing expressions. The expression set should be empty at the time of association.

```
BEGIN
  DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (attr_set => 'Car4Sale',
```

```
END;  
/  
expr_tab => 'Consumer',  
expr_col => 'Interest');
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates the exception table, used in validation, in the current schema.

Syntax

```
DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (  
    exception_tab IN VARCHAR2);
```

Parameters

Table 53–5 *BUILD_EXCEPTIONS_TABLE Procedure Parameter*

Parameter	Description
exception_tab	Name of the exception table

Usage Notes

- The expressions stored in a table column can be validated using the `VALIDATE_EXPRESSIONS` procedure. During expression validation, you can optionally provide the name of the exception table in which the references to the invalid expressions are stored. The `BUILD_EXCEPTIONS_TABLE` procedure creates the exception table in the current schema.
- See "Evaluation Semantics" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [VALIDATE_EXPRESSIONS Procedure](#) in this chapter for more information.
- Related view: `USER_TABLES`

Examples

The following command creates the exception table, `InterestExceptions`, in the current schema:

```
BEGIN  
    DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (  
                                                exception_tab => 'InterestExceptions');  
END;  
/
```

CLEAR_EXPRSET_STATS Procedure

This procedure clears the predicate statistics for the expression set stored in a table column.

Syntax

```
DBMS_EXPFIL.CLEAR_EXPRSET_STATS (
    expr_tab  IN  VARCHAR2,
    expr_col  IN  VARCHAR2);
```

Parameters

Table 53–6 *CLEAR_EXPRSET_STATS Procedure Parameters*

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

Usage Notes

- This procedure clears the predicate statistics for the expression set stored in a table column. See also [GET_EXPRSET_STATS Procedure](#) in this chapter for information about gathering the statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS

Examples

The following command clears the predicate statistics for the expression set stored in Interest column of the Consumer table:

```
BEGIN
    DBMS_EXPFIL.CLEAR_EXPRSET_STATS (expr_tab => 'Consumer',
                                     expr_col => 'Interest');
END;
/
```

COPY_ATTRIBUTE_SET Procedure

This procedure copies an attribute set along with its user-defined function list and default index parameters to another set.

Syntax

```
DBMS_EXPFIL.COPY_ATTRIBUTE_SET (
  from_set  IN  VARCHAR2,
  to_set    IN  VARCHAR2);
```

Parameters

Table 53–7 COPY_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
from_set	Name of an existing attribute set to be copied
to_set	Name of the new attribute set

Usage Notes

- A schema-extended name can be used for the `from_set` argument to copy an attribute set across schemas. The user issuing the command must have `EXECUTE` privileges for the object type associated with the original attribute set. The user must ensure that any references to schema objects (user-defined functions, tables, and embedded objects) are valid in the new schema.
- The default index parameters and the user-defined function list of the new set can be changed independent of the original set.
- Related views: `ALL_EXPFIL_ATTRIBUTE_SETS` and `ALL_EXPFIL_ATTRIBUTES`.

Examples

The following command makes a copy of the `Car4Sale` attribute set:

```
BEGIN
  DBMS_EXPFIL.COPY_ATTRIBUTE_SET (from_set => 'Car4Sale',
                                  to_set   => 'Vehicle');
END;
/
```

CREATE_ATTRIBUTE_SET Procedure

This procedure creates an empty attribute set or an attribute set with a complete set of elementary attributes derived from an object type with a matching name.

Syntax

```
DBMS_EXPFIL.CREATE_ATTRIBUTE_SET (
  attr_set   IN   VARCHAR2,
  from_type  IN   VARCHAR2 DEFAULT 'NO');
```

Parameters

Table 53–8 CREATE_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to be created
from_type	YES, if the attributes for the attribute set should be derived from an existing object type

Usage Notes

- The object type used for an attribute set cannot contain any user methods, and it should not be an evolved type (with the use of `ALTER TYPE` command). This object type should not have any dependent objects at the time of the attribute set creation. If the attribute set is not derived from an existing object type, this procedure creates an object type with a matching name.
- An attribute set with one or more table alias attributes cannot be derived from an object type. For this purpose, create an empty attribute set and add one elementary attribute at a time using the `DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE` procedure. (See Appendix A in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.)
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [ADD_ELEMENTARY_ATTRIBUTE Procedures](#) in this chapter for more information.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.

Examples

The following commands create an attribute set with all the required elementary attributes derived from the `Car4Sale` type:

```
CREATE OR REPLACE TYPE Car4Sale AS OBJECT
    (Model   VARCHAR2(20),
     Year    NUMBER,
     Price   NUMBER,
     Mileage NUMBER);
/

BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale',
                                  from_type => 'YES');
END;
/
```

Assuming that the `Car4Sale` type does not exist, the attribute set can be created from scratch as shown in the following example:

```
BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Model',
    attr_type => 'VARCHAR2(20)');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Year',
    attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Price',
    attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
    attr_set => 'Car4Sale',
    attr_name => 'Mileage',
    attr_type => 'NUMBER');
END;
/
```

DEFAULT_INDEX_PARAMETERS Procedure

This procedure assigns default index parameters to an attribute set. It also adds or drops a partial list of stored and indexed attributes to or from the default list associated with the attribute list.

Syntax

```
DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
  attr_set   IN   VARCHAR2,
  attr_list  IN   EXF$ATTRIBUTE_LIST,
  operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–9 *DEFAULT_INDEX_PARAMETERS Procedure Parameters*

Parameter	Description
attr_set	Name of the attribute set
attr_list	An instance of EXF\$ATTRIBUTE_LIST with a partial list of (default) stored and indexed attributes for an Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- Existing Expression Filter indexes are not modified when the default parameters for the corresponding attribute set are changed. The new index defaults are used when a new Expression Filter index is created and when an existing index is rebuilt. (See "Alter Index Rebuild" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.)
- See "Creating an Index from Default Parameters" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about assigning default index parameters to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command adds the specified stored and indexed attributes to the attribute set's default index parameters list:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
    attr_set => 'Car4Sale',
    attr_list => exf$attribute_list (
      exf$attribute (attr_name => 'Model',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'Price',
                    attr_oper => exf$indexoper('all'),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'HorsePower(Model, Year)',
                    attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
                    attr_indexed => 'FALSE'),
      exf$attribute (attr_name => 'CrashTestRating(Model, Year)',
```

```

        attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
        attr_indexed => 'FALSE'),
    operation => 'ADD');
END;
/

```

The following command drops the `CrashTestRating(Model, Year)` attribute (stored or indexed) from the previous list.

```

BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    attr_list => exf$attribute_list (
      exf$attribute (attr_name => 'CrashTestRating(Model, Year)'),
    operation => 'DROP');
END;
/

```

DEFAULT_XPINDEX_PARAMETERS Procedure

This procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set.

Syntax

```
DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS (
  attr_set   IN   VARCHAR2,
  xmlt_attr  IN   VARCHAR2,
  xptag_list IN   EXF$XP_PATH_TAGS,
  operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–10 DEFAULT_XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
xmlt_attr	Name of the attribute with the XMLType datatype
xptag_list	An instance of EXF\$XP_PATH_TAGS type with a partial list of XML elements and attributes to be configured for the Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- The attribute set used for an expression set may have one or more XML type attributes (defined with XMLType datatype) and the corresponding expressions may contain XPath predicates on these attributes. The Expression Filter index created for the expression set can be tuned to process these XPath predicates efficiently by using some XPath-specific index parameters (in addition to some non-XPath index parameters).
- The DEFAULT_XPINDEX_PARAMETERS procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set. The XPath parameters are assigned to a specific XMLType attribute in the attribute set and this information can be viewed using the USER_EXPFIL_DEF_INDEX_PARAMS view. The DEFAULT_INDEX_PARAMETERS procedure and the DEFAULT_XPINDEX_PARAMETERS procedure can be used independent of each other. They maintain a common list of default index parameters for the attribute set.
- See "Index Tuning for XPath Predicates" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about XPath parameters to the default index parameters of an attribute set. See also [DEFAULT_INDEX_PARAMETERS Procedure](#) in this chapter for more information about default index parameters.
- Related views: USER_EXPFIL_ATTRIBUTES and USER_EXPFIL_DEF_INDEX_PARAMS.

Note: The values assigned to the tag_name argument of exf\$xpath_tag type are case sensitive.

Examples

The following command adds the specified XML tags to the default index parameters list along with their preferences such as positional or value filter and indexed or stored predicate group:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    xmlt_attr => 'Details',
    xptag_list =>                                --- XPath tag list
    exf$xpath_tags(
      exf$xpath_tag(tag_name => 'stereo@make', --- XML attribute
                    tag_indexed => 'TRUE',
                    tag_type => 'VARCHAR(15)'), --- value filter
      exf$xpath_tag(tag_name => 'stereo', --- XML element
                    tag_indexed => 'FALSE',
                    tag_type => null), --- positional filter
      exf$xpath_tag(tag_name => 'memory', --- XML element
                    tag_indexed => 'TRUE',
                    tag_type => 'VARCHAR(10)'), --- value filter
      exf$xpath_tag(tag_name => 'GPS',
                    tag_indexed => 'TRUE',
                    tag_type => null)
    )
  );
END;
/
```

The following command drops the stereo@make tag from the default index parameters:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
    attr_set => 'Car4Sale',
    xmlt_attr => 'Details',
    xptag_list =>                                --- XPath tag list
    exf$xpath_tags(
      exf$xpath_tag(tag_name => 'stereo@make')
    ),
    operation => 'DROP'
  );
END;
/
```

DEFRAG_INDEX Procedure

This procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.

Syntax

```
DBMS_EXPFIL.DEFRAG_INDEX (
  idx_name IN VARCHAR2);
```

Parameters

Table 53–11 DEFRAG_INDEX Procedure Parameter

Parameter	Description
idx_name	Name of the Expression Filter index

Usage Notes

- The bitmap indexes defined for the indexed attributes of an Expression Filter index become fragmented as additions and updates are made to the expression set. The DEFRAG_INDEX procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.
- Indexes can be defragmented when the expression set is being modified. However, you should schedule defragmentation when the workload is relatively light.
- See "Index Storage and Maintenance" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.
- Related views: USER_EXPFIL_INDEXES and USER_INDEXES.

Examples

The following command is issued to defragment the bitmap indexes associated with the Expression Filter index:

```
BEGIN
  DBMS_EXPFIL.DEFRAG_INDEX (idx_name => 'InterestIndex');
END;
/
```

DROP_ATTRIBUTE_SET Procedure

This procedure drops an attribute set not being used for any expression set.

Syntax

```
DBMS_EXPFIL.DROP_ATTRIBUTE_SET (  
    attr_set IN VARCHAR2);
```

Parameters

Table 53–12 *DROP_ATTRIBUTE_SET Procedure Parameter*

Parameter	Description
attr_set	Name of the attribute set to be dropped

Usage Notes

- The DROP_ATTRIBUTE_SET procedure drops an attribute set not being used for any expression set. If the attribute set was initially created from an existing object type, the object type remains after dropping the attribute set. Otherwise, the object type is dropped with the attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS.

Examples

Assuming that the attribute set is not used by an Expression column, the following command drops the attribute set:

```
BEGIN  
    DBMS_EXPFIL.DROP_ATTRIBUTE_SET(attr_set => 'Car4Sale');  
END;  
/
```

GET_EXPRSET_STATS Procedure

This procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.

Syntax

```
DBMS_EXPFIL.GET_EXPRSET_STATS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

Parameters

Table 53–13 GET_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

Usage Notes

- When a representative set of expressions are stored in a table column, you can use predicate statistics for those expressions to configure the corresponding Expression Filter index (using the TOP parameters clause). The GET_EXPRSET_STATS procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.
- See "Creating an Index from Statistics" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about using predicate statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS.

Examples

The following command computes the predicate statistics for the expressions stored in the Interest column of the Consumer table:

```
BEGIN
  DBMS_EXPFIL.GET_EXPRSET_STATS (expr_tab => 'Consumer',
                                expr_col => 'Interest');
END;
/
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on one or more Expression columns to other users.

Syntax

```
DBMS_EXPFIL.GRANT_PRIVILEGE (
    expr_tab   IN  VARCHAR2,
    expr_col   IN  VARCHAR2,
    priv_type  IN  VARCHAR2,
    to_user    IN  VARCHAR2);
```

Parameters

Table 53–14 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of the privilege to be granted. Valid values: INSERT EXPRESSION, UPDATE EXPRESSION, ALL.
to_user	User to whom the privilege is to be granted

Usage Notes

- The SQL EVALUATE operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have INSERT and UPDATE privileges for the table and INSERT EXPRESSION and UPDATE EXPRESSION privilege for a specific Expression column in the table.
- Using the GRANT_PRIVILEGE procedure, the owner of the table can grant INSERT EXPRESSION or UPDATE EXPRESSION privileges on one or more Expression columns to other users. Both the privileges can be granted to a user by specifying ALL for the privilege type.
- See [REVOKE_PRIVILEGE Procedure](#) in this chapter and "Granting and Revoking Privileges" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The owner of Consumer table can grant INSERT EXPRESSION privileges to user SCOTT with the following command. User SCOTT should also have INSERT privileges on the table so that he can add new expressions to the set.

```
BEGIN
    DBMS_EXPFIL.GRANT_PRIVILEGE (expr_tab => 'Consumer',
                                expr_col  => 'Interest',
                                priv_type => 'INSERT EXPRESSION',
                                to_user   => 'SCOTT');
END;
```

INDEX_PARAMETERS Procedure

This procedure fine-tunes the index parameters for each expression set before index creation.

Syntax

```
DBMS_EXPFIL.INDEX_PARAMETERS (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2,
  attr_list IN  EXF$ATTRIBUTE_LIST,
  operation IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–15 INDEX_PARAMETERS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions.
attr_list	An instance of EXF\$ATTRIBUTE_LIST with a partial list of stored and indexed attributes
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- An attribute set can be used by multiple expression sets stored in different columns of user tables. By default, the index parameters associated with the attribute set are used to define an Expression Filter index on an expression set. If you need to fine-tune the index for each expression set, you can specify a small list of the index parameters in the PARAMETERS clause of the CREATE INDEX statement. However, when an Expression Filter index uses a large number of index parameters or if the index is configured for XPath predicates, fine-tuning the parameters with the CREATE INDEX statement is not possible.
- The INDEX_PARAMETERS procedure fine-tunes the index parameters for each expression set before index creation. This procedure can be used to copy the defaults from the corresponding attribute set and selectively add (or drop) additional index parameters for the expression set. (You use the XPINDEX_PARAMETERS procedure to add and drop XPath index parameters.) The Expression Filter index defined for an expression set with a non-empty list of index parameters always uses these parameters. The INDEX_PARAMETERS procedure cannot be used when the Expression Filter index is already defined for the column storing expressions.
- The operations allowed with this procedure include:
 - Deriving the current list of default index parameters (including any XPath-specific parameters) from the corresponding attribute set and assigning them to the specified expression set (a value of DEFAULT for the operation argument).
 - Adding (or dropping) one or more attributes to (or from) the current list of parameters assigned to the expression set (values of ADD or DROP for the operation argument).

- Clearing the index parameters assigned to the expression set. This enables the user to start using default parameters or tune the parameters from scratch (a value of CLEAR for the operation argument).

Note: This procedure is useful only when an attribute set is shared across multiple expression sets. In all other cases, the defaults assigned to the attribute set can be tuned for the expression set using it.

- See "Creating an Index from Exact Parameters" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [XPINDEX_PARAMETERS Procedure](#) in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_DEF_INDEX_PARAMS and USER_EXPFIL_INDEX_PARAMS.

Examples

The following command synchronizes the expression set's index parameters with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                              expr_col => 'Interest',
                              attr_list => null,
                              operation => 'DEFAULT');
END;
/
```

The following command adds a stored attribute to the expression set's index parameters.

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                              expr_col => 'Interest',
                              attr_list =>
                                exf$attribute_list (
                                  exf$attribute (
                                    attr_name => 'CrashTestRating(Model, Year)',
                                    attr_oper => exf$indexoper('all'),
                                    attr_indexed => 'FALSE')),
                              operation => 'ADD');
END;
/
```

The following command clears the index parameters associated with the expression set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                              expr_col => 'Interest',
                              attr_list => null,
                              operation => 'CLEAR');
END;
/
```

A subsequent index creation will use the default index parameters assigned to the corresponding attribute set.

MODIFY_OPERATOR_LIST Procedure

This procedure modifies the list of common operators associated with a certain attribute in the attribute set.

Syntax

```
DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
  attr_set   IN   VARCHAR2,
  attr_name  IN   VARCHAR2,
  attr_oper  IN   EXF$INDEXOPER);
```

Parameters

Table 53–16 *MODIFY_OPERATOR_LIST Procedure Parameters*

Parameter	Description
attr_set	Name of the attribute set
attr_name	Name of the stored or indexed attribute being modified
attr_oper	New list of operators that are frequently used in the predicates with the attribute

Usage Notes

- The `MODIFY_OPERATOR_LIST` procedure modifies the operator list for the stored and indexed attributes defined in the attribute set's default index parameters. Existing Expression Filter indexes are not affected when an attribute's operator list is modified. The updated index defaults are used when a new Expression Filter index is created or when an existing index is rebuilt.
- Related views: `USER_EXPFIL_DEF_INDEX_PARAMS`

Examples

The following command modifies the operator list associated with the `HorsePower (Model, Year)` attribute defined in the `Car4Sale` attribute set.

```
BEGIN
  DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
    attr_set => 'Car4Sale',
    attr_name => 'HorsePower (Model, Year)',
    attr_oper => exf$indexoper('=', '<', '>', 'between'));
END;
/
```

REVOKE_PRIVILEGE Procedure

This procedure revokes an expression privilege previously granted by the owner.

Syntax

```
DBMS_EXPFIL.REVOKE_PRIVILEGE (
    expr_tab   IN  VARCHAR2,
    expr_col   IN  VARCHAR2,
    priv_type  IN  VARCHAR2,
    from_user  IN  VARCHAR2);
```

Parameters

Table 53–17 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of privilege to be revoked
from_user	User from whom the privilege is to be revoked

Usage Notes

- The REVOKE_PRIVILEGE procedure revokes an expression privilege previously granted by the owner.
- See [GRANT_PRIVILEGE Procedure](#) in this chapter and "Granting and Revoking Privileges" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The following command revokes the INSERT EXPRESSION privilege on the Interest column of the Consumer table from user SCOTT:

```
BEGIN
    DBMS_EXPFIL.REVOKE_PRIVILEGE (expr_tab => 'Consumer',
                                  expr_col => 'Interest',
                                  priv_type => 'INSERT EXPRESSION',
                                  from_user => 'SCOTT');
END;
/
```

SYNC_TEXT_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions.

Syntax

```
DBMS_EXPFIL.SYNC_TEXT_INDEXES (
    expr_tab IN VARCHAR2);
```

Parameters

Table 53–18 SYNC_TEXT_INDEXES Procedure Parameters

Parameter	Description
expr_tab	Name of table with expression columns containing text predicates

Usage Notes

- When an expression filter index is defined on a column storing expressions, any text predicates in the expressions are indexed using a CTXRULE index. Unlike the other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process the predicates in the expression set, the CTXRULE index defined to process the text predicates is not transactional in nature. That is, when the text predicates are updated with DML operations on the table storing expressions, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results until the CTXRULE index is synchronized. This procedure can be used to synchronize all the CTXRULE indexes associated with a table with one or more expression columns. This procedure identifies all the CTXRULE indexes and invokes the CTX_DDL.SYNC_INDEX procedure on each of these indexes.

You must have EXECUTE privileges on the CTX_DDL package for successful synchronization of the text indexes.

Examples

The following command synchronizes the text indexes associated with the expression columns in the CONSUMER table:

```
BEGIN
    DBMS_EXPFIL.SYNC_TEXT_INDEXES (expr_tab => 'Consumer');
END;
/
```

UNASSIGN_ATTRIBUTE_SET Procedure

This procedure unassigns an attribute set from a column storing expressions.

Syntax

```
DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (
  expr_tab  IN  VARCHAR2,
  expr_col  IN  VARCHAR2);
```

Parameters

Table 53–19 UNASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

Usage Notes

- A column of an expression datatype can be converted back to a VARCHAR2 type by unassigning the attribute set. You can unassign an attribute set from a column storing expressions if an Expression Filter index is not defined on the column.
- See [ASSIGN_ATTRIBUTE_SET Procedure](#) in this chapter for information about assigning attribute sets.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_INDEXES.

Examples

The following command unassigns the attribute set previously assigned to the Interest column of the Consumer table. (See "Bulk Loading of Expression Data" in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.)

```
BEGIN
  DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (expr_tab => 'Consumer',
                                     expr_col => 'Interest');
END;
/
```

VALIDATE_EXPRESSIONS Procedure

This procedure validates all the expressions in a set.

Syntax

```
DBMS_EXPFIL.VALIDATE_EXPRESSIONS (
  expr_tab      IN  VARCHAR2,
  expr_col      IN  VARCHAR2,
  exception_tab IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 53–20 VALIDATE_EXPRESSIONS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
exception_tab	Name of the exception table. This table is created using the BUILD_EXCEPTIONS_TABLE procedure.

Usage Notes

- The expressions stored in a table may have references to schema objects like user-defined functions and tables. When these schema objects are dropped or modified, the expressions could become invalid and the subsequent evaluation (query with EVALUATE operator) could fail.
- The VALIDATE_EXPRESSIONS procedure validates all the expressions in a set. By default, the expression validation utility fails on the first expression that is invalid. Optionally, the caller can pass an exception table to store references to all the invalid expressions. In addition to validating expressions in the set, this procedure validates the parameters (stored and indexed attributes) of the associated index and the approved list of user-defined functions. Any errors in the index parameters or the user-defined function list are immediately reported to the caller.
- See "Evaluation Semantics" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and [BUILD_EXCEPTIONS_TABLE Procedure](#) in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_ASET_FUNCTIONS, and USER_EXPFIL_PREDTAB_ATTRIBUTES.

Examples

The following command validates the expressions stored in the Interest column of the Consumer table.

```
BEGIN
  DBMS_EXPFIL.VALIDATE_EXPRESSIONS (expr_tab => 'Consumer',
                                    expr_col => 'Interest');
END;
/
```

XPINDEX_PARAMETERS Procedure

This procedure is used in conjunction with the `INDEX_PARAMETERS` procedure to fine-tune the XPath-specific index parameters for each expression set.

Syntax

```
DBMS_EXPFIL.XPINDEX_PARAMETERS (
  expr_tab   IN   VARCHAR2,
  expr_col   IN   VARCHAR2,
  xmlt_attr  IN   VARCHAR2,
  xptag_list IN   EXF$XPATH_TAGS,
  operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 53–21 *XPINDEX_PARAMETERS Procedure Parameters*

Parameter	Description
<code>exp_tab</code>	Name of table storing the expression set
<code>expr_col</code>	Name of column in the table that stores the expressions
<code>xmlt_attr</code>	Name of the attribute with the XMLType datatype
<code>xptag_list</code>	An instance of EXF\$XPATH_TAGS type with a partial list of XML elements and attributes
<code>operation</code>	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- When an attribute set is shared by multiple expression sets, the `INDEX_PARAMETERS` procedure can be used to tune the simple (non-XPath) index parameters for each expression set. The `XPINDEX_PARAMETERS` procedure is used in conjunction with the `INDEX_PARAMETERS` procedure to fine-tune the XPath-specific index parameters for each expression set.
- See also [INDEX_PARAMETERS Procedure](#) in this chapter and "Index Tuning for XPath Predicates" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.
- Related views: `USER_EXPFIL_ATTRIBUTES`, `USER_EXPFIL_DEF_INDEX_PARAMS`, and `USER_EXPFIL_INDEX_PARAMS`.

Note: The values assigned to the `tag_name` argument of `exf$xpath_tag` type are case-sensitive.

Examples

The following command synchronizes the expression set's index parameters (XPath and non-XPath) with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab => 'Consumer',
                               expr_col => 'Interest',
                               attr_list => null,
                               operation => 'DEFAULT');
```

```
END;  
/
```

The following command adds an XPath-specific index parameter to the expression set:

```
BEGIN  
  DBMS_EXPFIL.XPINDEX_PARAMETERS(expr_tab => 'Consumer',  
    expr_col => 'Interest',  
    xmlt_attr => 'Details',  
    xptag_list =>  
      exf$xpath_tags(  
        exf$xpath_tag(tag_name => 'GPS',  
          tag_indexed => 'TRUE',  
          tag_type => NULL)),  
    operation => 'ADD');  
END;  
/
```

The DBMS_FGA package provides fine-grained security functions.

This chapter contains the following topics:

- [Using DBMS_FGA](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_FGA Subprograms](#)

Using DBMS_FGA

- [Security Model](#)
- [Operational Notes](#)

Security Model

Execute privilege on DBMS_FGA is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to `DBA_FGA_AUDIT_TRAIL` to analyze the SQL text and corresponding bind variables that are issued.

Summary of DBMS_FGA Subprograms

Table 54–1 DBMS_FGA Package Subprograms

Subprogram	Description
ADD_POLICY Procedure on page 54-6	Creates an audit policy using the supplied predicate as the audit condition
DISABLE_POLICY Procedure on page 54-11	Disables an audit policy
DROP_POLICY Procedure on page 54-12	Drops an audit policy
ENABLE_POLICY Procedure on page 54-13	Enables an audit policy

ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

Syntax

```
DBMS_FGA.ADD_POLICY (
    object_schema    VARCHAR2,
    object_name      VARCHAR2,
    policy_name      VARCHAR2,
    audit_condition  VARCHAR2,
    audit_column     VARCHAR2,
    handler_schema   VARCHAR2,
    handler_module   VARCHAR2,
    enable           BOOLEAN,
    statement_types  VARCHAR2,
    audit_trail      BINARY_INTEGER IN DEFAULT,
    audit_column_opts BINARY_INTEGER IN DEFAULT);
```

Parameters

Table 54–2 ADD_POLICY Procedure Parameters

Parameter	Description	Default Value
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)	NULL
object_name	The name of the object to be audited.	-
policy_name	The unique name of the policy.	-
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.	NULL
audit_column	The columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.	NULL
handler_schema	The schema that contains the event handler. The default, NULL, causes the current schema to be used.	NULL
handler_module	The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.	NULL
enable	Enables the policy if TRUE, which is the default.	TRUE
statement_types	The SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only.	SELECT
audit_trail	Destination (DB or XML) of fine grained audit records. Also specifies whether to populate LSQLTEXT and LSQLBIND in fga_log\$.	DB+EXTENDED
audit_column_opts	Establishes whether a statement is audited when the query references <i>any</i> column specified in the audit_column parameter or only when <i>all</i> such columns are referenced.	ANY_COLUMNS

Usage Notes

- If `object_schema` is not specified, the current log-on user schema is assumed.

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. This condition can be NULL (or omitted), which is interpreted as TRUE, but it cannot contain the following elements:
 - Subqueries or sequences
 - Any direct use of `SYSDATE`, `UID`, `USER` or `USERENV` functions. However, a user-defined function and other SQL functions can use these functions to return the desired information.
 - Any use of the pseudo columns `LEVEL`, `PRIOR`, or `ROWNUM`.

Specifying an audit condition of "1=1" to force auditing of all specified statements ("`statement_types`") affecting the specified column ("`audit_column`") is no longer needed to achieve this purpose. NULL will cause audit even if no rows were processed, so that all actions on a table with this policy are audited.

- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

```
PROCEDURE <fname> ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
VARCHAR2 ) AS ...
```

where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.

- The `audit_trail` parameter specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
 - If `audit_trail` includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\%DB_UNIQUE_NAME\adump` on Windows systems.)
 - If `audit_trail` includes DB instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database.
 - If `audit_trail` includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
 - For example:

- * Setting `audit_trail` to `DBMS_FGA.DB` sends the audit trail to the `SYS.FGA_LOG$` table in the database and omits SQL Text and SQL Bind.
- * Setting `audit_trail` to `DBMS_FGA.DB + DBMS_FGA.EXTENDED` sends the audit trail to the `SYS.FGA_LOG$` table in the database and includes SQL Text and SQL Bind.
- * Setting `audit_trail` to `DBMS_FGA.XML` writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
- * Setting `audit_trail` to `DBMS_FGA.XML + DBMS_FGA.EXTENDED` writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

The `audit_trail` parameter appears in the `ALL_AUDIT_POLICIES` view.

- You can change the operating system destination using the following command:

```
ALTER SYSTEM SET AUDIT_FILE_DEST = '<New Directory>' DEFERRED
```
- On many platforms, XML audit files are named `<process_name>_<processId>.xml`, for example, `ora_2111.xml`, or `s002_11.xml`. On Windows, the XML audit files are named `<process_name>_<ThreadId>.xml` (or `<process_name>_ProcessId.xml` if the process is not running as a thread).
- The `audit_column_opts` parameter establishes whether a statement is audited
 - when the query references *any* column specified in the `audit_column` parameter (`audit_column_opts = DBMS_FGA.ANY_COLUMNS`), or
 - only when *all* such columns are referenced (`audit_column_opts = DBMS_FGA.ALL_COLUMNS`).

The default is `DBMS_FGA.ANY_COLUMNS`.

The `ALL_AUDIT_POLICIES` view also shows `audit_column_opts`.

- When `audit_column_opts` is set to `DBMS_FGA.ALL_COLUMNS`, a SQL statement is audited only when all the columns mentioned in `audit_column` have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

Also, all these columns must refer to a single table/view or alias.

Thus, if a SQL statement selects the columns from different table aliases, the statement will not be audited.

V\$XML_AUDIT_TRAIL View

The new values for the `audit_trail` parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

A new dynamic view, `V$XML_AUDIT_TRAIL`, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Since the audit XML files are stored in files with extension .xml on all platforms, the dynamic view presents audit information similarly on all platforms, using the following schema:

Table 54-3 Elements in the V\$XML_AUDIT_TRAIL Dynamic View

Element	Type
AUDIT_TYPE	VARCHAR2 (18)
SESSION_ID	NUMBER
PROXY_SESSIONID	NUMBER
STATEMENTID	NUMBER
ENTRYID	NUMBER
EXTENDED_TIMESTAMP	TIMESTAMP (6) WITH TIME ZONE
GLOBAL_UID	VARCHAR2 (32)
DB_USER	VARCHAR2 (30)
CLIENT_ID	VARCHAR2 (64)
EXT_NAME	VARCHAR2 (4000)
OS_USER	VARCHAR2 (255)
USERHOST	VARCHAR2 (128)
OS_PROCESS	VARCHAR2 (16)
TERMINAL	VARCHAR2 (255)
INSTANCE_NUMBER	NUMBER
OBJECT_SCHEMA	VARCHAR2 (30)
OBJECT_NAME	VARCHAR2 (128)
POLICY_NAME	VARCHAR2 (30)
STATEMENT_TYPE	VARCHAR2 (28)
TRANSACTIONID	RAW (8)
SCN	NUMBER
COMMENT_TEXT	VARCHAR2 (4000)
SQL_BIND	VARCHAR2 (4000)
SQL_TEXT	VARCHAR2 (4000)

Usage Notes

- Every XML audit record contains the elements `AUDIT_TYPE` and `EXTENDED_TIMESTAMP`, with the latter printed in UTC zone (with no timezone information). Values retrieved using `V$XML_AUDIT_TRAIL` view are converted to session timezone and printed.
- For `SQL_TEXT` and `SQL_BIND` element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such `SQL_TEXT` and `SQL_BIND` values.
- For large numbers of XML audit files, querying `V$XML_AUDIT_TRAIL` is faster when they are loaded into a database table using `SQL*Loader` or a similar tool. XML audit files are larger than the equivalent written to OS files when `AUDIT_TRAIL=OS`.

- Error handling is the same as when AUDIT_TRAIL=OS. If any error occurs in writing an audit record to disk, including the directory identified by AUDIT_FILE_DEST being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.

Examples

```
DBMS_FGA.ADD_POLICY (  
  object_schema => 'scott',  
  object_name   => 'emp',  
  policy_name   => 'mypolicy1',  
  audit_condition => 'sal < 100',  
  audit_column  => 'comm,sal',  
  handler_schema => NULL,  
  handler_module => NULL,  
  enable        => TRUE,  
  statement_types => 'INSERT, UPDATE',  
  audit_trail   => DBMS_FGA.XML + DBMS_FGA.EXTENDED,  
  audit_column_opts => DBMS_FGA.ANY_COLUMNS);
```

DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2 );
```

Parameters

Table 54–4 *DISABLE_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

The default value for `object_schema` is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DISABLE_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1');
```

DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    policy_name    VARCHAR2 );
```

Parameters

Table 54–5 DROP_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

Usage Notes

The DBMS_FGA procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the DBMS_FGA procedures are part of the DDL transaction. The default value for object_schema is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DROP_POLICY (  
    object_schema => 'scott',  
    object_name   => 'emp',  
    policy_name   => 'mypolicy1');
```

ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_name    VARCHAR2,
  enable         BOOLEAN);
```

Parameters

Table 54–6 *ENABLE_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema of the object to be audited. (If <code>NULL</code> , the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.
enable	Defaults to <code>TRUE</code> to enable the policy.

Examples

```
DBMS_FGA.ENABLE_POLICY (
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1',
  enable        => TRUE);
```

DBMS_FILE_GROUP

The `DBMS_FILE_GROUP` package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. This package can be used to create and manage file group repositories.

See Also: *Oracle Streams Concepts and Administration*

This chapter contains the following topics:

- [Using DBMS_FILE_GROUP](#)
 - Overview
 - Constants
- [Summary of DBMS_FILE_GROUP Subprograms](#)

Using DBMS_FILE_GROUP

This section contains topics which relate to using the DBMS_FILE_GROUP package.

- [Overview](#)
- [Constants](#)

Overview

The following terms pertain to the DBMS_FILE_GROUP package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is `expdat.dmp`.
- The directory object that contains the file is `db_files`.
- The file type is `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

Version

A **version** is a collection of related files. For example, a version might consist of a set of datafiles and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can be used to logically group a set of versions. For example, a file group named `financial_quarters` can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as `Q1FY04`, `Q2FY04`, and so on.

Constants

The `DBMS_FILE_GROUP` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

Table 55–1 lists the parameters and enumerated constants.

Table 55–1 DBMS_FILE_GROUP Parameters with Enumerated Constants

Parameter	Option	Type	Description
<code>file_type</code>	<ul style="list-style-type: none"> ▪ <code>DATAFILE</code> 	<code>VARCHAR2 (30)</code>	<code>DATAFILE</code> is a datafile for a database. This constant can be specified as <code>'DATAFILE'</code> .
<code>new_file_type</code>	<ul style="list-style-type: none"> ▪ <code>EXPORT_DUMP_FILE</code> ▪ <code>DATAPUMP_LOG_FILE</code> 		<p><code>EXPORT_DUMP_FILE</code> is a Data Pump export dump file. This constant can be specified as <code>'DUMPSET'</code>.</p> <p><code>DATAPUMP_LOG_FILE</code> is a Data Pump export log file. This constant can be specified as <code>'DATAPUMPLOG'</code>.</p>
<code>max_versions</code> <code>retention_days</code>	<ul style="list-style-type: none"> ▪ <code>INFINITE</code> 	<code>NUMBER</code>	<code>INFINITE</code> specifies no limit. The <code>max_versions</code> or <code>retention_days</code> can increase without reaching a limit.
<code>privilege</code>	<p>System privilege specified in the <code>GRANT_SYSTEM_PRIVILEGE</code> procedure:</p> <ul style="list-style-type: none"> ▪ <code>READ_ANY_FILE_GROUP</code> ▪ <code>MANAGE_ANY_FILE_GROUP</code> ▪ <code>MANAGE_FILE_GROUP</code> <p>Object privilege specified in the <code>GRANT_OBJECT_PRIVILEGE</code> procedure:</p> <ul style="list-style-type: none"> ▪ <code>READ_ON_FILE_GROUP</code> ▪ <code>MANAGE_ON_FILE_GROUP</code> 	<code>BINARY_INTEGER</code>	<p><code>READ_ANY_FILE_GROUP</code> grants the privilege to view information about any file group in any schema in the data dictionary.</p> <p><code>MANAGE_ANY_FILE_GROUP</code> grants the privilege to create, manage, and drop any file group in any schema.</p> <p><code>MANAGE_FILE_GROUP</code> grants the privilege to create, manage, and drop file groups in the user's schema.</p> <p><code>READ_ON_FILE_GROUP</code> grants the privilege to view information about a specific file group in the data dictionary.</p> <p><code>MANAGE_ON_FILE_GROUP</code> grants the privilege to manage a specific file group in a schema other than the user's schema.</p>

Summary of DBMS_FILE_GROUP Subprograms

Table 55–2 DBMS_FILE_GROUP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 55-6	Adds a file to a version of a file group
ALTER_FILE Procedure on page 55-8	Alters a file in a version of a file group
ALTER_FILE_GROUP Procedure on page 55-10	Alters a file group
ALTER_VERSION Procedure on page 55-12	Alters a version of a file group
CREATE_FILE_GROUP Procedure on page 55-14	Creates a file group
CREATE_VERSION Procedure on page 55-16	Creates a version of a file group
DROP_FILE_GROUP Procedure on page 55-17	Drops a file group
DROP_VERSION Procedure on page 55-18	Drops a version of a file group
GRANT_OBJECT_PRIVILEGE Procedure on page 55-19	Grants object privileges on a file group to a user
GRANT_SYSTEM_PRIVILEGE Procedure on page 55-20	Grants system privileges for file group operations to a user
PURGE_FILE_GROUP Procedure on page 55-21	Purges a file group using the file group's retention policy
REMOVE_FILE Procedure on page 55-22	Removes a file from a version of a file group
REVOKE_OBJECT_PRIVILEGE Procedure on page 55-23	Revokes object privileges on a file group from a user
REVOKE_SYSTEM_PRIVILEGE Procedure on page 55-24	Revokes system privileges for file group operations from a user

Note: All subprograms commit unless specified otherwise.

ADD_FILE Procedure

This procedure adds a file to a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  file_type       IN VARCHAR2 DEFAULT NULL,
  file_directory IN VARCHAR2 DEFAULT NULL,
  version_name    IN VARCHAR2 DEFAULT NULL,
  comments        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 55–3 ADD_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being added to the version. Each file name in a version must be unique.
file_type	The file type. The following are reserved file types: <ul style="list-style-type: none"> ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' Data Pump metadata is populated when a Data Pump export dump file is imported. ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify <code>NULL</code> to omit a file type description. See " Constants " on page 55-4 for more information about the reserved file types.
file_directory	The name of the directory object that corresponds to the directory containing the file. If <code>NULL</code> , then the procedure uses the default directory object for the version. If <code>NULL</code> and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If <code>NULL</code> and no default directory object exists for the version or file group, then the procedure raises an error.

Table 55-3 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
<code>version_name</code>	<p>The name of the version to which the file is added.</p> <p>If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group.</p> <p>If NULL, then the procedure uses the version with the latest creation time for the file group.</p>
<code>comments</code>	Comments about the file being added

Usage Notes

To run this procedure with either `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

See Also: *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name    IN  VARCHAR2,
  file_name          IN  VARCHAR2,
  version_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_name      IN  VARCHAR2  DEFAULT NULL,
  new_file_directory IN  VARCHAR2  DEFAULT NULL,
  new_file_type      IN  VARCHAR2  DEFAULT NULL,
  remove_file_type   IN  VARCHAR2  DEFAULT 'N',
  new_comments       IN  VARCHAR2  DEFAULT NULL,
  remove_comments    IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 55–4 ALTER_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. Note: When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name. Note: When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

Table 55–4 (Cont.) ALTER_FILE Procedure Parameters

Parameter	Description
<code>new_file_type</code>	<p>The file type. The following are reserved file types:</p> <ul style="list-style-type: none"> ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' <p>If the file type is not one of the reserved file types, then enter a text description of the file type.</p> <p>If NULL, then the procedure does not change the file type.</p> <p>See Also: "Constants" on page 55-4 for more information about the reserved file types.</p>
<code>remove_file_type</code>	<p>If Y, then the procedure removes the file type. If Y and the <code>new_file_type</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not remove the file type.</p>
<code>new_comments</code>	<p>New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments.</p> <p>If NULL, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If Y, then the procedure removes the comments for the file. If Y and the <code>new_comments</code> parameter is non-NULL, then the procedure raises an error.</p> <p>If N, then the procedure does not change the existing comments.</p>

Usage Notes

If the file type is changed to `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `new_file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

See Also: *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP (
  file_group_name      IN  VARCHAR2,
  keep_files           IN  VARCHAR2  DEFAULT NULL,
  min_versions         IN  NUMBER    DEFAULT NULL,
  max_versions         IN  NUMBER    DEFAULT NULL,
  retention_days       IN  NUMBER    DEFAULT NULL,
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN VARCHAR2  DEFAULT 'N',
  new_comments         IN  VARCHAR2  DEFAULT NULL,
  remove_comments      IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 55–5 ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being altered, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	<p>If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged.</p> <p>If NULL, then this parameter is not changed.</p> <p>Note: If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.</p>
min_versions	<p>The minimum number of versions to retain. The specified value must be greater than or equal to 1.</p> <p>If NULL, then the procedure does not change the <i>min_versions</i> setting for the file group.</p>
max_versions	<p>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i>. When the number of versions exceeds the specified <i>max_versions</i>, the oldest version is purged.</p> <p>Specify <i>DBMS_FILE_GROUP.INFINITE</i> for no limit to the number of versions.</p> <p>If NULL, then the procedure does not change the <i>max_versions</i> setting for the file group.</p>

Table 55-5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
<code>retention_days</code>	<p>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <code>retention_days</code> and there are more versions than the number specified in <code>min_versions</code>, the version is purged. The age of a version is calculated by subtracting the creation time from the current time.</p> <p>A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours.</p> <p>Specify <code>DBMS_FILE_GROUP.INFINITE</code> for no limit to the number of days a version can exist.</p> <p>If <code>NULL</code>, then the procedure does not change the <code>retention_days</code> setting for the file group.</p>
<code>new_default_directory</code>	<p>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.</p> <p>If <code>NULL</code>, then the procedure does not change the default directory.</p>
<code>remove_default_directory</code>	<p>If <code>Y</code>, then the procedure removes the default directory for the file group. If <code>Y</code> and the <code>new_default_directory</code> parameter is set to a non-<code>NULL</code> value, then the procedure raises an error.</p> <p>If <code>N</code>, then the procedure does not remove the default directory for the file group.</p>
<code>new_comments</code>	<p>Comments about the file group. If non-<code>NULL</code>, then the new comments replace the existing comments for the file group.</p> <p>If <code>NULL</code>, then the procedure does not change the existing comments.</p>
<code>remove_comments</code>	<p>If <code>Y</code>, then the comments for the file group are removed. If <code>Y</code> and the <code>new_comments</code> parameter is set to a non-<code>NULL</code> value, then the procedure raises an error.</p> <p>If <code>N</code>, then the procedure does not change the comments for the file group.</p>

Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name      IN  VARCHAR2,
  version_name         IN  VARCHAR2  DEFAULT NULL,
  new_version_name     IN  VARCHAR2  DEFAULT NULL,
  remove_version_name  IN  VARCHAR2  DEFAULT 'N',
  new_default_directory IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory IN VARCHAR2  DEFAULT 'N',
  new_comments        IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 55–6 ALTER_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the <i>new_version_name</i> parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the <i>new_version_name</i> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the <i>new_default_directory</i> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.

Table 55–6 (Cont.) ALTER_VERSION Procedure Parameters

Parameter	Description
<code>new_comments</code>	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
<code>remove_comments</code>	If Y, then the procedure removes the comments for the version. If Y and the <code>new_comments</code> parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

CREATE_FILE_GROUP Procedure

This procedure creates a file group.

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP (
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER     DEFAULT 2,
  max_versions       IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER     DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 55–7 CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If Y , then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N , then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. Note: If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for <i>min_versions</i> . When the number of versions exceeds the specified <i>max_versions</i> , the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified <i>retention_days</i> and there are more versions than the number specified in <i>min_versions</i> , the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, <i>1.25</i> specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

Usage Notes

If `min_versions` is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least 2 if a version of the file group must be available at all times.

CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the `PURGE_FILE_GROUP` procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the `OUT` parameter `version_out`, and the other does not.

See Also: ["PURGE_FILE_GROUP Procedure"](#) on page 55-21

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  default_directory IN VARCHAR2 DEFAULT NULL,
  comments         IN  VARCHAR2 DEFAULT NULL,
  version_out      OUT VARCHAR2);
```

Parameters

Table 55–8 CREATE_VERSION Procedure Parameters

Parameter	Description
<code>file_group_name</code>	The name of the file group to which the new version is added, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
<code>version_name</code>	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk (<code>'*' </code>).
<code>default_directory</code>	The default directory object used when files are added to a version if no directory is specified when the files are added.
<code>comments</code>	Comments about the version being created
<code>version_out</code>	If the <code>version_name</code> parameter is set to a non-NULL value, then this parameter contains the specified version name. If the <code>version_name</code> parameter is set to NULL, then this parameter contains the generated version number.

DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name IN VARCHAR2,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 55–9 DROP_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being dropped, specified as [<i>schema_name.</i>] <i>file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
keep_files	If <i>Y</i> , then the procedure retains the files in the file group on hard disk. If <i>N</i> , then the procedure deletes the files in the file group from hard disk. If <i>NULL</i> , then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have *WRITE* privilege on the directory object that contains the files.

DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_files      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 55–10 DROP_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If <code>NULL</code> , then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions.
keep_files	If <code>Y</code> , then the procedure retains the files in the version on hard disk. If <code>N</code> , then the procedure deletes the files in the version from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  grantee      IN  VARCHAR2,
  grant_option IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 55–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
object_name	The name of the file group on which the privilege is granted, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See " Constants " on page 55-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

Note: When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS. Set the O7_DICTIONARY_ACCESSIBILITY initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 55–12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The constant that specifies the privilege. See " Constants " on page 55-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group except when purging a version will cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
    file_group_name IN VARCHAR2);
```

Parameter

Table 55–13 *PURGE_FILE_GROUP Procedure Parameter*

Parameter	Description
<code>file_group_name</code>	The name of the file group, specified as <code>[schema_name.]file_group_name</code> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default. If <code>NULL</code> and this procedure is run by <code>SYS</code> user, then the procedure purges all file groups.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name IN VARCHAR2,
  file_name       IN VARCHAR2,
  version_name    IN VARCHAR2 DEFAULT NULL,
  keep_file       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 55–14 REMOVE_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales_tbs</code> , then specify <code>hq_dba.sales_tbs</code> . If the schema is not specified, then the current user is the default.
file_name	The name of the file being removed from the version
version_name	The name of the version from which the file is removed. If a positive integer is specified as a <code>VARCHAR2</code> value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is removed from version 1 of the file group. If <code>NULL</code> , then the procedure uses the version with the latest creation time for the file group. If '*', then the procedure removes the file from all versions.
keep_file	If <code>Y</code> , then the procedure retains the file on hard disk. If <code>N</code> , then the procedure deletes the file from hard disk. If <code>NULL</code> , then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name IN VARCHAR2,
  privilege   IN BINARY_INTEGER,
  revokee     IN VARCHAR2);
```

Parameters

Table 55–15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
object_name	The name of the file group on which the privilege is revoked, specified as <i>[schema_name.]file_group_name</i> . For example, if the schema is <i>hq_dba</i> and the file group name is <i>sales_tbs</i> , then specify <i>hq_dba.sales_tbs</i> . If the schema is not specified, then the current user is the default.
privilege	The constant that specifies the privilege. See " Constants " on page 55-4 for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(  
  privilege IN BINARY_INTEGER,  
  revokee   IN VARCHAR2);
```

Parameters

Table 55–16 *REVOKE_SYSTEM_PRIVILEGE Procedure Parameters*

Parameter	Description
privilege	The constant that specifies the privilege. See " Constants " on page 55-4 for valid privileges.
revokee	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

DBMS_FILE_TRANSFER

The `DBMS_FILE_TRANSFER` package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

- [Using DBMS_FILE_TRANSFER](#)
 - Operating Notes
- [Summary of DBMS_FILE_TRANSFER Subprograms](#)

Using DBMS_FILE_TRANSFER

- [Operating Notes](#)

Operating Notes

Caution: DBMS_FILE_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS_FILE_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

Summary of DBMS_FILE_TRANSFER Subprograms

Table 56–1 DBMS_FILE_TRANSFER Package Subprograms

Subprogram	Description
COPY_FILE Procedure on page 56-5	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
GET_FILE Procedure on page 56-7	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
PUT_FILE Procedure on page 56-9	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE (
  source_directory_object    IN  VARCHAR2,
  source_file_name          IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name      IN  VARCHAR2);
```

Parameters

Table 56–2 COPY_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the CREATE DIRECTORY command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, +diskgroup1) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: +diskgroup1/dbs/control).
destination_file_name	<p>The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM:</p> <ul style="list-style-type: none"> ■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) ■ The file type tag assigned to the file is COPY_FILE ■ The value of the destination_file_name argument becomes the file's alias name in the designated destination directory <p>The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.</p>

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- READ privilege on the directory object specified in the `source_directory_object` parameter
- WRITE privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

See Also: *Oracle Database Storage Administrator's Guide* for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';
```

Directory created.

```
SQL> BEGIN
  2   DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR', 't_xdbtmp.f', 'DGROUP',
                                't_xdbtmp.f');
  3 END;
  4 /
```

PL/SQL procedure successfully completed.

```
SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
  source_directory_object    IN VARCHAR2,
  source_file_name          IN VARCHAR2,
  source_database           IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_file_name     IN VARCHAR2);
```

Parameters

Table 56–3 GET_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V\$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS '^t_work^';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- assumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
  source_directory_object      IN  VARCHAR2,
  source_file_name             IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name        IN  VARCHAR2,
  destination_database         IN  VARCHAR2);
```

Parameters

Table 56–4 PUT_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V\$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
  DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                                'dbs2' ) ;
END ;
```

DBMS_FLASHBACK

Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).

See Also: For detailed information about DBMS_FLASHBACK:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database SQL Language Reference*.

This chapter contains the following topics:

- [Using DBMS_FLASHBACK](#)
 - Overview
 - Security Model
 - Types
 - Exceptions
 - Operational Notes

- [Summary of DBMS_FLASHBACK Subprograms](#)

Using DBMS_FLASHBACK

- [Overview](#)
- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

Overview

DBMS_FLASHBACK provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction backout features that allow for selective removal of the effects of individual transactions. This should not be confused with a flashback database which actually moves the database back in time.

When DBMS_FLASHBACK is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use DBMS_FLASHBACK for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to restore deleted e-mail by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

Security Model

To use this package, a database administrator must grant `EXECUTE` privileges for `DBMS_FLASHBACK`.

Types

The following types are used by DBMS_FLASHBACK subprograms:

Table 57-1 DBMS_FLASHBACK

Type	Description
TXNAME_ARRAY	Creates a VARRAY for holding Transaction Names or Identifiers (XIDS)

Exceptions

Table 57–2 *DBMS_FLASHBACK Error Messages*

Error	Description
ORA-08180	Time specified is too old.
ORA-08181	Invalid system change number specified.
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode.
ORA-08183	User cannot enable Flashback within an uncommitted transaction.
ORA-08184	User cannot enable Flashback within another Flashback session.
ORA-08185	SYS cannot enable Flashback mode.

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need.

If you need to perform a Flashback over a 24-hour period, the DBA should set the `undo_retention` parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the `RETENTION GUARANTEE` clause for the undo tablespace to ensure that unexpired undo is not discarded. `UNDO_RETENTION` is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, `RETENTION GUARANTEE` prevents this. For more information, see the *Oracle Database Administrator's Guide*

In a Flashback-enabled session, `SYSDATE` will not be affected; it will continue to provide the current time.

DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```

DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
    employee_no    number(5) PRIMARY KEY,
    employee_name  varchar2(20),
    employee_mgr   number(5)
        CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
    salary         number,
    hiredate       date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20 seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE

Summary of DBMS_FLASHBACK Subprograms

Table 57–3 DBMS_FLASHBACK Package Subprograms

Subprogram	Description
DISABLE Procedure on page 57-12	Disables the Flashback mode for the entire session
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure on page 57-13	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries will return data consistent as of the specified wall-clock time or SCN
ENABLE_AT_TIME Procedure on page 57-14	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in <code>query_time</code>
GET_SYSTEM_CHANGE_NUMBER Function on page 57-15	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
TRANSACTION_BACKOUT Procedures on page 57-16	Provides the mechanism to backout a transaction

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');  
SELECT salary FROM emp where name = 'Joe'  
EXECUTE dbms_flashback.disable;
```

ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (  
    query_scn IN NUMBER);
```

Parameters

Table 57–4 *ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters*

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
    query_time    IN TIMESTAMP);
```

Parameters

Table 57–5 *ENABLE_AT_TIME Procedure Parameters*

Parameter	Description
<code>query_time</code>	<p>This is an input parameter of type <code>TIMESTAMP</code>. A time stamp can be specified in the following ways:</p> <ul style="list-style-type: none"> ■ Using the <code>TIMESTAMP</code> constructor <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TIMESTAMP '2001-01-09 12:31:00');</pre> <p>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</p> ■ Using the <code>TO_TIMESTAMP</code> function: <pre>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME (TO_ TIMESTAMP ('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</pre> <p>You provide the format you want to use. This example shows the <code>TO_TIMESTAMP</code> function for February 12, 2001, 2:35 PM.</p> ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER  
RETURN NUMBER;
```

TRANSACTION_BACKOUT Procedures

This procedure provides a mechanism to backout a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (XIDS).

The procedure analyzes the transactional dependencies, perform DML's and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DML's performed as part of transaction backout. However it will hold all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent the user needs to explicitly commit the transaction.

A report will be generated in the system tables DBA_FLASHBACK_TRANSACTION_STATE and DBA_FLASHBACK_TRANSACTION_REPORT.

Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numberofxids      NUMBER,
  xids              XID_ARRAY,
  options           NUMBER default NOCASCADE,
  timeHint         TIMESTAMP default MINTIME);
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numberofxids      NUMBER,
  xids              XID_ARRAY,
  options           NUMBER default NOCASCADE,
  scnHint          TIMESTAMP default 0 );
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numberofxids      NUMBER,
  txnnames         TXNAME_ARRAY,
  options           NUMBER default NOCASCADE,
  timehint         TIMESTAMP MINTIME );
```

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
  numberofxids      NUMBER,
  txnNames         TXNAME_ARRAY,
  options           NUMBER default NOCASCADE,
  scnHint          NUMBER 0);
```

Parameters

Table 57–6 TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
numberofxids	Number of transactions passed as input
xids	List of transaction IDs in the form of an array
txnnames	List of transaction names in the form of an array

Table 57–6 (Cont.) TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
options	Backout dependent transactions: <ul style="list-style-type: none"> ■ NOCASCADE - The user expects no dependency. If a dependency is found, this raises an error, with the first dependent transaction provided in the report. ■ NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK. ■ NONCONFLICT_ONLY - This option lets the user backout the changes to the non-conflicting rows of the given transactions. Note that a transaction dependency will happen due to a row conflict, whether either through WAW or primary/unique key constraints. If the user chooses to back out only the non-conflicting rows, this should not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data. ■ CASCADE - This will completely remove the given transactions including their dependents in a post order fashion (reverse order of commit times).
timehint	Time hint on the start of the transaction
scnhint	SCN hint on the start of the transaction

Usage Notes

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this will raise an error and terminate. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- [Summary of DBMS_FREQUENT_ITEMSET Subprograms](#)

Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 58–1 *DBMS_FREQUENT_ITEMSET Package Subprograms*

Subprogram	Description
FI_HORIZONTAL Function on page 58-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
FI_TRANSACTIONAL Function on page 58-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL (
  tranx_cursor      IN      SYSREFCURSOR,
  support_threshold IN      NUMBER,
  itemset_length_min IN     NUMBER,
  itemset_length_max IN     NUMBER,
  including_items   IN      SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN      SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

Parameters

Table 58–2 FI_HORIZONTAL Procedure Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned. The default is NULL.

Return Values

Table 58–3 *FI_HORIZONTAL Procedure Parameters*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

Example

Suppose you have a table `horiz_table_in`.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in `horiz_table_in` looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
    CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
            FROM horiz_table_in),
    0.3,
    2,
    5,
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                               ('apple','banana','orange'))),
    CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
  tranx_cursor      IN   SYSREFCURSOR,
  support_threshold IN   NUMBER,
  itemset_length_min IN  NUMBER,
  itemset_length_max IN  NUMBER,
  including_items   IN   SYS_REFCURSOR DEFAULT NULL,
  excluding_items   IN   SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER);
```

Parameters

Table 58–4 *FI_TRANSACTIONAL Procedure Parameters*

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

Return Values

Table 58–5 *FI_TRANSACTIONAL Procedure Parameters*

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table `tranx_table_in` looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of `VARCHAR2(30)`, you must create a nested table of `VARCHAR2(30)`:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in),
        0.6,
        2,
        5,
        NULL,
        NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```

0.6,
2,
5,
CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                           ('apple', 'banana', 'orange'))),
CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));

```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```

SELECT
  bt.setid, nt.*
FROM
  (SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
   FROM table(
     DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
       CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
       NULL, NULL)) bt,
   table(bt.itemset) nt);

```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the NESTED_TABLE_FAST_INSERT hint for performance:

```

CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */ INTO fq_nt
  SELECT cast(itemset as FI_VARCHAR_NT)
  FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));

```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```

CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP

```

```
        FETCH freqC INTO coll_nt;
        EXIT WHEN freqC%NOTFOUND;
        num_rows := num_rows + 1;
        num_itms := num_itms + coll_nt.count;
    END LOOP;
    CLOSE freqC;
    DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
```

```
END;
/
```

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through DBMS_HM package

See Also: *Oracle Database Administrator's Guide* for more information about "Health Monitor"

This chapter contains the following topics:

- [Using DBMS_HM](#)
 - Security Model
- [Summary of DBMS_HM Subprograms](#)

Using DBMS_HM

- [Security Model](#)

Security Model

Users must have EXECUTE privilege to run the procedures of DBMS_HM package.

Summary of DBMS_HM Subprograms

Table 59–1 DBMS_HM Package Subprograms

Subprogram	Description
GET_RUN_REPORT Function on page 59-5	Returns the report for the specified checker run
RUN_CHECK Procedure on page 59-6	Runs the specified checker with the given arguments

GET_RUN_REPORT Function

This function returns the report for the specified checker run.

Syntax

```
DBMS_HM.GET_RUN_REPORT (  
    run_name      IN  VARCHAR2,  
    type          IN  VARCHAR2 := 'TEXT',  
    level         IN  VARCHAR2 := 'BASIC',)  
RETURN CLOB;
```

Parameters

Table 59–2 GET_RUN_REPORT Function Parameters

Parameter	Description
run_name	Name of the check's run
type	Report format type. Possible values are 'HTML', 'XML' and 'TEXT'. Default report type is 'TEXT'.
level	Details of report, possible value are 'BASIC' and 'DETAIL'. Caution: Currently only 'BASIC' level is supported.

RUN_CHECK Procedure

This procedure runs the specified checker with the given arguments. It lets user to specify a name for the run, inputs needed and maximum timeout for the run. The run's report will be maintained persistently in database.

Syntax

```
DBMS_HM.RUN_CHECK (
    check_name      IN  VARCHAR2,
    run_name        IN  VARCHAR2 := NULL,
    timeout         IN  NUMBER := NULL,
    input_params    IN  VARCHAR2 := NULL);
```

Parameters

Table 59-3 RUN_CHECK Procedure Parameters

Parameter	Description
check_name	Name of the check to be invoked. Check names and their parameters can be accessed from the V\$HM_CHECK and V\$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: <code>SELECT name FROM V\$HM_CHECK WHERE INTERNAL_CHECK = 'N'</code> retrieves the list of checks that can be run manually by users.
run_name	Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.
timeout	Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.
input_params	<p>Input string: which consists of name, value pairs de-limited by a special character ';'. Example ('Data Block Integrity Check' invocation may take following type of input parameters. 'BLC_DF_NUM=1;BLC_BL_NUM=23456'</p> <p>Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively.</p> <p>Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V\$HM_CHECK_PARAM view.</p> <p>Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check'</p> <pre>SELECT a.* FROM v\$hm_check_param a, v\$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';</pre>

The DBMS_HPROF package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

See Also: *Oracle Database Advanced Application Developer's Guide* for more information about the "PL/SQL Hierarchical Profiler"

This chapter contains the following topic:

- [Summary of DBMS_HPROF Subprograms](#)

Summary of DBMS_HPROF Subprograms

This table lists the package subprograms in alphabetical order.

Table 60–1 DBMS_HPROF Package Subprograms

Subprogram	Description
ANALYZE Function on page 60-3	Analyzes the raw profiler output and produces hierarchical profiler information in database tables
START_PROFILING Procedure on page 60-5	Starts hierarchical profiler data collection in the user's session
STOP_PROFILING Procedure on page 60-6	Stops profiler data collection in the user's session.

ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables.

Syntax

```
DBMS_HPROF.ANALYZE (
  location      VARCHAR2,
  filename      VARCHAR2,
  summary_mode  BOOLEAN      DEFAULT FALSE,
  trace         VARCHAR2     DEFAULT NULL,
  skip          PLS_INTEGER  DEFAULT 0,
  collect       PLS_INTEGER  DEFAULT NULL,
  run_comment   VARCHAR2     DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 60–2 ANALYZE Function Parameters

Parameter	Description
location	Name of a directory object. The raw profiler data file is read from the file system directory mapped to this directory object. Output files are also written to this directory.
filename	Name of the raw profiler data file to be analyzed. The file must exist in the directory specified by the <code>location</code> parameter.
summary_mode	By default (that is, when <code>summary_mode</code> is <code>FALSE</code>), the detailed analysis is done. When <code>summary_mode</code> is <code>TRUE</code> , only top-level summary information is generated into the database table.
trace	Analyze only the subtrees rooted at the specified trace entry. By default (when <code>trace</code> is <code>NULL</code>), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format (including the schema name, module name & function name) as in for example, <code>"SCOTT"."PKG"."FOO"</code> or <code>"".""."__plssql_vm"</code> . If multiple overloads exist for the specified name, all of them will be analyzed.
skip	Used only when <code>trace</code> is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first <code>skip</code> invocations to trace. The default value for <code>skip</code> is 0.
collect	Used only when <code>trace</code> is specified. Analyze <code>collect</code> number of invocations of traces (starting from <code>skip+1</code> 'th invocation). By default only 1 invocation is collected.
run_comment	User-provided comment for this run

Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Use the `dbmshptab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Running `dbmshptab.sql` drops the any previously created hierarchical profiler tables.

Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/HR;  
@?/rdbms/admin/dbmshptab.sql
```

START_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

Syntax

```
DBMS_HPROF.START_PROFILING (
  location   VARCHAR2 DEFAULT NULL,
  filename   VARCHAR2 DEFAULT NULL,
  max_depth  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 60-3 START_PROFILING Procedure Parameters

Parameter	Description
location	Name of a directory object. The file system directory mapped to this directory object is where the raw profiler output is generated.
filename	Output filename for the raw profiler data. The file is created in the directory specified by the <code>location</code> parameter.
max_depth	By default (that is, when <code>max_depth</code> value is <code>NULL</code>) profile information is gathered for all functions irrespective of their call depth. When a non- <code>NULL</code> value is specified for <code>max_depth</code> , the profiler collects data only for functions up to a call depth level of <code>max_depth</code> .

Usage Notes

Even though the profiler does not individually track functions at depth greater than `max_depth`, the time spent in such functions is charged to the ancestor function at depth `max_depth`.

STOP_PROFILING Procedure

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_HPROF.STOP_PROFILING;
```

DBMS_HS_PARALLEL

The DBMS_HS_PARALLEL PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

DBMS_HS_PARALLEL is compiled with the authorization ID of CURRENT_USER, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

Following are the procedures of the DBMS_HS_PARALLEL package:

- [LOAD_TABLE](#)
- [CREATE_TABLE_TEMPLATE](#)
- [CREATE_OR_REPLACE_VIEW](#)
- [DROP_VIEW](#)

LOAD_TABLE

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it will be created automatically.

Following is the syntax for LOAD_TABLE:

```
LOAD_TABLE (remote_table, database_link, oracle_table, truncate, parallel_degree,
row_count)
```

The following table describes the parameters for LOAD_TABLE:

Table 61-1 LOAD_TABLE Parameters

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
truncate	IN BOOLEAN	Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.
row_count	OUT NUMBER	Contains the number of rows just added with the load table operation.

Using LOAD_TABLE

This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.

If the local table does not exist, the `LOAD_TABLE` procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.

If the remote table or the database link does not exist, an error message is returned.

If the local table is incompatible with the remote table, an error message is returned.

You need the `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `LOAD_TABLE` procedure.

If you encounter either the Oracle error message `ORA-12801: error signaled in parallel query server P003` or `ORA-00018: maximum number of session exceeded`, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file.

One of the following is required for parallel processing:

- The remote table is range partitioned.
- Histogram information for a numeric column is available.
- There is a numeric index or primary key.

To drop the local table, use the `DROP TABLE SQL` statement.

CREATE_TABLE_TEMPLATE

This procedure writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.

Following is the syntax for CREATE_TABLE_TEMPLATE:

```
CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table, create_table_
template_string)
```

The following table describes the parameters for CREATE_TABLE_TEMPLATE:

Table 61–2 CREATE_TABLE_TEMPLATE Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
create_table_template_string	OUT VARCHAR2	Contains the Oracle CREATE TABLE SQL template when the procedure is returned.

CREATE_OR_REPLACE_VIEW

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

Following is the syntax for CREATE_VIEW:

```
CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
```

The following table describes the parameters for CREATE_OR_REPLACE_VIEW:

Table 61-3 CREATE_VIEW Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_view	IN VARCHAR2	The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.

Using CREATE_OR_REPLACE_VIEW

The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the Oracle error message `ORA-00955: name is already used by an existing object` is raised.

This view is created as a read-only view. If you attempt to insert and update the view, the Oracle error message `ORA-01733: virtual column not allowed here` is raised.

If the remote table or the database link does not exist, the Oracle error message `ORA-00942: table or view does not exist` or `ORA-02019: connection description for remote database not found` is raised.

You need the `CREATE VIEW`, `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `CREATE_OR_REPLACE_VIEW` procedure.

If you encounter either the Oracle error message `ORA-12801: error signaled in parallel query server P003` or `ORA-00018: maximum number of session exceeded`, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file.

Because the `CREATE_OR_REPLACE_VIEW` procedure creates some internal objects, use the `DROP_VIEW` procedure to drop the view and the internal objects. The SQL `DROP VIEW` statement only drops the view and not the internal objects.

DROP_VIEW

This procedure drops the view and internal objects created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not already been created by the CREATE_OR_REPLACE_VIEW procedure, an error message is returned.

Following is the syntax for DROP_VIEW:

```
DROP_VIEW (oracle_view)
```

The following table describes the parameters for DROP_VIEW:

Table 61-4 CREATE_VIEW Parameter

Parameter	Value	Description
oracle_view	IN VARCHAR2 NOT NULL	The name of the Oracle view created by the CREATE_VIEW procedure. If the view has not been created by the CREATE_VIEW procedure, an error is returned.

DBMS_HS_PASSTHROUGH

The pass-through SQL feature allows an application developer to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows for operations in statements for which there is no equivalent in Oracle.

You can run these statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is run in the same transaction as regular "transparent" SQL statements.

This chapter discusses the following topic:

- [Summary of DBMS_HS_PASSTHROUGH Subprograms](#)

See Also: *Oracle Database Heterogeneous Connectivity User's Guide*

Summary of DBMS_HS_PASSTHROUGH Subprograms

Table 62–1 DBMS_HS_PASSTHROUGH Package Subprograms

Subprogram	Description
BIND_INOUT_VARIABLE Procedure on page 62-3	Binds IN OUT bind variables
BIND_INOUT_VARIABLE_RAW Procedure on page 62-4	Binds IN OUT bind variables of data type RAW
BIND_OUT_VARIABLE Procedure on page 62-5	Binds an OUT variable with a PL/SQL program variable
BIND_OUT_VARIABLE_RAW Procedure on page 62-6	Binds an OUT variable of data type RAW with a PL/SQL program variable
BIND_VARIABLE Procedure on page 62-7	Binds an IN variable positionally with a PL/SQL program variable
BIND_VARIABLE_RAW Procedure on page 62-8	Binds IN variables of type RAW
CLOSE_CURSOR Procedure on page 62-9	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
EXECUTE_IMMEDIATE Procedure on page 62-10	Runs a (non-SELECT) SQL statement immediately, without bind variables
EXECUTE_NON_QUERY Function on page 62-11	Runs a (non-SELECT) SQL statement
FETCH_ROW Function on page 62-12	Fetches rows from a query
GET_VALUE Procedure on page 62-13	Retrieves column value from SELECT statement, or retrieves OUT bind parameters
GET_VALUE_RAW Procedure on page 62-14	Similar to GET_VALUE, but for data type RAW
OPEN_CURSOR Function on page 62-15	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
PARSE Procedure on page 62-16	Parses SQL statement at non-Oracle system

BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  <dt>,
  n      IN      VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also: For binding IN OUT variables of data type RAW see [BIND_INOUT_VARIABLE_RAW Procedure](#) on page 62-4.

Parameters

Table 62–2 *BIND_INOUT_VARIABLE Procedure Parameters*

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–3 *BIND_INOUT_VARIABLE Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of data type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
  c      IN      BINARY_INTEGER NOT NULL,
  p      IN      BINARY_INTEGER NOT NULL,
  v      IN OUT  RAW,
  n      IN      VARCHAR2);
```

Parameters

Table 62–4 BIND_INOUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable. For example, in <code>SELECT * FROM emp WHERE ename= :ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–5 BIND_INOUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NULL,
  v      OUT <dt>,
  n      IN  VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also: For binding OUT variables of data type RAW, see [BIND_OUT_VARIABLE_RAW Procedure](#) on page 62-6.

Parameters

Table 62–6 BIND_OUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–7 BIND_OUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of data type RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
  c      IN  BINARY_INTEGER NOT NULL,
  p      IN  BINARY_INTEGER NOT NULL,
  v      OUT RAW,
  n      IN  VARCHAR2);
```

Parameters

Table 62–8 BIND_OUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename= :ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–9 BIND_OUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      IN <dt>,
  n      IN VARCHAR2);
```

<dt> is either DATE, NUMBER, or VARCHAR2.

See Also: To bind RAW variables use [BIND_VARIABLE_RAW Procedure](#) on page 62-8.

Parameters

Table 62–10 *BIND_VARIABLE Procedure Parameters*

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–11 *BIND_VARIABLE Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined: WNDS, RNDS

BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
  c    IN BINARY_INTEGER NOT NULL,
  p    IN BINARY_INTEGER NOT NULL,
  v    IN RAW,
  n    IN VARCHAR2);
```

Parameters

Table 62–12 BIND_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in <code>SELECT * FROM emp WHERE ename= :ename</code> , the position of the bind variable <code>:ename</code> is 1, the name is <code>:ename</code> . This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 62–13 BIND_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
  c IN BINARY_INTEGER NOT NULL);
```

Parameters

Table 62–14 *CLOSE_CURSOR Procedure Parameters*

Parameter	Description
c	Cursor to be released.

Exceptions

Table 62–15 *CLOSE_CURSOR Procedure Exceptions*

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN_CURSOR, PARSE, EXECUTE_NON_QUERY, CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
    s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62–16 EXECUTE_IMMEDIATE Procedure Parameters

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

Table 62–17 EXECUTE_IMMEDIATE Procedure Exceptions

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a `SELECT` statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
  c IN BINARY_INTEGER NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 62–18 EXECUTE_NON_QUERY Function Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 62–19 EXECUTE_NON_QUERY Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	<code>BIND_VARIABLE</code> procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

FETCH_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL `SELECT` statement. When there are no more rows to be fetched, the exception `NO_DATA_FOUND` is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
    c    IN BINARY_INTEGER NOT NULL,
    f    IN BOOLEAN)
RETURN BINARY_INTEGER;
```

Parameters

Table 62–20 *FETCH_ROW Function Parameters*

Parameter	Description
<code>c</code>	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
<code>first</code>	(Optional) Reexecutes <code>SELECT</code> statement. Possible values: <ul style="list-style-type: none"> - <code>TRUE</code>: reexecute <code>SELECT</code> statement. - <code>FALSE</code>: fetch the next row, or if run for the first time, then execute and fetch rows (default).

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 62–21 *FETCH_ROW Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

Pragmas

Purity level defined : `WNDS`

GET_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of `SELECT` statements, after a row has been fetched.
- It retrieves the `OUT` bind values, after the SQL statement has been run.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
  c      IN BINARY_INTEGER NOT NULL,
  p      IN BINARY_INTEGER NOT NULL,
  v      OUT <dt>);
```

<dt> is either `DATE`, `NUMBER`, or `VARCHAR2`.

See Also: For retrieving values of data type `RAW`, see [GET_VALUE_RAW Procedure](#) on page 62-14.

Parameters

Table 62–22 GET_VALUE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

Exceptions

Table 62–23 GET_VALUE Procedure Exceptions

Exception	Description
ORA-1403	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

Pragmas

Purity level defined : `WNDS`

GET_VALUE_RAW Procedure

This procedure is similar to `GET_VALUE`, but for data type `RAW`.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
  c    IN  BINARY_INTEGER NOT NULL,
  p    IN  BINARY_INTEGER NOT NULL,
  v    OUT RAW);
```

Parameters

Table 62–24 GET_VALUE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the <code>OUT</code> bind variable or select list item stores its value.

Exceptions

Table 62–25 GET_VALUE_RAW Procedure Exceptions

Exception	Description
ORA-1403	Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A <code>NULL</code> value was passed for a <code>NOT NULL</code> parameter.

Pragmas

Purity level defined : `WNDS`

OPEN_CURSOR Function

This function opens a cursor for running a pass-through SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure `CLOSE_CURSOR`.

Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
RETURN BINARY_INTEGER;
```

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 62–26 OPEN_CURSOR Function Exceptions

Exception	Description
ORA-28554	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' <code>OPEN_CURSORS</code> initialization parameter.

Pragmas

Purity level defined : WNDS, RNDS

PARSE Procedure

This procedure parses SQL statement at non-Oracle system.

Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
  c          IN  BINARY_INTEGER NOT NULL,
  stmt      IN  VARCHAR2 NOT NULL);
```

Parameters

Table 62–27 *PARSE Procedure Parameters*

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened using function OPEN_CURSOR.
stmt	Statement to be parsed.

Exceptions

Table 62–28 *PARSE Procedure Exceptions*

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

Purity level defined : WNDS, RNDS

The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- [Documentation of DBMS_JAVA](#)

Documentation of DBMS_JAVA

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer's Guide*.

The `DBMS_IOT` package creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command. `DBMS_IOT` can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the `enable_constraint` operation.

`DBMS_IOT` is not loaded during database installation. To install `DBMS_IOT`, run `dbmsiotc.sql`, available in the `ADMIN` directory.

This chapter contains the following topics:

- [Summary of DBMS_IOT Subprograms](#)

Note: With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

Summary of DBMS_IOT Subprograms

Table 64–1 *DBMS_IOT Package Subprograms*

Subprogram	Description
BUILD_CHAIN_ROWS_TABLE Procedure on page 64-3	Creates a table into which references to the chained rows for an index-organized table can be placed using the <code>ANALYZE</code> command
BUILD_EXCEPTIONS_TABLE Procedure on page 64-4	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

Table 64–2 BUILD_CHAIN_ROWS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS', 'L', 'LC');
```

A chained-row table is created with the following columns:

Column Name	Null?	Type
OWNER_NAME		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CLUSTER_NAME		VARCHAR2(30)
PARTITION_NAME		VARCHAR2(30)
SUBPARTITION_NAME		VARCHAR2(30)
HEAD_ROWID		ROWID
TIMESTAMP		DATE
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
  owner          IN VARCHAR2,
  iot_name       IN VARCHAR2,
  exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

Parameters

Table 64–3 BUILD_EXCEPTIONS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS', 'L', 'LE');
```

An exception table for the preceding index-organized table with the following columns:

Column Name	Null?	Type
ROW_ID		VARCHAR2(30)
OWNER		VARCHAR2(30)
TABLE_NAME		VARCHAR2(30)
CONSTRAINT		VARCHAR2(30)
A		CHAR(16)
B		CHAR(16)
C		CHAR(16)

The DBMS_JOB package schedules and manages jobs in the job queue.

Note: The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS_JOB by revoking the package execution privilege for users.

For more information, see [Chapter 113, "DBMS_SCHEDULER"](#) and "Moving from DBMS_JOB to DBMS_SCHEDULER" in *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS_JOB](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_JOB Subprograms](#)

Using DBMS_JOB

- [Security Model](#)
- [Operational Notes](#)

Security Model

No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

Operational Notes

- [Working with Oracle Real Application Clusters](#)
- [Stopping a Job](#)

Working with Oracle Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the [DBMS_SCHEDULER](#) package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

DBMS_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(
  job      OUT      BINARY_INTEGER,
  what     IN       VARCHAR2, NEXT_DATE IN DATE DEFAULTSYSDATE,
  interval IN       VARCHAR2 DEFAULT 'NULL',
  no_parse IN       BOOLEAN DEFAULT FALSE,
  instance IN       BINARY_INTEGER DEFAULT ANY_INSTANCE,
  force    IN       BOOLEAN DEFAULT FALSE);
```

Use the parameters `instance` and `force` to control job and instance affinity. The default value of `instance` is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the `instance` value. Oracle displays error ORA-23319 if the `instance` value is a negative number or NULL.

The `force` parameter defaults to `false`. If `force` is `TRUE`, any positive integer is acceptable as the job instance. If `force` is `FALSE`, the specified instance must be running, or Oracle displays error number ORA-23428.

DBMS_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE( JOB IN BINARY_INTEGER,
  instance          IN BINARY_INTEGER,
  force            IN BOOLEAN DEFAULT FALSE);
```

The `FORCE` parameter in this example defaults to `FALSE`. If the `instance` value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of `force`. If the `INSTANCE` value is positive and the `FORCE` parameter is `FALSE`, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the `force` parameter is `TRUE`, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the `instance` value is negative or NULL.

DBMS_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE( JOB IN BINARY_INTEGER,
```

```

        what                IN VARCHAR2 DEFAULT NULL,
next_date                IN DATE DEFAULT NULL,
interval                IN VARCHAR2 DEFAULT NULL,
instance                IN BINARY_INTEGER DEFAULT NULL,
force                    IN BOOLEAN DEFAULT FALSE );

```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the instance number is negative.

DBMS_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If `force` is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if `force` is `FALSE` and the connected instance is the incorrect instance.

```

DBMS_JOB.RUN(
    job    IN BINARY_INTEGER,
    force  IN BOOLEAN DEFAULT FALSE);

```

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

Summary of DBMS_JOB Subprograms

Table 65–1 DBMS_JOB Package Subprograms

Subprogram	Description
BROKEN Procedure on page 65-7	Disables job execution
CHANGE Procedure on page 65-8	Alters any of the user-definable parameters associated with a job
INSTANCE Procedure on page 65-9	Assigns a job to be run by an instance
INTERVAL Procedure on page 65-10	Alters the interval between executions for a specified job
NEXT_DATE Procedure on page 65-11	Alters the next execution time for a specified job
REMOVE Procedure on page 65-12	Removes specified job from the job queue
RUN Procedure on page 65-13	Forces a specified job to run
SUBMIT Procedure on page 65-14	Submits a new job to the job queue
USER_EXPORT Procedures on page 65-16	Re-creates a given job for export, or re-creates a given job for export with instance affinity
WHAT Procedure on page 65-17	Alters the job description for a specified job

BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```
DBMS_JOB.BROKEN (  
  job      IN  BINARY_INTEGER,  
  broken   IN  BOOLEAN,  
  next_date IN DATE DEFAULT SYSDATE);
```

Parameters

Table 65–2 *BROKEN Procedure Parameters*

Parameter	Description
job	Number of the job being run.
broken	Job broken: IN value is FALSE.
next_data	Date of the next refresh.

Note: If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```
DBMS_JOB.CHANGE (
  job      IN  BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN  DATE,
  interval IN  VARCHAR2,
  instance IN  BINARY_INTEGER DEFAULT NULL,
  force    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–3 *CHANGE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.
next_date	Date of the next refresh.
interval	Date function; evaluated immediately before the job starts running.
instance	When a job is submitted, specifies which instance can run the job. This defaults to <code>NULL</code> , which indicates that instance affinity is not changed.
force	If this is <code>FALSE</code> , then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are `NULL`, then leave that value as it is.

Example

```
BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;
```

INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```
DBMS_JOB.INSTANCE (
  job          IN BINARY_INTEGER,
  instance     IN BINARY_INTEGER,
  force       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–4 *INSTANCE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

You must issue a `COMMIT` statement immediately after the statement.

INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```
DBMS_JOB.INTERVAL (
  job      IN  BINARY_INTEGER,
  interval IN  VARCHAR2);
```

Parameters

Table 65–5 *INTERVAL Procedure Parameters*

Parameter	Description
job	Number of the job being run.
interval	Date function, evaluated immediately before the job starts running.

Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement `select interval into next_date from dual`;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
'sysdate + 7'	Run once a week.
'next_day(sysdate, ''TUESDAY'')'	Run once every Tuesday.
'null'	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- You must issue a `COMMIT` statement immediately after the statement.

NEXT_DATE Procedure

This procedure changes when an existing job next runs.

Syntax

```
DBMS_JOB.NEXT_DATE (  
    job          IN BINARY_INTEGER,  
    next_date IN DATE);
```

Parameters

Table 65–6 *NEXT_DATE Procedure Parameters*

Parameter	Description
job	Number of the job being run.
next_date	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```
DBMS_JOB.REMOVE (  
    job          IN BINARY_INTEGER );
```

Parameters

Table 65–7 REMOVE Procedure Parameters

Parameter	Description
job	Number of the job being run.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

Example

```
BEGIN  
    DBMS_JOB.REMOVE(14144);  
    COMMIT;  
END;
```

RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See view `user_jobs`.

Syntax

```
DBMS_JOB.RUN (
  job      IN BINARY_INTEGER,
  force    IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–8 *RUN Procedure Parameters*

Parameter	Description
<code>job</code>	Number of the job being run.
<code>force</code>	If this is <code>TRUE</code> , then instance affinity is irrelevant for running jobs in the foreground process. If this is <code>FALSE</code> , then the job can be run in the foreground only in the specified instance.

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

Caution: This re-initializes the current session's packages.

Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```
DBMS_JOB.SUBMIT (
  job      OUT BINARY_INTEGER,
  what     IN  VARCHAR2,
  next_date IN DATE DEFAULT sysdate,
  interval IN VARCHAR2 DEFAULT 'null',
  no_parse IN BOOLEAN DEFAULT FALSE,
  instance IN BINARY_INTEGER DEFAULT any_instance,
  force    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 65–9 SUBMIT Procedure Parameters

Parameter	Description
<code>job</code>	Number of the job being run.
<code>what</code>	PL/SQL procedure to run.
<code>next_date</code>	Next date when the job will be run.
<code>interval</code>	Date function that calculates the next time to run the job. The default is <code>NULL</code> . This must evaluate to either a future point in time or <code>NULL</code> .
<code>no_parse</code>	A flag. The default is <code>FALSE</code> . If this is set to <code>FALSE</code> , then Oracle parses the procedure associated with the job. If this is set to <code>TRUE</code> , then Oracle parses the procedure associated with the job the first time that the job is run. For example, if you want to submit a job before you have created the tables associated with the job, then set this to <code>TRUE</code> .
<code>instance</code>	When a job is submitted, specifies which instance can run the job.
<code>force</code>	If this is <code>TRUE</code> , then any positive integer is acceptable as the job instance. If this is <code>FALSE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
```

```
DBMS_JOB.SUBMIT(:jobno,  
  'dbms_ddl.analyze_object(''TABLE'',  
  'DQUON', 'ACCOUNTS',  
  'ESTIMATE', NULL, 50);'  
  SYSDATE, 'SYSDATE + 1');  
COMMIT;  
END;  
/  
Statement processed.  
print jobno  
JOBNO  
-----  
14144
```

USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (*8i* and after) and preserves the compatibility.

Syntax

```
DBMS_JOB.USER_EXPORT (  
  job      IN      BINARY_INTEGER,  
  mycall  IN OUT  VARCHAR2);
```

```
DBMS_JOB.USER_EXPORT (  
  job      IN      BINARY_INTEGER,  
  mycall  IN OUT  VARCHAR2,  
  myinst  IN OUT  VARCHAR2);
```

Parameters

Table 65–10 *USER_EXPORT Procedure Parameter*

Parameter	Description
job	Number of the job being run.
mycall	Text of a call to re-create the given job.
myinst	Text of a call to alter instance affinity.

WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```
DBMS_JOB.WHAT (  
  job      IN  BINARY_INTEGER,  
  what     IN  VARCHAR2);
```

Parameters

Table 65–11 WHAT Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.

Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- Some legal values of what (assuming the routines exist) are:
 - 'myproc(''10-JAN-82'', next_date, broken);'
 - 'scott.emppackage.give_raise(''JENKINS'', 30000.00);'
 - 'dbms_job.remove(job);'

The DBMS_LDAP package lets you access data from LDAP servers.

- [Documentation of DBMS_LDAP](#)

Documentation of DBMS_LDAP

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP` in the *Oracle Internet Directory Application Developer's Guide*.

DBMS_LDAP_UTL

The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

- [Documentation of DBMS_LDAP_UTL](#)

Documentation of DBMS_LDAP_UTL

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP_UTL` in the *Oracle Internet Directory Application Developer's Guide*.

DBMS_LIBCACHE

The `DBMS_LIBCACHE` package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- [Using DBMS_LIBCACHE](#)
 - Overview
 - Security Model
- [Summary of DBMS_LIBCACHE Subprograms](#)

Using DBMS_LIBCACHE

- [Overview](#)
- [Security Model](#)

Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements. The open and parse functions are executed in advance for `PL/SQL` and `DML`. For `PL/SQL`, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

Security Model

To execute `DBMS_LIBCACHE` you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, `DBMS_LIBCACHE` should be called for each.

Alternatively, `DBMS_LIBCACHE` may be called with the generic user `PARSER`. However, this user cannot parse the SQL that uses objects with access granted through roles. This is a standard PL/SQL security limitation.

Summary of DBMS_LIBCACHE Subprograms

Table 68–1 *DBMS_LIBCACHE Package Subprograms*

Subprogram	Description
COMPILE_FROM_REMOTE Procedure on page 68-6	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
  p_db_link          IN      dbms_libcache$def.db_link%type,
  p_username         IN      VARCHAR2 default null,
  p_threshold_executions IN  NATURAL default 3,
  p_threshold_sharable_mem IN NATURAL default 1000,
  p_parallel_degree  IN      NATURAL default 1);
```

Parameters

Table 68–2 *COMPILE_FROM_REMOTE Procedure Parameters*

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role <code>SELECT_ON_CATALOG</code> at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with <code>dbms_libcache\$def.ACCESS_METHOD = DB_LINK_METHOD</code>
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single <code>user_id</code> , for example <code>APPS</code> , <code>APPS</code> is the parsing <code>user_id</code> that is recorded in the shared pool. To select only SQL statements parsed by <code>APPS</code> , enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example <code>GL</code> . If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

Table 68-2 (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
<code>p_threshold_sharable_mem</code>	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
<code>p_parallel_degree</code>	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulation specific parts of a LOB or complete LOBs.

 - Exceptions
- [Summary of DBMS_LOB Subprograms](#)

Using DBMS_LOB

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Datatypes](#)
- [Rules and Limits](#)
- [Operational Notes](#)
- [Exceptions](#)

Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

Security Model

This package must be created under `SYS`. Operations provided by this package are performed under the current calling user, not under the package owner `SYS`.

Any `DBMS_LOB` subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any `DBMS_LOB` subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the `AUTHID` to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE proc1 authid definer ...
```

or

```
CREATE PROCEDURE proc1 authid current_user ...
```

See Also: For more information on `AUTHID` and privileges, see *Oracle Database PL/SQL Language Reference*

You can provide secure access to `BFILES` using the `DIRECTORY` feature discussed in `BFILENAME` function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see [Operational Notes](#).

Constants

DBMS_LOB defines the following constants:

Table 69–1 DBMS_LOB Constants

Constant	Definition
FILE_READONLY	CONSTANT BINARY_INTEGER := 0;
LOB_READONLY	CONSTANT BINARY_INTEGER := 0;
LOB_READWRITE	CONSTANT BINARY_INTEGER := 1;
LOBMAXSIZE	CONSTANT INTEGER := 18446744073709551615;
SESSION	CONSTANT PLS_INTEGER := 10;
CALL	CONSTANT PLS_INTEGER := 12;

Table 69–2 DBMS_LOB Option Types

Constant	Definition
OPT_COMPRESS	CONSTANT BINARY_INTEGER := 1;
OPT_ENCRYPT	CONSTANT BINARY_INTEGER := 2;
OPT_DEDUPLICATE	CONSTANT BINARY_INTEGER := 4;

Table 69–3 DBMS_LOB Option Values

Constant	Definition
COMPRESS_OFF	CONSTANT BINARY_INTEGER := 0;
COMPRESS_ON	CONSTANT BINARY_INTEGER := 1;
ENCRYPT_OFF	CONSTANT BINARY_INTEGER := 0;
ENCRYPT_ON	CONSTANT BINARY_INTEGER := 2;
DEDUPLICATE_OFF	CONSTANT BINARY_INTEGER := 0;
DEDUPLICATE_ON	CONSTANT PLS_INTEGER := 4;

Datatypes

The DBMS_LOB package uses the datatypes shown in [Table 69–4](#).

Table 69–4 Datatypes Used by DBMS_LOB

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause ANY_CS in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

Rules and Limits

- [General Rules and Limits](#)
- [Rules and Limits Specific to External Files \(BFILES\)](#)
- [Maximum LOB Size](#)
- [Maximum Buffer Size](#)

General Rules and Limits

- The following rules apply in the specification of subprograms in this package:
 - `length`, `offset`, and `amount` parameters for subprograms operating on BLOBs and BFILES must be specified in terms of *bytes*.
 - `length`, `offset`, and `amount` parameters for subprograms operating on CLOBs must be specified in terms of *characters*.
- A subprogram raises an `INVALID_ARGVAL` exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
 1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
 2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
 3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize` 18446744073709551615 (2^{64}) in any DBMS_LOB subprogram.
 4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed $(lobmaxsize/character_width_in_bytes)$ characters.

For example, if the CLOB consists of 2-byte characters, such as:

```
JA16SJISFIXED
```

Then, the maximum `amount` value should not exceed:

```
18446744073709551615/2 = 9223372036854775807
```

- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for `RAW` and `VARCHAR2` parameters used in DBMS_LOB subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for DBMS_LOB subprograms for CLOBs and NCLOBs.

- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

For example, in DBMS_LOB subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. If the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR`

data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of `amount` plus the `offset` exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as `READ`, `COMPARE`, `INSTR`, and `SUBSTR`, read until `End of Lob/File` is reached. For example, for a `READ` operation on a BLOB or BFILE, if the user specifies `offset` value of 3 GB and an `amount` value of 2 GB on a LOB that is 4GB in size, then `READ` returns only 1GB (4GB-3GB) bytes.

- Functions with NULL or invalid input values for parameters return a NULL. Procedures with NULL values for destination LOB parameters raise exceptions.
- Operations involving patterns as parameters, such as `COMPARE`, `INSTR`, and `SUBSTR` do not support regular expressions or special matching characters (such as % in the `LIKE` operator in SQL) in the `pattern` parameter or substrings.
- The `End Of LOB` condition is indicated by the `READ` procedure using a `NO_DATA_FOUND` exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The `READ` buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an `offset` parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the `amount` parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as `APPEND`, `COPY`, `ERASE`, `TRIM`, or `WRITE`. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILES)

- The subprograms `COMPARE`, `INSTR`, `READ`, `SUBSTR`, `FILECLOSE`, `FILECLOSEALL` and `LOADFROMFILE` operate only on an *opened* BFILE locator; that is, a successful `FILEOPEN` call must precede a call to any of these subprograms.
- For the functions `FILEEXISTS`, `FILEGETNAME` and `GETLENGTH`, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the `DIRECTORY` object and the file.
- DBMS_LOB does not support any concurrency control mechanism for BFILE operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the `FILECLOSEALL` subprogram to close all files opened in the session and resume file operations from the beginning.
- If you are the creator of a `DIRECTORY`, or if you have system privileges, then use the `CREATE OR REPLACE`, `DROP`, and `REVOKE` statements in SQL with extreme caution.

If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to

invoke a program or anonymous block that calls `FILECLOSEALL`, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the `BFILE`.

In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than `SESSION_MAX_OPEN_FILES`.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the `BFILE` variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open `BFILE`s are lost. The result is a larger open file count which may or may not exceed the `SESSION_MAX_OPEN_FILES` value.

For example, consider a `READ` operation past the end of the `BFILE` value, which generates a `NO_DATA_FOUND` exception:

```
-- This assumes a directory 'DDD' whose path is already known
DECLARE
    fil BFILE:= bfilename('DDD', 'filename.foo');
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

After the exception has occurred, the `BFILE` locator variable `file` goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: '||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
exception
```

```
        WHEN no_data_found
        THEN
            BEGIN
                dbms_output.put_line('End of File reached. Closing file');
                dbms_lob.fileclose(fil);
                -- or dbms_lob.filecloseall if appropriate
            END;
    END;
/
```

```
Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value $2^{32}-1$ (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

Maximum Buffer Size

The maximum buffer size, 32767 bytes, is represented by `maxbufsize`.

Operational Notes

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system. See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide*.

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- [Internal LOBs](#)
- [External LOBs](#)
- [Temporary LOBs](#)

Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a DIRECTORY object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the DIRECTORY object and the filename of the external LOB you are adding to the BFILENAME function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the given LOB locator.

After the LOBs are defined and created, you can then SELECT from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to DBMS_LOB for access to the LOB value.

For details on the different ways to do this, you must refer to the section of the *Oracle Database SecureFiles and Large Objects Developer's Guide* that describes "Accessing External LOBs (BFILES)."

Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as `CACHE/ NOCACHE`. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL `DBMS_LOB` package, PRO*C, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the `EMPTY_BLOB` or `EMPTY_CLOB` functions that are supported for permanent LOBs. The `EMPTY_BLOB` function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the `DBMS_LOB` package by using the appropriate `FREETEMPORARY` or `OCIDurationEnd` statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and `DBMS_LOB` statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or `DBMS_LOB COPY` command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a `v$` view called `V$TEMPORARY_LOBS`, which contains information about how many temporary LOBs exist for each session. `v$` views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using `V$TEMPORARY_LOBS` in conjunction with `DBA_SEGMENTS`, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in `DBMS_LOB` return `NULL` if any of the input parameters are `NULL`. All procedures in `DBMS_LOB` raise an exception if the `LOB` locator is input as `NULL`.
2. Operations based on `CLOBs` do not verify if the character set IDs of the parameters (`CLOB` parameters, `VARCHAR2` buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.

See Also: *Oracle Database PL/SQL Language Reference* for more information on `NOCOPY` syntax

Exceptions

Table 69–5 DBMS_LOB Exceptions

Exception	Code	Description
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
BUFFERING_ENABLED	22279	Cannot perform operation with LOB buffering enabled
INVALID_ARGVAL	21560	The argument is expecting a non-NULL, valid value but the argument value passed in is NULL, invalid, or out of range.
INVALID_DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
NO_DATA_FOUND		ENDOFLOB indicator for looping read operations. This is not a hard error.
NOEXIST_DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
OPERATION_FAILED	22288	The operation attempted on the file failed.
QUERY_WRITE	14553	Cannot perform a LOB write inside a query or PDML slave
SECUREFILE_BADLOB	43856	A non-SECUREFILE LOB type was used in a SECUREFILE only call
SECUREFILE_BADPARAM	43857	An invalid argument was passed to a SECUREFILE subprogram
SECUREFILE_MARKERASED	43861	The mark provided to a FRAGMENT_* operation has been deleted
SECUREFILE_OUTOFBOUNDS	43883	Attempted to perform a FRAGMENT_* operation past the LOB end
SECUREFILE_WRONGTYPE	43854	A BASICFILE LOB was used in subprogram that can be used with only SECUREFILE LOB
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

Summary of DBMS_LOB Subprograms

Table 69–6 DBMS_LOB Package Subprograms

Subprogram	Description
APPEND Procedures on page 69-17	Appends the contents of the source LOB to the destination LOB
CLOSE Procedure on page 69-18	Closes a previously opened internal or external LOB
COMPARE Functions on page 69-19	Compares two entire LOBs or parts of two LOBs
CONVERTTOBLOB Procedure on page 69-21	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
CONVERTTOCLOB Procedure on page 69-24	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
COPY Procedures on page 69-27	Copies all, or part, of the source LOB to the destination LOB
CREATETEMPORARY Procedures on page 69-29	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
ERASE Procedures on page 69-30	Erases all or part of a LOB
FILECLOSE Procedure on page 69-32	Closes the file
FILECLOSEALL Procedure on page 69-33	Closes all previously opened files
FILEEXISTS Function on page 69-34	Checks if the file exists on the server
FILEGETNAME Procedure on page 69-35	Gets the directory object name and file name
FILEISOPEN Function on page 69-36	Checks if the file was opened using the input BFILE locators
FILEOPEN Procedure on page 69-37	Opens a file
FRAGMENT_DELETE Procedure on page 69-38	Deletes the data at the given offset for the given length from the LOB
FRAGMENT_INSERT Procedures on page 69-39	Inserts the given data (limited to 32K) into the LOB at the given offset
FRAGMENT_MOVE Procedure on page 69-40	Moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the given offset to the new offset specified
FRAGMENT_REPLACE Procedures on page 69-41	Replaces the data at the given offset with the given data (not to exceed 32k)
FREETEMPORARY Procedures on page 69-43	Frees the temporary BLOB or CLOB in the default temporary tablespace

Table 69–6 (Cont.) DBMS_LOB Package Subprograms

Subprogram	Description
GETCHUNKSIZE Functions on page 69-45	Returns the amount of space used in the LOB chunk to store the LOB value
GETLENGTH Functions on page 69-46	Gets the length of the LOB value
GETOPTIONS Functions on page 69-47	Obtains settings corresponding to the <code>option_types</code> field for a particular LOB
GET_STORAGE_LIMIT Function on page 69-44	Returns the storage limit for LOBs in your database configuration
INSTR Functions on page 69-48	Returns the matching position of the <i>n</i> th occurrence of the pattern in the LOB
ISOPEN Functions on page 69-50	Checks to see if the LOB was already opened using the input locator
ISTEMPORARY Functions on page 69-51	Checks if the locator is pointing to a temporary LOB
LOADBLOBFROMFILE Procedure on page 69-52	Loads BFILE data into an internal BLOB
LOADCLOBFROMFILE Procedure on page 69-54	Loads BFILE data into an internal CLOB
LOADFROMFILE Procedure on page 69-58	Loads BFILE data into an internal LOB
OPEN Procedures on page 69-60	Opens a LOB (internal, external, or temporary) in the indicated mode
READ Procedures on page 69-62	Reads data from the LOB starting at the specified offset
SETOPTIONS Procedures on page 69-64	Enables CSCE features on a per-LOB basis, overriding the default LOB column settings
SUBSTR Functions on page 69-65	Returns part of the LOB value starting at the specified offset
TRIM Procedures on page 69-67	Trims the LOB value to the specified shorter length
WRITE Procedures on page 69-69	Writes data to the LOB from a specified offset
WRITEAPPEND Procedures on page 69-71	Writes a buffer to the end of a LOB

APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

There are two overloaded APPEND procedures.

Syntax

```
DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY BLOB,
  src_lob  IN          BLOB);

DBMS_LOB.APPEND (
  dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob  IN          CLOB  CHARACTER SET dest_lob%CHARSET);
```

Parameters

Table 69–7 APPEND Procedure Parameters

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

Exceptions

Table 69–8 APPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```
DBMS_LOB.CLOSE (
    lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
    lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
    file_loc   IN OUT NOCOPY BFILE);
```

Parameters

Table 69–9 *CLOSE Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILES), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

```
DBMS_LOB.COMPARE (
  lob_1          IN BLOB,
  lob_2          IN BLOB,
  amount         IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.COMPARE (
  lob_1          IN CLOB CHARACTER SET ANY_CS,
  lob_2          IN CLOB CHARACTER SET lob_1%CHARSET,
  amount         IN INTEGER := DBMS_LOB.LOBMAXSIZE,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

```
DBMS_LOB.COMPARE (
  lob_1          IN BFILE,
  lob_2          IN BFILE,
  amount         IN INTEGER,
  offset_1       IN INTEGER := 1,
  offset_2       IN INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–10 COMPARE Function Parameters

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.

Return Values

- INTEGER: Zero if the comparison succeeds, nonzero if not.
- NULL, if
 - amount < 1
 - amount > LOBMAXSIZE

- offset_1 or offset_2 < 1
- * offset_1 or offset_2 > LOBMAXSIZE

Usage Notes

You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

COMPARE returns zero if the data exactly matches over the range specified by the offset and amount parameters. Otherwise, a nonzero INTEGER is returned.

For fixed-width *n*-byte CLOBs, if the input amount for COMPARE is specified to be greater than (DBMS_LOB.LOBMAXSIZE/*n*), then COMPARE matches characters in a range of size (DBMS_LOB.LOBMAXSIZE/*n*), or Max(length(clob1), length(clob2)), whichever is lesser.

Exceptions

Table 69–11 COMPARE Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB (
  dest_lob      IN OUT  NOCOPY  BLOB,
  src_clob      IN      CLOB CHARACTER SET ANY_CS,
  amount        IN      INTEGER,
  dest_offset   IN OUT  INTEGER,
  src_offset    IN OUT  INTEGER,
  blob_csid     IN      NUMBER,
  lang_context  IN OUT  INTEGER,
  warning       OUT     INTEGER);
```

Parameters

Table 69–12 *CONVERTTOBLOB Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.
src_offset	(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 69–12 (Cont.) CONVERTTOBLOB Procedure Parameters

Parameter	Description
warning	<p>(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message.</p> <p>Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.</p>

Usage Notes

Preconditions

Before calling the `CONVERTTOBLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 69–13](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 69–13 DBMS_LOB.CONVERTTOBLOB Typical Values

Parameter	Value	Description
amount	<code>LOBMAXSIZE</code> (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
blob_csid	<code>DEFAULT_CSID</code> (IN)	default CSID, use same CSID as source LOB
lang_context	<code>DEFAULT_LANG_CTX</code> (IN)	default language context
warning	<code>NO_WARNING</code> (OUT)	no warning message, success
	<code>WARN_INCONVERTIBLE_CHAR</code> (OUT)	character in source cannot be properly converted

General Notes

You must specify the desired character set for the destination LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The `amount` and `src_offset` values are

in characters and the `dest_offset` is in bytes. To convert the entire LOB, you can specify `LOBMAXSIZE` for the `amount` parameter.

Exceptions

Table 69–14 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 69–14 *CONVERTTOBLOB Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: <ul style="list-style-type: none"> - <code>src_offset</code> or <code>dest_offset</code> < 1. - <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code>. - <code>amount</code> < 1. - <code>amount</code> > <code>LOBMAXSIZE</code>.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB (
    dest_lob      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    src_blob      IN             BLOB,
    amount        IN             INTEGER,
    dest_offset   IN OUT        INTEGER,
    src_offset    IN OUT        INTEGER,
    blob_csid     IN            NUMBER,
    lang_context  IN OUT        INTEGER,
    warning       OUT           INTEGER);
```

Parameters

Table 69–15 *CONVERTTOCLOB Procedure Parameters*

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant <code>DBMS_LOB.LOBMAXSIZE</code> . If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	(IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	(IN) Offset in bytes in the source LOB for the start of the read. (OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	The character set ID of the source data
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 69–15 (Cont.) CONVERTTOCLOB Procedure Parameters

Parameter	Description
warning	Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.

Usage Notes

Preconditions

Before calling the `CONVERTTOCLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the `CONVERTTOCLOB` procedure. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

[Table 69–16](#) gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 69–16 DBMS_LOB.CONVERTTOCLOB Typical Values

Parameter	Value	Description
amount	<code>LOBMAXSIZE</code> (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	<code>DEFAULT_CSID</code> (IN)	default CSID, use destination CSID
lang_context	<code>DEFAULT_LANG_CTX</code> (IN)	default language context
warning	<code>NO_WARNING</code> (OUT) <code>WARN_INCONVERTIBLE_CHAR</code> (OUT)	no warning message, success character in source cannot be properly converted

General Notes

You must specify the character set of the source data in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the database assumes that the BLOB contains character data in the same character set as the destination CLOB.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BLOB. The `amount` and `src_offset` values are in bytes and the `dest_offset` is in characters. To convert the entire BLOB, you can specify `LOBMAXSIZE` for the `amount` parameter.

Exceptions

Table 69–17 *CONVERTTOCLOB Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: <ul style="list-style-type: none">- <code>src_offset</code> or <code>dest_offset</code> < 1.- <code>src_offset</code> or <code>dest_offset</code> > <code>LOBMAXSIZE</code>.- <code>amount</code> < 1.- <code>amount</code> > <code>LOBMAXSIZE</code>.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY BLOB,
  src_lob    IN           BLOB,
  amount     IN           INTEGER,
  dest_offset IN          INTEGER := 1,
  src_offset IN          INTEGER := 1);
```

```
DBMS_LOB.COPY (
  dest_lob   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  src_lob    IN           CLOB CHARACTER SET dest_lob%CHARSET,
  amount     IN           INTEGER,
  dest_offset IN          INTEGER := 1,
  src_offset IN          INTEGER := 1);
```

Parameters

Table 69–18 COPY Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

Exceptions

Table 69–19 COPY Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - src_offset or dest_offset < 1 - src_offset or dest_offset > LOBMAXSIZE - amount < 1 - amount > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

Usage Notes

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the `src_offset` to the end of the source LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := DBMS_LOB.SESSION);
```

```
DBMS_LOB.CREATETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  cache   IN           BOOLEAN,
  dur     IN           PLS_INTEGER := 10);
```

Parameters

Table 69–20 CREATETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 3 predefined duration values (SESSION, TRANSACTION, or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session, transaction or call. If dur is omitted, then the session duration is used.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
- *Oracle Database PL/SQL Language Reference* for more information about NOCOPY and passing temporary lob as parameters

ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```
DBMS_LOB.ERASE (
  lob_loc          IN OUT NOCOPY BLOB,
  amount           IN OUT NOCOPY INTEGER,
  offset           IN              INTEGER := 1);

DBMS_LOB.ERASE (
  lob_loc          IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount           IN OUT NOCOPY INTEGER,
  offset           IN              INTEGER := 1);
```

Parameters

Table 69–21 ERASE Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be erased. For more information, see Operational Notes .
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

Usage Notes

Note: The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the ["TRIM Procedures"](#) on page 69-67.

When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.

The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.

Exceptions

Table 69–22 ERASE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - amount < 1 or amount > LOBMAXSIZE - offset < 1 or offset > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave

Table 69–22 (Cont.) ERASE Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- ["TRIM Procedures"](#) on page 69-67
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

Note: The database has only read-only access to BFILES. This means that BFILES cannot be written through the database.

Syntax

```
DBMS_LOB.FILECLOSE (
    file_loc IN OUT NOCOPY BFILE);
```

Parameters

Table 69–23 FILECLOSE Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE to be closed.

Exceptions

Table 69–24 FILECLOSE Procedure Exceptions

Exception	Description
VALUE_ERROR	NULL input value for file_loc.
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- ["FILEOPEN Procedure"](#) on page 69-37
- ["FILECLOSEALL Procedure"](#) on page 69-33
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILECLOSEALL Procedure

This procedure closes all BFILEs opened in the session.

Syntax

```
DBMS_LOB.FILECLOSEALL;
```

Exceptions

Table 69–25 FILECLOSEALL Procedure Exception

Exception	Description
UNOPENED_FILE	No file has been opened in the session.

See Also:

- ["FILEOPEN Procedure"](#) on page 69-37
- ["FILECLOSE Procedure"](#) on page 69-32
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEEXISTS Function

This function finds out if a given BFILE locator points to a file that actually exists on the server's file system.

Syntax

```
DBMS_LOB.FILEEXISTS (
    file_loc    IN    BFILE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–26 FILEEXISTS Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

Table 69–27 FILEEXISTS Function Return Values

Return	Description
0	Physical file does not exist.
1	Physical file exists.

Exceptions

Table 69–28 FILEEXISTS Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- ["FILEISOPEN Function"](#) on page 69-36.
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the `dir_alias` buffer is 30, and for the entire path name, it is 2000.

Syntax

```
DBMS_LOB.FILEGETNAME (
  file_loc  IN   BFILE,
  dir_alias OUT  VARCHAR2,
  filename  OUT  VARCHAR2);
```

Parameters

Table 69–29 FILEGETNAME Procedure Parameters

Parameter	Description
<code>file_loc</code>	Locator for the BFILE
<code>dir_alias</code>	Directory object name
<code>filename</code>	Name of the BFILE

Exceptions

Table 69–30 FILEGETNAME Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	<code>dir_alias</code> or <code>filename</code> are NULL.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEISOPEN Function

This function finds out whether a BFILE was opened with the given FILE locator.

Syntax

```
DBMS_LOB.FILEISOPEN (
    file_loc IN BFILE)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–31 FILEISOPEN Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

INTEGER: 0 = file is not open, 1 = file is open

Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 69–32 FILEISOPEN Function Exceptions

Exception	Description
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- ["FILEEXISTS Function"](#) on page 69-34
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```
DBMS_LOB.FILEOPEN (
  file_loc  IN OUT NOCOPY  BFILE,
  open_mode IN              BINARY_INTEGER := file_readonly);
```

Parameters

Table 69–33 FILEOPEN Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

Exceptions

Table 69–34 FILEOPEN Procedure Exceptions

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- ["FILECLOSE Procedure"](#) on page 69-32
- ["FILECLOSEALL Procedure"](#) on page 69-33
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FRAGMENT_DELETE Procedure

This procedure deletes the data at the specified offset for the given length from the LOB without having to rewrite all the data in the LOB following the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER);

DBMS_LOB.FRAGMENT_DELETE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER);
```

Parameters

Table 69–35 *FRAGMENT_DELETE Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion

Exceptions

Table 69–36 *FRAGMENT_DELETE Procedure Exceptions*

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

FRAGMENT_INSERT Procedures

This function inserts the given data (limited to 32K) into the LOB at the given offset.

Syntax

```
DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           RAW);

DBMS_LOB.FRAGMENT_INSERT (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–37 *FRAGMENT_INSERT Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion
buffer	Data to insert into the LOB

Exceptions

Table 69–38 *FRAGMENT_INSERT Procedure Exceptions*

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

FRAGMENT_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the given offset to the new offset specified.

Syntax

```
DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY BLOB,
  amount       IN          INTEGER,
  src_offset   IN          INTEGER,
  dest_offset  IN          INTEGER);

DBMS_LOB.FRAGMENT_MOVE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount       IN          INTEGER,
  src_offset   IN          INTEGER,
  dest_offset  IN          INTEGER);
```

Parameters

Table 69–39 FRAGMENT_MOVE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB
src_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
dest_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data

Exceptions

Table 69–40 FRAGMENT_MOVE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.

FRAGMENT_REPLACE Procedures

This procedure replaces the data at the given offset with the given data (not to exceed 32k).

Syntax

```
DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY BLOB,
  old_amount   IN           INTEGER,
  new_amount   IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           RAW);

DBMS_LOB.FRAGMENT_REPLACE (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  old_amount   IN           INTEGER,
  new_amount   IN           INTEGER,
  offset       IN           INTEGER,
  buffer       IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–41 *FRAGMENT_REPLACE Function Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
old_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB
new_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be written to the LOB
offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
buffer	Data to insert into the LOB

Exceptions

Table 69–42 *FRAGMENT_REPLACE Procedure Exceptions*

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

Usage Notes

Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.

FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

Syntax

```
DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY BLOB);
```

```
DBMS_LOB.FREETEMPORARY (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 69–43 *FREETEMPORARY Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Usage Notes

- When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, transaction, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.
- After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.
- If an invalid LOB locator is assigned to another LOB locator using OCILobLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

GET_STORAGE_LIMIT Function

This function returns the LOB storage limit for the given LOB.

Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT (  
    lob_loc IN CLOB CHARACTER SET ANY_CS)  
RETURN INTEGER;  
  
DBMS_LOB.GET_STORAGE_LIMIT (  
    lob_loc IN BLOB)  
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–44 GET_STORAGE_LIMIT Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Return Value

The value returned from this function is the maximum allowable size for given LOB locator. For BLOBs, the return value depends on the block size of the tablespace the LOB resides in and is calculated as $(2^{32})-1$ (4294967295) times the block size of the tablespace. For CLOBs/NCLOBs, the value returned will be the $(2^{32})-1$ (4294967295) times the block size of the tablespace divided by the character width of the CLOB/NCLOB.

Usage

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for details on LOB storage limits

GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```
DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN BLOB)
    RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (
    lob_loc IN CLOB CHARACTER SET ANY_CS)
    RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–45 GETCHUNKSIZE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Return Values

The value returned for BLOBs is in terms of bytes. The value returned for CLOBs is in terms of characters.

Usage Notes

With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the `WRITE` until you have enough for a chunk, instead of issuing several `WRITE` calls for the same chunk.

These tactics of performance improvement do not apply to securefiles.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

Exceptions

Table 69–46 GETCHUNKSIZE Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN BLOB)
RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (
  lob_loc   IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

```
DBMS_LOB.GETLENGTH (
  file_loc  IN BFILE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–47 GETLENGTH Function Parameter

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILES:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

Exceptions

Table 69–48 GETLENGTH Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

GETOPTIONS Functions

This function obtains settings corresponding to the `option_type` field for a particular LOB.

Syntax

```
DBMS_LOB.GETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;

DBMS_LOB.GETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 69–49 *GETOPTIONS Function Parameter*

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be examined. For more information, see Operational Notes .
<code>option_type</code>	See DBMS_LOB Option Types on page 69-5

Return Values

The return values are a combination of `COMPRESS_ON`, `ENCRYPT_ON` and `DEDUPLICATE_ON` (see [DBMS_LOB Option Values](#) on page 69-5) depending on which option types (see [DBMS_LOB Option Types](#) on page 69-5) are passed in.

Exceptions

Table 69–50 *GETOPTIONS Procedure Exceptions*

Exception	Description
<code>SECUREFILE_BADLOB</code>	Unsupported object type for the operation
<code>INVALID_ARGVAL</code>	A parameter value was invalid
<code>QUERY_WRITE</code>	Cannot perform operation during a query
<code>BUFFERING_ENABLED</code>	Cannot perform operation with LOB buffering enabled
<code>SECUREFILE_BADLOB</code>	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
<code>SECUREFILE_WRONGTYPE</code>	A BASICFILE LOB was used in a SECUREFILE LOB only call

INSTR Functions

This function returns the matching position of the *nth* occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (
  lob_loc    IN    BLOB,
  pattern    IN    RAW,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.INSTR (
  lob_loc    IN    CLOB      CHARACTER SET ANY_CS,
  pattern    IN    VARCHAR2  CHARACTER SET lob_loc%CHARSET,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;

DBMS_LOB.INSTR (
  file_loc   IN    BFILE,
  pattern    IN    RAW,
  offset     IN    INTEGER := 1,
  nth        IN    INTEGER := 1)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–51 INSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes .
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

Return Values

Table 69–52 INSTR Function Return Values

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.

Table 69–52 (Cont.) INSTR Function Return Values

Return	Description
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

Usage Notes

The form of the VARCHAR2 buffer (the `pattern` parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILES, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 69–53 INSTR Function Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

See Also:

- ["SUBSTR Functions"](#) on page 69-65
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
  lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISOPEN (
  lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;

DBMS_LOB.ISOPEN (
  file_loc IN BFILE)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–54 ISOPEN Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
file_loc	File locator.

Return Values

The return value will be 1 if the LOB is open, 0 otherwise.

Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILES), ISOPEN also requires a round-trip, because that's where the state is kept.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

Syntax

```
DBMS_LOB.ISTEMPORARY (
  lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
  lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 69–55 *ISTEMPORARY Procedure Parameters*

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .

Return Values

The return value will be 1 if the LOB is temporary is open, 0 otherwise.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
  dest_lob    IN OUT NOCOPY BLOB,
  src_bfile   IN          BFILE,
  amount      IN          INTEGER,
  dest_offset IN OUT      INTEGER,
  src_offset  IN OUT      INTEGER);
```

Parameters

Table 69–56 *LOADBLOBFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in bytes for BLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect

performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

Table 69–57 Suggested Values of the Parameter

Parameter	Default Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize          CONSTANT INTEGER          := DBMS_LOB.LOBMAXSIZE;
```

Exceptions

Table 69–58 LOADBLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the BLOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
  dest_lob      IN OUT NOCOPY  NOCOPY CLOB CHARACTER SET ANY_CS,
  src_bfile     IN              BFILE,
  amount        IN              INTEGER,
  dest_offset   IN OUT         INTEGER,
  src_offset    IN OUT         INTEGER,
  bfile_csid    IN              NUMBER,
  lang_context  IN OUT         INTEGER,
  warning       OUT            INTEGER);
```

Parameters

Table 69–59 *LOADCLOBFROMFILE Procedure Parameters*

Parameter	Description
dest_lob	CLOB/NCLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. Use DBMS_LOB.LOBLMAXSIZE of load until the end of the BFILE.
dest_offset	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
bfile_csid	Character set id of the source (BFILE) file.
lang_context	(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call

Table 69–59 (Cont.) LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined the constant value <code>DBMS_LOB.WARN_INCONVERTIBLE_CHAR</code> .

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is `LOBMAXSIZE` which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- `csid=0` indicates the default behavior that uses database `csid` for CLOB and national `csid` for NCLOB in the place of source `csid`. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

The source BFILE can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. [Table 69–60, "Supported Unicode Encoding Schemes"](#) lists Unicode encodings schemes supported by this subprogram.

Table 69–60 Supported Unicode Encoding Schemes

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-8	AL32UTF8	873
UTF-16BE	AL16UTF16	2000

Table 69–60 (Cont.) Supported Unicode Encoding Schemes

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-16LE	AL16UTF16LE	2002
CESU-8	UTF8	871
UTF-EBCDIC	UTFE	872
UTF-16	UTF16	1000

All three UTF-16 encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The UTF-16BE encoding scheme defines big-endian data. The UTF-16LE scheme defines little-endian data. The UTF-16 scheme requires that the source BFILE contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is 0xFEFF. If the code is stored as {0xFE, 0xFF}, the data is interpreted as big-endian. If it is stored as {0xFF, 0xFE}, the data is interpreted as little-endian.

In UTF-8 and in CESU-8 encodings the Byte Order Mark is stored as {0xEF, 0xBB, 0xBF}. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

Constants

Here is a summary of the constants and the suggested values that can be used.

Table 69–61 Suggested Values of the Parameter

Parameter	Suggested Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

lobmaxsize	CONSTANT INTEGER	:= 18446744073709551615;
warn_inconvertible_char	CONSTANT INTEGER	:= 1;
default_csid	CONSTANT INTEGER	:= 0;
default_lang_ctx	CONSTANT INTEGER	:= 0;
no_warning	CONSTANT INTEGER	:= 0;

Exceptions

Table 69–62 LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.

Table 69–62 (Cont.) LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: <ul style="list-style-type: none">- src_offset or dest_offset < 1.- src_offset or dest_offset > LOBMAXSIZE.- amount < 1.- amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the CLOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Syntax

```
DBMS_LOB.LOADFROMFILE (
  dest_lob    IN OUT NOCOPY BLOB,
  src_file    IN          BFILE,
  amount      IN          INTEGER,
  dest_offset IN          INTEGER := 1,
  src_offset  IN          INTEGER := 1);
```

Parameters

Table 69–63 *LOADFROMFILE Procedure Parameters*

Parameter	Description
<code>dest_lob</code>	LOB locator of the target for the load.
<code>src_file</code>	BFILE locator of the source for the load.
<code>amount</code>	Number of bytes to load from the BFILE.
<code>dest_offset</code>	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
<code>src_offset</code>	Offset in bytes in the source BFILE (origin: 1) for the start of the load.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is either in bytes or characters for BLOBs and CLOBs respectively.

Note: The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

Note: If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using `DBMS_LOB.LOADFROMFILE`, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use `sql*loader` instead of `LOADFROMFILE` to load data into a CLOB or NCLOB because `sql*loader` will provide the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Exceptions

Table 69–64 *LOADFROMFILE Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - <code>src_offset</code> or <code>dest_offset</code> < 1. - <code>src_offset</code> or <code>dest_offset</code> > LOBMAXSIZE. - <code>amount</code> < 1. - <code>amount</code> > LOBMAXSIZE.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```
DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY BLOB,
  open_mode IN          BINARY_INTEGER);

DBMS_LOB.OPEN (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  open_mode IN          BINARY_INTEGER);

DBMS_LOB.OPEN (
  file_loc IN OUT NOCOPY BFILE,
  open_mode IN          BINARY_INTEGER := file_readonly);
```

Parameters

Table 69–65 OPEN Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes .
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

Usage Notes

Note: If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILES), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input `offset` points past the End of LOB, then amount is set to 0, and a `NO_DATA_FOUND` exception is raised.

Syntax

```
DBMS_LOB.READ (
  lob_loc   IN          BLOB,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          RAW);

DBMS_LOB.READ (
  lob_loc   IN          CLOB CHARACTER SET ANY_CS,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
  file_loc  IN          BFILE,
  amount    IN OUT NOCOPY INTEGER,
  offset     IN          INTEGER,
  buffer     OUT          RAW);
```

Parameters

Table 69–66 READ Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the LOB to be read. For more information, see Operational Notes .
<code>file_loc</code>	The file locator for the LOB to be examined.
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
<code>buffer</code>	Output buffer for the read operation.

Exceptions

[Table 69–67](#) lists exceptions that apply to any LOB instance. [Table 69–68](#) lists exceptions that apply only to BFILEs.

Table 69–67 READ Procedure Exceptions

Exception	Description
<code>VALUE_ERROR</code>	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL.

Table 69–67 (Cont.) READ Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE - amount is greater, in bytes or characters, than the capacity of buffer.
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.

Table 69–68 READ Procedure Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

SETOPTIONS Procedures

This procedure enables/disables CSCE features on a per-LOB basis, overriding the default LOB column settings.

Syntax

```
DBMS_LOB.SETOPTIONS (
  lob_loc          IN      BLOB,
  option_types     IN      PLS_INTEGER,
  options          IN      PLS_INTEGER);

DBMS_LOB.SETOPTIONS (
  lob_loc          IN      CLOB CHARACTER SET ANY_CS,
  option_types     IN      PLS_INTEGER,
  options          IN      PLS_INTEGER);
```

Parameters

Table 69–69 *SETOPTIONS Procedure Parameter*

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes .
option_type	See DBMS_LOB Option Types on page 69-5
options	See DBMS_LOB Option Values on page 69-5

Exceptions

Table 69–70 *SETOPTIONS Procedure Exceptions*

Exception	Description
SECUREFILE_BADLOB	Unsupported object type for the operation
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_WRONGTYPE	A BASICFILE LOB was used in a SECUREFILE LOB only call

Usage Notes

DBMS_LOB.SETOPTIONS cannot be used to enable or disable encryption on individual LOBs.

SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than $(32767/n)$, then SUBSTR returns a character buffer of length $(32767/n)$, or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, n is the maximum byte-width used for characters in the CLOB.

Syntax

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      BLOB,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

```
DBMS_LOB.SUBSTR (
  lob_loc      IN      CLOB CHARACTER SET ANY_CS,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;
```

```
DBMS_LOB.SUBSTR (
  file_loc     IN      BFILE,
  amount       IN      INTEGER := 32767,
  offset       IN      INTEGER := 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 69–71 SUBSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes .
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

Return Values

Table 69–72 SUBSTR Function Return Values

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.

Table 69–72 (Cont.) SUBSTR Function Return Values

Return	Description
NULL	Either: <ul style="list-style-type: none"> - any input parameter is NULL - amount < 1 - amount > 32767 - offset < 1 - offset > LOBMAXSIZE

Exceptions

Table 69–73 SUBSTR Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

See Also:

- ["INSTR Functions"](#) on page 69-48
- ["READ Procedures"](#) on page 69-62
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the `newlen` parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

Note: The TRIM procedure decreases the length of the LOB to the value specified in the `newlen` parameter.

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in `newlen` is greater than the size of the LOB, then an exception is raised.

Syntax

```
DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY BLOB,
  newlen       IN          INTEGER);

DBMS_LOB.TRIM (
  lob_loc      IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  newlen       IN          INTEGER);
```

Parameters

Table 69–74 TRIM Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes .
<code>newlen</code>	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

Exceptions

Table 69–75 TRIM Procedure Exceptions

Exception	Description
VALUE_ERROR	<code>lob_loc</code> is NULL.
INVALID_ARGVAL	Either: - <code>new_len</code> < 0 - <code>new_len</code> > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit

or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- ["ERASE Procedures"](#) on page 69-30
- ["WRITEAPPEND Procedures"](#) on page 69-71
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the `buffer` parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY BLOB,
  amount   IN           INTEGER,
  offset   IN           INTEGER,
  buffer   IN           RAW);

DBMS_LOB.WRITE (
  lob_loc  IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount   IN           INTEGER,
  offset   IN           INTEGER,
  buffer   IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–76 WRITE Procedure Parameters

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see Operational Notes
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write
<code>offset</code>	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
<code>buffer</code>	Input buffer for the write

Exceptions

Table 69–77 WRITE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: <ul style="list-style-type: none"> - <code>amount</code> < 1 - <code>amount</code> > MAXBUFSIZE - <code>offset</code> < 1 - <code>offset</code> > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Table 69–77 (Cont.) WRITE Procedure Exceptions

Exception	Description
SECUREFILE_OUTOFBOUNDS	Attempted to perform a write operation past the end of a LOB having <code>FRAGMENT_*</code> on it

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.

The form of the `VARCHAR2` buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type `NCLOB`, then the buffer must contain `NCHAR` data. Conversely, if the input LOB parameter is of type `CLOB`, then the buffer must contain `CHAR` data.

When calling `DBMS_LOB.WRITE` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

- ["COPY Procedures"](#) on page 69-27
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the `buffer` parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY BLOB,
  amount IN           INTEGER,
  buffer IN           RAW);

DBMS_LOB.WRITEAPPEND (
  lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
  amount IN           INTEGER,
  buffer IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 69–78 *WRITEAPPEND Procedure Parameters*

Parameter	Description
<code>lob_loc</code>	Locator for the internal LOB to be written to. For more information, see Operational Notes
<code>amount</code>	Number of bytes (for BLOBs) or characters (for CLOBs) to write
<code>buffer</code>	Input buffer for the write

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 69–79 *WRITEAPPEND Procedure Exceptions*

Exception	Description
VALUE_ERROR	Any of <code>lob_loc</code> , <code>amount</code> , or <code>offset</code> parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - <code>amount</code> < 1 - <code>amount</code> > MAXBUFSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling `DBMS_LOB.WRITEAPPEND` from the client (for example, in a `BEGIN/END` block from within `SQL*Plus`), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the `LOB`.

It is not mandatory that you wrap the `LOB` operation inside the `Open/Close` interfaces. If you did not open the `LOB` before performing the operation, the functional and domain indexes on the `LOB` column are updated during the call. However, if you opened the `LOB` before performing the operation, you must close it before you commit or rollback the transaction. When an internal `LOB` is closed, it updates the functional and domain indexes on the `LOB` column.

If you do not wrap the `LOB` operation inside the `Open/Close` API, the functional and domain indexes are updated each time you write to the `LOB`. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the `LOB` within the `OPEN` or `CLOSE` statement.

The `DBMS_LOCK` package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

See Also: For more information, and an example of how to use the `DBMS_LOCK` package, see "About User Locks" in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- [Using DBMS_LOCK](#)

Using DBMS_LOCK

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Rules and Limits](#)
- [Operational Notes](#)

Overview

Some uses of user locks:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

Constants

The DBMS_LOCK package uses the constants shown in [Table 70-1](#).

Table 70-1 DBMS_LOCK Constants

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuLl	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	<ul style="list-style-type: none"> ■ Sub eXclusive ■ Row Exclusive Mode 	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	<ul style="list-style-type: none"> ■ Shared ■ Row Exclusive Mode ■ Intended Exclusive 	INTEGER	4	ULRSX	-
SSX_MODE	<ul style="list-style-type: none"> ■ Shared Sub eXclusive ■ Share Row Exclusive Mode 	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

Table 70-2 Lock Compatibility

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait constant integer := 32767;
```

The constant `maxwait` waits forever.

Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

DBMS_LOCK is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

Summary of DBMS_LOCK Subprograms

Table 70-3 DBMS_LOCK Package Subprograms

Subprogram	Description
ALLOCATE_UNIQUE Procedure on page 70-9	Allocates a unique lock ID to a named lock.
CONVERT Function on page 70-11	Converts a lock from one mode to another.
RELEASE Function on page 70-12	Releases a lock.
REQUEST Function on page 70-13	Requests a lock of a specific mode.
SLEEP Procedure on page 70-14	Puts a procedure to sleep for a specific time.

ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) given a lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
    lockname          IN  VARCHAR2,
    lockhandle        OUT VARCHAR2,
    expiration_secs   IN  INTEGER  DEFAULT 864000);
```

Parameters

Table 70–4 ALLOCATE_UNIQUE Procedure Parameters

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA\$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_secs	Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed on a given lock, before permitting that lock to be deleted from the DBMS_LOCK_ALLOCATED table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to recover space.

Usage Notes

If you choose to identify locks by name, you can use ALLOCATE_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms_lock_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration_secs (defaults to 10 days) past the last call to ALLOCATE_UNIQUE with the given lock name. After this time, the row in the dbms_lock_allocated table for this lock name may be deleted in order to recover space. ALLOCATE_UNIQUE performs a commit.

Note: Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a given name.

Exceptions

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog dbms_lock_allocated.

CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.CONVERT(
  id          IN INTEGER ||
  lockhandle  IN VARCHAR2,
  lockmode   IN INTEGER,
  timeout     IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;
```

Parameters

Table 70–5 CONVERT Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	New mode that you want to assign to the given lock. For the available modes and their associated integer identifiers, see Constants on page 70-5.
timeout	Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

Return Values

Table 70–6 CONVERT Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

RELEASE Function

This function explicitly releases a lock previously acquired using the `REQUEST` function. Locks are automatically released at the end of a session. `RELEASE` is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the `ALLOCATE_UNIQUE` procedure.

Syntax

```
DBMS_LOCK.RELEASE (
    id          IN INTEGER)
RETURN INTEGER;
```

```
DBMS_LOCK.RELEASE (
    lockhandle IN VARCHAR2)
RETURN INTEGER;
```

Parameters

Table 70–7 *RELEASE Function Parameter*

Parameter	Description
<code>id</code> or <code>lockhandle</code>	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code> , of the lock mode you want to change.

Return Values

Table 70–8 *RELEASE Function Return Values*

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by <code>id</code> or <code>lockhandle</code>
5	Illegal lock handle

REQUEST Function

This function requests a lock with a given mode. REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.REQUEST(
  id           IN  INTEGER ||
  lockhandle   IN  VARCHAR2,
  lockmode     IN  INTEGER DEFAULT X_MODE,
  timeout      IN  INTEGER DEFAULT MAXWAIT,
  release_on_commit IN  BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

The current default values, such as X_MODE and MAXWAIT, are defined in the DBMS_LOCK package specification.

Parameters

Table 70–9 REQUEST Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see Constants on page 70-5.
timeout	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).
release_on_commit	Set this parameter to TRUE to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

Return Values

Table 70–10 REQUEST Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by id or lockhandle
5	Illegal lock handle

SLEEP Procedure

This procedure suspends the session for a given period of time.

Syntax

```
DBMS_LOCK.SLEEP (  
    seconds IN NUMBER);
```

Parameters

Table 70–11 *SLEEP Procedure Parameters*

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

The DBMS_LOGMNR package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- [Summary of DBMS_LOGMNR Subprograms](#)

Using DBMS_LOGMNR

This section contains the following topics, which relate to using the DBMS_LOGMNR package:

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

See Also: [Chapter 72, "DBMS_LOGMNR_D"](#) for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR package.

Constants

The DBMS_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGMNR.NEW.

Table 71–1 describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 71–1 Constants for ADD_LOGFILE Options Flag

Constant	Description
NEW	Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
ADDFILE	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.

Table 71–2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

Table 71–2 Constants for START_LOGMNR Options Flag

Constant	Description
COMMITTED_DATA_ONLY	<p>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on).</p> <p>If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</p>
SKIP_CORRUPTION	<p>Directs a select operation on the V\$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V\$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.</p>
DDL_DICT_TRACKING	<p>If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open.</p> <p>This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.</p>

Table 71–2 (Cont.) Constants for START_LOGMNR Options Flag

Constant	Description
DICT_FROM_ONLINE_CATALOG	<p>Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed.</p> <p>This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files.</p> <p>Expect to see a value of 2 in the STATUS column of the V\$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.</p>
DICT_FROM_REDO_LOGS	<p>If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.</p>
NO_SQL_DELIMITER	<p>If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.</p>
NO_ROWID_IN_STMT	<p>If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled.</p> <p>When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.</p>
PRINT_PRETTY_SQL	<p>If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.</p>
CONTINUOUS_MINE	<p>Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled.</p> <p>Beginning with Oracle Database release 10.1, the CONTINUOUS_MINE options is supported for use in an Oracle Real Application Clusters (RAC) environment.</p>

Views

The DBMS_LOGMNR package uses the views listed in the section on Accessing LogMiner Operational Information in Views in *Oracle Database Utilities*.

Operational Notes

A **LogMiner session** begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue `SQL SELECT` statements against the `V$LOGMNR_CONTENTS` view to retrieve the data of interest.

Summary of DBMS_LOGMNR Subprograms

Table 71-3 DBMS_LOGMNR Package Subprograms

Subprogram	Description
ADD_LOGFILE Procedure on page 71-10	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
COLUMN_PRESENT Function on page 71-12	Call this function for any row returned from the V\$LOGMNR_CONTENTS view to determine if undo or redo column values exist for the column specified by the <code>column_name</code> input parameter to this function
END_LOGMNR Procedure on page 71-14	Finishes a LogMiner session
MINE_VALUE Function on page 71-15	Call this function for any row returned from the V\$LOGMNR_CONTENTS view to retrieve the undo or redo column value of the column specified by the <code>column_name</code> input parameter to this function
REMOVE_LOGFILE Procedure on page 71-17	Removes a redo log file from the list of redo log files for LogMiner to process
START_LOGMNR Procedure on page 71-18	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to <code>DBMS_LOGMNR.ADD_LOGFILE</code>)

ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
  LogFileName      IN VARCHAR2,
  options          IN BINARY_INTEGER default ADDFILE );
```

Parameters

Table 71–4 ADD_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: <ul style="list-style-type: none"> ■ Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW) ■ Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE) See Table 71–1, "Constants for ADD_LOGFILE Options Flag" .

Exceptions

Table 71–5 ADD_LOGFILE Procedure Exceptions

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

Usage Notes

- Before querying the V\$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

COLUMN_PRESENT Function

This function is designed to be used in conjunction with the `MINE_VALUE` function.

If the `MINE_VALUE` function returns a `NULL` value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a `NULL` value.

To distinguish between these two cases, use the `COLUMN_PRESENT` function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN NUMBER;
```

Parameters

Table 71–6 *COLUMN_PRESENT Function Parameters*

Parameter	Description
<code>sql_redo_undo</code>	Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V\$LOGMNR_CONTENTS</code> view from which to extract data values. See the Usage Notes for more information.
<code>column_name</code>	Specifies the fully qualified name (<code>schema.table.column</code>) of the column for which this function will return information.

Return Values

[Table 71–7](#) describes the return values for the `COLUMN_PRESENT` function. The `COLUMN_PRESENT` function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of `NULL` values returned by the `DBMS_LOGMNR.MINE_VALUE` function.

Table 71–7 *Return Values for COLUMN_PRESENT Function*

Return	Description
0	Specified column is not present in this row of <code>V\$LOGMNR_CONTENTS</code> .
1	Column is present in this row of <code>V\$LOGMNR_CONTENTS</code> .

Exceptions

Table 71–8 *COLUMN_PRESENT Function Exceptions*

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the <code>column_name</code> parameter is not a fully qualified column name.

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V\$logmnr_contents view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
 - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
 - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
 - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be NULL).
 - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be NULL).

END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

Table 71-9 *END_LOGMNR Procedure Exception*

Exception	Description
ORA-01307	No LogMiner session is currently active. The <code>END_LOGMNR</code> procedure was called without adding any log files or before the <code>START_LOGMNR</code> procedure was called

MINE_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```
DBMS_LOGMNR.MINE_VALUE (
    sql_redo_undo      IN RAW,
    column_name        IN VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

Table 71-10 MINE_VALUE Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V\$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 71-11 Return Values for MINE_VALUE Function

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

Exceptions

Table 71-12 MINE_VALUE Function Exceptions

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
- The MINE_VALUE function must be invoked in the context of a select operation from the V\$LOGMNR_CONTENTS view.

- The MINE_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the `sql_redo_undo` parameter depends on the operation performed and the data of interest:
 - If an update operation was performed and you want to know what the value was prior to the update operation, specify `UNDO_VALUE`.
 - If an update operation was performed and you want to know what the value is after the update operation, specify `REDO_VALUE`.
 - If an insert operation was performed, typically you would specify `REDO_VALUE` (because the value of a column prior to an insert operation will always be null).
 - If a delete operation was performed, typically you would specify `UNDO_VALUE` (because the value of a column after a delete operation will always be null).

REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

Note: This procedure replaces the REMOVEFILE constant that was an option on the ADD_LOGFILE procedure prior to Oracle Database 10g.

Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
    LogFileName      IN VARCHAR2);
```

Parameters

Table 71–13 REMOVE_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

Exceptions

Table 71–14 REMOVE_LOGFILE Procedure Exception

Exception	Description
ORA-01290	Cannot remove unlisted log file

Usage Notes

- Before querying the V\$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
  startScn          IN NUMBER default 0,
  endScn            IN NUMBER default 0,
  startTime         IN DATE default '01-jan-1988',
  endTime          IN DATE default '31-dec-2110',
  DictFileName     IN VARCHAR2 default '',
  Options          IN BINARY_INTEGER default 0 );
```

Parameters

Table 71–15 START_LOGMNR Procedure Parameters

Parameter	Description
startScn	Directs LogMiner to return only redo records with an SCN greater than or equal to the <code>startScn</code> specified. This fails if there is no redo log file containing the specified <code>startScn</code> value. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
endScn	Directs LogMiner to return only redo records with an SCN less than or equal to the <code>endScn</code> specified. If you specify an <code>endScn</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endScn</code> value in the redo log file that contains the most recent changes. (You can query the <code>FILENAME</code> , <code>LOW_SCN</code> , and <code>NEXT_SCN</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)
startTime	Directs LogMiner to return only redo records with a timestamp greater than or equal to the <code>startTime</code> specified. This fails if there is no redo log file containing the specified <code>startTime</code> value. (You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>startScn</code> is specified. See the Usage Notes for additional information.
endTime	Directs LogMiner to return only redo records with a timestamp less than or equal to the <code>endTime</code> specified. If you specify an <code>endTime</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endTime</code> in the redo log file that contains the most recent changes. You can query the <code>FILENAME</code> , <code>LOW_TIME</code> , and <code>HIGH_TIME</code> columns in the <code>V\$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>endScn</code> is specified. See the Usage Notes for additional information.

Table 71–15 (Cont.) START_LOGMNR Procedure Parameters

Parameter	Description
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct SQL_REDO and SQL_UNDO columns in V\$LOGMNR_CONTENTS, as well as to fully translate SEG_NAME, SEG_OWNER, SEG_TYPE_NAME, TABLE_NAME, and TABLE_SPACE columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither DICT_FROM_REDO_LOGS nor DICT_FROM_ONLINE_CATALOG is specified.
options	See Table 71–2, "Constants for START_LOGMNR Options Flag" .

Exceptions

Table 71–16 START_LOGMNR Procedure Exceptions

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.
ORA-01282	value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See *Oracle Database Utilities* and

Chapter 72, "DBMS_LOGMNR_D" in this manual for more information about the LogMiner dictionary.

- After executing the `START_LOGMNR` procedure, you can query the following views:
 - `V$LOGMNR_CONTENTS` - contains history of information in redo log files
 - `V$LOGMNR_DICTIONARY` - contains current information about the LogMiner dictionary file extracted to a flat file
 - `V$LOGMNR_PARAMETERS` - contains information about the LogMiner session(You can query the `V$LOGMNR_LOGS` view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to `DBMS_LOGMNR.START_LOGMNR`. You must specify all desired parameters and options (including SCN and time ranges) each time you call `DBMS_LOGMNR.START_LOGMNR`
- Be aware that specifying redo log files using a timestamp is not precise.
- The `CONTINUOUS_MINE` option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the `CONTINUOUS_MINE` option:
 - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the `V$ARCHIVED_LOGS` view to determine which redo log file entries will be found by LogMiner.

Even if an entry is listed in the database control file (and the `V$ARCHIVED_LOGS` view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be available.
 - If you specify the `CONTINUOUS_MINE` option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the `V$LOGMNR_CONTENTS` view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.
 - LogMiner can mine online redo logs. However, if the `CONTINUOUS_MINE` option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:

- If you specify neither a `startTime` nor a `startScn` parameter, LogMiner will set the `startScn` parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
- If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
- If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
- If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` without the `CONTINUOUS_MINE` option, and you specify:
 - * 0 for the `startTime` or `startScn` value, then the lowest SCN in the LogMiner redo log file list will be used as the `startScn`
 - * A nonzero number for the `startTime` or `startScn` value, then an error is returned
 - * 0 or a nonzero number for the `endTime` or `endScn` value, then the highest SCN in the LogMiner redo log file list will be used as the `endScn`
- If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` with the `CONTINUOUS_MINE` option, and you specify:
 - * 0 for the `startTime` or `startScn` value, then an error is returned.
 - * A `startTime` or `startScn` value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the `V$LOGMNR_CONTENTS` view.
 - * An `endTime` or `endScn` parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
 - * 0 for the `endTime` or `endScn` parameter value, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until you enter `CTL+C` or you terminate the PL/SQL cursor.

DBMS_LOGMNR_D

The DBMS_LOGMNR_D package, one of a set of LogMiner packages, contains two subprograms:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

 - Security Model
- [Summary of DBMS_LOGMNR_D Subprograms](#)

Using DBMS_LOGMNR_D

This section contains the following topics, which relate to using the DBMS_LOGMNR_D package:

- [Overview](#)
- [Security Model](#)

Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you. LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

See Also: [DBMS_LOGMNR](#) for information on the package subprograms used in running a LogMiner session.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR_D package.

Summary of DBMS_LOGMNR_D Subprograms

Table 72-1 DBMS_LOGMNR_D Package Subprograms

Subprogram	Description
BUILD Procedure on page 72-6	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
SET_TABLESPACE Procedure on page 72-9	Re-creates all LogMiner tables in an alternate tablespace

BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

Syntax

```
DBMS_LOGMNR_D.BUILD (
    dictionary_filename IN VARCHAR2,
    dictionary_location IN VARCHAR2,
    options             IN NUMBER);
```

Parameters

Table 72–2 BUILD Procedure Parameters

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the path to the LogMiner dictionary file directory.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

Exceptions

Table 72–3 BUILD Procedure Exceptions

Exception	Description
ora-01302	Dictionary build options are missing or incorrect. This error is returned under the following conditions: <ul style="list-style-type: none"> ■ If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified ■ If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified ■ If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified
ora-01308	Initialization parameter UTL_FILE_DIR is not set.
ora-01336	Specified dictionary file cannot be opened. This error is returned under the following conditions: <ul style="list-style-type: none"> ■ The specified value for the dictionary_location does not exist. ■ The UTL_FILE_DIR initialization parameter is not set to have access to the dictionary_location ■ The dictionary file is read-only.

Usage Notes

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the `STORE_IN_REDO_LOGS` option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the `STORE_IN_FLAT_FILE` option, the LogMiner dictionary is extracted to a flat file with the specified name.
- If you do not specify a filename and location, but do specify the `STORE_IN_REDO_LOGS` option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the `STORE_IN_REDO_LOGS` option, an error is returned.
- If you do not specify a filename and location, but do specify the `STORE_IN_FLAT_FILE` option, an error is returned.
- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9i release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- Do not run the `DBMS_LOGMNR_D.BUILD` procedure if there are any ongoing DDL operations.
- The database must be open when you run the `DBMS_LOGMNR_D.BUILD` procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:
 - You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter `UTL_FILE_DIR` in the initialization parameter file. For example:

```
UTL_FILE_DIR = /oracle/dictionary
```

After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.
 - You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

Be aware that the `DDL_DICT_TRACKING` option to the `DBMS_LOGMNR.START_LOGMNR` procedure is not supported for flat file dictionaries created prior to Oracle9i. If you attempt to use the `DDL_DICT_TRACKING` option with a LogMiner database extracted to a flat file prior to Oracle9i, the ORA-01330 error (problem loading a required build table) is returned.

- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The `DBMS_LOGMNR_D.BUILD` procedure must be run on a system that is running Oracle9i or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The `COMPATIBLE` parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers. See *Oracle Database Utilities* for information about using supplemental logging with LogMiner.

Examples

Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named `dictionary.ora` in a specified path (`/oracle/database`).

```
SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', -  
    '/oracle/database/', -  
    options => dbms_logmnr_d.store_in_flat_file);
```

Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -  
    options => dbms_logmnr_d.store_in_redo_logs);
```

SET_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYS_AUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (
    new_tablespace      IN VARCHAR2);
```

Parameters

Table 72–4 SET_TABLESPACE Parameter

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET_TABLESPACE procedure to move the tables to the SYS_AUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

See Also: *Oracle Database Concepts* and *Oracle Database SQL Language Reference* for information about tablespaces and how to create them

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS_LOGMNR_D.SET_TABLESPACE procedure.

```
SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
      SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

DBMS_LOGSTDBY

The DBMS_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

See Also: *Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

This chapter contains the following topics:

- [Using DBMS_LOGSTDBY](#)
 - Overview
 - Operational Notes
- [Summary of DBMS_LOGSTDBY Subprograms](#)

Using DBMS_LOGSTDBY

This section contains topics which relate to using the DBMS_LOGSTDBY package.

- [Overview](#)
- [Operational Notes](#)

Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The subprograms in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.
For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

Operational Notes

Privileges and Security

A prototype role, `LOGSTDBY_ADMINISTRATOR`, is created by default with `RESOURCE`, and `EXECUTE` on `DBMS_LOGSTDBY` privileges. If you choose to use this role, consider granting `ALTER DATABASE` and `ALTER SESSION` privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard. Oracle recommends using an account with `DBA` privileges to perform administration tasks on logical standby databases.

The six procedures associated with skipping transactions (`SKIP` and `UNSKIP`, `SKIP_ERROR` and `UNSKIP_ERROR`, and `SKIP_TRANSACTION` and `UNSKIP_TRANSACTION`) all require `DBA` privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where `SKIP` procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, `SYS`).

Summary of DBMS_LOGSTDBY Subprograms

Table 73–1 DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
APPLY_SET Procedure on page 73-7	Sets the values of various parameters that configure and maintain SQL Apply
APPLY_UNSET Procedure on page 73-10	Restores the default values of various parameters that configure and maintain SQL Apply
BUILD Procedure on page 73-11	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary
INSTANTIATE_TABLE Procedure on page 73-12	Creates and populates a table in the standby database from a corresponding table in the primary database
IS_APPLY_SERVER Function on page 73-14	This function returns TRUE if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the <code>fire_once</code> parameter in the <code>DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY</code> subprogram set to FALSE (the default is TRUE). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.
MAP_PRIMARY_SCN Function on page 73-15	Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database.
PREPARE_FOR_NEW_PRIMARY Procedure on page 73-16	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
PURGE_SESSION Procedure on page 73-18	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
REBUILD Procedure on page 73-19	Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
SET_TABLESPACE Procedure on page 73-20	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the <code>SYSAUX</code> tablespace.
SKIP Procedure on page 73-21	Specifies rules that control database operations that should not be applied to the logical standby database
SKIP_ERROR Procedure on page 73-29	Specifies rules regarding what action to take upon encountering errors

Table 73–1 (Cont.) DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
SKIP_TRANSACTION Procedure on page 73-33	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
UNSKIP Procedure on page 73-35	Deletes rules specified by the SKIP procedure
UNSKIP_ERROR Procedure on page 73-37	Deletes rules specified by the SKIP_ERROR procedure
UNSKIP_TRANSACTION Procedure on page 73-39	Deletes rules specified by the SKIP_TRANSACTION procedure

APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for `PRESERVE_COMMIT_ORDER`, can be changed without having to stop SQL Apply.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
    inname          IN VARCHAR,
    value           IN VARCHAR);
```

Parameters

Table 73–2 APPLY_SET Procedure Parameters

Parameter	Description
<code>APPLY_SERVERS</code>	Controls the number of <code>APPLIER</code> processes used to apply changes. The maximum number allowed is 1024, provided the <code>MAX_SERVERS</code> parameter is set to accommodate this.
<code>EVENT_LOG_DEST</code>	<p>Controls where SQL Apply records the occurrence of an interesting event. It takes the following values:</p> <ul style="list-style-type: none"> ▪ <code>DEST_ALL</code> - All events will be recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view and in the alert log. ▪ <code>DEST_EVENTS_TABLE</code> - All events that contain information about user data will be recorded only in the <code>DBA_LOGSTDBY_EVENTS</code> view. This is the default value. <p>For example, if SQL Apply receives an <code>ORA-1403</code> error, the whole event is recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view. Whereas, the alert log records only that SQL Apply stopped because of <code>ORA-1403</code>. No information regarding the user table or offending statement is logged in the alert log. However, if you stop the SQL Apply engine, it gets recorded in both the <code>DBA_LOGSTDBY_EVENTS</code> view and in the alert log.</p> <p>Note that this parameter affects the behavior of the following parameters: <code>RECORD_APPLIED_DDL</code>, <code>RECORD_SKIP_DDL</code>, <code>RECORD_SKIP_ERRORS</code>, and <code>RECORD_UNSUPPORTED_OPERATIONS</code>. For example, if <code>RECORD_APPLIED_DDL</code> is set to <code>TRUE</code>, but <code>EVENT_LOG_DEST</code> is set to <code>DEST_EVENTS_TABLE</code>, then the applied DDL string will only be recorded in the <code>DBA_LOGSTDBY_EVENTS</code> view.</p>
<code>LOG_AUTO_DEL_RETENTION_TARGET</code>	This parameter setting is only meaningful if <code>LOG_AUTO_DELETE</code> has been set to <code>TRUE</code> . The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes.
<code>LOG_AUTO_DELETE</code>	Automatically deletes archived redo log files once they have been applied on the logical standby database. Set to <code>TRUE</code> to enable automatic deletion of archived redo log files, and <code>FALSE</code> to disable automatic deletion. The default value is <code>TRUE</code> .

Table 73–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.
MAX_SERVERS	Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes.
PREPARE_SERVERS	Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
PRESERVE_COMMIT_ORDER	<p>TRUE: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting.</p> <p>FALSE: Transactions containing non-overlapping sets of rows may be committed in a different order than they were committed on the primary database.</p> <p>Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened on the primary database. See the Usage Notes for details and recommendations.</p> <p>You cannot modify this parameter while SQL Apply is running.</p>
RECORD_APPLIED_DDL	<p>Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p> <p>FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.</p>
RECORD_SKIP_DDL	<p>Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:</p> <p>TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.</p> <p>FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.</p>

Table 73–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_UNSUPPORTED_OPERATIONS	Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table.

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA_LOGSTDBY_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on a RAC configuration, you must be connected to the same instance where SQL Apply is running.

Exceptions

Table 73–3 APPLY_SET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

Examples

To record DDLs in the DBA_LOGSTDBY_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

APPLY_UNSET Procedure

Use the `APPLY_UNSET` procedure to restore the default values of the parameters that you changed with the `APPLY_SET` procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
    inname          IN VARCHAR);
```

Parameters

The parameter information for the `APPLY_UNSET` procedure is the same as that described for the `APPLY_SET` procedure. See [Table 73–2](#) for complete parameter information.

Exceptions

Table 73–4 *APPLY_UNSET Procedure Exceptions*

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use the `APPLY_SET` procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the `DBA_LOGSTDBY_EVENTS` view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- DBMS_LOGSTDBY.BUILD should be run only once for each logical standby database you want to create. You do not need to use DBMS_LOGSTDBY.BUILD for each RAC instance.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
    schema_name      IN VARCHAR2,
    table_name       IN VARCHAR2,
    dblink           IN VARCHAR2);
```

Parameters

Table 73–5 INSTANTIATE_TABLE Procedure Parameters

Parameter	Description
<code>schema_name</code>	Name of the schema
<code>table_name</code>	Name of the table to be created or re-created in the standby database
<code>dblink</code>	Name of the database link account that has privileges to read and lock the table in the primary database, as well as the <code>SELECT_CATALOG_ROLE</code> on the primary database

Exceptions

Table 73–6 INSTANTIATE_TABLE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress
ORA-16276	Specified database link does not correspond to primary database
ORA-16277	Specified table is not supported by logical standby database
ORA-16278	Specified table has a multi-object skip rule defined

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the `DBA_LOGSTDBY_EVENTS` view.

- The specified table must be a table that is supported by logical standby (that is, it does not appear in the `DBA_LOGSTDBY_UNsupported_TABLES` view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of `INSTANTIATE_TABLE`, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the `schema_name` or `table_name`, and have a `TABLE`, `DML`, or `SCHEMA_DDL` statement type), `INSTANTIATE_TABLE` will fail with an ORA-16278 error. Any multiobject skip rules that pertain to the table must be dropped or changed before re-attempting the `INSTANTIATE_TABLE` call.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-  
    SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -  
    DBLINK => 'INSTANTIATE_TBL_LINK');
```

IS_APPLY_SERVER Function

This function returns `TRUE` if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the `fire_once` parameter in the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram set to `FALSE` (the default is `TRUE`). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.

See Also: *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram.

Syntax

```
DBMS_LOGSTDBY.IS_APPLY_SERVER  
RETURN BOOLEAN;
```

Parameters

None

MAP_PRIMARY_SCN Function

Returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes. This function can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

Syntax

```
DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;
```

Exceptions

Table 73–7 MAP_PRIMARY_SCN Function Exceptions

Exception	Description
ORA-20001	Primary SCN is before mapped range
ORA-20002	SCN mapping requires PRESERVE_COMMIT_ORDER to be TRUE

Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.

PREPARE_FOR_NEW_PRIMARY Procedure

The `PREPARE_FOR_NEW_PRIMARY` procedure must be invoked at a logical standby database following a failover if that standby database was not the target of the failover operation. Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the `alert.log`. These logs must be copied to the logical standby and registered using the `ALTER DATABASE REGISTER LOGICAL LOGFILE` statement.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
    FORMER_STANDBY_TYPE    IN VARCHAR2,
    DBLINK                 IN VARCHAR2);
```

Parameters

Table 73–8 *PREPARE_FOR_NEW_PRIMARY Procedure Parameters*

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

Exceptions

Table 73–9 *PREPARE_FOR_NEW_PRIMARY Procedure Exceptions*

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

Usage Notes

- This routine is intended only for logical standby systems.
- This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully.
- Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally.
- Upon manual registration of the terminal logs, users should complete the process by calling either `START LOGICAL STANDBY APPLY` if the new primary database was formerly a physical standby database or `START LOGICAL STANDBY APPLY NEW PRIMARY` if the new primary database was formerly a logical standby database.
- See the alert log for more details regarding the reasons for any exception.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY ( -  
        FORMER_STANDBY_TYPE => 'LOGICAL',      -  
        DBLINK => 'dblink_to_newprimary');
```

PURGE_SESSION Procedure

Identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply. Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

Exceptions

Table 73–10 *PURGE_SESSION Procedure Exceptions*

Exception	Description
ORA-01309	Invalid session

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the `DBA_LOGMNR_PURGED_LOG` view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10g Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the `LOG_AUTO_DELETE` parameter described in the `DBMS_LOGSTDBY.APPLY_SET` procedure described on page 73-7.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the `DBA_LOGMNR_PURGED_LOG` view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;
```

```
FILE_NAME
-----
/boston/arc_dest/arc_1_40_509538672.log
/boston/arc_dest/arc_1_41_509538672.log
/boston/arc_dest/arc_1_42_509538672.log
/boston/arc_dest/arc_1_43_509538672.log
/boston/arc_dest/arc_1_44_509538672.log
/boston/arc_dest/arc_1_45_509538672.log
/boston/arc_dest/arc_1_46_509538672.log
/boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

Usage Notes

- LogMiner dictionary information is logged in the redo log files.
- The standby redo log files (if present) are archived.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

SET_TABLESPACE Procedure

Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the `SYSAUX` tablespace. SQL Apply cannot be running when you invoke this procedure.

Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(  
    NEW_TABLESPACE IN VARCHAR2)
```

Parameters

Table 73–11 SET_TABLESPACE Procedure Parameters

Parameter	Description
<code>NEW_TABLESPACE</code>	Name of the new tablespace where metadata tables will reside.

Exceptions

Table 73–12 SET_TABLESPACE Procedure Exceptions

Exception	Description
<code>ORA-16103</code>	Logical Standby apply must be stopped to allow this operation
<code>ORA-16236</code>	Logical Standby metadata operation in progress

Examples

To move metadata tables to a new tablespace named `LOGSTDBY_TBS`, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

SKIP Procedure

The `SKIP` procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database. For example, the `SKIP` procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Syntax

```
DBMS_LOGSTDBY.SKIP (
    stmt                IN VARCHAR2,
    schema_name        IN VARCHAR2 DEFAULT NULL,
    object_name        IN VARCHAR2 DEFAULT NULL,
    proc_name          IN VARCHAR2 DEFAULT NULL,
    use_like           IN BOOLEAN DEFAULT TRUE,
    esc                IN CHAR1 DEFAULT NULL);
```

Parameters

Table 73–13 SKIP Procedure Parameters

Parameter	Description
<code>stmt</code>	<p>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 73–14 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.</p> <p>The keyword <code>PL/SQL</code> is used for the execution of Oracle-supplied packages which are supported for replication. See <i>Oracle Data Guard Concepts and Administration</i> for information about supported packages.</p>
<code>schema_name</code>	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> .
<code>object_name</code>	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> .

Table 73–13 (Cont.) SKIP Procedure Parameters

Parameter	Description
<code>proc_name</code>	<p>Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' schema . package . procedure '</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>For DDLs, SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> ▪ <code>IN STATEMENT VARCHAR2</code> -- The SQL statement that matches the filter ▪ <code>IN STATEMENT_TYPE VARCHAR2</code> -- The <code>stmt</code> of the filter ▪ <code>IN SCHEMA VARCHAR2</code> -- The <code>schema_name</code> of the filter, if applicable ▪ <code>IN NAME VARCHAR2</code> -- The <code>object_name</code> of the filter, if applicable ▪ <code>IN XIDUSN NUMBER</code> -- Transaction ID part 1 ▪ <code>IN XIDSLT NUMBER</code> -- Transaction ID part 2 ▪ <code>IN XIDSQN NUMBER</code> -- Transaction ID part 3 ▪ <code>OUT SKIP_ACTION NUMBER</code> -- Action to be taken by SQL Apply upon completion of this routine. Valid values are: <ul style="list-style-type: none"> <code>SKIP_ACTION_APPLY</code> -- Execute the statement <code>SKIP_ACTION_SKIP</code> -- Skip the statement <code>SKIP_ACTION_ERROR</code> -- Halt apply so the DBA can take appropriate steps (for example, take compensating action) <code>SKIP_ACTION_REPLACE</code> -- Execute the replacement statement supplied in the <code>NEW_STATEMENT</code> output parameter <p>For PL/SQL, SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> ▪ <code>IN STATEMENT VARCHAR2</code> -- The SQL statement that matches the filter ▪ <code>IN PACKAGE_SCHEMA VARCHAR2</code> -- The schema of the package being skipped (for example, <code>SYS</code> or <code>XDB</code>) ▪ <code>IN PACKAGE_NAME VARCHAR2</code> -- The name of the package being skipped (for example, <code>DEMS_RLS</code>) ▪ <code>IN PROCEDURE_NAME VARCHAR2</code> -- The name of the procedure being skipped (for example, <code>ADD_POLICY</code>) ▪ <code>IN CURRENT_SCHEMA VARCHAR2</code> -- The name of the current schema in which the PL/SQL was executed on the primary ▪ <code>IN XIDUSN NUMBER</code> -- Transaction ID part 1 ▪ <code>IN XIDSLT NUMBER</code> -- Transaction ID part 2 ▪ <code>IN XIDSQN NUMBER</code> -- Transaction ID part 3 ▪ <code>IN EXIT_STATUS</code> -- 0 (Zero) if the PL/SQL succeeded on the primary, or 1

Table 73–13 (Cont.) SKIP Procedure Parameters

Parameter	Description
proc_name (cont.)	<ul style="list-style-type: none"> OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid return values are: SKIP_ACTION_APPLY -- Execute the statement SKIP_ACTION_APPLY -- Execute the statement SKIP_ACTION_ERROR – Raise an error which halts apply so that the DBA can take appropriate steps <p>Note 1: SKIP_ACTION_REPLACE is not supported for PL/SQL.</p> <p>Note 2: SQL Apply calls the skip handler when the procedure's exit is processed.</p> <p>Note 3: The use_like parameter must be set to FALSE for PL/SQL since wildcarding PL/SQL is not supported.</p> <p>The following example shows how to have a conditional skip rule on DBMS_RLS.DROP_POLICY:</p> <pre>Create or replace procedure sec_mgr.skip_drop_policy (statement in varchar2, pkgown in varchar2, pkgname in varchar2, procnm in varchar2, cuser in varchar2, xidusn in number, xidslt in number, xidsgn in number, exstatus in number, skip_action out number) Is Begin If 0 = exstatus Then Insert Into sec_mgr.logit Values ('Success: ' pkgown '.' pkgname '.' procnm ' by ' cuser); If cuser != 'TESTSCHEMA' Then skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY; Else skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP; End If; End If; End skip_drop_policy; Execute dbms_logstdby.skip('PL/SQL', 'SYS', 'DBMS_RLS', 'DROP_POLICY', 'SEC_MGR.SKIP_DROP_POLICY', FALSE);</pre>
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <i>Oracle Database SQL Language Reference</i> .
esc	Identifies an escape character (such as the character "/"") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Language Reference</i> for more information about pattern matching.

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: `invalid Logical Standby option requested` error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'DML', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'DML_HANDLER');
```

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the `SCHEMA_DDL` event for the `HR.EMPLOYEES` table, and a rule for the `ALTER TABLE` event for the `HR.EMPLOYEES` table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'SCHEMA DDL', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'TABLE_ALTER_HANDLER');
```

On encountering an `ALTER TABLE` statement, the `schema_ddl_handler` procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement.

Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the `empddl_handler` procedure being invoked upon encountering the `ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER` statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMP%', -
      proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
      stmt => 'ALTER TABLE', -
      schema_name => 'HR', -
      object_name => 'EMPLOYEES', -
      proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the `SKIP` procedure with caution, particularly when skipping DDL statements. If a `CREATE TABLE` statement is skipped, for example, you must also specify other DDL statements that refer to that table in the `SKIP` procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the `SKIP` procedure, SQL Apply must be halted. Do this by issuing an `ALTER DATABASE STOP LOGICAL STANDBY APPLY` statement. Once all desired filters have been specified, issue an `ALTER DATABASE START LOGICAL`

STANDBY APPLY IMMEDIATE statement to start SQL Apply using the new filter settings.

- See the UNSKIP procedure on page 73-35 for information about reversing (undoing) the settings of the SKIP procedure.
- For USER statements, the SCHEMA_NAME parameter will be the user and specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is supplied, it must already exist in DBA_PROCEEDURES and it must execute with DEFINER rights. If the procedure is declared with INVOKER rights, the ORA-1031: insufficient privileges message will be returned.
- If the procedure returns a REPLACEMENT statement, the REPLACEMENT statement will be executed using the SYSTEM and OBJECT privileges of the owner of the procedure.
- The PL/SQL block of a SKIP procedure cannot contain transaction control statements (for example, COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction.

Skip Statement Options

Table 73-14 lists the supported values for the stmt parameter of the SKIP procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the sys.audit_actions table (shown in the right column of Table 73-14) are also valid values. Note that keywords are generally defined by database object.

Table 73-14 Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
There is no keyword for this group of SQL statements.	GRANT REVOKE
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY	CREATE DIRECTORY DROP DIRECTORY
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
INDEX	ALTER INDEX CREATE INDEX DROP INDEX

Table 73–14 (Cont.) Supported Values for the `stmt` Parameter

Keyword	Associated SQL Statements
NON_SCHEMA_DDL	<i>All DDL that does not pertain to a particular schema</i> Note: SCHEMA_NAME and OBJECT_NAME must be null
PL/SQL ¹	Execute Oracle-supplied package.
PROCEDURE ²	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SCHEMA_DDL	<i>All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)</i> Note: SCHEMA_NAME and OBJECT_NAME must <i>not</i> be null
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
SYSTEM AUDIT	AUDIT <i>SQL_statements</i> NOAUDIT <i>SQL_statements</i>
TABLE	CREATE TABLE ALTER TABLE DROP TABLE TRUNCATE TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE ALTER TABLESPACE

Table 73–14 (Cont.) Supported Values for the `stmt` Parameter

Keyword	Associated SQL Statements
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW
VIEW	CREATE VIEW DROP VIEW

¹ See *Oracle Data Guard Concepts and Administration* for information about supported packages.

² Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 73–15 DBMS_LOGSTDBY.SKIP Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> ■ Procedure used <code>INVOKER</code> rights ■ Procedure needs <code>DBA</code> privileges
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret <code>SKIP</code> procedure return values." Indicates that a <code>SKIP</code> procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the <code>DBA_LOGSTDBY_EVENTS</code> view.
ORA-16236	Logical standby metadata operation in progress.

Examples

Example 1 Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the `HR` schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA DDL', -
      schema_name => 'HR', -
```

```

        table_name => '%', -
        proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
        schema_name => 'HR', -
        table_name => '%', -
        proc_name => null);

```

Example 2 Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a `SKIP` procedure to handle DDL statements with file specifications transparently.

The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the `SKIP` procedure to handle tablespace DDL statements:

```

CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl (

    old_stmt  IN  VARCHAR2,
    stmt_typ  IN  VARCHAR2,
    schema    IN  VARCHAR2,
    name      IN  VARCHAR2,
    xidusn    IN  NUMBER,
    xidslt    IN  NUMBER,
    xidsqn    IN  NUMBER,
    action    OUT NUMBER,
    new_stmt  OUT VARCHAR2
) AS
BEGIN

    -- All primary file specification that contains a directory
    -- /usr/orcl/primary/dbs
    -- should go to /usr/orcl/stdby directory specification

    new_stmt = replace(old_stmt,
                       '/usr/orcl/primary/dbs',
                       '/usr/orcl/stdby');

    action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;

EXCEPTION
    WHEN OTHERS THEN
        action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
        new_stmt := NULL;
END handle_tbs_ddl;

```

2. Register the `SKIP` procedure with SQL Apply:

```

SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
        proc_name => 'SYS.HANDLE_TBS_DDL');

```

SKIP_ERROR Procedure

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine if the error should cause SQL Apply to stop. All errors to be skipped are stored in system tables that describe how exceptions should be handled.

Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
    stmt          IN VARCHAR2,
    schema_name   IN VARCHAR2,
    object_name   IN VARCHAR2,
    proc_name     IN VARCHAR2,
    use_like      IN BOOLEAN,
    esc           IN CHAR1);
```

Parameters

Table 73–16 SKIP_ERROR Procedure Parameters

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 73–14 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> parameter. If not applicable, this value must be set to <code>NULL</code> .
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the <code>stmt</code> . If not applicable, this value must be set to <code>NULL</code> .

Table 73–16 (Cont.) SKIP_ERROR Procedure Parameters

Parameter	Description
proc_name	<p>Name of a stored procedure to call when SQL Apply determines a particular statement matches the filter defined by the <code>stmt</code>, <code>schema_name</code>, and <code>object_name</code> parameters. Specify the procedure in the following format:</p> <pre>' "schema" . "package" . "procedure" '</pre> <p>This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement.</p> <p>SQL Apply calls the stored procedure with the following call signature:</p> <ul style="list-style-type: none"> ■ <code>IN STATEMENT VARCHAR(4000)</code> -- The first 4K of the statement ■ <code>IN STATEMENT_TYPE VARCHAR2</code> -- The <code>stmt</code> of the filter ■ <code>IN SCHEMA VARCHAR2</code> -- The <code>schema_name</code> of the filter, if applicable ■ <code>IN NAME VARCHAR2</code> -- The <code>object_name</code> of the filter, if applicable ■ <code>IN XIDUSN NUMBER</code> -- Transaction ID part 1 ■ <code>IN XIDSLT NUMBER</code> -- Transaction ID part 2 ■ <code>IN XIDSQN NUMBER</code> -- Transaction ID part 3 ■ <code>IN ERROR VARCHAR(4000)</code> -- Text of error to be recorded (optional) ■ <code>OUT NEW_ERROR VARCHAR(4000)</code> -- Null or modified error text
use_like	<p>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The <code>use_like</code> parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the <i>Oracle Database SQL Language Reference</i>.</p>
esc	<p>Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See <i>Oracle Database SQL Language Reference</i> for more information about pattern matching.</p>

Usage Notes

- A stored procedure provided to the `SKIP_ERROR` procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the `STATUS` column of the `DBA_LOGSTDBY_EVENTS` table. The `STATUS_CODE` column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the `NEW_ERROR` is written to the events table. To truly have no effect, set `NEW_ERROR` to `ERROR` in the procedure.
- If the stored procedure requires that a shutdown be avoided, then you must set `NEW_ERROR` to `NULL`.
- This procedure requires DBA privileges to execute.

- For USER statements, the SCHEMA_NAME parameter will be the user and you should specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is specified, it must already exist in DBA_PROCEEDURES and it must execute with DEFINERS rights. If the procedure is declared with INVOKERS rights, the ORA-1031: insufficient privileges message will be returned.
- The PL/SQL block of a SKIP_ERROR procedure cannot contain transaction control statements (for example: COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

Exceptions

Table 73–17 SKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: <ul style="list-style-type: none"> ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Examples

To skip errors on GRANT statements on SYS or HR schemas, define a procedure handle_error_ddl and register it. In the following example, assume that handle_error_ddl is a free-standing procedure in the SYS schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl (
  old_stmt   IN VARCHAR2,
  stmt_type  IN VARCHAR2,
  schema     IN VARCHAR2,
  name       IN VARCHAR2,
  xidusn     IN NUMBER,
  xidslt     IN NUMBER,
  xidsqn     IN NUMBER,
  error      IN VARCHAR2,
  new_stmt   OUT VARCHAR2
) AS

BEGIN
  -- Default to what we already have
  new_stmt := old_stmt;

  -- Ignore any GRANT errors on SYS or HR schemas
  IF ((INSTR(UPPER(old_stmt), 'GRANT')) > 0) OR
      ((INSTR(UPPER(old_stmt), 'REVOKE')) > 0)
  THEN
    IF schema IS NULL
    OR (schema IS NOT NULL AND
        (UPPER(schema) = 'SYS' OR UPPER(schema) = 'HR' ))
    THEN
```

```
        THEN
            new_stmt := NULL;
            -- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
            -- code not shown here
        END IF;
    END IF;

END handle_error_ddl;
/
```

2. Register the error handler with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
        statement => 'NON_SCHEMA_DDL', -
        schema_name => NULL, -
        object_name => NULL, -
        proc_name => 'SYS.HANDLE_ERROR_DDL');
```

SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
    xidusn          IN NUMBER,
    xidslt          IN NUMBER,
    xidsqn          IN NUMBER);
```

Parameters

Table 73–18 SKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

CAUTION: `SKIP_TRANSACTION` is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the `V$LOGMNR_CONTENTS` view and have taken compensating actions at the logical standby database. `SKIP_TRANSACTION` is not the appropriate procedure to invoke to skip DML changes to a table.

To skip a DML failure, use a `SKIP` procedure, such as `SKIP('DML', 'MySchema', 'MyFailed Table')`. Using the `SKIP_TRANSACTION` procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

- This procedure requires DBA privileges to execute.
- Use the `DBA_LOGSTDBY_SKIP_TRANSACTION` view to list the transactions that are going to be skipped by SQL Apply.
- Also, see the `ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION` statement in *Oracle Database SQL Language Reference*.

Exceptions

Table 73–19 *SKIP_TRANSACTION Procedure Exceptions*

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-  
        XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure. The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See [Table 73–13](#) on page 73-21 for complete parameter information.

Exceptions

Table 73–20 UNSKIP Procedure Exceptions

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

CAUTION: If DML changes for a table have been skipped and not compensated for, you must follow the call to the UNSKIP procedure with a call to the **INSTANTIATE_TABLE** procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the UNSKIP procedure, and you will need a distinct UNSKIP procedure call to delete each rule that was previously specified.

For example, assume you have specified the following two rules to skip applying DML statements to the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => null);
```

In the following example, the wildcard in the `TABLE_NAME` parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML', -  
    SCHEMA_NAME => 'HR', -  
    OBJECT_NAME => 'EMP%');
```

In fact, this `UNSKIP` procedure matches neither of the rules, because the wildcard character in the `TABLE_NAME` parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding `SKIP` rule.

UNSKIP_ERROR Procedure

Use the UNSKIP_ERROR procedure to delete rules specified earlier with the SKIP_ERROR procedure. The parameters specified in the UNSKIP_ERROR procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
    stmt                IN VARCHAR2,
    schema_name         IN VARCHAR2 DEFAULT NULL,
    object_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

The parameter information for the UNSKIP_ERROR procedure is the same as that described for the SKIP_ERROR procedure. See [Table 73–16](#) for complete parameter information.

Exceptions

Table 73–21 UNSKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP_ERROR procedure, and you need a distinct UNSKIP_ERROR procedure call to delete each rule that you previously specified.

For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE', -
    PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPTEMP', -
    PROC_NAME => 'hr_tempemp_handler');
```

In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML', -
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT_NAME parameter will not be expanded.

Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -  
    statement => 'NON_SCHEMA_DDL', -  
    schema_name => NULL, -  
    object_name => NULL);
```

UNSKIP_TRANSACTION Procedure

Use the UNSKIP_TRANSACTION procedure to delete rules specified earlier with the SKIP_TRANSACTION procedure. The parameters specified in the UNSKIP_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
    xidusn_p      IN NUMBER,
    xidslt_p      IN NUMBER,
    xidsqn_p      IN NUMBER);
```

Parameters

Table 73–22 UNSKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

Exceptions

Table 73–23 UNSKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

DBMS_METADATA

The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

See Also: *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- [Using DBMS_METADATA](#)
 - Overview
 - Security Model
 - Rules and Limits
- [Data Structures - Object and Table Types](#)
- [Subprogram Groupings](#)
 - Subprograms for Retrieving Multiple Objects From the Database
 - Subprograms for Submitting XML to the Database
- [Summary of All DBMS_METADATA Subprograms](#)

Using DBMS_METADATA

This section contains topics which relate to using the DBMS_METADATA package.

- [Overview](#)
- [Security Model](#)
- [Rules and Limits](#)

Overview

You can use the DBMS_METADATA package to retrieve metadata and also to submit XML.

- [Retrieving Metadata](#)
- [Submitting XML](#)

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET_XML and GET_DDL return metadata for a single named object. The GET_DEPENDENT_XML, GET_DEPENDENT_DDL, GET_GRANTED_XML, and GET_GRANTED_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, SET_PARSE_ITEM, CONVERT, PUT, and CLOSE.

Security Model

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.
- For all objects that have passwords (for example, db links, users, and roles), the following rules apply:
 - A user who has the `SELECT_CATALOG_ROLE` can see all metadata for an object except the passwords for that object.
 - The `SYS` user, users who have the `EXP_FULL_DATABASE` role, and users who own an object can see all metadata for that object, including passwords.

Rules and Limits

In an Oracle Shared Server (OSS) environment, the `DBMS_METADATA` package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the `MAX_SHARED_SERVERS` initialization parameter.

Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the following OBJECT and TABLE types.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (  
    item          VARCHAR2(30),  
    value         VARCHAR2(4000),  
    object_row    NUMBER )  
/  
  
CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;  
  
CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item  
/  
  
CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;  
  
CREATE TYPE sys.ku$_ddl AS OBJECT (  
    ddlText      CLOB,  
    parsedItem   sys.ku$_parsed_items )  
/  
  
CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;  
  
CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl  
/  
  
CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;  
  
CREATE TYPE sys.ku$_multi_ddl AS OBJECT (  
    object_row   NUMBER,  
    ddls         sys.ku$_ddls )  
/  
  
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;  
  
CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;  
/  
  
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR  
    sys.ku$_multi_ddls;  
  
CREATE TYPE sys.ku$_ErrorLine IS OBJECT (  
    errorNumber  NUMBER,  
    errorText    VARCHAR2(2000) )  
/  
  
CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;  
  
CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine  
/  
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;  
  
CREATE TYPE sys.ku$_SubmitResult AS OBJECT (  
    ddl          sys.ku$_ddl,  
    errorLines   sys.ku$_ErrorLines );  
/  

```

```
CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult  
/  
  
CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;
```

Subprogram Groupings

The `DBMS_METADATA` subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- [Table 74–1](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to retrieve multiple objects from a database.
- [Table 74–2](#) provides a summary, in alphabetical order, of `DBMS_METADATA` subprograms used to submit XML metadata to a database.

Subprograms for Retrieving Multiple Objects From the Database

Table 74–1 lists the subprograms used for retrieving multiple objects from the database.

Table 74–1 DBMS_METADATA Subprograms for Retrieving Multiple Objects

Subprogram	Description
ADD_TRANSFORM Function on page 74-12	Specifies a transform that <code>FETCH_XXX</code> applies to the XML representation of the retrieved objects
CLOSE Procedure on page 74-15	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
FETCH_XXX Functions and Procedures on page 74-18	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
GET_QUERY Function on page 74-25	Returns the text of the queries that are used by <code>FETCH_XXX</code>
GET_XXX Functions on page 74-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
OPEN Function on page 74-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
SET_COUNT Procedure on page 74-35	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_XXX</code> call
SET_FILTER Procedure on page 74-36	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 74-46	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 74-49	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

Subprograms for Submitting XML to the Database

Table 74–2 lists the subprograms used for submitting XML to the database.

Table 74–2 DBMS_METADATA Subprograms for Submitting XML

Subprogram	Description
ADD_TRANSFORM Function on page 74-12	Specifies a transform for the XML documents
CLOSE Procedure on page 74-15	Closes the context opened with <code>OPENW</code>
CONVERT Functions and Procedures on page 74-16	Converts an XML document to DDL
OPENW Function on page 74-32	Opens a write context
PUT Function on page 74-33	Submits an XML document to the database
SET_PARSE_ITEM Procedure on page 74-46	Specifies an object attribute to be parsed
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 74-49	<code>SET_TRANSFORM_PARAM</code> specifies a parameter to a transform <code>SET_REMAP_PARAM</code> specifies a remapping for a transform

Summary of All DBMS_METADATA Subprograms

Table 74-3 DBMS_METADATA Package Subprograms

Subprogram	Description
ADD_TRANSFORM Function on page 74-12	Specifies a transform that <code>FETCH_xxx</code> applies to the XML representation of the retrieved objects
CLOSE Procedure on page 74-15	Invalidates the handle returned by <code>OPEN</code> and cleans up the associated state
CONVERT Functions and Procedures on page 74-16	Converts an XML document to DDL.
FETCH_xxx Functions and Procedures on page 74-18	Returns metadata for objects meeting the criteria established by <code>OPEN</code> , <code>SET_FILTER</code> , <code>SET_COUNT</code> , <code>ADD_TRANSFORM</code> , and so on
GET_xxx Functions on page 74-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
GET_QUERY Function on page 74-25	Returns the text of the queries that are used by <code>FETCH_xxx</code>
OPEN Function on page 74-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
OPENW Function on page 74-32	Opens a write context
PUT Function on page 74-33	Submits an XML document to the database
SET_COUNT Procedure on page 74-35	Specifies the maximum number of objects to be retrieved in a single <code>FETCH_xxx</code> call
SET_FILTER Procedure on page 74-36	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 74-46	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 74-49	Specifies parameters to the XSLT stylesheets identified by <code>transform_handle</code>

ADD_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects.
- When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9
- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
    handle      IN NUMBER,
    name        IN VARCHAR2,
    encoding    IN VARCHAR2 DEFAULT NULL,
    object_type IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 74–4 ADD_TRANSFORM Function Parameters

Parameters	Description
handle	The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata.
name	The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See <i>Oracle XML DB Developer's Guide</i> . Otherwise, name designates a transform implemented by <code>DBMS_METADATA</code> . The following transforms are defined: <ul style="list-style-type: none"> ■ <code>DDL</code> - the document is transformed to DDL that creates the object. The output of this transform is <i>not</i> an XML document. ■ <code>MODIFY</code> - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.
encoding	The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left <code>NULL</code> and the URL is external to the database, UTF-8 encoding is assumed. If left <code>NULL</code> and the URL is internal to the database (that is, it begins with <code>/oradb/</code>), then the encoding is assumed to be the database character set.

Table 74–4 (Cont.) ADD_TRANSFORM Function Parameters

Parameters	Description
object_type	<p>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</p> <ol style="list-style-type: none"> When you use ADD_TRANSFORM to retrieve objects, the following definition of object_type applies: <p>Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur:</p> <ul style="list-style-type: none"> if object_type is omitted, the transform applies to all object types within the heterogeneous collection if object_type is specified, the transform only applies to that specific object type within the collection <p>If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.</p> When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of the DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_XXX for the OPEN context. After the first call to FETCH_XXX is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:

- `encoding` is specified even though `name` is not a URL
- `object_type` is not part of the collection designated by `handle`

CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by `OPEN` (or `OPENW`) and cleans up the associated state.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9
- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

```
DBMS_METADATA.CLOSE (
    handle IN NUMBER);
```

Parameters

Table 74-5 *CLOSE Procedure Parameters*

Parameter	Description
handle	The handle returned from <code>OPEN</code> (or <code>OPENW</code>).

Usage Notes

Note: The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by `OPEN` or (`OPENW`).

- If a call to `FETCH_XXX` returns `NULL`, indicating no more objects, a call to `CLOSE` is made transparently. In this case, you can still call `CLOSE` on the handle and not get an exception. (The call to `CLOSE` is not required.)
- If you know that only one specific object will be returned, you should explicitly call `CLOSE` after the single `FETCH_XXX` call to free resources held by the handle.

Exceptions

- `INVALID_ARGVAL`. The value for the `handle` parameter is `NULL` or invalid.

CONVERT Functions and Procedures

The `CONVERT` functions and procedures transform input XML documents. The `CONVERT` functions return creation DDL. The `CONVERT` procedures return either XML or DDL, depending on the specified transforms.

See Also: For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

The `CONVERT` functions are as follows:

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN sys.XMLType)
RETURN sys.ku$_multi_ddls;
```

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN CLOB)
RETURN sys.ku$_multi_ddls;
```

The `CONVERT` procedures are as follows:

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN sys.XMLType,
    result IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.CONVERT (
    handle IN NUMBER,
    document IN CLOB,
    result IN OUT NOCOPY CLOB);
```

Parameters

Table 74-6 *CONVERT Subprogram Parameters*

Parameter	Description
<code>handle</code>	The handle returned from <code>OPENW</code> .
<code>document</code>	The XML document containing object metadata of the type of the <code>OPENW</code> handle.
<code>result</code>	The converted document.

Return Values

DDL to create the object(s).

Usage Notes

You can think of `CONVERT` as the second half of `FETCH_XXX`, either `FETCH_DDL` (for the function variants) or `FETCH_CLOB` (for the procedure variants). There are two differences:

- `FETCH_XXX` gets its XML document from the database, but `CONVERT` gets its XML document from the caller
- `FETCH_DDL` returns its results in a `sys.ku$_ddls` nested table, but `CONVERT` returns a `sys.ku$_multi_ddls` nested table

The transforms specified with `ADD_TRANSFORM` are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the `parsedItems` column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in `OPENW`.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. No transform was specified. The DDL transform was not specified (function variants only).
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. See "Usage Notes" on page 74-19 for the variants.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9

Syntax

The FETCH functions are as follows:

```
DBMS_METADATA.FETCH_XML (
    handle IN NUMBER)
RETURN sys.XMLType;
```

See Also: *Oracle XML DB Developer's Guide* for a description of XMLType

```
DBMS_METADATA.FETCH_DDL (
    handle IN NUMBER)
RETURN sys.ku$_ddls;
```

```
DBMS_METADATA.FETCH_CLOB (
    handle      IN NUMBER,
    cache_lob   IN BOOLEAN DEFAULT TRUE,
    lob_duration IN PLS_INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.FETCH_XML_CLOB (
    handle IN NUMBER,
    doc    IN OUT NOCOPY CLOB,
    parsed_items OUT sys.ku$_parsed_items,
    object_type_path OUT VARCHAR2);
```

Parameters

Table 74–7 *FETCH_xxx Function Parameters*

Parameters	Description
handle	The handle returned from OPEN.
cache_lob	TRUE=read LOB into buffer cache
lob_duration	The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.
doc	The metadata for the objects, or NULL if all objects have been returned.

Table 74–7 (Cont.) FETCH_xxx Function Parameters

Parameters	Description
<code>parsed_items</code>	A nested table containing the items specified by <code>SET_PARSE_ITEM</code> . If <code>SET_PARSE_ITEM</code> was not called, a NULL is returned.
<code>object_type_path</code>	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to <code>FETCH_xxx</code> . If <code>handle</code> designates a homogeneous object type, a NULL is returned.

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to `OPEN` that returned the handle, and subsequent calls to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on. Each call to `FETCH_xxx` returns the number of objects specified by `SET_COUNT` (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to `FETCH_xxx` return NULL and cause the stream created by `OPEN` to be transparently closed.

There are several different `FETCH_xxx` functions and procedures:

- The `FETCH_XML` function returns the XML metadata for an object as an `XMLType`. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The `FETCH_DDL` function returns the DDL (to create the object) in a `sys.ku$_ddl$` nested table. It assumes that the DDL transform has been specified. Each row of the `sys.ku$_ddl$` nested table contains a single DDL statement in the `ddlText` column; if requested, parsed items for the DDL statement will be returned in the `parsedItems` column. Multiple DDL statements may be returned under the following circumstances:
 - When you call `SET_COUNT` to specify a count greater than 1
 - When an object is transformed into multiple DDL statements. For example, A `TYPE` object that has a DDL transform applied to it can be transformed into both `CREATE TYPE` and `CREATE TYPE BODY` statements. A `TABLE` object can be transformed into a `CREATE TABLE`, and one or more `ALTER TABLE` statements
- The `FETCH_CLOB` function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the `cache_lob` and `lob_duration` parameters.
- The `FETCH_CLOB` procedure returns the objects by reference in an `IN OUT NOCOPY` parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The `FETCH_XML_CLOB` procedure returns the XML metadata for the objects as a CLOB in an `IN OUT NOCOPY` parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by `FETCH_XXX` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.
- If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object's metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_ddl`s nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:
 - `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
 - `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
 - `object_row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_XXX`, (because `SET_COUNT` specified a count greater than 1) then `object_row=1` for all items for the first object, 2 for the second, and so on.
- The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be `NULL`.
- If `SET_PARSE_ITEM` was not called, `NULL` is returned as the value of the parsed items nested table.
- It is expected that the same variant of `FETCH_XXX` will be called for all objects selected by `OPEN`. That is, programs will not intermix calls to `FETCH_XML`, `FETCH_DDL`, `FETCH_CLOB`, and so on using the same `OPEN` handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the `FETCH_XXX` calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. Either `FETCH_XML` was called when the DDL transform had been specified, or `FETCH_DDL` was called when the DDL transform had *not* been specified.

GET_xxx Functions

The following GET_xxx functions let you fetch metadata for objects with a single call:

- GET_XML
- GET_DDL
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9

Syntax

```
DBMS_METADATA.GET_XML (
object_type      IN VARCHAR2,
name             IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

```
DBMS_METADATA.GET_DDL (
object_type      IN VARCHAR2,
name             IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;
```

```
DBMS_METADATA.GET_DEPENDENT_XML (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

```
DBMS_METADATA.GET_DEPENDENT_DDL (
object_type      IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

```
DBMS_METADATA.GET_GRANTED_XML (
```

```

object_type      IN VARCHAR2,
grantee          IN VARCHAR2 DEFAULT NULL,
version          IN VARCHAR2 DEFAULT 'COMPATIBLE',
model            IN VARCHAR2 DEFAULT 'ORACLE',
transform        IN VARCHAR2 DEFAULT NULL,
object_count     IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

```

DBMS_METADATA.GET_GRANTED_DDL (
object_type      IN VARCHAR2,
grantee          IN VARCHAR2 DEFAULT NULL,
version          IN VARCHAR2 DEFAULT 'COMPATIBLE',
model            IN VARCHAR2 DEFAULT 'ORACLE',
transform        IN VARCHAR2 DEFAULT 'DDL',
object_count     IN NUMBER   DEFAULT 10000)
RETURN CLOB;

```

Parameters

Table 74–8 GET_xxx Function Parameters

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See Table 74–17 for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See SET_COUNT Procedure on page 74-35.

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML or DDL.
 - GET_XXX is used to fetch named objects, especially schema objects (tables, views).
 - GET_DEPENDENT_XXX is used to fetch dependent objects (audits, object grants).
 - GET_GRANTED_XXX is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET_XXX to fetch an index by name, or GET_DEPENDENT_XXX to fetch the same index by specifying the table on which it is defined.
- GET_XXX only returns a single named object.
- For GET_DEPENDENT_XXX and GET_GRANTED_XXX, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)
- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE', 'EMP', 'SCOTT')
FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET_TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
```

```
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM, 'STORAGE', false);
SELECT DBMS_METADATA.GET_DDL('TABLE', u.table_name)
      FROM USER_ALL_TABLES u
      WHERE u.nested='NO'
      AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM, 'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
      'EMPLOYEES', 'HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT', 'SCOTT')
      FROM DUAL;
```

GET_QUERY Function

This function returns the text of the queries that are used by `FETCH_XXX`. This function assists in debugging.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9

Syntax

```
DBMS_METADATA.GET_QUERY (
    handle IN NUMBER)
RETURN VARCHAR2;
```

Parameters

Table 74–9 GET_QUERY Function Parameters

Parameter	Description
handle	The handle returned from <code>OPEN</code> . It cannot be the handle for a heterogeneous object type.

Return Values

The text of the queries that will be used by `FETCH_XXX`.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for the `handle` parameter.

OPEN Function

This function specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9

Syntax

```
DBMS_METADATA.OPEN (
  object_type IN VARCHAR2,
  version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model       IN VARCHAR2 DEFAULT 'ORACLE',
  network_link IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 74–10 Open Function Parameters

Parameter	Description
object_type	<p>The type of object to be retrieved. Table 74–11 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see model in this table).</p> <p>The Attributes column in Table 74–11 specifies some object type attributes:</p> <ul style="list-style-type: none"> ▪ Schema objects, such as tables, belong to schemas. ▪ Named objects have unique names (if they are schema objects, the name is unique to the schema). ▪ Dependent objects, such as indexes, are defined with reference to a base schema object. ▪ Granted objects are granted or assigned to a user or role and therefore have a named grantee. ▪ Heterogeneous object types denote a collection of related objects of different types. See Table 74–12 for a listing of object types returned for the heterogeneous object type. <p>These attributes are relevant when choosing object selection criteria. See "SET_FILTER Procedure" on page 74-36 for more information.</p>
version	<p>The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</p> <p>COMPATIBLE (default)—the version of the metadata corresponds to the database compatibility level.</p> <p>LATEST—the version of the metadata corresponds to the database version.</p> <p>A specific database version. The value cannot be lower than 9.2.0.</p>

Table 74–10 (Cont.) Open Function Parameters

Parameter	Description
model	Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported.
network_link	The name of a database link to the database whose metadata is to be retrieved. If NULL (the default), metadata is retrieved from the database on which the caller is running

Table 74–11 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

Table 74–11 DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: <ul style="list-style-type: none"> ■ primary key constraint for IOT ■ column NOT NULL constraints ■ certain REF SCOPE and WITH ROWID constraints for tables with REF columns
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.

Table 74–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
FUNCTION	stored functions	SN	None
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None
MATERIALIZED_VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See " SET_FILTER Procedure " on page 74-36.
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INITIAL_CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None

Table 74–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in CREATE PUBLIC SYNONYM FOO FOR BAR, the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table (<i>not</i> the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See " SET_FILTER Procedure " on page 74-36.
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.

Table 74–12 lists the types of objects returned for the major heterogeneous object types. For SCHEMA_EXPORT, certain object types are only returned if the INCLUDE_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE_USER.

Table 74–12 Object Types Returned for the Heterogeneous Object Type

Object Type	DATABASE_EXPORT	SCHEMA_EXPORT	TABLE_EXPORT	TRANSPORTABLE_EXPORT
ASSOCIATION	Yes	No	No	No
AUDIT	Yes	No	No	No
AUDIT_OBJ	Yes	Yes	Yes	Yes
CLUSTER	Yes	Yes	No	Yes

TYPE_SPEC	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

Return Values

An opaque handle to the class of objects. This handle is used as input to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, `GET_QUERY`, `SET_PARSE_ITEM`, `FETCH_XXX`, and `CLOSE`.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `version` or `model` parameter was not valid for the `object_type`.

OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

See Also: For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

```
DBMS_METADATA.OPENW
(object_type IN VARCHAR2,
 version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
 model      IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

Parameters

Table 74–13 OPENW Function Parameters

Parameter	Description
object_type	The type of object to be submitted. Valid types names and their meanings are listed in Table 74–11 . The type cannot be a heterogeneous object type.
version	The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: <ul style="list-style-type: none"> ▪ COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher. ▪ LATEST - The version of the DDL corresponds to the database version. ▪ A specific database version. The value cannot be lower than 9.2.0.
model	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.

Return Values

An opaque handle to write context. This handle is used as input to the ADD_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The model parameter was not valid for the object_type.

PUT Function

This function submits an XML document containing object metadata to the database to create the object.

See Also: For more information about related subprograms:

- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

```
DBMS_METADATA.PUT (
  handle      IN          NUMBER,
  document    IN          sys.XMLType,
  flags       IN          NUMBER,
  results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

```
DBMS_METADATA.PUT (
  handle      IN          NUMBER,
  document    IN          CLOB,
  flags       IN          NUMBER,
  results     IN OUT NOCOPY sys.ku$_SubmitResults)
RETURN BOOLEAN;
```

Parameters

Table 74–14 PUT Function Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata for the type of the OPENW handle.
flags	Reserved for future use
results	Detailed results of the operation.

Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the sys.ku\$_SubmitResults nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. The DDL transform was not specified.
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single `FETCH_XXX` call. By default, each call to `FETCH_XXX` returns one object. You can use the `SET_COUNT` procedure to override this default. If `FETCH_XXX` is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single `FETCH_XXX` operation only returns objects of a single object type.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9

Syntax

```
DBMS_METADATA.SET_COUNT (
    handle          IN NUMBER,
    value          IN NUMBER,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74–15 *SET_COUNT Procedure Parameters*

Parameter	Description
handle	The handle returned from <code>OPEN</code> .
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the <code>OPEN</code> handle. When the <code>OPEN</code> handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> ▪ if <code>object_type_path</code> is omitted, the count applies to all object types within the heterogeneous collection ▪ if <code>object_type_path</code> is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_COUNT` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first call to `FETCH_XXX` is made, no further calls to `SET_COUNT` for the current `OPEN` context are permitted.
- `INCONSISTENT_ARGS`. `object_type` parameter is not consistent with handle.

SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9

Syntax

```
DBMS_METADATA.SET_FILTER (
    handle          IN NUMBER,
    name           IN VARCHAR2,
    value          IN VARCHAR2,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (
    handle          IN NUMBER,
    name           IN VARCHAR2,
    value          IN BOOLEAN DEFAULT TRUE,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_FILTER (
    handle          IN NUMBER,
    name           IN VARCHAR2,
    value          IN NUMBER,
    object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74–16 SET_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
name	<p>The name of the filter. For each filter, Table 74–17 lists the <code>object_type</code> it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any).</p> <p>The Datatype column of Table 74–17 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.)) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (<i>not</i> a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows:</p> <pre>' IN ('DEPT' , 'EMP')'</pre> <p>The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.</p>
value	The value of the filter. Text, Boolean, and Numeric filters are supported.

Table 74–16 (Cont.) SET_FILTER Procedure Parameters

Parameter	Description
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 74–18 for a listing of some of the values for this parameter.

[Table 74–17](#) describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

Table 74–17 SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Named objects	NAME	text	Objects with this exact name are selected.
Named objects	NAME_EXPR	text expression	The filter value is combined with the object attribute corresponding to the object name to produce a WHERE condition in the query that fetches the objects. By default, all named objects of object_type are selected.
Named objects	EXCLUDE_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched. By default, all named objects of the object type are selected.
Schema objects	SCHEMA	text	Objects in this schema are selected. If the object type is SYNONYM, specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	text	Objects in this tablespace (or having a partition in this tablespace) are selected.

Table 74–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in <code>obj\$</code> is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in <code>obj\$</code> is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_NAME	text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.
Dependent Objects	BASE_OBJECT_SCHEMA	text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BASE_OBJECT_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT_SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT_TYPE	text	The object type of the base object.
Dependent Objects	BASE_OBJECT_TYPE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT_TABLESPACE	text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT_TABLESPACE_EXPR	text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_GENERATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.

Table 74–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Granted Objects	PRIVNAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the privilege or role name. By default, all privileges/roles are returned.
Granted Objects	GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_ GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	text	Object grants are selected that are granted by this user.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME	text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME_EXPR	text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	text	<p>The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used.</p> <p>The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.</p>
SCHEMA_EXPORT	SCHEMA	text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	text expression	<p>The filter value is either:</p> <p>combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects,</p> <p>combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects.</p> <p>By default the current user's objects are selected.</p>
SCHEMA_EXPORT	INCLUDE_USER	Boolean	<p>If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA.</p> <p>Defaults to FALSE.</p>
TABLE_EXPORT	SCHEMA	text	Objects (tables and their dependent objects) in this schema are selected.
TABLE_EXPORT	SCHEMA_EXPR	text expression	<p>The filter value is either:</p> <p>combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables,</p> <p>combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects.</p> <p>By default the current user's objects are selected.</p>

Table 74–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	NAME	text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.
Heterogeneous objects	INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR	text expression	For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 74–18 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.

Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle, 'SCHEMA', 'SCOTT');
SET_FILTER(handle, 'NAME', 'EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle, 'NAME_EXPR', '>=' 'FELIX'');
```

```
SET_FILTER(handle, 'NAME_EXPR', '<=' 'OSCAR'');
```

- With `SET_FILTER`, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is `SYS` or has `SELECT_CATALOG_ROLE`, then any object can be retrieved; otherwise, only the following can be retrieved:
 - Schema objects owned by the current user
 - Public synonyms
 - System privileges granted to the current user or to `PUBLIC`
 - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as `PUBLIC`).
 - `SCHEMA_EXPORT` where the name is the current user
 - `TABLE_EXPORT` where `SCHEMA` is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program `invokers-rights`.

- For heterogeneous object types, the `BEGIN_WITH` and `BEGIN_AFTER` filters allow restart on an object type boundary. Appropriate filter values are returned by the `FETCH_XML_CLOB` procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for `SCHEMA_EXPORT` the `NAME` filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a `NAME_EXPR` filter explicitly for the `TABLE` object type path. [Table 74–18](#) lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: `DATABASE_EXPORT_OBJECTS`, `SCHEMA_EXPORT_OBJECTS`, and `TABLE_EXPORT_OBJECTS`.) See [Table 74–17](#) for filters defined for each path name. These path names are valid in the `INCLUDE_PATH_EXPR` and `EXCLUDE_PATH_EXPR` filters. Path names marked with an asterisk (*) are *only* valid in those filters; they cannot be used as values of the `SET_FILTER object_type_path` parameter.

Table 74–18 Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants

Table 74–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION.** SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.
- **INCONSISTENT_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
 - filter name not valid for the object type associated with the OPEN context
 - filter name not valid for the object_type_path
 - object_type_path not part of the collection designated by handle
 - filter value is the wrong datatype

SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9
- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
    handle      IN NUMBER,
    name       IN VARCHAR2,
    object_type IN VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
    handle      IN NUMBER,
    name       IN VARCHAR2);
```

Parameters

Table 74–19 SET_PARSE_ITEM Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).
name	The name of the object attribute to be parsed and returned. See Table 74–20 for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: <ul style="list-style-type: none"> ▪ if object_type is omitted, the parse item applies to all object types within the heterogeneous collection ▪ if object_type is specified, the parse item only applies to that specific object type within the collection This parameter only applies when SET_PARSE_ITEM is used for object retrieval.

[Table 74–20](#) describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Table 74–20 SET_PARSE_ITEM: Parse Items

Object Type	Name	Meaning
All objects	VERB	If <code>FETCH_XML_CLOB</code> is called, no value is returned. If <code>FETCH_DDL</code> is called, then for every row in the <code>sys.ku\$_ddl</code> s nested table returned by <code>FETCH_DDL</code> the verb in the corresponding <code>ddlText</code> is returned. If the <code>ddlText</code> is a SQL DDL statement, then the SQL verb (for example, <code>CREATE</code> , <code>GRANT</code> , <code>AUDIT</code>) is returned. If the <code>ddlText</code> is a procedure call (for example, <code>DBMS_AQADM.CREATE_QUEUE_TABLE()</code>) then the <code>package.procedure-name</code> is returned.
All objects	OBJECT_TYPE	If <code>FETCH_XML_CLOB</code> is called, an object type name from Table 74–11 is returned. If <code>FETCH_DDL</code> is called and the <code>ddlText</code> is a SQL DDL statement whose verb is <code>CREATE</code> or <code>ALTER</code> , the object type as used in the DDL statement is returned (for example, <code>TABLE</code> , <code>PACKAGE_BODY</code> , and so on). Otherwise, an object type name from Table 74–11 is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a <code>TABLE_DATA</code> object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, <code>ENABLE</code> is returned. If the trigger is disabled, <code>DISABLE</code> is returned.
OBJECT_ GRANT, TABLESPACE_ QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

Usage Notes

These notes apply when using `SET_PARSE_ITEM` to retrieve objects.

By default, the `FETCH_xxx` routines return an object's metadata as XML or creation DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

You can call `SET_PARSE_ITEM` multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For `TABLE_DATA` objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table (<i>not</i> the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the `BASE_OBJECT_NAME`, `BASE_OBJECT_SCHEMA` and `BASE_OBJECT_TYPE` parse items for secondary `TABLE` objects return the name, schema, and type of the domain index.

See Also:

- ["FETCH_xxx Functions and Procedures"](#) on page 74-18
- *Oracle Database Utilities* for information about using the Metadata API

By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- `INCONSISTENT_ARGS`. The attribute name is not valid for the object type associated with the `OPEN` context.

SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. SET_TRANSFORM_PARAM and SET_REMAP_PARAM specify parameters to the XSLT stylesheet identified by transform_handle. Use them to modify or customize the output of the transform.

See Also: For more information about related subprograms:

- [Subprograms for Retrieving Multiple Objects From the Database](#) on page 74-9
- [Subprograms for Submitting XML to the Database](#) on page 74-10

Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle IN NUMBER,
  name             IN VARCHAR2,
  value           IN VARCHAR2,
  object_type     IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle IN NUMBER,
  name             IN VARCHAR2,
  value           IN BOOLEAN DEFAULT TRUE,
  object_type     IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
  transform_handle IN NUMBER,
  name             IN VARCHAR2,
  value           IN NUMBER,
  object_type     IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_METADATA.SET_REMAP_PARAM (
  transform_handle IN NUMBER,
  name             IN VARCHAR2,
  old_value       IN VARCHAR2,
  new_value       IN VARCHAR2,
  object_type     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 74-21 describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.

Table 74-21 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
transform_handle	<p>Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session.</p> <p>Note that the handle returned by OPEN is not a valid transform handle.</p> <p>For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.</p>

Table 74–21 (Cont.) SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
name	<p>The name of the parameter.</p> <p>Table 74–22 lists the transform parameters defined for the DDL transform, specifying the <code>object_type</code> it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive.</p> <p>Table 74–23 describes the parameters for the MODIFY transform in the <code>SET_TRANSFORM_PARAM</code> procedure.</p> <p>Table 74–24 describes the parameters for the MODIFY transform in the <code>SET_REMAP_PARAM</code> procedure.</p>
value	The value of the transform. This parameter is valid only for <code>SET_TRANSFORM_PARAM</code> .
old_value	The old value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> .
new_value	The new value for the remapping. This parameter is valid only for <code>SET_REMAP_PARAM</code> .
object_type	<p>Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply:</p> <ul style="list-style-type: none"> ▪ If <code>object_type</code> is omitted, the parameter applies to all applicable object types within the heterogeneous collection. ▪ If <code>object_type</code> is specified, the parameter only applies to that object type. <p>This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.</p>

[Table 74–22](#) describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the `SET_TRANSFORM_PARAM` procedure.

Table 74–22 SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
TABLE	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is FALSE.) Defaults to TRUE.
TABLE	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if <code>SEGMENT_ATTRIBUTES</code> is FALSE.) Defaults to TRUE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, emit all non-referential table constraints. Defaults to TRUE.
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, emit all referential constraints (foreign keys). Defaults to TRUE.

Table 74–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, emit table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE	OID	BOOLEAN	If TRUE, emit the OID clause for object tables. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, emit the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
TABLE, INDEX	PARTITIONING	BOOLEAN	If TRUE, emit partitioning clauses; if FALSE, suppress them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE	SPECIFICATION	BOOLEAN	If TRUE, emit the type specification. Defaults to TRUE.
TYPE	BODY	BOOLEAN	If TRUE, emit the type body. Defaults to TRUE.
TYPE	OID	BOOLEAN	If TRUE, emit the OID clause. Defaults to FALSE.
PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, emit the package specification. Defaults to TRUE.
PACKAGE	BODY	BOOLEAN	If TRUE, emit the package body. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, emit the INSERT statements into the OL\$ dictionary tables that will create the outline and its hints. If FALSE, emit a CREATE OUTLINE statement. Defaults to FALSE. Note: This object type is being deprecated.
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.

Table 74–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.
ROLE	REVOKE_FROM	Text	The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is emitted after the CREATE ROLE. Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant. Defaults to null string.
TABLESPACE	REUSE	BOOLEAN	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. Defaults to FALSE.
CLUSTER, INDEX, ROLLBACK_ SEGMENT, TABLE, TABLESPACE	PCTSPACE	NUMBER	A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundredths of the current allocation. For example, 100 means 100%. If the object type is TABLESPACE, the following size values are affected: - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE For other object types, INITIAL and NEXT are affected.

Table 74–23 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure.

Table 74–23 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document. This parameter is additive. By default, all objects are copied to the output document.

Table 74–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

Table 74–24 SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	<p>Objects in the document will have their filespecs renamed as follows: any filespec matching <code>old_value</code> will be changed to <code>new_value</code>. Filespecs should <i>not</i> be enclosed in quotes.</p> <p>This parameter is additive.</p> <p>By default, filespecs are not renamed.</p>
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	<p>Any schema object in the document whose name matches <code>old_value</code> will have its schema name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object schema name matches <code>old_value</code> will have its base object schema name changed to <code>new_value</code>.</p> <p>Any granted object whose grantee name matches <code>old_value</code> will have its grantee name changed to <code>new_value</code>.</p> <p>Any user whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, schemas are not remapped.</p>
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_ SEGMENT, MATERIALIZED_ VIEW, MATERIALIZED_ VIEW_LOG, TABLESPACE_ QUOTA	REMAP_TABLESPACE	Text	<p>Objects in the document will have their tablespaces renamed as follows: any tablespace name matching <code>old_value</code> will be changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, tablespaces are not remapped.</p>
Named objects and all objects dependent on named objects	REMAP_NAME	Text	<p>Any named object in the document whose name matches <code>old_value</code> will have its name changed to <code>new_value</code>.</p> <p>Any dependent object whose base object name matches <code>old_value</code> will have its base schema name changed to <code>new_value</code>.</p> <p>This parameter is additive.</p> <p>By default, names are not remapped.</p> <p>(Use <code>REMAP_TABLESPACE</code> to remap the name of a <code>TABLESPACE</code> object.)</p>

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OPERATION`. Either `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` was called after the first call to `FETCH_XXX` for the `OPEN` context. After the first call to `FETCH_XXX` is made, no further calls to `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` are permitted.
- `INCONSISTENT_ARGS`. The arguments are inconsistent. This can mean the following:

- The transform parameter name is not valid for the object type associated with the OPEN context or for the transform associated with the transform handle.
- The transform applies to all object types in a heterogeneous collection, but `object_type` is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call `SET_TRANSFORM_PARAM` or `SET_REMAP_PARAM` to specify the value of a parameter to be passed to the stylesheet identified by `transform_handle`.

Normally, if you call `SET_TRANSFORM_PARAMETER` multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the `STORAGE` transform parameter to `TRUE`.

```
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', false);
SET_TRANSFORM_PARAM(tr_handle, 'STORAGE', true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the `OBJECT_ROW` parameter to the `MODIFY` transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 5);
SET_TRANSFORM_PARAM(tr_handle, 'OBJECT_ROW', 8);
```

The `REMAP_TABLESPACE` parameter is also additive. If you specify the following, then tablespaces `TBS1` and `TBS3` are changed to `TBS2` and `TBS4`, respectively.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS3', 'TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS1', 'TBS2');
SET_REMAP_PARAM(tr_handle, 'REMAP_TABLESPACE', 'TBS2', 'TBS3');
```

Note: The number of remap parameters that can be specified for a `MODIFY` transform is limited to ten. That is, you can specify up to ten `REMAP_DATAFILE` parameters, up to ten `REMAP_SCHEMA` parameters and so on. Additional instances are ignored. To work around this, you can perform another `DBMS_METADATA.ADD_TRANSFORM` and specify additional remap parameters.

The `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant `SESSION_TRANSFORM` as the handle of the DDL transform at the session level. You can call `SET_TRANSFORM_PARAM` using `DBMS_METADATA.SESSION_TRANSFORM` as the transform handle to set transform parameters for the whole session. `GET_DDL`, `GET_DEPENDENT_DDL`, and `GET_GRANTED_DDL` inherit these parameters when they invoke the DDL transform.

Note: The enumerated constant must be prefixed with the package name `DBMS_METADATA.SESSION_TRANSFORM`.

DBMS_MGD_ID_UTL

The DBMS_MGD_ID_UTL package contains various functions and procedures that make up several utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

See Also: *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- [Using DBMS_MGD_ID_UTL](#)
 - [Constants](#)
 - [Exceptions](#)
- [Summary of DBMS_MGD_ID_UTL Subprograms](#)

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Using DBMS_MGD_ID_UTL

- [Constants](#)
- [Exceptions](#)

Constants

DBMS_MGD_ID_UTL uses the constants shown in [Table 75-1](#).

Table 75-1 DBMS_MGD_ID_UTL Constants

Name	Value
Installed Category IDs and Names	
EPC_ENCODING_CATEGORY_ID	1
EPC_ENCODING_CATEGORY_NAME	EPC
Logging Levels	
LOGGING_LEVEL_OFF	0
LOGGING_LEVEL_SEVERE	1
LOGGING_LEVEL_WARNING	2
LOGGING_LEVEL_INFO	3
LOGGING_LEVEL_FINE	4
LOGGING_LEVEL_FINER	5
LOGGING_LEVEL_FINEST	6
LOGGING_LEVEL_ALL	7

Exceptions

DBMS_MGD_ID_UTL uses the exceptions shown in [Table 75–2](#).

Table 75–2 *Exceptions Raised by DBMS_MGD_ID_UTL Package*

Name	Error Code	Description
TDTJavaException	-55200	During the tag data translation, a Java exception was raised.
TDTCategoryNotFound	-55201	The specified category was not found.
TDTSchemeNotFound	-55202	During the tag data translation, the specified scheme was not found.
TDTLevelNotFound	-55203	During the tag data translation, the specified level was not found.
TDTOptionNotFound	-55204	During the tag data translation, the specified option was not found.
TDTFieldValidationException	-55205	During the tag data translation, the validation operation failed on a field.
TDTUndefinedField	-55206	During the tag data translation, an undefined field was detected.
TDTRuleEvaluationFailed	-55207	During the tag data translation, the rule evaluation operation failed.
TDTTooManyMatchingLevels	-55208	During the tag data translation, too many matching levels were found.

Summary of DBMS_MGD_ID_UTL Subprograms

Table 75–3 describes the utility subprograms in the DBMS_MGD_ID_UTL package.

All the values and names passed to the procedures defined in the DBMS_MGD_ID_UTL package are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 75–3 DBMS_MGD_ID_UTL Package Subprograms

Subprogram	Description
ADD_SCHEME Procedure	Adds a tag data translation scheme to an existing category
CREATE_CATEGORY Function	Creates a new category or a new version of a category
EPC_TO_ORACLE_SCHEME Function	Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML
GET_CATEGORY_ID Function	Returns the category ID given the category name and the category version
GET_COMPONENTS Function	Returns all relevant separated component names separated by semicolon (;) for the specified scheme
GET_ENCODINGS Function	Returns a list of semicolon (;) separated encodings (formats) for the specified scheme
GET_JAVA_LOGGING_LEVEL Function	Returns an integer representing the current Java trace logging level
GET_PLSQL_LOGGING_LEVEL Function	Returns an integer representing the current PL/SQL trace logging level
GET_SCHEME_NAMES Function	Returns a list of semicolon (;) separated scheme names for the specified category
GET_TDT_XML Function	Returns the Oracle tag data translation XML for the specified scheme
GET_VALIDATOR Function	Returns the Oracle tag data translation schema
REFRESH_CATEGORY Function	Refreshes the metadata information on the Java stack for the specified category
REMOVE_CATEGORY Procedure	Removes a category including all the related TDT XML if the value of <code>category_version</code> is NULL
REMOVE_PROXY Procedure	Unsets the host and port of the proxy server
REMOVE_SCHEME Procedure	Removes a tag data translation scheme from a category
SET_JAVA_LOGGING_LEVEL Procedure	Sets the Java logging level
SET_PLSQL_LOGGING_LEVEL Procedure	Sets the PL/SQL tracing logging level
SET_PROXY Procedure	Sets the host and port of the proxy server for Internet access
VALIDATE_SCHEME Function	Validates the input tag data translation XML against the Oracle tag data translation schema

ADD_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

Syntax

```
procedure DBMS_MGD_ID_UTL.ADD_SCHEME (
    category_id IN VARCHAR2,
    tdt_xml     IN CLOB);
```

Parameters

Table 75–4 ADD_SCHEME Procedure Parameters

Parameter	Description
category_id	Category ID
tdt_xml	Tag data translation XML

Usage Notes

None.

Examples

The following example creates a category, adds a contractor scheme and an employee scheme to the MGD_SAMPLE_CATEGORY category, validates the MGD_SAMPLE_CATEGORY scheme, tests the tag translation of the contractor scheme and the employee scheme, then removes the contractor scheme, tests the tag translation of the contractor scheme and this returns the expected exception for the removed contractor scheme, tests the tag translation of the employee scheme and this returns the expected values, then removes the MGD_SAMPLE_CATEGORY category:

```
--contents of add_scheme2.sql
SET LINESIZE 160
-----
---CREATE CATEGORY, ADD_SCHEME, REMOVE_SCHEME, REMOVE_CATEGORY-----
-----
DECLARE
    amt          NUMBER;

CREATE_CATEGORY Function

This function creates a new category or a new version of a category.

Syntax

```
function DBMS_MGD_ID_UTL.CREATE_CATEGORY (  
    category_name    IN  VARCHAR2,  
    category_version IN  VARCHAR2,  
    agency           IN  VARCHAR2,  
    URI              IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 75–5 CREATE_CATEGORY Function Parameters

Parameter	Description
category_name	Name of category
category_version	Category version
agency	Organization that owns the category. For example, EPCglobal owns the category 'EPC'.
URI	URI that provides additional information about the category

Usage Notes

The return value is the category ID.

Examples

See the [ADD_SCHEME Procedure](#) for an example of creating the MGD_SAMPLE_CATEGORY category.

EPC_TO_ORACLE_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML.

Syntax

```
function DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME (
    xml_scheme IN CLOB)
RETURN CLOB;
```

Parameters

Table 75–6 EPC_TO_ORACLE_SCHEME Function Parameters

Parameter	Description
xml_scheme	Name of EPC tag scheme to be converted

Usage Notes

The return value is the contents of the CLOB containing the Oracle tag data translation XML.

Examples

The following example converts standard EPCglobal Tag Data Translation (TDT) files into Oracle TDT files:

```
--Contents of MGD_ID_DOC2.sql
-----
-- EPC_TO_ORACLE_SCHEME --
-----
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');

BEGIN
  DBMS_JAVA.set_output(1000000);
  DBMS_OUTPUT.ENABLE(1000000);
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;
/

DECLARE

GET_CATEGORY_ID Function

This function returns the category ID for a given category name and category version.

Syntax

```
function DBMS_MGD_ID_UTL.GET_CATEGORY_ID (
    category_name    IN VARCHAR2,
    category_version IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–7 GET_CATEGORY_ID Function Parameters

Parameter	Description
category_name	Name of category
category_version	Category version

Usage Notes

- If the value of `category_version` is `NULL`, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

Examples

The following example returns a category ID given a category name and its version:

```
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;
```

```
SQL> @get_category1.sql
```

```
.
.
.
```

```
DBMS_MGD_ID_UTL.GET_CATEGORY_ID('EPC',NULL)
```

```
-----
1
```

```
.
.
.
```

GET_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (;) for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_COMPONENTS (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 75–8 GET_COMPONENTS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

The return value contains the component names separated by a semicolon (;) for the specified scheme.

Examples

The following example gets the components:

```
--Contents of get_components.sql
DECLARE
    id          mgd_id;
    getcomps   VARCHAR2(1000);
    getencodings VARCHAR2(1000);
    getschemenames VARCHAR2(1000);
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    getcomps := DBMS_MGD_ID_UTL.get_components(1, 'SGTIN-64');
    dbms_output.put_line('Component names are: ' || getcomps);
    getencodings := DBMS_MGD_ID_UTL.get_encodings(1, 'SGTIN-64');
    dbms_output.put_line('Encodings are: ' || getencodings);
    getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
    dbms_output.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

GET_ENCODINGS Function

This function returns a list of semicolon (;) separated encodings (formats) for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_ENCODINGS (  
    category_id IN VARCHAR2,  
    scheme_name IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 75–9 GET_ENCODINGS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

The return value contains the encodings separated by a semicolon (;) for the specified scheme.

Examples

See the [GET_COMPONENTS Function](#) for an example.

GET_JAVA_LOGGING_LEVEL Function

This function returns an integer representing the current trace logging level.

Syntax

```
function DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL RETURN INTEGER;
```

Parameters

None.

Usage Notes

The return value is the integer value denoting the current Java logging level.

Examples

The following example gets the Java logging level.

```
--Contents of getjavalogginglevel.sql
DECLARE
    loglevel    NUMBER;
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    loglevel := DBMS_MGD_ID_UTL.get_java_logging_level();
    dbms_output.put_line('Java logging level = ' || loglevel);
END;
/

GET_PLSQL_LOGGING_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

Syntax

```
function DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL RETURN INTEGER;  
PRAGMA restrict_references(get_plsql_logging_level, WNDS);
```

Parameters

None.

Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqllogginglevel.sql  
DECLARE  
    loglevel    NUMBER;  
BEGIN  
    DBMS_MGD_ID_UTL.set_plsql_logging_level(0);  
    loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();  
    dbms_output.put_line('PL/SQL logging level = ' || loglevel);  
END;  
/  
SHOW ERRORS;

GET_SCHEME_NAMES Function

This function returns a list of semicolon (;) separated scheme names for the specified category.

Syntax

```
function DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (  
        category_id IN VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 75–10 *GET_SCHEME_NAMES Function Parameters*

Parameter	Description
category_id	Category ID

Usage Notes

The return value contains the scheme names for the specified category ID.

Examples

See the [GET_COMPONENTS Function](#) for an example.

GET_TDT_XML Function

This function returns the Oracle tag data translation XML for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_TDT_XML (
    category_id IN VARCHAR2,
    scheme_name IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 75–11 GET_TDT_XML Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

The return value contains the Oracle tag data translation XML for the specified scheme.

Examples

The following example gets the Oracle TDT XML for the specified scheme:

```
--Contents of get_tdtxml.sql
DECLARE
    gettdtxml CLOB;

BEGIN
    gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1, 'SGTIN-64');
    dbms_output.put_line('Length of tdt XML is '||DBMS_LOB.GETLENGTH(gettdtxml));
    dbms_output.put_line(DBMS_LOB.SUBSTR(gettdtxml, DBMS_LOB.GETLENGTH(gettdtxml), 1));
END;

GET_VALIDATOR Function

This function returns the Oracle tag data translation schema.

Syntax

```
function DBMS_MGD_ID_UTL.GET_VALIDATOR RETURN CLOB;
```

Parameters

None.

Usage Notes

The return value contains the Oracle tag data translation schema.

Examples

This example returns the Oracle TDT schema.

```

REFRESH_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category. This function must be called before using MGD_ID functions.

Syntax

```
function DBMS_MGD_ID_UTL.REFRESH_CATEGORY (
    category_id IN VARCHAR2);
```

Parameters

Table 75–12 REFRESH_CATEGORY Function Parameters

Parameter	Description
category_id	Category ID

Usage Notes

None.

Examples

The following example refreshes the metadata information for the EPC category ID.

```
--Contents of tostring3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
    id          MGD_ID;
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    dbms_output.put_line('..Testing to_string');
    DBMS_OUTPUT.PUT_LINE('test to_string');
    id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
'scheme=GID-96');
    DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
    DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;

mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970

PL/SQL procedure successfully completed.
```

REMOVE_CATEGORY Procedure

This procedure removes a category including all the related TDT XML. This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Removes a category based on the specified category ID.

```
procedure DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
    category_id IN VARCHAR2);
```

Removes a category based on the specified category name and category version.

```
procedure DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
    category_name IN VARCHAR2,
    category_version IN VARCHAR2);
```

Parameters

Table 75–13 REMOVE_CATEGORY Procedure Parameters

Parameter	Description
category_id	Category ID
category_name	Name of category
category_version	Category version

Usage Notes

If the value of `category_version` is NULL, all versions for the specified category will be removed.

Examples

See the [ADD_SCHEME Procedure](#) for an example of removing a category.

REMOVE_PROXY Procedure

This procedure unsets the host and port of the proxy server.

Syntax

```
procedure DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

Parameters

None.

Usage Notes

None.

Examples

See the [REFRESH_CATEGORY Function](#) for an example.

REMOVE_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

Syntax

```
procedure DBMS_MGD_ID_UTL.REMOVE_SCHEME (  
    category_id IN VARCHAR2,  
    scheme_name IN VARCHAR2);
```

Parameters

Table 75–14 REMOVE_SCHEME Procedure Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

None.

Examples

See the [ADD_SCHEME Procedure](#) for an example of removing a scheme.

SET_JAVA_LOGGING_LEVEL Procedure

This procedure sets the Java trace logging level.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (
    logginglevel IN INTEGER);
```

Parameters

Table 75–15 SET_JAVA_LOGGING_LEVEL Procedure Parameters

Parameter	Description
logginglevel	Logging level. The Java logging level can be one of the following values in descending order: <ul style="list-style-type: none"> ▪ LOGGING_LEVEL_OFF CONSTANT INTEGER := 0 ▪ LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1 ▪ LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2 ▪ LOGGING_LEVEL_INFO CONSTANT INTEGER := 3 ▪ LOGGING_LEVEL_FINE CONSTANT INTEGER := 4 ▪ LOGGING_LEVEL_FINER CONSTANT INTEGER := 5 ▪ LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6 ▪ LOGGING_LEVEL_ALL CONSTANT INTEGER := 7

Usage Notes

None.

Examples

See the [GET_JAVA_LOGGING_LEVEL Function](#) for an example.

SET_PLSQL_LOGGING_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (
    level IN INTEGER);
PRAGMA restrict_references(set_plsql_logging_level, WNDS);
```

Parameters

Table 75–16 SET_PLSQL_LOGGING_LEVEL Procedure Parameters

Parameter	Description
level	Logging level. The PL/SQL logging level can be one of the following values in descending order: <ul style="list-style-type: none"> ▪ LOGGING_LEVEL_OFF CONSTANT INTEGER := 0 ▪ LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1 ▪ LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2 ▪ LOGGING_LEVEL_INFO CONSTANT INTEGER := 3 ▪ LOGGING_LEVEL_FINE CONSTANT INTEGER := 4 ▪ LOGGING_LEVEL_FINER CONSTANT INTEGER := 5 ▪ LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6 ▪ LOGGING_LEVEL_ALL CONSTANT INTEGER := 7

Usage Notes

None.

Examples

See the [GET_PLSQL_LOGGING_LEVEL Function](#) for an example.

SET_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access. This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

This procedure does not need to be called, if you are only using schemes that do not contain any rules requiring Internet access.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_PROXY (  
    proxt_host IN VARCHAR2,  
    proxy_port IN VARCHAR2);
```

Parameters

Table 75–17 SET_PROXY Procedure Parameters

Parameter	Description
proxy_host	Name of host
proxy_port	Host port number

Usage Notes

None.

Examples

See the [REFRESH_CATEGORY Function](#) for an example.

VALIDATE_SCHEME Function

This function validates the input tag data translation XML against the Oracle tag data translation schema.

Syntax

```
function DBMS_MGD_ID_UTL.VALIDATE_SCHEME (  
        xml_scheme IN CLOB)  
RETURN VARCHAR2;
```

Parameters

Table 75–18 VALIDATE_SCHEME Function Parameters

Parameter	Description
xml_scheme	Scheme to be validated.

Usage Notes

The return value contains the components names for the specified scheme.

Examples

See the [ADD_SCHEME Procedure](#) or the [EPC_TO_ORACLE_SCHEME Function](#) for an example.

DBMS_MGWADM

DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note: You must run the `catmgw.sql` script to load the Messaging Gateway packages and types into the database.

See Also: *Oracle Streams Advanced Queuing User's Guide* contains information on loading database objects and using DBMS_MGWADM

This chapter contains the following topics:

- [Using DBMS_MGWADM](#)
 - Constants
 - Deprecated Subprograms
- [Data Structures](#)
- [Summary of DBMS_MGWADM Subprograms](#)

Using DBMS_MGWADM

- [Deprecated Subprograms](#)
- [Constants](#)

Deprecated Subprograms

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1 having been superseded by improved technology:

- [ADD_SUBSCRIBER Procedure](#) - use instead [CREATE_JOB Procedure](#)
- [ALTER_PROPAGATION_SCHEDULE Procedure](#) - use instead [ALTER_JOB Procedure](#)
- [ALTER_SUBSCRIBER Procedure](#) - use instead [ALTER_JOB Procedure](#)
- [DB_CONNECT_INFO Procedure](#) - use instead [ALTER_AGENT Procedures](#)
- [DISABLE_PROPAGATION_SCHEDULE Procedure](#) - use instead [DISABLE_JOB Procedure](#)
- [ENABLE_PROPAGATION_SCHEDULE Procedure](#) - use instead [ENABLE_JOB Procedure](#)
- [REMOVE_SUBSCRIBER Procedure](#) - use instead [REMOVE_JOB Procedure](#)
- [RESET_SUBSCRIBER Procedure](#) - use instead [RESET_JOB Procedure](#)
- [SCHEDULE_PROPAGATION Procedure](#) - use instead [CREATE_JOB Procedure](#)
- [UNSCHEDULE_PROPAGATION Procedure](#) - use instead [REMOVE_JOB Procedure](#)

Constants

- [DBMS_MGWADM Constants—Cleanup Actions](#) on page 76-4
- [DBMS_MGWADM Constants—Force Values](#) on page 76-4
- [DBMS_MGWADM Constants—Logging Levels](#) on page 76-4
- [DBMS_MGWADM Constants—Named Property Constants](#) on page 76-5
- [DBMS_MGWADM Constants—Other Constants](#) on page 76-5
- [DBMS_MGWADM Constants—Propagation Types](#) on page 76-6
- [DBMS_MGWADM Constants—Queue Domain Types](#) on page 76-6
- [DBMS_MGWADM Constants—Shutdown Modes](#) on page 76-6
- [DBMS_MGWADM Constants—WebSphere MQ Interface Types](#) on page 76-6
- [DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures](#) on page 76-6
- [DBMS_MGWADM Constants—connstype Argument of CREATE_AGENT and ALTER_AGENT Procedures](#) on page 76-6

Table 76-1 DBMS_MGWADM Constants—Cleanup Actions

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_REC	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

Table 76-2 DBMS_MGWADM Constants—Force Values

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

Table 76-3 DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file

Table 76-3 (Cont.) DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

Table 76-4 DBMS_MGWADM Constants—Named Property Constants

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP\$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP\$_REMOVE_ALL) for the reserved property name used to remove all properties

Table 76-5 DBMS_MGWADM Constants—Other Constants

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.
DEFAULT_AGENT	CONSTANT VARCHAR2	Name of the Messaging Gateway default agent

Table 76-6 DBMS_MGWADM Constants—Propagation Types

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Streams AQ propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Streams AQ queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Streams AQ to non-Oracle propagation. The propagation source is a local Oracle Streams AQ queue and the destination is a queue in a foreign (non-Oracle) messaging system.

Table 76-7 DBMS_MGWADM Constants—Queue Domain Types

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

Table 76-8 DBMS_MGWADM Constants—Shutdown Modes

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

Table 76-9 DBMS_MGWADM Constants—WebSphere MQ Interface Types

Name	Type	Description
MQSERIES_BASE_JAVA_INTERFACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

Table 76-10 DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures

Name	Type	Description
AGENT_JAVA_PROP	CONSTANT PLS_INTEGER	Used for an agent option used to set a Java System property
MSGLINK_OPTION	CONSTANT PLS_INTEGER	Used for a messaging system link option
JOB_OPTION	CONSTANT PLS_INTEGER	Used for a propagation job option

Table 76-11 DBMS_MGWADM Constants—conntype Argument of CREATE_AGENT and ALTER_AGENT Procedures

Name	Type	Description
JDBC_OCI	CONSTANT VARCHAR2	Used to specify the JDBC OCI driver
JDBC_THIN	CONSTANT VARCHAR2	Used to specify the JDBC Thin driver

Data Structures

The DBMS_MGWADM package defines the following OBJECT types.

Object Types

- [SYS.MGW_MQSERIES_PROPERTIES](#) Object Type
- [SYS.MGW_PROPERTIES](#) Object Type
- [SYS.MGW_PROPERTY](#) Object Type
- [SYS.MGW_TIBRV_PROPERTIES](#) Object Type

SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```

TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
    queue_manager      VARCHAR2(64),
    hostname           VARCHAR2(64),
    port               INTEGER,
    channel            VARCHAR2(64),
    interface_type     INTEGER,
    max_connections    INTEGER,
    username           VARCHAR2(64),
    password           VARCHAR2(64),
    inbound_log_queue  VARCHAR2(64),
    outbound_log_queue VARCHAR2(64),

    -- Methods
    STATIC FUNCTION construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES,

    STATIC FUNCTION alter_construct
    RETURN SYS.MGW_MQSERIES_PROPERTIES );

```

Attributes

Table 76–12 SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not NULL.
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.
interface_type	The type of messaging interface to use. Values: <ul style="list-style-type: none"> ■ DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used. ■ DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner. ■ DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues ■ DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system

Table 76–12 (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source:</p> <ul style="list-style-type: none"> ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.
outbound_log_queue	<p>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:</p> <ul style="list-style-type: none"> ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.

Methods

Table 76–13 SYS.MGW_MQSERIES_PROPERTIES Methods

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types are assigned a value of NULL.

SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes

Table 76–14 SYS.MGW_PROPERTIES Attributes

Attribute	Description
name	Property name
value	Property value

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the MGWPROP\$_ prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

```
MGW_PROPERTY.NAME = property_name
MGW_PROPERTY.VALUE = property_value
```

If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
MGW_PROPERTY.VALUE = name_of_property_to_remove
```

No action is taken if the property name does not exist in the original list.

- Remove all properties

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
MGW_PROPERTY.VALUE = not used
```

See Also: "The DBMS_MGWADM package defines constants to represent the reserved property names on [Table 76-4](#), "DBMS_MGWADM Constants—Named Property Constants"

SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
    name VARCHAR2(500),
    value VARCHAR2(4000),

    -- Methods
    STATIC FUNCTION construct    --- (1)
    RETURN SYS.MGW_PROPERTY,

    STATIC FUNCTION construct(  --- (2)
        p_name  IN VARCHAR2,
        p_value IN VARCHAR2)
    RETURN SYS.MGW_PROPERTY );
```

Attributes

Table 76–15 SYS.MGW_PROPERTY Attributes

Attribute	Description
name	Property name
value	Property value

Methods

Table 76–16 SYS.MGW_PROPERTY Methods

Method	Description
construct --- (1)	Constructs a new MGW_PROPERTY instance. All attributes are assigned a value of NULL
construct --- (2)	Constructs a new MGW_PROPERTY instance initialized using the given parameters

SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

Syntax

```
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
  service   VARCHAR2(128),
  daemon    VARCHAR2(128),
  network   VARCHAR2(256),
  cm_name   VARCHAR2(256),
  cm_ledger VARCHAR2(256),

  -- Methods
  STATIC FUNCTION construct
  RETURN SYS.MGW_TIBRV_PROPERTIES,

  STATIC FUNCTION alter_construct
  RETURN SYS.MGW_TIBRV_PROPERTIES );
```

Attributes

Table 76–17 *SYS.MGW_TIBRV_PROPERTIES Attributes*

Attribute	Description
<code>service</code>	The service parameter for the rvd transport
<code>daemon</code>	The daemon parameter for the rvd transport
<code>network</code>	The network parameter for the rvd transport
<code>cm_name</code>	The CM correspondent name. Reserved for future use.
<code>cm_ledger</code>	The CM ledger file name. Reserved for future use.

Methods

Table 76–18 *SYS.MGW_TIBRV_PROPERTIES Methods*

Method	Description
<code>construct</code>	Constructs a new <code>SYS.MGW_TIBRV_PROPERTIES</code> instance. All attributes will be assigned a value of <code>NULL</code> .
<code>alter_construct</code>	Constructs a new <code>SYS.MGW_TIBRV_PROPERTIES</code> instance. This function is useful for altering the properties of an existing messaging link. All attributes having a <code>VARCHAR2</code> data type will be assigned a value of <code>DBMS_MGWADM.NO_CHANGE</code> . Attributes of other data types will be assigned a value of <code>NULL</code> .

Summary of DBMS_MGWADM Subprograms

Table 76–19 DBMS_MGWADM Package Subprograms

Subprogram	Description
ADD_SUBSCRIBER Procedure on page 76-16	Adds a subscriber used to consume messages from a source queue for propagation to a destination
ALTER_AGENT Procedures on page 76-20	Alters Messaging Gateway agent parameters
ALTER_JOB Procedure on page 76-22	Alters the properties of a propagation job
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 76-24	Alters the properties of a TIB/Rendezvous messaging system link
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 76-25	Alters the properties of a WebSphere MQ messaging system link
ALTER_PROPAGATION_SCHEDULE Procedure on page 76-26	Alters a propagation schedule
ALTER_SUBSCRIBER Procedure on page 76-27	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
CLEANUP_GATEWAY Procedures on page 76-29	Cleans up Messaging Gateway
CREATE_AGENT Procedure on page 76-32	Creates a Messaging Gateway agent that will be used to process propagation jobs
CREATE_JOB Procedure on page 76-34	Creates a job used to propagate message from a source to a destination
CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous on page 76-38	Creates a messaging system link to a TIB/Rendezvous messaging system
CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ on page 76-39	Creates a messaging system link to a WebSphere MQ messaging system
DB_CONNECT_INFO Procedure on page 76-40	Configures connection information used by the Messaging Gateway agent for connections to Oracle Database
DISABLE_JOB Procedure on page 76-41	Disables a propagation job
DISABLE_PROPAGATION_SCHEDULE Procedure on page 76-42	Disables a propagation schedule
ENABLE_JOB Procedure on page 76-43	Enables a propagation job
ENABLE_PROPAGATION_SCHEDULE Procedure on page 76-44	Enables a propagation schedule
REGISTER_FOREIGN_QUEUE Procedure on page 76-45	Registers a non-Oracle queue entity in Messaging Gateway

Table 76–19 (Cont.) DBMS_MGWADM Package Subprograms

Subprogram	Description
REMOVE_AGENT Procedure on page 76-46	Removes a Messaging Gateway agent
REMOVE_JOB Procedure on page 76-47	Removes a propagation job
REMOVE_MSGSYSTEM_LINK Procedure on page 76-48	Removes a messaging system link for a non-Oracle messaging system
REMOVE_OPTION Procedure on page 76-49	Removes a Messaging Gateway configuration option
REMOVE_SUBSCRIBER Procedure on page 76-51	Removes a subscriber used to consume messages from a source queue for propagation to a destination
RESET_JOB Procedure on page 76-52	Resets the propagation error state for a propagation job
RESET_SUBSCRIBER Procedure on page 76-53	Resets the propagation error state for a subscriber
SCHEDULE_PROPAGATION Procedure on page 76-54	Schedules message propagation from a source to a destination
SET_LOG_LEVEL Procedures on page 76-56	Dynamically alters the Messaging Gateway agent logging level
SET_OPTION Procedure on page 76-57	Sets a Messaging Gateway configuration option
SHUTDOWN Procedures on page 76-59	Shuts down the Messaging Gateway agent
STARTUP Procedures on page 76-60	Starts the Messaging Gateway agent
UNREGISTER_FOREIGN_QUEUE Procedure on page 76-61	Removes a non-Oracle queue entity in Messaging Gateway
UNSCHEDULE_PROPAGATION Procedure on page 76-62	Removes a propagation schedule

ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Note: This subprogram has been deprecated as a result of improved technology (see [CREATE_JOB Procedure](#) on page 76-34), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
  subscriber_id      IN VARCHAR2,
  propagation_type  IN BINARY_INTEGER,
  queue_name        IN VARCHAR2,
  destination       IN VARCHAR2,
  rule              IN VARCHAR2 DEFAULT NULL,
  transformation     IN VARCHAR2 DEFAULT NULL,
  exception_queue   IN VARCHAR2 DEFAULT NULL,
  options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

Table 76–20 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. <code>DBMS_MGWADM.OUTBOUND_PROPAGATION</code> is for Oracle Streams AQ to non-Oracle propagation. <code>DBMS_MGWADM.INBOUND_PROPAGATION</code> is for non-Oracle to Oracle Streams AQ propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is <code>NULL</code> if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for <code>propagation_type</code> .
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code> . If <code>NULL</code> , then the Oracle Streams AQ payload type must be supported by Messaging Gateway.

Table 76–20 (Cont.) ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.

Usage Notes

See Also: "Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Streams Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

See Also: For additional information regarding subscriber options

- "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide*
- "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide*

OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- queue_name specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of schema.queue.
- destination specifies the foreign queue to which messages are propagated. This must have a syntax of registered_queue@message_link.
- rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used.
- transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a

known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

ALTER_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

Syntax

```
DBMS_MGWADM.ALTER_AGENT (
    max_connections IN BINARY_INTEGER DEFAULT NULL,
    max_memory      IN BINARY_INTEGER DEFAULT NULL,
    max_threads     IN BINARY_INTEGER DEFAULT NULL,
    service         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

```
DBMS_MGWADM.ALTER_AGENT (
    agent_name      IN VARCHAR2,
    username        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    password        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    database        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    conntype        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    max_memory      IN PLS_INTEGER DEFAULT NULL,
    max_threads     IN PLS_INTEGER DEFAULT NULL,
    service         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    initfile        IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
    comment         IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 76–21 ALTER_AGENT Procedure Parameters

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged. Caution: This parameter has been deprecated.
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In a RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.
username	Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified.

Table 76–21 (Cont.) ALTER_AGENT Procedure Parameters

Parameter	Description
password	Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full pathname of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
comment	Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.

Note: The `max_connections` parameter included in previous versions of this subprogram has been deprecated and is non-operational

Usage Notes

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
- Changes to the `max_memory` and `max_threads` parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
- The `service` parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is NULL, the job class will belong to an internal service that is mapped to all instances.
- The `max_connections` parameter is being deprecated as of the Oracle RDBMS 11g release. The number of messaging connections used by the Messaging Gateway Agent is based on the value of the `max_threads` parameter.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role `MGW_AGENT_ROLE`.

ALTER_JOB Procedure

This procedure alters the properties of a propagation job.

Syntax

```
DBMS_MGWADM.ALTER_JOB (
  job_name          IN   VARCHAR2,
  rule              IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation    IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue   IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  poll_interval     IN   PLS_INTEGER DEFAULT 0,
  options          IN   SYS.MGW_PROPERTIES DEFAULT NULL,
  comments         IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 76–22 ALTER_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job
rule	Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL, 0, or value > 0: <ul style="list-style-type: none"> ■ If zero (default), the current value will not be changed. ■ If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.

Table 76–22 (Cont.) ALTER_JOB Procedure Parameters

Parameter	Description
options	Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options.
comments	An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed.

Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS_MGWADM.NO_CHANGE (the default value).
- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.

ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 76–23 ALTER_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed.
options	Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	A user-specified description, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value will not be changed.

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: [SYS.MGW_PROPERTIES Object Type](#) on page 76-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
  linkname IN VARCHAR2,
  properties IN SYS.MGW_MQSERIES_PROPERTIES,
  options IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

Parameters

Table 76–24 ALTER_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameters	Description
linkname	The messaging system link name
properties	Basic properties for a WebSphere MQ messaging system link. If it is NULL, then no link properties are changed.
options	Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.
comment	An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed.

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 data type, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another data type, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: [SYS.MGW_PROPERTIES Object Type](#) on page 76-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see [ALTER_JOB Procedure](#) on page 76-22), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
    schedule_id IN VARCHAR2,
    duration     IN NUMBER DEFAULT NULL,
    next_time    IN VARCHAR2 DEFAULT NULL,
    latency      IN NUMBER DEFAULT NULL);
```

Parameters

Table 76–25 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be altered
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

Note: This subprogram has been deprecated as a result of improved technology (see [ALTER_JOB Procedure](#) on page 76-22), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
  subscriber_id  IN VARCHAR2,
  rule           IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  transformation IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  exception_queue IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 76–26 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

CLEANUP_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The `MGW_GATEWAY` view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY (
  action      IN   BINARY_INTEGER,
  sarg        IN   VARCHAR2 DEFAULT NULL);
```

```
DBMS_MGWADM.CLEANUP_GATEWAY (
  agent_name  IN   VARCHAR2,
  action      IN   BINARY_INTEGER,
  sarg        IN   VARCHAR2 DEFAULT NULL );
```

Parameters

Table 76–27 CLEANUP_GATEWAY Procedure Parameters

Parameter	Description
<code>action</code>	The cleanup action to be performed. Values: <ul style="list-style-type: none"> ▪ <code>DBMS_MGWADM.CLEAN_STARTUP_STATE</code> for Messaging Gateway start up state recovery ▪ <code>DBMS_MGWADM.CLEAN_LOG_QUEUES</code> for log queue cleanup ▪ <code>DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC</code> for propagation job recovery due to missing log record ▪ <code>DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE</code> for propagation job recovery due to missing message
<code>sarg</code>	Optional argument whose meaning depends on the value specified for <code>action</code> . This should be <code>NULL</code> if it is not used for the specified action.
<code>agent_name</code>	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

Usage Notes

CLEAN_STARTUP_STATE

`sarg` is not used and must be `NULL`.

The `CLEAN_STARTUP_STATE` action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The `CLEAN_STARTUP_STATE` action may be needed when the `MGW_GATEWAY` view shows that the `AGENT_STATUS` value is something other than `NOT_STARTED` or `START_SCHEDULED`, and the `AGENT_PING` value is `UNREACHABLE` for an extended period of time.

If the `AGENT_STATUS` value is `BROKEN`, then the Messaging Gateway agent cannot be started until the problem has been resolved and the `CLEAN_STARTUP_STATE` action used to reset the agent status. A `BROKEN` status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to `NOT_STARTED`.

Execution of this command fails if:

- The agent status is `NOT_STARTED` or `START_SCHEDULED`.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is `STARTING`.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

Note: Terminate any Messaging Gateway agent process that may still be running after a `CLEAN_STARTUP_STATE` action has been successfully performed. This should be done before calling `DBMS_MGWADM.STARTUP` to start Messaging Gateway. The process is usually named `extprocmgwextproc`.

CLEAN_LOG_QUEUES

`sarg` is not used and must be `NULL`.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

Note: The `CLEAN_LOG_QUEUES` action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

Caution: If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.

CREATE_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

Syntax

```
DBMS_MGWADM.CREATE_AGENT (
  agent_name      IN   VARCHAR2,
  username        IN   VARCHAR2 DEFAULT NULL,
  password        IN   VARCHAR2 DEFAULT NULL,
  database        IN   VARCHAR2 DEFAULT NULL,
  conntype        IN   VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
  max_memory      IN   PLS_INTEGER DEFAULT 64,
  max_threads     IN   PLS_INTEGER DEFAULT 1,
  service         IN   VARCHAR2 DEFAULT NULL,
  initfile        IN   VARCHAR2 DEFAULT NULL,
  comment         IN   VARCHAR2  DEFAULT NULL );
```

Parameters

Table 76–28 CREATE_AGENT Procedure Parameters

Parameter	Description
agent_name	A name used to identify the agent
username	Specifies the username used for connections to the Oracle Database
password	Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strongly recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database. Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN
max_memory	Specifies the maximum heap size, in MB, used by the Messaging Gateway agent
max_threads	Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In a RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance.
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full pathname of the file.
comment	An optional comment for this agent. NULL if one is not desired.

Usage Notes

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

CREATE_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

Syntax

```
DBMS_MGWADM.CREATE_JOB (
  job_name          IN  VARCHAR2,
  propagation_type  IN  PLS_INTEGER,
  source            IN  VARCHAR2,
  destination       IN  VARCHAR2,
  rule              IN  VARCHAR2 DEFAULT NULL,
  transformation     IN  VARCHAR2 DEFAULT NULL,
  exception_queue   IN  VARCHAR2 DEFAULT NULL,
  poll_interval     IN  PLS_INTEGER DEFAULT NULL,
  options           IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  enabled           IN  BOOLEAN DEFAULT TRUE,
  comments          IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–29 CREATE_JOB Procedure Parameters

Parameter	Description
job_name	A user defined name to identify the propagation job
propagation_type	Specifies the type of message propagation. <ul style="list-style-type: none"> DBMS_MGWADM.OUTBOUND_PROPAGATION for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used to dequeue messages from the source queue. This should be NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If no transformation is specified the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.

Table 76–29 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
<code>poll_interval</code>	<p>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available.</p> <p>Values: NULL or value > 0. If NULL, then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.</p>
<code>options</code>	Optional job properties, NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.
<code>enabled</code>	<p>Specifies whether this propagation job is enabled after creation. Values: TRUE, FALSE.</p> <ul style="list-style-type: none"> ■ If TRUE (default), the job will be enabled after it is created. ■ If FALSE, the job will be disabled after it is created. A propagation job must be enabled and the Messaging Gateway agent running before messages can be propagated.
<code>comments</code>	An optional comment for this job. NULL if one is not desired.

Usage Notes

- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

OUTBOUND_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of `schema.queue`. This can be either a multiple consumer queue or a single consumer queue.
- `destination` specifies the non-Oracle queue to which messages are propagated. This must have syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used. This parameter must be NULL if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (`schema.name`) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be `schema.queue`.

If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form `sys.aq$_agent('MGW_job_name', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_job_name`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following conditions:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source queue and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE`. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type `DBMS_AQADM.EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Jobs

The parameters for an inbound propagation job are interpreted as follows:

- `source` specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified

Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not

running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT NULL );
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
  linkname      IN  VARCHAR2,
  agent_name    IN  VARCHAR2,
  properties    IN  SYS.MGW_TIBRV_PROPERTIES,
  options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN  VARCHAR2 DEFAULT NULL );
```

Parameters

Table 76–30 CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameter	Description
linkname	A user-defined name to identify this messaging system link
properties	Basic properties of a TIB/Rendezvous messaging system link.
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system
comment	A user-specified description. NULL if one is not desired.
agent_name	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname      IN VARCHAR2,
  properties    IN SYS.MGW_MQSERIES_PROPERTIES,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT NULL);
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
  linkname      IN VARCHAR2,
  agent_name    IN VARCHAR2,
  properties    IN SYS.MGW_MQSERIES_PROPERTIES,
  options       IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–31 CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameter	Description
linkname	A user-defined name to identify the messaging system link
properties	Basic properties of a WebSphere MQ messaging system link
options	Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.
comment	A user-specified description. NULL if one is not desired
agent_name	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

DB_CONNECT_INFO Procedure

This procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

Note: This subprogram has been deprecated as a result of improved technology (see [ALTER_AGENT Procedures](#) on page 76-20), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
  username      IN VARCHAR2,
  password      IN VARCHAR2,
  database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–32 DB_CONNECT_INFO Procedure Parameters

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from <code>tnsnames.ora</code> .

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role `MGW_AGENT_ROLE`, and then call this procedure to configure Messaging Gateway. Role `MGW_AGENT_ROLE` is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.

DISABLE_JOB Procedure

This procedure disables a propagation job.

Syntax

```
DBMS_MGWADM.DISABLE_JOB (  
    job_name IN VARCHAR2);
```

Parameters

Table 76–33 *DISABLE_JOB Procedure Parameters*

Parameter	Description
job_name	Identifies the propagation job

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see [DISABLE_JOB Procedure](#) on page 76-41), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2);
```

Parameters

Table 76–34 *DISABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

ENABLE_JOB Procedure

This procedure enables a propagation job.

Syntax

```
DBMS_MGWADM.ENABLE_JOB (  
    job_name IN VARCHAR2 );
```

Parameters

Table 76–35 *ENABLE_JOB Procedure Parameters*

Parameter	Description
job_name	Identifies the propagation job

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see [ENABLE_JOB Procedure](#) on page 76-43), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2 );
```

Parameters

Table 76–36 *ENABLE_PROPAGATION_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE (
  name           IN VARCHAR2,
  linkname       IN VARCHAR2,
  provider_queue IN VARCHAR2 DEFAULT NULL,
  domain         IN INTEGER DEFAULT NULL,
  options        IN SYS.MGW_PROPERTIES DEFAULT NULL,
  comment        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 76–37 REGISTER_FOREIGN_QUEUE Procedure Parameters

Parameters	Description
name	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
linkname	The link name for the messaging system on which this queue exists
provider_queue	The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.
domain	The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model).
options	Optional queue properties
comment	A user-specified description. Can be NULL.

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

See Also: For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Streams Advanced Queuing User's Guide*.

REMOVE_AGENT Procedure

This procedure removes a Messaging Gateway agent.

Syntax

```
DBMS_MGWADM.REMOVE_AGENT (  
    agent_name IN VARCHAR2 );
```

Parameters

Table 76–38 REMOVE_AGENT Procedure Parameters

Parameters	Description
agent_name	Identifies the Messaging Gateway agent

Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.

REMOVE_JOB Procedure

This procedure removes a propagation job.

Syntax

```
DBMS_MGWADM.REMOVE_JOB (
  job_name  IN  VARCHAR2,
  force     IN  PLS_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

Parameters

Table 76–39 REMOVE_JOB Procedure Parameters

Parameters	Description
job_name	Identifies the propagation job
force	<p>Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job.</p> <p>Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE</p> <ul style="list-style-type: none"> ■ NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully ■ FORCE means the job is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(  
    linkname IN VARCHAR2);
```

Parameters

Table 76–40 REMOVE_MSGSYSTEM_LINK Procedure Parameters

Parameters	Description
linkname	The messaging system link name

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

REMOVE_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.REMOVE_OPTION (
    target_type IN PLS_INTEGER,
    target_name IN VARCHAR2,
    option_name IN VARCHAR2);
```

Parameters

Table 76–41 REMOVE_OPTION Procedure Parameters

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> ■ DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent ■ DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option ■ DBMS_MGWADM.JOB_OPTION to remove a propagation job option
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.

See Also: [Table 76–10, "DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures"](#) on page 76-6 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property
- encrypted can be either TRUE or FALSE

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS_MGWADM.ALTER_MSGSYSTEM_LINK and using the options parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

DBMS_MGWADM.JOB_OPTION Target

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the `options` parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

Note: This subprogram has been deprecated as a result of improved technology (see [REMOVE_JOB Procedure](#) on page 76-47), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (
  subscriber_id IN VARCHAR2,
  force         IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

Parameters

Table 76–42 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	<p>Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber.</p> <p>Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE</p> <ul style="list-style-type: none"> ■ NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default) ■ FORCE means the subscriber is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.

RESET_JOB Procedure

This procedure resets the propagation error state for a propagation job.

Syntax

```
DBMS_MGWADM.RESET_JOB (  
    job_name IN VARCHAR2);
```

Parameters

Table 76–43 *RESET_JOB Procedure Parameters*

Parameter	Description
job_name	Identifies the propagation job

Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The `STATUS` field of the `MGW_JOBS` view indicates the job status.

RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

Note: This subprogram has been deprecated as a result of improved technology (see [RESET_JOB Procedure](#) on page 76-52), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (  
    subscriber_id IN VARCHAR2 );
```

Parameters

Table 76–44 *RESET_SUBSCRIBER Procedure Parameters*

Parameter	Description
subscriber_id	Identifies the subscriber

SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

Note: This subprogram has been deprecated as a result of improved technology (see [CREATE_JOB Procedure](#) on page 76-34), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
  schedule_id      IN VARCHAR2,
  propagation_type IN BINARY_INTEGER,
  source           IN VARCHAR2,
  destination      IN VARCHAR2,
  start_time       IN DATE DEFAULT SYSDATE,
  duration         IN NUMBER DEFAULT NULL,
  next_time        IN VARCHAR2 DEFAULT NULL,
  latency          IN NUMBER DEFAULT NULL);
```

Parameters

Table 76–45 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Specifies a user-defined name that identifies the schedule
propagation_type	Specifies the type of message propagation. DBMS_MGWADM. OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM. INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
start_time	Reserved for future use
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

SET_LOG_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
    log_level    IN    BINARY_INTEGER);
```

```
DBMS_MGWADM.SET_LOG_LEVEL (
    agent_name  IN    VARCHAR2,
    log_level   IN    BINARY_INTEGER);
```

Parameters

Table 76–46 SET_LOG_LEVEL Procedure Parameters

Parameter	Description
log_level	Level at which the Messaging Gateway agent logs information. DBMS_MGWADM.BASIC_LOGGING generates the least information while DBMS_MGWADM.TRACE_DEBUG_LOGGING generates the most information.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

See Also: [Table 76–3, "DBMS_MGWADM Constants—Logging Levels"](#) on page 76-4 for details on the log_level parameter

SET_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.SET_OPTION (
  target_type  IN  PLS_INTEGER,
  target_name  IN  VARCHAR2,
  option_name  IN  VARCHAR2,
  option_value IN  VARCHAR2,
  encrypted    IN  BOOLEAN DEFAULT FALSE );
```

Parameters

Table 76–47 SET_OPTION Procedure Parameters

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: <ul style="list-style-type: none"> ■ DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent ■ DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option ■ DBMS_MGWADM.JOB_OPTION to set a propagation job option
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.
option_value	Option value
encrypted	Indicates whether the value should be stored as encrypted: <ul style="list-style-type: none"> ■ TRUE if the value should be stored in an encrypted form ■ FALSE if the value should be stored in a cleartext form

See Also: [Table 76–10, "DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures"](#) on page 76-6 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property

- `encrypted` can be either `TRUE` or `FALSE`

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling `DBMS_MGWADM.ALTER_MSGSYSTEM_LINK` and using the options parameter to set an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

DBMS_MGWADM.JOB_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to set an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
    sdmode          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

```
DBMS_MGWADM.SHUTDOWN (
    agent_name     IN VARCHAR2);
```

Parameters

Table 76–48 SHUTDOWN Procedure Parameters

Parameter	Description
sdmode	The shutdown mode. The only value currently supported is <code>DBMS_MGWADM.SHUTDOWN_NORMAL</code> for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.
agent_name	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP (
  instance      IN  BINARY_INTEGER DEFAULT 0,
  force         IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);

DBMS_MGWADM.STARTUP (
  agent_name    IN  VARCHAR2);
```

Parameters

Table 76–49 *STARTUP Procedure Parameters*

Parameter	Description
instance	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance. Caution: This parameter has been deprecated.
force	If this is <code>DBMS_MGWADM.FORCE</code> , then any positive integer is acceptable as the job instance. If this is <code>DBMS_MGWADM.NO_FORCE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception. Caution: This parameter has been deprecated.
agent_name	Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.

Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The `force` and `instance` parameters are no longer used and will be ignored. If the `instance` affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the `DBMS_MGWADM.ALTER_AGENT` procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the `DBMS_MGWADM.CREATE_AGENT` or `DBMS_MGWADM.ALTER_AGENT` subprograms.

UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE (  
    name          IN VARCHAR2,  
    linkname     IN VARCHAR2);
```

Parameters

Table 76–50 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

Parameter	Description
name	The queue name
linkname	The link name for the messaging system on which the queue exists

Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

UNSCCHEDULE_PROPAGATION Procedure

This procedure removes a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see [REMOVE_JOB Procedure](#) on page 76-52), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (  
    schedule_id IN VARCHAR2 );
```

Parameters

Table 76–51 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

DBMS_MGWMSG

DBMS_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

See Also: [Chapter 76, "DBMS_MGWADM"](#) which describes the Messaging Gateway administrative interface, `DBMS_MGWADM`

This chapter contains the following topics:

- [Using DBMS_MGWMSG](#)
 - Security Model
 - Constants
 - Types
- [Summary of DBMS_MGWMSG Subprograms](#)

Using DBMS_MGWMSG

- [Security Model](#)
- [Constants](#)
- [Types](#)

Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by SYS.

Note: You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User's Guide* for information on loading database objects and using DBMS_MGWMSG.

Constants

Table 77–1 DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5
INTEGER_VALUE	CONSTANT BINARY_INTEGER := 6
LONG_VALUE	CONSTANT BINARY_INTEGER := 7
FLOAT_VALUE	CONSTANT BINARY_INTEGER := 8
DOUBLE_VALUE	CONSTANT BINARY_INTEGER := 9
DATE_VALUE	CONSTANT BINARY_INTEGER := 10

Table 77–2 DBMS_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value

Value	Constant
BOOLEAN_FALSE	CONSTANT BINARY_INTEGER := 0
BOOLEAN_TRUE	CONSTANT BINARY_INTEGER := 1

Table 77–3 DBMS_MGWMSG Constants: Case Comparisons

Value	Constant
CASE_SENSITIVE	CONSTANT BINARY_INTEGER := 0
CASE_INSENSITIVE	CONSTANT BINARY_INTEGER := 1

Table 77–4 Constants for the TIB/Rendezvous field type

SYS.MGW_NAME_VALUE_T Type

This type specifies a named value. The name attribute, type attribute, and one of the <>_value attributes are typically not NULL.

Syntax

```

TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
  name          VARCHAR2(250),
  type          INTEGER,
  integer_value INTEGER,
  number_value  NUMBER,
  text_value    VARCHAR2(4000),
  raw_value     RAW(2000),
  date_value    DATE,

  -- Methods
  STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_BOOLEAN (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_BYTE (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_SHORT (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_INTEGER (
    name  IN VARCHAR2,
    value IN INTEGER )
  RETURN SYS.MGW_NAME_VALUE_T,

  STATIC FUNCTION CONSTRUCT_LONG (
    name  IN VARCHAR2,

```

```

        value IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
    name   IN VARCHAR2,
    value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
    name   IN VARCHAR2,
    value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
    name   IN VARCHAR2,
    value  IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
    name   IN VARCHAR2,
    value  IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
    name   IN VARCHAR2,
    value  IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );

```

Attributes

Table 77-5 SYS.MGW_NAME_VALUE_T Attributes

Attribute	Description
name	Name associated with the value
type	Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in Table 77-1 . This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
integer_value	Stores a numeric integer value
number_value	Stores a numeric float or large integer value
text_value	Stores a text value
raw_value	Stores a RAW (bytes) value
date_value	Stores a date value

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

[Table 77-6](#) shows the mapping between the value type and the attribute used to store the value.

Table 77-6 SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.TEXT_VALUE	text_value
DBMS_MGWMSG.RAW_VALUE	raw_value
DBMS_MGWMSG.BOOLEAN_VALUE	integer_value

Table 77-6 (Cont.) SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_TYPE Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in [Table 77-6](#).

Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
    name    IN VARCHAR2,
    value   IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

SYS.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_value attributes should be set.

Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
    small_value VARCHAR2(4000),
```

```

    large_value CLOB,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);

```

Attributes

Table 77-7 SYS.MGW_TEXT_VALUE_T Attributes

Attribute	Description
small_value	Small TEXT value. Used for values <= 4000.
large_value	Large TEXT value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new `SYS.MGW_TEXT_VALUE_T` instance. All attributes are assigned a value of `NULL`.

Syntax

```

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;

```

SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the `<` `>`_value attributes.

Syntax

```

TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
    small_value RAW(2000),
    large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);

```

Attributes

Table 77-8 SYS.MGW_RAW_VALUE_T Attributes

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new `SYS.MGW_RAW_VALUE_T` instance. All attributes are assigned a value of `NULL`.

Syntax

```

STATIC FUNCTION CONSTRUCT

```

```
RETURN SYS.MGW_RAW_VALUE_T;
```

SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
  header      SYS.MGW_NAME_VALUE_ARRAY_T,
  text_body   SYS.MGW_TEXT_VALUE_T,
  raw_body    SYS.MGW_RAW_VALUE_T,

  --Methods
  STATIC FUNCTION CONSTRUCT
  RETURN SYS.MGW_BASIC_MSG_T);
```

Attributes

Table 77–9 SYS.MGW_BASIC_MSG_T Attributes

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

SYS.MGW_TIBRV_FIELD_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name   VARCHAR2(256),
  field_id     INTEGER,
  field_type   INTEGER,
  number_value NUMBER,
  number_array_value SYS.MGW_NUMBER_ARRAY_T,
```

```

text_value      VARCHAR2 (4000) ,
raw_value       RAW(2000) ,
date_value      DATE,
clob_value      CLOB,
blob_value      BLOB);

```

Attributes

Table 77-10 SYS.MGW_TIBRV_FIELD_T Attributes

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Table 77-11 describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

Table 77-11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value

Table 77–11 (Cont.) SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

SYS.MGW_TIBRV_MSG_T Type

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```

TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
    send_subject    VARCHAR2(256),
    reply_subject   VARCHAR2(256),
    cm_time_limit   NUMBER,
    cm_sender_name  VARCHAR2(256),
    cm_sequence_num NUMBER,
    fields          SYS.MGW_TIBRV_IFIELDS_T,
    clob_data1      CLOB,
    clob_data2      CLOB,
    clob_data3      CLOB,
    blob_data1      BLOB,
    blob_data2      BLOB,
    blob_data3      BLOB,

    STATIC FUNCTION construct
