Constructs a new `SYS.MGW_TIBRV_MSG_T` instance. All attributes are set to `NULL`.

Syntax

```

STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;

```

ADD_<> Procedures

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> (
    name IN VARCHAR2,
    id   IN INTEGER,
    value IN datatype );
```

Parameters

Table 77–13 *SYS.MGW_TIBRV_MSG_T ADD_<> Method Parameters*

Parameter	Description
name	Field name
id	Field identifier
value	Field data

Table 77–14 shows, for each add method, the field type that will be assigned and valid values for the field data.

Table 77–14 *MGW_TIBRV_MSG_T Add Method Field Types*

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a
add_f64	TIBRVMSG_F64	n/a
add_i8	TIBRVMSG_I8	Valid range: -128...127
add_i16	TIBRVMSG_I16	Valid range: -32768...32767
add_i32	TIBRVMSG_I32	Valid range: -2147483648...2147483647
add_i64	TIBRVMSG_I64	n/a
add_ipaddr32	TIBRVMSG_IPADDR32	n/a
add_ipport16	TIBRVMSG_IPPORT16	n/a
add_datetime	TIBRVMSG_DATETIME	n/a
add_f32array	TIBRVMSG_F32ARRAY	n/a
add_f64array	TIBRVMSG_F64ARRAY	n/a
add_i8array	TIBRVMSG_I8ARRAY	Valid range: -128...127
add_i16array	TIBRVMSG_I16ARRAY	Valid range: -32768...32767
add_i32array	TIBRVMSG_I32ARRAY	Valid range: -2147483648...2147483647
add_i64array	TIBRVMSG_I64ARRAY	n/a
add_opaque	TIBRVMSG_OPAQUE	Value stored as RAW if size < 2000; otherwise value stored in BLOB
add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

Table 77-14 (Cont.) MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

SET_<> Methods

Accessor methods to set an instance attribute to a specific value.

Syntax

```
MEMBER PROCEDURE SET_<> (
    value IN datatype );
```

Parameters**Table 77-15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters**

Parameter	Description
value	Value to be assigned

GET_<> Methods

Accessor methods to retrieve the value for an instance attribute.

Syntax

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Procedure

Gets the number of message fields.

Syntax

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Procedure

Retrieves field information for the field having a given field collection index. This method should only be called if the GET_FIELD_COUNT Procedure returns a

nonzero value and `idx` must specify a valid collection index; that is, $1 \leq idx \leq get_field_count()$.

Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 77–16 *SYS.MGW_TIBRV_MSG_T GET_FIELD Procedure Parameters*

Parameter	Description
<code>idx</code>	Specifies the 1-based field collection index of the field to retrieve

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Procedure

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

```
MEMBER PROCEDURE get_field_by_name (
    name IN  VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 77–17 *SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Procedure Parameters*

Parameter	Description
<code>name</code>	Specifies the field name to search for. This can be <code>NULL</code> to find the first field that does not have a field name.

Return Values

Returns the field information, or `NULL` if no match was found.

GET_FIELD_BY_ID Procedure

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or `NULL`, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

```
MEMBER PROCEDURE get_field_by_id (
    id    IN    INTEGER )
```

```
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 77-18 *SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Procedure Parameters*

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Procedure

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

```
MEMBER PROCEDURE find_field_name (
    name      IN VARCHAR2,
    start_idx IN INTEGER )
RETURN INTEGER;
```

Parameters

Table 77-19 *SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Procedure Parameters*

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Procedure

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

```
MEMBER PROCEDURE find_field_id (
    id      IN INTEGER,
    start_idx IN INTEGER )
RETURN INTEGER;
```

Parameters

Table 77–20 *SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Procedure Parameters*

Parameter	Description
<code>id</code>	Specifies the field identifier to search for. This can be zero (0) or <code>NULL</code> to find a field that does not have an identifier.
<code>start_idx</code>	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

Summary of DBMS_MGWMSG Subprograms

Table 77–21 DBMS_MGWMSG Package Subprograms

Subprogram	Description
LCR_TO_XML Function on page 77-22	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD) to a SYS.XMLTYPE object
NVARRAY_ADD Procedure on page 77-23	Appends a name-value element to the end of a name-value array
NVARRAY_FIND_NAME Function on page 77-24	Searches a name-value array for the element with the name you specify in p_name
NVARRAY_FIND_NAME_TYPE Function on page 77-25	Searches a name-value array for an element with the name and value type you specify
NVARRAY_GET Function on page 77-26	Gets the name-value element of the name you specify in p_name from a name-value array
NVARRAY_GET_BOOLEAN Function on page 77-27	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
NVARRAY_GET_BYTE Function on page 77-28	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
NVARRAY_GET_DATE Function on page 77-29	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type
NVARRAY_GET_DOUBLE Function on page 77-30	Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type
NVARRAY_GET_FLOAT Function on page 77-31	Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type
NVARRAY_GET_INTEGER Function on page 77-32	Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type
NVARRAY_GET_LONG Function on page 77-33	Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type
NVARRAY_GET_RAW Function on page 77-34	Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type
NVARRAY_GET_SHORT Function on page 77-35	Gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type
NVARRAY_GET_TEXT Function on page 77-36	Gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type
XML_TO_LCR Function on page 77-37	Converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR\$_ROW_RECORD) or a DDL LCR (LCR\$_DDL_RECORD)

LCR_TO_XML Function

This function converts a `SYS.ANYDATA` object encapsulating a row LCR (Logical Change Record, in this case a `LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`) to a `SYS.XMLTYPE` object.

See Also: [XML_TO_LCR Function](#) on page 77-37

Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
    p_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

Parameters

Table 77-22 LCR_TO_XML Function Parameters

Parameter	Description
<code>p_anydata</code>	An <code>ANYDATA</code> object to be converted

Return Values

Returns a `SYS.XMLTYPE` object.

Usage Notes

An exception is raised if the encapsulated type `p_anydata` is not an LCR.

NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (  
    p_array IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_value IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

Table 77–23 NVARRAY_ADD Procedure Parameters

Parameter	Description
p_array	On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.
p_value	The value to add. If NULL, then p_array is not changed.

NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 77-24 NVARRAY_FIND_NAME Function Parameters

Parameters	Description
<code>p_array</code>	The name-value array to search
<code>p_name</code>	The name to find
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.

NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_type     IN BINARY_INTEGER
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 77-25 NVARRAY_FIND_NAME_TYPE Function Parameters

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in Table 77-1 on page 77-4.
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

NVARRAY_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 77-26 NVARRAY_GET Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the matching element, or `NULL` if the specified name is not found.

NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `BOOLEAN_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
  p_array      IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name       IN VARCHAR2,
  p_compare    IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77-27 NVARRAY_GET_BOOLEAN Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `BYTE_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (  
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name     IN VARCHAR2,  
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN INTEGER;
```

Parameters

Table 77-28 NVARRAY_GET_BYTE Function

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DATE_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

Parameters

Table 77-29 NVARRAY_GET_DATE Function Parameters

Parameters	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DOUBLE_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 77-30 NVARRAY_GET_DOUBLE Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `FLOAT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 77-31 NVARRAY_GET_FLOAT Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_INTEGER Function

This function gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77-32 NVARRAY_GET_INTEGER Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `LONG_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 77-33 NVARRAY_GET_LONG Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `RAW_VALUE` value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 77-34 NVARRAY_GET_RAW Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `SHORT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 77-35 NVARRAY_GET_SHORT Function Parameters

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `TEXT_VALUE` value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (
  p_array   IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name    IN VARCHAR2,
  p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;
```

Parameters

Table 77-36 *NVARRAY_GET_TEXT Function Parameters*

Parameter	Description
<code>p_array</code>	The name-value array
<code>p_name</code>	The value name
<code>p_compare</code>	Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code> .

Return Values

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

XML_TO_LCR Function

This function converts a `SYS.XMLTYPE` object to a `SYS.ANYDATA` object encapsulating a row LCR (`LCR$_ROW_RECORD`) or a DDL LCR (`LCR$_DDL_RECORD`).

See Also: [LCR_TO_XML Function](#) on page 77-22

Syntax

```
DBMS_MGWMSG.XML_TO_LCR (  
    p_xmldata IN SYS.XMLTYPE )  
    RETURN SYS.ANYDATA;
```

Parameters

Table 77-37 XML_TO_LCR Function Parameters

Parameter	Description
<code>p_xmldata</code>	An <code>XMLTYPE</code> object representing an LCR

Return Values

Returns a `SYS.ANYDATA` object.

Usage Notes

An exception is raised if `p_xmldata` cannot be converted to an LCR.

The DBMS_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- [Summary of DBMS_MONITOR Subprograms](#)

Summary of DBMS_MONITOR Subprograms

Table 78–1 DBMS_MONITOR Package Subprograms

Subprogram	Description
CLIENT_ID_STAT_DISABLE Procedure on page 78-3	Disables statistic gathering previously enabled for a given Client Identifier
CLIENT_ID_STAT_ENABLE Procedure on page 78-4	Enables statistic gathering for a given Client Identifier
CLIENT_ID_TRACE_DISABLE Procedure on page 78-5	Disables the trace previously enabled for a given Client Identifier globally for the database
CLIENT_ID_TRACE_ENABLE Procedure on page 78-6	Enables the trace for a given Client Identifier globally for the database
DATABASE_TRACE_DISABLE Procedure on page 78-7	Disables SQL trace for the whole database or a specific instance
DATABASE_TRACE_ENABLE Procedure on page 78-8	Enables SQL trace for the whole database or a specific instance
SERV_MOD_ACT_STAT_DISABLE Procedure on page 78-9	Disables statistic gathering enabled for a given combination of Service Name, MODULE and ACTION
SERV_MOD_ACT_STAT_ENABLE Procedure on page 78-10	Enables statistic gathering for a given combination of Service Name, MODULE and ACTION
SERV_MOD_ACT_TRACE_DISABLE Procedure on page 78-12	Disables the trace for ALL enabled instances for a or a given combination of Service Name, MODULE and ACTION name globally
SERV_MOD_ACT_TRACE_ENABLE Procedure on page 78-13	Enables SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified
SESSION_TRACE_DISABLE Procedure on page 78-15	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
SESSION_TRACE_ENABLE Procedure on page 78-16	Enables the trace for a given database session identifier (SID) on the local instance

CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V\$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(  
    client_id          IN  VARCHAR2);
```

Parameters

Table 78–2 CLIENT_ID_STAT_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is disabled

Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V\$CLIENT_STATS views.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(  
    client_id          IN  VARCHAR2);
```

Parameters

Table 78–3 CLIENT_ID_STAT_ENABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is enabled

Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(  
  client_id  IN  VARCHAR2);
```

Parameters

Table 78–4 CLIENT_ID_TRACE_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which SQL tracing is disabled

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(  
  client_id  IN  VARCHAR2,  
  waits     IN  BOOLEAN DEFAULT TRUE,  
  binds     IN  BOOLEAN DEFAULT FALSE,  
  plan_stat IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78-5 CLIENT_ID_TRACE_ENABLE Procedure Parameters

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,  
FALSE);
```

DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(  
    instance_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–6 DATABASE_TRACE_DISABLE Procedure Parameters

Parameter	Description
instance_name	Disables tracing for the named instance

DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(  
    waits          IN BOOLEAN DEFAULT TRUE,  
    binds          IN BOOLEAN DEFAULT FALSE,  
    instance_name  IN VARCHAR2 DEFAULT NULL,  
    plan_stat      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–7 DATABASE_TRACE_ENABLE Procedure Parameters

Parameter	Description
waits	If TRUE, wait information will be present in the trace
binds	If TRUE, bind information will be present in the trace
instance_name	If set, restricts tracing to the named instance
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V\$SERV_MOD_ACT_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
  service_name  IN VARCHAR2,
  module_name   IN VARCHAR2,
  action_name   IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 78-8 *SERV_MOD_ACT_STAT_DISABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which statistic aggregation is disabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V\$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE (
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 78–9 *SERV_MOD_ACT_STAT_ENABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for a module specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1', 'PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE  
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1', 'GLEDGER', 'DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.

SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
  service_name  IN  VARCHAR2,
  module_name   IN  VARCHAR2,
  action_name   IN  VARCHAR2 DEFAULT ALL_ACTIONS,
  instance_name IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–10 *SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
  DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
  FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
  DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1', 'PAYROLL');
```

SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
  service_name    IN VARCHAR2,
  module_name     IN VARCHAR2 DEFAULT ANY_MODULE,
  action_name     IN VARCHAR2 DEFAULT ANY_ACTION,
  waits          IN BOOLEAN DEFAULT TRUE,
  binds          IN BOOLEAN DEFAULT FALSE,
  instance_name  IN VARCHAR2 DEFAULT NULL,
  plan_stat      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–11 *SERV_MOD_ACT_TRACE_ENABLE Procedure Parameters*

Parameter	Description
service_name	Name of the service for which SQL trace is enabled
module_name	Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled for all modules and actions in a given service.
action_name	Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
instance_name	If set, this restricts tracing to the named instance_name
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.

- Specifying `NULL` for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the `MODULE` attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
        DBMS_MONITOR.ALL_MODULES, DBMS_MONITOR.ALL_ACTIONS, TRUE,
        FALSE, NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONS):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
        DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
  session_id      IN      BINARY_INTEGER DEFAULT NULL,
  serial_num      IN      BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 78–12 *SESSION_TRACE_DISABLE Procedure Parameters*

Parameter	Description
session_id	Name of the service for which SQL trace is disabled
serial_num	Serial number for this session

Usage Notes

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is no longer traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE (
  session_id  IN  BINARY_INTEGER DEFAULT NULL,
  serial_num  IN  BINARY_INTEGER DEFAULT NULL,
  waits       IN  BOOLEAN DEFAULT TRUE,
  binds       IN  BOOLEAN DEFAULT FALSE,
  plan_stat   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 78–13 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
session_id	Database Session Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.
serial_num	Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify NULL `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

DBMS_MVIEW

DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

Note: DBMS_MVIEW is a synonym for DBMS_SNAPSHOT.

Using DBMS_MVIEW

This section contains topics which relate to using the DBMS_MVIEW package.

- [Operational Notes](#)
- [Rules and Limits](#)

Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN . . END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

Rules and Limits

The `EXPLAIN_REWRITE` procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the `EXPLAIN_MVIEW` procedure.

Summary of DBMS_MVIEW Subprograms

Table 79-1 DBMS_MVIEW Package Subprograms

Subprogram	Description
BEGIN_TABLE_REORGANIZATION Procedure on page 79-6	Performs a process to preserve materialized view data needed for refresh
END_TABLE_REORGANIZATION Procedure on page 79-7	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
ESTIMATE_MVIEW_SIZE Procedure on page 79-8	Estimates the size of a materialized view that you might create, in bytes and rows
EXPLAIN_MVIEW Procedure on page 79-9	Explains what is possible with a materialized view or potential materialized view
EXPLAIN_REWRITE Procedure on page 79-10	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
I_AM_A_REFRESH Function on page 79-12	Returns the value of the I_AM_REFRESH package state
PMARKER Function on page 79-13	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
PURGE_DIRECT_LOAD_LOG Procedure on page 79-14	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
PURGE_LOG Procedure on page 79-15	Purges rows from the materialized view log
PURGE_MVIEW_FROM_LOG Procedure on page 79-16	Purges rows from the materialized view log
REFRESH Procedures on page 79-17	Refreshes one or more materialized views that are not members of the same refresh group
REFRESH_ALL_MVIEWS Procedure on page 79-19	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
REFRESH_DEPENDENT Procedures on page 79-20	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
REGISTER_MVIEW Procedure on page 79-22	Enables the administration of individual materialized views
UNREGISTER_MVIEW Procedure on page 79-24	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (  
    tabowner    IN    VARCHAR2,  
    tabname     IN    VARCHAR2);
```

Parameters

Table 79–2 *BEGIN_TABLE_REORGANIZATION Procedure Parameters*

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (  
    tabowner    IN    VARCHAR2,  
    tabname     IN    VARCHAR2);
```

Parameters

Table 79-3 *END_TABLE_REORGANIZATION Procedure Parameters*

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW. ESTIMATE_MVIEW_SIZE (  
    stmt_id      IN VARCHAR2,  
    select_clause IN VARCHAR2,  
    num_rows     OUT NUMBER,  
    num_bytes    OUT NUMBER);
```

Parameters

Table 79–4 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
stmt_id	Arbitrary string used to identify the statement in an EXPLAIN PLAN
select_clause	The SELECT statement to be analyzed
num_rows	Estimated cardinality
num_bytes	Estimated number of bytes

EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call `DBMS_MVIEW.EXPLAIN_MVIEW`, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the `SELECT` string or `CREATE MATERIALIZED VIEW` statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called `MV_CAPABILITIES_TABLE`, which is the default, or to an array called `MSG_ARRAY`.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to `MV_CAPABILITIES_TABLE`.
- The second version is for explaining an existing or potential materialized view with output to a `VARRAY`.

Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
  mv          IN VARCHAR2,
  statement_id IN VARCHAR2:= NULL);
```

```
DBMS_MVIEW.EXPLAIN_MVIEW (
  mv          IN VARCHAR2,
  msg_array   OUT SYS.ExplainMVArrayType);
```

Parameters

Table 79–5 *EXPLAIN_MVIEW Procedure Parameters*

Parameter	Description
<code>mv</code>	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a <code>SELECT</code> statement or a <code>CREATE MATERIALIZED VIEW</code> statement for a potential materialized view.
<code>statement_id</code>	A client-supplied unique identifier to associate output rows with specific invocations of <code>EXPLAIN_MVIEW</code>
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_MVIEW</code> 's output to a PL/SQL <code>VARRAY</code> rather than <code>MV_CAPABILITIES_TABLE</code> .

Usage Notes

You must run the `utlxmlv.sql` script to create `MV_CAPABILITIES_TABLE` in the current schema prior to calling `EXPLAIN_MVIEW` except when you direct output to a `VARRAY`. The script is found in the `ADMIN` directory.

EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

A demo file, `xrwutl.sql`, is available to help format the output from EXPLAIN_REWRITE.

Syntax

You can obtain the output from `DBMS_MVIEW.EXPLAIN_REWRITE` in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query          VARCHAR2,
    mv             VARCHAR2(30),
    statement_id   VARCHAR2(30));
```

You can create an output table called `REWRITE_TABLE` by executing the `utl_xrw.sql` script.

The `query` parameter is a text string representing the SQL query. The parameter, `mv`, is a fully qualified materialized view name in the form of `schema.mv`. This is an optional parameter. When it is not specified, `EXPLAIN_REWRITE` returns any relevant messages regarding all the materialized views considered for rewriting the given query. When `schema` is omitted and only `mv` is specified, `EXPLAIN_REWRITE` looks for the materialized view in the current schema.

If you want to direct the output of `EXPLAIN_REWRITE` to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query          [VARCHAR2 | CLOB],
    mv             VARCHAR2(30),
    output_array   SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, `EXPLAIN_REWRITE` can be easily invoked with the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN . . . END` block, as shown in the examples in `/rdbms/demo/smxrw*`.

You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

Parameters

Table 79–6 *EXPLAIN_REWRITE Procedure Parameters*

Parameter	Description
<code>query</code>	SQL <code>SELECT</code> statement to be explained
<code>mv</code>	The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code> . For multiple materialized views, you can provide a comma-delimited list of names.
<code>statement_id</code>	A client-supplied unique identifier to distinguish output messages
<code>msg_array</code>	The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code> 's output to a PL/SQL <code>VARRAY</code> .

Usage Notes

To obtain the output into a table, you must run the `utl_xrw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

I_AM_A_REFRESH Function

This function returns the value of the I_AM_REFRESH package state.

Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH  
RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(  
    rid IN ROWID)  
RETURN NUMBER;
```

Parameters

Table 79–7 *PMARKER Procedure Parameters*

Parameter	Description
rid	The rowid of a row entry in a master table

PURGE_DIRECT_LOAD_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

See Also: *Oracle Database Data Warehousing Guide* for more information

Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG ( ) ;
```

PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

```
DBMS_MVIEW.PURGE_LOG (
  master      IN   VARCHAR2,
  num         IN   BINARY_INTEGER := 1,
  flag        IN   VARCHAR2      := 'NOP');
```

Parameters

Table 79–8 *PURGE_LOG Procedure Parameters*

Parameter	Description
master	Name of the master table or master materialized view.
num	<p>Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 2);</pre> <p>To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 9999);</pre> <p>This statement completely purges the materialized view log that corresponds to <code>master_table</code> if fewer than 9999 materialized views are based on <code>master_table</code>. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.</p>
flag	<p>Specify <code>delete</code> to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter <code>num</code>. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:</p> <pre>DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');</pre>

PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its `mview_id` or the combination of the `mviewowner`, `mviewname`, and the `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
  mview_id      IN   BINARY_INTEGER |
  mviewowner    IN   VARCHAR2,
  mviewname     IN   VARCHAR2,
  mviewsite     IN   VARCHAR2);
```

Note: This procedure is overloaded. The `mview_id` parameter is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

Parameters

Table 79–9 PURGE_MVIEW_FROM_LOG Procedure Parameters

Parameter	Description
<code>mview_id</code>	<p>If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the <code>mview_id</code> parameter. Query the <code>DBA_BASE_TABLE_MVIEWS</code> view at the materialized view log site for a listing of materialized view IDs.</p> <p>Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (<code>DBA_REGISTERED_MVIEWS</code>).</p>
<code>mviewowner</code>	<p>If you do not specify an <code>mview_id</code>, enter the owner of the target materialized view using the <code>mviewowner</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view owners.</p>
<code>mviewname</code>	<p>If you do not specify an <code>mview_id</code>, enter the name of the target materialized view using the <code>mviewname</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view names.</p>
<code>mviewsite</code>	<p>If you do not specify an <code>mview_id</code>, enter the site of the target materialized view using the <code>mviewsite</code> parameter. Query the <code>DBA_REGISTERED_MVIEWS</code> view at the materialized view log site to view the materialized view sites.</p>

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```
DBMS_MVIEW.REFRESH (
  { list          IN    VARCHAR2,
  | tab          IN    DBMS_UTILITY.UNCL_ARRAY, }
  method        IN    VARCHAR2      := NULL,
  rollback_seg  IN    VARCHAR2      := NULL,
  push_deferred_rpc IN    BOOLEAN    := true,
  refresh_after_errors IN    BOOLEAN  := false,
  purge_option   IN    BINARY_INTEGER := 1,
  parallelism   IN    BINARY_INTEGER := 0,
  heap_size     IN    BINARY_INTEGER := 0,
  atomic_refresh IN    BOOLEAN      := true,
  nested        IN    BOOLEAN      := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 79–10 REFRESH Procedure Parameters

Parameter	Description
<code>list</code> <code>tab</code>	<p>Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database.</p> <p>Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view.</p>
<code>method</code>	<p>A string of refresh methods indicating how to refresh the listed materialized views. An <code>f</code> indicates fast refresh, <code>?</code> indicates force refresh, <code>C</code> or <code>c</code> indicates complete refresh, and <code>A</code> or <code>a</code> indicates always refresh. <code>A</code> and <code>C</code> are equivalent. <code>P</code> or <code>p</code> refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH ('countries_mv,regions_mv,hr.employees_mv','cf');</pre> <p>This statement performs a complete refresh of the <code>countries_mv</code> materialized view, a fast refresh of the <code>regions_mv</code> materialized view, and a default refresh of the <code>hr.employees</code> materialized view.</p>
<code>rollback_seg</code>	<p>Name of the materialized view site rollback segment to use while refreshing materialized views</p>

Table 79–10 (Cont.) REFRESH Procedure Parameters

Parameter	Description
<code>push_deferred_rpc</code>	Used by updatable materialized views only. Set this parameter to <code>true</code> if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
<code>refresh_after_errors</code>	If this parameter is <code>true</code> , an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the <code>DEFERROR</code> view for the materialized view's master table or master materialized view. If this parameter is <code>true</code> and <code>atomic_refresh</code> is <code>false</code> , this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
<code>purge_option</code>	If you are using the parallel propagation mechanism (in other words, <code>parallelism</code> is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set <code>purge</code> to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute <code>PUSH</code> with this parameter set to 2 to reduce the queue.
<code>parallelism</code>	0 specifies serial propagation. $n > 1$ specifies parallel propagation with n parallel processes. 1 specifies parallel propagation using only one parallel process.
<code>heap_size</code>	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. Note: Do not set this parameter unless directed to do so by Oracle Support Services.
<code>atomic_refresh</code>	If this parameter is set to <code>true</code> , then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to <code>false</code> , then each of the materialized views is refreshed in a separate transaction.
<code>nested</code>	If <code>true</code> , then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
  number_of_failures  OUT  BINARY_INTEGER,
  method              IN   VARCHAR2         := NULL,
  rollback_seg        IN   VARCHAR2         := NULL,
  refresh_after_errors IN  BOOLEAN          := false,
  atomic_refresh      IN   BOOLEAN          := true);
```

Parameters

Table 79–11 REFRESH_ALL_MVIEWS Procedure Parameters

Parameter	Description
number_of_failures	Returns the number of failures that occurred during processing
method	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.

REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
  number_of_failures    OUT    BINARY_INTEGER,
  { list                IN     VARCHAR2,
  | tab                 IN     DBMS_UTILITY.UNCL_ARRAY, }
  method               IN     VARCHAR2      := NULL,
  rollback_seg         IN     VARCHAR2      := NULL,
  refresh_after_errors IN     BOOLEAN       := false,
  atomic_refresh       IN     BOOLEAN       := true,
  nested               IN     BOOLEAN       := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 79–12 REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
<code>number_of_failures</code>	Returns the number of failures that occurred during processing
<code>list</code> <code>tab</code>	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type <code>DBMS_UTILITY.UNCL_ARRAY</code> , where each element is the name of a table.

Table 79–12 (Cont.) REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
method	<p>A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</p> <p>If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:</p> <pre>DBMS_MVIEW.REFRESH_DEPENDENT ('employees,departments,hr.regions','cf');</pre> <p>performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.</p>
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	<p>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated.</p> <p>If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.</p>
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
  mviewowner  IN   VARCHAR2,
  mviewname   IN   VARCHAR2,
  mviewsite   IN   VARCHAR2,
  mview_id    IN   DATE | BINARY_INTEGER,
  flag        IN   BINARY_INTEGER,
  qry_txt     IN   VARCHAR2,
  rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 79–13 REGISTER_MVIEW Procedure Parameters

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	<p>A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following:</p> <p>DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view</p> <p>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view</p> <p>DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view</p> <p>DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed</p> <p>DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable</p> <p>A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter:</p> <p>DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW</p> <p>You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.</p>
qry_txt	The first 32,000 bytes of the materialized view definition query.

Table 79–13 (Cont.) REGISTER_MVIEW Procedure Parameters

Parameter	Description
rep_type	Version of the materialized view. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site ■ DBMS_MVIEW.REG_V8_SNAPSHOT if the materialized view is at an Oracle database version 8.x or higher site DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (  
    mviewowner      IN  VARCHAR2,  
    mviewname       IN  VARCHAR2,  
    mviewsite       IN  VARCHAR2);
```

Parameters

Table 79–14 UNREGISTER_MVIEW Procedure Parameters

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

DBMS_NETWORK_ACL_ADMIN

The DBMS_NETWORK_ACL_ADMIN package provides the interface to administer the network Access Control List (ACL).

See Also: For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

The chapter contains the following topics:

- [Using DBMS_NETWORK_ACL_ADMIN](#)
 - Examples
- [Summary of DBMS_NETWORK_ACL_ADMIN Subprograms](#)

Using DBMS_NETWORK_ACL_ADMIN

- [Examples](#)

Examples

Example 1

Grant the connect and resolve privileges for host www.us.oracle.com to SCOTT.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(acl          => 'www.xml',
                                     description => 'WWW ACL',
                                     principal   => 'SCOTT',
                                     is_grant    => true,
                                     privilege    => 'connect');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl          => 'www.xml',
                                       principal    => 'SCOTT',
                                       is_grant     => true,
                                       privilege     => 'resolve');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl => 'www.xml',
                                    host => 'www.us.oracle.com');

END;
/
COMMIT;
```

Example 2

Grant the resolve privilege for www.us.oracle.com to ADAMS. Since an ACL for www.us.oracle.com exists already, just add the privilege for ADAMS.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl          => 'www.xml',
                                       principal    => 'ADAMS',
                                       is_grant     => true,
                                       privilege     => 'resolve');

END;
/
COMMIT;
```

Example 3

Assign the ACL www.xml to www-proxy.us.oracle.com so that SCOTT and ADAMS can access www-proxy.us.oracle.com also.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl => 'www.xml',
                                    host => 'www-proxy.us.oracle.com');

END;
/
COMMIT;
```

Example 4

Unassign the ACL from www.us.oracle.com so that no access to www.us.oracle.com is allowed.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(host => 'www.us.oracle.com');

END;
/
COMMIT;
```

Example 5

The [DOMAINS Function](#) in the DBMS_NETWORK_ACL_UTILILITY package returns all the domains a host belongs to. It can be used in conjunction with the [CHECK_PRIVILEGE_ACLID Function](#) in this package to determine the privilege assignments affecting a user's permission to access a network host. The function [DOMAIN_LEVEL Function](#) in the DBMS_NETWORK_ACL_UTILILITY package returns the level of each domain and can be used to order the ACL assignments by their precedence.

For example, for SCOTT's permission to connect to www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
FROM dba_network_acls
WHERE host IN
      (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILILITY.DOMAINS('www.us.oracle.com'))
      ORDER BY DBMS_NETWORK_ACL_UTILILITY.DOMAIN_LEVEL(host) desc, lower_port,
              upper_port;
```

HOST	LOWER_PORT	UPPER_PORT	ACL	PRIVILEGE
www.us.oracle.com	80	80	/sys/acls/www.xml	GRANTED
www.us.oracle.com	3000	3999	/sys/acls/www.xml	GRANTED
www.us.oracle.com			/sys/acls/www.xml	GRANTED
*.oracle.com			/sys/acls/all.xml	
*			/sys/acls/all.xml	

Example 6

For example, for SCOTT's permission to do domain name resolution for www.us.oracle.com:

```
SELECT host, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM dba_network_acls
WHERE host IN
      (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILILITY.DOMAINS('www.us.oracle.com'))) and
      lower_port IS NULL AND upper_port IS NULL
ORDER BY DBMS_NETWORK_ACL_UTILILITY.DOMAIN_LEVEL(host) desc;
```

HOST	ACL	PRIVILEGE
www.us.oracle.com	/sys/acls/www.xml	GRANTED
*.oracle.com	/sys/acls/all.xml	
*	/sys/acls/all.xml	

Note that the 'resolve' privilege takes effect only in ACLs assigned without any port range (when lower_port and upper_port are NULL). For this reason, we do not include lower_port and upper_port columns in the query.

Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

Table 80–1 DBMS_NETWORK_ACL_ADMIN Package Subprograms

Subprogram	Description
ADD_PRIVILEGE Procedure on page 80-6	Adds a privilege to grant or deny the network access to the user in an access control list (ACL)
ASSIGN_ACL Procedure on page 80-8	Assigns an access control list (ACL) to a network host, and optionally specific to a TCP port range
CHECK_PRIVILEGE Function on page 80-10	Checks if a privilege is granted to or denied from the user in an access control list (ACL)
CHECK_PRIVILEGE_ACLID Function on page 80-11	Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list
CREATE_ACL Procedure on page 80-12	Creates an access control list (ACL) with an initial privilege setting
DELETE_PRIVILEGE Procedure on page 80-13	Deletes a privilege in an access control list (ACL)
DROP_ACL Procedure on page 80-14	Drops an access control list (ACL)
UNASSIGN_ACL Procedure on page 80-15	Unassigns the access control list (ACL) currently assigned to a network host.

ADD_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) will be created if it does not exist.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
  acl          IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN,
  privilege    IN VARCHAR2,
  position     IN PLS_INTEGER DEFAULT NULL,
  start_date   IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
  end_date     IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

Parameters

Table 80–2 ADD_PRIVILEGE Function Parameters

Parameter	Description
<code>acl</code>	Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> .
<code>principal</code>	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
<code>is_grant</code>	Network privilege to be granted or denied - <code>'connect resolve'</code> (case sensitive). A database user needs the <code>connect</code> privilege to an external network host computer if he or she is connecting using the <code>UTL_TCP</code> , <code>UTL_HTTP</code> , <code>UTL_SMTP</code> , and <code>UTL_MAIL</code> utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the <code>UTL_INADDR</code> package, grant the database user the <code>resolve</code> privilege.
<code>privilege</code>	Network privilege to be granted or denied
<code>position</code>	Position (1-based) of the ACE. If a non-NULL value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same <code>is_grant</code> (grant or deny). If a NULL value is given, the privilege will be added to the ACE matching the principal and the <code>is_grant</code> if one exists, or to the end of the ACL if the matching ACE does not exist.
<code>start_date</code>	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The <code>start_date</code> will be ignored if the privilege is added to an existing ACE.
<code>end_date</code>	End date of the access control entry (ACE). When specified, the ACE will expire after the specified date. The <code>end_date</code> must be greater than or equal to the <code>start_date</code> . The <code>end_date</code> will be ignored if the privilege is added to an existing ACE.

Usage Notes

To remove the permission, use the [DELETE_PRIVILEGE Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
```

```
acl          => 'us-oracle-com-permissions.xml',  
principal   => 'ST_USERS',  
is_grant    => TRUE,  
privilege   => 'connect')  
END;
```

ASSIGN_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
  acl          IN VARCHAR2,
  host         IN VARCHAR2,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 80–3 *ASSIGN_ACL Function Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to <code>"/sys/acls"</code> .
host	Host to which the ACL will be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive.
lower_port	Lower bound of a TCP port range if not NULL
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the [DROP_ACL Procedure](#). To remove an access control list assignment, use the [UNASSIGN_ACL Procedure](#).
- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host say "www.us.oracle.com", the following domains are listed in decreasing precedences:
 - www.us.oracle.com
 - *.us.oracle.com
 - *.oracle.com
 - *.com
 - *

In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address say "192.168.0.100", the following subnets are listed in decreasing precedences:

- 192.168.0.100

- 192.168.0.*
- 192.168.*
- 192.*
- *

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both `lower_port` and `upper_port` must not be NULL and `upper_port` must be greater than or equal to `lower_port`. The port range must not overlap with any other port ranges for the same host assigned already.
- To remove the assignment, use [UNASSIGN_ACL Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
    acl          => 'us-oracle-com-permissions.xml',
    host         => '*.us.oracle.com',
    lower_port   => 80);
END;
```

CHECK_PRIVILEGE Function

This function checks if a privilege is granted to or denied from the user in an ACL.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
  acl          IN VARCHAR2,
  user         IN VARCHAR2,
  privilege    IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 80–4 CHECK_PRIVILEGE Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

Examples

```
SELECT DECODE(
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(
    'us-oracle-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

CHECK_PRIVILEGE_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (
  aclid          IN RAW,
  user           IN VARCHAR2 DEFAULT NULL)
  privilege     IN VARCHAR2,
  RETURN NUMBER;
```

Parameters

Table 80–5 CHECK_PRIVILEGE_ACLID Function Parameters

Parameter	Description
aclid	Object ID of the ACL
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

CREATE_ACL Procedure

This procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to network target.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
    acl           IN VARCHAR2,
    description   IN VARCHAR2,
    principal     IN VARCHAR2,
    is_grant      IN BOOLEAN,
    privilege     IN VARCHAR2,
    start_date    IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    end_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

Parameters

Table 80–6 CREATE_ACL Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
description	Description attribute in the ACL
principal	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
is_grant	Privilege is granted or not (denied)
privilege	Network privilege to be granted or denied - 'connect resolve' (case sensitive). A database user needs the connect privilege to an external network host computer if he or she is connecting using the UTL_TCP, UTL_HTTP, UTL_SMTP, and UTL_MAIL utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the UTL_INADDR package, grant the database user the resolve privilege.
start_date	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date.
end_date	End date of the access control entry (ACE). When specified, the ACE will expire after the specified date. The end_date must be greater than or equal to the start_date.

Usage Notes

To drop the access control list, use the [DROP_ACL Procedure](#).

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl           => 'us-oracle-com-permissions.xml',
    description   => 'Network permissions for *.us.oracle.com',
    principal     => 'SCOTT',
    is_grant      => TRUE,
    privilege     => 'connect');
END;
```

DELETE_PRIVILEGE Procedure

This procedure deletes a privilege in an access control list.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
  acl          IN VARCHAR2,
  principal    IN VARCHAR2,
  is_grant     IN BOOLEAN DEFAULT NULL,
  privilege    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 80–7 *DELETE_PRIVILEGE Function Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
principal	Principal (database user or role) for whom all the ACE will be deleted
is_grant	Privilege is granted or not (denied). If a null value is given, the deletion is applicable to both granted or denied privileges.
privilege	Network privilege to be deleted. If a NULL value is given, the deletion is applicable to all privileges.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
    acl          => 'us-oracle-com-permissions.xml',
    principal    => 'ST_USERS')
END;
```

DROP_ACL Procedure

This procedure drops an access control list (ACL).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
    acl          IN VARCHAR2);
```

Parameters

Table 80–8 *DROP_ACL Function Parameters*

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".

Examples

```
BEGIN
    DBMS_NETWORK_ACL_ADMIN.DROP_ACL(
        acl => 'us-oracle-com-permissions.xml');
END;
```

UNASSIGN_ACL Procedure

This procedure unassigns the access control list (ACL) currently assigned to a network host.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
  acl          IN VARCHAR2 DEFAULT NULL,
  host         IN VARCHAR2 DEFAULT NULL,
  lower_port   IN PLS_INTEGER DEFAULT NULL,
  upper_port   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 80–9 UNASSIGN_ACL Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls". If acl is NULL, any ACL assigned to the host will be unassigned.
host	Host from which the ACL will be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is null, the ACL will be unassigned from any host. If both host and acl are NULL, all ACL assignments will be deleted.
lower_port	Lower bound of a TCP port range if not NULL
upper_port	Upper bound of a TCP port range. If NULL, lower_port is assumed.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
    host      => '*.us.oracle.com',
    lower_port => 80);
END;
```

DBMS_NETWORK_ACL_UTILITY

The `DBMS_NETWORK_ACL_UTILITY` package provides utilities to the interface for administering the network Access Control List (ACL).

See Also: For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

The chapter contains the following topics:

- [Using DBMS_NETWORK_ACL_UTILITY](#)
 - Examples
- [Summary of DBMS_NETWORK_ACL_UTILITY Subprograms](#)

Using DBMS_NETWORK_ACL_UTILITY

- [Examples](#)

Examples

The [DOMAINS Function](#) in this package returns all the domains a host belongs to. It can be used in conjunction with the [CHECK_PRIVILEGE_ACLID Function](#) in the DBMS_NETWORK_ACL_ADMIN package to determine the privilege assignments affecting a user's permission to access a network host. The function [DOMAIN_LEVEL Function](#) in this package returns the level of each domain and can be used to order the ACL assignments by their precedence.

Example 1

For example, for SCOTT's permission to connect to www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
  FROM dba_network_acls
 WHERE host IN
       (SELECT * FROM
        TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com')))
 ORDER BY DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) desc, lower_port,
          upper_port;
```

HOST	LOWER_PORT	UPPER_PORT	ACL	PRIVILEGE
www.us.oracle.com	80	80	/sys/acls/www.xml	GRANTED
www.us.oracle.com	3000	3999	/sys/acls/www.xml	GRANTED
www.us.oracle.com			/sys/acls/www.xml	GRANTED
*.oracle.com			/sys/acls/all.xml	
*			/sys/acls/all.xml	

Example 2

For example, for SCOTT's permission to do domain name resolution for www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
       DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', null) privilege
  FROM dba_network_acls
 WHERE host IN
       (SELECT * FROM
        TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com'))) and
       lower_port IS NULL AND upper_port IS NULL
 ORDER BY DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) desc;
```

HOST	LOWER_PORT	UPPER_PORT	ACL	PRIVILEGE
www.us.oracle.com			/sys/acls/www.xml	GRANTED
*.oracle.com			/sys/acls/all.xml	
*			/sys/acls/all.xml	

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when lower_port and upper_port are NULL). For this reason, we do not include lower_port and upper_port columns in the query.

Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

Table 81-1 *DBMS_NETWORK_ACL_UTILITY Package Subprograms*

Subprogram	Description
DOMAIN_LEVEL Function on page 81-5	Returns the domain level of the given host name, domain, or subnet
DOMAINS Function on page 81-6	For a given host, this function returns the domains whose ACL assigned will be used to determine if a user has the privilege to access the given host or not.

DOMAIN_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (  
    host IN VARCHAR2)  
RETURN NUMBER;
```

Parameters

Table 81-2 *DOMAIN_LEVEL Function Parameters*

Parameter	Description
host	Network host, domain, or subnet

Return Values

The domain level of the given host, domain, or subnet.

Examples

```
SELECT DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL('www.us.oracle.com') FROM DUAL;
```

DOMAINS Function

For a given host, this function returns the domains whose ACL assigned will be used to determine if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

Syntax

```
DBMS_NETWORK_ACL_UTLILITY.DOMAINS (  
    host IN VARCHAR2)  
RETURN DOMAIN_TABLE PIPELINED;
```

Parameters

Table 81-3 *DOMAINS Function Parameters*

Parameter	Description
host	Network host

Return Values

The domains or subnets for the given host.

Examples

```
SELECT * FROM TABLE (DBMS_NETWORK_ACL_UTLILITY.DOMAINS('www.us.oracle.com'));
```

DBMS_OBFUSCATION_TOOLKIT

DBMS_OBFUSCATION_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

This chapter contains the following topics:

Using DBMS_OBFUSCATION_TOOLKIT

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search: 2^{112} or 2^{168} attempts instead of 2^{56} attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

Security Model

Oracle installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed. The package also grants access to the `PUBLIC` role so no explicit grant needs to be done.

Operational Notes

- [Key Management](#)
- [Storing the Key in the Database](#)
- [Storing the Key in the Operating System](#)
- [User-Supplied Keys](#)

Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The DBMS_OBFUSCATION_TOOLKIT package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package.

Furthermore, the encryption and decryption done by the DBMS_OBFUSCATION_TOOLKIT takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See *Oracle Database Advanced Security Administrator's Guide* for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.

The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

Storing the Key in the Database

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the DBMS_OBFUSCATION_TOOLKIT package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with SELECT access to EMP from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the EMP table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).

Storing the Key in the Operating System

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

User-Supplied Keys

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.

Summary of DBMS_OBFUSCATION Subprograms

Table 82–1 DBMS_OBFUSCATION Package Subprograms

Subprogram	Description
DES3DECRYPT Procedures and Functions on page 82-8	Generates the decrypted form of the input data
DES3ENCRYPT Procedures and Functions on page 82-10	Generates the encrypted form of the input data by passing it through the Triple DES encryption algorithm
DES3GETKEY Procedures and Functions on page 82-8	Takes a random value and uses it to generate an encryption key, using Triple DES
DESDECRYPT Procedures and Functions on page 82-13	Generates the decrypted form of the input data
DESENCRYPT Procedures and Functions on page 82-15	Generates the encrypted form of the input data
DESGETKEY Procedures and Functions on page 82-17	Takes a random value and uses it to generate an encryption key
MD5 Procedures and Functions on page 82-18	Generates MD5 hashes of data

DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "[DES3ENCRYPT Procedures and Functions](#)" on page 82-10.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input          IN   RAW,
  key            IN   RAW,
  decrypted_data OUT  RAW,
  which         IN   PLS_INTEGER DEFAULT TwoKeyMode
  iv           IN   RAW          DEFAULT NULL);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input_string   IN   VARCHAR2,
  key_string     IN   VARCHAR2,
  decrypted_string OUT VARCHAR2,
  which         IN   PLS_INTEGER DEFAULT TwoKeyMode
  iv_string     IN   VARCHAR2   DEFAULT NULL);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input          IN RAW,
  key            IN RAW,
  which         IN PLS_INTEGER DEFAULT TwoKeyMode
  iv           IN RAW          DEFAULT NULL)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT (
  input_string IN VARCHAR2,
  key_string   IN VARCHAR2,
  which       IN PLS_INTEGER DEFAULT TwoKeyMode
  iv_string   IN VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 82–2 *DES3DECRYPT Parameters for Raw Data*

Parameter	Description
input	Data to be decrypted
key	Decryption key
decrypted_data	Decrypted data
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector
input_string	String to be decrypted
key_string	Decryption key string
decrypted_string	Decrypted string
iv_string	Initialization vector

Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3ENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

Syntax

```

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input          IN    RAW,
  key            IN    RAW,
  encrypted_data OUT   RAW,
  which         IN    PLS_INTEGER DEFAULT TwoKeyMode
  iv            IN    RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input_string   IN    VARCHAR2,
  key_string     IN    VARCHAR2,
  encrypted_string OUT VARCHAR2,
  which         IN    PLS_INTEGER DEFAULT TwoKeyMode
  iv_string     IN    VARCHAR2   DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input          IN RAW,
  key            IN RAW,
  which         IN PLS_INTEGER DEFAULT TwoKeyMode
  iv            IN RAW          DEFAULT NULL)
RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt (
  input_string IN VARCHAR2,
  key_string   IN VARCHAR2,
  which       IN PLS_INTEGER DEFAULT TwoKeyMode
  iv_string   IN VARCHAR2   DEFAULT NULL)
RETURN VARCHAR2;

```

Parameters

Table 82–3 *DES3ENCRYPT Parameters Procedure and Function*

Parameter	Description
input	Data to be encrypted.
key	Encryption key.
encrypted_data	Encrypted data.
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector.
input_string	String to be encrypted.
key_string	Encryption key string.
encrypted_string	Encrypted string.
iv_string	Initialization vector.

Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the `DES3ENCRYPT` procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The `DES3ENCRYPT` procedure uses the 2-key implementation by default.

You also have the option of providing an *initialization vector* (IV) with the `DES3ENCRYPT` procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL `DES3ENCRYPT` procedure is empty, then the procedure raises the error `ORA-28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the `DES3ENCRYPT` procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double encrypt data using the `DES3ENCRYPT` procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the `which` parameter, `ORA-28236 "Invalid Triple DES mode"` is generated. Only the values 0 (`TwoKeyMode`) and 1 (`ThreeKeyMode`) are valid.

Restrictions

The `DES3ENCRYPT` procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the `DES3ENCRYPT` function itself more than once to encrypt the same data using 3DES.)

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed       IN   RAW,
  key        OUT  RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed_string IN  VARCHAR2,
  key        OUT  VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which IN PLS_INTEGER DEFAULT TwoKeyMode,
  seed  IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
  which      IN   PLS_INTEGER DEFAULT TwoKeyMode,
  seed_string IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 82–4 *DES3GETKEY Procedure and Function Parameters*

Parameter	Description
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
seed	A value at least 80 characters long.
key	Encryption key.
seed_string	A value at least 80 characters long.
key	Encryption key.

DESDECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input          IN  RAW,
  key            IN  RAW,
  decrypted_data OUT RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input_string   IN  VARCHAR2,
  key_string     IN  VARCHAR2,
  decrypted_string OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input          IN  RAW,
  key            IN  RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt (
  input_string   IN  VARCHAR2,
  key_string     IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 82–5 *DESDECRYPT Procedure and Function Parameters*

Parameter	Description
input	Data to be decrypted.
key	Decryption key.
decrypted_data	Decrypted data.
input_string	String to be decrypted.
key_string	Decryption key string.
decrypted_string	Decrypted string.

Usage Notes

If the input data or key given to the PL/SQL DESDECRYPT function is empty, then Oracle raises ORA error 28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DESDECRYPT function is not a multiple of 8 bytes, Oracle raises ORA error 28232 "Invalid input size for Obfuscation toolkit."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Note: ORA-28233 is not applicable to the DESDECRYPT function.

Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

Note: The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.

DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input          IN   RAW,
  key            IN   RAW,
  encrypted_data OUT  RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input_string   IN   VARCHAR2,
  key_string     IN   VARCHAR2,
  encrypted_string OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input          IN RAW,
  key            IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt (
  input_string IN VARCHAR2,
  key_string  IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 82–6 DESENCRYPT Procedure and Function Parameters

Parameter	Description
input	Data to be encrypted.
key	Encryption key.
encrypted_data	Encrypted data.
input_string	String to be encrypted.
key_string	Encryption key string.
encrypted_string	Encrypted string.

Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the DESENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit."

If you try to double-encrypt data using the DESENCRYPT procedure, then the procedure raises the error ORA-28233 "Double encryption not supported."

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Restrictions

The DESENCRYPT procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DESGETKEY Procedures and Functions

These subprograms take a random value and use it to generate an encryption key.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed      IN  RAW,
  key       OUT RAW);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed_string IN VARCHAR2,
  key         OUT VARCHAR2);
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed IN RAW)
RETURN RAW;
```

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
  seed_string IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 82–7 *DESGETKEY Procedure and Function Parameters*

Parameter	Description
seed	A value at least 80 characters long.
key	Encryption key.
seed_string	A value at least 80 characters long.
key	Encryption key.

MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input          IN  RAW,
  checksum       OUT raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input_string   IN  VARCHAR2,
  checksum_string OUT varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input          IN RAW)
RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5 (
  input_string IN VARCHAR2)
RETURN varchar2_checksum;
```

Parameters

Table 82–8 MD5 Procedure and Function Parameters

Parameter Name	Description
input	Data to be hashed
checksum	128-bit cryptographic message digest
input_string	Data to be hashed
checksum_string	128-bit cryptographic message digest

DBMS_ODCI package contains a single user function related to the use of Data Cartridges.

See Also:

- *Oracle Database Data Cartridge Developer's Guide*

This chapter contains the following topic:

- [Summary of DBMS_ODCI Subprograms](#)

Summary of DBMS_ODCI Subprograms

Table 83–1 *DBMS_ODCI Package Subprograms*

Subprogram	Description
ESTIMATE_CPU_UNITS Function on page 83-3	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, `ESTIMATE_CPU_UNITS` considers the speed of a single processor.

Syntax

```
DBMS_ODCI.ESTIMATE_CPU_UNITS (  
    elapsed_time    NUMBER)  
RETURN NUMBER;
```

Parameters

Parameter	Description
<code>elapsed_time</code>	The elapsed time in seconds that it takes to execute a function.

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.

DBMS_OFFLINE_OG

The DBMS_OFFLINE_OG package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

- [Documentation of DBMS_OFFLINE_OG](#)

Documentation of DBMS_OFFLINE_OG

For a complete description of this package within the context of Replication, see DBMS_OFFLINE_OG in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_OUTLN

The DBMS_OUTLN package, synonymous with OUTLN_PKG, contains the functional interface for subprograms associated with the management of stored outlines.

See Also: For more information about using the DBMS_OUTLN package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

Note: Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD_PLANS_FROM_CURSOR_CACHE Functions](#) or [LOAD_PLANS_FROM_SQLSET Function](#) of the DBMS_SPM package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- [Using DBMS_OUTLN](#)
 - Overview
 - Security Model
- [Summary of DBMS_OUTLN Subprograms](#)

Using DBMS_OUTLN

- [Overview](#)
- [Security Model](#)

Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the [LOAD_PLANS_FROM_CURSOR_CACHE Functions](#) or the [LOAD_PLANS_FROM_SQLSET Function](#) of the [DBMS_SPM](#) package. When the migration is complete, you should disable or remove the stored outlines.

Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

Summary of DBMS_OUTLN Subprograms

Table 85–1 DBMS_OUTLN Package Subprograms

Subprogram	Description
CLEAR_USED Procedure on page 85-6	Clears the outline 'used' flag
CREATE_OUTLINE Procedure on page 85-7	Generates outlines from the shared cursor identified by hash value and child number
DROP_BY_CAT Procedure on page 85-8	Drops outlines that belong to a specified category
DROP_UNUSED Procedure on page 85-9	Drops outlines that have never been applied in the compilation of a SQL statement
EXACT_TEXT_SIGNATURES Procedure on page 85-10	Updates outline signatures to those that compute based on exact text matching
UPDATE_BY_CAT Procedure on page 85-11	Changes the category of outlines in one category to a new category
UPDATE_SIGNATURES Procedure on page 85-12	Updates outline signatures to the current version's signature

CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (  
    name      IN      VARCHAR2);
```

Parameters

Table 85–2 *CLEAR_USED Procedure Parameters*

Parameter	Description
name	Name of the outline.

CREATE_OUTLINE Procedure

This procedure generates an outline from the shared cursor identified by hash value and child number.

Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (  
    hash_value     IN NUMBER,  
    child_number  IN NUMBER,  
    category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

Parameters

Table 85-3 CREATE_OUTLINE Procedure Parameters

Parameter	Description
hash_value	Hash value identifying the target shared cursor.
child_number	Child number of the target shared cursor.
category	Category in which to create outline (optional).

DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the `DEFAULT` category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

```
DBMS_OUTLN.DROP_BY_CAT (  
    cat VARCHAR2);
```

Parameters

Table 85–4 DROP_BY_CAT Procedure Parameters

Parameter	Description
cat	Category of outlines to drop.

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the `DEFAULT` category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

```
DBMS. OUTLN. EXACT_TEXT_SIGNATURES ;
```

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

```
DBMS.OUTLN.UPDATE_BY_CAT (  
  oldcat   VARCHAR2 default 'DEFAULT',  
  newcat   VARCHAR2 default 'DEFAULT');
```

Parameters

Table 85-5 *UPDATE_BY_CAT Procedure Parameters*

Parameter	Description
oldcat	The current category of outlines.
newcat	The new category of outlines.

UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

```
DBMS. OUTLN. UPDATE_SIGNATURES;
```

Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- [Using DBMS_OUTPUT](#)
 - Overview
 - Security Model
 - Operational Notes
 - Exceptions
 - Rules and Limits
 - Examples
- [Data Structures](#)
 - TABLE Types
 - OBJECT Types
- [Summary of DBMS_OUTPUT Subprograms](#)

Using DBMS_OUTPUT

This section contains topics which relate to using the DBMS_OUTPUT package.

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Rules and Limits](#)
- [Examples](#)

Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command DESCRIBE to procedures).

The [PUT Procedure](#) and [PUT_LINE Procedure](#) in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the [GET_LINE Procedure](#) and [GET_LINES Procedure](#).

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

Operational Notes

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.
- SQL*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking `DBMS_OUTPUT.ENABLE (buffer_size => NULL);`
with no limit on the output.
- You should generally avoid having application code invoke either the [DISABLE Procedure](#) or [ENABLE Procedure](#) because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

Note: Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

Exceptions

DBMS_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

Table 86-1 DBMS_OUTPUT Errors

Error	Description
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

Rules and Limits

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

Examples

Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here: '||:new.col||' is the new value');
```

If you have enabled the DBMS_OUTPUT package, then the text produced by this PUT_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
    DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to [GET_LINES Procedure](#) which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in ["Example 3: Retrieving Information About an Object"](#) on page 86-9.

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
    CURSOR emp_cursor IS
        SELECT sal, comm FROM emp WHERE deptno = dnum;
    total_wages    NUMBER(11, 2) := 0;
    counter        NUMBER(10) := 1;
BEGIN

    FOR emp_record IN emp_cursor LOOP
        emp_record.comm := NVL(emp_record.comm, 0);
        total_wages := total_wages + emp_record.sal
            + emp_record.comm;
        DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
            ' ; Wages = ' || TO_CHAR(total_wages)); /* Debug line */
        counter := counter + 1; /* Increment debug counter */
    END LOOP;
    /* Debug line */
    DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
        TO_CHAR(total_wages));
    RETURN total_wages;

END dept_salary;
```

Assume the EMP table contains the following rows:

EMPNO	SAL	COMM	DEPT
1002	1500	500	20
1203	1000		30
1289	1000		10

```
1347          1000      250      20
```

Assume the user executes the following statements in SQL*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250
```

PL/SQL procedure successfully executed.

Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```

/*****
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                */
*****/
CREATE OR REPLACE PROCEDURE explain_out
(statement_id IN VARCHAR2) AS

-- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

CURSOR explain_rows IS
SELECT level, id, position, operation, options,
       object_name
FROM plan_table
WHERE statement_id = explain_out.statement_id
CONNECT BY PRIOR id = parent_id
       AND statement_id = explain_out.statement_id
START WITH id = 0
       ORDER BY id;

BEGIN

-- Loop through information retrieved from PLAN_TABLE:

FOR line IN explain_rows LOOP

-- At start of output, include heading with estimated cost.

IF line.id = 0 THEN
DBMS_OUTPUT.PUT_LINE ('Plan for statement '
|| statement_id
|| ', estimated cost = ' || line.position);
END IF;

-- Output formatted information. LEVEL determines indention level.

DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||

```

```
        line.operation || ' ' || line.options || ' ' ||  
        line.object_name);  
    END LOOP;  
  
END;
```

See Also: [Chapter 206, "UTL_FILE"](#)

Data Structures

The DBMS_OUTPUT package declares 2 collection types for use with the [GET_LINES Procedure](#).

TABLE Types

[CHARARR Table Type](#)

OBJECT Types

[DBMSOUTPUT_LINESARRAY Object Type](#)

CHARARR Table Type

This package type is to be used with the [GET_LINES Procedure](#) to obtain text submitted through the [PUT Procedure](#) and [PUT_LINE Procedure](#).

Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

DBMSOUTPUT_LINESARRAY Object Type

This package type is to be used with the [GET_LINES Procedure](#) to obtain text submitted through the [PUT Procedure](#) and [PUT_LINE Procedure](#).

Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS  
  VARRAY (2147483647) OF VARCHAR2 (32767);
```

Summary of DBMS_OUTPUT Subprograms

Table 86–2 *DBMS_OUTPUT Package Subprograms*

Subprogram	Description
DISABLE Procedure on page 86-15	Disables message output
ENABLE Procedure on page 86-16	Enables message output
GET_LINE Procedure on page 86-17	Retrieves one line from buffer
GET_LINES Procedure on page 86-18	Retrieves an array of lines from buffer
NEW_LINE Procedure on page 86-19	Terminates a line created with PUT
PUT Procedure on page 86-20	Places a line in the buffer
PUT_LINE Procedure on page 86-21	Places partial line in buffer

Note: The [PUT Procedure](#) that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the [ENABLE Procedure](#), you do not need to call this procedure if you are using the `SERVEROUTPUT` option of SQL*Plus.

Syntax

```
DBMS_OUTPUT.DISABLE;
```

Pragmas

```
pragma restrict_references (disable, WNDS, RNDS);
```

ENABLE Procedure

This procedure enables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`. Calls to these procedures are ignored if the `DBMS_OUTPUT` package is not activated.

Syntax

```
DBMS_OUTPUT.ENABLE (  
    buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters

Table 86–3 *ENABLE Procedure Parameters*

Parameter	Description
<code>buffer_size</code>	Upper limit, in bytes, the amount of buffered information. Setting <code>buffer_size</code> to <code>NULL</code> specifies that there should be no limit.

Usage Notes

- It is not necessary to call this procedure when you use the `SET SERVEROUTPUT` option of `SQL*Plus`.
- If there are multiple calls to `ENABLE`, then `buffer_size` is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies `buffer_size` (`NOT NULL`).
- `NULL` is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (
    line    OUT VARCHAR2,
    status  OUT INTEGER);
```

Parameters

Table 86–4 GET_LINE Procedure Parameters

Parameter	Description
line	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small".
status	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.

GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (
    lines      OUT   CHARARR,
    numlines  IN OUT INTEGER);

DBMS_OUTPUT.GET_LINES (
    lines      OUT   DBMSOUTPUT_LINESARRAY,
    numlines  IN OUT INTEGER);
```

Parameters

Table 86–5 GET_LINES Procedure Parameters

Parameter	Description
lines	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the VARRAY overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
numlines	Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.

NEW_LINE Procedure

This procedure puts an end-of-line marker. The [GET_LINE Procedure](#) and the [GET_LINES Procedure](#) return "lines" as delimited by "newlines". Every call to the [PUT_LINE Procedure](#) or [NEW_LINE Procedure](#) generates a line that is returned by [GET_LINE\(S\)](#).

Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

PUT Procedure

This procedure places a partial line in the buffer.

Note: The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

Parameters

Table 86–6 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 86–7 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

PUT_LINE Procedure

This procedure places a line in the buffer.

Note: The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT_LINE (
    item IN VARCHAR2);
```

Parameters

Table 86–8 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 86–9 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
    2 DBMS_OUTPUT.PUT_LINE ('hello');
    3 DBMS_LOCK.SLEEP (10);
    4 END;
```

DBMS_PCLXUTIL

The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

See Also: There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS_PCLXUTIL](#)
 - Overview
 - Operational Notes
 - Rules and Limits
- [Summary of DBMS_PCLXUTIL Subprograms](#)

Using DBMS_PCLXUTIL

- [Overview](#)
- [Operational Notes](#)
- [Rules and Limits](#)

Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

```
CREATE INDEX <idx_name> on <tab_name>(…) local(…) unusable;
```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

2. Local index maintenance

By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The *force_opt* parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(…) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using *force_opt* = TRUE:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

Rules and Limits

Note: For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the `job_queue_processes` initialization parameter. Clearly, if the job processes are not started before calling `BUILD_PART_INDEX()`, then the package will not function properly. The background processes are specified by the following `init.ora` parameters:

```
job_queue_processes=n    #the number of background processes = n
```
- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the `j*.trc` trace files.

Summary of DBMS_PCLXUTIL Subprograms

Table 87–1 DBMS_PCLXUTIL Package Subprograms

Subprogram	Description
BUILD_PART_INDEX Procedure on page 87-7	Provides intra-partition parallelism for creating partition-wise local indexes

BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
  jobs_per_batch  IN NUMBER    DEFAULT 1,
  procs_per_job   IN NUMBER    DEFAULT 1,
  tab_name        IN VARCHAR2  DEFAULT NULL,
  idx_name        IN VARCHAR2  DEFAULT NULL,
  force_opt       IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 87-2 BUILD_PART_INDEX Procedure Parameters

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel query slaves to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX (2, 4, 'PROJECT', 'IDX', TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

Using DBMS_PIPE

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)
- [Exceptions](#)
- [Examples](#)

Overview

Pipe functionality has several potential applications:

- **External service interface:** You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- **Independent transactions:** The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- **Alerters (non-transactional):** You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.
- **Debugging:** Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- **Concentrator:** This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either [Public Pipes](#) or [Private Pipes](#).

Constants

```
maxwait  constant integer := 86400000; /* 1000 days */
```

This is the maximum time to wait attempting to send or receive a message.

Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of DBMS_PIPE is considered with regard to the following topics:

- [Public Pipes](#)
- [Writing and Reading Pipes](#)
- [Private Pipes](#)

Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the CREATE_PIPE function with the private flag set to FALSE. You must deallocate explicitly-created pipes by calling the REMOVE_PIPE function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Writing and Reading Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have EXECUTE permission on the DBMS_PIPE package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the PACK_MESSAGE procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the SEND_MESSAGE function, designating the pipe name to be used to send the message. When SEND_MESSAGE is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the RECEIVE_MESSAGE function, designating the pipe name from which to receive the message. The process then calls the UNPACK_MESSAGE procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the CREATE_PIPE function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the REMOVE_PIPE function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, `CREATE_PIPE` returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as `SYSDBA`

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to `PACK_MESSAGE` before calling `SEND_MESSAGE`. Similarly, you must call `RECEIVE_MESSAGE` to retrieve the message before accessing the items in the message by calling `UNPACK_MESSAGE`.

Exceptions

DBMS_PIPE package subprograms can return the following errors:

Table 88-1 DBMS_PIPE Errors

Error	Description
ORA-23321:	Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

Examples

- [Example 1: Debugging - PL/SQL](#)
- [Example 3: Execute System Commands](#)
- [Example 4: External Service Interface](#)

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int      status;
    int      msg_length;
    char     retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "SCOTT/TIGER");
    username.len = strlen(username.arr);

    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;

    printf("connected\n");

    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;)

```

```

    {
        EXEC SQL EXECUTE
        DECLARE
            len INTEGER;
            typ INTEGER;
            sta INTEGER;
            chr VARCHAR2(2000);
        BEGIN
            chr := '';
            sta := dbms_pipe.receive_message('plsql_debug');
            IF sta = 0 THEN
                DBMS_PIPE.UNPACK_MESSAGE(len);
                DBMS_PIPE.UNPACK_MESSAGE(chr);
            END IF;
            :status := sta;
            :retval := chr;
            IF len IS NOT NULL THEN
                :msg_length := len;
            ELSE
                :msg_length := 2000;
            END IF;
        END;
    END-EXEC;
    IF (status == 0)
        printf("\n%.*s\n", msg_length, retval);
    ELSE
        printf("abnormal status, value is %d\n", status);
    }
}

void sql_error()
{
    char msg[1024];
    int rlen, len;
    len = sizeof(msg);
    sqlglm(msg, &len, &rlen);
    printf("ORACLE ERROR\n");
    printf("%.*s\n", rlen, msg);
    exit(1);
}

```

Example 3: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the *system()* call or executing a SQL command using embedded SQL.

DAEMON.SQL is the source code for the PL/SQL package. This package contains procedures that use the DBMS_PIPE package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the STOP command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro*C daemon to execute the command *system("ls -la")*.

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                      timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending. Status = ' ||
        status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
```

```
        RAISE_APPLICATION_ERROR(-20012,
        'Execute_system: Done not received.');
```

```
END IF;

DBMS_PIPE.UNPACK_MESSAGE(command_code);
DBMS_OUTPUT.PUT_LINE('System command executed. result = ' ||
                    command_code);
RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                    timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

    status      NUMBER;
    result      VARCHAR2(20);
    command_code NUMBER;
    pipe_name   VARCHAR2(30);

BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SQL');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20020,
        'Execute_sql: Error while sending. Status = ' || status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20021,
        'execute_sql: Error while receiving.
        Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
        RAISE_APPLICATION_ERROR(-20022,
        'execute_sql: done not received.');
```

```
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(command_code);
    DBMS_OUTPUT.PUT_LINE
        ('SQL command executed. sqlcode = ' || command_code);
    RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE('STOP');
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
        RAISE_APPLICATION_ERROR(-20030,
        'stop: error while sending. status = ' || status);
    END IF;
```

```

    END stop;
END daemon;

```

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

Note: To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```

#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
    char *uid = "scott/tiger";
    int status;
    VARCHAR command[20];
    VARCHAR value[2000];
    VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:\n");
    printf("%. *s\n", msg_length, msg_buffer);
    printf("Daemon quitting.\n");
    exit(1);
}

void
sql_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while executing:\n");
    printf("%. *s\n", msg_length, msg_buffer);
    printf("Daemon continuing.\n");
}

main()
{
    command.len = 20; /*initialize length components*/

```

```
value.len = 2000;
return_name.len = 30;
EXEC SQL WHENEVER SQLERROR DO connect_error();
EXEC SQL CONNECT :uid;
printf("Daemon connected.\n");

EXEC SQL WHENEVER SQLERROR DO sql_error();
printf("Daemon waiting...\n");
while (1) {
    EXEC SQL EXECUTE
        BEGIN
            :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
            IF :status = 0 THEN
                DBMS_PIPE.UNPACK_MESSAGE(:command);
            END IF;
        END;
    END-EXEC;
    IF (status == 0)
    {
        command.arr[command.len] = '\0';
        IF (!strcmp((char *) command.arr, "STOP"))
        {
            printf("Daemon exiting.\n");
            break;
        }

        ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
        {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
            value.arr[value.len] = '\0';
            printf("Will execute system command '%s'\n", value.arr);

            status = system(value.arr);
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.PACK_MESSAGE('done');
                    DBMS_PIPE.PACK_MESSAGE(:status);
                    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
                END;
            END-EXEC;

            IF (status)
            {
                printf
                    ("Daemon error while responding to system command.");
                printf(" status: %d\n", status);
            }
        }
        ELSE IF (!strcmp((char *) command.arr, "SQL")) {
            EXEC SQL EXECUTE
                BEGIN
                    DBMS_PIPE.UNPACK_MESSAGE(:return_name);
                    DBMS_PIPE.UNPACK_MESSAGE(:value);
                END;
            END-EXEC;
```

```

value.arr[value.len] = '\0';
printf("Will execute sql command '%s'\n", value.arr);

EXEC SQL WHENEVER SQLERROR CONTINUE;
EXEC SQL EXECUTE IMMEDIATE :value;
status = sqlca.sqlcode;

EXEC SQL WHENEVER SQLERROR DO sql_error();
EXEC SQL EXECUTE
  BEGIN
    DBMS_PIPE.PACK_MESSAGE('done');
    DBMS_PIPE.PACK_MESSAGE(:status);
    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
  END;
END-EXEC;

IF (status)
{
  printf("Daemon error while responding to sql command.");
  printf("  status: %d\n", status);
}
}
ELSE
{
  printf
    ("Daemon error: invalid command '%s' received.\n",
     command.arr);
}
}
ELSE
{
  printf("Daemon error while waiting for signal.");
  printf("  status = %d\n", status);
}
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

```

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

protocol_version	VARCHAR2	- '1', 10 bytes or less
returnpipe	VARCHAR2	- 30 bytes or less
service	VARCHAR2	- 30 bytes or less
arg1	VARCHAR2/NUMBER/DATE	
...		
argn	VARCHAR2/NUMBER/DATE	

The recommended format for returning the result is:

success	VARCHAR2	- 'SUCCESS' if OK, otherwise error message
arg1	VARCHAR2/NUMBER/DATE	
...		

```
argn          VARCHAR2/NUMBER/DATE
```

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

```
<loop forever>
BEGIN dbms_stock_server.get_request(:stocksymbol); END;
<figure out price based on stocksymbol (probably from some radio
signal), set error if can't find such a stock>
BEGIN dbms_stock_server.return_price(:error, :price); END;
```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe  VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error: ' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                 INTEGER;
    service           VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error: ' || to_char(s) ||
        ' reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
```

```

BEGIN
  IF errormsg IS NULL THEN
    dbms_pipe.pack_message('SUCCESS');
    dbms_pipe.pack_message(price);
  ELSE
    dbms_pipe.pack_message(errormsg);
  END IF;
  s := dbms_pipe.send_message(returnpipe);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' sending on pipe');
  END IF;
END;

```

The procedure called by the client is:

```

CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
RETURN VARCHAR2 IS
  s      INTEGER;
  price  VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1'); -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error: ' || to_char(s) ||
      ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;

```

You would typically only GRANT EXECUTE on DBMS_STOCK_SERVICE to the stock service application server, and would only GRANT EXECUTE on stock_request to those users allowed to use the service.

Summary of DBMS_PIPE Subprograms

Table 88–2 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function on page 88-19	Creates a pipe (necessary for private pipes)
NEXT_ITEM_TYPE Function on page 88-21	Returns datatype of next item in buffer
PACK_MESSAGE Procedures on page 88-22	Builds message in local buffer
PURGE Procedure on page 88-24	Purges contents of named pipe
RECEIVE_MESSAGE Function on page 88-25	Copies message from named pipe into local buffer
REMOVE_PIPE Function on page 88-28	Removes the named pipe
RESET_BUFFER Procedure on page 88-27	Purges contents of local buffer
SEND_MESSAGE Function on page 88-29	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
UNIQUE_SESSION_NAME Function on page 88-31	Returns unique session name
UNPACK_MESSAGE Procedures on page 88-32	Accesses next item in buffer

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
    pipename      IN VARCHAR2,
    maxpipesize   IN INTEGER DEFAULT 8192,
    private       IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 88–3 CREATE_PIPE Function Parameters

Parameter	Description
<code>pipename</code>	<p>Name of the pipe you are creating.</p> <p>You must use this name when you call <code>SEND_MESSAGE</code> and <code>RECEIVE_MESSAGE</code>. This name must be unique across the instance.</p> <p>Caution: Do not use pipe names beginning with <code>ORA\$</code>. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.</p>
<code>maxpipesize</code>	<p>The maximum size allowed for the pipe, in bytes.</p> <p>The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default <code>maxpipesize</code> is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value use the existing, larger value.</p>
<code>private</code>	<p>Uses the default, <code>TRUE</code>, to create a private pipe.</p> <p>Public pipes can be implicitly created when you call <code>SEND_MESSAGE</code>.</p>

Return Values

Table 88–4 CREATE_PIPE Function Return Values

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 88–5 CREATE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `NEXT_ITEM_TYPE`.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values

Table 88–6 *NEXT_ITEM_TYPE* Function Return Values

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to `PACK_MESSAGE`. Then, call `SEND_MESSAGE` to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type `VARCHAR2`, `NCHAR`, `NUMBER`, `DATE`, `RAW` and `ROWID` items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than `VARCHAR` is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (
    item IN VARCHAR2);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NCHAR);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN NUMBER);
```

```
DBMS_PIPE.PACK_MESSAGE (
    item IN DATE);
```

```
DBMS_PIPE.PACK_MESSAGE_RAW (
    item IN RAW);
```

```
DBMS_PIPE.PACK_MESSAGE_ROWID (
    item IN ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

Table 88–7 *PACK_MESSAGE Procedure Parameters*

Parameter	Description
item	Item to pack into the local message buffer.

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

Syntax

```
DBMS_PIPE.PURGE (  
    pipename IN VARCHAR2);
```

Pragmas

```
pragma restrict_references (purge, WNDS, RNDS);
```

Parameters

Table 88–8 *PURGE Procedure Parameters*

Parameter	Description
<code>pipename</code>	Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

Usage Notes

Because `PURGE` calls `RECEIVE_MESSAGE`, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an `ORA-23322` (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (receive_message, WNDS, RNDS);
```

Parameters

Table 88–9 RECEIVE_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA\$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

Return Values

Table 88–10 RECEIVE_MESSAGE Function Return Values

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is

overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Exceptions

Table 88–11 *RECEIVE_MESSAGE Function Exceptions*

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

RESET_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by SEND_MESSAGE are automatically removed when empty. However, pipes created explicitly by CREATE_PIPE are removed only by calling REMOVE_PIPE, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling PURGE on an implicitly-created pipe.

Syntax

```
DBMS_PIPE.REMOVE_PIPE (
    pipename IN VARCHAR2)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

Parameters

Table 88–12 REMOVE_PIPE Function Parameters

Parameter	Description
pipename	Name of pipe that you want to remove.

Return Values

Table 88–13 REMOVE_PIPE Function Return Values

Return	Description
0	Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

Exceptions

Table 88–14 REMOVE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to `PACK_MESSAGE`. You can create a pipe explicitly using `CREATE_PIPE`, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename      IN VARCHAR2,
    timeout       IN INTEGER DEFAULT MAXWAIT,
    maxpipesize   IN INTEGER DEFAULT 8192)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (send_message, WNDS, RNDS);
```

Parameters

Table 88–15 SEND_MESSAGE Function Parameters

Parameter	Description
pipename	<p>Name of the pipe on which you want to place the message.</p> <p>If you are using an explicit pipe, then this is the name that you specified when you called <code>CREATE_PIPE</code>.</p> <p>Caution: Do not use pipe names beginning with 'ORA\$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.</p>
timeout	<p>Time to wait while attempting to place a message on a pipe, in seconds.</p> <p>The default value is the constant <code>MAXWAIT</code>, which is defined as 86400000 (1000 days).</p>
maxpipesize	<p>Maximum size allowed for the pipe, in bytes.</p> <p>The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes.</p> <p>The <code>maxpipesize</code> for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of <code>SEND_MESSAGE</code> with larger values cause the <code>maxpipesize</code> to be increased. Callers with a smaller value simply use the existing, larger value.</p> <p>Specifying <code>maxpipesize</code> as part of the <code>SEND_MESSAGE</code> procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional <code>maxpipesize</code> parameter to override the creation pipe size specifications.</p>

Return Values

Table 88–16 SEND_MESSAGE Function Return Values

Return	Description
0	<p>Success.</p> <p>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</p> <p>If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</p>
1	<p>Timed out.</p> <p>This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</p>
3	<p>An interrupt occurred.</p> <p>If the pipe was implicitly created and is empty, then it is removed.</p>
ORA-23322	<p>Insufficient privileges.</p> <p>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</p>

Exceptions

Table 88–17 SEND_MESSAGE Function Exception

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the PIPENAME parameter for your SEND_MESSAGE and RECEIVE_MESSAGE calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME  
    RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called `RECEIVE_MESSAGE` to place pipe information in a local buffer, call `UNPACK_MESSAGE`.

Note: The `UNPACK_MESSAGE` procedure is overloaded to return items of type `VARCHAR2`, `NCHAR`, `NUMBER`, or `DATE`. There are two additional procedures to unpack `RAW` and `ROWID` items.

Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
    item OUT VARCHAR2);

DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NCHAR);

DBMS_PIPE.UNPACK_MESSAGE (
    item OUT NUMBER);

DBMS_PIPE.UNPACK_MESSAGE (
    item OUT DATE);

DBMS_PIPE.UNPACK_MESSAGE_RAW (
    item OUT RAW);

DBMS_PIPE.UNPACK_MESSAGE_ROWID (
    item OUT ROWID);
```

Pragmas

```
pragma restrict_references (unpack_message, WNDS, RNDS);
pragma restrict_references (unpack_message_raw, WNDS, RNDS);
pragma restrict_references (unpack_message_rowid, WNDS, RNDS);
```

Parameters

Table 88–18 UNPACK_MESSAGE Procedure Parameters

Parameter	Description
<code>item</code>	Argument to receive the next unpacked item from the local message buffer.

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

DBMS_PREDICTIVE_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

See Also: *Oracle Data Mining Concepts* for an overview of Oracle predictive analytics, including information about the Oracle Spreadsheet Add-In for Predictive Analytics.

This chapter contains the following topics:

- [Using DBMS_PREDICTIVE_ANALYTICS](#)
 - [Overview](#)
- [Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms](#)

Using DBMS_PREDICTIVE_ANALYTICS

This section contains topics that relate to using the DBMS_PREDICTIVE_ANALYTICS package.

- [Overview](#)

Overview

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

DBMS_PREDICTIVE_ANALYTICS automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Table 89–1 *DBMS_PREDICTIVE_ANALYTICS Package Subprograms*

Subprogram	Purpose
EXPLAIN Procedure on page 89-5	Ranks attributes in order of influence in explaining a target column.
PREDICT Procedure on page 89-7	Predicts the value of a target column based on values in the input data.
PROFILE Procedure on page 89-9	Generates rules that identify the records that have the same target value.

EXPLAIN Procedure

The `EXPLAIN` procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not `NULL`). These records are used by the procedure to train a model that calculates the attribute importance.

Note: `EXPLAIN` supports `DATE` and `TIMESTAMP` data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide*.

The `EXPLAIN` procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
    data_table_name      IN VARCHAR2,
    explain_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–2 *EXPLAIN Procedure Parameters*

Parameter	Description
<code>data_table_name</code>	Name of input table or view
<code>explain_column_name</code>	Name of the column to be explained
<code>result_table_name</code>	Name of the table where results are saved
<code>data_schema_name</code>	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The `EXPLAIN` procedure creates a result table with the columns described in [Table 89–3](#).

Table 89–3 EXPLAIN Procedure Result Table

Column Name	Data Type	Description
ATTRIBUTE_NAME	VARCHAR2 (30)	Name of a column in the input data; all columns except the explained column are listed in the result table.
EXPLANATORY_VALUE	NUMBER	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1. An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column. An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for PREDICT. In practice, an explanatory power equal to 1 is rarely returned.
RANK	NUMBER	Ranking of explanatory power. Rows with equal values for explanatory_value have the same rank. Rank values are not skipped in the event of ties.

Example

The following example performs an EXPLAIN operation on the SUPPLEMENTARY_DEMOGRAPHICS table of Sales History.

```
--Perform EXPLAIN operation
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
    data_table_name      => 'supplementary_demographics',
    explain_column_name => 'home_theater_package',
    result_table_name   => 'demographics_explain_result');
END;
/
--Display results
SELECT * FROM demographics_explain_result;
```

ATTRIBUTE_NAME	EXPLANATORY_VALUE	RANK
Y_BOX_GAMES	.524311073	1
YRS_RESIDENCE	.495987246	2
HOUSEHOLD_SIZE	.146208506	3
AFFINITY_CARD	.0598227	4
EDUCATION	.018462703	5
OCCUPATION	.009721543	6
FLAT_PANEL_MONITOR	.00013733	7
PRINTER_SUPPLIES	0	8
OS_DOC_SET_KANJI	0	8
BULK_PACK_DISKETTES	0	8
BOOKKEEPING_APPLICATION	0	8
COMMENTS	0	8
CUST_ID	0	8

The results show that Y_BOX_GAMES, YRS_RESIDENCE, and HOUSEHOLD_SIZE are the best predictors of HOME_THEATER_PACKAGE.

PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

Note: PREDICT supports DATE and TIMESTAMP data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide*.

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy           OUT NUMBER,
    data_table_name    IN VARCHAR2,
    case_id_column_name IN VARCHAR2,
    target_column_name IN VARCHAR2,
    result_table_name  IN VARCHAR2,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–4 PREDICT Procedure Parameters

Parameter	Description
accuracy	Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean.
data_table_name	Name of the input table or view.
case_id_column_name	Name of the column that uniquely identifies each case (record) in the input data.
target_column_name	Name of the column to predict.
result_table_name	Name of the table where results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The PREDICT procedure creates a result table with the columns described in [Table 89–5](#).

Table 89–5 PREDICT Procedure Result Table

Column Name	Data Type	Description
Case ID column name	VARCHAR2 or NUMBER	The name of the case ID column in the input data.
PREDICTION	VARCHAR2 or NUMBER	The predicted value of the target column for the given case.
PROBABILITY	NUMBER	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

Note: Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

Example

The following example performs a PREDICT operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy          => v_accuracy,
        data_table_name   => 'supplementary_demographics',
        case_id_column_name => 'cust_id',
        target_column_name => 'affinity_card',
        result_table_name => 'pa_demographics_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/
```

Accuracy = .788696903

```
--Display results
SELECT * FROM pa_demographics_predict_result WHERE rownum < 10;
```

CUST_ID	PREDICTION	PROBABILITY
101501	1	.834069848
101502	0	.991269965
101503	0	.99978311
101504	1	.971643388
101505	1	.541754127
101506	0	.803719133
101507	0	.999999303
101508	0	.999999987
101509	0	.999953074

PROFILE Procedure

The PROFILE procedure generates rules that describe the cases (records) from the input data. For example, if a target column CHURN has values 'Yes' and 'No', PROFILE generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not NULL). These cases are used by the procedure to build a model that calculates the rules.

Note: PROFILE does not support nested types or dates.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide*.

The PROFILE procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
    data_table_name          IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–6 PROFILE Procedure Parameters

Parameter	Description
data_table_name	Name of the table containing the data to be analyzed.
target_column_name	Name of the target column.
result_table_name	Name of the table where the results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The PROFILE procedure creates a result table with the columns described in [Table 89–7](#).

Table 89–7 PROFILE Procedure Result Table

Column Name	Data Type	Description
PROFILE_ID	NUMBER	A unique identifier for this profile (rule).
RECORD_COUNT	NUMBER	The number of records described by the profile.
DESCRIPTION	SYS.XMLTYPE	The profile rule. See " XML Schema for Profile Rules ".

XML Schema for Profile Rules

The DESCRIPTION column of the result table contains XML that conforms to the following XSD:

```

<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>

```

Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```

SET serveroutput ON
SET trimspool ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
    SELECT cust_id, education, occupation, affinity_card
    FROM sh.supplementary_demographics;
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.PROFILE(
    DATA_TABLE_NAME => 'cust_edu_occ_view',
    TARGET_COLUMN_NAME => 'affinity_card',
    RESULT_TABLE_NAME => 'profile_result');
END;
/
EXEC dbms_xdb_print.setPrintMode(dbms_xdb_print.PRINT_PRETTY, 2);

```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```

SELECT a.profile_id, a.record_count, a.description.getstringval()
FROM profile_result a;

```

This `SELECT` statement returns the rules for a target value of 0.

```

SELECT *
FROM profile_result t
WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;

```

To obtain more readable output, you can cut and paste the XML for a rule into a text file, save it with the `.xml` extension, and view the rule in a browser. The eight rules generated by this example are displayed as follows.

```

<SimpleRule id="1" score="0" recordCount="443">

DBMS_PREPROCESSOR

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics

- [Using DBMS_PREPROCESSOR](#)
 - Overview
 - Operating Notes
- [Data Structures](#)
 - Table Types
- [Summary of DBMS_PREPROCESSOR Subprograms](#)

Using DBMS_PREPROCESSOR

- [Overview](#)
- [Operating Notes](#)

Overview

There are three styles of subprograms.

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a `VARCHAR2` string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a `VARCHAR2` index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is `VALID` and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single `VARCHAR2` string in the second style, or as a `VARCHAR2` index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the `VARCHAR2` length limit.

Operating Notes

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be `VALID`. Likewise, the source text passed in as a `VARCHAR2` string or a `VARCHAR2` index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.
- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as `CREATE` or `REPLACE`. In general, the input source should be syntactically prepared in a way as if it were obtained from the `ALL_SOURCE` view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

anonymous block	(BEGIN DECLARE) ...
package	PACKAGE <name> ...
package body	PACKAGE BODY <name> ...
procedure	PROCEDURE <name> ...
function	FUNCTION <name> ...
type	TYPE <name> ...
type body	TYPE BODY <name> ...
trigger	(BEGIN DECLARE) ...

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the `ALL_SOURCE` view, the keyword `WRAPPED` always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the [GET_POST_PROCESSED_SOURCE Functions](#) or to one of the [PRINT_POST_PROCESSED_SOURCE Procedures](#), the exception `DBMS_PREPROCESSOR.WRAPPED_INPUT` is raised.

Data Structures

The DBMS_PREPROCESSOR package defines a TABLE type.

Table Types

[SOURCE_LINES_T Table Type](#)

SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

Syntax

```
TYPE source_lines_t IS  
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_PREPROCESSOR Subprograms

Table 90-1 DBMS_PREPROCESSOR Package Subprograms

Subprogram	Description
GET_POST_PROCESSED_SOURCE Functions on page 90-8	Returns the post-processed source text
PRINT_POST_PROCESSED_SOURCE Procedures on page 90-10	Prints post-processed source text

GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    object_type    VARCHAR2,
    schema_name    VARCHAR2,
    object_name    VARCHAR2);
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         VARCHAR2);
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
    source         source_lines_t);
RETURN source_lines_t;
```

Parameters

Table 90–2 GET_POST_PROCESSED_SOURCE Function Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions

Table 90-3 *GET_POST_PROCESSED_SOURCE* Function Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: <ul style="list-style-type: none">Character string buffer too smallA line is too long (> 32767 bytes)

PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls `DBMS_OUTPUT.PUT_LINE` to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    object_type    VARCHAR2,
    schema_name    VARCHAR2,
    object_name    VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source         VARCHAR2);
```

Prints post-processed source text of an `INDEX-BY` table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
    source         source_lines_t);
```

Parameters

Table 90-4 PRINT_POST_PROCESSED_SOURCE Procedure Parameters

Parameter	Description
<code>object_type</code>	Must be one of <code>PACKAGE</code> , <code>PACKAGE BODY</code> , <code>PROCEDURE</code> , <code>FUNCTION</code> , <code>TYPE</code> , <code>TYPE, BODY</code> or <code>TRIGGER</code> . Case sensitive.
<code>schema_name</code>	The schema name. Case insensitive unless a quoted identifier is used. If <code>NULL</code> , use current schema.
<code>object_name</code>	The name of the object. The <code>object_type</code> is always case insensitive. Case insensitive unless a quoted identifier is used.
<code>source</code>	The source text of the compilation unit
<code>source_lines_t</code>	<code>INDEX-BY</code> table containing the source text of the compilation unit. The source text is a concatenation of all the non- <code>NULL</code> <code>INDEX-BY</code> table elements in ascending index order.

Exceptions

Table 90-5 PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of <code>PACKAGE</code> , <code>PACKAGE BODY</code> , <code>PROCEDURE</code> , <code>FUNCTION</code> , <code>TYPE</code> , <code>TYPE, BODY</code> or <code>TRIGGER</code> .
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The <code>object_name</code> should not be <code>NULL</code> .

Table 90-5 (Cont.) PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-06502	Numeric or value error: <ul style="list-style-type: none">▪ Character string buffer too small▪ A line is too long (> 32767 bytes)

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

DBMS_PROFILER

The DBMS_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- [Using DBMS_PROFILER](#)
 - Overview
 - Security Model
 - Operational Notes
 - Exceptions
- [Summary of DBMS_PROFILER Subprograms](#)

Using DBMS_PROFILER

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)
- [Exceptions](#)

Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

Note: It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on). And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in [Table 91-1](#), [Table 91-2](#), and [Table 91-3](#).

Table 91-1 Columns in Table PLSQL_PROFILER_RUNS

Column	Datatype	Definition
runid	NUMBER PRIMARY KEY	Unique run identifier from plsql_profiler_runnumber
related_run	NUMBER	Runid of related run (for client/server correlation)
run_owner	VARCHAR2 (32)	User who started run
run_date	DATE	Start time of run
run_comment	VARCHAR2 (2047)	User provided comment for this run
run_total_time	NUMBER	Elapsed time for this run in nanoseconds
run_system_info	VARCHAR2 (2047)	Currently unused
run_comment1	VARCHAR2 (2047)	Additional comment
spare1	VARCHAR2 (256)	Unused

Table 91-2 Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
runid	NUMBER	Primary key, references plsql_profiler_runs,
unit_number	NUMBER	Primary key, internally generated library unit #
unit_type	VARCHAR2 (32)	Library unit type
unit_owner	VARCHAR2 (32)	Library unit owner name
unit_name	VARCHAR2 (32)	Library unit name timestamp on library unit
unit_timestamp	DATE	In the future will be used to detect changes to unit between runs

Table 91–2 (Cont.) Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

Table 91–3 Columns in Table PLSQL_PROFILER_DATA

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(`profrep.sql`) is provided with the PL/SQL demo scripts.

Security Model

The profiler only gathers data for units for which a user has `CREATE` privilege; you cannot use the package to profile units for which `EXECUTE ONLY` access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled `DEBUG`. Oracle advises that modules that are being profiled should be compiled `DEBUG`, since this provides additional information about the unit in the database.

Note: `DBMS_PROFILER` treats any program unit that is compiled in `NATIVE` mode as if you do not have `CREATE` privilege, that is, you will not get any output.

Operational Notes

- [Typical Run](#)
- [Two Methods of Exception Generation](#)

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a *"run"*. A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

Note: The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, *"warm up"* the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the `SYSADMIN` should use a modified `PROFLOAD.SQL` script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

Note: Do not alter the actual fields of the tables.

See Also: ["FLUSH_DATA Function and Procedure"](#) on page 91-10.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

Exceptions

Table 91–4 *DBMS_PROFILER Exceptions*

Exception	Description
<code>version_mismatch</code>	Corresponds to <code>error_version</code> .
<code>profiler_error</code>	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'
`error_param` constant `binary_integer` := 1;
- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'
`error_io` constant `binary_integer` := 2;
- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.
`error_version` constant `binary_integer` := -1;

Summary of DBMS_PROFILER Subprograms

Table 91-5 DBMS_PROFILER Package Subprograms

Subprogram	Description
FLUSH_DATA Function and Procedure on page 91-10	Flushes profiler data collected in the user's session
GET_VERSION Procedure on page 91-11	Gets the version of this API
INTERNAL_VERSION_CHECK Function on page 91-12	Verifies that this version of the DBMS_PROFILER package can work with the implementation in the database
PAUSE_PROFILER Function and Procedure on page 91-13	Pauses profiler data collection
RESUME_PROFILER Function and Procedure on page 91-14	Resumes profiler data collection
START_PROFILER Functions and Procedures on page 91-15	Starts profiler data collection in the user's session
STOP_PROFILER Function and Procedure on page 91-16	Stops profiler data collection in the user's session

FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

Note: Use the `PROFTAB.SQL` script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.FLUSH_DATA;
```

GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

Table 91-6 *GET_VERSION Procedure Parameters*

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK  
RETURN BINARY_INTEGER;
```

PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER  
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.PAUSE_PROFILER;
```

RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.RESUME_PROFILER;
```

START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the `START_PROFILER` function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER (
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER (
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.START_PROFILER (
    run_comment    IN VARCHAR2 := sysdate,
    run_comment1   IN VARCHAR2 := '',
    run_number     OUT BINARY_INTEGER);
```

```
DBMS_PROFILER.START_PROFILER (
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '');
```

Parameters

Table 91-7 *START_PROFILER Function Parameters*

Parameter	Description
<code>run_comment</code>	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
<code>run_number</code>	Stores the number of the run so you can store and later recall the run's data.
<code>run_comment1</code>	Allows you to make interesting comments about the run.

STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER  
    RETURN BINARY_INTEGER;  
  
DBMS_PROFILER.STOP_PROFILER;
```

DBMS_PROPAGATION_ADM

The DBMS_PROPAGATION_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

This chapter contains the following topic:

- [Summary of DBMS_PROPAGATION_ADM Subprograms](#)

Summary of DBMS_PROPAGATION_ADM Subprograms

Table 92–1 *DBMS_PROPAGATION_ADM Package Subprograms*

Subprogram	Description
ALTER_PROPAGATION Procedure on page 92-3	Adds, alters, or removes a rule set for a propagation
CREATE_PROPAGATION Procedure on page 92-5	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
DROP_PROPAGATION Procedure on page 92-8	Drops a propagation
START_PROPAGATION Procedure on page 92-10	Starts a propagation
STOP_PROPAGATION Procedure on page 92-11	Stops a propagation

Note: All subprograms commit unless specified otherwise.

ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

See Also: *Oracle Streams Concepts and Administration* and [Chapter 112, "DBMS_RULE_ADM"](#) for more information about rules and rule sets

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
  propagation_name      IN  VARCHAR2,
  rule_set_name         IN  VARCHAR2  DEFAULT NULL,
  remove_rule_set      IN  BOOLEAN   DEFAULT FALSE,
  negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
  remove_negative_rule_set IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 92–2 ALTER_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing positive rule set. If you specify <code>NULL</code> and the <code>remove_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing positive rule set.</p>
remove_rule_set	<p>If <code>TRUE</code>, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages.</p> <p>If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the positive rule set for the specified propagation.</p> <p>If the <code>rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

Table 92–2 (Cont.) ALTER_PROPAGATION Procedure Parameters

Parameter	Description
<code>negative_rule_set_name</code>	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>FALSE</code>, then the procedure retains any existing negative rule set. If you specify <code>NULL</code> and the <code>remove_negative_rule_set</code> parameter is set to <code>TRUE</code>, then the procedure removes any existing negative rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
<code>remove_negative_rule_set</code>	<p>If <code>TRUE</code>, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages.</p> <p>If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If <code>FALSE</code>, then the procedure retains the negative rule set for the specified propagation.</p> <p>If the <code>negative_rule_set_name</code> parameter is non-<code>NULL</code>, then this parameter should be set to <code>FALSE</code>.</p>

CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION (
    propagation_name      IN VARCHAR2,
    source_queue          IN VARCHAR2,
    destination_queue     IN VARCHAR2,
    destination_dblink   IN VARCHAR2 DEFAULT NULL,
    rule_set_name        IN VARCHAR2 DEFAULT NULL,
    negative_rule_set_name IN VARCHAR2 DEFAULT NULL,
    queue_to_queue       IN BOOLEAN  DEFAULT NULL,
    original_propagation_name IN VARCHAR2 DEFAULT NULL,
    auto_merge_threshold IN NUMBER   DEFAULT NULL);
```

Parameters

Table 92-3 CREATE_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. Note: The propagation_name setting cannot be altered after the propagation is created.
source_queue	The name of the source queue, specified as [<i>schema_name</i> .] <i>queue_name</i> . The current database must contain the source queue. For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.
destination_queue	The name of the destination queue, specified as [<i>schema_name</i> .] <i>queue_name</i> . For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.
destination_dblink	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. Note: Connection qualifiers are not allowed.

Table 92–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
rule_set_name	<p>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages.</p> <p>If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a positive rule set in the <code>hr</code> schema named <code>prop_rules</code>, enter <code>hr.prop_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</p>
negative_rule_set_name	<p>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</p> <p>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form <code>[schema_name.] rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_rules</code>, enter <code>hr.neg_rules</code>. If the schema is not specified, then the current user is the default.</p> <p>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package.</p> <p>If you specify <code>NULL</code>, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.</p> <p>If you specify <code>NULL</code>, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.</p> <p>If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.</p>
queue_to_queue	<p>If <code>TRUE</code>, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If <code>FALSE</code> or <code>NULL</code>, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Table 92–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
<code>original_propagation_name</code>	<p>Specify the original propagation name if the propagation being created is part of a split and merge operation initiated by the <code>SPLIT_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream using the <code>MERGE_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package.</p> <p>Specify <code>NULL</code> if the propagation being created is not part of a split and merge operation.</p> <p>See Also: "SPLIT_STREAMS Procedure" on page 129-158 and "MERGE_STREAMS Procedure" on page 129-116</p>
<code>auto_merge_theshold</code>	<p>Specify a positive number if both of the following conditions are met:</p> <ul style="list-style-type: none"> ■ The propagation being created is part of a split and merge operation initiated by the <code>SPLIT_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package. ■ The stream will be merged back to the original stream automatically. <p>Specify <code>NULL</code> if either of the following conditions are met:</p> <ul style="list-style-type: none"> ■ The propagation being created is not part of a split and merge operation. ■ The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically. <p>See Also: "SPLIT_STREAMS Procedure" on page 129-158 and "MERGE_STREAMS Procedure" on page 129-116</p>

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

- [Chapter 112, "DBMS_RULE_ADM"](#)
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name      IN VARCHAR2,
    drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 92–4 DROP_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	<p>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set.</p> <p>If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.</p>

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note: When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(  
    propagation_name IN VARCHAR2);
```

Parameter

Table 92–5 *START_PROPAGATION Procedure Parameter*

Parameter	Description
propagation_name	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
  propagation_name IN VARCHAR2,
  force            IN BOOLEAN DEFAULT FALSE);
```

Parameter

Table 92–6 STOP_PROPAGATION Procedure Parameter

Parameter	Description
propagation_name	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
force	If TRUE, then the procedure stops the propagation and clears the statistics for the propagation. If FALSE, then the procedure stops the propagation without clearing the statistics for the propagation.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the propagation is not started upon database instance startup.

DBMS_RANDOM

The DBMS_RANDOM package provides a built-in random number generator. DBMS_RANDOM is not intended for cryptography.

This chapter contains the following topics:

- [Using DBMS_RANDOM](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_RANDOM Subprograms](#)

Using DBMS_RANDOM

- [Security Model](#)
- [Operational Notes](#)

Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session.

Operational Notes

- `DBMS_RANDOM.RANDOM` produces integers in $[-2^{31}, 2^{31})$.
- `DBMS_RANDOM.VALUE` produces numbers in $[0,1)$ with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, userid, and process id if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

Summary of DBMS_RANDOM Subprograms

Table 93–1 DBMS_RANDOM Package Subprograms

Subprogram	Description
INITIALIZE Procedure on page 93-6	Initializes the package with a seed value
NORMAL Function on page 93-7	Returns random numbers in a normal distribution
RANDOM Procedure on page 93-8	Generates a random number
SEED Procedures on page 93-9	Resets the seed
STRING Function on page 93-10	Gets a random string
TERMINATE Procedure on page 93-11	Terminates package
VALUE Functions on page 93-12	This function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to low and less than high

Note: The [INITIALIZE Procedure](#), [RANDOM Procedure](#) and the [TERMINATE Procedure](#) are all obsolete and, while currently supported, are included in this release for legacy reasons only.

INITIALIZE Procedure

This procedure initializes the generator (but see [Usage Notes](#)).

Syntax

```
DBMS_RANDOM.INITIALIZE (  
    val IN BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS)
```

Parameters

Table 93–2 INITIALIZE Procedure Parameters

Parameter	Description
val	The seed number used to generate a random number.

Usage Notes

This procedure is obsolete as it simply calls the [SEED Procedures](#) on page 93-9.

NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL  
RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS)
```

Return Values

Table 93–3 *NORMAL Procedure Parameters*

Parameter	Description
number	Returns a random number.

RANDOM Procedure

This procedure generates a random number (but see [Usage Notes](#)).

Syntax

```
DBMS_RANDOM.RANDOM  
RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS)
```

Return Values

Table 93–4 *RANDOM Procedure Parameters*

Parameter	Description
binary_integer	Returns a random integer greater or equal to $-\text{power}(2,31)$ and less than $\text{power}(2,31)$.

Usage Notes

This procedure is obsolete and, although it is currently supported, it should not be used.

SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (  
    seed IN BINARY_INTEGER);
```

```
DBMS_RANDOM.SEED (  
    seed IN VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 93–5 SEED Procedure Parameters

Parameter	Description
seed	Seed number or string used to generate a random number.

Usage Notes

The seed can be a string up to length 2000.

STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING  
  opt IN CHAR,  
  len IN NUMBER)  
RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS)
```

Parameters

Table 93–6 *STRING Function Parameters*

Parameter	Description
opt	Specifies what the returning string looks like: <ul style="list-style-type: none">▪ 'u', 'U' - returning string in uppercase alpha characters▪ 'l', 'L' - returning string in lowercase alpha characters▪ 'a', 'A' - returning string in mixed case alpha characters▪ 'x', 'X' - returning string in uppercase alpha-numeric characters▪ 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.
len	The length of the returning string.

Return Values

Table 93–7 *STRING Function Return Values*

Parameter	Description
VARCHAR2	Returns a VARCHAR2.

TERMINATE Procedure

When you are finished with the package, call the TERMINATE procedure (but see [Usage Notes](#))

Syntax

```
DBMS_RANDOM.TERMINATE
```

Usage Notes

This procedure performs no function and, although it is currently supported, it is obsolete and should not be used.

VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number *x*, where *x* is greater than or equal to *low* and less than *high*.

Syntax

```
DBMS_RANDOM.VALUE  
RETURN NUMBER;
```

```
DBMS_RANDOM.VALUE(  
  low IN NUMBER,  
  high IN NUMBER)  
RETURN NUMBER;
```

Parameters

Table 93–8 VALUE Function Parameters

Parameter	Description
<i>low</i>	The lowest number in a range from which to generate a random number. The number generated may be equal to <i>low</i> .
<i>high</i>	The highest number below which to generate a random number. The number generated will be less than <i>high</i> .

Return Values

Table 93–9 VALUE Function Return Values

Parameter	Description
NUMBER	Returns an Oracle Number.

DBMS_RECTIFIER_DIFF

The DBMS_RECTIFIER_DIFF package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

- [Documentation of DBMS_RECTIFIER_DIFF](#)

Documentation of DBMS_RECTIFIER_DIFF

For a complete description of this package within the context of Replication, see DBMS_RECTIFIER_DIFF in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REDEFINITION

The DBMS_REDEFINITION package provides an interface to perform an online redefinition of tables.

See Also: *Oracle Database Administrator's Guide* for more information about online redefinition of tables

This chapter contains the following topics:

- [Using DBMS_REDEFINITION](#)
 - Overview
 - Constants
 - Operational Notes
- [Summary of DBMS_REDEFINITION Subprograms](#)

Using DBMS_REDEFINITION

- [Overview](#)
- [Constants](#)
- [Operational Notes](#)

Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

Constants

The `DBMS_REDEFINITION` package uses the constants shown in [Table 95–1, "DBMS_REDEFINITION Constants"](#):

Table 95–1 DBMS_REDEFINITION Constants

Constant	Type	Value	Description
<code>CONS_CONSTRAINT</code>	<code>PLS_INTEGER</code>	3	Used to specify that dependent object type is a constraint
<code>CONS_INDEX</code>	<code>PLS_INTEGER</code>	2	Used to specify that dependent object type is a index
<code>CONS_MVLOG</code>	<code>PLS_INTEGER</code>	10	Used to (un)register a materialized view log, as a dependent object of the table, via the REGISTER_DEPENDENT_OBJECT Procedure and the UNREGISTER_DEPENDENT_OBJECT Procedure .
<code>CONS_ORIG_PARAMS</code>	<code>PLS_INTEGER</code>	1	Used to specify that indexes should be cloned with their original storage parameters
<code>CONS_TRIGGER</code>	<code>PLS_INTEGER</code>	4	Used to specify that dependent object type is a trigger
<code>CONS_USE_PK</code>	<code>BINARY_INTEGER</code>	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
<code>CONS_USE_ROWID</code>	<code>BINARY_INTEGER</code>	2	Used to indicate that the redefinition should be done using rowids

Operational Notes

- `CONS_USE_PK` and `CONS_USE_ROWID` are constants used as input to the "options_flag" parameter in both the [START_REDEF_TABLE Procedure](#) and [CAN_REDEF_TABLE Procedure](#). `CONS_USE_ROWID` is used to indicate that the redefinition should be done using rowids while `CONS_USE_PK` implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- `CONS_INDEX`, `CONS_MVLOG`, `CONS_TRIGGER` and `CONS_CONSTRAINT` are used to specify the type of the dependent object being (un)registered in [REGISTER_DEPENDENT_OBJECT Procedure](#) and [UNREGISTER_DEPENDENT_OBJECT Procedure](#) (parameter "dep_type").
`CONS_INDEX ==>` dependent object is of type INDEX
`CONS_TRIGGER ==>` dependent object is of type TRIGGER
`CONS_CONSTRAINT==>` dependent object type is of type CONSTRAINT
`CONS_MVLOG ==>` dependent object is of type MATERIALIZED VIEW LOG
- `CONS_ORIG_PARAMS` as used as input to the "copy_indexes" parameter in [COPY_TABLE_DEPENDENTS Procedure](#). Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

Rules and Limits

For information about various rules and limits that apply to implementation of this package, see the *Oracle Database Administrator's Guide*.

Summary of DBMS_REDEFINITION Subprograms

Table 95–2 DBMS_REDEFINITION Package Subprograms

Subprogram	Description
ABORT_REDEF_TABLE Procedure on page 95-8	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
CAN_REDEF_TABLE Procedure on page 95-9	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure on page 95-10	Copies the dependent objects of the original table onto the interim table
FINISH_REDEF_TABLE Procedure on page 95-12	Completes the redefinition process.
REGISTER_DEPENDENT_OBJECT Procedure on page 95-13	Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table
START_REDEF_TABLE Procedure on page 95-14	Initiates the redefinition process
SYNC_INTERIM_TABLE Procedure on page 95-15	Keeps the interim table synchronized with the original table
UNREGISTER_DEPENDENT_OBJECT Procedure on page 95-16	Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table

ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after the [START_REDEF_TABLE Procedure](#) has been called and before the [FINISH_REDEF_TABLE Procedure](#) is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 95–3 ABORT_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
  uname          IN  VARCHAR2,
  tname          IN  VARCHAR2,
  options_flag   IN  PLS_INTEGER := 1,
  part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 95–4 CAN_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table
tname	The name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> ▪ If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. ▪ If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  copy_indexes    IN PLS_INTEGER := 1,
  copy_triggers   IN BOOLEAN := TRUE,
  copy_constraints IN BOOLEAN := TRUE,
  copy_privileges IN BOOLEAN := TRUE,
  ignore_errors   IN BOOLEAN := FALSE,
  num_errors      OUT PLS_INTEGER,
  copy_statistics IN BOOLEAN := FALSE,
  copy_mvlog      IN BOOLEAN := FALSE);
```

Parameters

Table 95–5 COPY_TABLE_DEPENDENTS Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table being redefined.
int_table	The name of the interim table.
copy_indexes	A flag indicating whether to copy the indexes <ul style="list-style-type: none"> ■ 0 - do not copy any index ■ dbms_redefinition.cons_orig_params - copy the indexes using the physical parameters of the source indexes
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	The number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing
copy_mvlog	TRUE = copy materialized view log, FALSE = do nothing

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the [COPY_TABLE_DEPENDENTS Procedure](#) again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the [REGISTER_DEPENDENT_OBJECT Procedure](#).
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
    uname          IN VARCHAR2,  
    orig_table     IN VARCHAR2,  
    int_table      IN VARCHAR2,  
    part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 95–6 FINISH_REDEF_TABLE Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  dep_type        IN PLS_INTEGER,
  dep_owner       IN VARCHAR2,
  dep_orig_name   IN VARCHAR2,
  dep_int_name    IN VARCHAR2);
```

Parameters

Table 95–7 REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA_REDEFINITION_ERRORS if an entry exists for that object.

START_REDEF_TABLE Procedure

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  col_mapping    IN VARCHAR2 := NULL,
  options_flag   IN BINARY_INTEGER := 1,
  orderby_cols  IN VARCHAR2 := NULL,
  part_name     IN VARCHAR2 := NULL);
```

Parameters

Table 95–8 *START_REDEF_TABLE Procedure Parameters*

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
col_mapping	The mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the <code>SELECT</code> clause of a query.) If <code>NULL</code> , all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use. <ul style="list-style-type: none"> ■ If <code>dbms_redefinition.cons_use_pk</code>, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having <code>NOT NULL</code> constraints). The default method of redefinition is using primary keys. ■ If <code>dbms_redefinition.cons_use_rowid</code>, the redefinition is done using rowids.
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) <code>ascending</code> / <code>descending</code>) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. <code>NULL</code> implies the entire table is being redefined.

SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
  uname          IN VARCHAR2,
  orig_table     IN VARCHAR2,
  int_table      IN VARCHAR2,
  part_name      IN VARCHAR2 := NULL);
```

Parameters

Table 95–9 SYNC_INTERIM_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the [FINISH_REDEF_TABLE Procedure](#) before completing the online redefinition.
- This procedure can be called between long running operations (such as CREATE INDEX) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPEPENDENT_OBJECT (
  uname           IN VARCHAR2,
  orig_table      IN VARCHAR2,
  int_table       IN VARCHAR2,
  dep_type        IN PLS_INTEGER,
  dep_owner       IN VARCHAR2,
  dep_orig_name   IN VARCHAR2,
  dep_int_name    IN VARCHAR2);
```

Parameters

Table 95–10 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

DBMS_REFRESH

The DBMS_REFRESH package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- [Documentation of DBMS_REFRESH](#)

Documentation of DBMS_REFRESH

For a complete description of this package within the context of Replication, see DBMS_REFRESH in the *Oracle Database Advanced Replication Management API Reference*.

The DBMS_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

See Also: For detailed information about using the DBMS_REPAIR package, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

Using DBMS_REPAIR

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Operating Notes](#)
- [Exceptions](#)
- [Examples](#)

Overview

Note: The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

Security Model

The package is owned by SYS. Execution privilege is not granted to other users.

Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

Table 97-1 lists the parameters and the enumerated constants.

Table 97-1 DBMS_REPAIR Parameters with Enumerated Constants

Parameter	Option	Type	Description
object_type	■ TABLE_OBJECT	BINARY_	-
	■ INDEX_OBJECT	INTEGER	
	■ CLUSTER_OBJECT		
action	■ CREATE_ACTION	BINARY_	-
	■ DROP_ACTION	INTEGER	
	■ PURGE_ACTION		
table_type	■ REPAIR_TABLE	BINARY_	-
	■ ORPHAN_TABLE	INTEGER	
flags	■ SKIP_FLAG	BINARY_	-
	■ NOSKIP_FLAG	INTEGER	
object_id	■ ALL_INDEX_ID := 0	BINARY_	Clean up all objects that qualify
wait_for_lock	■ LOCK_WAIT := 1	BINARY_	Specifies whether to try getting DML locks on underlying table [[sub]partition] object
	■ LOCK_NOWAIT := 0	INTEGER	

Note: The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

Operating Notes

The procedure to create the `ORPHAN_KEYS_TABLE` is similar to the one used to create the `REPAIR_TABLE`.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the [CHECK_OBJECT Procedure](#) would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;
```

When invoking the [CHECK_OBJECT Procedure](#) the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the [ADMIN_TABLES Procedure](#) or `CREATE_ACTION`.

Other actions in the [ADMIN_TABLES Procedure](#) can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

Exceptions

Table 97–2 DBMS_REPAIR Exceptions

Exception	Description	Action
942	Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.	-
955	Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.	-
24120	An invalid parameter was passed to the specified DBMS_REPAIR procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the BLOCK_START and BLOCK_END parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid ACTION parameter was specified.	Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.	Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.
24127	TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.	Do not specify TABLESPACE when performing actions other than CREATE_ACTION.
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

Examples

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');  
  
/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/  
  
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

Summary of DBMS_REPAIR Subprograms

Table 97–3 DBMS_REPAIR Package Subprograms

Subprogram	Description
ADMIN_TABLES Procedure on page 97-10	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
CHECK_OBJECT Procedure on page 97-11	Detects and reports corruptions in a table or index
DUMP_ORPHAN_KEYS Procedure on page 97-13	Reports on index entries that point to rows in corrupt data blocks
FIX_CORRUPT_BLOCKS Procedure on page 97-14	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
ONLINE_INDEX_CLEAN Function on page 97-15	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
REBUILD_FREELISTS Procedure on page 97-16	Rebuilds an object's freelists
SEGMENT_FIX_STATUS Procedure on page 97-17	Fixes the corrupted state of a bitmap entry
SKIP_CORRUPT_BLOCKS Procedure on page 97-18	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
    table_name IN VARCHAR2,
    table_type IN BINARY_INTEGER,
    action      IN BINARY_INTEGER,
    tablespace IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 97-4 ADMIN_TABLES Procedure Parameters

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See " Constants " on page 97-5.
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See " Constants " on page 97-5.
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  partition_name   IN VARCHAR2      DEFAULT NULL,
  object_type      IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN BINARY_INTEGER DEFAULT NULL,
  relative_fno    IN BINARY_INTEGER DEFAULT NULL,
  block_start     IN BINARY_INTEGER DEFAULT NULL,
  block_end       IN BINARY_INTEGER DEFAULT NULL,
  corrupt_count   OUT BINARY_INTEGER);
```

Parameters

Table 97-5 CHECK_OBJECT Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " Constants " on page 97-5.
repair_table_name	Name of the repair table to be populated. The table must exist in the <code>SYS</code> schema. Use the <code>ADMIN_TABLES</code> Procedure to create a repair table. The default name is <code>REPAIR_TABLE</code> .
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of <code>block_start</code> or <code>block_end</code> is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  orphan_table_name IN  VARCHAR2      DEFAULT 'ORPHAN_KEYS_TABLE',
  flags            IN  BINARY_INTEGER DEFAULT NULL,
  key_count        OUT BINARY_INTEGER);
```

Parameters

Table 97-6 DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is <code>INDEX_OBJECT</code> . See " Constants " on page 97-5.
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the <code>SYS</code> schema. The <code>ADMIN_TABLES</code> Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the [CHECK_OBJECT Procedure](#).

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
  schema_name      IN  VARCHAR2,
  object_name      IN  VARCHAR2,
  partition_name   IN  VARCHAR2      DEFAULT NULL,
  object_type      IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
  repair_table_name IN  VARCHAR2      DEFAULT 'REPAIR_TABLE',
  flags           IN  BINARY_INTEGER DEFAULT NULL,
  fix_count       OUT BINARY_INTEGER);
```

Parameters

Table 97-7 *FIX_CORRUPT_BLOCKS Procedure Parameters*

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if <code>partition_name</code> is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either <code>TABLE_OBJECT</code> (default) or <code>INDEX_OBJECT</code> . See " Constants " on page 97-5.
repair_table_name	Name of the repair table with the repair directives. Must exist in the <code>SYS</code> schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds. This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns TRUE if all indexes specified were cleaned up and FALSE if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
    object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
    wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

Parameters

Table 97-8 *ONLINE_INDEX_CLEAN Function Parameters*

Parameter	Description
object_id	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
wait_for_lock	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If LOCK_NOWAIT is specified, then the lock get does not retry.

REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
  schema_name    IN VARCHAR2,
  object_name    IN  VARCHAR2,
  partition_name IN VARCHAR2 DEFAULT NULL,
  object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 97-9 REBUILD_FREELISTS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See " Constants " on page 97-5.

SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
  segment_owner  IN VARCHAR2,
  segment_name   IN VARCHAR2,
  segment_type   IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  file_number    IN BINARY_INTEGER DEFAULT NULL,
  block_number   IN BINARY_INTEGER DEFAULT NULL,
  status_value   IN BINARY_INTEGER DEFAULT NULL,
  partition_name IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 97–10 *SEGMENT_FIX_STATUS Procedure Parameters*

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: <ul style="list-style-type: none"> ■ 1 = block is full ■ 2 = block is 0-25% free ■ 3 = block is 25-50% free ■ 4 = block is 50-75% free ■ 5 = block is 75-100% free The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

Note: When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
  schema_name  IN VARCHAR2,
  object_name  IN VARCHAR2,
  object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
  flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 97-11 SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be processed.
object_name	Name of the object.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See "Constants" on page 97-5.
flags	If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See "Constants" on page 97-5.

The DBMS_REPCAT package provides routines to administer and update the replication catalog and environment.

- [Documentation of DBMS_REPCAT](#)

Documentation of DBMS_REPCAT

For a complete description of this package within the context of Replication, see DBMS_REPCAT in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPCAT_ADMIN

The DBMS_REPCAT_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

- [Documentation of DBMS_REPCAT_ADMIN](#)

Documentation of DBMS_REPCAT_ADMIN

For a complete description of this package within the context of Replication, see DBMS_REPCAT_ADMIN in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPCAT_INSTANTIATE

The DBMS_REPCAT_INSTANTIATE package instantiates deployment templates.

- [Documentation of DBMS_REPCAT_INSTANTIATE](#)

Documentation of DBMS_REPCAT_INSTANTIATE

For a complete description of this package within the context of Replication, see DBMS_REPCAT_INSTANTIATE in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPCAT_RGT

The DBMS_REPCAT_RGT package controls the maintenance and definition of refresh group templates.

- [Documentation of DBMS_REPCAT_RGT](#)

Documentation of DBMS_REPCAT_RGT

For a complete description of this package within the context of Replication, see DBMS_REPCAT_RGT in the *Oracle Database Advanced Replication Management API Reference*.

DBMS_REPUTIL

The DBMS_REPUTIL package contains subprograms to generate shadow tables, triggers, and packages for table replication, as well as subprograms to generate wrappers for replication of standalone procedure invocations and packaged procedure invocations. This package is referenced only by the generated code.

- [Documentation of DBMS_REPUTIL](#)

Documentation of DBMS_REPUTIL

For a complete description of this package within the context of Replication, see DBMS_REPUTIL in the *Oracle Database Advanced Replication Management API Reference*.

The DBMS_RESCONFIG package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

See Also: *Oracle XML DB Developer's Guide* for more information about "Resource Configuration".

This chapter contains the following topics:

- [Using DBMS_RESCONFIG](#)
 - Overview
- [Summary of DBMS_RESCONFIG Subprograms](#)

Using DBMS_RESCONFIG

- [Overview](#)

Overview

The DBMS_RESCONFIG package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

Summary of DBMS_RESCONFIG Subprograms

This table lists the package subprograms in alphabetical order.

Table 103–1 DBMS_RESCONFIG Package Subprograms

Subprogram	Description
ADDREPOSITORYRESCONFIG Procedure on page 103-5	Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list
ADDRESCONFIG Procedure on page 103-6	Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list
APPENDRESCONFIG Procedure on page 103-7	Appends the resource configuration specified by rpath to the target resource's configuration list if it is not already included in the list
DELETEREPOSITORYRESCONFIG Procedure on page 103-8	Removes the configuration at the given position in the repository's configuration list.
DELETERESCONFIG Procedures on page 103-9	Removes the configuration at the given position in the target resource's configuration list. 1
GETLISTENERS Function on page 103-10	Returns the list of listeners applicable for a given resource
GETREPOSITORYRESCONFIG Function on page 103-11	Returns the resource configuration at the specified position of the repository's configuration list
GETREPOSITORYRESCONFIGPATHS Function on page 103-12	Returns a list of resource configuration paths defined for the repository
GETRESCONFIG Function on page 103-13	Returns the resource configuration at the specified position of the target resource's configuration list
GETRESCONFIGPATHS Function on page 103-14	Returns a list of resource configuration paths defined in the target resource's configuration list

ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG (
  rcpath      IN   VARCHAR2,
  pos         IN   PLS_INTEGER := NULL);
```

Parameters

Table 103–2 ADDREPOSITORYRESCONFIG Function Parameters

Parameter	Description
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if <code>rcpath</code> already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (<code>pos < 0</code> or <code>pos ></code> the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `XDBADMIN` role and `READ` privilege on the resource configuration to be inserted; otherwise, an error is returned.

ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
    respath    IN    VARCHAR2,
    rcpath     IN    VARCHAR2,
    pos        IN    PLS_INTEGER := NULL);
```

Parameters

Table 103–3 ADDRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range ($pos < 0$ or $pos >$ the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by `rpath` to the target resource's configuration list if it is not already included in the list.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
  respath      IN  VARCHAR2,
  rpath        IN  VARCHAR2,
  appendOption IN  PLS_INTEGER);
```

Parameters

Table 103–4 ADDRESCONFIG Function Parameters

Parameter	Description
<code>respath</code>	Absolute path of the target resource
<code>rpath</code>	Absolute path of the resource configuration to be appended at the end of the target's configuration list. If <code>rpath</code> already exists in the list then nothing is appended.
<code>appendOption</code>	Either <code>APPEND_RESOURCE</code> or <code>APPEND_RECURSIVE</code> . If <code>APPEND_RESOURCE</code> is specified then only the target resource is affected. If <code>APPEND_RECURSIVE</code> is specified then the target resource and all its descendents will be affected.

Usage Notes

- An error is raised if the document referenced by `rpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(  
    pos          IN    PLS_INTEGER);
```

Parameters

Table 103–5 DELETEREPOSITORYRESCONFIG Function Parameters

Parameter	Description
pos	The index of the configuration to be removed. An exception is raised if the index is out of range (pos < 0 or pos >= the size of the target resource's configuration list).

Usage Notes

- Users must have XDBADMIN role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG(
  respath      IN  VARCHAR2,
  pos          IN  PLS_INTEGER);
```

```
DBMS_RESCONFIG.DELETERESCONFIG(
  respath      IN  VARCHAR2,
  rcpath       IN  VARCHAR2,
  deleteOption IN  PLS_INTEGER);
```

Parameters

Table 103–6 DELETERESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
pos	The index of the configuration to be removed. An exception is raised if the index is out of range (<code>pos < 0</code> or <code>pos >=</code> the size of the target resource's configuration list).
rcpath	Absolute path of the resource configuration to be deleted if found in list.
deleteOption	Either <code>DELETE_RESOURCE</code> or <code>DELETE_RECURSIVE</code> . If <code>DELETE_RESOURCE</code> is specified then only the configuration list of the target resource is affected. If <code>DELETE_RECURSIVE</code> is specified then the configuration list of the target resource and all its descendents will be affected.

Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

Syntax

```
DBMS_RESCONFIG.GETLISTENERS(  
    path    IN    VARCHAR2)  
RETURN XMLTYPE;
```

Parameters

Table 103–7 *GETLISTENERS Function Parameters*

Parameter	Description
path	Absolute path of the target resource

Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(  
    pos    IN    PLS_INTEGER)  
RETURN XMLTYPE;
```

Parameters

Table 103–8 GETREPOSITORYRESCONFIG Function Parameters

Parameter	Description
pos	Index of element to return. An exception is raised if the index is out of range ($pos < 0$ or $pos \geq$ the size of the repository's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS  
RETURN XDB$STRING_LIST_T;
```

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(
    respath IN VARCHAR2,
    pos IN PLS_INTEGER)
RETURN XMLTYPE;
```

Parameters

Table 103–9 GETRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
pos	Index of element to return. An exception is raised if the index is out of range (<code>pos < 0</code> or <code>pos >=</code> the size of the target resource's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS (  
    respath IN VARCHAR2)  
RETURN XDB$STRING_LIST_T;
```

Parameters

Table 103–10 *GETRESCONFIGPATHS Function Parameters*

Parameter	Description
respath	Absolute path of the target resource

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

DBMS_RESOURCE_MANAGER

The DBMS_RESOURCE_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

See Also: For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Using DBMS_RESOURCE_MANAGER](#)
 - Deprecated Subprograms
 - Security Model
 - Constants
- [Summary of DBMS_RESOURCE_MANAGER Subprograms](#)

Using DBMS_RESOURCE_MANAGER

- [Deprecated Subprograms](#)
- [Security Model](#)
- [Constants](#)

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g:

- [SET_INITIAL_CONSUMER_GROUP Procedure](#)

Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures. The procedures to grant and revoke this privilege are in the package [Chapter 105, "DBMS_RESOURCE_MANAGER_PRIVS"](#).

Constants

Table 104–1 DBMS_RESOURCE_MANAGER Constants

Constant	Definition
CLIENT_MACHINE	CONSTANT VARCHAR2(30) := 'CLIENT_MACHINE';
CLIENT_OS_USER	CONSTANT VARCHAR2(30) := 'CLIENT_OS_USER';
CLIENT_PROGRAM	CONSTANT VARCHAR2(30) := 'CLIENT_PROGRAM';
MODULE_NAME	CONSTANT VARCHAR2(30) := 'MODULE_NAME';
MODULE_NAME_ACTION	CONSTANT VARCHAR2(30) := 'MODULE_NAME_ACTION';
ORACLE_USER	CONSTANT VARCHAR2(30) := 'ORACLE_USER';
SERVICE_MODULE	CONSTANT VARCHAR2(30) := 'SERVICE_MODULE';
SERVICE_MODULE_ACTION	CONSTANT VARCHAR2(30) := 'SERVICE_MODULE_ACTION';
SERVICE_NAME	CONSTANT VARCHAR2(30) := 'SERVICE_NAME';
PERFORMANCE_CLASS	CONSTANT VARCHAR2(30) := 'PERFORMANCE_CLASS';

Summary of DBMS_RESOURCE_MANAGER Subprograms

Table 104–2 DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
CALIBRATE_IO Procedure on page 104-8	Calibrates the I/O capabilities of storage
CLEAR_PENDING_AREA Procedure on page 104-11	Clears the work area for the resource manager
CREATE_CONSUMER_GROUP Procedure on page 104-12	Creates entries which define resource consumer groups
CREATE_PENDING_AREA Procedure on page 104-13	Creates a work area for changes to resource manager objects
CREATE_PLAN Procedure on page 104-15	Creates entries which define resource plans
CREATE_PLAN_DIRECTIVE Procedure on page 104-16	Creates resource plan directives
CREATE_SIMPLE_PLAN Procedure on page 104-20	Creates a single-level resource plan containing up to eight consumer groups in one step
DELETE_CONSUMER_GROUP Procedure on page 104-22	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure on page 104-23	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure on page 104-24	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure on page 104-25	Deletes resource plan directives
SET_CONSUMER_GROUP_MAPPING Procedure on page 104-26	Adds, deletes, or modifies pairs for the login and run-time attribute mappings
SET_CONSUMER_GROUP_MAPPING_PRI Procedure on page 104-27	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_GROUP Procedure on page 104-28	Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)
SUBMIT_PENDING_AREA Procedure on page 104-29	Submits pending changes for the resource manager
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure on page 104-30	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_GROUP_FOR_USER Procedure on page 104-31	Changes the resource consumer group for all sessions with a given user name
SWITCH_PLAN Procedure on page 104-32	Sets the current resource manager plan

Table 104–2 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
UPDATE_CONSUMER_GROUP Procedure on page 104-33	Updates entries which define resource consumer groups
UPDATE_PLAN Procedure on page 104-34	Updates entries which define resource plans
UPDATE_PLAN_DIRECTIVE Procedure on page 104-35	Updates resource plan directives
VALIDATE_PENDING_AREA Procedure on page 104-39	Validates pending changes for the resource manage

CALIBRATE_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the `V$IO_CALIBRATION_STATUS` view and results for a successful calibration run are located in `DBA_RSRC_IO_CALIBRATE` table.

Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
    num_physical_disks    IN  PLS_INTEGER DEFAULT 1,
    max_latency           IN  PLS_INTEGER DEFAULT 20,
    max_iops              OUT PLS_INTEGER,
    max_mbps              OUT PLS_INTEGER,
    actual_latency        OUT PLS_INTEGER);
```

Parameters

Table 104–3 CALIBRATE_IO Procedure Parameters

Parameter	Description
<code>num_physical_disks</code>	Approximate number of physical disks in the database storage
<code>max_latency</code>	Maximum tolerable latency in milliseconds for database-block-sized IO requests
<code>max_iops</code>	Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.
<code>max_mbps</code>	Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.
<code>actual_latency</code>	Average latency of database-block-sized I/O requests at <code>max_iops</code> rate, expressed in milliseconds

Usage Notes

- Only users with the `SYSDBA` privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `asynch_io` is enabled for datafiles. This can be achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `asynch_io` status by means of the following SQL statement:

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
  WHERE f.file#      = i.file_no
  AND  filetype_name = 'Data File'
/
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (RAC) database, the workload is simultaneously generated from all instances.

See Also: *Oracle Database Performance Tuning Guide* for more information about calibration

Examples

Example of using I/O Calibration procedure

```

SET SERVEROUTPUT ON
DECLARE
    lat INTEGER;
    iops INTEGER;
    mbps INTEGER;
BEGIN
-- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
    DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

    DBMS_OUTPUT.PUT_LINE ('max_iops = ' || iops);
    DBMS_OUTPUT.PUT_LINE ('latency = ' || lat);
    dbms_output.put_line('max_mbps = ' || mbps);
end;
/

```

View for I/O calibration results

```
SQL> desc V$IO_CALIBRATION_STATUS
```

Name	Null?	Type
STATUS		VARCHAR2(13)
CALIBRATION_TIME		TIMESTAMP(3)

```
SQL> desc gv$io_calibration_status
```

Name	Null?	Type
INST_ID		NUMBER
STATUS		VARCHAR2(13)
CALIBRATION_TIME		TIMESTAMP(3)

Column explanation:

STATUS:

IN PROGRESS : Calibration in Progress (Results from previous calibration run displayed, if available)

READY : Results ready and available from earlier run

NOT AVAILABLE : Calibration results not available.

CALIBRATION_TIME: End time of the last calibration run

DBA table that stores I/O Calibration results

```
SQL> desc DBA_RSRC_IO_CALIBRATE
```

Name	Null?	Type
START_TIME		TIMESTAMP(6)
END_TIME		TIMESTAMP(6)
MAX_IOPS		NUMBER
MAX_MBPS		NUMBER
MAX_PMBPS		NUMBER
LATENCY		NUMBER
NUM_PHYSICAL_DISKS		NUMBER

comment on table DBA_RSRC_IO_CALIBRATE is
'Results of the most recent I/O calibration'

/

comment on column DBA_RSRC_IO_CALIBRATE.START_TIME is

```
'start time of the most recent I/O calibration'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.END_TIME is  
'end time of the most recent I/O calibration'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.MAX_IOPS is  
'maximum number of data-block read requests that can be sustained per second'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.MAX_MBPS is  
'maximum megabytes per second of maximum-sized read requests that can be  
sustained'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.MAX_PMBPS is  
'maximum megabytes per second of large I/O requests that  
can be sustained by a single process'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.LATENCY is  
'latency for data-block read requests'  
/  
comment on column DBA_RSRC_IO_CALIBRATE.NUM_PHYSICAL_DISKS is  
'number of physical disks in the storage subsystem (as specified by user)'  
/
```

CLEAR_PENDING_AREA Procedure

This procedure clears pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

CREATE_CONSUMER_GROUP Procedure

This procedure creates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2,  
    comment        IN VARCHAR2,  
    cpu_mth        IN VARCHAR2 DEFAULT NULL,  
    mgmt_mth       IN VARCHAR2 DEFAULT 'ROUND-ROBIN');
```

Parameters

Table 104–4 CREATE_CONSUMER_GROUP Procedure Parameters

Parameter	Description
consumer_group	The name of the consumer group.
comment	The user's comment.
cpu_mth	Name of CPU resource allocation method (deprecated)
mgmt_mth	Name of CPU resource allocation method

CREATE_PENDING_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you have made are valid. You do not have to do your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

Note: Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

The following rules must be adhered to, and they are checked whenever the `validate` or `submit` procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- For Oracle8i, the plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 32 plan directives coming from any given plan (that is, no plan can have more than 32 children).
- There cannot be more than 32 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix the problem(s) and reissue the `validate` or `submit` procedures.

CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
  plan           IN  VARCHAR2,
  comment        IN  VARCHAR2,
  cpu_mth        IN  VARCHAR2 DEFAULT NULL, -- deprecated
  active_sess_pool_mth IN VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
  parallel_degree_limit_mth IN VARCHAR2 DEFAULT
    'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
  queueing_mth   IN  VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
  mgmt_mth       IN  VARCHAR2 DEFAULT 'EMPHASIS');
```

Parameters

Table 104-5 CREATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
comment	User's comment.
cpu_mth	Allocation method for CPU resources (deprecated)
active_sess_pool_mth	The Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	The resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	The Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available
mgmt_mth	The resource allocation method for specifying how much resources (e.g. CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> ■ EMPHASIS - for multi-level plans that use percentages to specify how I/O is resources are distributed among consumer groups. ■ RATIO - for single-level plans that use ratios to specify how I/O is resources are distributed.

Usage Notes

If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

CREATE_PLAN_DIRECTIVE Procedure

This procedure creates resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
  plan                IN VARCHAR2,
  group_or_subplan    IN VARCHAR2,
  comment             IN VARCHAR2,
  cpu_p1              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p2              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p3              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p4              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p5              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p6              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p7              IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p8              IN NUMBER   DEFAULT NULL, -- deprecated
  active_sess_pool_p1 IN NUMBER   DEFAULT NULL,
  queueing_p1        IN NUMBER   DEFAULT NULL,
  parallel_degree_limit_p1 IN NUMBER DEFAULT NULL,
  switch_group       IN VARCHAR2  DEFAULT NULL,
  switch_time        IN NUMBER   DEFAULT NULL,
  switch_estimate    IN BOOLEAN   DEFAULT FALSE,
  max_est_exec_time  IN NUMBER   DEFAULT NULL,
  undo_pool          IN NUMBER   DEFAULT NULL,
  max_idle_time      IN NUMBER   DEFAULT NULL,
  max_idle_blocker_time IN NUMBER DEFAULT NULL,
  switch_time_in_call IN NUMBER   DEFAULT NULL, -- deprecated
  mgmt_p1            IN NUMBER   DEFAULT NULL,
  mgmt_p2            IN NUMBER   DEFAULT NULL,
  mgmt_p3            IN NUMBER   DEFAULT NULL,
  mgmt_p4            IN NUMBER   DEFAULT NULL,
  mgmt_p5            IN NUMBER   DEFAULT NULL,
  mgmt_p6            IN NUMBER   DEFAULT NULL,
  mgmt_p7            IN NUMBER   DEFAULT NULL,
  mgmt_p8            IN NUMBER   DEFAULT NULL,
  switch_io_megabytes IN NUMBER   DEFAULT NULL,
  switch_io_reqs      IN NUMBER   DEFAULT NULL,
  switch_for_call     IN BOOLEAN   DEFAULT NULL);
```

Parameters

Table 104–6 CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
comment	Comment for the plan directive.
cpu_p1	First parameter for the CPU resources allocation method (deprecated use mgmt_p1 instead)
cpu_p2	Second parameter for the CPU resources allocation method (deprecated use mgmt_p2 instead)
cpu_p3	Third parameter for the CPU resources allocation method (deprecated use mgmt_p3 instead)

Table 104–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
cpu_p4	Fourth parameter for the CPU resources allocation method (deprecated use mgmt_p4 instead)
cpu_p5	Fifth parameter for the CPU resources allocation method (deprecated use mgmt_p5 instead)
cpu_p6	Sixth parameter for the CPU resources allocation method (deprecated use mgmt_p6 instead)
cpu_p7	Seventh parameter for the CPU resources allocation method (deprecated use mgmt_p7 instead)
cpu_p8	Eighth parameter for the CPU resources allocation method (deprecated use mgmt_p8 instead)
active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
switch_group	Specifies consumer group to switch to, once a switch condition is met. If the group name is 'CANCEL_SQL', then the current call is canceled when the switch condition is met. If the group name is 'KILL_SESSION', then the session is killed when the switch condition is met. Default is NULL.
switch_time	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
max_est_exec_time	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_time	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
switch_time_in_call	Deprecated. If this parameter is specified, switch_time will be effectively set to switch_time_in_call and switch_for_call will be effectively set to TRUE.
mgmt_p1	Resource allocation value for level 1 (replaces cpu_p1): <ul style="list-style-type: none"> ■ EMPHASIS - specifies the resource percentage at the first level ■ RATIO - specifies the weight of resource usage

Table 104–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
mgmt_p2	Resource allocation value for level 2 (replaces <code>cpu_p2</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the second level RATIO - non-applicable
mgmt_p3	Resource allocation value for level 3 (replaces <code>cpu_p3</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the third level RATIO - non-applicable
mgmt_p4	Resource allocation value for level 4 (replaces <code>cpu_p4</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the fourth level RATIO - non-applicable
mgmt_p5	Resource allocation value for level 5 (replaces <code>cpu_p5</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the fifth level RATIO - non-applicable
mgmt_p6	Resource allocation value for level 6 (replaces <code>cpu_p6</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the sixth level RATIO - non-applicable
mgmt_p7	Resource allocation value for level 7 (replaces <code>cpu_p7</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the seventh level RATIO - non-applicable
mgmt_p8	Resource allocation value for level 8 (replaces <code>cpu_p8</code>) <ul style="list-style-type: none"> EMPHASIS - specifies the resource percentage at the eighth level RATIO - non-applicable
switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is <code>NULL</code> , which means unlimited.
switch_for_call	Specifies that if an action is taken because of the <code>switch_time</code> , <code>switch_io_megabytes</code> , or <code>switch_io_reqs</code> parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is <code>FALSE</code> , which means that the original consumer group is not restored at the end of the top call.

Usage Notes

- All parameters default to `NULL`. However, for the `EMPHASIS` CPU resource allocation method, this case would starve all the users.

- For `max_idle_time` and `max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_time_in_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.

CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the `CREATE_CONSUMER_GROUP` and `CREATE_RESOURCE_PLAN_DIRECTIVES` procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
  simple_plan      IN VARCHAR2 DEFAULT NULL,
  consumer_group1 IN VARCHAR2 DEFAULT NULL,
  group1_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group2 IN VARCHAR2 DEFAULT NULL,
  group2_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group3 IN VARCHAR2 DEFAULT NULL,
  group3_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group4 IN VARCHAR2 DEFAULT NULL,
  group4_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group5 IN VARCHAR2 DEFAULT NULL,
  group5_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group6 IN VARCHAR2 DEFAULT NULL,
  group6_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group7 IN VARCHAR2 DEFAULT NULL,
  group7_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  consumer_group8 IN VARCHAR2 DEFAULT NULL,
  group8_cpu      IN NUMBER   DEFAULT NULL,   -- deprecated
  group1_percent  IN NUMBER   DEFAULT NULL,
  group2_percent  IN NUMBER   DEFAULT NULL,
  group3_percent  IN NUMBER   DEFAULT NULL,
  group4_percent  IN NUMBER   DEFAULT NULL,
  group5_percent  IN NUMBER   DEFAULT NULL,
  group6_percent  IN NUMBER   DEFAULT NULL,
  group7_percent  IN NUMBER   DEFAULT NULL,
  group8_percent  IN NUMBER   DEFAULT NULL);
```

Parameters

Table 104–7 CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
<code>simple_plan</code>	The name of the resource plan.
<code>consumer_group1</code>	Name of the consumer group
<code>group1_cpu</code>	Percentage for group (deprecated)
<code>consumer_group2</code>	Name of the consumer group
<code>group2_cpu</code>	Percentage for group (deprecated)
<code>consumer_group3</code>	Name of the consumer group
<code>group3_cpu</code>	Percentage for group (deprecated)
<code>consumer_group4</code>	Name of the consumer group
<code>group4_cpu</code>	Percentage for group (deprecated)
<code>consumer_group5</code>	Name of the consumer group
<code>group5_cpu</code>	Percentage for group (deprecated)

Table 104–7 (Cont.) CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
consumer_group6	Name of the consumer group
group6_cpu	Percentage for group (deprecated)
consumer_group7	Name of the consumer group
group7_cpu	Percentage for group (deprecated)
consumer_group8	Name of the consumer group
group8_cpu	Percentage for group (deprecated)
group1_percent	Percentage of resources allocated for this consumer group
group2_percent	Percentage of resources allocated for this consumer group
group3_percent	Percentage of resources allocated for this consumer group
group4_percent	Percentage of resources allocated for this consumer group
group5_percent	Percentage of resources allocated for this consumer group
group6_percent	Percentage of resources allocated for this consumer group
group7_percent	Percentage of resources allocated for this consumer group
group8_percent	Percentage of resources allocated for this consumer group

DELETE_CONSUMER_GROUP Procedure

This procedure delete entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (  
    consumer_group IN VARCHAR2);
```

Parameters

Table 104–8 *DELETE_CONSUMER_GROUP Procedure Parameters*

Parameters	Description
consumer_group	The name of the consumer group to be deleted.

DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (  
    plan IN VARCHAR2);
```

Parameters

Table 104–9 *DELETE_PLAN Procedure Parameters*

Parameter	Description
plan	The name of the resource plan to delete.

DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (  
    plan IN VARCHAR2);
```

Parameters

Table 104–10 *DELETE_PLAN_CASCADE Procedure Parameters*

Parameters	Description
plan	The name of the plan.

Usage Notes

If `DELETE_PLAN_CASCADE` encounters any error, then it rolls back, and nothing is deleted.

DELETE_PLAN_DIRECTIVE Procedure

This procedure deletes resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (  
    plan           IN VARCHAR2,  
    group_or_subplan IN VARCHAR2);
```

Parameters

Table 104–11 *DELETE_PLAN_DIRECTIVE Procedure Parameters*

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the group or subplan.

SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(  
  attribute      IN VARCHAR2,  
  value         IN VARCHAR2,  
  consumer_group IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 104–12 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

Parameters	Description
attribute	The mapping attribute to add/modify. It can be one of the Constants listed.
value	The attribute value to match.
consumer_group	The name of the mapped consumer group, or NULL to delete a mapping.

Usage Notes

If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is NULL, then any mapping from the given attribute and value will be deleted.

SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI (
  explicit           IN NUMBER,
  oracle_user       IN NUMBER,
  service_name      IN NUMBER,
  client_os_user    IN NUMBER,
  client_program    IN NUMBER,
  client_machine    IN NUMBER,
  module_name       IN NUMBER,
  module_name_action IN NUMBER,
  service_module    IN NUMBER,
  service_module_action IN NUMBER);
```

Parameters

Table 104–13 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

Parameters	Description
explicit	The priority of the explicit mapping.
oracle_user	The priority of the Oracle user name mapping.
service_name	The priority of the client service name mapping.
client_os_user	The priority of the client operating system user name mapping.
client_program	The priority of the client program mapping.
client_machine	The priority of the client machine mapping.
module_name	The priority of the application module name mapping.
module_name_action	The priority of the application module name and action mapping.
service_module	The priority of the service name and application module name mapping.
module_name_action	The priority of the service name, application module name, and application action mapping.

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
 - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
 - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.

SET_INITIAL_CONSUMER_GROUP Procedure

Note: This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user          IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

Parameters

Table 104–14 SET_INITIAL_CONSUMER_GROUP Procedure Parameters

Parameters	Description
user	The name of the user.
consumer_group	The user's initial consumer group.

Usage Notes

The ADMINISTER_RESOURCE_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

Note: These semantics are similar to those for ALTER USER DEFAULT ROLE.

If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT_CONSUMER_GROUP.

DEFAULT_CONSUMER_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have DEFAULT_CONSUMER_GROUP as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT_CONSUMER_GROUP.

SUBMIT_PENDING_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

Note: A call to SUBMIT_PENDING_AREA may fail even if VALIDATE_PENDING_AREA succeeds. This may happen if a plan being deleted is loaded by an instance after a call to VALIDATE_PENDING_AREA, but before a call to SUBMIT_PENDING_AREA.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (  
    session_id      IN NUMBER,  
    session_serial  IN NUMBER,  
    consumer_group  IN VARCHAR2);
```

Parameters

Table 104–15 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

Parameter	Description
session_id	SID column from the view V\$SESSION.
session_serial	SERIAL# column from view V\$SESSION.
consumer_group	The name of the consumer group to switch to.

SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also change the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
    user          IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

Parameters

Table 104–16 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

Parameter	Description
user	The name of the user.
consumer_group	The name of the consumer group to switch to.

Usage Notes

The [SWITCH_CONSUMER_GROUP_FOR_SESS Procedure](#) and SWITCH_CONSUMER_GROUP_FOR_USER procedures let you to raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.

These procedures cause the session to be moved into the newly specified consumer group immediately.

SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
  plan_name          IN  VARCHAR2,
  sid                IN  VARCHAR2 DEFAULT '*',
  allow_scheduler_plan_switches IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 104–17 SWITCH_PLAN Procedure Parameters

Parameter	Description
plan_name	The name of the plan to which to switch. Passing in an empty string (") for the plan_name, disables the resource manager
sid	The sid parameter is relevant only in a Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To re-enable automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

UPDATE_CONSUMER_GROUP Procedure

This procedure updates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
  consumer_group IN VARCHAR2,
  new_comment    IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth    IN VARCHAR2 DEFAULT NULL,
  new_mgmt_mth   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 104–18 UPDATE_CONSUMER_GROUP Procedure Parameter

Parameter	Description
consumer_group	The name of consumer group
new_comment	New user's comment
new_cpu_mth	Name of new method for CPU resource allocation (deprecated)
new_mgmt_mth	Name of new method for CPU resource allocation

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
  plan                IN VARCHAR2,
  new_comment         IN VARCHAR2 DEFAULT NULL,
  new_cpu_mth        IN VARCHAR2 DEFAULT NULL, -- deprecated
  new_active_sess_pool_mth IN VARCHAR2 DEFAULT NULL,
  new_parallel_degree_limit_mth IN VARCHAR2 DEFAULT NULL,
  new_queueing_mth   IN VARCHAR2 DEFAULT NULL,
  new_queueing_mth   IN VARCHAR2 DEFAULT NULL,
  new_mgmt_mth       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 104–19 UPDATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of resource plan.
new_comment	New user's comment.
new_cpu_mth	The name of new allocation method for CPU resources (deprecated).
new_active_sess_pool_mth	The name of new method for maximum active sessions.
new_parallel_degree_limit_mth	The name of new method for degree of parallelism.
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature.
new_mgmt_mth	The resource allocation method for specifying how much resources (e.g. CPU or I/O) each consumer group or sub-plan gets <ul style="list-style-type: none"> ▪ EMPHASIS - for multi-level plans that use percentages to specify how I/O is resources are distributed among consumer groups. ▪ RATIO - for single-level plans that use ratios to specify how I/O is resources are distributed.

Usage Notes

- If the parameters to [UPDATE_PLAN Procedure](#) are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

UPDATE_PLAN_DIRECTIVE Procedure

This procedure updates resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
  plan                               IN VARCHAR2,
  group_or_subplan                   IN VARCHAR2,
  new_comment                         IN VARCHAR2 DEFAULT NULL,
  new_cpu_p1                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p2                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p3                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p4                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p5                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p6                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p7                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_cpu_p8                         IN NUMBER   DEFAULT NULL, -- deprecated
  new_active_sess_pool_p1            IN NUMBER   DEFAULT NULL,
  new_queueing_p1                    IN NUMBER   DEFAULT NULL,
  new_parallel_degree_limit_p1       IN NUMBER   DEFAULT NULL,
  new_switch_group                    IN VARCHAR2 DEFAULT NULL,
  new_switch_time                    IN NUMBER   DEFAULT NULL,
  new_switch_estimate                IN BOOLEAN  DEFAULT FALSE,
  new_max_est_exec_time               IN NUMBER   DEFAULT NULL,
  new_undo_pool                       IN NUMBER   DEFAULT NULL,
  new_max_idle_time                  IN NUMBER   DEFAULT NULL,
  new_max_idle_blocker_time          IN NUMBER   DEFAULT NULL,
  switch_time_in_call                 IN NUMBER   DEFAULT NULL, -- deprecated
  mgmt_p1                            IN NUMBER   DEFAULT NULL,
  mgmt_p2                            IN NUMBER   DEFAULT NULL,
  mgmt_p3                            IN NUMBER   DEFAULT NULL,
  mgmt_p4                            IN NUMBER   DEFAULT NULL,
  mgmt_p5                            IN NUMBER   DEFAULT NULL,
  mgmt_p6                            IN NUMBER   DEFAULT NULL,
  mgmt_p7                            IN NUMBER   DEFAULT NULL,
  mgmt_p8                            IN NUMBER   DEFAULT NULL,
  switch_io_megabytes                IN NUMBER   DEFAULT NULL,
  switch_io_reqs                     IN NUMBER   DEFAULT NULL,
  switch_for_call                     IN BOOLEAN  DEFAULT NULL);
```

Parameters

Table 104–20 UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
new_comment	Comment for the plan directive.
new_cpu_p1	First parameter for the CPU resources allocation method ((deprecated - use new_mgmt_p1 instead)
new_cpu_p2	Parameter for the CPU resources allocation method ((deprecated - use new_mgmt_p2 instead)
new_cpu_p3	Parameter for the CPU resources allocation method (deprecated - use new_mgmt_p3 instead)

Table 104–20 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
<code>new_cpu_p4</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p4</code> instead)
<code>new_cpu_p5</code>	Parameter for the CPU resources allocation method (deprecated - use <code>new_mgmt_p5</code> instead)
<code>new_cpu_p6</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p6</code> instead)
<code>new_cpu_p7</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p7</code> instead)
<code>new_cpu_p8</code>	Parameter for the CPU resources allocation method (deprecated- use <code>new_mgmt_p8</code> instead)
<code>new_active_sess_pool_p1</code>	Specifies maximum number of concurrently active sessions for a consumer group. Default is <code>NULL</code> , which means unlimited.
<code>new_queueing_p1</code>	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is <code>NULL</code> , which means unlimited.
<code>new_switch_group</code>	Specifies a limit on the degree of parallelism for any operation. Default is <code>NULL</code> , which means unlimited. Switches to another group once a switch condition is met.
<code>new_switch_time</code>	Specifies consumer group to which this session is switched if other switch criteria is met. Default is <code>NULL</code> . If the group name is <code>'CANCEL_SQL'</code> , the current call will be canceled when other switch criteria are met. If the group name is <code>'KILL_SESSION'</code> , the session will be killed when other switch criteria are met.
<code>new_switch_estimate</code>	Specifies time (in seconds) that a session can execute before an action is taken. Default is <code>NULL</code> , which means unlimited.
<code>new_max_est_exec_time</code>	If <code>TRUE</code> , tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is <code>FALSE</code> .
<code>new_undo_pool</code>	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than <code>MAX_EST_EXEC_TIME</code> , the operation is not started and <code>ORA-07455</code> is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is <code>NULL</code> , which means unlimited.
<code>new_parallel_degree_limit_p1</code>	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is <code>NULL</code> , which means unlimited.
<code>new_max_idle_time</code>	Indicates the maximum session idle time. Default is <code>NULL</code> , which means unlimited.
<code>new_max_idle_blocker_time</code>	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
<code>new_switch_time_in_call</code>	Deprecated. If this parameter is specified, <code>new_switch_time</code> will be effectively set to <code>new_switch_time_in_call</code> and <code>new_switch_for_call</code> will be effectively set to <code>TRUE</code> .
<code>new_mgmt_p1</code>	Resource allocation value for level 1 (replaces <code>new_cpu_p1</code>): <ul style="list-style-type: none"> ■ EMPHASIS - specifies the resource percentage at the first level ■ RATIO - specifies the weight of resource usage

Table 104–20 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
new_mgmt_p2	Resource allocation value for level 2 (replaces new_cpu_p2) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the second level ▪ RATIO - non-applicable
new_mgmt_p3	Resource allocation value for level 3 (replaces new_cpu_p3) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the third level ▪ RATIO - non-applicable
new_mgmt_p4	Resource allocation value for level 4 (replaces new_cpu_p4) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the fourth level ▪ RATIO - non-applicable
new_mgmt_p5	Resource allocation value for level 5 (replaces new_cpu_p5) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the fifth level ▪ RATIO - non-applicable
new_mgmt_p6	Resource allocation value for level 6 (replaces new_cpu_p6) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the sixth level ▪ RATIO - non-applicable
new_mgmt_p7	Resource allocation value for level 7 (replaces new_cpu_p7) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the seventh level ▪ RATIO - non-applicable
new_mgmt_p8	Resource allocation value for level 8 (replaces new_cpu_p8) <ul style="list-style-type: none"> ▪ EMPHASIS - specifies the resource percentage at the eighth level ▪ RATIO - non-applicable
new_switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited.
new_switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited.
new_switch_for_call	Specifies that if an action is taken because of the new_switch_time, new_switch_io_megabytes, or new_switch_io_reqs parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is FALSE, which means that the original consumer group is not restored at the end of the top call.

Usage Notes

- If the parameters for UPDATE_PLAN_DIRECTIVE are left unspecified, then they remain unchanged in the data dictionary.

- For `new_max_idle_time` and `new_max_idle_blocker_time`, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.

VALIDATE_PENDING_AREA Procedure

This procedure validates pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

DBMS_RESOURCE_MANAGER_PRIVS

The DBMS_RESOURCE_MANAGER_PRIVS package maintains privileges associated with the Resource Manager.

See Also: For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- [Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms](#)

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Table 105–1 DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

Subprogram	Description
GRANT_SWITCH_CONSUMER_GROUP Procedure on page 105-3	Grants the privilege to switch to resource consumer groups
GRANT_SYSTEM_PRIVILEGE Procedure on page 105-4	Performs a grant of a system privilege
REVOKE_SWITCH_CONSUMER_GROUP Procedure on page 105-5	Revokes the privilege to switch to resource consumer groups.
REVOKE_SYSTEM_PRIVILEGE Procedure on page 105-6	Performs a revoke of a system privilege

GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
    grantee_name  IN VARCHAR2,
    consumer_group IN VARCHAR2,
    grant_option  IN BOOLEAN);
```

Parameters

Table 105–2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the `grant_option` parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also: [Chapter 104, "DBMS_RESOURCE_MANAGER"](#)

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
    'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
    dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name  IN VARCHAR2,
  privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
  admin_option  IN BOOLEAN);
```

Parameters

Table 105–3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
<code>grantee_name</code>	Name of the user or role to whom privilege is to be granted.
<code>privilege_name</code>	Name of the privilege to be granted.
<code>admin_option</code>	TRUE if the grant is with <code>admin_option</code> , FALSE otherwise.

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: `ADMINISTER_RESOURCE_MANAGER`. Database administrators have this system privilege with the `ADMIN` option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the `ADMIN` option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called `scott` without the `ADMIN` option:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
  grantee_name => 'scott',
  privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
  admin_option => FALSE);
END;
/
```

REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
    revokee_name    IN VARCHAR2,
    consumer_group  IN VARCHAR2);
```

Parameters

Table 105–4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the DEFAULT_CONSUMER_GROUP consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from PUBLIC, then any users who could previously only use the consumer group through PUBLIC will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to mail_maintenance_group from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
    'scott', 'mail_maintenance_group');
END;
/
```

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (  
    revokee_name    IN VARCHAR2,  
    privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 105–5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
revokee_name	Name of the user or role from whom privilege is to be revoked.
privilege_name	Name of the privilege to be revoked.

Examples

The following call revokes the ADMINISTER_RESOURCE_MANAGER from user scott:

```
BEGIN  
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');  
END;  
/
```

DBMS_RESULT_CACHE

The `DBMS_RESULT_CACHE` package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache. Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about "Using the Cross-Session PL/SQL Function Result Cache"
- *Oracle Database Performance Tuning Guide* for more information about "Result Cache Concepts"

This chapter contains the following topics:

- [Using DBMS_RESULT_CACHE](#)
 - Constants
- [Summary of DBMS_RESULT_CACHE Subprograms](#)

Using DBMS_RESULT_CACHE

- [Constants](#)

Constants

Table 106–1 DBMS_RESULT_CACHE Constants

Constant	Definition
STATUS_BYPS	CONSTANT VARCHAR(10) := 'BYPASS';
STATUS_DISA	CONSTANT VARCHAR(10) := 'DISABLED';
STATUS_ENAB	CONSTANT VARCHAR(10) := 'ENABLED';
STATUS_SYNC	CONSTANT VARCHAR(10) := 'SYNC';

Summary of DBMS_RESULT_CACHE Subprograms

Table 106–2 DBMS_RESULT_CACHE Package Subprograms

Subprogram	Description
BYPASS Procedure on page 106-5	Sets the bypass mode for the Result Cache
FLUSH Function & Procedure on page 106-6	Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics
INVALIDATE Functions & Procedures on page 106-7	Invalidates all the result-set objects that dependent upon the specified dependency object
INVALIDATE_OBJECT Functions & Procedures on page 106-8	Invalidates the specified result-set object(s)
MEMORY_REPORT Procedure on page 106-9	Produces the memory usage report for the Result Cache
STATUS Function on page 106-10	Checks the status of the Result Cache

BYPASS Procedure

This procedure sets the bypass mode for the Result Cache:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

Syntax

```
DBMS_RESULT_CACHE.BYPASS (
    bypass_mode IN BOOLEAN);
```

Parameters

Table 106–3 *BYPASS Procedure Parameters*

Parameter	Description
bypass_mode	<ul style="list-style-type: none"> ■ TRUE => Result Cache usage is bypassed ■ FALSE => Result Cache usage is turned on

Usage Notes

This operation is database instance specific.

Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS(TRUE);
    DBMS_RESULT_CACHE.FLUSH;
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

```
BEGIN
    DBMS_RESULT_CACHE.BYPASS(FALSE);
END;
/
```

This step must be performed on each instance if in a Oracle Real Application Clusters environment.

FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

Syntax

```
DBMS_RESULT_CACHE.FLUSH (  
    retainMem IN BOOLEAN DEFAULT FALSE,  
    retainSta IN BOOLEAN DEFAULT FALSE)  
RETURN BOOLEAN;
```

```
DBMS_RESULT_CACHE.FLUSH (  
    retainMem IN BOOLEAN DEFAULT FALSE,  
    retainSta IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 106–4 *FLUSH Function & Procedure Parameters*

Parameter	Description
retainMem	<ul style="list-style-type: none">TRUE => retains the free memory in the cacheFALSE (default) => releases the free memory to the system
retainSta	<ul style="list-style-type: none">TRUE => retains the existing cache statisticsFALSE (default) => clears the existing cache statistics

Return Values

TRUE if successful in removing all the objects.

INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (
  owner      IN VARCHAR2,
  name       IN VARCHAR2)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  owner      IN VARCHAR2,
  name       IN VARCHAR2);
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  object_id  IN BINARY_INTEGER)
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (
  object_id  IN BINARY_INTEGER);
```

Parameters

Table 106–5 *INVALIDATE Function & Procedure Parameters*

Parameter	Description
owner	Schema name
name	Object name
object_id	Dictionary object number

Return Values

The number of objects invalidated.

INVALIDATE_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (  
    id          IN BINARY_INTEGER)  
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (  
    id          IN BINARY_INTEGER);
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (  
    cache_id    IN VARCHAR2)  
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (  
    cache_id    IN VARCHAR2);
```

Parameters

Table 106–6 *INVALIDATE Function & Procedure Parameters*

Parameter	Description
id	Address of the cache object in the Result Cache
cache_id	Cache-id

Return Values

The number of objects invalidated.

MEMORY_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (  
    detailed    IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 106–7 MEMORY_REPORT Procedure Parameters

Parameter	Description
detailed	<ul style="list-style-type: none">■ TRUE => produces a more detailed report■ FALSE (default) => produces the standard report

Usage Notes

Invoking this procedure from SQL*Plus requires that the serveroutput be turned on.

STATUS Function

This function checks the status of the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.STATUS  
RETURN VARCHAR2;
```

Return Values

One of the following values:

- STATUS_DISA - Cache is not available
- STATUS_ENAB - Cache is available
- STATUS_BYPS: Cache has been made temporarilyunavailable.
- STATUS_SYNC - Cache is available, but synchronizing with RAC nodes

DBMS_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- [Using DBMS_RESUMABLE](#)
 - Operational Notes
- [Summary of DBMS_RESUMABLE Subprograms](#)

Using DBMS_RESUMABLE

- [Operational Notes](#)

Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

Summary of DBMS_RESUMABLE Subprograms

Table 107–1 DBMS_RESUMABLE Package Subprograms

Subprogram	Description
ABORT Procedure on page 107-5	Aborts a suspended resumable space allocation
GET_SESSION_TIMEOUT Function on page 107-6	Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code>
GET_TIMEOUT Function on page 107-7	Returns the current timeout value of resumable space allocations for the current session
SET_SESSION_TIMEOUT Procedure on page 107-8	Sets the timeout of resumable space allocations for a session with <code>session_id</code>
SET_TIMEOUT Procedure on page 107-9	Sets the timeout of resumable space allocations for the current session
SPACE_ERROR_INFO Function on page 107-10	Looks for space-related errors in the error stack, otherwise returning <code>FALSE</code>

ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (  
    session_id IN NUMBER);
```

Parameters

Table 107–2 *ABORT Procedure Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (  
    session_id IN NUMBER)  
RETURN NUMBER;
```

Parameters

Table 107-3 *GET_SESSION_TIMEOUT Function Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.

Return Values

Table 107-4 *GET_SESSION_TIMEOUT Function Return Values*

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for a session with <code>session_id</code> . The timeout is returned in seconds.

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT  
RETURN NUMBER;
```

Return Values

Table 107-5 *GET_TIMEOUT Function Return Values*

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.

SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (  
    session_id IN NUMBER,  
    timeout    IN NUMBER);
```

Parameters

Table 107–6 *SET_SESSION_TIMEOUT Procedure Parameters*

Parameter	Description
<code>session_id</code>	The session identifier of the resumable space allocation.
<code>timeout</code>	The timeout of the resumable space allocation.

SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (  
    timeout IN NUMBER);
```

Parameters

Table 107-7 SET_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The timeout of the resumable space allocation.

SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
  error_type      OUT VARCHAR2,
  object_type     OUT VARCHAR2,
  object_owner    OUT VARCHAR2,
  table_space_name OUT VARCHAR2,
  object_name     OUT VARCHAR2,
  sub_object_name OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 107–8 SPACE_ERROR_INFO Function Parameters

Parameter	Description
<code>error_type</code>	The space error type. It will be one of the following: <ul style="list-style-type: none"> ▪ NO MORE SPACE ▪ MAX EXTENTS REACHED ▪ SPACE QUOTA EXCEEDED
<code>object_type</code>	The object type. It will be one of the following: <ul style="list-style-type: none"> ▪ TABLE ▪ INDEX ▪ CLUSTER ▪ TABLE SPACE ▪ ROLLBACK SEGMENT ▪ UNDO SEGMENT ▪ LOB SEGMENT ▪ TEMP SEGMENT ▪ INDEX PARTITION ▪ TABLE PARTITION ▪ LOB PARTITION ▪ TABLE SUBPARTITION ▪ INDEX SUBPARTITION ▪ LOB SUBPARTITION <p>The type can also be <code>NULL</code> if it does not apply.</p>
<code>object_owner</code>	The owner of the object. <code>NULL</code> if it cannot be determined.
<code>table_space_name</code>	The table space where the object resides. <code>NULL</code> if it cannot be determined.
<code>object_name</code>	The name of rollback segment, temp segment, table, index, or cluster.
<code>sub_object_name</code>	The partition name or sub-partition name of <code>LOB</code> , <code>TABLE</code> , or <code>INDEX</code> . <code>NULL</code> if it cannot be determined.

The DBMS_RLMGR package contains various procedures to create and manage rules and rule sessions by the Rules Manager.

See Also: *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topic:

- [Summary of Rules Manager Subprograms](#)

Summary of Rules Manager Subprograms

Table 108–1 describes the subprograms in the DBMS_RLMGR package.

All the values and names passed to the procedures defined in the DBMS_RLMGR package are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 108–1 DBMS_RLMGR Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the event structure (also the Expression Filter attribute set)
ADD_EVENT Procedures	Adds an event to a rule class in an active session
ADD_FUNCTIONS Procedure	Adds a Function, a Type, or a Package to the approved list of functions with an event structure (also the Expression Filter attribute set)
ADD_RULE Procedure	Adds a rule to the rule class
CONDITION_REF Function	Retrieves the primitive rule condition reference from a rule condition for composite events
CONSUME_EVENT Function	Consumes an event using its identifiers and prepares the corresponding rule for action execution
CONSUME_PRIM_EVENTS Function	Consumes one or more primitive events with all or none semantics
CREATE_CONDITIONS_TABLE Procedure	Creates a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes
CREATE_EVENT_STRUCT Procedure	Creates an event structure
CREATE_EXPFIL_INDEXES Procedure	Creates expression filter indexes for the rule class if the default indexes have been dropped
CREATE_INTERFACE Procedure	Creates a rule class interface package to directly operate on the rule class
CREATE_RULE_CLASS Procedure	Creates a rule class
DELETE_RULE Procedure	Deletes a rule from a rule class
DROP_CONDITIONS_TABLE Procedure	Drops the conditions table
DROP_EVENT_STRUCT Procedure	Drops an event structure
DROP_EXPFIL_INDEXES Procedure	Drops Expression Filter indexes for the rule conditions
DROP_INTERFACE Procedure	Drops the rule class interface package
DROP_RULE_CLASS Procedure	Drops a rule class
EXTEND_EVENT_STRUCT Procedure	Adds an attribute to the primitive event structure
GET_AGGREGATE_VALUE Function	Retrieves the aggregate value computed for a collection event
GRANT_PRIVILEGE Procedure	Grants a privilege on a rule class to another user
PROCESS_RULES Procedure	Process the rules for a given event

Table 108-1 (Cont.) DBMS_RLMGR Package Subprograms

Subprogram	Description
PURGE_EVENTS Procedure	Resets the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events
RESET_SESSION Procedure	Starts a new rule session within a database session
REVOKE_PRIVILEGE Procedure	Revokes a privilege on a rule class from a user
SYNC_TEXT_INDEXES Procedure	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to an event structure, which is also the Expression Filter attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct  IN  VARCHAR2,
    attr_name     IN  VARCHAR2,
    attr_type     IN  VARCHAR2,
    attr_defv1    IN  VARCHAR2 default NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the event structure:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct  IN  VARCHAR2,
    attr_name     IN  VARCHAR2,
    tab_alias     IN  rlm$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    event_struct  IN  VARCHAR2,
    attr_name     IN  VARCHAR2,
    attr_type     IN  VARCHAR2,
    text_pref     IN  EXP$TEXT);
```

Parameters

Table 108–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
event_struct	Name of the event structure or attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
tab_alias	The type that identifies the database table to which the attribute is aliased
attr_defv1	Default value for the elementary attribute
text_pref	Text preferences such as LEXER and WORDLIST specification

Usage Notes

- This procedure adds an elementary attribute to an event structure. The event structure is internally managed as the Expression Filter attribute set. If the event structure was originally created from an existing object type, then additional attributes cannot be added.

Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions, which is equivalent to an event structure that is used for a rule class.

- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.
- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a VARCHAR2 or a CLOB. The preferences specified for a text attribute are used to process the predicates involving CONTAINS operator on the attributes. The valid preferences are those that are valid in the PARAMETERS clause of CTXRULE index creation. See *Oracle Text Application Developer's Guide* for the syntax.

Examples

The following commands adds two elementary attributes to an attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'HRAttrSet',
    ATTR_NAME => 'HRREP',
    attr_type => 'VARCHAR2');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'HRAttrSet',
    ATTR_NAME => 'DEPT',
    TAB_ALIAS => RLM$TABLE_ALIAS('DEPT'));
END;
```

The following commands create an attribute set with each hotel reservation including some additional information, described as the `AddlInfo` attribute of CLOB datatype. Rule conditions specified for this event structure can include text predicates on this attribute.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT (EVENT_STRUCT => 'AddFlight');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'AddHotel',
    ATTR_NAME => 'CustId',
    ATTR_TYPE => 'NUMBER');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'AddHotel',
    ATTR_NAME => 'Type',
    ATTR_TYPE => 'VARCHAR2(20)');
  . . .
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
    EVENT_STRUCT => 'AddHotel',
    ATTR_NAME => 'AddlInfo',
```

```
ATTR_TYPE => 'CLOB',  
TEXT_PREF => EXF$TEXT('LEXER hotelreserv_lexer');  
  
END;
```

ADD_EVENT Procedures

This procedure adds a primitive event to a rule class in an active rule session. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds a string representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
    rule_class      IN VARCHAR2,
    event_inst      IN VARCHAR2,
    event_type      IN VARCHAR2 default null);
```

Adds an AnyData representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
    rule_class      IN VARCHAR2,
    event_inst      IN sys.AnyData);
```

Parameters

Table 108–3 ADD_EVENT Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to add a primitive or a simple event to a rule class within an active rule session. By default, a rule session is the same as the database session. Optionally, multiple (sequential) rule sessions can be started within a database session by using the `RESET_SESSION` or `PROCESS_RULES` procedures.
- When the rule class is configured for simple events (consisting of only one primitive event structure), the `event_type` argument for the `ADD_EVENT` procedure can be ignored. Also, when the AnyData format of the event instance is passed, the event type information is embedded in the AnyData instance. In all other cases, the name of the primitive event structure being added to the rule class should be assigned to the `event_type` argument.
- For a valid event instance, the `ADD_EVENT` procedure processes the rules in the rule class and captures the results in the rule class results view (configured at the time of rule class creation). These results are preserved until the end of the rule session.
- When schema extended name is used for the rule class, you should have `PROCESS_RULES` privilege on the rule class. See the [GRANT_PRIVILEGE Procedure](#) for additional information. The value specified for the `event_type` argument is always resolved in the rule class owner's schema and should not use schema extended names. When a composite event structure is configured with a table alias

primitive event type, the name of the corresponding table should be assigned to the `event_type` argument.

Examples

The following commands add two events to the `CompTravelPromo` rule class that is configured for two types of primitive events (`AddFlight` and `AddRentalCar`).

```
BEGIN
  DBMS_RLMGR.ADD_EVENT(rule_class => 'CompTravelPromo',
                      event_inst =>
                        AddFlight.getVarchar(987, 'Abcair', 'Boston',
                                             'Orlando', '01-APR-2003', '08-APR-2003'),
                      event_type => 'AddFlight');

  DBMS_RLMGR.ADD_EVENT(rule_class => 'Scott.CompTravelPromo',
                      event_inst =>
                        AnyData.convertObject(
                          AddRentalCar(987, 'Luxury', '03-APR-2003',
                                       '08-APR-2003', NULL)));

END;
/
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the event structure, which is also the Expression Filter attribute set.

Syntax

```
DBMS_RLMGR.ADD_FUNCTIONS (
    event_struct IN VARCHAR2,
    funcs_name  IN VARCHAR2);
```

Parameters

Table 108–4 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
event_struct	Name of the event structure to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use in the rule conditions. If the expression set refers to a user-defined function, the expression set must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list.
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the rule condition are considered valid. The conditional expression can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets" in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ASET_FUNCTIONS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
    DBMS_RLMGR.ADD_FUNCTIONS (attr_set => 'Car4Sale',
                             funcs_name => 'HorsePower');
    DBMS_RLMGR.ADD_FUNCTIONS (attr_set => 'Car4Sale',
                             funcs_name => 'Scott.CrashTestRating');
END;
/
```

ADD_RULE Procedure

This procedure adds new rules to a rule class.

Syntax

```
DBMS_RLMGR.ADD_RULE (
    rule_class      IN  VARCHAR2,
    rule_id        IN  VARCHAR2,
    rule_cond      IN  VARCHAR2,
    actprf_nml     IN  VARCHAR2 DEFAULT NULL,
    actprf_vall    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 108–5 ADD_RULE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Unique identifier for the rule within the rule class
rule_cond	The condition for the rule. The condition uses the variables defined in the rule class's event structure.
actprf_nml	The list of action preference names for which values will be assigned through the actprf_vall argument
actprf_vall	The list of action preference values for the names list assigned to the actprf_nml argument

Usage Notes

- This procedure is used to add new rules to the rule class. The rule condition passed to the ADD_RULE procedure is validated using the event structure associated with the rule class. The action preferences names list is a subset of action preference categories configured during rule class creation.
- When schema extended name is used for the rule class, you should have ADD RULE privilege on the rule class. See the [GRANT_PRIVILEGE Procedure](#) for more information.
- Alternately, the owner of the rule class can add the rules using SQL INSERT statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users.

Note: The AUTOCOMMIT property of the rule class is ignored if the new rules are added using the SQL INSERT statement instead of the ADD_RULE procedure.

- See the [CREATE_RULE_CLASS Procedure](#) procedure for the structure of the rule class table.

Examples

The following command adds a rule to the rule class.

```

BEGIN
DBMS_RLMGR.ADD_RULE (
    rule_class => 'CompTravelPromo',
    rule_id => 'AB_AV_FL',
    rule_cond =>
        '<condition>
            <and join="Flt.CustId = Car.CustId">
                <object name="Flt">
                    Airline='Abcair' and ToCity='Orlando'
                </object>
                <object name="Car">
                    CarType = 'Luxury'
                </object>
            </and>
        </condition>' ,
    actprf_nml => 'PromoType, OfferedBy',
    actprf_vall => ''RentalCar', 'Acar'');
END;

```

With proper privileges, the following SQL INSERT statement can be used to add the rule to the rule class.

```

INSERT INTO CompTravelPromo (rlm$ruleid, rlm$rulecond, PromoType, OfferedBy)
VALUES ('AB_AV_FL',
        '<condition>
            <and join="Flt.CustId = Car.CustId">
                <object name="Flt">
                    Airline='Abcair' and ToCity='Orlando'
                </object>
                <object name="Car">
                    CarType = 'Luxury'
                </object>
            </and>
        </condition>',
        'RentalCar', 'Acar');

```

CONDITION_REF Function

This function retrieves the primitive rule condition reference from a rule condition for composite events.

Syntax

```
DBMS_RLMGR.CONDITION_REF (
    rule_cond IN  VARCHAR2,
    eventnm   IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 108–6 *CONDITION_REF Procedure Parameters*

Parameter	Description
rule_cond	Rule condition in XML format
eventnm	Name of the event for which the reference should be retrieved

Usage Notes

- For a rule condition in XML format, with a root <condition> element, this function retrieves the reference to a shared conditional expression on a particular primitive event.
- This function can be used in a query operating on the rule class table to find all the references to a given primitive rule condition. To speed-up such queries, one or more functional indexes are defined on the rlm\$rulecond column of the rule class table using this function signature. In order to make use of the index for a lookup query, the value assigned to the eventnm argument should be case sensitive.

Examples

The following command joins the rule class table with the primitive conditions table to identify all the rule conditions that have references to the shareable primitive conditions (the query uses a functional index defined on the rlm\$rulecond column). This query identifies all the rule conditions that refer to any shared conditions stored in the FlightConditions table.

```
select ctp.rlm$ruleid from CompTravelPromo ctp, FlightConditions fc
where dbms_rlmgr.condition_ref(ctp.rlm$rulecond, 'FLT') = fc.rlm$condid;
```

CONSUME_EVENT Function

This function consumes an event and prepares the corresponding rule for action execution. This is required only when the action (or rule execution) is carried by the user's application and not in the callback.

Syntax

```
DBMS_RLMGR.CONSUME_EVENT (
    rule_class      IN VARCHAR2,
    event_ident     IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 108–7 CONSUME_EVENT Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifier obtained from the corresponding rule class results view (or arguments of the action callback procedure in the case of rule class configured for RULE based consumption policy)

Returns

The function returns:

- 1 -- If the event is successfully consumed.
- 0 -- If the event is expired (owing to duration policy) or consumed by another session prior to this call.

Usage Notes

- When an **EXCLUSIVE** consumption policy is set for the events in a rule class, an event must be deleted from the system immediately after the rule it matched is executed (action is executed). When the rule action is carried in the rule class callback procedure by calling the **PROCESS_RULES** procedure, the rule manager automatically handles the consumption of the events. However, when you request the results from matching events with rules in a rule class results view using the **ADD_EVENT** procedure, you should take appropriate action to indicate the exact rule-event combination that is to be used for rule execution. The **CONSUME_EVENT** procedure performs the required housekeeping services when the unique identifier for the event used in a rule execution is passed in.
- Since there could be a time lag between fetching the rule class matching results and the execution of the user initiated action, the application should execute the action only if the **CONSUME_EVENT** call succeeds in consuming the event. This avoids any race condition with parallel sessions trying to consume the same events. When the event is successfully consumed, this call returns 1. In all other cases, it returns 0. A return value of 0 implies that the event is already consumed by another session and hence it is not available for this session.
- The **CONSUME_EVENT** procedure deletes the events configured with **EXCLUSIVE** consumption policy and does nothing for events configured for 4 consumption policy.

- Unlike the EXCLUSIVE and SHARED consumption policies, which are determined at the rule class level, a RULE consumption policy can be used to determine the consumption of an event on a rule by rule basis. That is a subset of the rules in a rule class may be configured such that when they are matched, the event is deleted from the system. At the same time the other set of rules could leave the event in the system even after executing the corresponding action. In this scenario, the action callback procedure implemented by the application developer can call CONSUME_EVENT function (with appropriate arguments) to conditionally consume the event for certain rules. Also see the use of [CONSUME_PRIM_EVENTS Function](#) for rule classes configured for RULE consumption policy

Examples

The following commands identify an event that is used for a rule execution and consumes it using its identifier.

```
var eventid VARCHAR(40);
var evtcnsmd NUMBER;

BEGIN
  SELECT rlm$eventid INTO :eventid FROM MatchingPromos WHERE rownum < 2;

  -- carry the required action for a rule matched by the above event --
  :evtcnsmd := DBMS_RLMGR.CONSUME_EVENT(rule_class => 'TravelPromotion',
                                       event_ident => :eventid);
END;
```

CONSUME_PRIM_EVENTS Function

This function consumes a set of primitive events with all or nothing semantics in the case of a rule class configured with `RULE` based consumption policy.

Syntax

```
DBMS_RLMGR.CONSUME_PRIM_EVENTS (
  rule_class      IN VARCHAR2,
  event_idents   IN RLM$EVENTIDS)
RETURN NUMBER;
```

Parameters

Table 108–8 CONSUME_PRIM_EVENTS Function Parameters

Parameter	Description
<code>rule_class</code>	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
<code>event_ident</code>	Event identifiers obtained from the corresponding rule class results view or the arguments of the action callback procedure

Returns

The function returns:

- 1 -- If all the events, the identifiers for which are passed in, are successfully consumed.
- 0 -- If one or more primitive event could not be consumed.

Usage Notes

- When the rule class is configured for `RULE` based consumption policy, the `CONSUME_PRIM_EVENTS` function can be used to consume one or more primitive events that constitute a composite event. This operation will succeed only when all the events passed in are still valid and are available for consumption. Any user initiated action should be implemented after checking the return value of the `CONSUME_PRIM_EVENTS` call.

Examples

The following commands show the body of the action callback procedure for a rule class configured for `RULE` consumption policy. This demonstrates the use of `CONSUME_PRIM_EVENTS` procedure to consume the events before executing the action for the matched rules.

```
create or replace procedure PromoAction (
  Flt      AddFlight,
  Flt_EvtId ROWID,    --- rowid for the flight primitive event
  Car      AddRentalCar,
  Car_EvtId ROWID,
  rlm$rule TravelPromotions%ROWTYPE) is
  evtcnsmd  NUMBER;
BEGIN
  evtcnsmd := DBMS_RLMGR.CONSUME_PRIM_EVENTS(
    rule_class => 'TravelPromotions',
    event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));
```

```
if (evtcnsmd = 1) then
  -- consume operation was successful; perform the action ---
  OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
end if;
END;
/
```

CREATE_CONDITIONS_TABLE Procedure

This procedure creates a conditions table, which is a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Creates a conditions table to store shareable primitive conditions defined for a primitive event.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table     IN  VARCHAR2,
    pevent_struct IN  VARCHAR2,
    stg_clause     IN  VARCHAR2 DEFAULT NULL);
```

Creates a conditions table to store shareable primitive conditions defined for a relational table identified through table aliases.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table     IN  VARCHAR2,
    tab_alias      IN  rlm$table_alias,
    stg_clause     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 108–9 CREATE_CONDITIONS_TABLE Procedure Parameters

Parameter	Description
pevent_struct	Primitive event structure for which the shareable primitive rule conditions are defined
cond_table	Name of the table storing the primitive rule conditions
stg_clause	Storage clause for the conditions table
tab_alias	Type that identifies the database table for which the shareable primitive rule conditions are defined

Usage Notes

- This procedure creates a relational table to store the primitive rule conditions that can be shared by multiple rules. The table is created with the user specified name and it has a VARCHAR2 column to store the unique identifier for each primitive rule condition (`rlm$condid`), an expression data type column to store the conditional expressions (`rlm$condition`), and a VARCHAR2 column to store the descriptions for the primitive rule conditions in plain text (`rlm$conddesc`).
- Once the table is created, the primitive rule condition can be added or modified using standard DML operations on the conditions table. The conditions table is configured to validate the primitive rule conditions (in the `rlm$condition` column) using the primitive event structure specified for the `pevent_struct` argument.
- A rule class configured with a primitive event structure can include some rule conditions that refer to rows in the conditions table using corresponding identifiers.

Examples

The following command creates a conditions table that can store shareable primitive rule conditions for the AddRentalCar event structure:

```
BEGIN
  DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table    => 'FlightConditions',
    pevent_struct => 'AddFlight',
    stg_clause    => 'TABLESPACE TBS_1');
END;
/
```

CREATE_EVENT_STRUCT Procedure

This procedure creates an event structure.

Syntax

```
DBMS_RLMGR.CREATE_EVENT_STRUCT (
    event_struct IN VARCHAR2);
```

Parameters

Table 108–10 CREATE_EVENT_STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to be created in the current schema

Usage Notes

- This procedure creates a dummy the event structure in the current schema. One or more attributes can be added to this event structure using the `ADD_ELEMENTARY_ATTRIBUTE` procedure.

Examples

The following command creates the event structure.

```
BEGIN
    DBMS_RLMGR.CREATE_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

CREATE_EXPFIL_INDEXES Procedure

This procedure creates expression filter indexes for the rule class if the default indexes have been dropped. If a representative set of rules is stored in the rule class table, the indexes can be tuned for these expressions by collecting statistics.

Syntax

```
DBMS_RLMGR.CREATE_EXPFIL_INDEXES (
    rule_class IN VARCHAR2,
    coll_stats IN VARCHAR2 default 'NO');
```

Parameters

Table 108–11 CREATE_EXPFIL_INDEXES Procedure Parameter

Parameter	Description
rule_class	Name of the rule class
coll_stats	To collect expression statistics for building the indexes

Usage Notes

- Expression filter indexes are used to identify the rule conditions in a rule class for appropriate events. The default indexes created at the time of rule class creation assume that all types of predicates (equality, inequality, etc) involving scalar attributes in an event structure are equally likely. The performance of a rule class can be improved by tuning the expression filter indexes for a specific workload. This is achieved either by collecting statistics on a representative workload or by identifying the most common predicate constructs with some domain knowledge.
- The default expression filter indexes created for the rule class can be dropped using the DBMS_RLMGR.DROP_EXPFIL_INDEXES API. Once the indexes are dropped, they can be recreated using the DBMS_RLMGR.CREATE_EXPFIL_INDEXES API. When the coll_stats argument of the CREATE_EXPFIL_INDEXES API is set to YES, rule condition statistics are collected for the most common predicate constructs and the indexes are created using these statistics. Alternately, a domain expert can manually set the index parameters by identifying the most common and discriminating predicate constructs and then create the indexes with these parameters. Note that the index parameters can be set for each of the primitive event structures associated with the rule class. The index parameters can be assigned to the event structure (which is also the Expression Filter attribute set) using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS API. When the coll_stats argument of the CREATE_EXPFIL_INDEXES API is set to NO, the expression filter indexes created for the rule class make use of the default index parameters associated with each primitive event structure. (See Section 11 "Indexing Expressions" from Application Developer's Guide Rules Manager and Expression Filter for additional information on tuning the Expression Filter indexes for better performance).
- Related views: USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following commands collect the statistics for the rules defined in the CompTravelPromo rule class and create the expression filter indexes that are based on the most common predicates in the set.

```

BEGIN
DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo',
                                coll_stats => 'yes');
END;
/

```

This is an Expression Filter tuning example where the domain knowledge is used to assign specific index parameters. The following commands associate specific index parameters to the AddFlight event structure such that the expression filter index created for corresponding expressions are optimized accordingly. The subsequent CREATE_EXPFIL_INDEXES step makes use of these index parameters.

```

BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS('AddFlight',
    exf$attribute_list (
      exf$attribute (attr_name => 'Airline',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'ToCity',
                    attr_oper => exf$indexoper('='),
                    attr_indexed => 'TRUE'),
      exf$attribute (attr_name => 'Depart',
                    attr_oper => exf$indexoper('=', '<', '>', '>=', '<='),
                    attr_indexed => 'FALSE')
    )
  );
  -- create the indexes after assigning the index parameters --
  DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/

```

CREATE_INTERFACE Procedure

This procedure creates a rule class interface package that can be used to directly operate on the rule class for efficiency and ease of use.

Syntax

```
DBMS_RLMGR.CREATE_INTERFACE (
    rule_class IN VARCHAR2,
    interface_nm IN VARCHAR2);
```

Parameters

Table 108–12 CREATE_INTERFACE Procedure Parameter

Parameter	Description
rule_class	Name of the rule class for which the interface package is created
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

Usage Notes

- The common set of DBMS_RLMGR procedures used for runtime operations such as processing the rules for some events, consuming the events and resetting the session make use of the rule class name passed in as one of the arguments and associate them to the corresponding operations on the rule class. The overhead involved in this step can be avoided by creating a rule class interface package that is used to directly operate on the rule class.
- The rule class interface package is a PL/SQL package that has procedures/functions to process rules (PROCESS_RULES), add event (ADD_EVENT), consume events (CONSUME_EVENT, CONSUME_PRIM_EVENTS) and reset rule session (RESET_SESSION). The operational characteristics of these procedures and functions are the same as those of DBMS_RLMGR procedures and functions with matching names with two exceptions. Since the rule class interface package is created for a specific rule class, the rule class name is implicit and it need not be passed in as an argument to the procedures and functions of the rule class interface package. Additionally, the rule class interface package has separate PROCESS_RULES and ADD_EVENT procedures to accept each primitive event type configured with the rule class. This is in contrast to the same procedures in the DBMS_RLMGR package, which are generalized to accept the event instances only as a VARCHAR or an AnyData instance.

Examples

The following commands create the rule class interface package for the CompTravelPromo rule class.

```
BEGIN
    DBMS_RLMGR.CREATE_INTERFACE (rule_class => 'CompTravelPromo',
                                interface_nm => 'TravelPromoRules');
END;
```

The following commands make use of the interface created in previous step to process the rules for an instance of AddFlight event.

```
BEGIN
```

```
TravelPromoRules.process_rules (event_inst =>
    AddFlight(987, 'Abcair', 'Boston', 'Orlando',
              '01-APR-2003', '08-APR-2003');
END;
```

CREATE_RULE_CLASS Procedure

This procedure creates a rule class.

Syntax

```
DBMS_RLMGR.CREATE_RULE_CLASS (
  rule_class      IN  VARCHAR2,
  event_struct    IN  VARCHAR2,
  action_cbk      IN  VARCHAR2,
  actprf_spec     IN  VARCHAR2  default null,
  rslt_viewnm     IN  VARCHAR2  default null,
  rlcls_prop      IN  VARCHAR2  default <simple/>);
```

Parameters

Table 108–13 CREATE_RULE_CLASS Procedure Parameters

Parameter	Description
rule_class	Name of the rule class to be created in the current schema
event_struct	Name of the object type or an Expression Filter attribute set in the current schema that represents the event structure for the rule class
action_cbk	Name of the action callback procedure to be created for the rule class
actprf_spec	Specification (name and SQL datatype pairs) for the action preferences associated with the rule class
rslt_viewnm	Name of rule class results view that lists the matching events and rules within a session. A view with this name is created in the current schema.
rlcls_prop	XML document for setting the rule class properties. By default, the rule class created is for simple events (non-composite).

Usage Notes

- For successful creation of a rule class, you should have sufficient privileges to create views, object types, tables, packages, and procedures.
- This command creates the rule class and its dependent objects in the user's schema. For this operation to succeed the name specified for the event structure should refer to an existing object type or an Expression Filter attribute set in the user's schema. When an object type is used for an event structure, the CREATE_RULE_CLASS procedure implicitly creates an attribute set for the object type. In the case of a rule class configured for composite events, the previous procedure also creates attribute sets for the object types that are directly embedded in the event structure's object type (or the attribute set). A maximum of 32 embedded objects (and/or table aliases) can be specified with an event structure that is used for a composite rule class. The types of dependent objects created with this procedure and their structure depend on the properties of the rule class and its event structure. The minimum set of dependent objects created for a rule class is as follows:
 - Rule class table – A rule class table that shares the name of the rule class is created in the user's schema to store the rule definitions (rule identifiers, rule conditions, rule descriptions, and action preferences). This table implicitly has four columns, rlm\$ruleid, rlm\$rulecond, rlm\$enabled, and rlm\$ruledesc to store the rule identifiers, rule conditions, rule states, and rule descriptions respectively. In addition to these four columns, the rule class

table has few columns according to the rule classes' action preference specification. For example, if a TravelPromotion rule class uses 'PromoType VARCHAR(20), OfferedBy VARCHAR(20)' as its action preference specification (assigned to `actpref_spec` argument), the rule class table is created with the following structure.

```
TABLE TravelPromotion (
  rlm$ruleid VARCHAR(100),      -- rule identifier column --
  PromoType VARCHAR(20),       -- action preference 1 --
  OfferedBy VARCHAR(20),       -- action preference 2 --
  rlm$rulecond VARCHAR(4000),  -- rule condition --
  rlm$ruledesc VARCHAR(1000),  -- rule description --
  rlm$enabled CHAR(1);         -- rule status --
```

The rule class table structure varies from one rule class to another based on the exact list of action preference categories specified for the rule class.

- Action Callback Procedure – The skeleton for the action callback procedure with the given name is created in the user's schema and it is associated with the rule class. During rule evaluation, the callback procedure is called for each matching rule and event. You should implement the body of the action callback procedure to perform the appropriate action for each rule. The exact action for a rule can be determined based on the event that matched the rule and rule definition along with its action preferences. This information is passed to the action callback procedure through its arguments. Hence, the argument list for the action callback procedure depends on the event structure associated with the rule class and the rule class itself.

In the case of a rule class configured for simple events (<simple/> assigned to the properties of the rule class), the event that matches a rule is passed through a `rlm$event` argument that is declared to be of the same type as the event structure. Additionally, the rule definitions are passed to the action callback procedure using an `rlm$rule` argument that is declared as ROWTYPE of the corresponding rule class table. For example, the structure of the PromoAction action callback procedure created for a TravelPromotion rule class configured for a simple (non-composite) AddFlight event structure is as follows:

```
PROCEDURE PromoAction (rlm$event AddFlight,
  rlm$rule TravlePromotion%ROWTYPE);
```

In the case of a rule class created for composite events (<composite/> assigned to the properties of the rule class), the action callback procedure is created to pass each primitive event as a separate argument. For example, the CompPromoAction action callback procedure created for a rule class CompTravelPromo configured for a composite event with AddFlight and AddRentalCar primitive events are shown as follows:

```
-- composite event structure --
TYPE TSCompEvent (Flt AddFlight,
  Car AddRentalCar);
-- corresponding action callback procedure --
PROCEDURE PromoAction (Flt AddFlight,
  Car AddRentalCar,
  rlm$rule CompTravelPromo%ROWTYPE)
```

Note that the action callback procedure includes additional arguments when the rule class is configured for the RULE consumption policy or when the rule class is enabled for one or more collection events. The arguments in these

cases include the identifiers for the events (ROWID data type) in addition to the event instances. These event identifiers can be used to further operate on the matched rules. For example, in the case of the rule class configured for rule consumption, the event identifiers are used to consume the events with `DBMS_RLMGR.CONSUME_PRIM_EVENTS` function. In the case of rule class enabled for collection events, the same identifiers for the collection events can be used to fetch specific aggregate values with the `DBMS_RLMGR.GET_AGGREGATE_VALUE` function.

- Rule class results view – A view to display the results from matching some events with rules is created in the same schema as the rule class. By default, this view is created with a system-generated name. Optionally, the rule class creator can specify a name for this view with the `rlst_viewnm` argument of the `CREATE_RULE_CLASS` procedure. When the events are added to the rule manager within a rule session using the `ADD_EVENT` procedure, the list of matching events and rules are displayed in the rule class results view.

The structure of the view defined for the rule class results depends on the event structure and the action preferences configured with the rule class. Minimally, the view has three columns to display the system generated event identifier (`rlm$eventid`), the identifier of the rule it matches (`rlm$ruleid`), and the rule condition (`rlm$rulecond`). Additionally, it has columns to display the event information and the rule action preferences.

In the case of a rule class configured for simple events, the event information is displayed as `rlm$event` that is declared to be of the event structure type. So, a `MatchingPromos` view created for the `TravelPromotion` rule class configured for a simple `AddFlight` event structure is as follows:

```
VIEW MatchingPromos (
    rlm$eventid ROWID,
    rlm$event AddFlight,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

In the case of a rule class configured for composite events, the primitive events matching a rule are displayed separately using corresponding columns. For the above `CompTravelPromo` rule class, a `MatchingCompPromos` view is created with the following structure.

```
VIEW MatchingCompPromos (
    rlm$eventid ROWID,
    Flt AddFlight,
    Car AddRentalCar,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

The values from the `rlm$eventid` column are used to enforce rule class consumption policies when the corresponding rule is executed. See the [CONSUME_EVENT Function](#) procedure for more information.

Examples

The following commands create a rule class for simple events (of AddFlight type).

```
CREATE or REPLACE TYPE AddFlight AS OBJECT (
    CustId NUMBER,
    Airline VARCHAR(20),
    FromCity VARCHAR(30),
    ToCity VARCHAR(30),
    Depart DATE,
    Return DATE);
BEGIN
    DBMS_RLMGR.CREATE_RULE_CLASS (
        rule_class => 'TravelPromotion', -- rule class name --
        event_struct => 'AddFlight', -- event struct name --
        action_cbk => 'PromoAction', -- callback proc name --
        rslt_viewnm => 'MatchingPromos', -- results view --
        actprf_spec => 'PromoType VARCHAR(20),
                        OfferedBy VARCHAR(20)');
END;
```

The following commands create a rule class for composite events consisting of two primitive events (AddFlight and AddRentalCar).

```
CREATE or REPLACE TYPE TSCompEvent (Flt AddFlight,
                                    Car AddRentalCar);
BEGIN
    DBMS_RLMGR.CREATE_RULE_CLASS (
        rule_class => 'CompTravelPromo', -- rule class name --
        event_struct => 'TSCompEvent', -- event struct name --
        action_cbk => 'CompPromoAction', -- callback proc name --
        rslt_viewnm => 'MatchingCompPromos', -- results view --
        actprf_spec => 'PromoType VARCHAR(20),
                        OfferedBy VARCHAR(20)',
        properties => '<composite/>');
END;
```

DELETE_RULE Procedure

This procedure deletes a rule from a rule class.

Syntax

```
DBMS_RLMGR.DELETE_RULE (
    rule_class    IN    VARCHAR2,
    rule_id       IN    VARCHAR2);
```

Parameters

Table 108–14 *DELETE_RULE Procedure Parameters*

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Identifier for the rule to be deleted

Usage Notes

- This procedure is used to delete a rule from the rule class. The identifier for the rule to be deleted can be obtained by querying the rule class table (that shares the same name as the rule class). Alternately, the owner of the rule class can use a SQL DELETE statement on one rule class table to delete a rule.
- When schema extended name is used for the rule class, you should have DELETE RULE privilege on the rule class. See the [GRANT_PRIVILEGE Procedure](#) procedure for more information.

Note: AUTOCOMMIT property of the rule class is ignored if the rules are deleted with the SQL DELETE statement instead of the DELETE_RULE procedure.

- See the [CREATE_RULE_CLASS Procedure](#) procedure for the structure of the rule class table.

Examples

The following command deletes a rule from the rule class.

```
BEGIN
    DBMS_RLMGR.DELETE_RULE (
        rule_class => 'CompTravelPromo',
        rule_id    => 'AB_AV_FL');
END;
```

Alternately, the following SQL DELETE statement can be issued to delete the above rule from the rule class.

```
DELETE FROM CompTravelPromo WHERE rlm$ruleid = 'AB_AV_FL';
```

DROP_CONDITIONS_TABLE Procedure

This procedure drops the conditions table.

Syntax

```
DBMS_RLMGR.DROP_CONDITIONS_TABLE (  
    cond_table IN VARCHAR2);
```

Parameters

Table 108–15 *DROP_CONDITIONS_TABLE Procedure Parameters*

Parameter	Description
cond_table	Name of conditions table in the user schema

Usage Notes

- This procedure drops the table that stores the shareable conditional expressions. If one of the conditional expressions in this table is used to form a rule condition in a rule class, the drop operation fails with an appropriate error.

Examples

The following command drops the conditions table:

```
BEGIN  
    DBMS_RLMGR.DROP_CONDITIONS_TABLE (cond_table => 'FlightConditions');  
END;  
/
```

DROP_EVENT_STRUCT Procedure

This procedure drops an event structure.

Syntax

```
DBMS_RLMGR.DROP_EVENT_STRUCT (  
    event_struct IN VARCHAR2);
```

Parameters

Table 108–16 *DROP_EVENT_STRUCT Procedure Parameter*

Parameter	Description
event_struct	Name of event structure in the current schema

Usage Notes

- This procedure drops the event structure from the current schema. This drops all the dependent objects created to manage the event structure.

Examples

The following command drops the event structure.

```
BEGIN  
    DBMS_RLMGR.DROP_EVENT_STRUCT(event_struct => 'AddFlight');  
END;
```

DROP_EXPFIL_INDEXES Procedure

This procedure drops the expression filter indexes created for a rule class.

Syntax

```
DBMS_RLMGR.DROP_EXPFIL_INDEXES (
  rule_class IN VARCHAR2);
```

Parameters

Table 108–17 *DROP_EXPFIL_INDEXES Procedure Parameter*

Parameter	Description
rule_class	Name of the rule class

Usage Notes

This procedure drops all the expression filter indexes associated with a rule class. The indexes can be recreated using the `DBMS_RLMGR.CREATE_EXPFIL_INDEXES` call.

Examples

The following command drops the expression filter indexes created for the `CompTravelPromo` rule class.

```
BEGIN
DBMS_RLMGR.DROP_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

DROP_INTERFACE Procedure

This procedure drops the rule class interface package created for a rules application.

Syntax

```
DBMS_RLMGR.DROP_INTERFACE (  
    interface_nm IN VARCHAR2);
```

Parameters

Table 108–18 *DROP_INTERFACE Procedure Parameter*

Parameter	Description
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

Usage Notes

This procedure drops the rule class interface package created with the `DBMS_RLMGR.CREATE_INTERFACE` call.

Examples

The following command drops the rule class interface package `TravelPromoRules`.

```
BEGIN  
    DBMS_RLMGR.DROP_INTERFACE (interface_nm => 'TravelPromoRules'  
END;
```

DROP_RULE_CLASS Procedure

This procedure drops a rule class.

Syntax

```
DBMS_RLMGR.DROP_RULE_CLASS (  
    rule_class IN VARCHAR2);
```

Parameters

Table 108–19 *DROP_RULE_CLASS Procedure Parameter*

Parameter	Description
rule_class	Name of rule class in the current schema

Usage Notes

- This procedure drops the rule class from the current schema. This drops all the dependent objects created to manage the rule class. Because an event structure in a user's schema can be shared across multiple rule classes, the event structure is not dropped with this command. The `DROP_EVENT_STRUCTURE` API should be used for the composite event as well as the individual primitive events to cleanup unused event structures.

Examples

The following command drops the rule class.

```
BEGIN  
    DBMS_RLMGR.DROP_RULE_CLASS(rule_class => 'CompTravelPromo');  
END;
```

EXTEND_EVENT_STRUCT Procedure

This is used to extend the primitive event structure used by one or more rule classes by adding a new attribute.

Syntax

```
DBMS_RLMGR.EXTEND_EVENT_STRUCT (
    event_struct    IN   VARCHAR2,
    attr_name       IN   VARCHAR2,
    attr_type       IN   VARCHAR2,
    attr_defvl     IN   VARCHAR2 default NULL);
```

Parameters

Table 108–20 *EXTEND_EVENT_STRUCT Procedure Parameter*

Parameter	Description
event_struct	Name of the event structure to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defvl	Default value for the elementary attribute

Usage Notes

- This procedure is used to extend a primitive event structure already associated with a rule class to include a new attribute. This procedure is mostly used to migrate a fully developed rules application to use extended event structures and it should not be used in the place of ADD_ELEMENTARY_ATTRIBUTE call. Unlike the ADD_ELEMENTARY_ATTRIBUTE call, which builds an event structure one attribute at a time, the EXTEND_EVENT_STRUCT call evolves the object type associated with the event structure to include the new attributes and performs some maintenance operations on the dependent objects.
- The usage of the EXTEND_EVENT_STRUCT call is similar to that of the ADD_ELEMENTARY_ATTRIBUTE call with the same set of arguments. Table alias attributes and attributes of text and spatial data types cannot be added to the event structure using the EXTEND_EVENT_STRUCT call.

Examples

The following commands add an attribute to the AddRentalCar event structure that is used by the CompTravelPromo rule class.

```
BEGIN
  DBMS_RLMGR.EXTEND_EVENT_STRUCT (
    event_struct => 'AddRentalCar',
    attr_name    => 'PrefMemberId',
    attr_type    => 'VARCHAR2(30)');
END;
```

GET_AGGREGATE_VALUE Function

This function retrieves the aggregate value computed for a collection event.

Syntax

```
DBMS_RLMGR.GET_AGGREGATE_VALUE (
  rule_class      IN VARCHAR2,
  event_ident    IN VARCHAR2,
  aggr_func      IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 108–21 GET_AGGREGATE_VALUE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class for the collection event
event_ident	System-generated identifier for the collection event
aggr_func	Signature for the aggregate value to be retrieved

Usage Notes

- When a rule condition with `collection` construct matches a set of events, an instance representing the collection event and a system-generated identifier for the collection event are passed into the action callback procedure. This event identifier can be used to fetch any aggregate values that are computed as part of the collection event evaluation.
- Within a collection construct in a rule condition, the aggregate functions can be included in the `HAVING` clause or in the `COMPUTE` clause. For example, the following rule condition computes three aggregate values for `sum(amount)`, `count(*)`, and `max(amount)`. At the time of action execution, these values can be obtained using the identifier for the collection event that represents all the instance of `BankTransaction` with the same `subjectId` (the attribute on which the events are grouped).

```
<condition>
  <collection name="bank" groupby="subjectId"
    having="sum(amount) > 10000"
    compute="max(amount), count(*)" />
</condition>
```

- The signature for the aggregate function is bound to the `aggr_func` argument of the `GET_AGGREGATE_VALUE` function to fetch the specific aggregate value. If the value is a `NUMBER` or a `DATE` datatype, the equivalent `VARCHAR` representation is returned. If an attempt was made to fetch an aggregate value that is never computed as part of the collection event, a `NULL` value is returned.

Examples

The following example shows a sample implementation of the action callback procedure that prints the computed aggregate values as part of action execution. In this particular case, the `BankTransaction` primitive event is enabled for collections.

```
CREATE OR REPLACE PROCEDURE LAWENFORCEMENTCBK (
  bank            banktransaction,
  bankcollid     rowid,
```

```
transport          transportation,
fldrpt            fieldreport,
rlm$rule         LawEnforcementRC%ROWTYPE) IS
aggrval          VARCHAR(30);
begin
  dbms_output.put_line('Mathing Rule : '||rlm$rule.rlm$ruleid||chr(10));

  if (bank is not null) then
    dbms_output.put_line('-->Bank Transactions by ('||bank.subjectId||')'||chr(10);

    aggrval := dbms_rlmgr.get_aggregate_value(rule_class =>'LawEnforcementRC',
                                             event_ident => bankcollid,
                                             aggr_func  => 'sum(amount)');

    if (aggrval is not null) then
      dbms_output.put_line('---> Sum of the amounts is : '||aggrval||chr(10));
    end if;
    . . .
  end if;
end;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on a rule class to another user.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE (
  rule_class      IN VARCHAR2,
  priv_type       IN VARCHAR2,
  to_user         IN VARCHAR2);
```

Parameters

Table 108–22 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be granted
to_user	User to whom the privilege is to be granted

Usage Notes

- This procedure grants appropriate privileges to a user who is not the owner of the rule class. The types of privileges that can be granted to a user are:
 - PROCESS RULES: A user with PROCESS RULES privilege on a rule class can process the rules in the rule class using the PROCESS_RULES procedure or the ADD_EVENT procedure. Also, the user with this privilege can select from the corresponding rule class results view.
 - ADD RULE: A user with ADD RULE privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant INSERT privileges on one rule class table to other users.
 - DELETE RULE: A user with DELETE RULE privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant DELETE privileges on one rule class table to other users.
 - ALL: Granting the ALL privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.
- The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user.
- A user should also have EXECUTE privileges on the primitive event types associated with a rule class in order to make use of the corresponding rule class results view

Examples

The following command grants PROCESS RULES privilege on TravelPromo rule class to the user SCOTT.

```
BEGIN
  DBMS_RLMGR.GRANT_PRIVILEGE(rule_class => 'TravelPromo',
                              priv_type => 'PROCESS RULES',
```

```
to_user => 'SCOTT');  
END;
```

PROCESS_RULES Procedure

This procedure processes the rules for a given event. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Processes the rules for a string representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES (
  rule_class  IN  VARCHAR2,
  event_inst  IN  VARCHAR2,
  event_type  IN  VARCHAR2 default null);
```

Processes the rules for an AnyData representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES (
  rule_class  IN  VARCHAR2,
  event_inst  IN  sys.AnyData);
```

Parameters

Table 108–23 *PROCESS_RULES Procedure Parameters*

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to process the rules in a rule class for an event instance assigned to the event_inst argument.
- In the case of a rule class configured for simple events (non-composite), the event instance is an instantiation of the corresponding event structure. The rules are evaluated (conclusively) for this event and the corresponding action callback procedure is called for each matching rule. If the event does not match any rule, no further action is performed. If the event matches two or more rules, the ordering clause configured for the rule class is used to order them accordingly to invoke the action callback procedure. If the rule class is configured for EXCLUSIVE consumption policy, once the first rule in this order is executed (and the corresponding action callback procedure is called), the rest of the rules that matched the event are ignored.
- In the case of a rule class configured for composite events, the event instance assigned to the event_inst argument is an instantiation of one of the primitive type within the composite event. When the instance is represented as a string, the corresponding type name should be assigned to the event_type argument. The PROCESS_RULES call on a rule class configured for composite events performs

various actions depending on the state of the rule class and the kind of rules in the rule class.

- The rules operating only on the primitive event passed in are evaluated conclusively and the action callback procedure is called for the matching rules, as described in previous paragraph.
- In the case of a rule operating on more than one primitive event, the event instance passed through PROCESS_RULES procedure could match only a part of the rule.
 - * If there is (are) another primitive event instance(s) that matches the rest of the rule, the current event instance is combined with the other instance(s) to form a complete composite event that matches a rule in the rule class. So, the event instance assigned to the `event_inst` argument of the PROCESS_RULES procedure could be combined with various other primitive events (previously processed) to evaluate one or more rules conclusively. The rule classes' action callback procedure is called for each such combination of primitive events (composite event) and the rule. The ordering clause for the rule class and the consumption policy for the primitive events in taken into account while invoking the action callback procedure.
 - * If there is no other primitive event that matches the rest of the rule, the current event instance and its (incremental) evaluation results are recorded in the database. These results are preserved until either the event is consumed or deleted from the system owing to the duration policy used for the rule class.

Examples

The following command processes the rules in the TravelPromotion rule class for the given events.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES (
    rule_class => 'TravelPromotion',
    event_inst =>
      AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                          '01-APR-2003', '08-APR-2003'));
END;
```

The following commands process the rules in the CompTravelPromo rule class for the two primitive events shown.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES(
    rule_class => 'CompTravelPromo',
    event_inst =>
      AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                          '01-APR-2003', '08-APR-2003'),
    event_type => 'AddFlight');
  DBMS_RLMGR.PROCESS_RULES(
    rule_class => 'Scott.CompTravelPromo',
    event_inst =>
      AnyData.convertObject(AddRentalCar(987, 'Luxury', '03-APR-2003',
                                         '08-APR-2003', NULL)));
END;
```

PURGE_EVENTS Procedure

This procedure resets the incremental state maintained by the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events.

Syntax

```
DBMS_RLMGR.PURGE_EVENTS (
    rule_class IN  VARCHAR2);
```

Parameters

Table 108–24 *PURGE_EVENTS Procedure Parameters*

Parameter	Description
rule_class	Name of rule class in the current schema

Usage Notes

- This procedure is used while developing rules applications using Rules Manager. The rules defined in the rule class can be tested with hypothetical events and these events can all be removed by issuing this procedure call. This call cleans up all the events in the events repository and purges any partial state information associated with the matching rules.

Examples

The following command removes the events associated with the CompTravelPromo rule class:

```
BEGIN
    DBMS_RLMGR.PURGE_EVENTS (rule_class => 'CompTravelPromo');
END;
/
```

RESET_SESSION Procedure

This procedure starts a new session and thus discards the results in the rule class results view.

Syntax

```
DBMS_RLMGR.RESET_SESSION (  
    rule_class IN VARCHAR2);
```

Parameters

Table 108–25 *RESET_SESSION Procedure Parameter*

Parameter	Description
rule_class	Name of rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.

Usage Notes

- When the `ADD_EVENT` procedure is used to add events to the rule class, the results from matching rules with events are recorded in the rule class results view. By default, these results are reset at the end of the database session. Alternately, the [RESET_SESSION Procedure](#) can be used to reset and start a new rule session within a database session.
- This procedure is only applicable while using [ADD_EVENT Procedures](#) to evaluate the rules.

Examples

The following command resets a rule class session.

```
BEGIN  
    DBMS_RLMGR.RESET_SESSION(  
        rule_class => 'CompTravelPromo');  
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes privileges on a rule class from another user.

Syntax

```
DBMS_RLMGR.REVOKE_PRIVILEGE (
  rule_class      IN VARCHAR2,
  priv_type       IN VARCHAR2,
  from_user       IN VARCHAR2);
```

Parameters

Table 108–26 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be revoked
from_user	User from whom the privilege is to be revoked

Usage Notes

- This procedure revokes appropriate privileges from a user. The types of privileges that can be revoked are the same as the types listed in the [GRANT_PRIVILEGE Procedure](#) description. Rule class privileges cannot be revoked from the owner of the rule class.

Examples

The following command revokes PROCESS RULES privilege on TravelPromo rule class from the user SCOTT.

```
BEGIN
  DBMS_RLMGR.REVOKE_PRIVILEGE(rule_class => 'TravelPromo',
                               priv_type  => 'PROCESS RULES',
                               from_user  => 'SCOTT');
END;
```

SYNC_TEXT_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions.

Syntax

```
DBMS_RLMGR.SYNC_TEXT_INDEXES (
    rule_class IN VARCHAR2);
```

Parameters

Table 108–27 SYNC_TEXT_INDEXES Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema

Usage Notes

- When a rule class is configured for events with one or more text attributes, the text predicates in the corresponding rule conditions are processed using CTXRULE indexes. Unlike other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process other types of predicates in the rule conditions, the CTXRULE indexes are not transactional in nature. That is, if the text predicates in a rule condition are modified in a database transaction, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results while matching events with the rule conditions. All the CTXRULE indexes associated with a rule class can be synchronized with the latest rule conditions using this procedure.

You must have EXECUTE privileges on the CTX_DDL package for successful synchronization of the text indexes.

Examples

The following command synchronizes any text indexes associated CompTravelPromo rule class:

```
BEGIN
    DBMS_RLMGR.SYNC_TEXT_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS_RLS is available with the Enterprise Edition only.

See Also: *Oracle Database Security Guide* for usage information on DBMS_RLS .

- [Summary of DBMS_RLS Subprograms](#)

Using DBMS_RLS

- [Overview](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (
    'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

Note: The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', FALSE);
```

Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v\$vpd_policies.

A synonym can reference only a view or a table.

Summary of DBMS_RLS Subprograms

Table 109–1 DBMS_RLS Subprograms Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure on page 109-7	Adds a policy associated with a policy group
ADD_POLICY Procedure on page 109-9	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure on page 109-13	Adds the context for the active application
CREATE_POLICY_GROUP Procedure on page 109-14	Creates a policy group
DELETE_POLICY_GROUP Procedure on page 109-15	Deletes a policy group
DISABLE_GROUPED_POLICY Procedure on page 109-16	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure on page 109-17	Drops a policy associated with a policy group
DROP_POLICY Procedure on page 109-18	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure on page 109-19	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure on page 109-20	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure on page 109-21	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure on page 109-22	Reparses the SQL statements associated with a refreshed policy
REFRESH_POLICY Procedure on page 109-23	Causes all the cached statements associated with the policy to be reparsed

ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY (
  object_schema      VARCHAR2,
  object_name        VARCHAR2,
  policy_group       VARCHAR2,
  policy_name        VARCHAR2,
  function_schema    VARCHAR2,
  policy_function     VARCHAR2,
  statement_types    VARCHAR2,
  update_check       BOOLEAN,
  enabled            BOOLEAN,
  static_policy       IN BOOLEAN FALSE,
  policy_type        IN BINARY_INTEGER NULL,
  long_predicate     IN BOOLEAN FALSE,
  sec_relevant_cols  IN VARCHAR2,
  sec_relevant_cols_opt IN BINARY_INTEGER NULL);
```

Parameters

Table 109–2 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy; must be unique for the same table or view.
function_schema	The schema owning the policy function.
policy_function	The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 109–4 . Specifying any of these policy types overrides the value of static_policy.

Table 109–2 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries (<code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See "Usage Notes" on page 109-11 for restrictions and additional information about this option.

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the [CREATE_POLICY_GROUP Procedure](#) on page 109-14.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, `SYS_DEFAULT`, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with `EXEMPT ACCESS POLICY` system privilege.
- If no `object_schema` is specified, the current log-on user schema is assumed.

ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: [Operational Notes](#) on page 109-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
  object_schema          IN VARCHAR2 NULL,
  object_name            IN VARCHAR2,
  policy_name            IN VARCHAR2,
  function_schema        IN VARCHAR2 NULL,
  policy_function         IN VARCHAR2,
  statement_types        IN VARCHAR2 NULL,
  update_check           IN BOOLEAN  FALSE,
  enable                  IN BOOLEAN  TRUE,
  static_policy           IN BOOLEAN  FALSE,
  policy_type             IN BINARY_INTEGER NULL,
  long_predicate          IN BOOLEAN  FALSE,
  sec_relevant_cols       IN VARCHAR2,
  sec_relevant_cols_opt  IN BINARY_INTEGER NULL);
```

Parameters

Table 109–3 ADD_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified, the current log-on user schema is assumed.
object_name	Name of table, view, or synonym to which the policy is added.
policy_name	Name of policy to be added. It must be unique for the same table or view.
function_schema	Schema of the policy function (current default schema, if NULL).
policy_function	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.

Table 109–3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
<code>static_policy</code>	The default is <code>FALSE</code> . If it is set to <code>TRUE</code> , the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for <code>SYS</code> or the privilege user who has the <code>EXEMPT ACCESS POLICY</code> privilege.
<code>policy_type</code>	Default is <code>NULL</code> , which means <code>policy_type</code> is decided by the value of <code>static_policy</code> . The available policy types are listed in Table 109–4 . Specifying any of these policy types overrides the value of <code>static_policy</code> .
<code>long_predicate</code>	Default is <code>FALSE</code> , which means the policy function can return a predicate with a length of up to 4000 bytes. <code>TRUE</code> means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.
<code>sec_relevant_cols</code>	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
<code>sec_relevant_cols_opt</code>	Use with <code>sec_relevant_cols</code> to display all rows for column-level VPD filtered queries (<code>SELECT</code> only), but where sensitive columns appear as <code>NULL</code> . Default is set to <code>NULL</code> , which allows the filtering defined with <code>sec_relevant_cols</code> to take effect. Set to <code>dbms_rls.ALL_ROWS</code> to display all rows, but with sensitive column values, which are filtered by <code>sec_relevant_cols</code> , displayed as <code>NULL</code> . See "Usage Notes" on page 109-11 for restrictions and additional information about this option.

Table 109–4 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
<code>STATIC</code>	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as <code>SYS_CONTEXT</code> or <code>SYSDATE</code> . Applies to only one object.
<code>SHARED_STATIC</code>	Same as <code>STATIC</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
<code>CONTEXT_SENSITIVE</code>	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
<code>SHARED_CONTEXT_SENSITIVE</code>	Same as <code>CONTEXT_SENSITIVE</code> except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
<code>DYNAMIC</code>	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function on each statement parsing or execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- If no object_schema is specified, the current log-on user schema is assumed.
- The policy functions which generate dynamic predicates are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table of view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of WNDS (write no database state).

See Also: The *Oracle Database Advanced Application Developer's Guide* has more details about the RESTRICT_REFERENCES pragma.

- Dynamic predicates generated out of different policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with sec_relevant_cols_opt => dbms_ols.ALL_ROWS) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as NULL. The restrictions for this option are as follows:
 - Only applies to SELECT statements
 - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
 - If your application performs calculations, or does not expect NULL values, then you should use the default behavior of column-level VPD, which is specified with the sec_relevant_cols parameter.
 - If you use UPDATE AS SELECT with this option, then only the values in the columns you are allowed to see will be updated.
 - This option may prevent some rows from displaying. For example:

```
select * from employees
where salary = 10
```

This query may not return rows if the salary column returns a NULL value because the column masking option has been set.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
dbms_ols.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hr_policy',
function_schema =>'hr',
policy_function => 'hrfun',
statement_types =>'select,index',
policy_type => dbms_ols.CONTEXT_SENSITIVE,
sec_relevant_cols=>'salary,birthdate,ssn');
END;
/
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
dbms_ols.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hosting_policy',
function_schema =>'hr',
policy_function => 'subfun',
policy_type => dbms_ols.SHARED_STATIC);
END;
/
```

ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  namespace     VARCHAR2,
  attribute      VARCHAR2);
```

Parameters

Table 109–5 ADD_POLICY_CONTEXT Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
namespace	The namespace of the driving context
attribute	The attribute of the driving context.

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- If no object_schema is specified, the current log-on user schema is assumed.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_
group','policy1','SYS','HR.ACCESS');
```

CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    policy_group   VARCHAR2);
```

Parameters

Table 109–6 CREATE_POLICY_GROUP Procedure Parameters

Parameter	Description
<code>object_schema</code>	Schema containing the table, view, or synonym.
<code>object_name</code>	Name of the table, view, or synonym to which the policy is added.
<code>policy_group</code>	Name of the policy group that the policy belongs to.

Usage Notes

The group must be unique for each table or view.

DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
  object_schema  VARCHAR2,
  object_name    VARCHAR2,
  policy_group   VARCHAR2);
```

Parameters

Table 109–7 *DELETE_POLICY_GROUP Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    group_name     VARCHAR2,  
    policy_name    VARCHAR2);
```

Parameters

Table 109–8 *ENABLE_GROUPED_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym with which the policy is associated.
group_name	The name of the group of the policy.
policy_name	The name of the policy to be enabled or disabled.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.

DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    policy_group   VARCHAR2,  
    policy_name    VARCHAR2);
```

Parameters

Table 109–9 *DROP_GROUPED_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is dropped.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy.

DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: [Operational Notes](#) on page 109-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (  
    object_schema    IN VARCHAR2 NULL,  
    object_name      IN VARCHAR2,  
    policy_name      IN VARCHAR2);
```

Parameters

Table 109–10 *DROP_GROUPED_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema containing the table, view or synonym (current default schema if NULL)..
object_name	Name of the table, view, or synonym for which the policy is dropped.
policy_name	Name of policy to be dropped from table, view, or synonym.

DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    namespace      VARCHAR2,  
    attribute      VARCHAR2);
```

Parameters

Table 109–11 *DROP_POLICY_CONTEXT Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is dropped.
namespace	The namespace of the driving context.
attribute	The attribute of the driving context.

ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (  
    object_schema  VARCHAR2,  
    object_name    VARCHAR2,  
    group_name     VARCHAR2,  
    policy_name    VARCHAR2,  
    enable         BOOLEAN);
```

Parameters

Table 109–12 *ENABLE_GROUPED_POLICY Procedure Parameters*

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym with which the policy is associated.
group_name	The name of the group of the policy.
policy_name	The name of the policy to be enabled or disabled.
enable	TRUE enables the policy; FALSE disables the policy.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: [Operational Notes](#) on page 109-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2,
  policy_name   IN VARCHAR2,
  enable       IN BOOLEAN);
```

Parameters

Table 109–13 *ENABLE_POLICY Procedure Parameters*

Parameter	Description
object_schema	Schema containing table, view, or synonym (current default schema if NULL).
object_name	Name of table, view, or synonym with which the policy is associated.
policy_name	Name of policy to be enabled or disabled.
enable	TRUE to enable the policy, FALSE to disable the policy.

REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (  
    object_schema    VARCHAR2,  
    object_name      VARCHAR2,  
    group_name       VARCHAR2,  
    policy_name      VARCHAR2);
```

Parameters

Table 109–14 REFRESH_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym with which the policy is associated.
group_name	The name of the group of the policy.
policy_name	The name of the policy.

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.

REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: [Operational Notes](#) on page 109-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (
  object_schema IN VARCHAR2 NULL,
  object_name   IN VARCHAR2 NULL,
  policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 109–15 REFRESH_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym.
object_name	Name of table, view, or synonym with which the policy is associated.
policy_name	Name of policy to be refreshed.

Usage Notes

The procedure returns an error if it tries to refresh a disabled policy.

The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

Note: DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

- [Using DBMS_ROWID](#)
 - Security Model
 - Types
 - Exceptions
 - Operational Notes
 - Examples
- [Summary of DBMS_ROWID Subprograms](#)

Using DBMS_ROWID

- [Security Model](#)
- [Types](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Types

- [Extension and Restriction Types](#)
- [Verification Types](#)
- [Object Types](#)
- [Conversion Types](#)

Extension and Restriction Types

The types are as follows:

- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note: Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

Verification Types

Table 110–1 *Verification Types*

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 110–2 *Object Types*

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 110–3 *Conversion Types*

Result	Description
INTERNAL	Convert to/from column of ROWID type

Table 110-3 (Cont.) Conversion Types

Result	Description
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;  
rowid_convert_external constant integer := 1;
```

Exceptions

Table 110–4 *Exceptions*

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;  
  pragma exception_init(ROWID_INVALID, -1410);
```

```
ROWID_BAD_BLOCK exception;  
  pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

Operational Notes

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

Note: ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
FROM emp
WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
 - A problem with the current procedure or function
 - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
 - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
     WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

Summary of DBMS_ROWID Subprograms

Table 110–5 DBMS_ROWID Package Subprograms

Subprogram	Description
ROWID_BLOCK_NUMBER Function on page 110-10	Returns the block number of a ROWID
ROWID_CREATE Function on page 110-11	Creates a ROWID, for testing only
ROWID_INFO Procedure on page 110-12	Returns the type and components of a ROWID
ROWID_OBJECT Function on page 110-13	Returns the object number of the extended ROWID
ROWID_RELATIVE_FNO Function on page 110-14	Returns the file number of a ROWID
ROWID_ROW_NUMBER Function on page 110-15	Returns the row number
ROWID_TO_ABSOLUTE_FNO Function on page 110-16	Returns the absolute file number associated with the ROWID for a row in a specific table
ROWID_TO_EXTENDED Function on page 110-17	Converts a ROWID from restricted format to extended
ROWID_TO_RESTRICTED Function on page 110-19	Converts an extended ROWID to restricted format
ROWID_TYPE Function on page 110-20	Returns the ROWID type: 0 is restricted, 1 is extended
ROWID_VERIFY Function on page 110-21	Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function

ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input ROWID.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (  
    row_id      IN   ROWID,  
    ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 110–6 ROWID_BLOCK_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')  
FROM some_table  
WHERE key_value = 42);
```

ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (
    rowid_type     IN NUMBER,
    object_number  IN NUMBER,
    relative_fno   IN NUMBER,
    block_number   IN NUMBER,
    row_number     IN NUMBER)
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 110–7 ROWID_CREATE Function Parameters

Parameter	Description
rowid_type	Type (restricted or extended). Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted).
relative_fno	Relative file number.
block_number	Block number in this file.
row_number	Returns row number in this block.

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID. This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
  rowid_in      IN  ROWID,
  rowid_type    OUT NUMBER,
  object_number OUT NUMBER,
  relative_fno  OUT NUMBER,
  block_number  OUT NUMBER,
  row_number    OUT NUMBER);
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 110–8 ROWID_INFO Procedure Parameters

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended).
object_number	Returns data object number (rowid_object_undefined for restricted).
relative_fno	Returns relative file number.
block_number	Returns block number in this file.
row_number	Returns row number in this block.

See Also: ["ROWID_TYPE Function"](#) on page 110-20

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO (
  my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

ROWID_OBJECT Function

This function returns the data object number for an extended ROWID. The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
  rowid_id IN ROWID)
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES (rowid_object, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 110–9 ROWID_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Note: The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object(ROWID)
FROM emp
WHERE empno = 7499;
```

ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (  
    rowid_id      IN   ROWID,  
    ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 110–10 ROWID_RELATIVE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE  
    file_number    INTEGER;  
    rowid_val      ROWID;  
BEGIN  
    SELECT ROWID INTO rowid_val  
        FROM dept  
        WHERE loc = 'Boston';  
    file_number :=  
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');  
    ...  
END;
```

ROWID_ROW_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (  
    row_id IN ROWID)  
RETURN NUMBER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (rowid_row_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 110–11 ROWID_ROW_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)  
FROM emp  
WHERE ename = 'ALLEN';
```

ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table. The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (  
    row_id      IN ROWID,  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2)  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 110–12 ROWID_TO_ABSOLUTE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
schema_name	Name of the schema which contains the table.
object_name	Table name.

Examples

```
DECLARE  
    abs_fno      INTEGER;  
    rowid_val    CHAR(18);  
    object_name  VARCHAR2(20) := 'EMP';  
BEGIN  
    SELECT ROWID INTO rowid_val  
    FROM emp  
    WHERE empno = 9999;  
    abs_fno := dbms_rowid.rowid_to_absolute_fno(  
        rowid_val, 'SCOTT', object_name);
```

Note: For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format. Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
  old_rowid      IN ROWID,
  schema_name    IN VARCHAR2,
  object_name    IN VARCHAR2,
  conversion_type IN INTEGER)
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 110–13 ROWID_TO_EXTENDED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
schema_name	Name of the schema which contains the table (optional).
object_name	Table name (optional).
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
SET rowid_col =
  dbms_rowid.rowid_to_extended (
    rowid_col, 'SCOTT', TABLE_COL, 0);
```

Usage Notes

If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the

converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.

If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.

If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the `INVALID_ROWID` exception is raised. If they do match, the input ROWID is returned.

See Also: The [ROWID_VERIFY Function](#) has a method to determine if a given ROWID can be converted to the extended format.

ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (  
    old_rowid      IN ROWID,  
    conversion_type IN INTEGER)  
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 110–14 ROWID_TO_RESTRICTED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (  
    rowid_id IN ROWID)  
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES (rowid_type, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 110–15 ROWID_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN  
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

ROWID_VERIFY Function

This function verifies the ROWID. It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

Note: You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
  rowid_in          IN ROWID,
  schema_name      IN VARCHAR2,
  object_name      IN VARCHAR2,
  conversion_type  IN INTEGER
) RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 110–16 ROWID_VERIFY Function Parameters

Parameter	Description
rowid_in	ROWID to be verified.
schema_name	Name of the schema which contains the table.
object_name	Table name.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Examples

Considering the schema in the example for the ROWID_TO_EXTENDED function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
  FROM SCOTT.RIDS
 WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

The DBMS_RULE package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

- [Chapter 236, "Rule TYPES"](#) for more information about the types used with the DBMS_RULE package
- [Chapter 112, "DBMS_RULE_ADM"](#) and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

- [Using DBMS_RULE](#)
 - Security Model
- [Summary of DBMS_RULE Subprograms](#)

Using DBMS_RULE

This section contains topics which relate to using the DBMS_RULE package.

- [Security Model](#)

Security Model

PUBLIC is granted EXECUTE privilege on this package.

Summary of DBMS_RULE Subprograms

Table 111-1 DBMS_RULE Package Subprograms

Subprogram	Description
CLOSE_ITERATOR Procedure on page 111-5	Closes an open iterator
EVALUATE Procedures on page 111-6	Evaluates the rules in the specified rule set that use the evaluation context specified
GET_NEXT_HIT Function on page 111-10	Returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator; returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(  
    iterator IN BINARY_INTEGER);
```

Parameter

Table 111-2 *CLOSE_ITERATOR Procedure Parameter*

Parameter	Description
iterator	The iterator to be closed

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

See Also: ["EVALUATE Procedures"](#) on page 111-6

EVALUATE Procedures

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```
DBMS_RULE.EVALUATE (
  rule_set_name          IN  VARCHAR2,
  evaluation_context     IN  VARCHAR2,
  event_context          IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values           IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values          IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values        IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values       IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  stop_on_first_hit      IN  BOOLEAN                 DEFAULT FALSE,
  simple_rules_only      IN  BOOLEAN                 DEFAULT FALSE,
  true_rules             OUT SYS.RE$RULE_HIT_LIST,
  maybe_rules            OUT SYS.RE$RULE_HIT_LIST);
```

```
DBMS_RULE.EVALUATE (
  rule_set_name          IN  VARCHAR2,
  evaluation_context     IN  VARCHAR2,
  event_context          IN  SYS.RE$NV_LIST           DEFAULT NULL,
  table_values           IN  SYS.RE$TABLE_VALUE_LIST  DEFAULT NULL,
  column_values          IN  SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values        IN  SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values       IN  SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  simple_rules_only      IN  BOOLEAN                 DEFAULT FALSE,
  true_rules_iterator    OUT BINARY_INTEGER,
  maybe_rules_iterator   OUT BINARY_INTEGER);
```

Parameters

Table 111–3 EVALUATE Procedure Parameters

Parameter	Description
<code>rule_set_name</code>	Name of the rule set in the form <code>[schema_name.]rule_set_name</code> . For example, to evaluate all of the rules in a rule set named <code>hr_rules</code> in the <code>hr</code> schema, enter <code>hr.hr_rules</code> for this parameter. If the schema is not specified, then the schema of the current user is used.
<code>evaluation_context</code>	An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code> . If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
<code>event_context</code>	A list of name-value pairs that identify events that cause evaluation

Table 111-3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
<code>table_values</code>	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
<code>column_values</code>	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in <code>table_values</code> .
<code>variable_values</code>	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
<code>attribute_values</code>	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in <code>variable_values</code> .
<code>stop_on_first_hit</code>	If <code>TRUE</code> , then the rules engine stops evaluation as soon as it finds a <code>TRUE</code> rule. If <code>TRUE</code> and there are no <code>TRUE</code> rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to <code>TRUE</code> given more data. If <code>FALSE</code> , then the rules engine continues to evaluate rules even after it finds a <code>TRUE</code> rule.
<code>simple_rules_only</code>	If <code>TRUE</code> , then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If <code>FALSE</code> , then evaluates all rules.
<code>true_rules</code>	Receives the output of the <code>EVALUATE</code> procedure into a varray of <code>RE\$RULE_HIT_LIST</code> type. If no rules evaluate to <code>TRUE</code> , then <code>true_rules</code> is empty. If at least one rule evaluates to <code>TRUE</code> and <code>stop_on_first_hit</code> is <code>TRUE</code> , then <code>true_rules</code> contains one rule that evaluates to <code>TRUE</code> . If <code>stop_on_first_hit</code> is <code>FALSE</code> , then <code>true_rules</code> contains all rules that evaluate to <code>TRUE</code> .
<code>maybe_rules</code>	If all rules can be evaluated completely, without requiring any additional data, then <code>maybe_rules</code> is empty. If <code>stop_on_first_hit</code> is <code>TRUE</code> , then if there is at least one rule that may evaluate to <code>TRUE</code> given more data, and no rules evaluate to <code>TRUE</code> , then <code>maybe_rules</code> contains one rule that may evaluate to <code>TRUE</code> . If <code>stop_on_first_hit</code> is <code>FALSE</code> , then <code>maybe_rules</code> contains all rules that may evaluate to <code>TRUE</code> given more data.
<code>true_rules_iterator</code>	Contains the iterator for accessing rules that are <code>TRUE</code>
<code>maybe_rules_iterator</code>	Contains the iterator for accessing rules that may be <code>TRUE</code> given additional data or the ability to issue SQL

Usage Notes

Note: Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as `TRUE`, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
 - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
 - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free

resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

Note: The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

- ["GET_NEXT_HIT Function"](#) on page 111-10
- ["CLOSE_ITERATOR Procedure"](#) on page 111-5

GET_NEXT_HIT Function

This function returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator. The function returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(
  iterator IN BINARY_INTEGER)
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 111-4 GET_NEXT_HIT Function Parameter

Parameter	Description
<code>iterator</code>	The iterator from which the rule that evaluated to <code>TRUE</code> or <code>MAYBE</code> is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns `NULL`, it is closed automatically. If an open iterator is no longer needed, then use the `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package to close it.

Note: This function raises an error if the rule set being evaluated was modified after the call to the `DBMS_RULE.EVALUATE` procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

Summary of DBMS_RULE_ADM Subprograms

Table 112–1 DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ADD_RULE Procedure on page 112-5	Adds the specified rule to the specified rule set
ALTER_EVALUATION_CONTEXT Procedure on page 112-7	Alters a rule evaluation context
ALTER_RULE Procedure on page 112-10	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure on page 112-12	Creates a rule evaluation context
CREATE_RULE Procedure on page 112-14	Creates a rule with the specified name
CREATE_RULE_SET Procedure on page 112-16	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure on page 112-17	Drops the rule evaluation context with the specified name
DROP_RULE Procedure on page 112-18	Drops the rule with the specified name
DROP_RULE_SET Procedure on page 112-19	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure on page 112-20	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SYSTEM_PRIVILEGE Procedure on page 112-22	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure on page 112-24	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure on page 112-26	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SYSTEM_PRIVILEGE Procedure on page 112-27	Revokes the specified system privilege from the specified user or role

Note: All subprograms commit unless specified otherwise.

ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
  rule_name          IN  VARCHAR2,
  rule_set_name     IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_comment      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 112–2 ADD_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are adding to the rule set, specified as [<i>schema_name</i> .] <i>rule_name</i> . For example, to add a rule named <i>all_a</i> in the <i>hr</i> schema, enter <i>hr.all_a</i> for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set to which you are adding the rule, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to add the rule to a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An evaluation context name in the form [<i>schema_name</i> .] <i>evaluation_context_name</i> . If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
rule_comment	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE privilege on the rule
- Have EXECUTE_ANY_RULE system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name    IN  VARCHAR2,
  table_aliases              IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases      IN  BOOLEAN                    DEFAULT FALSE,
  variable_types            IN  SYS.RE$VARIABLE_TYPE_LIST   DEFAULT NULL,
  remove_variable_types     IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function       IN  VARCHAR2                   DEFAULT NULL,
  remove_evaluation_function IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment IN  VARCHAR2                   DEFAULT NULL,
  remove_eval_context_comment IN  BOOLEAN                  DEFAULT FALSE);
```

Parameters

Table 112-3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as [<i>schema_name.</i>] <i>evaluation_context_name</i> . For example, to alter an evaluation context named <i>dept_eval_context</i> in the <i>hr</i> schema, enter <i>hr.dept_eval_context</i> for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If NULL and <i>remove_table_aliases</i> is FALSE, then the procedure retains the existing table aliases. If NULL and <i>remove_table_aliases</i> is TRUE, then the procedure removes the existing table aliases. If non-NULL, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If TRUE and <i>table_aliases</i> is NULL, then the procedure removes the existing table aliases for the evaluation context. If TRUE and <i>table_aliases</i> is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove table aliases.
variable_types	If NULL and <i>remove_variable_types</i> is FALSE, then the procedure retains the variable types. If NULL and <i>remove_variable_types</i> is TRUE, then the procedure removes the existing variable types. If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.

Table 112-3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_variable_types	<p>If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the variable types.</p>
evaluation_function	<p>If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function.</p> <p>If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function.</p> <p>An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default.</p> <p>See "CREATE_EVALUATION_CONTEXT Procedure" on page 112-12 for more information about evaluation functions.</p>
remove_evaluation_function	<p>If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation function.</p>
evaluation_context_comment	<p>If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment.</p> <p>If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment.</p> <p>An evaluation context comment is an optional description of the rule evaluation context.</p>
remove_eval_context_comment	<p>If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not remove the evaluation context comment.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user

- Have ALTER_ANY_EVALUATION_CONTEXT system privilege

See Also: [Chapter 236, "Rule TYPES"](#) for more information about the types used with the DBMS_RULE_ADM package

ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE (
    rule_name           IN  VARCHAR2,
    condition           IN  VARCHAR2          DEFAULT NULL,
    evaluation_context  IN  VARCHAR2          DEFAULT NULL,
    remove_evaluation_context IN  BOOLEAN      DEFAULT FALSE,
    action_context      IN  SYS.RE$NV_LIST    DEFAULT NULL,
    remove_action_context IN  BOOLEAN          DEFAULT FALSE,
    rule_comment        IN  VARCHAR2          DEFAULT NULL,
    remove_rule_comment IN  BOOLEAN          DEFAULT FALSE);
```

Parameters

Table 112–4 ALTER_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are altering, specified as [<i>schema_name</i> .] <i>rule_name</i> . For example, to alter a rule named <i>all_a</i> in the <i>hr</i> schema, enter <i>hr.all_a</i> for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form [<i>schema_name</i> .] <i>evaluation_context_name</i> . If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the <i>evaluation_context</i> parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the <i>action_context</i> parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.

Table 112-4 (Cont.) ALTER_RULE Procedure Parameters

Parameter	Description
remove_rule_comment	<p>If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule.</p> <p>If FALSE, then the procedure retains any comment for the specified rule.</p> <p>If the rule_comment parameter is non-NULL, then this parameter should be set to FALSE.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule
- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also: [Chapter 236, "Rule TYPES"](#) for more information about the types used with the DBMS_RULE_ADM package

CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT (
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST  DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST DEFAULT NULL,
  evaluation_function           IN  VARCHAR2                 DEFAULT NULL,
  evaluation_context_comment    IN  VARCHAR2                 DEFAULT NULL);
```

Parameters

Table 112–5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as [<i>schema_name.</i>] <i>evaluation_context_name</i> . For example, to create an evaluation context named <i>dept_eval_context</i> in the <i>hr</i> schema, enter <i>hr.dept_eval_context</i> for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context
evaluation_function	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the <i>DBMS_RULE.EVALUATE</i> procedure. If the schema is not specified, then the current user is the default. See " Usage Notes " for more information about the evaluation function.
evaluation_context_comment	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have *CREATE_EVALUATION_CONTEXT_OBJ* system privilege
- Have *CREATE_ANY_EVALUATION_CONTEXT* system privilege

See Also: [Chapter 236, "Rule TYPES"](#) for more information about the types used with the *DBMS_RULE_ADM* package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name      IN  VARCHAR2,
```

```

evaluation_context IN VARCHAR2,
event_context     IN SYS.RE$NV_LIST          DEFAULT NULL,
table_values      IN SYS.RE$TABLE_VALUE_LIST DEFAULT NULL,
column_values     IN SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
variable_values   IN SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
attribute_values  IN SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
stop_on_first_hit IN BOOLEAN                DEFAULT FALSE,
simple_rules_only  IN BOOLEAN                DEFAULT FALSE,
true_rules        OUT SYS.RE$RULE_HIT_LIST,
maybe_rules      OUT SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;

```

Note: Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
  rule_name          IN  VARCHAR2,
  condition          IN  VARCHAR2,
  evaluation_context IN  VARCHAR2          DEFAULT NULL,
  action_context     IN  SYS.RE$NV_LIST   DEFAULT NULL,
  rule_comment       IN  VARCHAR2          DEFAULT NULL);
```

Parameters

Table 112–6 CREATE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are creating, specified as [<i>schema_name.</i>] <i>rule_name</i> . For example, to create a rule named <i>all_a</i> in the <i>hr</i> schema, enter <i>hr.all_a</i> for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition: <code>department_id = 30</code> Ensure that the proper case is used for text in rule conditions. Note: Do not include the word "WHERE" in the condition.
evaluation_context	An optional evaluation context name in the form [<i>schema_name.</i>] <i>evaluation_context_name</i> , which is associated with the rule. If the schema is not specified, then the current user is the default. If <i>evaluation_context</i> is not specified, then the rule inherits the evaluation context from its rule set.
action_context	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
rule_comment	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE_RULE_OBJ system privilege
- Have CREATE_ANY_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.

- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also: [Chapter 236, "Rule TYPES"](#) for more information about the types used with the DBMS_RULE_ADM package

CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_set_comment   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 112-7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are creating, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to create a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An optional evaluation context name in the form [<i>schema_name</i> .] <i>evaluation_context_name</i> , which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
rule_set_comment	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT (
  evaluation_context_name IN VARCHAR2,
  force                    IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 112–8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	<p>The name of the evaluation context you are dropping, specified as [<i>schema_name</i>.]<i>evaluation_context_name</i>.</p> <p>For example, to drop an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
force	<p>If <code>TRUE</code>, then the procedure removes the rule evaluation context from all rules and rule sets that use it.</p> <p>If <code>FALSE</code> and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context.</p> <p>If <code>FALSE</code> and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception.</p> <p>Caution: Setting <code>force</code> to <code>TRUE</code> can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE(
    rule_name IN VARCHAR2,
    force     IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 112–9 DROP_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are dropping, specified as [<i>schema_name</i> .] <i>rule_name</i> . For example, to drop a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
force	If <code>TRUE</code> , then the procedure removes the rule from all rule sets that contain it. If <code>FALSE</code> and no rule sets contain the rule, then the procedure drops the rule. If <code>FALSE</code> and one or more rule sets contain the rule, then the procedure raises an exception.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have `DROP_ANY_RULE` system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the `REMOVE_RULE` procedure.
 - The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.
-
-

DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
  rule_set_name IN VARCHAR2,
  delete_rules  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 112–10 DROP_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to drop a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If TRUE , then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE , then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have **DROP_ANY_RULE_SET** system privilege
- Be the owner of the rule set

Note: The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE (
  privilege      IN  BINARY_INTEGER,
  object_name    IN  VARCHAR2,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 112–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the object privilege to grant to the grantee on the object. See "Usage Notes" on page 112-20 for the available object privileges.
object_name	The name of the object for which you are granting the privilege to the grantee, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, to grant the privilege on a rule set named <i>apply_rules</i> in the <i>hr</i> schema, enter <i>hr.apply_rules</i> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
grantee	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

[Table 112–12](#) lists the object privileges.

Table 112–12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
<code>SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT</code>	Alter and execute a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.ALL_ON_RULE</code>	Alter and execute a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET</code>	Alter and execute a particular rule set in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT</code>	Alter a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE</code>	Alter a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET</code>	Alter a particular rule set in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT</code>	Execute a particular evaluation context in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE</code>	Execute a particular rule in another user's schema
<code>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET</code>	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named `hr_dml` in the `strmadmin` schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name => 'strmadmin.hr_dml',
    grantee => 'hr',
    grant_option => FALSE);
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE (
  privilege      IN  BINARY_INTEGER,
  grantee        IN  VARCHAR2,
  grant_option   IN  BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 112–13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

[Table 112–14](#) lists the system privileges.

Table 112–14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema

Table 112–14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the `strmadmin` user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee   => 'strmadmin',
    grant_option => FALSE);
END;
/
```

Note: When you grant a privilege on "ANY" object (for example, `ALTER_ANY_RULE`), and the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to `FALSE`, you give the user access to that type of object in all schemas except the `SYS` schema. By default, the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to `FALSE`.

If you want to grant access to an object in the `SYS` schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the `O7_DICTIONARY_ACCESSIBILITY` initialization parameter to `TRUE`. Then privileges granted on "ANY" object will allow access to any schema, including `SYS`.

REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name          IN VARCHAR2,
  rule_set_name     IN VARCHAR2,
  evaluation_context IN VARCHAR2 DEFAULT NULL,
  all_evaluation_contexts IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 112–15 REMOVE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	The name of the rule you are removing from the rule set, specified as [<i>schema_name</i> .] <i>rule_name</i> . For example, to remove a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>rule_set_name</code>	The name of the rule set from which you are removing the rule, specified as [<i>schema_name</i> .] <i>rule_set_name</i> . For example, to remove the rule from a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>evaluation_context_name</code>	<p>The name of the evaluation context associated with the rule you are removing, specified as [<i>schema_name</i>.] <i>evaluation_context_name</i>. For example, to specify an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the <code>ADD_RULE</code> procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error.</p> <p>Specify <code>NULL</code> if you did not specify an evaluation context when you added the rule to the rule set. If you specify <code>NULL</code> and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.</p>
<code>all_evaluation_contexts</code>	<p>If <code>TRUE</code>, then the procedure removes the rule from the rule set with all of its associated evaluation contexts.</p> <p>If <code>FALSE</code>, then the procedure only removes the rule with the specified evaluation context.</p> <p>This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.</p>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Note: This procedure does not drop a rule from the database. To drop a rule from the database, use the DROP_RULE procedure.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE (
  privilege    IN  BINARY_INTEGER,
  object_name  IN  VARCHAR2,
  revokee      IN  VARCHAR2);
```

Parameters

Table 112–16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the object privilege on the object to revoke from the revokee. See " GRANT_OBJECT_PRIVILEGE Procedure " on page 112-20 for a list of the object privileges.
object_name	The name of the object for which you are revoking the privilege from the revokee, specified as [<i>schema_name.</i>] <i>object_name</i> . For example, to revoke an object privilege on a rule set named <code>apply_rules</code> in the <code>hr</code> schema, enter <code>hr.apply_rules</code> for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
revokee	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(  
    privilege IN BINARY_INTEGER,  
    revokee   IN VARCHAR2);
```

Parameters

Table 112-17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to revoke from the revokee. See " GRANT_SYSTEM_PRIVILEGE Procedure " on page 112-22 for a list of the system privileges.
revokee	The name of the user or role from which the privilege is revoked

DBMS_SCHEDULER

The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that are callable from any PL/SQL program.

See Also: *Oracle Database Administrator's Guide* for more information regarding how to use DBMS_SCHEDULER

This chapter contains the following topics:

- [Data Structures](#)
- [Using DBMS_SCHEDULER](#)
 - Rules and Limits
 - Operational Notes
- [Summary of DBMS_SCHEDULER Subprograms](#)

Data Structures

The DBMS_SCHEDULER package defines OBJECT types and TABLE types.

OBJECT Types

- [JOBARG Object Type](#)
- [JOB Object Type](#)
- [JOBATTR Object Type](#)
- [SCHEDULER\\$_STEP_TYPE Object Type](#)

TABLE Types

- [JOBARG_ARRAY Table Type](#)
- [JOB_ARRAY Table Type](#)
- [JOBATTR_ARRAY Table Type](#)
- [SCHEDULER\\$_STEP_TYPE_LIST Table Type](#)

JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
  arg_position      NUMBER,
  arg_text_value    VARCHAR2(4000),
  arg_anydata_value ANYDATA,
  arg_operation     VARCHAR2(5);
```

Attributes

Table 113–1 JOBARG Object Type Attributes

Attribute	Description
arg_position	Position of the argument
arg_text_value	Value of the argument if the type is VARCHAR2
arg_anydata_value	Value of the argument if the type is AnyData
arg_operation	Type of the operation: <ul style="list-style-type: none"> ■ SET ■ RESET

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN VARCHAR2)
RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_value         IN ANYDATA)
RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
  arg_position      IN POSITIVEN,
  arg_reset        IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;
```

Parameters

Table 113–2 *JOBARG Constructor Function Parameters*

Parameter	Description
<code>arg_position</code>	Position of the argument
<code>arg_value</code>	Value of the argument
<code>arg_reset</code>	If <code>arg_reset</code> is <code>TRUE</code> , then the argument at that position is reset. Setting <code>arg_reset</code> to <code>FALSE</code> (which is the default) will create an argument with a <code>NULL</code> value.

JOBARG_ARRAY Table Type

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

JOB Object Type

This type is used by the `CREATE_JOBS` procedure and represents a job in a batch of jobs.

Syntax

```

TYPE job IS OBJECT (
  job_name          VARCHAR2(100),
  job_class         VARCHAR2(32),
  job_style         VARCHAR2(11),
  job_template      VARCHAR2(100),
  program_action    VARCHAR2(4000),
  action_type       VARCHAR2(20),
  schedule_name     VARCHAR2(65),
  repeat_interval   VARCHAR2(4000),
  schedule_limit    INTERVAL DAY(2) TO SECOND(6),
  start_date        TIMESTAMP(6) WITH TIME ZONE,
  end_date          TIMESTAMP(6) WITH TIME ZONE,
  event_condition   VARCHAR2(4000),
  queue_spec        VARCHAR2(100),
  number_of_args    NUMBER,
  arguments         JOBARG_ARRAY,
  priority          NUMBER,
  job_weight        NUMBER,
  max_run_duration  INTERVAL DAY(2) TO SECOND(6),
  max_runs          NUMBER,
  max_failures      NUMBER,
  logging_level     NUMBER,
  restartable       VARCHAR2(5),
  stop_on_window_exit VARCHAR2(5),
  raise_events      NUMBER,
  comments          VARCHAR2(240),
  auto_drop         VARCHAR2(5),
  enabled           VARCHAR2(5),
  follow_default_tz VARCHAR2(5),
  parallel_instances VARCHAR2(5),
  aq_job            VARCHAR2(5),
  instance_id       NUMBER);

```

Object Attributes

Table [Table 113–3](#) describes the attributes of the JOB object type. For more information about these attributes, see "[SET_ATTRIBUTE Procedure](#)" on page 113-99.

Table 113–3 *JOB Object Type Attributes*

Attribute	Description
job_name	Name of the job
job_class	Name of the job class
job_style	Style of the job: <ul style="list-style-type: none"> ■ REGULAR ■ LIGHTWEIGHT
job_template	Name of the program. Equivalent to the <code>program_name</code> argument of the CREATE_JOB Procedure .

Table 113–3 (Cont.) JOB Object Type Attributes

Attribute	Description
program_action	Inline action of the job. Equivalent to the <code>job_action</code> argument of the CREATE_JOB Procedure .
action_type	Job action type. Equivalent to the <code>job_type</code> argument of the CREATE_JOB Procedure . Either <code>job_template</code> must be set and <code>program_action</code> and <code>action_type</code> left null, or <code>program_action</code> and <code>action_type</code> must be set and <code>job_template</code> left null.
schedule_name	Name of the schedule that specifies when the job has to execute
repeat_interval	Inline time-based schedule
schedule_limit	Time from the scheduled execution time that the job should be run
start_date	Start date and time of the job
end_date	End date and time of the job
event_condition	Event condition for event-based jobs
queue_spec	Queue specification for event-based jobs
number_of_args	Number of job arguments
arguments	Array of job arguments
priority	Job priority
job_weight	Weight of the job
max_run_duration	Maximum run duration of the job
max_runs	Maximum number of runs before the job is marked as completed
max_failures	Maximum number of failures to tolerate before the job is marked as broken
logging_level	Job logging level
restartable	Indicates whether the job is restartable (<code>TRUE</code>) or not (<code>FALSE</code>)
stop_on_window_exit	Indicates whether the job should be stopped when the window it is running in ends (<code>TRUE</code>) or not (<code>FALSE</code>). Equivalent to the <code>stop_on_window_close</code> job attribute described in the SET_ATTRIBUTE Procedure .
raise_events	State changes on which events should be raised
comments	Comments on the job
auto_drop	If <code>TRUE</code> (the default), indicates that the job should be dropped once completed
enabled	Indicates whether the job should be enabled immediately after creating it (<code>TRUE</code>) or not (<code>FALSE</code>)

Table 113-3 (Cont.) JOB Object Type Attributes

Attribute	Description
follow_default_tz	If TRUE and if the job <code>start_date</code> is null, then when the <code>default_timezone</code> scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone. For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone. (If the job <code>start_date</code> is not null, then the time zone for the run date and time for the job is always specified by the time zone of the <code>start_date</code> .) If FALSE, the next start date and time for the job is not recomputed when the <code>default_timezone</code> scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel.
aq_job	For internal use only.
instance_id	The instance ID of the instance that the job must run on.

JOB Constructor Function

This constructor function constructs a job object.

Syntax

```

constructor function job (
  job_name           IN VARCHAR2,
  job_style          IN VARCHAR2 DEFAULT 'REGULAR',
  job_template       IN VARCHAR2 DEFAULT NULL,
  program_action     IN VARCHAR2 DEFAULT NULL,
  action_type        IN VARCHAR2 DEFAULT NULL,
  schedule_name      IN VARCHAR2 DEFAULT NULL,
  repeat_interval    IN VARCHAR2 DEFAULT NULL,
  event_condition    IN VARCHAR2 DEFAULT NULL,
  queue_spec         IN VARCHAR2 DEFAULT NULL,
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  number_of_args     IN NATURAL DEFAULT NULL,
  arguments          IN JOBARG_ARRAY DEFAULT NULL,
  job_class          IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
  schedule_limit     IN INTERVAL DAY TO SECOND DEFAULT NULL,
  priority           IN NATURAL DEFAULT NULL,
  job_weight         IN NATURAL DEFAULT NULL,
  max_run_duration   IN INTERVAL DAY TO SECOND DEFAULT NULL,
  max_runs           IN NATURAL DEFAULT NULL,
  max_failures       IN NATURAL DEFAULT NULL,
  logging_level      IN NATURALN DEFAULT 64,
  restartable        IN BOOLEAN DEFAULT FALSE,
  stop_on_window_exit IN BOOLEAN DEFAULT FALSE,
  raise_events       IN NATURAL DEFAULT NULL,
  comments           IN VARCHAR2 DEFAULT NULL,
  auto_drop          IN BOOLEAN DEFAULT TRUE,
  enabled            IN BOOLEAN DEFAULT FALSE,
  follow_default_tz  IN BOOLEAN DEFAULT FALSE,
  parallel_instances IN BOOLEAN DEFAULT FALSE,
  aq_job             IN BOOLEAN DEFAULT FALSE,

```

```
instance_id          IN NATURAL DEFAULT NULL)  
RETURN SELF AS RESULT;
```

JOB_ARRAY Table Type

Syntax

```
TYPE job_array IS TABLE OF job;
```

JOBATTR Object Type

This type is used by the SET_JOB_ATTRIBUTES procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
  job_name          VARCHAR2(100),
  attr_name         VARCHAR2(30),
  char_value        VARCHAR2(4000),
  char_value2       VARCHAR2(4000),
  args_value        JOBARG_ARRAY,
  num_value         NUMBER,
  timestamp_value   TIMESTAMP(6) WITH TIME ZONE,
  interval_value    INTERVAL DAY(2) TO SECOND(6);
```

Attributes

Table 113–4 *JOBATTR Object Type Attributes*

Attribute	Description
job_name	Name of the job
attr_name	Name of the attribute
char_value	Value of the argument if the type is VARCHAR2
char_value2	Second VARCHAR2 attribute value
args_value	Value of the argument if the type is a JOBARG array
num_value	Value of the argument if the type is NUMBER
timestamp_value	Value of the argument if the type is TIMESTAMP WITH TIME ZONE
interval_value	Value of the argument if the type is INTERVAL DAY TO SECOND

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

Syntax

```
constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN VARCHAR2,
  attr_value2       IN VARCHAR2 DEFAULT NULL)
  RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2,
  attr_value        IN [NUMBER, BOOLEAN,
  TIMESTAMP WITH TIME ZONE,
  INTERVAL DAY TO SECOND, JOBARG_ARRAY])
```

```
RETURN SELF AS RESULT;

constructor function jobattr (
  job_name          IN VARCHAR2,
  attr_name         IN VARCHAR2)
RETURN SELF AS RESULT;
```

Parameters

Table 113–5 *JOBATTR Constructor Function Parameters*

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

JOBATTR_ARRAY Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

SCHEDULER\$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a List of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (  
    step_name  VARCHAR2(32),  
    step_type  VARCHAR2(32));
```

Attributes

Table 113–6 SCHEDULER\$_STEP_TYPE Object Type

Attribute	Description
step_name	Name of the step
step_type	State of the step

SCHEDULER\$_STEP_TYPE_LIST Table Type

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

Using DBMS_SCHEDULER

This section contains:

- [Rules and Limits](#)
- [Operational Notes](#)

Rules and Limits

The following rules apply when using the DBMS_SCHEDULER package:

- Only SYS can do anything in SYS schema.
- Several of the procedures accept comma-delimited lists of object names. When a list of names is provided, the Scheduler will stop executing the list on the very first object that returns an error. This means that the Scheduler will not perform the task on the objects in the list after the one that caused the error. For example, consider the statement `DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3');` If job3 could not be stopped, then job1 and job2 will be stopped, but the jobs in jobclass1, jobclass2, and jobclass3 will not be stopped.
- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

Operational Notes

The Scheduler uses a rich **calendar**ing syntax to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

In the following calendaring syntax, * means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause] [";" periods_clause]
[";" byperiod_clause]

combined_schedule = schedule_list [";" include_clause]
[";" exclude_clause] [";" intersect_clause]

frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
"HOURLY" | "MINUTELY" | "SECONDLY"
user_defined_frequency = named_schedule

interval_clause = "INTERVAL" "=" intervalnum
intervalnum = 1 through 99

Table 113–7 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 999.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.

Table 113-7 (Cont.) Values for repeat_interval

Name	Description
BYWEEKNO	<p>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. That last definition is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th.</p> <p>The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year.</p> <p>As an example, in the year 1998 the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01; and January 1st, 1999, is in the ISO week 1998-53.</p> <p>byweekno is only valid for YEARLY.</p> <p>Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1".</p>
BYYEARDAY	<p>This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.</p>
BYDATE	<p>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause is the following:</p> <pre data-bbox="537 1056 1110 1077">BYDATE=0115,0315,0615,0915,1215,20060115</pre> <p>The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10:</p> <pre data-bbox="537 1188 813 1209">BYDATE=0110+SPAN:5D</pre> <p>The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of n days or weeks centered around the supplied date. If n is an even number, it is adjusted up to the next odd number.</p> <p>Offsets adjust the supplied date by adding or subtracting n days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.</p>
BYMONTHDAY	<p>This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.</p>
BYDAY	<p>This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.</p>
BYHOUR	<p>This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.</p>
BYMINUTE	<p>This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.</p>

Table 113–7 (Cont.) Values for repeat_interval

Name	Description
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	This selects one or more items by position in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1 Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.
INCLUDE	This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.
EXCLUDE	This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure.
INTERSECT	This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps. For example, assume that the named schedule last_sat indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule end_qtr indicates the last day of each quarter in 2005: 3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005 The following calendaring expression results in these dates: 3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005 FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr In this example, the terms FREQ=MONTHLY; BYMONTHDAY=-1 indicate the last day of each month.

Table 113–7 (Cont.) Values for repeat_interval

Name	Description
PERIODS	This identifies the number of periods that together form one cycle of a user defined frequency. It is used in the <code>repeat_interval</code> expression of the schedule that defines the user defined frequency. It is mandatory when the <code>repeat_interval</code> expression in the main schedule contains a <code>BYPERIOD</code> clause. The following example defines the quarters of a fiscal year. <code>FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4</code>
BYPERIOD	This selects periods from a user defined frequency. For example, if a main schedule names a user defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause <code>BYPERIOD=2,4</code> in the main schedule selects the 2nd and 4th fiscal quarters.

Combining Schedules There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules
For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule. You can follow the initial list of individual schedules with `include`, `exclude`, and `intersect` clauses to create more complex combinations.
- Embedding other schedules into the main schedule using `include`, `exclude`, and `intersect` clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the `INCLUDE` clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the `INTERVAL` clause, the `BYPERIOD` clause, or the `BYMONTH` clause for `freq=monthly`.
- Days that are added by the `INCLUDE` clause follow the hourly/ minutely/secondly execution pattern of the main schedule.
- When the `INCLUDE` clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See ["Start Dates and Repeat Intervals"](#), later in this section.) For example, a `repeat_interval` of `FREQ=MONTHLY; INCLUDE=HOLIDAY` executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the `INTERVAL` clause. If the start date of the main schedule is 1/1/2005, then 2/20 isn't added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m.

on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User Defined Frequencies Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following `repeat_interval` expression is used in a schedule named `fiscal_year` that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the `fiscal_year` schedule as a user defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user defined frequency do not have to be equal in length. In the main schedule, the `BYSETPOS` clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the `BYPERIOD` clause in the main schedule. To enable this, the schedule that is used as the user defined frequency must include a `PERIODS` clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYMONTH` or `BYMONTHDAY` clause in the repeat interval, the month and day on which to run the job are retrieved from the start date. Similarly, if frequency is monthly but there is no `BYMONTHDAY` clause in the repeat interval, the day of the month on which to run the job is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.

The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule `S1` has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semi-colon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.
- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "`FREQ=YEARLY`" with a start date of 02/15/2003 becomes "`FREQ=YEARLY; BYMONTH=FEB; BYMONTHDAY=15`", which means every year on the 15th of February.

"`FREQ=YEARLY; BYMONTH=JAN, JUL`" with start date 01/21/2003 becomes "`FREQ=YEARLY; BYMONTH=JAN, JUL; BYMONTHDAY=21`", which means every year on January 21 and July 21.

- The `byweekno` clause is only allowed if the frequency is `YEARLY`. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a `BYDAY` clause. For example, "`FREQ=YEARLY; BYWEEKNO=2`" with a start date of 01/01/2003 will return:

```
01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
```

Note that when the `byweekno` clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "`FREQ=YEARLY; BYWEEKNO=1, 53`" for the specified week numbers in 2004, it will return the dates:

```
12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
```

- For those `BY` clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying `BYMONTHDAY=31` will not give you the last day of every month, because not every month has 31 days. Instead, `BYMONTHDAY=-1` will give you the last day of the month.

This is not supported for `BY` clauses that are fixed in size. In other words, `BYMONTH`, `BYHOUR`, `BYMINUTE`, and `BYSECOND` are not supported.

- The basic values for the `BYDAY` clause are the days of the week. When the frequency is `YEARLY`, or `MONTHLY`, you are allowed to specify a positive or negative number in front of each day of the week. In the case of `YEARLY`, `BYDAY=40MON`, indicates the 40th Monday of the year. In the case of `MONTHLY`, `BYDAY=-2SAT`, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments you must make sure that you specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as 'US/Eastern' in New York will make sure that daylight saving adjustments are automatically applied. If instead the time zone of the `start_date` is set to an absolute offset, such as '-5:00', daylight savings adjustments are not followed and your job execution will be off by an hour half of the year.
- When `start_date` is NULL, the Scheduler will determine the time zone for the repeat interval as follows:
 1. It will check whether the session time zone is a region name. The session time zone can be set by either:
 - Issuing an ALTER SESSION statement, for example:

```
SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
```
 - Setting the ORA_SDTZ environment variable.
 2. If the session time zone is an absolute offset instead of a region name, the Scheduler will use the value of the DEFAULT_TIMEZONE Scheduler attribute. For more information, see the [SET_SCHEDULER_ATTRIBUTE Procedure](#).
 3. If the DEFAULT_TIMEZONE attribute is NULL, the Scheduler will use the time zone of `sysimestamp` when the job or window is enabled.

BYSETPOS Clause Rules The following are rules for the BYSETPOS clause.

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is

to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which `BYSETPOS` is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

```
FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
```

on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules The following are rules for the `BYDATE` clause.

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

```
freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
```

then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

OFFSET Rules You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

Example 113–1 Putting It All Together

This example demonstrates the use of user defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword in an offset clause is optional.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
  dbms_scheduler.create_schedule('year_start', repeat_interval=>
    'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
  dbms_scheduler.create_schedule('retail_fiscal_year',
    to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
    'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing holiday schedule.

```
begin
  dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
    'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
    BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

Summary of DBMS_SCHEDULER Subprograms

Table 113–8 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure on page 113-27	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE
ADD_WINDOW_GROUP_MEMBER Procedure on page 113-28	Adds a window to an existing window group
ALTER_CHAIN Procedure on page 113-29	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure on page 113-31	Alters specified steps of a running chain
CLOSE_WINDOW Procedure on page 113-33	Closes an open window prematurely
COPY_JOB Procedure on page 113-34	Copies an existing job
CREATE_CHAIN Procedure on page 113-35	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_CREDENTIAL Procedure on page 113-36	Creates a credential
CREATE_EVENT_SCHEDULE Procedure on page 113-37	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_JOB Procedure on page 113-39	Creates a single job
CREATE_JOB_CLASS Procedure on page 113-45	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_JOBS Procedure on page 113-47	Creates multiple jobs
CREATE_PROGRAM Procedure on page 113-48	Creates a program
CREATE_SCHEDULE Procedure on page 113-50	Creates a schedule
CREATE_WINDOW Procedure on page 113-51	Creates a window, which provides a way to automatically activate different resource plans at different times
CREATE_WINDOW_GROUP Procedure on page 113-53	Creates a window group
DEFINE_ANYDATA_ARGUMENT Procedure on page 113-54	Defines a program argument whose value is of a complex type and must be passed encapsulated in an AnyData object
DEFINE_CHAIN_EVENT_STEP Procedure on page 113-55	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: <code>DEFINE_CHAIN_STEP</code> .
DEFINE_CHAIN_RULE Procedure on page 113-56	Adds a rule to an existing chain

Table 113–8 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DEFINE_CHAIN_STEP Procedure on page 113-59	Defines a chain step, which can be a program or another (nested) chain. See also: DEFINE_CHAIN_EVENT_STEP .
DEFINE_METADATA_ARGUMENT Procedure on page 113-60	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument
DEFINE_PROGRAM_ARGUMENT Procedure on page 113-62	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure on page 113-64	Disables a program, job, chain, window, or window group
DROP_CHAIN Procedure on page 113-67	Drops an existing chain
DROP_CHAIN_RULE Procedure on page 113-68	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure on page 113-69	Drops a chain step
DROP_CREDENTIAL Procedure on page 113-70	Drops a credential
DROP_JOB Procedure on page 113-71	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure on page 113-72	Drops a job class
DROP_PROGRAM Procedure on page 113-73	Drops a program
DROP_PROGRAM_ARGUMENT Procedure on page 113-74	Drops a program argument
DROP_SCHEDULE Procedure on page 113-75	Drops a schedule
DROP_WINDOW Procedure on page 113-76	Drops a window
DROP_WINDOW_GROUP Procedure on page 113-77	Drops a window group
ENABLE Procedure on page 113-78	Enables a program, job, chain, window, or window group
END_DETACHED_JOB_RUN Procedure on page 113-79	Ends a running detached job
EVALUATE_CALENDAR_STRING Procedure on page 113-80	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_CHAIN Procedure on page 113-82	Forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied
GENERATE_JOB_NAME Function on page 113-83	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named <code>sally1</code> , <code>sally2</code> , and so on

Table 113–8 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
GET_ATTRIBUTE Procedure on page 113-84	Retrieves the value of an attribute of an object
GET_FILE Procedure on page 113-85	Retrieves a file from a host
GET_SCHEDULER_ATTRIBUTE Procedure on page 113-87	Retrieves the value of a Scheduler attribute
OPEN_WINDOW Procedure on page 113-88	Opens a window prematurely. The window is opened immediately for the duration
PURGE_LOG Procedure on page 113-89	Purges specific rows from the job and window logs
PUT_FILE Procedure on page 113-90	Saves a file to one or more hosts
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure on page 113-91	Unsubscribes a user from the Scheduler event queue <code>SYS.SCHEDULER\$_EVENT_QUEUE</code>
REMOVE_WINDOW_GROUP_MEMBER Procedure on page 113-92	Removes a window from an existing window group. This fails if the specified window is not a member of the given group
RESET_JOB_ARGUMENT_VALUE Procedure on page 113-93	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedure on page 113-94	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure on page 113-96	Runs a job immediately
SET_AGENT_REGISTRATION_PASS Procedure on page 113-98	Sets the agent registration password for a database
SET_ATTRIBUTE Procedure on page 113-99	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure on page 113-110	Changes an attribute of an object to <code>NULL</code>
SET_JOB_ANYDATA_VALUE Procedure on page 113-111	Sets the value of a job argument encapsulated in an <code>AnyData</code> object
SET_JOB_ARGUMENT_VALUE Procedure on page 113-112	Sets the value of a job argument
SET_JOB_ATTRIBUTES Procedure on page 113-113	Sets the value of a job attribute
SET_SCHEDULER_ATTRIBUTE Procedure on page 113-114	Sets the value of a Scheduler attribute
STOP_JOB Procedure on page 113-116	Stops a currently running job or all jobs in a job class

ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
  subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–9 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
<code>subscriber_name</code>	Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If <code>NULL</code> , an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

ADD_WINDOW_GROUP_MEMBER Procedure

This procedure adds one or more windows to an existing window group.

Syntax

```
DBMS_SCHEDULER.ADD_WINDOW_GROUP_MEMBER (  
    group_name          IN VARCHAR2,  
    window_list        IN VARCHAR2);
```

Parameters

Table 113–10 ADD_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the window group
window_list	The name of the window or windows

Usage Notes

If an already open window is added to a window group, the Scheduler will not pick up jobs that point to this window group until the next window in the window group opens.

Adding a window to a group requires the `MANAGE SCHEDULER` privilege.

Note that a window group cannot be a member of another window group.

ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  attribute            IN VARCHAR2,
  value               IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  attribute            IN VARCHAR2,
  char_value          IN VARCHAR2);
```

Parameters

Table 113–11 ALTER_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step or a comma-separated list of steps to alter. This cannot be NULL.

Table 113–11 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
attribute	<p>The attribute of the steps to change. Must be one of the following:</p> <ul style="list-style-type: none"> ■ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain FALSE). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. ■ 'SKIP'—If the SKIP attribute is set TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED. ■ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. ■ 'DESTINATION'—Valid only for steps that run remote external jobs. Specifies the destination where the step is to run. Must be of the form <i>host:port</i>, where <i>host</i> is the host name or IP address of the destination host, and <i>port</i> is the port number on which the Scheduler agent on that host listens. NULL by default. ■ 'CREDENTIAL_NAME'—Valid only for steps that run external jobs (local or remote). Specifies the credential to use when running this step. NULL by default.
value	The value to set for the attribute (for a boolean attribute).
char_value	The value to set for the attribute (for a character attribute).

Usage Notes

Altering a chain requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
  job_name          IN VARCHAR2,
  step_name        IN VARCHAR2,
  attribute         IN VARCHAR2,
  value            IN {BOOLEAN|VARCHAR2});
```

Parameters

Table 113–12 ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to NULL and attribute is PAUSE or SKIP, then all steps of the running chain will be altered.
attribute	<p>The attribute of the steps to change. This must be one of: 'PAUSE', 'SKIP', 'RESTART_ON_RECOVERY', or 'STATE'.</p> <ul style="list-style-type: none"> ▪ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain false). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE will be set to TRUE for all steps of this running chain. ▪ 'SKIP'—If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP will be set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step will immediately change to state PAUSED. ▪ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. ▪ 'STATE'—This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. This must be one of: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code'

Usage Notes

Altering a running chain requires alter privileges on the job which is running (either by being the owner, or by having `ALTER` privileges on the job or by having the `CREATE ANY JOB` system privilege).

CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler will switch the resource plan to the one that was in effect outside the window or in the case of overlapping windows to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name          IN VARCHAR2);
```

Parameters

Table 113–13 *CLOSE_WINDOW Procedure Parameters*

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running will not stop when the window it is running in closes unless the attribute `stop_on_window_close` was set to `TRUE` for the job. However, the resources allocated to the job may change because the resource plan may change.

When a running job has a window group as its schedule, the job will not be stopped when its window is closed if another window that is also a member of the same window group then becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to `TRUE`.

Closing a window requires the `MANAGE SCHEDULER` privilege.

COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (  
    old_job          IN VARCHAR2,  
    new_job          IN VARCHAR2);
```

Parameters

Table 113–14 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

Copying a job requires privileges to create a job in the schema of the new job (the CREATE JOB system privilege if it is in the user's own schema, and the CREATE ANY JOB system privilege otherwise). If the old job is not in the user's own schema, then he needs to additionally have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, `myschema.mychain`).

A chain is always created disabled and must be enabled with the [ENABLE Procedure](#) before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
  chain_name          IN VARCHAR2,
  rule_set_name       IN VARCHAR2 DEFAULT NULL,
  evaluation_interval IN INTERVAL DAY TO SECOND DEFAULT NULL,
  comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–15 CREATE_CHAIN Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, so there must not already be a table or other object with this name and schema.
<code>rule_set_name</code>	In the normal case, no rule set should be passed in. The Scheduler will automatically create a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created will be of the form <code>SCHED_RULESET\${N}</code> and the evaluation context created will be of the form <code>SCHED_EVCTX\${N}</code> . See <i>Oracle Streams Concepts and Administration</i> for information on rules and rule sets.
<code>evaluation_interval</code>	If this is <code>NULL</code> , reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non- <code>NULL</code> value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at <code>NULL</code> if possible. <code>evaluation_interval</code> cannot be less than a minute or greater than a day.
<code>comments</code>	An optional comment describing the purpose of the chain

Usage Notes

Creating a chain in one's own schema requires the `CREATE JOB` system privilege. Creating a chain in a different schema requires the `CREATE ANY JOB` system privilege. If no `rule_set_name` is given, a rule set and evaluation context will be created in the schema that the chain is being created in, so the user will need to have the privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called a credential.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
  credential_name      IN VARCHAR2,
  username             IN VARCHAR2,
  password             IN VARCHAR2,
  database_role        IN VARCHAR2 DEFAULT NULL,
  windows_domain       IN VARCHAR2 DEFAULT NULL,
  comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–16 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
credential_name	This is the name that will be used to refer to the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double-quotes.
username	This is the user name that will be used to login to the operating system to run a job if this credential is chosen. This cannot be set to NULL.
password	This is the password that will be used to login to the remote operating system to run a job if this credential is chosen. This cannot be set to NULL and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views.
database_role	Reserved for future use.
windows_domain	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.
comments	This is a text string that can be used to describe the credential. This field is not used by the Scheduler.

Usage Notes

Credentials reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a credential in a schema other than your own, you must have the CREATE ANY JOB privilege.

The user name is case sensitive. It cannot contain double quotes or spaces.

CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
  schedule_name      IN VARCHAR2,
  start_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  event_condition    IN VARCHAR2,
  queue_spec         IN VARCHAR2,
  end_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–17 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
schedule_name	This attribute specifies a unique identifier for the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the date and time on which this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.
queue_spec	This argument specifies the queue into which events that start this particular job will be enqueued (the source queue). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <code>queue_name, agent name</code> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
end_date	The date and time after which jobs will not run and windows will not open. An event schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> has to be after the <code>start_date</code> . If this is not the case, then an error will be generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is <code>NULL</code> .

Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in one's own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it

can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

CREATE_JOB Procedure

This procedure creates a single job (regular or lightweight). If you create the job enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the [SET_ATTRIBUTE Procedure](#).

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
  start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval   IN VARCHAR2              DEFAULT NULL,
  end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN               DEFAULT FALSE,
  auto_drop         IN BOOLEAN               DEFAULT TRUE,
  comments          IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name      IN VARCHAR2,
  schedule_name     IN VARCHAR2,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN               DEFAULT FALSE,
  auto_drop         IN BOOLEAN               DEFAULT TRUE,
  comments          IN VARCHAR2              DEFAULT NULL,
  job_style         IN VARCHAR2              DEFAULT 'REGULAR');
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name      IN VARCHAR2,
  start_date        IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval   IN VARCHAR2              DEFAULT NULL,
  end_date          IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class         IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN               DEFAULT FALSE,
  auto_drop         IN BOOLEAN               DEFAULT TRUE,
  comments          IN VARCHAR2              DEFAULT NULL,
  job_style         IN VARCHAR2              DEFAULT 'REGULAR');
```

Creates a job using a named schedule object and an inlined program:

```
DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  schedule_name     IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER          DEFAULT 0,
```

```

job_class          IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
enabled            IN BOOLEAN           DEFAULT FALSE,
auto_drop          IN BOOLEAN           DEFAULT TRUE,
comments          IN VARCHAR2          DEFAULT NULL);

```

Creates a job using an inlined program and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  job_type          IN VARCHAR2,
  job_action        IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER    DEFAULT 0,
  start_date        IN TIMESTAMP WITH TIME ZONE,
  event_condition   IN VARCHAR2,
  queue_spec        IN VARCHAR2,
  end_date          IN TIMESTAMP WITH TIME ZONE,
  job_class         IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN           DEFAULT FALSE,
  auto_drop         IN BOOLEAN           DEFAULT TRUE,
  comments          IN VARCHAR2          DEFAULT NULL);

```

Creates a job using a named program object and an event:

```

DBMS_SCHEDULER.CREATE_JOB (
  job_name          IN VARCHAR2,
  program_name      IN VARCHAR2,
  start_date        IN TIMESTAMP WITH TIME ZONE,
  event_condition   IN VARCHAR2,
  queue_spec        IN VARCHAR2,
  end_date          IN TIMESTAMP WITH TIME ZONE,
  job_class         IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
  enabled           IN BOOLEAN           DEFAULT FALSE,
  auto_drop         IN BOOLEAN           DEFAULT TRUE,
  comments          IN VARCHAR2          DEFAULT NULL,
  job_style         IN VARCHAR2          DEFAULT 'REGULAR');

```

Parameters

Table 113–18 CREATE_JOB Procedure Parameters

Parameter	Description
job_name	This attribute specifies the name of the job and uniquely identifies the job. The name has to be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name. If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure call generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See " GENERATE_JOB_NAME Function " on page 113-83 for more information.

Table 113–18 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
<code>job_type</code>	<p>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. The supported values are:</p> <ul style="list-style-type: none"> ■ <code>'PLSQL_BLOCK'</code> This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is <code>PLSQL_BLOCK</code>. In this case, the number of arguments must be 0. ■ <code>'STORED_PROCEDURE'</code> This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. ■ <code>'EXECUTABLE'</code> This specifies that the job is a job external to the database. External jobs are anything that can be executed from the operating system's command line. Anydata arguments are not supported with a job or program type of <code>EXECUTABLE</code>. The job owner must have the <code>CREATE EXTERNAL JOB</code> system privilege before the job can be enabled or run. ■ <code>'CHAIN'</code> This specifies that the job is a chain. Arguments are not supported for a chain, so <code>number_of_arguments</code> must be 0.
<code>job_action</code>	<p>This attribute specifies the action of the job. The following actions are possible:</p> <p>For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, <code>my_proc()</code>; or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;</code>. Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 113–30 on page 113-60 for details on available metadata attributes.</p> <p>For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job.</p> <p>PL/SQL procedures with <code>INOUT</code> or <code>OUT</code> arguments are not supported as <code>job_action</code> when the job or program type is <code>STORED_PROCEDURE</code>.</p> <p>For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> <p>For a chain, the action is the name of a Scheduler chain object. You have to specify the schema of the chain if it resides in a different schema than the job.</p> <p>If <code>job_action</code> is not specified for an inline program, an error is generated when creating the job.</p>

Table 113–18 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
number_of_arguments	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
program_name	The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.
start_date	<p>This attribute specifies the first date and time on which this job is scheduled to start. If <code>start_date</code> and <code>repeat_interval</code> are left null, then the job is scheduled to run as soon as the job is enabled.</p> <p>For repeating jobs that use a calendaring expression to specify the repeat interval, <code>start_date</code> is used as a reference date. The first time the job will be scheduled to run is the first match of the calendaring expression that is on or after the current date and time.</p> <p>The Scheduler cannot guarantee that a job will execute on an exact time because the system may be overloaded and thus resources unavailable.</p>
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code> . For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.
queue_spec	This argument specifies the queue into which events that start this particular job will be enqueued (the source queue). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <code>queue_name, agent name</code> . For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
repeat_interval	<p>This attribute specifies how often the job should repeat. You can specify the repeat interval by using calendaring or PL/SQL expressions.</p> <p>The expression specified is evaluated to determine the next time the job should run. If <code>repeat_interval</code> is not specified, the job will run only once at the specified start date. See "Calendaring Syntax" on page 113-14 for further information.</p>
schedule_name	The name of the schedule, window, or window group associated with this job.
job_class	The class this job is associated with.
end_date	<p>This attribute specifies the date and time after which the job expires and is no longer run. After the <code>end_date</code>, if <code>auto_drop</code> is TRUE, the job is dropped. If <code>auto_drop</code> is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for <code>end_date</code> is specified, the job repeats forever unless <code>max_runs</code> or <code>max_failures</code> is set, in which case the job stops when either value is reached.</p> <p>The value for <code>end_date</code> must be after the value for <code>start_date</code>. If it is not, an error is generated when the job is enabled.</p>
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.

Table 113–18 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_style	<p>Style of the job to create. This argument can have one of the following values:</p> <ul style="list-style-type: none"> ▪ 'REGULAR' - a regular job will be created. This is the default. ▪ 'LIGHTWEIGHT' - a lightweight job is created. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain.
enabled	<p>This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured and the job exists as a database object but the Scheduler will ignore it and the job coordinator will not pick the job for processing. In order for the job coordinator to process the job, the job has to be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.</p>
auto_drop	<p>This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> ▪ Its end date (or its schedule's end date) has passed. ▪ It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. ▪ It is not a repeating job and has run once. <p>A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p>

Usage Notes

Jobs are created disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

To create a job in your own schema, you need to have the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires EXECUTE privileges for that class or program.

Not all possible job attributes can be set with CREATE_JOB. Some must be set after the job is created. For example, job arguments must be set with the [SET_JOB_ARGUMENT_VALUE Procedure](#) or the [SET_JOB_ANYDATA_VALUE Procedure](#). Other job attributes, such as job_priority and max_runs, are set with the [SET_ATTRIBUTE Procedure](#).

To create multiple jobs efficiently, use the CREATE_JOBS procedure.

Note: The Scheduler runs event-based jobs for each occurrence of an event that matches the job's event condition. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the `SYS` schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
  job_class_name          IN VARCHAR2,
  resource_consumer_group IN VARCHAR2 DEFAULT NULL,
  service                 IN VARCHAR2 DEFAULT NULL,
  logging_level           IN PLS_INTEGER
                          DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
  log_history             IN PLS_INTEGER DEFAULT NULL,
  comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–19 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
<code>job_class_name</code>	<p>The name of the class being created. A schema other than <code>SYS</code> cannot be specified.</p> <p>This attribute specifies the name of the job class and uniquely identifies the job class. The name has to be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</p>
<code>resource_consumer_group</code>	<p>This attribute specifies the resource consumer group this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with will determine the resources that will be allocated to the job class.</p> <p>If the resource consumer group that a job class is associated with is dropped, the job class will then be associated with the default resource consumer group.</p> <p>If no resource consumer group is specified, the job class is associated with the default resource consumer group.</p> <p>If the specified resource consumer group does not exist when creating the job class, an error occurs.</p>
<code>service</code>	<p>This attribute specifies the database service that the jobs in this class will have affinity to. In a RAC environment, this means that the jobs in this class will only run on those database instances that are assigned to the specific service.</p> <p>Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See <code>DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING</code> for details. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are specified, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.</p> <p>If no service is specified, the job class will belong to the default service, which means it will have no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service.</p> <p>If the specified service does not exist when creating the job class, then an error occurs.</p>

Table 113–19 (Cont.) CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
logging_level	<p>This attribute specifies how much information is logged. The possible options are:</p> <ul style="list-style-type: none"> ■ DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. ■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. ■ DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. ■ DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log.
log_history	<p>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately.</p> <p>The range of valid values is 0 through 999. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).</p>
comments	<p>This attribute is for an optional comment about the job class. By default, this attribute is NULL.</p>

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE SCHEDULER system privilege.

CREATE_JOBS Procedure

This procedure creates multiple jobs (regular or lightweight) and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
  job_array          IN JOB_ARRAY,
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 113–20 CREATE_JOBS Procedure Parameters

Parameter	Description
job_array	The array of job definitions. See "Data Structures" on page 113-2 for a description of the JOB_ARRAY and JOB data types.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> ▪ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous creates that were successful are committed to disk. This is the default. ▪ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. ▪ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts to create the rest of the jobs on the list and commits all the creates that were successful.

Usage Notes

This procedure allows for the creation of a large number of jobs in the context of a single transaction. To realize the desired performance gains, the jobs to create must be grouped into batches of sufficient size. Calling CREATE_JOBS with a small array size may not be much faster than calling CREATE_JOB once for each job.

CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
  program_name          IN VARCHAR2,
  program_type          IN VARCHAR2,
  program_action        IN VARCHAR2,
  number_of_arguments  IN PLS_INTEGER DEFAULT 0,
  enabled               IN BOOLEAN DEFAULT FALSE,
  comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–21 CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_name	This attribute specifies a unique identifier for the program. The name has to be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
program_type	This attribute specifies the type of program you are creating. If it is not specified then you will get an error. There are three supported values for program_type: <ul style="list-style-type: none"> ■ 'PLSQL_BLOCK' <p>This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.</p> ■ 'STORED_PROCEDURE' <p>This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported.</p> ■ 'EXECUTABLE' <p>This specifies that the program is external to the database. External programs implies anything that can be executed from the operating system's command line. AnyData arguments are not supported with job or program type EXECUTABLE.</p>

Table 113–21 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_action	<p>This attribute specifies the action of the program. The following actions are possible:</p> <p>For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, <code>my_proc()</code>; or <code>BEGIN my_proc(); END;</code> or <code>DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;</code>. Note that the Scheduler wraps <code>job_action</code> in its own block and passes the following to PL/SQL for execution: <code>DECLARE ... BEGIN job_action END;</code> This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except <code>event_message</code> in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 113–30 on page 113-60 for details on available metadata attributes.</p> <p>For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job.</p> <p>For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.</p> <p>If <code>program_action</code> is not specified, an error is generated</p> <p>If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: <code>job_name</code>, <code>job_owner</code>, <code>job_start</code>, <code>window_start</code>, <code>window_end</code>. For more information on these, see the information regarding <code>define_metadata_argument</code>.</p>
number_of_arguments	<p>This attribute specifies the number of arguments the program takes. If this parameter is not specified then the default will be 0. A program can have a maximum of 255 arguments.</p> <p>If the <code>program_type</code> is <code>PLSQL_BLOCK</code>, this field is ignored.</p>
enabled	<p>This flag specifies whether the program should be created enabled or not. If the flag is set to <code>TRUE</code>, then validity checks will be made and the program will be created <code>ENABLED</code> should all the checks be successful. By default, this flag is set to <code>FALSE</code>, which means that the program is not created enabled. You can also call the <code>ENABLE</code> procedure to enable the program before it can be used.</p>
comments	<p>A comment about the program. By default, this attribute is <code>NULL</code>.</p>

Usage Notes

To create a program in his own schema, a user needs the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the `enabled` field is set to `TRUE`). It cannot be executed by a job until it is enabled.

For other users to use your programs, they must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

See Also: "[DEFINE_PROGRAM_ARGUMENT Procedure](#)" on page 113-62

CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
  schedule_name      IN VARCHAR2,
  start_date         IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  repeat_interval    IN VARCHAR2,
  end_date           IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
  comments           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–22 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
<code>schedule_name</code>	This attribute specifies a unique identifier for the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
<code>start_date</code>	<p>This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for <code>start_date</code> is a reference date. In this case, the start of the schedule is not the <code>start_date</code>; it depends on the repeat interval specified. <code>start_date</code> is used to determine the first instance of the schedule.</p> <p>If <code>start_date</code> is specified in the past and no value for <code>repeat_interval</code> is specified, the schedule is invalid. For a repeating job or window, <code>start_date</code> can be derived from the <code>repeat_interval</code> if it is not specified.</p> <p>If <code>start_date</code> is null, then the date that the job or window is enabled is used. <code>start_date</code> and <code>repeat_interval</code> cannot both be null.</p>
<code>repeat_interval</code>	This attribute specifies how often the schedule should repeat. It is expressed using calendaring syntax. See " Calendaring Syntax " on page 113-14 for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
<code>end_date</code>	<p>The date and time after which jobs will not run and windows will not open.</p> <p>A non-repeating schedule that has no <code>end_date</code> will be valid forever. <code>end_date</code> has to be after the <code>start_date</code>. If this is not the case, then an error will be generated when the schedule is created.</p>
<code>comments</code>	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the `CREATE JOB` privilege to create a schedule in one's own schema or the `CREATE ANY JOB` privilege to create a schedule in someone else's schema by specifying `schema.schedule_name`. Once a schedule has been created, it can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. The window can then be used to schedule jobs, which run under the associated resource plan. Windows are created in the `SYS` schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
    window_name          IN VARCHAR2,
    resource_plan        IN VARCHAR2,
    schedule_name        IN VARCHAR2,
    duration              IN INTERVAL DAY TO SECOND,
    window_priority      IN VARCHAR2 DEFAULT 'LOW',
    comments              IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
    window_name          IN VARCHAR2,
    resource_plan        IN VARCHAR2,
    start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    repeat_interval      IN VARCHAR2,
    end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    duration             IN INTERVAL DAY TO SECOND,
    window_priority      IN VARCHAR2 DEFAULT 'LOW',
    comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–23 CREATE_WINDOW Procedure Parameters

Parameter	Description
<code>window_name</code>	This attribute uniquely identifies the window. The name has to be unique in the SQL namespace. All windows are in the <code>SYS</code> schema, so you can optionally preface the window name with <code>'SYS.'</code>
<code>resource_plan</code>	<p>This attribute specifies the resource plan that is automatically activated when the window opens. When the window closes, the system switches to the appropriate resource plan, which in most cases is the resource plan that was in effect before the window opened, but can also be the resource plan of yet another window.</p> <p>Only one resource plan can be associated with a window. It may be <code>NULL</code> or the empty string (<code>''</code>). When it is <code>NULL</code>, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</p> <p>If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</p>

Table 113–23 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
start_date	<p>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created.</p> <p>For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</p>
duration	<p>This attribute specifies how long the window will be open for. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if none is specified when creating the window, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</p>
schedule_name	<p>The name of the schedule associated with the window.</p>
repeat_interval	<p>This attribute specifies how often the window should repeat. It is expressed using the Scheduler's calendaring syntax. See "Calendaring Syntax" on page 113-14 for more information.</p> <p>A PL/SQL expression cannot be used to specify the repeat interval for a window.</p> <p>The expression specified is evaluated to determine the next time the window should open. If no repeat_interval is specified, the window will open only once at the specified start date.</p>
end_date	<p>This attribute specifies the date and time after which the window will no longer open. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window will be set to FALSE.</p> <p>A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified then the window will keep repeating forever.</p> <p>The end_date has to be after the start_date. If this is not the case, then an error is generated when the window is created.</p>
window_priority	<p>This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority will be used to determine which window will be opened. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, which implies that the low priority window does not open if it overlaps with a high priority window. By default, a window is created with a priority of 'LOW'.</p>
comments	<p>This attribute specifies an optional comment about the window. By default, this attribute is NULL.</p>

Usage Notes

Creating a window requires the `MANAGE SCHEDULER` privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the `ALTER SYSTEM SET RESOURCE_MANAGER_PLAN` statement or the `DBMS_RESOURCE_MANAGER.SWITCH_PLAN` package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and ["SWITCH_PLAN Procedure"](#) on page 104-32.

CREATE_WINDOW_GROUP Procedure

This procedure creates a new window group. A window group is defined by a list of Scheduler windows. You can assign a window group as a job schedule. The job then runs when any of the windows in the group become active.

Window groups are created in the SYS schema.

Syntax

```
DBMS_SCHEDULER.CREATE_WINDOW_GROUP (
    group_name          IN VARCHAR2,
    window_list        IN VARCHAR2 DEFAULT NULL,
    comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–24 CREATE_WINDOW_GROUP Procedure Parameters

Parameter	Description
group_name	The name of the window group
window_list	A list of the windows assigned to the window group. If a window that does not exist is specified, an error is generated and the window group is not created. Windows can also be added using the ADD_WINDOW_GROUP_MEMBER procedure. A window group cannot be a member of another window group. Can be NULL.
comments	A comment about the window group

Usage Notes

Creating a window group requires the `MANAGE SCHEDULER` privilege. Window groups, like windows, are created with access to `PUBLIC`, therefore, no privileges are required to access window groups.

A window group cannot contain another window group.

DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an ANYDATA object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN SYS.ANYDATA,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–25 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure .
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

- ["SET_JOB_ANYDATA_VALUE Procedure"](#) on page 113-111

DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event. Once started in a running chain, this step will not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step will replace the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  event_schedule_name IN VARCHAR2,
  timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  event_condition     IN VARCHAR2,
  queue_spec          IN VARCHAR2,
  timeout             IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

Parameters

Table 113–26 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

See Also: "[DEFINE_CHAIN_STEP Procedure](#)" on page 113-59

DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax, and indicates the prerequisites for the action to occur. The action specifies what is to be done as a result of the condition being met.

An actual rule object is created to store the rule in the schema in which the chain resides. If a rule name is given, this name will be used for the rule object. If a rule name is given and a rule already exists with this name in the chain's schema, the existing rule will be altered. (A schema different than the chain's schema cannot be specified). If no rule name is given, one will be generated of the form SCHED_RULE\${N}.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
    chain_name          IN VARCHAR2,
    condition           IN VARCHAR2,
    action              IN VARCHAR2,
    rule_name           IN VARCHAR2 DEFAULT NULL,
    comments            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–27 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
condition	<p>A boolean expression expressed using either SQL or the Scheduler chain condition syntax. (Scheduler chain condition syntax is described below.) The expression must evaluate to TRUE for the action to be performed.</p> <p>If the condition is expressed with SQL, it must use the syntax of a SELECT statement WHERE clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is :step_name.attribute. (step_name refers to a typed object.) Possible attributes are: completed, state, start_date, end_date, error_code, and duration. Possible values for the state attribute include: 'NOT_STARTED', 'SCHEDULED', 'RUNNING', 'PAUSED', 'STALLED', 'SUCCEEDED', 'FAILED', and 'STOPPED'. If a step is in the state 'SUCCEEDED', 'FAILED', or 'STOPPED', its completed attribute is set to 'TRUE', otherwise completed is 'FALSE'.</p> <p>Every chain must have a rule that evaluates to TRUE to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</p>

Table 113–27 (Cont.) DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
<code>action</code>	<p>The action to be performed when the rule evaluates to TRUE. The action must consist of at least a keyword with an optional value and an optional delay clause.</p> <p>Possible actions include:</p> <ul style="list-style-type: none"> ▪ <code>[AFTER <i>delay_interval</i>] START <i>step_1</i> [, <i>step_2</i> ...]</code> ▪ <code>STOP <i>step_1</i> [, <i>step_2</i> ...]</code> ▪ <code>END [{<i>end_value</i> <i>step_name.error_code</i>}]</code> <p>At the beginning of the START action, a delay clause can be given which specifies a delay interval to wait before performing the action. <i>delay_interval</i> is a formatted datetime interval of the form HH:MM:SS.</p> <p>The END action ends the chain with an error code equal to either the supplied <i>end_value</i> or the error code that <i>step_name</i> completed with. The default error code is 0, indicating a successful chain run.</p>
<code>rule_name</code>	The name of the rule that will be created. If no <code>rule_name</code> is given, one will be generated of the form <code>SCHED_RULE\${N}</code> .
<code>comments</code>	An optional comment describing the rule. This will be stored in the rule object created.

Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain. The following are the available constructs, all of which are boolean expressions:

```

TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer

```

The following boolean operators are available to create more complex conditions:

```

expression AND expression
expression OR expression
NOT (expression)

```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the NOT operator.

PL/SQL code that runs as part of a step can set the value of `ERROR_CODE` for that step with the `RAISE_APPLICATION_ERROR` statement.

Usage Notes

Defining a chain rule requires ALTER privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'  
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any  
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)  
  
'step1 succeeded and step2 succeeded'  
-- satisfied when steps step1 and step2 have both succeeded  
  
'step1 error_code > 100'  
-- satisfied when step step1 has failed with an error_code greater than 100  
  
'step1 error_code IN (1, 3, 5, 7)'  
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7
```

Rule Conditions Using SQL Syntax

```
':step1.completed = ''TRUE'' AND :step1.end_date >SYSDATE-1/24'  
--satisfied when step step1 completed less than an hour ago  
  
' :step1.duration > interval '5' minute'  
-- satisfied when step step1 has completed and took longer than 5 minutes to  
complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'  
--After an hour start steps step1 and step2  
  
'STOP step1'  
--Stop step step1  
  
END step4.error_code'  
--End the chain with the error code that step step4 finished with. If step4 has  
not completed, the chain will be ended unsuccessfully with error code 27435.  
  
'END' or 'END 0'  
--End the chain successfully (with error_code 0)  
  
'END 100'  
--End the chain unsuccessfully with error code 100.
```

DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have EXECUTE privileges on the program or chain associated with the step. Only one program or chain can run during a step.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
    chain_name          IN VARCHAR2,
    step_name           IN VARCHAR2,
    program_name        IN VARCHAR2);
```

Parameters

Table 113–28 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
<code>chain_name</code>	The name of the chain to alter.
<code>step_name</code>	The name of the step being defined. If a step already exists with this name, the new step will replace the old one.
<code>program_name</code>	The name of a program or chain to run during this step. The chain owner must have EXECUTE privileges on this program or chain.

Usage Notes

Defining a chain step requires ALTER privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

See Also: ["DEFINE_CHAIN_EVENT_STEP Procedure"](#) on page 113-55

DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name          IN VARCHAR2,
  metadata_attribute    IN VARCHAR2,
  argument_position     IN PLS_INTEGER,
  argument_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–29 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table Table 113–30 describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. This cannot be greater than the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 113–30 Metadata Attributes

Metadata Attribute	Data Type	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The data type of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table.

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except `event_message` can also be used in PL/SQL blocks that you enter into the `job_action` or `program_action` attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER,
    argument_name         IN VARCHAR2 DEFAULT NULL,
    argument_type         IN VARCHAR2,
    default_value         IN VARCHAR2,
    out_argument          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–31 *DEFINE_PROGRAM_ARGUMENT Procedure Parameters*

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the <code>number_of_arguments</code> specified for the program. This must be unique so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure .
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to <code>FALSE</code> .

Usage Notes

All program arguments from 1 to the `number_of_arguments` value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#) on page 113-54
- ["SET_JOB_ARGUMENT_VALUE Procedure"](#) on page 113-112

DISABLE Procedure

This procedure disables a program, job, chain, window, or window group.

Syntax

```
DBMS_SCHEDULER.DISABLE (
    name          IN VARCHAR2,
    force         IN BOOLEAN DEFAULT FALSE,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 113–32 *DISABLE Procedure Parameters*

Parameter	Description
name	<p>The name of the object being disabled. Can be a comma-delimited list.</p> <p>If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled.</p> <p>If a window group name is specified, then the window group will be disabled, but the windows that are members of the window group will not be disabled.</p>
force	Whether to ignore dependencies. See the usage notes for more information.
commit_semantics	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> ▪ <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. ▪ <code>TRANSACTIONAL</code> - This value permitted only when disabling jobs. The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when <code>force</code> is set to <code>TRUE</code>. ▪ <code>ABSORB_ERRORS</code> - This value permitted only when disabling jobs. The procedure tries to absorb any errors and attempts disabling the rest of the jobs and commits all the disable operations that were successful. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Disabling an object that is already disabled does not generate an error. Because the `DISABLE` procedure is used for several Scheduler objects, when disabling windows and window groups, they must be preceded by `SYS`.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or window group, you must have the `MANAGE SCHEDULER` privilege. Otherwise, you must be the owner of the object being disabled or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

Programs

When a program is disabled, the status is changed to `disabled`. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call, and are allowed to continue

Any argument that pertains to the program will not be affected when the program is disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error will occur.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is re-enabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a window group is disabled, jobs, other than a running job, that has the window group as its schedule will not run even if the member windows open. However, if the job had one of the window group members as its schedule, it would still run.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run.

If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime.

Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
    chain_name          IN VARCHAR2,
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–33 *DROP_CHAIN Procedure Parameters*

Parameter	Description
chain_name	The name of a chain to drop. Can also be a comma-delimited list of chains.
force	<p>If <i>force</i> is set to <code>FALSE</code>, the chain must not be referenced by any job otherwise an error will occur.</p> <p>If <i>force</i> is set to <code>TRUE</code>, all jobs pointing to the chain are disabled before dropping the chain.</p> <p>Running jobs that point to this chain will be stopped before the chain is dropped.</p>

Usage Notes

Dropping a chain requires alter privileges on the chain (either by being the owner, or by having `ALTER` privileges on the chain or by having the `CREATE ANY JOB` system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user needs to have the privileges required to do this. See the `DBMS_RULE_ADM.DROP_RULE_SET` and `DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT` procedures for more information.

If *force* is `FALSE`, no jobs may be using this chain. If *force* is `TRUE`, any jobs that use this chain will be disabled before dropping the chain (and any of these jobs that are running will be stopped).

DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (  
    chain_name          IN VARCHAR2,  
    rule_name           IN VARCHAR2,  
    force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–34 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If <i>force</i> is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If <i>force</i> is set to FALSE and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so the user needs to have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
  chain_name          IN VARCHAR2,
  step_name           IN VARCHAR2,
  force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–35 *DROP_CHAIN_STEP Procedure Parameters*

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If <i>force</i> is set to TRUE , this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If <i>force</i> is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires **ALTER** privileges on the chain (either by being the owner, or by having **ALTER** privileges on the chain or by having the **CREATE ANY JOB** system privilege).

DROP_CREDENTIAL Procedure

This procedure drops a credential.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (  
    credential_name      IN VARCHAR2,  
    force                 IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–36 *DROP_CREDENTIAL Procedure Parameters*

Parameter	Description
credential_name	The name of the credential being dropped. This can optionally be prefixed with a schema. This cannot be set to NULL.
force	If set to FALSE, the credential must not be referenced by any job or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

See Also: ["CREATE_CREDENTIAL Procedure"](#) on page 113-36

DROP_JOB Procedure

This procedure drops a job or all jobs in a job class. It results in the job being removed from the job queue, its metadata being removed, and no longer being visible in the *_SCHEDULER_JOBS views. Therefore, no more runs of the job will be executed. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
  job_name           IN VARCHAR2,
  force              IN BOOLEAN DEFAULT FALSE,
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 113-37 DROP_JOB Procedure Parameters

Parameter	Description
job_name	The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
force	If force is set to FALSE, and an instance of the job is running at the time of the call, the call results in an error. If force is set to TRUE, the Scheduler first attempts to stop the running job instance (by issuing the STOP_JOB call with the force flag set to false), and then drops the job.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> ▪ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous drop operations that were successful are committed to disk. This is the default. ▪ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. This type is not supported when force is set to TRUE. ▪ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts dropping the rest of the jobs and commits all the drops that were successful.

Usage Notes

Dropping a job requires ALTER privileges on the job either by being the owner of the job, or by having the ALTER object privilege on the job or by having the CREATE ANY JOB system privilege.

DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (  
    job_class_name      IN VARCHAR2,  
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–38 *DROP_JOB_CLASS Procedure Parameters*

Parameter	Description
job_class_name	The name of the job class. Can be a comma-delimited list.
force	<p>If <i>force</i> is set to <i>FALSE</i>, a class must not be referenced by any jobs to be dropped otherwise an error will occur.</p> <p>If <i>force</i> is set to <i>TRUE</i>, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful will the class be dropped.</p> <p>Running jobs that belong to the job class are not affected.</p>

Usage Notes

Dropping a job class requires the *MANAGE SCHEDULER* system privilege.

DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
  program_name      IN VARCHAR2,
  force             IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–39 *DROP_PROGRAM Procedure Parameters*

Parameter	Description
program_name	The name of the program to be dropped. Can be a comma-delimited list.
force	<p>If <i>force</i> is set to <code>FALSE</code>, the program must not be referenced by any job otherwise an error will occur.</p> <p>If <i>force</i> is set to <code>TRUE</code>, all jobs referencing the program are disabled before dropping the program.</p> <p>Running jobs that point to the program are not affected by the <code>DROP_PROGRAM</code> call, and are allowed to continue.</p>

Usage Notes

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.

DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_position     IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
    program_name          IN VARCHAR2,
    argument_name         IN VARCHAR2);
```

Parameters

Table 113–40 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_name	The name of the argument being dropped
argument_position	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (
  schedule_name  IN VARCHAR2,
  force          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–41 *DROP_SCHEDULE Procedure Parameters*

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	<p>If <code>force</code> is set to <code>FALSE</code>, the schedule must not be referenced by any job or window otherwise an error will occur.</p> <p>If <code>force</code> is set to <code>TRUE</code>, any jobs or windows that use this schedule will be disabled before the schedule is dropped</p> <p>Running jobs and open windows that point to the schedule are not affected.</p>

Usage Notes

You must be the owner of the schedule being dropped or have `ALTER` privileges for the schedule or the `CREATE ANY JOB` privilege.

DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. All references to the window are removed from window groups.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (
    window_name          IN VARCHAR2,
    force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–42 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.
force	<p>If <i>force</i> is set to <code>FALSE</code>, the window must not be open or referenced by any job otherwise an error will occur.</p> <p>If <i>force</i> is set to <code>TRUE</code>, the window will be dropped and those jobs that have the window as their schedule will be disabled. However, jobs that have a window group of which the dropped window was a member as their schedule will not be disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply.</p> <p>Running jobs that have the window as their schedule will be allowed to continue, unless the <code>stop_on_window_close</code> flag was set to <code>TRUE</code> for the job. If this is the case, the job will be stopped when the window is dropped.</p>

Usage Notes

Dropping a window requires the `MANAGE SCHEDULER` privilege.

DROP_WINDOW_GROUP Procedure

This procedure drops a window group but not the windows that are members of this window group.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW_GROUP (
  group_name          IN VARCHAR2
  force               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–43 *DROP_WINDOW_GROUP Procedure Parameters*

Parameter	Description
group_name	The name of the window group
force	<p>If <i>force</i> is set to <code>FALSE</code>, the window group must not be referenced by any job otherwise an error will occur.</p> <p>If <i>force</i> is set to <code>TRUE</code>, the window group will be dropped and those jobs that have the window group as their schedule will be disabled. Running jobs that have the window group as their schedule are allowed to continue, even if the <code>stop_on_window_close</code> flag was set to <code>TRUE</code> when for the job.</p> <p>If a member of the window group that is being dropped is open, the window group can still be dropped.</p>

Usage Notes

If you want to drop all the windows that are members of this group but not the window group itself, you can use the `DROP_WINDOW` procedure and provide the name of the window group to the call.

To drop a window group, you must have the `MANAGE SCHEDULER` privilege.

ENABLE Procedure

This procedure enables a program, job, chain, window, or window group. When an object is enabled, the enabled flag is set to `TRUE`. By default, jobs, chains, and programs are created disabled and windows and window groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
    name          IN VARCHAR2,
    commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 113–44 *ENABLE Procedure Parameters*

Parameter	Description
name	<p>The name of the Scheduler object being enabled. Can be a comma-delimited list of names.</p> <p>If a job class name is specified, then all the jobs in the job class are enabled.</p> <p>If a window group name is specified, then the window group will be enabled, but the windows that are members of the window group, will not be enabled.</p>
commit_semantics	<p>The commit semantics. The following types are supported:</p> <ul style="list-style-type: none"> ■ <code>STOP_ON_FIRST_ERROR</code> - The procedure returns on the first error and the previous enable operations that were successful are committed to disk. This is the default. ■ <code>TRANSACTIONAL</code> - This value permitted only when enabling jobs. The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. ■ <code>ABSORB_ERRORS</code> - This value permitted only when enabling jobs. The procedure tries to absorb any errors and attempts enabling the rest of the jobs and commits all the enable operations that were successful. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Because the `ENABLE` procedure is used for several Scheduler objects, when enabling windows or window groups, they must be preceded by `SYS`.

To run `ENABLE` for a window or window group, you must have the `MANAGE SCHEDULER` privilege. Otherwise, you must be the owner of the object being enabled or have `ALTER` privileges on that object or have the `CREATE ANY JOB` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`. A detached job run does not end until this procedure or the [STOP_JOB Procedure](#) is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
  job_name          IN VARCHAR2,
  error_number      IN PLS_INTEGER DEFAULT 0,
  additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–45 *END_DETACHED_JOB_RUN Procedure Parameters*

Parameter	Description
<code>job_name</code>	The name of the job to end. Must be a detached job that is running.
<code>error_number</code>	If zero, then the job run is logged as succeeded. If non-zero, then the job run is logged as failed with this error number. If -1013, then the job run is logged as stopped.
<code>additional_info</code>	This text is stored in the <code>additional_info</code> column of the <code>*_scheduler_job_run_details</code> views for this job run.

Usage Notes

This procedure requires that you be the owner of the job or have `ALTER` privileges on the job. You can also end any detached job run if you have the `CREATE ANY JOB` privilege.

See Also: *Oracle Database Administrator's Guide* for information about detached jobs.

EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler's calendaring syntax. This procedure evaluates the calendar expression and tells you what the next execution date and time of a job or window will be. This is very useful for testing the correct definition of the calendar string without having to actually schedule the job or window.

This procedure can also be used to get multiple steps of the repeat interval by passing the `next_run_date` returned by one invocation as the `return_date_after` argument of the next invocation of this procedure.

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
    calendar_string    IN  VARCHAR2,
    start_date         IN  TIMESTAMP WITH TIME ZONE,
    return_date_after  IN  TIMESTAMP WITH TIME ZONE,
    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 113–46 *EVALUATE_CALENDAR_STRING Procedure Parameters*

Parameter	Description
<code>calendar_string</code>	The calendar string to be evaluated. The string must be in the calendaring syntax described in "Operational Notes" on page 113-14.
<code>start_date</code>	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be <code>NULL</code> .
<code>return_date_after</code>	With the <code>start_date</code> and the calendar string, the Scheduler has sufficient information to determine all valid execution dates. By setting this argument, the Scheduler knows which one of all possible matches to return. When a <code>NULL</code> value is passed for this argument, the Scheduler automatically fills in <code>sys_timestamp</code> as its value.
<code>next_run_date</code>	The first timestamp that matches the calendar string and start date that occurs after the value passed in for the <code>return_date_after</code> argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
    start_date          TIMESTAMP;
    return_date_after  TIMESTAMP;
    next_run_date       TIMESTAMP;
BEGIN
    start_date :=
        to_timestamp_tz('01-JAN-2003 10:00:00', 'DD-MON-YYYY HH24:MI:SS');
    return_date_after := start_date;
    FOR i IN 1..5 LOOP
        DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
```

```
'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',  
start_date, return_date_after, next_run_date);  
DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);  
return_date_after := next_run_date;  
END LOOP;  
END;  
/
```

```
next_run_date: 02-JAN-03 09.30.00.000000 AM  
next_run_date: 03-JAN-03 09.30.00.000000 AM  
next_run_date: 06-JAN-03 09.30.00.000000 AM  
next_run_date: 07-JAN-03 09.30.00.000000 AM  
next_run_date: 08-JAN-03 09.30.00.000000 AM
```

PL/SQL procedure successfully completed.

Usage Notes

No specific Scheduler privileges are required.

EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE_RUNNING_CHAIN is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
    job_name          IN VARCHAR2);
```

Parameters

Table 113–47 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
job_name	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running EVALUATE_RUNNING_CHAIN on a job requires alter privileges on the job (either by being the owner, or by having ALTER privileges on the job or by having the CREATE ANY JOB system privilege).

Note: The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with one of the event steps of the chain

For most chains, this is sufficient. EVALUATE_RUNNING_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER_RUNNING_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE_RUNNING_CHAIN may not be needed if you set the evaluation_interval attribute when you created the chain.

GENERATE_JOB_NAME Function

This function returns a unique name for a job. The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB\$_1, JOB\$_2, JOB\$_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
    prefix          IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 113–48 *GENERATE_JOB_NAME Function Parameter*

Parameter	Description
prefix	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to NULL, the name will be just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function will never return the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to output values of the following types: VARCHAR2, TIMESTAMP WITH TIMEZONE, BOOLEAN, PLS_INTEGER, and INTERVAL DAY TO SECOND.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                  PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.GET_ATTRIBUTE (
  name          IN VARCHAR2,
  attribute     IN VARCHAR2,
  value        OUT {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                  PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});
  value2       OUT VARCHAR2);
```

Parameters

Table 113–49 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved
value	The existing value of the attribute
value2	Most attributes have only one value associated with them, but some can have two. The value2 argument is for this optional second value.

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or a window group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.

GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

This procedure differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle Database) installed.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file          IN VARCHAR2,
    source_host         IN VARCHAR2,
    credential_name     IN VARCHAR2,
    file_contents       OUT {BLOB|CLOB});

DBMS_SCHEDULER.GET_FILE (
    source_file          IN VARCHAR2,
    source_host         IN VARCHAR2,
    credential_name     IN VARCHAR2,
    destination_file_name IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–50 GET_FILE Procedure Parameters

Parameter	Description
<code>source_file</code>	<p>Fully qualified pathname of the file to retrieve from the operating system. The file name is case sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host.</p> <p>If the format of this parameter is <code>external_log_id_stdout</code>, then the stdout from the designated external job run is returned. If the format of this parameter is <code>external_log_id_stderr</code>, the error text from the designated external job run is returned. You obtain the value of <code>external_log_id</code> from the <code>ADDITIONAL_INFO</code> column of the <code>*_SCHEDULER_JOB_RUN_DETAILS</code> views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the <code>external_log_id</code> name/value pair, and then append either <code> "_stdout"</code> or <code> "_stderr"</code> to its value.</p> <p>The external job must have an associated credential. The <code>credential_name</code> parameter of <code>GET_FILE</code> must name the same credential that is used by the job, and the <code>source_host</code> parameter must be the same as the <code>destination</code> attribute of the job.</p>
<code>source_host</code>	<p>If the file is to be retrieved from a remote host, then the <code>host:port</code> of the Scheduler agent must be specified. If <code>source_host</code> is <code>NULL</code> or set to <code>'localhost'</code>, then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the <code>schagent.conf</code> file, which is located in the Scheduler agent home directory on the remote host.</p>
<code>credential_name</code>	<p>The name of the credential to use for accessing the file system.</p>

Table 113–50 (Cont.) GET_FILE Procedure Parameters

Parameter	Description
file_contents	The contents of the file will be returned in this variable.
destination_ file_name	The contents of the file will be written into this file in the specified directory object.
destination_ directory_object	The contents of the file will be written into the directory specified by this directory object. The caller must have the necessary privileges on the directory object.
destination_ permissions	Reserved for future use

Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.

GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
  attribute    IN VARCHAR2,
  value       OUT VARCHAR2);
```

Parameters

Table 113–51 *GET_SCHEDULER_ATTRIBUTE Procedure Parameters*

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

Usage Notes

To run `GET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE_SCHEDULER` privilege.

[Table 113–52](#) lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see [Table 113–75](#) on page 113-115 and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 113–52 *Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE*

Scheduler Attribute	Description
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows
log_history	Retention period in days for job and window logs
max_job_slave_processes	Maximum number of job slave processes that the Scheduler can start. May be NULL.
current_open_window	Name of the currently open window
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.

OPEN_WINDOW Procedure

This procedure opens a window independent of its schedule. This window will open and the resource plan associated with it, will take effect immediately for the duration specified or for the normal duration of the window if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
  window_name          IN VARCHAR2,
  duration             IN INTERVAL DAY TO SECOND,
  force                IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 113–53 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window will be opened for the regular duration as specified in the window metadata.
force	<p>If <code>force</code> is set to FALSE, opening an already open window, will generate an error.</p> <p>If <code>force</code> is set to TRUE:</p> <p>You can open a window that is already open. The window stays open for the duration specified in the call, from the time the OPEN_WINDOW command was issued. Consider an example to illustrate this. <code>window1</code> was created with a duration of four hours. It has now been open for two hours. If at this point you reopen <code>window1</code> using the OPEN_WINDOW call and do not specify a duration, then <code>window1</code> will be open for another four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.</p> <p>The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.</p>

Usage Notes

If there are jobs running when the window opens, the resources allocated to them might change due to the switch in resource plan.

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated, and will be as determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the ALTER SYSTEM statement with the `force` option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the `MANAGE SCHEDULER` privilege.

PURGE_LOG Procedure

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The `PURGE_LOG` procedure is used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
    log_history          IN PLS_INTEGER  DEFAULT 0,
    which_log           IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',
    job_name            IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 113–54 *PURGE_LOG Procedure Parameters*

Parameter	Description
<code>log_history</code>	This specifies how much history (in days) to keep. The valid range is 0 - 999. If set to 0, no history is kept.
<code>which_log</code>	This specifies which type of log. Valid values for <code>which_log</code> are <code>job_log</code> , <code>window_log</code> , and <code>job_and_window_log</code> .
<code>job_name</code>	This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever <code>job_name</code> has a value other than <code>NULL</code> , the <code>which_log</code> argument implicitly includes the job log.

Usage Notes

This procedure requires the `MANAGE SCHEDULER` privilege.

Examples

The following will completely purge all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following will purge all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following will purge all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in `jobclass1` and that are older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer. It differs from the equivalent `UTL_FILE` procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```
DBMS_SCHEDULER.PUT_FILE (
    destination_file      IN VARCHAR2,
    destination_host     IN VARCHAR2,
    credential_name      IN VARCHAR2,
    file_contents        IN {BLOB|CLOB},
    destination_permissions IN VARCHAR2 DEFAULT NULL);
DBMS_SCHEDULER.PUT_FILE (
    destination_file      IN VARCHAR2,
    destination_host     IN VARCHAR2,
    credential_name      IN VARCHAR2,
    source_file_name     IN VARCHAR2,
    source_directory_object IN VARCHAR2,
    destination_permissions IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–55 PUT_FILE Procedure Parameters

Parameter	Description
<code>destination_file</code>	Fully qualified pathname of the file to save to the operating system file system. The file name is case sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
<code>destination_host</code>	If NULL or set to 'localhost', the file is saved to the file system of the local computer. For saving to a remote host, must contain the <i>host:port</i> of the remote host, where <i>host</i> is the host name or IP address of the remote host, and <i>port</i> is the port on which the remote Scheduler agent listens. To determine the port number of a remote Scheduler agent, view the <code>schagent.conf</code> file, which is located in the Scheduler agent home directory on the remote host.
<code>credential_name</code>	The name of the credential to use for accessing the destination file system.
<code>file_contents</code>	The contents of the file will be read from this variable.
<code>source_file_name</code>	The contents of the file will be read from this file.
<code>source_directory_object</code>	The directory object that specifies the path to the source file, when <code>source_file_name</code> is used. The caller must have the necessary privileges on the directory object.
<code>destination_permissions</code>	Reserved for future use

Usage Notes

The caller must have the `CREATE EXTERNAL JOB` system privilege and have `EXECUTE` privileges on the credential.

REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER\$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (  
    subscriber_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–56 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent for which to remove the subscription. If NULL, the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

REMOVE_WINDOW_GROUP_MEMBER Procedure

This procedure removes one or more windows from an existing window group.

Syntax

```
DBMS_SCHEDULER.REMOVE_WINDOW_GROUP_MEMBER (  
    group_name          IN VARCHAR2,  
    window_list        IN VARCHAR2);
```

Parameters

Table 113–57 REMOVE_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the window group.
window_list	The name of the window or windows.

Usage Notes

If any of the windows specified is either invalid, does not exist, or is not a member of the given group, the call fails. Removing a window from a group requires the `MANAGE SCHEDULER` privilege.

Dropping an open window from a window group has no impact on running jobs that has the window as its schedule since the jobs would only be stopped when a window closes.

RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2);
```

Parameters

Table 113–58 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job will be disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given. If no `job_name` is given, one will be generated of the form `RUN_CHAIN$_chainnameN`, where `chainname` is the first 8 characters of the chain name and `N` is an integer.

If a list of start steps is given, only those steps will be started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run). If `start_steps` is `NULL`, then the chain will start normally—that is, an initial evaluation will be done to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    start_steps        IN VARCHAR2,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
    chain_name          IN VARCHAR2,
    step_state_list    IN SYS.SCHEDULER$_STEP_TYPE_LIST,
    job_name            IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–59 RUN_CHAIN Procedure Parameters

Parameter	Description				
<code>chain_name</code>	The name of the chain to run				
<code>job_name</code>	The name of the job to create to run the chain				
<code>start_steps</code>	Comma-separated list of the steps to start when the chain starts running				
<code>step_state_list</code>	List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each. Set the attributes of <code>sys.scheduler\$_step_type</code> as follows: <table border="0" style="margin-left: 20px;"> <tr> <td><code>step_name</code></td> <td>The name of the step</td> </tr> <tr> <td><code>step_type</code></td> <td>'SUCCEEDED' or 'FAILED <i>error_number</i>'</td> </tr> </table> where <i>error_number</i> is a positive or negative integer.	<code>step_name</code>	The name of the step	<code>step_type</code>	'SUCCEEDED' or 'FAILED <i>error_number</i> '
<code>step_name</code>	The name of the step				
<code>step_type</code>	'SUCCEEDED' or 'FAILED <i>error_number</i> '				

Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs `execute` privileges on the chain (by being the owner of the chain, by having the `EXECUTE` privilege on the chain, or by having the `EXECUTE ANY PROGRAM` system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

RUN_JOB Procedure

This procedure runs a job immediately.

It is not necessary to call RUN_JOB to run a job according to its schedule. Provided that that job is enabled, the Scheduler runs it automatically. Use RUN_JOB to run a job outside of its normal schedule.

Syntax

```
DBMS_SCHEDULER.RUN_JOB (
  job_name          IN VARCHAR2,
  use_current_session IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 113–60 RUN_JOB Procedure Parameters

Parameter	Description
job_name	The name of the job being run
use_current_session	<p>This specifies whether the job run should occur in the same session as the one that the procedure was invoked from.</p> <p>When use_current_session is set to TRUE:</p> <ul style="list-style-type: none"> ■ The job runs as the user who called RUN_JOB. ■ You can test a job and see any possible errors on the command line. ■ run_count, last_start_date, last_run_duration, and failure_count are not updated. ■ RUN_JOB can be run in parallel with a regularly scheduled job run. <p>When use_current_session is set to FALSE:</p> <ul style="list-style-type: none"> ■ The job runs as the user who is the job owner. ■ You need to check the job log to find error information. ■ run_count, last_start_date, last_run_duration, and failure_count are updated. ■ RUN_JOB fails if a regularly scheduled job is running.

Usage Notes

The job does not have to be enabled. If the job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

The job can be run in two different modes. One is in the current user session. In this case, the call to RUN_JOB will block until it has completed the job. Any errors that

occur during the execution of the job will be returned as errors to the `RUN_JOB` procedure. The other option is to run the job immediately like a regular job. In this case, `RUN_JOB` returns immediately and the job will be picked up by the coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

When using `RUN_JOB` with jobs that point to chains, `use_current_session` must be `FALSE`.

`RUN_JOB` requires that you be the owner of the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database. A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
    registration_password    IN VARCHAR2,
    expiration_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    max_uses                 IN NUMBER DEFAULT NULL);
```

Parameters

Table 113–61 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
registration_password	This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.
expiration_date	If this is set to a non-NULL value, then the registration_password will not be valid after this date. After this date, no agents will be able to register with the database. This cannot be set to a date in the past.
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents will be able to register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the `MANAGE_SCHEDULER` system privilege.

By default, `max_uses` is set to NULL which means that there will be no limit on the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.

SET_ATTRIBUTE Procedure

This procedure changes an attribute of an object. It is overloaded to accept values of the following types: VARCHAR2, TIMESTAMP WITH TIMEZONE, BOOLEAN, PLS_INTEGER, and INTERVAL DAY TO SECOND. To set an attribute to NULL, the SET_ATTRIBUTE_NULL procedure should be used. What attributes can be set depends on the object being altered. With the exception of the object name, all object attributes can be changed.

SET_ATTRIBUTE is overloaded.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        IN {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                    PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
    name          IN VARCHAR2,
    attribute     IN VARCHAR2,
    value        IN {VARCHAR2|TIMESTAMP WITH TIMEZONE|
                    PLS_INTEGER|BOOLEAN|INTERVAL DAY TO SECOND});
    value2       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 113–62 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	See Table 113–63 through Table 113–70 .
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	Most attributes have only one value associated with them, but some can have two. The value2 argument is for this optional second value.

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler will first disable it, make the change and then re-enable it. If any errors are encountered during the enable process, the object is not re-enabled and an error is generated.

If an object is altered and it was in the disabled state, it will remain disabled after it is altered.

To run SET_ATTRIBUTE for a window, window group, or job class, you must have the MANAGE_SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only seen in future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run will be scheduled using the new schedule attributes. Schedule attributes of a job include `schedule_name`, `start_date`, `end_date`, and `repeat_interval`.

If any of the program attributes of a job are altered while the job is running, the new program attributes will take effect the next time the job runs. Program attributes of a job include `program_name`, `job_action`, `job_type`, and `number_of_arguments`. This is also the case for job argument values that have been set.

Granting `ALTER` on a job will let a user alter all attributes of that job except its program attributes (`program_name`, `job_type`, `job_action`, `program_action`, and `number_of_arguments`) and will not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column `SYSTEM` set to `TRUE` in job views.

Program

If any currently running jobs use the program that is altered, they will continue to run with the program definition prior to the alter. The job will run with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change will not affect running jobs and open windows that use this schedule. The change will only be in effect the next time the jobs runs or the window opens.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the `MANAGE_SCHEDULER` privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan when a window opens that designates a resource plan, the Resource Manager activates with that plan.

Job Attribute Values

[Table 113–63](#) lists attribute values for jobs.

Note: See the `CREATE_JOB` procedure and the `CREATE_JOBS` procedure for more complete descriptions of the attributes in this table.

Table 113–63 Job Attribute Values

Name	Description
auto_drop	<p>This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if:</p> <ul style="list-style-type: none"> ■ Its end date (or its schedule's end date) has passed. ■ It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. ■ It is not a repeating job and has run once. <p>A job is automatically disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.</p> <p>If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure.</p> <p>By default, jobs are created with auto_drop set to TRUE.</p>
comments	An optional comment.
credential_name	<p>This attribute specifies the credential to use when running an external job. If this attribute is NULL (the default) and destination is NULL, then a preferred (default) credential is selected. A remote external job must have a non-NULL credential_name. See <i>Oracle Database Administrator's Guide</i> for information about preferred credentials for local external jobs.</p>
database_role	<p>This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.</p> <p>Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.</p>
destination	<p>This attribute specifies a host and port on which to run a remote external job. The attribute is of the form <i>host:port</i>, where <i>host</i> is the host name or IP address of the destination host, and <i>port</i> is the port number on which the Scheduler agent on that host listens. This attribute is set to NULL by default.</p>
end_date	<p>Specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED.</p> <p>If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached.</p> <p>The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.</p>
event_spec	<p>This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments in the CREATE_JOB procedure.</p>

Table 113–63 (Cont.) Job Attribute Values

Name	Description
follow_ default_ timezone	<p>If TRUE and if the job <code>start_date</code> is null, then when the <code>default_timezone</code> scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone. For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone. (If the job <code>start_date</code> is not null, then the time zone for the run date and time for the job is always specified by the time zone of the <code>start_date</code>.) If FALSE, the next start date and time for the job is not recomputed when the <code>default_timezone</code> scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone.</p> <p>(Summer/winter transitions do not change the default time zone name.)</p>
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
instance_ stickiness	<p>This attribute should only be used for a database running in an Oracle Real Application Clusters (RAC) environment. By default, it is set to TRUE. If you set <code>instance_stickiness</code> to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it will not start new jobs for a significant period of time, another instance will run the job. If the interval between runs is large, <code>instance_stickiness</code> will be ignored and the job will be handled as if it were a non-sticky job.</p> <p>If <code>instance_stickiness</code> is set to FALSE, each instance of the job runs on the first instance available.</p> <p>For non-RAC environments, this attribute is not useful because there is only one instance.</p>
job_action	The action that the job performs, depending on the <code>job_type</code> attribute. For example, if <code>job_type</code> is 'STORED_PROCEDURE', <code>job_action</code> contains the name of the stored procedure.
job_class	The class this job is associated with.
job_ priority	<p>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution.</p> <p>If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</p>
job_type	<p>The type of this job. Can be any of: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', and 'CHAIN'.</p> <p>If this is set, <code>program_name</code> must be NULL.</p>
job_weight	<p>This attribute is for expert users of parallel technology only. If your job will be using parallel technology, you can set the value of this attribute to the degree of parallelism of your SQL inside the job.</p> <p><code>job_weight</code> has a range of 1-100, with 1 being the default</p>

Table 113–63 (Cont.) Job Attribute Values

Name	Description
logging_ level	<p>This attribute specifies how much information is logged. The possible options are:</p> <p>DBMS_SCHEDULER.LOGGING_OFF</p> <p>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</p> <p>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</p> <p>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p>DBMS_SCHEDULER.LOGGING_RUNS</p> <p>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</p> <p>DBMS_SCHEDULER.LOGGING_FULL</p> <p>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.</p>
max_ failures	<p>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views.</p> <p>max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job will be started regardless of how many previous instances have failed.</p>
max_run_ duration	<p>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.</p>
max_runs	<p>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED.</p> <p>max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it will repeat forever or until end_date or max_failures is reached.</p>
number_of_ arguments	<p>The number of arguments if the program is inlined. If this is set, program_name should be NULL.</p>
parallel_ instances	<p>This is a Boolean attribute. If set to TRUE and an event is raised, then a run-once lightweight job will be created to handle the event; the job will be dropped once it has completed running.</p> <p>This lightweight job will not be visible in any of the *_SCHEDULER_JOBS views - it will be visible in the *_SCHEDULER_RUNNING_JOBS views. The name of this lightweight job will be the same as that of the parent job and a subtitle will be automatically generated to distinguish it from its parent and from its siblings.</p>
program_ name	<p>The name of a program object to use with this job. If this is set, job_action, job_type and number_of_arguments should be NULL.</p>

Table 113–63 (Cont.) Job Attribute Values

Name	Description
raise_events	<p>This attribute tells the Scheduler at what stages of the job's execution events should be raised. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it.</p> <ul style="list-style-type: none"> ▪ job_started CONSTANT PLS_INTEGER := 1 ▪ job_succeeded CONSTANT PLS_INTEGER := 2 ▪ job_failed CONSTANT PLS_INTEGER :=4 ▪ job_broken CONSTANT PLS_INTEGER :=8 ▪ job_completed CONSTANT PLS_INTEGER :=16 ▪ job_stopped CONSTANT PLS_INTEGER :=32 ▪ job_sch_lim_reached CONSTANT PLS_INTEGER :=64 ▪ job_disabled CONSTANT PLS_INTEGER :=128 ▪ job_chain_stalled CONSTANT PLS_INTEGER :=256 ▪ job_all_events CONSTANT PLS_INTEGER := 511 ▪ job_run_completed CONSTANT PLS_INTEGER := job_succeeded + job_failed + job_stopped <p>Table 113–64 describes these event types in detail.</p>
repeat_interval	<p>Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" on page 113-14 for more information.</p>

Table 113–63 (Cont.) Job Attribute Values

Name	Description
restartable	<p>This attribute specifies whether a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to <code>FALSE</code>. Setting this to <code>TRUE</code> means that if a job fails while running, it will be restarted from the beginning point of the job.</p> <p>In the case of a chain job, if this attribute is <code>TRUE</code>, the chain is restarted from the beginning after an application failure. If this attribute is <code>FALSE</code>, or if there has been a database failure, the chain is restarted at the last running step. The <code>restart_on_recovery</code> attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.)</p> <p>Note that setting this attribute to <code>TRUE</code> might lead to data inconsistencies in some situations, for example, if data is committed within a job.</p> <p>Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries.</p> <p>The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler will retry the job a maximum of six times. The first time, it will wait for one second and multiply this wait time with a factor of 10 each time thereafter.</p> <p>Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1.</p> <p>The Scheduler will stop retrying a job when:</p> <ul style="list-style-type: none"> ■ One of the retries succeeds. ■ All of its six retries have failed. ■ The next retry would occur after the next regularly scheduled run of the job. <p>The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.</p>
schedule_limit	<p>In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m.</p> <p>If <code>schedule_limit</code> is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log will be made to reflect the skipped run.</p>
schedule_name	<p>The name of a schedule or window or window group to use as the schedule for this job. If this is set, <code>end_date</code>, <code>start_date</code> and <code>repeat_interval</code> should all be <code>NULL</code>.</p>
start_date	<p>The original date and time on which this job started or will be scheduled to start. If this is set, <code>schedule_name</code> should be <code>NULL</code>.</p>

Table 113–63 (Cont.) Job Attribute Values

Name	Description
stop_on_window_close	<p>This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should be stopped once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE.</p> <p>By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job will be allowed to continue after the window closes.</p> <p>Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.</p>

Table 113–64 Event Types Raised by the Scheduler

Event Type	Description
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_broken	The job has been disabled and has changed to the BROKEN state because it exceeded the number of failures defined by the max_failures job attribute
job_chain_stalled	A job running a chain was put into the CHAIN_STALLED state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain evaluation_interval is set to NULL. No progress will be made in the chain unless there is manual intervention.
job_completed	The job completed because it reached its max_runs or end_date
job_disabled	The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE
job_failed	The job failed, either by throwing an error or by abnormally terminating
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The job's schedule limit was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to STOP_JOB
job_succeeded	The job completed successfully

Program Attribute Values

Table 113–65 lists program attribute values.

Note: See the CREATE_PROGRAM procedure for more complete descriptions of the attributes in this table.

Table 113–65 Program Attribute Values

Name	Description
comments	An optional comment. This can describe what the program does, or give usage details.

Table 113–65 (Cont.) Program Attribute Values

Name	Description
detached	If TRUE, the program is a detached program. See <i>Oracle Database Administrator's Guide</i> for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, depending on the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure.
program_type	The type of program. This must be one of the following supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.

Job Class Attribute Values

Table 113–66 lists job class attribute values.

Note: See the CREATE_JOB_CLASS procedure for more complete descriptions of the attributes in this table.

Table 113–66 Job Class Attribute Values

Name	Description
comments	An optional comment about the class.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 999. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
logging_level	This attribute specifies how much information is logged. The possible options are: <ul style="list-style-type: none"> ■ DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. ■ DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. ■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. ■ DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.
resource_consumer_group	The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See <i>Oracle Database Administrator's Guide</i> for a description of resource consumer groups and the Database Resource Manager.

Table 113–66 (Cont.) Job Class Attribute Values

Name	Description
service	The database service that the jobs in the job class have affinity to. If both the <code>resource_consumer_group</code> and <code>service</code> attributes are set for a job class, and if the service is mapped to a resource consumer group, the <code>resource_consumer_group</code> attribute takes precedence.

Window Attribute Values

Table 113–67 lists window attribute values.

Note: See the `CREATE_WINDOW` procedure for more complete descriptions of the attributes in this table.

Table 113–67 Window Attribute Values

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.
end_date	The date after which the window will no longer open. If this is set, <code>schedule_name</code> must be <code>NULL</code> .
repeat_interval	A string using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, <code>schedule_name</code> must be <code>NULL</code> . See "Calendaring Syntax" on page 113-14 for more information.
resource_plan	The resource plan to be associated with a window. When the window opens, the system will switch to this resource plan. When the window closes, the original resource plan will be restored. If a resource plan has been made active with the <code>force</code> option, no resource plan switch will occur. Only one resource plan can be associated with a window. It may be <code>NULL</code> or the empty string (<code>''</code>). When it is <code>NULL</code> , the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, <code>start_date</code> , <code>end_date</code> , and <code>repeat_interval</code> must all be <code>NULL</code> .
start_date	The next date and time on which this window is scheduled to open. If this is set, <code>schedule_name</code> must be <code>NULL</code> .
window_priority	The priority of the window. Must be one of 'LOW' (default) or 'HIGH'.

Window Group Attribute Values

Table 113–68 lists window group attribute values.

Table 113–68 Window Group Attribute Values

Name	Description
comments	An optional comment about the window group.

Schedule Attribute Values

Table 113–69 lists schedule attribute values.

Note: See the CREATE_SCHEDULE and CREATE_CALENDAR_SCHEDULE procedures for more complete descriptions of the attributes in this table.

Table 113–69 Schedule Attribute Values

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule will not specify any dates.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments to the CREATE_JOB procedure.
repeat_interval	An expression using the calendaring syntax. See " Calendaring Syntax " on page 113-14 for more information.
source	The host name that the database is running on. This is used by remote agents to know where to send the job run details.
start_date	The start or reference date and time used by the calendaring syntax.

Chain Attribute Values

[Table 113–70](#) lists chain attribute values.

Note: See the CREATE_CHAIN procedure for more complete descriptions of the attributes in this table.

Table 113–70 Chain Attribute Values

Name	Description
comments	An optional comment describing the purpose of the chain.
evaluation_interval	If this is not NULL, evaluation of the chain occurs not only at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives), but also periodically at this interval. For most chains, the normal evaluation times are sufficient. Because evaluation of a large chain is CPU intensive, this attribute should be used only when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to NULL. What attributes can be set depends on the object being altered. If the object is enabled, it will be disabled before being altered and be reenabled afterward. If the object cannot be reenabled, an error is generated and the object will be left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2);
```

Parameters

Table 113–71 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run SET_ATTRIBUTE_NULL for a window, window group, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an AnyData object. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_ANYDATA_ARGUMENT Procedure](#)

No type checking of the argument is done at any time by the Scheduler.

SET_JOB_ANYDATA_VALUE is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
  job_name           IN VARCHAR2,
  argument_position  IN PLS_INTEGER,
  argument_value     IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
  job_name           IN VARCHAR2,
  argument_name      IN VARCHAR2,
  argument_value     IN SYS.ANYDATA);
```

Parameters

Table 113–72 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be assigned to the program argument, encapsulated in an AnyData object

Usage Notes

SET_JOB_ANYDATA_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- ["SET_JOB_ARGUMENT_VALUE Procedure"](#) on page 113-112
- ["DEFINE_ANYDATA_ARGUMENT Procedure"](#) on page 113-54

SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument of the associated program for a job. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the [DEFINE_PROGRAM_ARGUMENT Procedure](#) or the [DEFINE_METADATA_ARGUMENT Procedure](#)

No type checking of the argument is done at any time by the Scheduler.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
    job_name           IN VARCHAR2,
    argument_position  IN PLS_INTEGER,
    argument_value     IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
    job_name           IN VARCHAR2,
    argument_name      IN VARCHAR2,
    argument_value     IN VARCHAR2);
```

Parameters

Table 113–73 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_ARGUMENT_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- ["SET_JOB_ANYDATA_VALUE Procedure"](#) on page 113-111
- ["DEFINE_PROGRAM_ARGUMENT Procedure"](#) on page 113-62

SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
  jobattr_array      IN JOBATTR_ARRAY,
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 113–74 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: <ul style="list-style-type: none"> ▪ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous attribute changes that were successful are committed to disk. This is the default. ▪ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. ▪ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts the rest of the job attribute changes on the list and commits all the changes that were successful.

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and re-enables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately. The attributes you can set are `default_timezone`, `max_job_slave_processes`, and `log_history`.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (  
    attribute      IN VARCHAR2,  
    value          IN VARCHAR2);
```

Parameters

Table 113–75 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	<p>The name of the Scheduler attribute. Possible values are:</p> <ul style="list-style-type: none"> <p>■ default_timezone: It is very important that this attribute is set. Whenever a <code>repeat_interval</code> is specified without setting the <code>start_date</code>, the Scheduler needs to know which time zone it must apply to the repeat interval syntax. For example, if the repeat interval is specified as</p> <pre>"FREQ=DAILY;BYHOUR=22"</pre> <p>the job will repeat every day at 10pm, but 10pm in which time zone? If no <code>start_date</code> is specified the Scheduler will pick up the time zone from this <code>default_timezone</code> attribute. If you want your job or window to follow daylight savings adjustments, you must set this attribute to the proper region name. For instance, if your database resides in Paris, you would set this to 'Europe/Warsaw'.</p> <p>Daylight saving adjustments will not be followed if you specify an absolute offset. For example, '-8:00' would be correct for only half of the year in San Francisco. If no value is specified for this attribute, the Scheduler uses the time zone of <code>sys_timestamp</code> when the job or window is enabled. This is always an absolute offset and will not follow daylight savings adjustments.</p> <p>■ log_history: This controls the number of days that log entries for both the job log and the window log are retained. It helps prevent logs from growing indiscriminately. The range of valid values is 0 through 999. If set to 0, no history is kept. Default value is 30. You can override this value at the job class level by setting a value for the <code>log_history</code> attribute of the job class.</p> <p>■ max_job_slave_processes: This enables you to set a maximum number of slave processes for a particular system configuration and load. The default value is NULL, and the valid range is 1-999.</p> <p>Even though the Scheduler automatically determines what the optimum number of slave processes is for a given system configuration and load, you still might want to set a fixed limit on the Scheduler. If this is the case, you can set this attribute.</p> <p>Although the number set by <code>max_job_slave_processes</code> is a real maximum, it does not mean the Scheduler will start the specified number of slaves. For example, even though this attribute is set to 10, the Scheduler might still determine that it should not start more than 3 slave processes. However, if it wants to start 15, but it is set to 10, it will not start more than 10.</p> <p>■ event_expiry_time: The time in seconds before an event generated by the Scheduler (in other words, a message enqueued by the Scheduler into the Scheduler event queue) expires (in other words, is automatically purged from the queue). If NULL, Scheduler-generated events expire after 24 hours.</p>
value	The new value of the attribute

Usage Notes

To run `SET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE SCHEDULER` privilege.

STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class. Any instance of the job will be stopped. After stopping the job, the state of a one-time job will be set to STOPPED whereas the state of a repeating job will be set to SCHEDULED or COMPLETED depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all steps of the running chain that are running are stopped.

For external jobs, STOP_JOB stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
  job_name          IN VARCHAR2
  force             IN BOOLEAN DEFAULT FALSE
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 113–76 STOP_JOB Procedure Parameters

Parameter	Description
job_name	The name of the job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are stopped. The job class is not affected by this call.
force	If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned. If force is set to TRUE, the Scheduler will immediately terminate the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed. Use of the force option requires the MANAGE SCHEDULER system privilege.
commit_semantics	The commit semantics. The following two types are supported: <ul style="list-style-type: none"> ▪ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous stop operations that were successful are committed to disk. This is the default. ▪ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts stopping the rest of the jobs and commits all the stop operations that were successful.

Usage Notes

STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that you have the MANAGE SCHEDULER privilege.

DBMS_SERVER_ALERT

The `DBMS_SERVER_ALERT` package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- [Using DBMS_SERVER_ALERT](#)
- [Summary of DBMS_SERVER_ALERT Subprograms](#)

Using DBMS_SERVER_ALERT

This section contains topics which relate to using the DBMS_SERVER_ALERT package. The following topics define constants used in package procedures.

- [Object Types](#)
- [Relational Operators](#)
- [Supported Metrics](#)

Object Types

You qualify the metric by an individual object for the following object types.

Table 114–1 Object Types Defined as Constants

Constant	Description
OBJECT_TYPE_SYSTEM	Metrics collected on the system level for each instance.
OBJECT_TYPE_FILE	Metrics collected on the file level. These are used for AVERAGE_FILE_READ_TIME and AVERAGE_FILE_WRITE_TIME metrics.
OBJECT_TYPE_SERVICE	Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.
OBJECT_TYPE_TABLESPACE	Metrics collected on the tablespace level.
OBJECT_TYPE_EVENT_CLASS	Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.
OBJECT_TYPE_SESSION	Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.

Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 114–2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

Supported Metrics

The following metrics are supported. All internal metric names are supplied as package constants.

Table 114–3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
TRANSACTION_RATE	Number of Transactions (for each second)	Transactions for each Second
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second

Table 114–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LOGONS_CURRENT	Current Number of Logons	Number of Logons
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
LOG_SWITCH_SEC	Background Checkpoints (for each second)	Checkpoints for each Second
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSSES_SEC	Total Parses (for each second)	Parses for each Second

Table 114-3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
TOTAL_PARSSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
HARD_PARSSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
USER_CALLS_PCT	User Calls (%)	% of all calls
TXN_COMMITTED_PCT	Transactions Committed (%)	% of all transactions
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
DATA_DICT_HIT	Data Dictionary Hit (%)	% of dictionary accesses
DATA_DICT_MISS	Data Dictionary Miss (%)	% of dictionary accesses
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
AVERAGE_FILE_READ_TIME	Average File Read Time	Microseconds
AVERAGE_FILE_WRITE_TIME	Average File Write Time	Microseconds
DISK_IO	Disk I/O	Milliseconds
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
APPL_DESGN_WAIT_SCT	Application Design Wait (by session count)	Count of sessions
APPL_DESGN_WAIT_TIME	Application Design Wait (by time)	Microseconds
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYS_DESGN_WAIT_TIME	Physical Design Wait (by time)	Microseconds
CONTENTION_WAIT_SCT	Internal Contention Wait (by session count)	Count of sessions
CONTENTION_WAIT_TIME	Internal Contention Wait (by time)	Microseconds
PSERVICE_WAIT_SCT	Process Service Wait (by session count)	Count of sessions

Table 114–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PSERVICE_WAIT_TIME	Process Service Wait (by time)	Microseconds
NETWORK_MSG_WAIT_SCT	Network Message Wait (by session count)	Count of sessions
NETWORK_MSG_WAIT_TIME	Network Message Wait (by time)	Microseconds
DISK_IO_WAIT_SCT	Disk I/O Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_SCT	Operating System Service Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_TIME	Operating System Service Wait (by time)	Microseconds
DBR_IO_LIMIT_WAIT_SCT	Resource Mgr I/O Limit Wait (by session count)	Count of sessions
DBR_IO_LIMIT_WAIT_TIME	Resource Mgr I/O Limit Wait (by time)	Microseconds
DBR_CPU_LIMIT_WAIT_SCT	Resource Mgr CPU Limit Wait (by session count)	Count of sessions
DBR_CPU_LIMIT_WAIT_TIME	Resource Mgr CPU Limit Wait (by time)	Microseconds
DBR_USR_LIMIT_WAIT_SCT	Resource Mgr User Limit Wait (by session count)	Count of sessions
DBR_USR_LIMIT_WAIT_TIME	Resource Mgr User Limit Wait (by time)	Microseconds
OS_SCHED_CPU_WAIT_SCT	Operating System Scheduler CPU Wait (by session count)	Count of sessions
OS_SCHED_CPU__WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
CLUSTER_MSG_WAIT_SCT	Cluster Messaging Wait (by session count)	Count of sessions
CLUSTER_MSG_WAIT_TIME	Cluster Messaging Wait (by time)	Microseconds
OTHER_WAIT_SCT	Other Waits (by session count)	Count of sessions
OTHER_WAIT_TIME	Other Waits (by time)	Microseconds
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction

Table 114–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
DB_BLKCHANGES_SEC	DB Block Changes (for each second)	Changes for each Second
DB_BLKCHANGES_TXN	DB Block Changes (for each transaction)	Changes for each Transaction
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second

Table 114–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
CPU_TIME_PER_CALL	CPU time for each user call for each service	Microseconds for each call
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free

Summary of DBMS_SERVER_ALERT Subprograms

Table 114-4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function on page 114-12	Expands alert messages
GET_THRESHOLD Procedure on page 114-13	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure on page 114-14	Sets the warning and critical thresholds for a specified metric

EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE (
  user_language      IN   VARCHAR2,
  message_id        IN   NUMBER,
  argument_1        IN   VARCHAR2,
  argument_2        IN   VARCHAR2,
  argument_3        IN   VARCHAR2,
  argument_4        IN   VARCHAR2,
  argument_5        IN   VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 114–5 *EXPAND_MESSAGE Procedure Parameters*

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD (
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    OUT BINARY_INTEGER,
  warning_value       OUT VARCHAR2,
  critical_operator   OUT BINARY_INTEGER,
  critical_value      OUT VARCHAR2,
  observation_period  OUT BINARY_INTEGER,
  consecutive_occurrences OUT BINARY_INTEGER,
  instance_name       IN  VARCHAR2,
  object_type         IN  BINARY_INTEGER,
  object_name         IN  VARCHAR2);
```

Parameters

Table 114–6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics" on page 114-5.
warning_operator	The operator for the comparing the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV\$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid.

SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
  metrics_id          IN  BINARY_INTEGER,
  warning_operator    IN  BINARY_INTEGER,
  warning_value       IN  VARCHAR2,
  critical_operator   IN  BINARY_INTEGER,
  critical_value      IN  VARCHAR2,
  observation_period  IN  BINARY_INTEGER,
  consecutive_occurrences IN BINARY_INTEGER,
  instance_name       IN  VARCHAR2,
  object_type         IN  BINARY_INTEGER,
  object_name        IN  VARCHAR2);
```

Parameters

Table 114–7 SET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics" on page 114-5.
warning_operator	The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See "Relational Operators" on page 114-4.
warning_value	The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.
critical_operator	The operator for the comparing the actual value with the critical threshold. See "Relational Operators" on page 114-4.
critical_value	The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.
observation_period	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
consecutive_occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts.
object_type	See "Object Types" on page 114-3.
object_name	The name of the object. This is NULL for SYSTEM.

Usage Notes

Note that this subprogram does not check if the value of the `instance_name` parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the `DBA_THRESHOLDS` view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

The DBMS_SERVICE package lets you create, delete, activate and deactivate services for a single instance.

The chapter contains the following topics:

- [Using DBMS_SERVICE](#)
 - Overview
 - Security Model
 - Constants
 - Exceptions
- [Summary of DBMS_SERVICE Subprograms](#)

See Also: *Oracle Real Application Clusters Administration and Deployment Guide* for administering services in Oracle Real Application Clusters.

Using DBMS_SERVICE

This section contains topics which relate to using the DBMS_SERVICE package.

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)

Overview

DBMS_SERVICE supports the management of services in the RDBMS for the purposes of workload measurement, management, prioritization, and XA/and distributed transaction management.

Oracle Real Application Clusters (RAC) has a functionality to manage service names across instances. This package allows the creation, deletion, starting and stopping of services in both RAC and a single instance. Additionally it provides the ability to disconnect all sessions which connect to the instance with a service name when RAC removes that service name from the instance.

See Also: For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

Security Model

Privileges

The client using this package should have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

Schemas

This package should be installed under `SYS` schema.

Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

Constants

The DBMS_SERVICE package uses the constants shown in following tables

- Constants used in calling arguments are described in [Table 115-1, "Constants used in Calling Arguments"](#)
- Constants used in connection balancing goal arguments are described in [Table 115-2, "Constants used in Connection Balancing Goal Arguments"](#)
- Constants used TAF failover attribute arguments are described in [Table 115-3, "Constants used in TAF Failover Attribute Arguments"](#)

Table 115-1 Constants used in Calling Arguments

Name	Type	Value	Description
GOAL_NONE	NUMBER	0	Disables Load Balancing Advisory
GOAL_SERVICE_TIME	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
GOAL_THROUGHPUT	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 115-2 Constants used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_SHORT	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=NONE (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections per instance using session count per service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 115-3 Constants used in TAF Failover Attribute Arguments

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time. It is not possible to pre-establish a backup connection. (which is to say, PRECONNECT is not supported)

Table 115–3 (Cont.) Constants used in TAF Failover Attribute Arguments

Name	Type	Value	Description
FAILOVER_TYPE_ NONE	NUMBER		Server side TAF type is NONE
FAILOVER_TYPE_ SESSION	NUMBER		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF will re-connect to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_ SELECT	NUMBER		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of retries to use during a failover. Specifies the number of times that TAF should attempt the re-connect and re-authenticate pair. The value must be integral and greater than 0. The maximum value is UB4MAXVAL
FAILOVER_DELAY	NUMBER		Number of seconds delay before trying to failover. Specifies the delay (in seconds) that TAF will incur if the re-connect / re-authentication fails. The value must be integral and greater than 0. The maximum value is UB4MAXVAL.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF will continue to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay should be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method will default to BASIC. Delay and retries are optional and may be specified independently.

Exceptions

The following table lists the exceptions raised by DBMS_SERVICE package.

Table 115-4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
NULL_SERVICE_NAME	44301	The service name argument was found to be NULL
NULL_NETWORK_NAME	44302	The network name argument was found to be NULL
SERVICE_EXISTS	44303	This service name was already in existence
SERVICE_DOES_NOT_EXIST	44304	The specified service was not in existence
SERVICE_IN_USE	44305	The specified service was running
SERVICE_NAME_TOO_LONG	44306	The service name was too long
NETWORK_PREFIX_TOO_LONG	44307	The network name, excluding the domain, was too long
NOT_INITIALIZED	44308	The services layer was not yet initialized
GENERAL_FAILURE	44309	There was an unknown failure
MAX_SERVICES_EXCEEDED	44310	The maximum number of services has been reached
SERVICE_NOT_RUNNING	44311	The specified service was not running
DATABASE_CLOSED	44312	The database was closed
INVALID_INSTANCE	44313	The instance name argument was not valid
NETWORK_EXISTS	44314	The network name was already in existence
NULL_ATTRIBUTES	44315	All attributes specified were NULL
INVALID_ARGUMENT	44316	Invalid argument supplied
DATABASE_READONLY	44317	The database is open read-only
MAX_SN_LENGTH	44318	The total length of all running service network names exceeded the maximum allowable length

Summary of DBMS_SERVICE Subprograms

Table 115–5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure on page 115-9	Creates service
DELETE_SERVICE Procedure on page 115-10	Deletes service
DISCONNECT_SESSION Procedure on page 115-11	Disconnects service
MODIFY_SERVICE Procedure on page 115-12	Modifies service
START_SERVICE Procedure on page 115-13	Activates service
STOP_SERVICE Procedure on page 115-14	Stops service

CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
  service_name      IN VARCHAR2,
  network_name     IN VARCHAR2,
  goal              IN NUMBER DEFAULT NULL,
  dtp               IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications IN BOOLEAN DEFAULT NULL,
  failover_method  IN VARCHAR2 DEFAULT NULL,
  failover_type    IN VARCHAR2 DEFAULT NULL,
  failover_retries IN NUMBER DEFAULT NULL,
  failover_delay   IN NUMBER DEFAULT NULL,
  clb_goal         IN NUMBER DEFAULT NULL);
```

Parameters

Table 115–6 CREATE_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	The name of the service limited to 64 characters in the Data Dictionary
<code>network_name</code>	The network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET <code>service_names</code> character set (see <i>Oracle Database Net Services Reference</i>).
<code>goal</code>	The workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> ■ <code>DBMS_SERVICE.GOAL_SERVICE_TIME</code> ■ <code>DBMS_SERVICE.GOAL_THROUGHPUT</code> ■ <code>DBMS_SERVICE.GOAL_NONE</code>
<code>dtp</code>	Declares the service to be for DTP or distributed transactions including XA transactions
<code>aq_ha_notifications</code>	Determines whether HA events are sent via AQ for this service
<code>failover_method</code>	The TAF failover method for the service
<code>failover_type</code>	The TAF failover type for the service
<code>failover_retries</code>	The TAF failover retries for the service
<code>failover_delay</code>	The TAF failover delay for the service
<code>clb_goal</code>	Method used for Connection Load Balancing (see Table 115–2, "Constants used in Connection Balancing Goal Arguments")

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.us.oracle.com', 'ernie.us.oracle.com');
```

DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(  
    service_name    IN VARCHAR2);
```

Parameters

Table 115–7 *DELETE_SERVICE Procedure Parameters*

Parameter	Description
service_name	The name of the service limited to 64 characters in the Data Dictionary

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.us.oracle.com');
```

DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
    service_name IN VARCHAR2);
```

Parameters

Table 115–8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
service_name	The name of the service limited to 64 characters in the Data Dictionary

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions disconnected.

Examples

This disconnects sessions with service_name 'ernie.us.oracle.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.us.oracle.com');
```

MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
    service_name      IN VARCHAR2,
    goal              IN NUMBER DEFAULT NULL,
    dtp              IN BOOLEAN DEFAULT NULL,
    aq_ha_notifications IN BOOLEAN DEFAULT NULL,
    failover_method  IN VARCHAR2 DEFAULT NULL,
    failover_type    IN VARCHAR2 DEFAULT NULL,
    failover_retries IN NUMBER DEFAULT NULL,
    failover_delay   IN NUMBER DEFAULT NULL,
    clb_goal         IN NUMBER DEFAULT NULL);
```

Parameters

Table 115–9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
service_name	The name of the service limited to 64 characters in the Data Dictionary
goal	The workload management goal directive for the service. Valid values: <ul style="list-style-type: none"> ▪ DBMS_SERVICE.GOAL_SERVICE_TIME ▪ DBMS_SERVICE.GOAL_THROUGHPUT ▪ DBMS_SERVICE.GOAL_NONE
dtp	Declares the service to be for DTP or distributed transactions including XA transactions
aq_ha_notifications	Determines whether HA events are sent via AQ for this service
failover_method	The TAF failover method for the service
failover_type	The TAF failover type for the service
failover_retries	The TAF failover retries for the service
failover_delay	The TAF failover delay for the service
clb_goal	Method used for Connection Load Balancing (see Table 115–2, "Constants used in Connection Balancing Goal Arguments")

START_SERVICE Procedure

This procedure starts a service. This procedure alters the `service_name` IOP to contain this `service_name`. In RAC, implementing this option will act on the instance specified.

Syntax

```
DBMS_SERVICE.START_SERVICE(
  service_name IN VARCHAR2,
  instance_name IN VARCHAR2);
```

Parameters

Table 115–10 START_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	The name of the service limited to 64 characters in the Data Dictionary
<code>instance_name</code>	The name of the instance where the service should be activated (optional). The instance on which to start the service. <code>NULL</code> results in starting of the service on the local instance. In single instance this can only be the current instance or <code>NULL</code> . Specify <code>DBMS_SERVICE.ALL_INSTANCES</code> to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.us.oracle.com');
```

STOP_SERVICE Procedure

This procedure stops a service, altering the `service_name` IOP to remove this `service_name`. In RAC this will call out to CRS to stop the service optionally on the instance specified.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(  
    service_name IN VARCHAR2,  
    instance_name IN VARCHAR2);
```

Parameters

Table 115–11 STOP_SERVICE Procedure Parameters

Parameter	Description
<code>service_name</code>	The name of the service limited to 64 characters in the Data Dictionary
<code>instance_name</code>	The name of the instance where the service should be stopped (optional). The instance on which to stop the service. NULL results in stopping of the service locally. n single instance this can only be the current instance or NULL. The default in RAC and exclusive case is NULL. Specify <code>DBMS_SERVICE.ALL_INSTANCES</code> to stop the service on all configured instances.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.us.oracle.com');
```

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- [Using DBMS_SESSION](#)
 - Security Model
 - Operational Notes
- [Summary of DBMS_SESSION Subprograms](#)

Using DBMS_SESSION

- [Security Model](#)
- [Operational Notes](#)

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

Summary of DBMS_SESSION Subprograms

Table 116–1 DBMS_SESSION Package Subprograms

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure on page 116-6	Clears all context information
CLEAR_CONTEXT Procedure on page 116-7	Clears the context
CLEAR_IDENTIFIER Procedure on page 116-8	Clears the identifier
CLOSE_DATABASE_LINK Procedure on page 116-9	Closes database link
FREE_UNUSED_USER_MEMORY Procedure on page 116-10	Lets you reclaim unused memory after performing operations requiring large amounts of memory
IS_ROLE_ENABLED Function on page 116-12	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function on page 116-13	Determines if the specified session is active
LIST_CONTEXT Procedures on page 116-14	Returns a list of active namespace and context for the current session
SESSION_TRACE_DISABLE Procedure on page 116-19	Resets the session-level SQL trace for the session from which it was called.
SESSION_TRACE_ENABLE Procedure on page 116-20	Enables session-level SQL trace for the invoking session
RESET_PACKAGE Procedure on page 116-21	De-instantiates all packages in the session
SET_CONTEXT Procedure on page 116-23	Sets or resets the value of a context attribute
SET_IDENTIFIER on page 116-25	Sets the identifier
SET-NLS Procedure on page 116-26	Sets Globalization Support (NLS)
SET_ROLE Procedure on page 116-27	Sets role
SET_SQL_TRACE Procedure on page 116-28	Turns tracing on or off
SWITCH_CURRENT_CONSUMER_GROUP Procedure on page 116-29	Facilitates changing the current resource consumer group of a user's current session
UNIQUE_SESSION_ID Function on page 116-31	Returns an identifier that is unique for all sessions currently connected to this database

CLEAR_ALL_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT  
  namespace          VARCHAR2);
```

Parameters

Table 116–2 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

This procedure must be invoked directly or indirectly by the trusted package.

CLEAR_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
  namespace      VARCHAR2,
  client_identifier VARCHAR2
  attribute      VARCHAR2);
```

Parameters

Table 116–3 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	<p>The namespace in which the application context is to be cleared. Required.</p> <p>For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context.</p> <p>For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.</p>
client_identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum.
attribute	The specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_identifier arguments is cleared.

Usage Notes

This procedure must be invoked directly or indirectly by the trusted package.

CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:

```
ALTER SESSION CLOSE DATABASE LINK <name>
```

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (  
    dblink VARCHAR2);
```

Parameters

Table 116–4 *CLOSE_DATABASE_LINK Procedure Parameters*

Parameter	Description
dblink	Name of the database link to close.

FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

Note: This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server:** This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server:** This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA

memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
  type number_idx_tbl is table of number indexed by binary_integer;

  store1_table number_idx_tbl;    -- PL/SQL indexed table
  store2_table number_idx_tbl;    -- PL/SQL indexed table
  store3_table number_idx_tbl;    -- PL/SQL indexed table
  ...
END;                                -- end of foobar

DECLARE
  ...
  empty_table number_idx_tbl;    -- uninitialized ("empty") version
BEGIN
  FOR i in 1..1000000 loop
    store1_table(i) := i;        -- load data
  END LOOP;
  ...
  store1_table := empty_table;    -- "truncate" the indexed table
  ...
  -
  dbms_session.free_unused_user_memory; -- give memory back to system

  store1_table(1) := 100;        -- index tables still declared;
  store2_table(2) := 200;        -- but truncated.
  ...
END;
```

IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (  
    rolename    VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 116–5 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.

Return Values

Table 116–6 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled.

IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (  
    uniqueid VARCHAR2)  
RETURN BOOLEAN;
```

Parameters

Table 116–7 IS_SESSION_ALIVE Function Parameters

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

Return Values

Table 116–8 IS_SESSION_ALIVE Function Return Values

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active.

LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
    namespace VARCHAR2(30),
    attribute VARCHAR2(30),
    value     VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
    list OUT AppCtxTabTyp,
    size OUT NUMBER);
```

Parameters

Table 116–9 LIST_CONTEXT Procedure Parameters

Parameter	Description
list	Buffer to store a list of application context set in the current session.

Return Values

Table 116–10 LIST_CONTEXT Procedure Return Values

Return	Description
list	A list of (namespace, attribute, values) set in current session.
size	Returns the number of entries in the buffer returned.

Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because list is a table type variable, its size is dynamically adjusted to the size of returned list.

MODIFY_PACKAGE_STATE Procedure

This procedure can be used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running. The procedure uses the DBMS_SESSION constants listed in [Table 116–12](#).

Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE (
    action_flags IN PLS_INTEGER);
```

Parameters

Table 116–11 *MODIFY_PACKAGE_STATE Procedure Parameters*

Parameter	Description
<code>action_flags</code>	<p>Bit flags that determine the action taken on PL/SQL program units:</p> <p><code>DBMS_SESSION.FREE_ALL_RESOURCES</code> (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstated and package globals are reinitialized. Invoking <code>MODIFY_PACKAGE_STATE</code> with the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> parameter provides functionality identical to the <code>DBMS_SESSION.RESET_PACKAGE()</code> interface.</p> <p><code>DBMS_SESSION.REINITIALIZE</code> (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the <code>DBMS_SESSION.REINITIALIZE</code> flag is similar to the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> flag in that both have the effect of reinitializing all packages.</p> <p>However, <code>DBMS_SESSION.REINITIALIZE</code> should exhibit better performance than the <code>DBMS_SESSION.FREE_ALL_RESOURCES</code> option because:</p> <ul style="list-style-type: none"> ■ Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. ■ Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. ■ The session memory for PL/SQL modules without global state (such as types, stored-procedures) will not be freed and recreated.

Usage Notes

See the parameter descriptions in [Table 116–13](#) for the differences between the flags and why `DBMS_SESSION.REINITIALIZE` exhibits better performance than `DBMS_SESSION.FREE_ALL_RESOURCES`.

Table 116–12 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
<code>FREE_ALL_RESOURCES</code>	<code>PLS_INTEGER:= 1</code>
<code>REINITIALIZE</code>	<code>PLS_INTEGER:= 2</code>

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```

package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ...
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/

```

For the package P, reinitialization involves:

- Setting `P.n` to `NULL`
- Invoking function `P2.foo` and setting `P.m` to the value returned from `P2.foo`
- Setting `P.d` to the return value of `SYSDATE` built-in
- Closing cursor `P.c` if it was previously opened
- Setting `P.v` to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.

- When using `FREE_ALL_RESOURCES` or `REINITIALIZE`, make sure that resetting package variable values does not affect the application.
- Because `DBMS_SESSION.REINITIALIZE` does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the `FREE_ALL_RESOURCES` flag or the `RESET_PACKAGE` procedure had been used. For instance, after performing `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)`, if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages will remain until the end of the session (or until `DBMS_SESSION.RESET_PACKAGE` is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)` does not compile on the client because it uses the constant `DBMS_SESSION.REINITIALIZE`.

Instead, use `DBMS_SESSION.MODIFY_PACKAGE_STATE(2)` on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of `DBMS_SESSION.MODIFY_PACKAGE_STATE`. Consider a package `P` with some global state (a cursor `c` and a number `cnt`). When the package is first initialized, the package variable `cnt` is 0 and the cursor `c` is `CLOSED`. Then, in the session, change the value of `cnt` to 111 and also execute an `OPEN` operation on the cursor. If you call `print_status` to display the state of the package, you see that `cnt` is 111 and that the cursor is `OPEN`. Next, call `DBMS_SESSION.MODIFY_PACKAGE_STATE`. If you print the status of the package `P` again using `print_status`, you see that `cnt` is 0 again and the cursor is `CLOSED`. If the call to `DBMS_SESSION.MODIFY_PACKAGE_STATE` had not been made, then the second `print_status` would have printed 111 and `OPEN`.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2  P.cnt := 111;
  3  open p.c;
```

```
4 P.print_status;
5 end;
6 /
P.cnt = 111
P.c is OPEN
```

PL/SQL procedure successfully completed.

```
SQL> begin
2 dbms_session.modify_package_state(dbms_session.reinitialize);
3 end;
4 /
```

PL/SQL procedure successfully completed.

```
SQL> set serveroutput on;
SQL>
SQL> begin
2 P.print_status;
3 end;
4 /
P.cnt = 0
P.c is CLOSED
```

PL/SQL procedure successfully completed.

SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE();
```

SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(  
    waits      IN   BOOLEAN DEFAULT TRUE,  
    binds      IN   BOOLEAN DEFAULT FALSE,  
    plan_stat  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 116–13 *SESSION_TRACE_ENABLE Procedure Parameters*

Parameter	Description
waits	Specifies if wait information is to be traced
binds	Specifies if bind information is to be traced
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note: See "[SESSION_TRACE_ENABLE Procedure](#)" on page 116-20. The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to RESET_PACKAGE frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

RESET_PACKAGE can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. RESET_PACKAGE guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use RESET_PACKAGE to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values will not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

RESET_PACKAGE does not free the memory, cursors, and package variables immediately when called.

Note: RESET_PACKAGE only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (
    namespace VARCHAR2,
    attribute VARCHAR2,
    value      VARCHAR2,
    username  VARCHAR2,
    client_id  VARCHAR2 );
```

Parameters

Table 116–14 SET_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace of the application context to be set, limited to 30 bytes.
attribute	The attribute of the application context to be set, limited to 30 bytes.
value	The value of the application context to be set, limited to 4 kilobytes.
username	The database username attribute of the application context. Default: NULL
client_id	The application-specific client_id attribute of the application context (64-byte maximum). Default: NULL

Usage Notes

Note the following:

- For 8i compatibility, only the first three parameters are used.
- The first three parameters are required for all types of context.
- The username parameter must be a valid SQL identifier
- The client_id parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for set_identifier.
- If the namespace parameter is a global context namespace, then the username parameter is matched against the current database user name in the session, and the client_id parameter will be matched against the current client_id in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.

- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.

See Also: *Oracle Database Security Guide* for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

SET_IDENTIFIER

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (  
    client_id VARCHAR2);
```

Parameters

Table 116–15 SET_IDENTIFIER Procedure Parameters

Parameter	Description
client_id	The application-specific identifier of the current database session.

Usage Notes

Note the following:

- SET_IDENTIFIER initializes the current session with a client identifier to identify the associated global application context
- client_id is case sensitive; it must match the client_id parameter in the set_context
- This procedure is executable by public

SET-NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the following SQL statement:

```
ALTER SESSION SET <nls_parameter> = <value>
```

Syntax

```
DBMS_SESSION.SET-NLS (  
    param VARCHAR2,  
    value VARCHAR2);
```

Parameters

Table 116–16 SET-NLS Procedure Parameters

Parameter	Description
param	Globalization Support parameter. The parameter name must begin with 'NLS'.
value	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "set_nls (nls_date_format, 'DD-MON-YY')".

SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the SET ROLE SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (  
    role_cmd VARCHAR2);
```

Parameters

Table 116–17 SET_ROLE Procedure Parameters

Parameter	Description
role_cmd	This text is appended to "set role" and then run as SQL.

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the following SQL statement:

```
ALTER SESSION SET SQL_TRACE ...
```

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (  
    sql_trace boolean);
```

Parameters

Table 116–18 *SET_SQL_TRACE Procedure Parameters*

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off.

SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
    new_consumer_group    IN  VARCHAR2,
    old_consumer_group    OUT VARCHAR2,
    initial_group_on_error IN  BOOLEAN);
```

Parameters

Table 116–19 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
new_consumer_group	Name of consumer group to which you want to switch.
old_consumer_group	Name of the consumer group from which you just switched out.
initial_group_on_error	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error.

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

Note: You can switch back to the old consumer group later using the value returned in `old_consumer_group`.

Exceptions

Table 116–20 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group.
1031	Insufficient privileges.
29396	Cannot switch to OTHER_GROUPS consumer group.

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (`old_consumer_group`) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting `initial_group_on_error` to TRUE, SWITCH_CURRENT_CONSUMER_GROUP puts the current session into the default group, if it can't put it into the group designated by `new_consumer_group`. The error associated with the attempt to move

a session into `new_consumer_group` is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
  old_group varchar2(30);
  prev_group varchar2(30);
  curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error will be thrown, but the consumer group will not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
      -- It is possible that the procedure owner does not have privileges
      -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
      -- that the user is moved out of the privileged group in such a
      -- situation

      dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
      RAISE;
    END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID  
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

Table 116–21 *UNIQUE_SESSION_ID Function Return Values*

Return	Description
unique_session_id	Returns up to 24 bytes.

DBMS_SHARED_POOL

The `DBMS_SHARED_POOL` package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. `DBMS_SHARED_POOL` enables you to display the sizes of objects in the shared pool, and mark them for keeping or unkeeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- [Using DBMS_SHARED_POOL](#)
 - Overview
 - Operational Notes
- [Summary of DBMS_SHARED_POOL Subprograms](#)

Using DBMS_SHARED_POOL

- [Overview](#)
- [Operational Notes](#)

Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

Operational Notes

To create `DBMS_SHARED_POOL`, run the `DBMSPOOL.SQL` script. The `PRVTPool.PLB` script is automatically executed after `DBMSPOOL.SQL` runs. These scripts are *not* run by as part of standard database creation.

Summary of DBMS_SHARED_POOL Subprograms

Table 117-1 DBMS_SHARED_POOL Package Subprograms

Subprogram	Description
ABORTED_REQUEST_THRESHOLD Procedure on page 117-6	Sets the aborted request threshold for the shared pool
KEEP Procedure on page 117-7	Keeps an object in the shared pool
PURGE Procedure on page 117-8	Purges the named object or specified heap(s) of the object
SIZES Procedure on page 117-9	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure on page 117-10	Unkeeps the named object

ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (  
    threshold_size NUMBER);
```

Parameters

Table 117–2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
threshold_size	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than threshold_size. This user gets the 'out of memory' error without attempting to search the LRU list.

KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
    name VARCHAR2,
    flag CHAR          DEFAULT 'P');
```

Parameters

Table 117–3 KEEP Procedure Parameters

Parameter	Description
name	Name of the object to keep. The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be kept.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.

Exceptions

An exception is raised if the named object cannot be found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871'). The complete hexadecimal address must be in the first 8 characters.

PURGE Procedure

This procedure purges the named object or specified heap(s) of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
  name      VARCHAR2,
  flag      CHAR DEFAULT 'P',
  heaps     NUMBER DEFAULT 1)
```

Parameters

Table 117-4 PURGE Procedure Parameters

Parameter	Description
name	Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v\$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default is 1, that is, heap 0 which means the whole object would be purged

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the [KEEP Procedure](#) are supported for PURGE.

SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (  
    minsize NUMBER);
```

Parameters

Table 117-5 SIZES Procedure Parameters

Parameter	Description
<code>minsize</code>	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the `SQLDBA` or `SQLPLUS` `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (  
  name VARCHAR2,  
  flag CHAR      DEFAULT 'P');
```

Caution: This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 117–6 UNKEEP Procedure Parameters

Parameter	Description
name	Name of the object to unkeep. See description of the name object for the <code>KEEP</code> procedure.
flag	See description of the flag parameter for the <code>KEEP</code> procedure.

Exceptions

An exception is raised if the named object cannot be found.

The DBMS_SPACE package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- [Using DBMS_SPACE](#)
 - Security Model
- [Summary of DBMS_SPACE Subprograms](#)

Using DBMS_SPACE

- [Security Model](#)

Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

Data Structures

The DBMS_SPACE package defines a RECORD type and a TABLE type.

RECORD Types

[ASA_RECO_ROW](#) Record Type

TABLE Types

[ASA_RECO_ROW_TB](#) Table Type

ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the [ASA_RECOMMENDATIONS Function](#).

Syntax

```
TYPE asa_reco_row IS RECORD (
  tablespace_name    VARCHAR2 (30),
  segment_owner      VARCHAR2 (30),
  segment_name       VARCHAR2 (30),
  segment_type       VARCHAR2 (18),
  partition_name     VARCHAR2 (30),
  allocated_space    NUMBER,
  used_space         NUMBER,
  reclaimable_space  NUMBER,
  chain_rowexcess    NUMBER,
  recommendations    VARCHAR2 (1000),
  c1                 VARCHAR2 (1000),
  c2                 VARCHAR2 (1000),
  c3                 VARCHAR2 (1000),
  task_id            NUMBER,
  mesg_id            NUMBER);
```

Attributes

Table 118-1 ASA_RECO_ROW Attributes

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

ASA_RECO_ROW_TB Table Type

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

Summary of DBMS_SPACE Subprograms

Table 118–2 DBMS_SPACE Package Subprograms

Subprogram	Description
ASA_RECOMMENDATIONS Function on page 118-8	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure on page 118-9	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures on page 118-10	Determines the size of the table given various attributes
FREE_BLOCKS Procedure on page 118-12	Returns information about free blocks in an object (table, index, or cluster)
OBJECT_DEPENDENT_SEGMENTS Function on page 118-14	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function on page 118-16	A table function where each row describes the space usage of the object at a specific point in time
SPACE_USAGE Procedures on page 118-18	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure on page 118-21	Returns information about unused space in an object (table, index, or cluster)

ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (  
  all_runs      IN   VARCHAR2 DEFAULT := TRUE,  
  show_manual   IN   VARCHAR2 DEFAULT := TRUE,  
  show_findings IN   VARCHAR2 DEFAULT := FALSE)  
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 118–3 *CREATE_INDEX_COST Procedure Parameters*

Parameter	Description
all_runs	If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
show_manual	If TRUE, we show the results of manual invocations only. The auto advisor results are excluded. If FALSE, results of manual invocation of segment advisor are not returned.
show_findings	Show only the findings instead of the recommendations

CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
  ddl          IN   VARCHAR2,
  used_bytes   OUT  NUMBER,
  alloc_bytes  OUT  NUMBER,
  plan_table   IN   VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

Table 118–4 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
ddl	The create index DDL statement
used_bytes	The number of bytes representing the actual index data
alloc_bytes	Size of the index when created in the tablespace
plan_table	Which plan table to use, default NULL

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    avg_row_size       IN NUMBER,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
DBMS_SPACE.CREATE_TABLE_COST (
    tablespace_name    IN VARCHAR2,
    colinfos           IN CREATE_TABLE_COST_COLUMNS,
    row_count          IN NUMBER,
    pct_free           IN NUMBER,
    used_bytes         OUT NUMBER,
    alloc_bytes        OUT NUMBER);
```

```
CREATE TYPE create_table_cost_colinfo IS OBJECT (
    COL_TYPE    VARCHAR(200),
    COL_SIZE    NUMBER);
```

Parameters

Table 118–5 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  c1 sys.create_table_cost_columns;
BEGIN
  c1 := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('VARCHAR2',30),
    sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',c1,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See [SPACE_USAGE Procedures](#) for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
  segment_owner      IN  VARCHAR2,
  segment_name       IN  VARCHAR2,
  segment_type       IN  VARCHAR2,
  freelist_group_id  IN  NUMBER,
  free_blks          OUT NUMBER,
  scan_limit         IN  NUMBER DEFAULT NULL,
  partition_name     IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references (free_blocks, WNDS);
```

Parameters

Table 118–6 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> ▪ TABLE ▪ TABLE PARTITION ▪ TABLE SUBPARTITION ▪ INDEX ▪ INDEX PARTITION ▪ INDEX SUBPARTITION ▪ CLUSTER ▪ LOB ▪ LOB PARTITION ▪ LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note: An error is raised if `scan_limit` is not a positive number.

OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS (
  objowner   IN   VARCHAR2,
  objname    IN   VARCHAR2,
  partname   IN   VARCHAR2,
  objtype    IN   NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 118–7 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition
objtype	Type of the object: <ul style="list-style-type: none"> ▪ OBJECT_TYPE_TABLE constant positive := 1; ▪ OBJECT_TYPE_NESTED_TABLE constant positive := 2; ▪ OBJECT_TYPE_INDEX constant positive := 3; ▪ OBJECT_TYPE_CLUSTER constant positive := 4; ▪ OBJECT_TYPE_TABLE_PARTITION constant positive := 7; ▪ OBJECT_TYPE_INDEX_PARTITION constant positive := 8; ▪ OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; ▪ OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; ▪ OBJECT_TYPE_MV constant positive := 13; ▪ OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
  segment_owner   VARCHAR2(100),
  segment_name    VARCHAR2(100),
  segment_type    VARCHAR2(100),
  tablespace_name VARCHAR2(100),
  partition_name  VARCHAR2(100),
```

```
lob_column_name    VARCHAR2(100);
```

Table 118–8 *OBJECT_DEPENDENT_SEGMENT Type Parameters*

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segment_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

OBJECT_GROWTH_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
  object_owner      IN   VARCHAR2,
  object_name       IN   VARCHAR2,
  object_type       IN   VARCHAR2,
  partition_name    IN   VARCHAR2 DEFAULT NULL,
  start_time        IN   TIMESTAMP DEFAULT NULL,
  end_time          IN   TIMESTAMP DEFAULT NULL,
  interval          IN   DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
  skip_interpolated IN   VARCHAR2 DEFAULT 'FALSE',
  timeout_seconds   IN   NUMBER DEFAULT NULL,
  single_datapoint_flag IN VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 118–9 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
object_owner	The schema containing the object
object_name	The name of the object
object_type	The type of the object
partition_name	The name of the partition
start_time	Statistics generated after this time will be used in generating the growth trend
end_time	Statistics generated until this time will be used in generating the growth trend
interval	The interval at which to sample
skip_interpolated	Whether interpolation of missing values should be skipped
timeout_seconds	The time-out value for the function in seconds
single_data_point_flag	Whether in the absence of statistics the segment should be sampled

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
  timepoint      TIMESTAMP,
  space_usage    NUMBER,
  space_alloc    NUMBER,
  quality        VARCHAR(20));
```

Table 118-10 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
timepoint	The time at which the statistic was recorded
space_usage	The space used by data
space_alloc	The size of the segment including overhead and unused space
quality	The quality of result: "GOOD", "INTERPOLATED", "PROJECTION"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

SPACE_USAGE Procedures

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired.

Syntax

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    unformatted_blocks OUT NUMBER,
    unformatted_bytes  OUT NUMBER,
    fs1_blocks         OUT NUMBER,
    fs1_bytes          OUT NUMBER,
    fs2_blocks         OUT NUMBER,
    fs2_bytes          OUT NUMBER,
    fs3_blocks         OUT NUMBER,
    fs3_bytes          OUT NUMBER,
    fs4_blocks         OUT NUMBER,
    fs4_bytes          OUT NUMBER,
    full_blocks        OUT NUMBER,
    full_bytes         OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

```
DBMS_SPACE.SPACE_USAGE(
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    segment_size_blocks OUT NUMBER,
    segment_size_bytes OUT NUMBER,
    used_blocks        OUT NUMBER,
    used_bytes         OUT NUMBER,
    expired_blocks     OUT NUMBER,
    expired_bytes      OUT NUMBER,
    unexpired_blocks   OUT NUMBER,
    unexpired_bytes    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 118–11 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed

Table 118–11 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> ▪ TABLE ▪ TABLE PARTITION ▪ TABLE SUBPARTITION ▪ INDEX ▪ INDEX PARTITION ▪ INDEX SUBPARTITION ▪ CLUSTER ▪ LOB ▪ LOB PARTITION ▪ LOB SUBPARTITION
unformatted_blocks	Total number of blocks unformatted
unformatted_bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
full_blocks	Total number of blocks full in the segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
```

```
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                       'TABLE',
                       :unf, :unfb,
                       :fs1, :fs1b,
                       :fs2, :fs2b,
                       :fs3, :fs3b,
                       :fs4, :fs4b,
                       :full, :fullb);

end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
    segment_owner      IN  VARCHAR2,
    segment_name       IN  VARCHAR2,
    segment_type       IN  VARCHAR2,
    total_blocks       OUT NUMBER,
    total_bytes        OUT NUMBER,
    unused_blocks      OUT NUMBER,
    unused_bytes       OUT NUMBER,
    last_used_extent_file_id OUT NUMBER,
    last_used_extent_block_id OUT NUMBER,
    last_used_block    OUT NUMBER,
    partition_name     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 118–12 *UNUSED_SPACE Procedure Parameters*

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): <ul style="list-style-type: none"> ▪ TABLE ▪ TABLE PARTITION ▪ TABLE SUBPARTITION ▪ INDEX ▪ INDEX PARTITION ▪ INDEX SUBPARTITION ▪ CLUSTER ▪ LOB ▪ LOB PARTITION ▪ LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data

Table 118–12 (Cont.) UNUSED_SPACE Procedure Parameters

Parameter	Description
<code>partition_name</code>	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,  
    :total_bytes, :unused_blocks, :unused_bytes, :lastextf,  
    :last_extb, :lastusedblock);
```

DBMS_SPACE_ADMIN

The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

See Also: *Oracle Database Administrator's Guide* for an example and description of using DBMS_SPACE_ADMIN.

This chapter contains the following topics:

- [Using DBMS_SPACE_ADMIN](#)
 - Security Model
 - Constants
 - Operational Notes
- [Summary of DBMS_SPACE_ADMIN Subprograms](#)

Using DBMS_SPACE_ADMIN

This section contains topics which relate to using the DBMS_SPACE_ADMIN package.

- [Security Model](#)
- [Constants](#)
- [Operational Notes](#)

Security Model

This package runs with *SYS* privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

Constants

Table 119–1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_VERIFY_EXTENTS	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
SEGMENT_VERIFY_EXTENTS_GLOBAL	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
SEGMENT_MARK_CORRUPT	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation).
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the DBA range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the DBA range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks HWM
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map

Table 119-1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace. will take either the basic or the deep option
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

Operational Notes

Before migrating the `SYSTEM` tablespace, the following conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

Summary of DBMS_SPACE_ADMIN Subprograms

Table 119–2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure on page 119-8	Verifies segments created in ASSM tablespaces
ASSM_TABLESPACE_VERIFY Procedure on page 119-10	Verifies ASSM tablespaces
SEGMENT_CORRUPT Procedure on page 119-11	Marks the segment corrupt or valid so that appropriate error recovery can be done
SEGMENT_DROP_CORRUPT Procedure on page 119-12	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure on page 119-13	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure on page 119-14	Verifies the consistency of the extent map of the segment
TABLESPACE_FIX_BITMAPS Procedure on page 119-15	Marks the appropriate DBA range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STATES Procedure on page 119-16	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure on page 119-17	Migrates a locally-managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure on page 119-18	Migrates a tablespace from dictionary managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure on page 119-19	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure on page 119-20	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure on page 119-21	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure on page 119-22	Verifies that the bitmaps and extent maps for the segments in the tablespace are in sync

ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in ASSM (Automatic Segment Space Management) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
    segment_owner    IN VARCHAR2,
    segment_name     IN VARCHAR2,
    segment_type     IN VARCHAR2,
    partition_name   IN VARCHAR2,
    verify_option    IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
    attrib           IN POSITIVE  DEFAULT NULL);
```

Parameters

Table 119–3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	The schema that owns the segment
segment_name	The name of the segment to be verified
segment_type	The segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	<ul style="list-style-type: none"> ■ SEGMENT_VERIFY_DEEP := 9. Performs deep verification ■ SEGMENT_VERIFY_BASIC:= 10. Performs the basic metadata checks (Default)

Table 119-3 (Cont.) ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
attrib	<p>When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following:</p> <ul style="list-style-type: none"> ■ HWM_CHECK - CONSTANT POSITIVE := 12; checks whether high water mark information is accurate. ■ BMB_CHECK - CONSTANT POSITIVE := 13; checks whether space bitmap blocks have correct backpointers to the segment header. ■ SEG_DICT_CHECK - CONSTANT POSITIVE := 14; checks whether dictionary information for segment is accurate. ■ EXTENT_TS_BITMAP_CHECK - CONSTANT POSITIVE := 15; checks whether extent maps are consistent with file level bitmaps. ■ DB_BACKPOINTER_CHECK - CONSTANT POSITIVE := 16; checks whether datablocks have correct backpointers to the space metadata blocks. ■ EXTENT_SEGMENT_BITMAP_CHECK - CONSTANT POSITIVE := 17; checks whether extent map in the segment match with the bitmaps in the segment. ■ BITMAPS_CHECK - CONSTANT POSITIVE := 18; checks whether space bitmap blocks are accurate.

Usage Notes

- Using this procedure requires SYSDBA privileges to execute.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

ASSM_TABLESPACE_VERIFY Procedure

This procedure verifies all the segments created in an ASSM tablespace. The verification per segment is either basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name    IN VARCHAR2,
    ts_option          IN POSITIVE,
    segment_option     IN POSITIVE DEFAULT NULL);
```

Parameters

Table 119–4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace to verify, tablespace should be ASSM
ts_option	<ul style="list-style-type: none"> ■ TS_VERIFY_BITMAPS - CONSTANT POSITIVE := 19; The bitmaps are verified against the extents. This will detect bits that are marked used or free wrongly and will also detect multiple allocation of extents. The file metadata will be validated against file\$ and control file. This is the default option (1). ■ TS_VERIFY_DEEP - CONSTANT POSITIVE := 20; This option is used to verify the file bitmaps as well perform checks on all the segments (2). ■ TS_SEGMENTS - CONSTANT POSITIVE := 21; This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally the user can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY (3).
segment_option	<p>When the TABLESPACE_VERIFY_SEGMENTS or TABLESPACE_VERIFY_DEEP is selected, the SEGMENT_OPTION can be specified optionally.</p> <p>When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:</p> <ul style="list-style-type: none"> ■ SEGMENT_VERIFY_BASIC - CONSTANT POSITIVE := 9; ■ SEGMENT_VERIFY_DEEP - CONSTANT POSITIVE := 10; <p>The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BASIC is specified.</p>

Usage Notes

Using this procedure requires SYSDBA privileges to execute.

This procedure outputs a dump file named `sid_ora_process_ID.trc` to the location specified in the USER_DUMP_DEST initialization parameter.

SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block        IN   POSITIVE,
  corrupt_option       IN   POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 119–5 *SEGMENT_CORRUPT Procedure Parameters*

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
corrupt_option	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 3);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 4);
```

SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment should have been marked *temporary*. To mark a corrupt segment as temporary, issue a DROP command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (  
    tablespace_name      IN    VARCHAR2,  
    header_relative_file IN    POSITIVE,  
    header_block         IN    POSITIVE);
```

Parameters

Table 119–6 *SEGMENT_DROP_CORRUPT Procedure Parameters*

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header

Usage Notes

The procedure cannot be used on the SYSTEM tablespace.

The space for the segment is not released, and it must be fixed by using the [TABLESPACE_FIX_BITMAPS Procedure](#) or the [TABLESPACE_REBUILD_BITMAPS Procedure](#).

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
  tablespace_name      IN   VARCHAR2,
  header_relative_file IN   POSITIVE,
  header_block         IN   POSITIVE,
  dump_option          IN   POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 119–7 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
dump_option	SEGMENT_DUMP_EXTENT_MAP SEGMENT_DUMP_BITMAP_SUMMARY.

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass SEGMENT_DUMP_BITMAP_SUMMARY as the dump_option parameter.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
  tablespace_name      IN    VARCHAR2,
  header_relative_file IN    POSITIVE,
  header_block        IN    POSITIVE,
  verify_option       IN    POSITIVE DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 119–8 *SEGMENT_VERIFY Procedure Parameters*

Parameters	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
verify_option	What kind of check to do: SEGMENT_VERIFY_EXTENTS or SEGMENT_VERIFY_EXTENTS_GLOBAL

Usage Notes

Anomalies are output as dba-range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all dba-ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps in sync.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, 1);
```

Note: All DBMS_SPACE_ADMIN package examples use the tablespace USERS which contains SCOTT.EMP.

TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate DBA range (extent) as free or used in bitmap. It cannot be used on the `SYSTEM` tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
  tablespace_name      IN   VARCHAR2,
  dbarange_relative_file IN  POSITIVE,
  dbarange_begin_block IN  POSITIVE,
  dbarange_end_block   IN  POSITIVE,
  fix_option           IN  POSITIVE);
```

Parameters

Table 119–9 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbarange_relative_file	Relative file number of DBA range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	TABLESPACE_EXTENT_MAKE_FREE or TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as `USED` in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, 7);
```

Alternately, specifying an option of 8 marks the bits `FREE` in bitmaps. The `BEGIN` and `END` blocks should be in extent boundary and should be extent multiple. Otherwise, an error is raised.

TABLESPACE_FIX_SEGMENT_STATES Procedure

Use this procedure to fix the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, the segment states are corrected by SMON when event 10906 is set. Database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (  
    tablespace_name    IN    VARCHAR);
```

Parameters

Table 119–10 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Purpose
tablespace_name	Name of the tablespace whose segments need to be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES ('TS1');
```

TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally-managed tablespace to a dictionary-managed tablespace. You cannot use this procedure for SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (  
    tablespace_name      IN      VARCHAR2);
```

Parameter

Table 119–11 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

TABLESPACE_MIGRATE_TO_LOCAL Procedure

Use this procedure to migrate the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
    tablespace_name    IN    VARCHAR,
    unit_size          IN    POSITIVE DEFAULT NULL,
    rfno               IN    INTGER DEFAULT NULL);
```

Parameters

Table 119–12 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Purpose
tablespace_name	Name of the tablespace to be migrated
unit_size	Unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace
rfno	Relative File Number of the file where the bitmap blocks should be placed (optional)

Usage Notes

Before you migrate the *SYSTEM* tablespace, you should migrate any dictionary-managed tablespaces that you may want to use in read/write mode to locally managed. After the *SYSTEM* tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

See Also: *Oracle Database Administrator's Guide*

The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.

Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the *MINIMUM EXTENT* for the tablespace (5 if *MINIMUM EXTENT* is not specified). Thus, the calculated value will not be larger than the *MINIMUM EXTENT* for the tablespace. The last free extent in every file will be ignored for GCD calculation. If you specify the unit size, it has to be a factor of the *UNIT* size calculated by the system, otherwise an error message is returned.

The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, an error is issued. The data file specified should be part of the tablespace being migrated. If the dataflow is not specified then the system will choose a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, an error will be raised.

Examples

To migrate a tablespace 'TS1' with minimum extent size 1m, use

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps will be placed in file with relative file number 2.

TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block DBA is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
  tablespace_name      IN   VARCHAR2,
  bitmap_relative_file IN   POSITIVE  DEFAULT NULL,
  bitmap_block        IN   POSITIVE  DEFAULT NULL);
```

Parameters

Table 119–13 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Note: Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (  
    tablespace_name          IN      VARCHAR2);
```

Parameters

Table 119–14 *TABLESPACE_REBUILD_QUOTAS Procedure Parameters*

Parameter	Description
tablespace_name	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

TABLESPACE_RELOCATE_BITMAPS Procedure

Use this procedure to relocate the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
    tablespace_name IN     VARCHAR2,
    filno           IN     POSITIVE,
    blkno           IN     POSITIVE);
```

Parameters

Table 119–15 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Purpose
tablespace_name	Name of Tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination DBA

Usage Notes

Migration of a tablespace from dictionary managed to locally managed format could result in the creation of `SPACE HEADER` segment that contains the bitmap blocks. The `SPACE HEADER` segment is treated as user data. If the user wishes to explicitly resize a file at or below the space header segment, an error is issued. Use the `TABLESPACE_RELOCATE_BITMAPS` command to move the control information to a different destination and then resize the file.

This procedure cannot be used on the `SYSTEM` tablespace.

The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

Note: The source and the destination addresses should not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location an error is raised.

TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are in sync.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (  
    tablespace_name      IN    VARCHAR2,  
    verify_option        IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 119–16 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

The DBMS_SPM package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

See Also: For more information about "Using SQL Plan Management" in the *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

- [Using DBMS_SPM](#)
 - Security Model
- [Summary of DBMS_SPM Subprograms](#)

Using DBMS_SPM

- [Security Model](#)

Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.

Summary of DBMS_SPM Subprograms

This table lists the package subprograms in alphabetical order.

Table 120-1 DBMS_SPM Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_BASELINE Function on page 120-5	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CONFIGURE Procedure on page 120-7	Sets configuration options for SQL management base, in parameter/value format
CREATE_STGTAB_BASELINE Procedure on page 120-8	Creates a staging table that will be used for the purpose of transporting SQL plan baselines from one system to another
DROP_SQL_PLAN_BASELINE Function on page 120-9	Drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BASELINE Function on page 120-10	Evolves SQL plan baselines associated with one or more SQL statements
LOAD_PLANS_FROM_CURSOR_CACHE Functions on page 120-12	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_SQLSET Function on page 120-14	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
PACK_STGTAB_BASELINE Function on page 120-15	Packs (exports) SQL plan baselines from SQL management base into a staging table
UNPACK_STGTAB_BASELINE Function on page 120-16	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  attribute_name  IN VARCHAR2,
  attribute_value IN VARCHAR2)
RETURN PLS_INTEGER;
```

Parameters

Table 120–2 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

Table 120–3 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30-characters
description	Plan description.	String of up to 500-characters

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

CONFIGURE Procedure

This procedure sets configuration options for SQL management base, in parameter/value format. This function can be called numerous times, each time setting a different configuration option.

Syntax

```
DBMS_SPM.CONFIGURE (
  parameter_name  IN VARCHAR2,
  parameter_value IN NUMBER);
```

Parameters

Table 120–4 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Name of parameter to set (see table below)
parameter_value	Value of parameter to use (see table below)

Table 120–5 Names & Values for CONFIGURE Procedure Parameters

Name	Description	Possible Values	Default Value
space_budget_percent	Maximum percent of SYSAUX space that can be used for SQL management base	1,2, ..., 50	10
plan_retention_weeks	Number of weeks to retain unused plans before they are purged	5,6, ..., 523	53

Usage Notes

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table that will be used for the purpose of transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  tablespace_name IN VARCHAR2 := NULL);
```

Parameters

Table 120–6 CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
table_name	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
table_owner	Name of owner of the staging table. Default NULL means current schema is the table owner.
tablespace_name	Name of tablespace. Default NULL means create staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
  sql_handle      IN VARCHAR2 := NULL,
  plan_name      IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 120-7 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.

Return Values

The number of plans dropped

EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans. If interrogated by the user (parameter `verify = 'YES'`), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit = 'YES'`).

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    sql_handle   IN VARCHAR2 := NULL,
    plan_name    IN VARCHAR2 := NULL,
    time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
    verify       IN VARCHAR2 := 'YES',
    commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    plan_list    IN DBMS_SPM.NAME_LIST,
    time_limit   IN INTEGER   := DBMS_SPM.AUTO_LIMIT,
    verify       IN VARCHAR2 := 'YES',
    commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

Table 120–8 *EVOLVE_SQL_PLAN_BASELINE Function Parameters*

Parameter	Description
<code>sql_handle</code>	SQL statement identifier. Unless <code>plan_name</code> is specified, <code>NULL</code> means to consider all statements with non-accepted plans in their SQL plan baselines.
<code>plan_name</code>	Plan identifier. Default <code>NULL</code> means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if <code>sql_handle</code> is <code>NULL</code> .
<code>plan_list</code>	A list of plan names. Each plan in the list can belong to same or different SQL statement.
<code>time_limit</code>	Time limit in number of minutes. This applies only if <code>verify = 'YES'</code> . The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. <ul style="list-style-type: none"> ■ <code>DBMS_SPM.AUTO_LIMIT</code> (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. ■ <code>DBMS_SPM.NO_LIMIT</code> means there is no time limit. ■ A positive integer value represents a user specified time limit.

Table 120–8 (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
<code>verify</code>	<p>Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan.</p> <ul style="list-style-type: none"> ▪ 'YES' (Default) will verify that a non-accepted plan gives better performance before changing it to an accepted plan. ▪ 'NO' means not to execute plans but only to change non-accepted plans into accepted plans.
<code>commit</code>	<p>Specifies whether to update the <code>ACCEPTED</code> status of non-accepted plans from 'NO' to 'YES'.</p> <ul style="list-style-type: none"> ▪ 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when <code>verify = 'YES'</code>. ▪ 'NO' - generate a report without any updates. Note that <code>commit = 'NO'</code> together with <code>verify = 'NO'</code> represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its `ACCEPTED` status, and if `verify = 'YES'` the result of their performance verification.

Usage Notes

Invoking this subprogram requires the `ADMINISTER SQL MANAGEMENT OBJECT` privilege.

LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_text        IN CLOB,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  sql_handle      IN VARCHAR2,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER   := NULL,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
  attribute_name  IN VARCHAR2,
  attribute_value IN VARCHAR2,
  fixed           IN VARCHAR2 := 'NO',
  enabled         IN VARCHAR2 := 'YES')
RETURN PLS_INTEGER;
```

Parameters

Table 120–9 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and it is used to identify the SQL plan baseline into which the plan(s) will be loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.

Table 120–9 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The <code>sql_handle</code> must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans will be used as 'non-fixed' plans. Value 'YES' means the loaded plans will be used as 'fixed' plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: <ul style="list-style-type: none"> ■ <code>SQL_TEXT</code> ■ <code>'PARSING_SCHEMA_NAME'</code> ■ <code>'MODULE'</code> ■ <code>'ACTION'</code>
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is <code>'SQL_TEXT'</code> . Otherwise, it is used as an equality search value. (for example, for specifying <code>attribute_name => 'SQL_TEXT'</code> , and <code>attribute_value => '% HR-123 %'</code> means applying <code>SQL_TEXT LIKE '% HR-123 %'</code> as a selection filter. Similarly, specifying <code>attribute_name => 'MODULE'</code> , and <code>attribute_value => 'HR'</code> means applying <code>MODULE = 'HR'</code> as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is <code>'SQL_TEXT'</code> .
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This procedure can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sqlset_owner     IN  VARCHAR2 := NULL,
  basic_filter     IN  VARCHAR2 := NULL,
  fixed            IN  VARCHAR2 := 'NO',
  enabled          IN  VARCHAR2 := 'YES'
  commit_rows     IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 120–10 *LOAD_PLANS_FROM_SQLSET Function Parameters*

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.
basic_filter	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example <code>basic_filter => 'sql_text like ''select /*LOAD_STS*/%''</code> or <code>basic_filter => 'sql_id="b62q7nc33gzwx"'</code> .
fixed	Default 'NO' means the loaded plans will be used as 'non-fixed' plans. Value 'YES' means the loaded plans will be used as 'fixed' plans and the SQL plan baseline will not be evolved over time.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this procedure.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
    table_name      IN VARCHAR2,
    table_owner    IN VARCHAR2 := NULL,
    sql_handle     IN VARCHAR2 := NULL,
    plan_name      IN VARCHAR2 := NULL,
    sql_text       IN CLOB      := NULL,
    creator        IN VARCHAR2 := NULL,
    origin         IN VARCHAR2 := NULL,
    enabled        IN VARCHAR2 := NULL,
    accepted       IN VARCHAR2 := NULL,
    fixed          IN VARCHAR2 := NULL,
    module         IN VARCHAR2 := NULL,
    action         IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 120–11 *PACK_STGTAB_BASELINE Function Parameters*

Parameter	Description
table_name	Name of staging table into which SQL plan baselines will be packed (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-QLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
  table_name      IN VARCHAR2,
  table_owner     IN VARCHAR2 := NULL,
  sql_handle      IN VARCHAR2 := NULL,
  plan_name       IN VARCHAR2 := NULL,
  sql_text        IN CLOB      := NULL,
  creator         IN VARCHAR2 := NULL,
  origin          IN VARCHAR2 := NULL,
  enabled         IN VARCHAR2 := NULL,
  accepted        IN VARCHAR2 := NULL,
  fixed           IN VARCHAR2 := NULL,
  module          IN VARCHAR2 := NULL,
  action          IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 120–12 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table from which SQL plan baselines will be unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner. Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive, % wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of plans unpacked

The `DBMS_SQL` package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a `DROP TABLE` statement from within a stored procedure by using the `PARSE` procedure supplied with the `DBMS_SQL` package.

See Also: For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference*.

This chapter contains the following topics:

Using DBMS_SQL

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Exceptions](#)
- [Operational Notes](#)
- [Examples](#)

Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to DBMS_SQL that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than DBMS_SQL. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)

Also, there are some tasks that can only be performed using DBMS_SQL.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

See Also: *Oracle Call Interface Programmer's Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the DBMS_SQL package. These differences include the following:

- The OCI uses bind by address, while the DBMS_SQL package uses bind by value.
- With DBMS_SQL you must call VARIABLE_VALUE to retrieve the value of an OUT parameter for an anonymous block, and you must call COLUMN_VALUE after fetching rows to actually retrieve the values of the columns in the rows into your program.
- The current release of the DBMS_SQL package does not provide CANCEL cursor procedures.
- Indicator variables are not required, because NULLs are fully supported as values of a PL/SQL variable.

A sample usage of the DBMS_SQL package follows. For users of the Oracle Call Interface, this code should seem fairly straightforward.

Security Model

DBMS_SQL is a SYS-owned package compiled with AUTHID CURRENT_USER. Any DBMS_SQL subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

See Also: *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

In Oracle Database 11g, Release 1 (11.1), Oracle introduces a number of enhancements to DBMS_SQL to improve the security of the package.

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, ORA-29471, is raised when any DBMS_SQL subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the [IS_OPEN Function](#) denotes a cursor currently open in the session, the return value is TRUE. If the actual value is NULL, then the return value is FALSE. Otherwise, this raises an ORA-29471 error.

Note that the [OPEN_CURSOR Function](#) is the only DBMS_SQL subprogram that has no formal parameter for the cursor number; rather, it returns a cursor number. Therefore it is not within the scope of these rules.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS_SQL subprogram call. The check is:

- The `current_user` is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be a superset of the enabled roles on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, and ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the `OPEN_CURSOR` subprogram which takes a formal parameter, `security_level`, with allowed values NULL, 1 and 2.

- When `security_level = 1` (or is NULL), the checks are made only when binding and executing.
- When `security_level = 2`, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in Oracle Database 10g, Release 2 (10.2) and previous releases. As a consequence, users of DBMS_SQL may encounter runtime errors on upgrade. While these security enhancements make for more secure applications, users may wish to relax the security checks temporarily as they migrate to Oracle Database 11g, Release 1 (11.1). If so, please consult with Oracle Support on steps to relax the above security restrictions.

Constants

The constants described in [Table 121-1](#) are used with the `language_flag` parameter of the [PARSE Procedures](#).

Table 121-1 *DBMS_SQL Constants*

Name	Type	Value	Description
V6	INTEGER	0	Specifies Oracle database version 6 behavior
NATIVE	INTEGER	1	Specifies normal behavior for the database to which the program is connected
V7	INTEGER	2	Specifies Oracle database version 7 behavior

Exceptions

```
inconsistent_type EXCEPTION;  
  pragma exception_init(inconsistent_type, -6562);
```

This exception is raised by the [COLUMN_VALUE Procedure](#) or the [VARIABLE_VALUE Procedures](#) when the type of the given OUT parameter (for where to put the requested value) is different from the type of the value.

Operational Notes

- Execution Flow
- Processing Queries
- Processing Updates, Inserts, and Deletes
- Locating Errors

Execution Flow

1. OPEN_CURSOR
2. PARSE
3. BIND_VARIABLE or BIND_ARRAY
4. DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
5. EXECUTE
6. FETCH_ROWS or EXECUTE_AND_FETCH
7. VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG
8. CLOSE_CURSOR

OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the [OPEN_CURSOR Function](#) function, you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle. These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the DBMS_SQL package.

PARSE

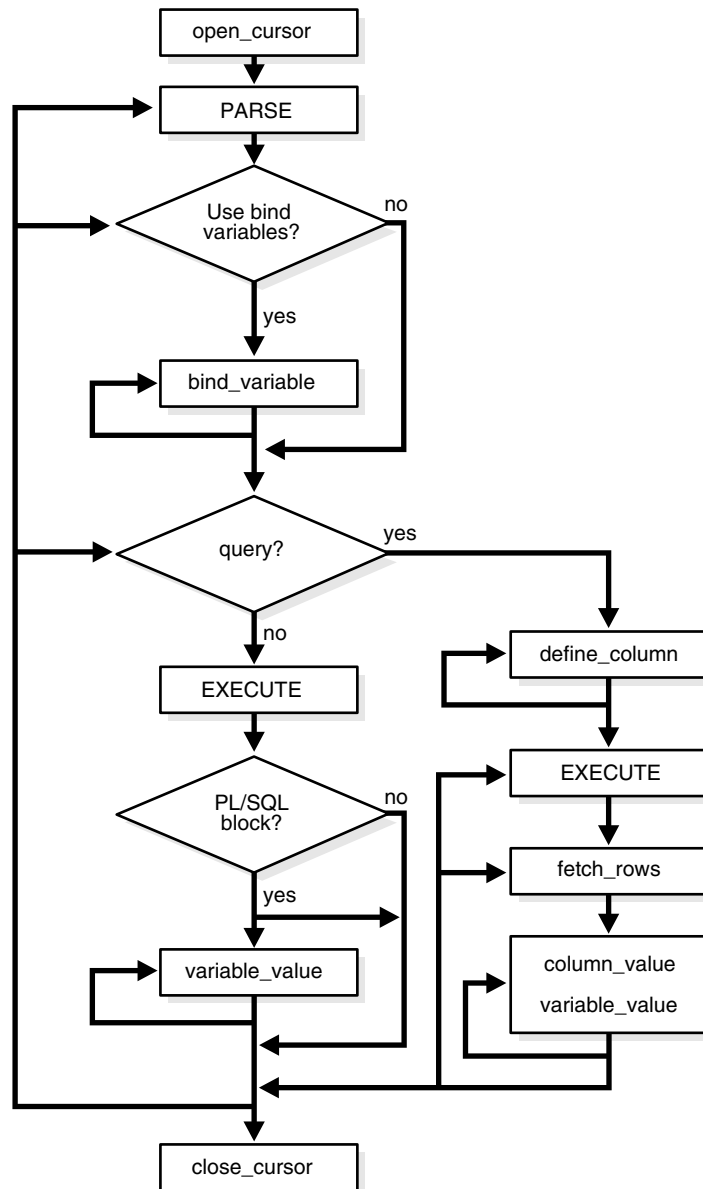

Every SQL statement must be parsed by calling the [PARSE Procedures](#). Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

Note: When parsing a DDL statement to drop a package or a procedure, a deadlock can occur if you're still using a procedure in the package. After a call to a procedure, that procedure is considered to be in use until execution has returned to the user side. Any such deadlock times out after five minutes.

The execution flow of DBMS_SQL is shown in [Figure 121-1](#).

Figure 121-1 DBMS_SQL Execution Flow

**BIND_VARIABLE or BIND_ARRAY**

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the bind procedures, the [BIND_ARRAY Procedures](#) on page 121-51 or the [BIND_VARIABLE Procedures](#) on page 121-54, to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind, variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The `BIND_ARRAY` procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each `EXECUTE`. This is similar to the array interface supported by the OCI.

DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The columns of the row being selected in a `SELECT` statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (`DEFINE_COLUMN`, `DEFINE_COLUMN_LONG`, or `DEFINE_ARRAY`) to specify the variables that are to receive the `SELECT` values, much the way an `INTO` clause does for a static query.

Use the `DEFINE_COLUMN_LONG` procedure to define `LONG` columns, in the same way that `DEFINE_COLUMN` is used to define non-`LONG` columns. You must call `DEFINE_COLUMN_LONG` before using the `COLUMN_VALUE_LONG` procedure to fetch from the `LONG` column.

Use the `DEFINE_ARRAY` procedure to define a PL/SQL collection into which you want to fetch rows in a single `SELECT` statement. `DEFINE_ARRAY` provides an interface to fetch multiple rows at one fetch. You must call `DEFINE_ARRAY` before using the `COLUMN_VALUE` procedure to fetch the rows.

EXECUTE

Call the `EXECUTE` function to run your SQL statement.

FETCH_ROWS or EXECUTE_AND_FETCH

The `FETCH_ROWS` function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve anymore rows. Instead of calling `EXECUTE` and then `FETCH_ROWS`, you may find it more efficient to call `EXECUTE_AND_FETCH` if you are calling `EXECUTE` for a single execution.

VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG

For queries, call `COLUMN_VALUE` to determine the value of a column retrieved by the `FETCH_ROWS` call. For anonymous blocks containing calls to PL/SQL procedures or DML statements with `returning` clause, call `VARIABLE_VALUE` to retrieve the values assigned to the output variables when statements were run.

To fetch just part of a `LONG` database column (which can be up to two gigabytes in size), use the `COLUMN_VALUE_LONG` procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling `CLOSE_CURSOR`. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the [DEFINE_COLUMN Procedure](#), the [DEFINE_COLUMN_LONG Procedure](#), or the [DEFINE_ARRAY Procedure](#).
2. Run your `SELECT` statement by calling the [EXECUTE Function](#).
3. Call the [FETCH_ROWS Function](#) (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.

4. Call [COLUMN_VALUE Procedure](#) or [COLUMN_VALUE_LONG Procedure](#) to determine the value of a column retrieved by the [FETCH_ROWS Function](#) for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. You must first run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the [EXECUTE Function](#).
2. If statements have the `returning` clause, then you must call the [VARIABLE_VALUE Procedures](#) to retrieve the values assigned to the output variables.

Locating Errors

There are additional functions in the `DBMS_SQL` package for obtaining information about the last referenced cursor in the session. The values returned by these functions are only meaningful immediately after a SQL statement is run. In addition, some error-locating functions are only meaningful after certain `DBMS_SQL` calls. For example, you call the [LAST_ERROR_POSITION Function](#) immediately after a `PARSE`.

Examples

This section provides example procedures that make use of the DBMS_SQL package.

Example 1

This example does not require the use of dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The DEMO procedure deletes all of the employees from the EMP table whose salaries are greater than the salary that you specify when you run DEMO.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
  cursor_name INTEGER;
  rows_processed INTEGER;
BEGIN
  cursor_name := dbms_sql.open_cursor;
  DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
    DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
  rows_processed := DBMS_SQL.EXECUTE(cursor_name);
  DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
  DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(string IN varchar2) AS
  cursor_name INTEGER;
  ret INTEGER;
BEGIN
  cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
  DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
  ret := DBMS_SQL.EXECUTE(cursor_name);
  DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@hq.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id          of type NUMBER
name        of type VARCHAR2(30)
birthdate  of type DATE
```

This procedure does not specifically require the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var      NUMBER;
    name_var    VARCHAR2(30);
    birthdate_var DATE;
    source_cursor INTEGER;
    destination_cursor INTEGER;
    ignore      INTEGER;
BEGIN

-- Prepare a cursor to select from the source table:
source_cursor := dbms_sql.open_cursor;
DBMS_SQL.PARSE(source_cursor,
    'SELECT id, name, birthdate FROM ' || source,
    DBMS_SQL.NATIVE);
DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
ignore := DBMS_SQL.EXECUTE(source_cursor);

-- Prepare a cursor to insert into the destination table:
destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
    'INSERT INTO ' || destination ||
    ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
    DBMS_SQL.NATIVE);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
    IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
        -- get column values of the row
        DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
        DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
        DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

-- Bind the row into the cursor that inserts into the destination table. You
-- could alter this example to require the use of dynamic SQL by inserting an
-- if condition before the bind.
        DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
        DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
        DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
birthdate_var);
        ignore := DBMS_SQL.EXECUTE(destination_cursor);
    ELSE

-- No more rows to copy:
```

```

        EXIT;
    END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
    WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(source_cursor) THEN
            DBMS_SQL.CLOSE_CURSOR(source_cursor);
        END IF;
        IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
            DBMS_SQL.CLOSE_CURSOR(destination_cursor);
        END IF;
        RAISE;
END;
/

```

Examples 3, 4, and 5: Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements INSERT, UPDATE and DELETE.

Here is an example of a bulk INSERT statement that demonstrates adding seven new employees to the emp table:

```

DECLARE
    stmt VARCHAR2(200);
    empno_array      DBMS_SQL.NUMBER_TABLE;
    empname_array    DBMS_SQL.VARCHAR2_TABLE;
    jobs_array       DBMS_SQL.VARCHAR2_TABLE;
    mgr_array        DBMS_SQL.NUMBER_TABLE;
    hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
    sal_array        DBMS_SQL.NUMBER_TABLE;
    comm_array       DBMS_SQL.NUMBER_TABLE;
    deptno_array     DBMS_SQL.NUMBER_TABLE;
    c                NUMBER;
    dummy            NUMBER;
BEGIN
    empno_array(1) := 9001;
    empno_array(2) := 9002;
    empno_array(3) := 9003;
    empno_array(4) := 9004;
    empno_array(5) := 9005;
    empno_array(6) := 9006;
    empno_array(7) := 9007;

    empname_array(1) := 'Dopey';
    empname_array(2) := 'Grumpy';
    empname_array(3) := 'Doc';
    empname_array(4) := 'Happy';
    empname_array(5) := 'Bashful';
    empname_array(6) := 'Sneezy';
    empname_array(7) := 'Sleepy';

    jobs_array(1) := 'Miner';
    jobs_array(2) := 'Miner';
    jobs_array(3) := 'Miner';
    jobs_array(4) := 'Miner';

```

```
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

deptno_array(1) := 11;
deptno_array(2) := 11;
deptno_array(3) := 11;
deptno_array(4) := 11;
deptno_array(5) := 11;
deptno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES(
      :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
      :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
```

```

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/
SHOW ERRORS;

```

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

```

DECLARE
  stmt VARCHAR2(200);
  empno_array DBMS_SQL.NUMBER_TABLE;
  salary_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
BEGIN

  empno_array(1) := 7369;
  empno_array(2) := 7876;
  empno_array(3) := 7900;
  empno_array(4) := 7934;

  salary_array(1) := 10000;
  salary_array(2) := 10000;
  salary_array(3) := 10000;
  salary_array(4) := 10000;

  stmt := 'update emp set sal = :salary_array
  WHERE empno = :num_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
  DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

In a DELETE statement, for example, you could bind in an array in the WHERE clause and have the statement be run for each element in the array:

```

DECLARE
  stmt VARCHAR2(200);
  dept_no_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
begin
  dept_no_array(1) := 10; dept_no_array(2) := 20;
  dept_no_array(3) := 30; dept_no_array(4) := 40;
  dept_no_array(5) := 30; dept_no_array(6) := 40;
  stmt := 'delete from emp where deptno = :dept_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);

```

```

DBMS_SQL.BIND_ARRAY(c, 'dept_array', dept_no_array, 1, 4);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
END;
/

```

In the preceding example, only elements 1 through 4 are used as specified by the `BIND_ARRAY` call. Each element of the array potentially deletes a large number of employees from the database.

Examples 6 and 7: Defining an Array

The following examples show how to use the `DEFINE_ARRAY` procedure:

```

declare
  c      NUMBER;
  d      NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  indx   NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dbms_sql.parse(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

    EXIT WHEN d != 10;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/

```

Each time the preceding example does a [FETCH_ROWS Function](#) call, it fetches 10 rows that are kept in `DBMS_SQL` buffers. When the [COLUMN_VALUE Procedure](#) call is run, those rows move into the PL/SQL table specified (in this case `n_tab`), at positions -10 to -1, as specified in the `DEFINE` statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at `EXECUTE` and keeps getting updated every time a `COLUMN_VALUE` call is made. If you re-execute at any point, then the current index for each `DEFINE` is re-initialized to "indx".

In this way the entire result of the query is fetched into the table. When `FETCH_ROWS` cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the `DEFINE_ARRAY` procedure:

Consider a table `MULTI_TAB` defined as:

```
CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
declare
  c      NUMBER;
  d      NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  d_tab1 DBMS_SQL.DATE_TABLE;
  v_tab  DBMS_SQL.VARCHAR2_TABLE;
  d_tab2 DBMS_SQL.DATE_TABLE;
  indx  NUMBER := 10;
BEGIN

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

    EXIT WHEN d != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  /*

The four tables can be used for anything. One usage might be to use BIND_ARRAY to
move the rows to another table by using a statement such as 'INSERT into SOME_T
values (:a, :b, :c, :d);

*/

EXCEPTION WHEN OTHERS THEN
  IF DBMS_SQL.IS_OPEN(c) THEN
    DBMS_SQL.CLOSE_CURSOR(c);
  END IF;
  RAISE;
```

```
END;
/
```

Example 8: Describe Columns

This can be used as a substitute to the SQL*Plus DESCRIBE call by using a SELECT * query on the table that you want to describe.

```
DECLARE
  c          NUMBER;
  d          NUMBER;
  col_cnt    INTEGER;
  f          BOOLEAN;
  rec_tab    DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type          = '
      || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen       = '
      || rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name        = '
      || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len    = '
      || rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name = '
      || rec.col_schema_name);
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len = '
      || rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision   = '
      || rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale       = '
      || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok      = ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
    ELSE
      DBMS_OUTPUT.PUT_LINE('false');
    END IF;
  END;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

  d := DBMS_SQL.EXECUTE(c);

  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

  /*
  * Following loop could simply be for j in 1..col_cnt loop.
  * Here we are simply illustrating some of the PL/SQL table
  * features.
  */
  col_num := rec_tab.first;
  IF (col_num IS NOT NULL) THEN
    LOOP
      print_rec(rec_tab(col_num));
      col_num := rec_tab.next(col_num);
      EXIT WHEN (col_num IS NULL);
    END LOOP;
  END IF;
END;
```

```

        END LOOP;
    END IF;

    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

Example 9: RETURNING clause

The RETURNING clause was added to DML statements in an earlier Oracle database release. With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions. These values are returned in bind variables.

DBMS_SQL.BIND_VARIABLE is used to bind these outbinds if a single row is inserted, updated, or deleted. If multiple rows are inserted, updated, or deleted, then DBMS_SQL.BIND_ARRAY is used. DBMS_SQL.VARIABLE_VALUE must be called to get the values in these bind variables.

Note: This is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an out-bind inside DBMS_SQL.

i) Single row insert

```

CREATE OR REPLACE PROCEDURE single_Row_insert
    (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
    c NUMBER;
    n NUMBER;
begin
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

ii) Single row update

```

CREATE OR REPLACE PROCEDURE single_Row_update
    (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
    c NUMBER;
    n NUMBER;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
        'WHERE rownum < 2' ||
        'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
    DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
    n := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
    DBMS_SQL.CLOSE_CURSOR(c);
END;

```

/

iii) Single row delete

```

CREATE OR REPLACE PROCEDURE single_Row_Delete
  (c1 NUMBER, c2 NUMBER, r OUT NUMBER) IS
c NUMBER;
n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'delete from tab ' ||
    'where rownum < 2 ' ||
    'returning c1*c2 into :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

iv) Multiple row insert

```

CREATE OR REPLACE PROCEDURE multi_Row_insert
  (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
  r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

v) Multiple row Update.

```

CREATE OR REPLACE PROCEDURE multi_Row_update
  (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

```

Note: bnd1 and bnd2 can be arrays as well. The value of the expression for all the rows updated will be in bnd3. There is no way of differentiating which rows were updated of each value of bnd1 and bnd2.

vi) Multiple row delete

```
CREATE OR REPLACE PROCEDURE multi_row_delete
  (c1 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
                 'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

vii) Out-bind in bulk PL/SQL

```
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/
```

Note: DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 10: Binds and Defines of User-defined Types in DBMS_SQL

```
CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/

INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
```

```
/
INSERT INTO depts
    VALUES ('Asia', dnames_var('Finance', 'Payroll', 'Shipping', 'Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
    some_dnames dnames_var;
    c          NUMBER;
    r          NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
        INTO :b3';

BEGIN

    c := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
    DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

    r := DBMS_SQL.EXECUTE(c);

    -- Get value of outbind variable
    DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- select dept_names
    sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
    DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

    r := DBMS_SQL.EXECUTE_AND_FETCH(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections
    FOR i IN some_dnames.FIRST .. some_dnames.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
    END LOOP;
END;
/

DECLARE
    new_dnames dnames_var;
BEGIN
    new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                             'Executive', 'Marketing');
    update_depts(new_dnames, 'Asia');
END;
```

/

Data Structures

The DBMS_SQL package defines the following RECORD types and TABLE types.

RECORD Types

- DESC_REC Record Type
- DESC_REC2 Record Type
- DESC_REC3 Record Type

TABLE Types

- BFILE_TABLE Table Type
- BINARY_DOUBLE_TABLE Table Type
- BINARY_FLOAT_TABLE Table Type
- BLOB_TABLE Table Type
- CLOB_TABLE Table Type
- DATE_TABLE Table Type
- DESC_TAB Table Type
- DESC_TAB2 Table Type
- DESC_TAB3 Table Type
- INTERVAL_DAY_TO_SECOND_TABLE
- INTERVAL_YEAR_TO_MONTH_TABLE Table Type
- NUMBER_TABLE Table Type
- TIME_TABLE Table Type
- TIME_WITH_TIME_ZONE_TABLE Table Type
- TIMESTAMP_TABLE Table Type
- TIMESTAMP_WITH_LTZ_TABLE Table Type
- TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
- UROWID_TABLE Table Type
- VARCHAR2_TABLE Table Type
- VARCHAR2A Table Type
- VARCHAR2S Table Type

DESC_REC Record Type

Note: This type has been deprecated in favor of the [DESC_REC2 Record Type](#).

This record type holds the describe information for a single column in a dynamic query. It is the element type of the `DESC_TAB` table type and the [DESCRIBE_COLUMNS Procedure](#).

Syntax

```
TYPE desc_rec IS RECORD (
    col_type          BINARY_INTEGER := 0,
    col_max_len      BINARY_INTEGER := 0,
    col_name         VARCHAR2(32)   := '',
    col_name_len     BINARY_INTEGER := 0,
    col_schema_name  VARCHAR2(32)   := '',
    col_schema_name_len BINARY_INTEGER := 0,
    col_precision   BINARY_INTEGER := 0,
    col_scale       BINARY_INTEGER := 0,
    col_charsetid   BINARY_INTEGER := 0,
    col_charsetform BINARY_INTEGER := 0,
    col_null_ok     BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

Table 121–2 *DESC_REC Fields*

Field	Description
<code>col_type</code>	Type of column
<code>col_max_len</code>	Maximum column length
<code>col_name</code>	Name of column
<code>col_name_len</code>	Length of column name
<code>col_schema_name</code>	Column schema name
<code>col_schema_name_len</code>	Length of column schema name
<code>col_precision</code>	Precision of column
<code>col_scale</code>	Scale of column
<code>col_charsetid</code>	Column character set id
<code>col_charsetform</code>	Column character set form
<code>col_null_ok</code>	NULL column flag; TRUE, if NULL possible

DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the [DESCRIBE_COLUMNS2 Procedure](#).

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```
TYPE desc_rec2 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32)   := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean        := TRUE);
```

Fields

Table 121–3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the [DESCRIBE_COLUMNS3 Procedure](#).

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (`type_name`) and type name len (`type_name_len`) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The `col_type_name` and `col_type_name_len` fields are only populated when the `col_type` field's value is 109, the Oracle type number for user-defined types.

Syntax

```
TYPE desc_rec3 IS RECORD (
  col_type          binary_integer := 0,
  col_max_len       binary_integer := 0,
  col_name          varchar2(32767) := '',
  col_name_len      binary_integer := 0,
  col_schema_name   varchar2(32) := '',
  col_schema_name_len binary_integer := 0,
  col_precision     binary_integer := 0,
  col_scale         binary_integer := 0,
  col_charsetid     binary_integer := 0,
  col_charsetform   binary_integer := 0,
  col_null_ok       boolean := TRUE,
  col_type_name     varchar2(32767) := '',
  col_type_name_len binary_integer := 0);
```

Fields

Table 121–4 DESC_REC3 Fields

Field	Description
<code>col_type</code>	Type of column
<code>col_max_len</code>	Maximum column length
<code>col_name</code>	Name of column
<code>col_name_len</code>	Length of column name
<code>col_schema_name</code>	Column schema name
<code>col_schema_name_len</code>	Length of column schema name
<code>col_precision</code>	Precision of column
<code>col_scale</code>	Scale of column
<code>col_charsetid</code>	Column character set ID
<code>col_charsetform</code>	Column character set form
<code>col_null_ok</code>	NULL column flag; TRUE, if NULL possible
<code>col_type_name</code>	User-define type column type name, this field is valid when <code>col_type</code> is 109
<code>col_type_name_len</code>	Length of user-define type column type name, this field is valid when <code>col_type</code> is 109

BFILE_TABLE Table Type

This is a table of BFILE.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

BINARY_DOUBLE_TABLE Table Type

This is a table of BINARY_DOUBLE.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

BINARY_FLOAT_TABLE Table Type

This is a table of BINARY_FLOAT.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

DATE_TABLE Table Type

This is a table of DATE.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

DESC_TAB Table Type

This is a table of [DESC_REC Record Type](#).

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

DESC_TAB2 Table Type

This is a table of [DESC_REC2 Record Type](#).

Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

DESC_TAB3 Table Type

This is a table of [DESC_REC3 Record Type](#).

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

INTERVAL_DAY_TO_SECOND_TABLE

This is a table of DSINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF  
    DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of YMINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;
```

NUMBER_TABLE Table Type

This is a table of NUMBER.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

TIME_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED  
INDEX BY BINARY_INTEGER;
```

TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of `TIMESTAMP_LTZ_UNCONSTRAINED`

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
    TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF  
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

UROWID_TABLE Table Type

This is a table of UROWID.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

VARCHAR2_TABLE Table Type

This is table of VARCHAR2 (2000).

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

VARCHAR2A Table Type

This is table of VARCHAR2 (32767).

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

VARCHAR2S Table Type

This is table of VARCHAR2 (256) .

Note: This type has been superseded by the [VARCHAR2A Table Type](#). Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_SQL Subprograms

Table 121-5 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures on page 121-51	Binds a given value to a given collection
BIND_VARIABLE Procedures on page 121-54	Binds a given value to a given variable
CLOSE_CURSOR Procedure on page 121-56	Closes given cursor and frees memory
COLUMN_VALUE Procedure on page 121-57	Returns value of the cursor element for a given position in a cursor
COLUMN_VALUE_LONG Procedure on page 121-60	Returns a selected part of a LONG column, that has been defined using <code>DEFINE_COLUMN_LONG</code>
DEFINE_ARRAY Procedure on page 121-61	Defines a collection to be selected from the given cursor, used only with <code>SELECT</code> statements
DEFINE_COLUMN Procedure on page 121-64	Defines a column to be selected from the given cursor, used only with <code>SELECT</code> statements
DEFINE_COLUMN_LONG Procedure on page 121-66	Defines a LONG column to be selected from the given cursor, used only with <code>SELECT</code> statements
DESCRIBE_COLUMNS Procedure on page 121-67	Describes the columns for a cursor opened and parsed through <code>DBMS_SQL</code>
DESCRIBE_COLUMNS2 Procedure on page 121-68	Describes describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure
DESCRIBE_COLUMNS3 Procedure on page 121-69	Describes describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure
EXECUTE Function on page 121-71	Executes a given cursor
EXECUTE_AND_FETCH Function on page 121-72	Executes a given cursor and fetch rows
FETCH_ROWS Function on page 121-73	Fetches a row from a given cursor
IS_OPEN Function on page 121-74	Returns <code>TRUE</code> if given cursor is open
LAST_ERROR_POSITION Function on page 121-75	Returns byte offset in the SQL statement text where the error occurred
LAST_ROW_COUNT Function on page 121-76	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function on page 121-77	Returns <code>ROWID</code> of last row processed
LAST_SQL_FUNCTION_CODE Function on page 121-78	Returns SQL function code for statement
OPEN_CURSOR Function on page 121-79	Returns cursor ID number of new cursor
PARSE Procedures on page 121-80	Parses given statement
TO_CURSOR_NUMBER Function on page 121-80	Takes an <code>OPENED</code> strongly or weakly-typed ref cursor and transforms it into a <code>DBMS_SQL</code> cursor number

Table 121-5 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
TO_REFCURSOR Function on page 121-84	Takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL
VARIABLE_VALUE Procedures on page 121-86	Returns value of named variable for given cursor

BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
  c                IN INTEGER,
  name             IN VARCHAR2,
  <table_variable> IN <datatype>
  [, index1       IN INTEGER,
  index2          IN INTEGER] );
```

Where the <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>     Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
```

Notice that the BIND_ARRAY procedure is overloaded to accept different datatypes.

Parameters

Table 121–6 BIND_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the collection in the statement.
table_variable	Local variable that has been declared as <datatype>.
index1	Index for the table element that marks the lower bound of the range.
index2	Index for the table element that marks the upper bound of the range.

Usage Notes

The length of the bind variable name should be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — tab(index1) and tab(index2) — but the range does not have to be dense. Index1 must be less than or equal to index2. All elements between tab(index1) and tab(index2) are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

See Also: "Examples 3, 4, and 5: Bulk DML" on page 121-13 for examples of how to bind collections.

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local `DBMS_SQL` buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in `DBMS_SQL`.

```

TYPE binary_double_table
           IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
           IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
           IS TABLE OF dsinterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
           IS TABLE OF yminterval_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
           IS TABLE OF time_tz_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_table
           IS TABLE OF timestamp_unconstrained
                                   INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
  
```

```
                IS TABLE OF timestamp_ltz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                IS TABLE OF timestamp_tz_unconstrained
                                INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID      INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>    Time_Table
<ttz_tab>   Time_With_Time_Zone_Table
<tms_tab>   Timestamp_Table
<tstz_tab>  Timestamp_With_ltz_Table;
<tstz_tab>  Timestamp_With_Time_Zone_Table
<ids_tab>   Interval_Day_To_Second_Table
<iym_tab>   Interval_Year_To_Month_Table
```

BIND_VARIABLE Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN <datatype>)
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Notice that BIND_VARIABLE is overloaded to accept different datatypes.

The following syntax is also supported for BIND_VARIABLE. The square brackets [] indicate an optional parameter for the BIND_VARIABLE function.

```
DBMS_SQL.BIND_VARIABLE (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (
    c           IN INTEGER,
    name        IN VARCHAR2,
    value       IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (
    c           IN INTEGER,
```

```

name          IN VARCHAR2,
value         IN ROWID);

```

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 121–7 BIND_VARIABLE Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the variable in the statement.
value	Value that you want to bind to the variable in the cursor. For IN and IN/OUT variables, the value has the same type as the type of the value being passed in for this parameter.
out_value_size	Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.

Usage Notes

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

The length of the bind variable name should be <=30 bytes.

See Also: ["Examples 3, 4, and 5: Bulk DML"](#) on page 121-13 for examples of how to bind collections.

CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (  
    c      IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 121–8 *CLOSE_CURSOR Procedure Parameters*

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT <datatype>
    [,column_error OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

Where square brackets [] indicate optional parameters and <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT CHAR CHARACTER SET ANY_CS
    [,column_error OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_RAW (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT RAW
    [,column_error OUT NUMBER]
    [,actual_length OUT INTEGER]);
```

```
DBMS_SQL.COLUMN_VALUE_ROWID (
    c           IN  INTEGER,
    position    IN  INTEGER,
    value       OUT ROWID
    [,column_error OUT NUMBER]
```

```
[,actual_length OUT INTEGER]);
```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
  c           IN           INTEGER,
  position    IN           INTEGER,
  <param_name> IN OUT NOCOPY <table_type>);
```

Where the <param_name> and its corresponding <table_type> can be any one of these matching pairs:

```
bdbl_tab      Binary_Double_Table
bflt_tab      Binary_Float_Table
bf_tab        Bfile_Table
bl_tab        Blob_Table
cl_tab        Clob_Table
d_tab         Date_Table
ids_tab       Interval_Day_To_Second_Table
iym_tab       Interval_Year_To_Month_Table
n_tab         Number_Table
tm_tab        Time_Table
ttz_tab       Time_With_Time_Zone_Table
tms_tab       Timestamp_Table
tstz_tab      Timestamp_With_ltz_Table;
tstz_tab      Timestamp_With_Time_Zone_Table
ur_tab        Urowid_Table
c_tab         Varchar2_Table
```

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 121–9 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception ORA-06562, <i>inconsistent_type</i> , if the type of this output parameter differs from the actual type of the value, as defined by the call to <i>DEFINE_COLUMN</i> .
column_error	Returns any error code for the specified column value.
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 121–10 *COLUMN_VALUE Procedure Parameters (Bulk)*

Parameter	Description
<code>c</code>	ID number of the cursor from which you are fetching the values.
<code>position</code>	Relative position of the column in the cursor. The first column in a statement has position 1.
<code><param_name></code>	Local variable that has been declared <code><table_type></code> . <code><param_name></code> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the <code>cnt</code> parameter) of 10 rows was specified and a start index (<code>lower_bound</code>) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter `value` is different from the actual type of the value. This type was the given type when the column was defined by calling procedure `DEFINE_COLUMN`.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide*

COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (  
    c           IN  INTEGER,  
    position   IN  INTEGER,  
    length     IN  INTEGER,  
    offset     IN  INTEGER,  
    value      OUT VARCHAR2,  
    value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references (column_value_long, RNDS, WNDS);
```

Parameters

Table 121–11 *COLUMN_VALUE_LONG Procedure Parameters*

Parameter	Description
c	Cursor ID number of the cursor from which to get the value.
position	Position of the column of which to get the value.
length	Number of bytes of the long value to fetch.
offset	Offset into the long field for start of fetch.
value	Value of the column as a VARCHAR2.
value_length	Number of bytes actually returned in value.

DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a `FETCH_ROWS` call). This procedure lets you do batch fetching of rows from a single `SELECT` statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into `DBMS_SQL` buffers until you run a `COLUMN_VALUE` call, at which time the rows are copied into the table that was passed as an argument to the `COLUMN_VALUE` call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using `DBMS_SQL`. (These are the same types as you can specify for the `BIND_ARRAY` procedure.)

```

TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
TYPE bfile_table
    IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
TYPE blob_table
    IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
TYPE clob_table
    IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table
    IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
    IS TABLE OF dsinterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
    IS TABLE OF yminterval_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE number_table
    IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table
    IS TABLE OF time_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
    IS TABLE OF timestamp_ltz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
    IS TABLE OF timestamp_tz_unconstrained
    INDEX BY BINARY_INTEGER;
TYPE urowid_table
    IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table
    IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab> Time_Table
<ttz_tab> Time_With_Time_Zone_Table
<tms_tab> Timestamp_Table
<tstz_tab> Timestamp_With_ltz_Table;
<tstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab> Interval_Day_To_Second_Table
<iym_tab> Interval_Year_To_Month_Table

```

Syntax

```
DBMS_SQL.DEFINE_ARRAY (
    c           IN INTEGER,
    position    IN INTEGER,
    <table_variable> IN <datatype>
    cnt         IN INTEGER,
    lower_bnd   IN INTEGER);
```

Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>      Clob_Table
<bflt_tab>      Binary_Float_Table
<bdbl_tab>      Binary_Double_Table
<blob_tab>      Blob_Table
<bfile_tab>     Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
```

Note that DEFINE_ARRAY is overloaded to accept different datatypes.

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is made, these rows are placed in positions indx, indx+1, indx+2, and so on. While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

Parameters

Table 121–12 DEFINE_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind an array.
position	Relative position of the column in the array being defined. The first column in a statement has position 1.
table_variable	Local variable that has been declared as <datatype>.
cnt	Number of rows that must be fetched.
lower_bnd	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The indx can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
```

```
TYPE sallist IS TABLE OF employees.salary%TYPE;
names    namelist;
sals     sallist;
c        NUMBER;
r        NUMBER;
sql_stmt VARCHAR2(32767) :=
    'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

    r := DBMS_SQL.EXECUTE(c);

    LOOP
        r := DBMS_SQL.FETCH_ROWS(c);
        DBMS_SQL.COLUMN_VALUE(c, 1, names);
        DBMS_SQL.COLUMN_VALUE(c, 2, sals);
        EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST LOOP
        DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/
```

See Also: ["Examples 6 and 7: Defining an Array"](#) on page 121-16 for examples of how to define collections.

DEFINE_COLUMN Procedure

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

Syntax

```
DBMS_SQL.DEFINE_COLUMN (
    c                IN INTEGER,
    position         IN INTEGER,
    column           IN <datatype>)
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Note that `DEFINE_COLUMN` is overloaded to accept different datatypes.

The following syntax is also supported for the `DEFINE_COLUMN` procedure:

```
DBMS_SQL.DEFINE_COLUMN (
    c                IN INTEGER,
    position         IN INTEGER,
    column           IN VARCHAR2 CHARACTER SET ANY_CS,
    column_size      IN INTEGER),
    urowid           IN INTEGER;
```

To define columns with `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the procedure syntax:

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
    c                IN INTEGER,
    position         IN INTEGER,
    column           IN CHAR CHARACTER SET ANY_CS,
    column_size      IN INTEGER);
```

```
DBMS_SQL.DEFINE_COLUMN_RAW (
    c                IN INTEGER,
```

```

position      IN INTEGER,
column        IN RAW,
column_size   IN INTEGER);

DBMS_SQL.DEFINE_COLUMN_ROWID (
  c            IN INTEGER,
  position     IN INTEGER,
  column       IN ROWID);

```

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 121–13 *DEFINE_COLUMN Procedure Parameters*

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value, in bytes, for columns of type VARCHAR2, CHAR, and RAW.

DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (  
    c           IN INTEGER,  
    position   IN INTEGER);
```

Parameters

Table 121–14 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (  
  c           IN  INTEGER,  
  col_cnt    OUT INTEGER,  
  desc_t     OUT DESC_TAB);
```

Parameters

Table 121–15 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

See Also: ["Example 8: Describe Columns"](#) on page 121-18 illustrates how to use DESCRIBE_COLUMNS.

DESCRIBE_COLUMNS2 Procedure

This function describes the specified column. This is an alternative to [DESCRIBE_COLUMNS Procedure](#).

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (  
  c           IN  INTEGER,  
  col_cnt    OUT INTEGER,  
  desc_t     OUT DESC_TAB2);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 121–16 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

DESCRIBE_COLUMNS3 Procedure

This function describes the specified column. This is an alternative to [DESCRIBE_COLUMNS Procedure](#).

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
  c           IN  INTEGER,
  col_cnt    OUT INTEGER,
  desc_t     OUT  DESC_TAB3);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 121-17 DESCRIBE_COLUMNS3 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENED and PARSED, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
  ( projname      VARCHAR2(20),
    mgr           VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid      NUMBER;
  desctab    DBMS_SQL.DESC_TAB3;
  colcnt     NUMBER;
  sql_stmt   VARCHAR2(200) := 'select * from projecttab';
BEGIN

  curid := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

  DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

  FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 109 THEN
```

```
        DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
        DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                               desctab(i).col_type_name);
    END IF;
END LOOP;

DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

Output:

```
PROJECT is user-defined type: HR.PROJECT_T
```

EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed. The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and should be ignored.

Syntax

```
DBMS_SQL.EXECUTE (  
    c    IN INTEGER)  
RETURN INTEGER;
```

Parameters

Table 121–18 EXECUTE Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to execute.

EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling `EXECUTE` and then calling `FETCH_ROWS`. Calling `EXECUTE_AND_FETCH` instead, however, may reduce the number of network round-trips when used against a remote database.

The `EXECUTE_AND_FETCH` function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (  
    c          IN INTEGER,  
    exact      IN BOOLEAN DEFAULT FALSE)  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (execute_and_fetch, WNDS);
```

Parameters

Table 121–19 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
<code>c</code>	ID number of the cursor to execute and fetch.
<code>exact</code>	Set to <code>TRUE</code> to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch <code>TRUE</code> option with <code>LONG</code> columns. Even if an exception is raised, the rows are still fetched and available.

FETCH_ROWS Function

This function fetches a row from a given cursor. You can call `FETCH_ROWS` repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling `COLUMN_VALUE`, for each column, after each call to `FETCH_ROWS`.

The `FETCH_ROWS` function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (  
    c          IN INTEGER)  
    RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 121–20 *FETCH_ROWS Function Parameters*

Parameter	Description
c	ID number.

IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```
DBMS_SQL.IS_OPEN (  
    c          IN INTEGER)  
    RETURN BOOLEAN;
```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 121–21 IS_OPEN Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to check.

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the [CLOSE_CURSOR Procedure](#) Procedure `NULLs` out the cursor variable passed to it.

Exceptions

`ORA-29471 DBMS_SQL access denied`: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent `DBMS_SQL` call in the same session will raise this error, meaning that `DBMS_SQL` is non-operational for this session.

LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (last_error_position, RNDS, WNDS);
```

Usage Notes

Call this function after a PARSE call, before any other DBMS_SQL procedures or functions are called.

LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (last_row_count, RNDS, WNDS);
```

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call. If called after an `EXECUTE` call, then the value returned is zero.

LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID  
RETURN ROWID;
```

Pragmas

```
pragma restrict_references (last_row_id, RNDS, WNDS);
```

Usage Notes

Call this function after a `FETCH_ROWS` or an `EXECUTE_AND_FETCH` call.

LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement. These codes are listed in the *Oracle Call Interface Programmer's Guide*.

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE  
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references (last_sql_function_code, RNDS, WNDS);
```

Usage Notes

You should call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

OPEN_CURSOR Function

This procedure opens a new cursor. The second overload takes a `security_level` parameter to apply fine-grained control to the security of the opened cursor.

When you no longer need this cursor, you must close it explicitly by calling the [CLOSE_CURSOR Procedure](#).

Syntax

```
DBMS_SQL.OPEN_CURSOR
RETURN INTEGER;

DBMS_SQL.OPEN_CURSOR (
    security_level IN INTEGER)
RETURN INTEGER;
```

Parameters

Table 121–22 OPEN_CURSOR Function Parameters

Parameter	Description
<code>security_level</code>	<p>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of <code>open_cursor</code> without the <code>security_level</code> parameter, the default security level value 1 will be enforced on the opened cursor.</p> <ul style="list-style-type: none"> ▪ Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. ▪ Level 1 - requires that the effective userid and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. ▪ Level 2 - requires that the effective userid and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.

Pragmas

```
pragma restrict_references (open_cursor, RNDS, WNDS);
```

Return Values

This function returns the cursor ID number of the new cursor.

Usage Notes

You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are three versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Taking VARCHAR2a, table of VARCHAR2(32767), as an argument. The VARCHAR2A overload version of the procedure concatenates elements of a PL/SQL table statement and parses the resulting string. You can use this procedure to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

```
DBMS_SQL.PARSE (
  c           IN  INTEGER,
  statement   IN  VARCHAR2,
  language_flag IN  INTEGER);

DBMS_SQL.PARSE (
  c           IN  INTEGER,
  statement   IN  CLOB,
  language_flag IN  INTEGER);

DBMS_SQL.PARSE (
  c           IN  INTEGER,
  statement   IN  VARCHAR2A,
  lb         IN  INTEGER,
  ub         IN  INTEGER,
  lfflg      IN  BOOLEAN,
  language_flag IN  INTEGER);
```

Parameters

Table 121–23 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike PL/SQL statements, your SQL statement should not include a final semicolon. For example: DBMS_SQL . PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL . PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);
lb	Lower bound for elements in the statement.
ub	Upper bound for elements in the statement.

Table 121–23 (Cont.) PARSE Procedure Parameters

Parameter	Description
<code>lfflg</code>	If <code>TRUE</code> , then insert a linefeed after each element on concatenation.
<code>language_flag</code>	Determines how Oracle handles the SQL statement. The following options are recognized: <ul style="list-style-type: none"> ▪ <code>V6</code> (or <code>0</code>) specifies version 6 behavior. ▪ <code>NATIVE</code> (or <code>1</code>) specifies normal behavior for the database to which the program is connected. ▪ <code>V7</code> (or <code>2</code>) specifies Oracle database version 7 behavior.

Usage Notes

- Using `DBMS_SQL` to dynamically run DDL statements can result in the program hanging. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, results in a hang.

- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

For example, the following code does *not* compile on the client:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
DBMS_SQL.NATIVE
```

The following code works on the client, because the argument is explicitly provided:

```
DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
```

- The `VARCHAR2S` type is currently supported for backward compatibility of legacy code. However, you are advised to use `VARCHAR2A` both for its superior capability and because `VARCHAR2S` will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new `CLOB` overload version of the `PARSE` procedure can be used instead of the `VARCHAR2A` overload

Exceptions

If you create a type/procedure/function/package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the procedure is still created.

TO_CURSOR_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
    rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;
```

Parameters

Table 121–24 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- Toggle between REF CURSOR and DBMS_SQL cursor number after started to fetch is not allowed, and an error is raised.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
    TYPE CurType IS REF CURSOR;
    src_cur        CurType;
    curid          NUMBER;
    desctab        DBMS_SQL.DESC_TAB;
    colcnt         NUMBER;
    namevar        VARCHAR2(50);
    numvar         NUMBER;
    datevar        DATE;
    empno          NUMBER := 100;
BEGIN

    -- sql_stmt := 'select ..... from employees where employee_id = :b1';
    OPEN src_cur FOR sql_stmt USING empno;

    -- Switch from native dynamic SQL to DBMS_SQL
    curid := DBMS_SQL.TO_CURSORID(src_cur);

    DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

    -- Define columns
    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 2 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
```

```
        ELSIF desctab(i).col_type = 12 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
        .....
        ELSE
            DBMS_SQL.DEFINE_COLUMN(curid, i, namevar);
        END IF;
    END LOOP;

-- Fetch Rows
    WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
        FOR i IN 1 .. colcnt LOOP
            IF (desctab(i).col_type = 1) THEN
                DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
            ELSIF (desctab(i).col_type = 2) THEN
                DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
            ELSIF (desctab(i).col_type = 12) THEN
                DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
        .....
            END IF;
        END LOOP;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

TO_REFCURSOR Function

This function takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQLswitched to use native dynamic SQL. This subprogram is only used with SELECT cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR (
    cursor_number IN INTEGER)
RETURN SYS_REFCURSOR;
```

Parameters

Table 121–25 TO_REFCURSOR Function Parameters

Parameter	Description
cursor_number	Cursor number of the cursor to be transformed into REF CURSOR

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number.

Usage Notes

- The cursor passed in by the cursor_number has to be OPENED, PARSED, and EXECUTED; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.
- Toggle between REF CURSOR and DBMS_SQL cursor number after started to fetch is not allowed, and an error is raised.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
    TYPE CurType IS REF CURSOR;
    src_cur          CurType;
    curid            NUMBER;
    sql_stmt         VARCHAR2(200);
    ret              INTEGER;
    empnos           DBMS_SQL.Number_Table;
    depts            DBMS_SQL.Number_Table;
BEGIN

    -- DBMS_SQL.OPEN_CURSOR
    curid := DBMS_SQL.OPEN_CURSOR;

    sql_stmt :=
        'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
```

```
ret := DBMS_SQL.EXECUTE(curid);

-- Switch from DBMS_SQL to native dynamic SQL
src_cur := DBMS_SQL.TO_REFCURSOR(curid);

-- Fetch with native dynamic SQL
FETCH src_cur BULK COLLECT INTO empnos, depts;

IF empnos.COUNT > 0 THEN
  DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
  DBMS_OUTPUT.PUT_LINE('-----');
  -- Loop through the empnos and depts collections
  FOR i IN 1 .. empnos.COUNT LOOP
    DBMS_OUTPUT.PUT_LINE(empnos(i) || ' ' || depts(i));
  END LOOP;
END IF;

-- Close cursor
CLOSE src_cur;
END;
/
```

VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

Syntax

```
DBMS_SQL.VARIABLE_VALUE (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT CHAR CHARACTER SET ANY_CS);
```

```
DBMS_SQL.VARIABLE_VALUE_RAW (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT RAW);
```

```
DBMS_SQL.VARIABLE_VALUE_ROWID (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
  value       OUT ROWID);
```

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
  c           IN  INTEGER,
  name        IN  VARCHAR2,
```

```
value          OUT NOCOPY <table_type>;
```

For bulk operations, <table_type> can be:

```
Binary_Double_Table
Binary_Float_Table
Bfile_Table
Blob_Table
Clob_Table
Date_Table
Interval_Day_To_Second_Table
Interval_Year_To_Month_Table
Number_Table
Time_Table
Time_With_Time_Zone_Table
Timestamp_Table
Timestamp_With_ltz_Table;
Timestamp_With_Time_Zone_Table
Urowid_Table
Varchar2_Table
```

Pragmas

```
pragma restrict_references (variable_value, RNDS, WNDS);
```

Parameters

Table 121–26 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	<ul style="list-style-type: none"> ▪ Single row option: Returns the value of the variable for the specified position. Oracle raises the exception <code>ORA-06562, inconsistent_type</code>, if the type of this output parameter differs from the actual type of the value, as defined by the call to <code>BIND_VARIABLE</code>. ▪ Array option: Local variable that has been declared <table_type>. For bulk operations, value is an <code>OUT NOCOPY</code> parameter.

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

- [Summary of DBMS_SQLDIAG Subprograms](#)

Using DBMS_SQLDIAG

- [Overview](#)
- [Constants](#)
- [Examples](#)

Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement.

This section covers the following topics:

- [About the SQL Repair Advisor](#)
- [Running the SQL Repair Advisor](#)
- [Removing a SQL Patch](#)

About the SQL Repair Advisor

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

Running the SQL Repair Advisor

You run the SQL Repair Advisor by creating and executing a diagnostic task using the `CREATE_DIAGNOSIS_TASK` and `EXECUTE_DIAGNOSIS_TASK` respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

1. Identify the problem SQL statement

Consider the SQL statement that gives a critical error:

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2
WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)
```

You use the SQL Repair advisor to repair this critical error.

2. Create a diagnosis task

Invoke `DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK`. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as 'error_task' and a problem type as 'DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR'.

```
DECLARE
    rep_out          CLOB;
    t_id             VARCHAR2(50);
BEGIN
    t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
        sql_text => 'DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT
MAX(ROWID) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)',
        task_name => 'error_task',
        problem_type =>DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR);
```

3. Execute the diagnosis task

To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call `DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK` with the task ID returned by the `CREATE_DIAGNOSIS_TASK`. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (t_id);
```

4. Report the diagnosis task

The analysis of the diagnosis task is accessed through `dbms_sqldiag.report_diagnosis_task`. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

```
rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);

DBMS_OUTPUT.PUT_LINE ('Report : ' || rep_out);

END;
/
```

5. Applying the patch

If a patch recommendation is present in the report, you can run the `ACCEPT_SQL_PATCH` command to accept the patch by invoking `DBMS_SQLDIAG.ACCEPT_SQL_PATCH`. This procedure takes the `task_name` as an argument.

```
EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner =>
'SYS', replace => TRUE);
```

6. Test the patch

Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run 'explain plan' for this statement, you will see that a SQL patch was used to generate the plan.

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2
WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d);
```

Removing a SQL Patch

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call `DBMS_SQLDIAG.DROP_SQL_PATCH` with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view `DBA_SQL_PATCHES`.

Constants

The DBMS_SQLDIAG package uses the constants shown in the following tables:

- [Table 122-1, "DBMS_SQLDIAG Constants - SQLDIAG Advisor Name"](#) describes the name of SQL repair advisor as seen by the advisor framework
- [Table 122-2, "DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values"](#) describes SQLDIAG advisor task scope parameter values
- [Table 122-3, "DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants"](#) describes SQLDIAG advisor time_limit constants
- [Table 122-4, "DBMS_SQLDIAG Constants - Report Type \(possible values\) Constants"](#) describes possible formats for a report
- [Table 122-5, "DBMS_SQLDIAG Constants - Report Level \(possible values\) Constants"](#) describes possible levels of detail in the report
- [Table 122-6, "DBMS_SQLDIAG Constants - Report Section \(possible values\) Constants"](#) describes possible report sections (comma delimited)
- [Table 122-7, "DBMS_SQLDIAG Constants - Problem Type Constants"](#) describes possible values for the problem_type parameter of the [CREATE_DIAGNOSIS_TASK Functions](#)
- [Table 122-8, "DBMS_SQLDIAG Constants - Findings Filter Constants"](#) describes possible values for the _sql_findings_mode parameter

Table 122-1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
ADV_SQL_DIAG_NAME	VARCHAR2(18)	'SQL Repair Advisor'	Name of SQL repair advisor as seen by the advisor framework

Table 122-2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
SCOPE_COMPREHENSIVE	VARCHAR2(13)	'COMPREHENSIVE'	Detailed analysis of the problem which may take more time to execute
SCOPE_LIMITED	VARCHAR2(7)	'LIMITED'	Brief analysis of the problem

Table 122-3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
TIME_LIMIT_DEFAULT	NUMBER	1800	Default time limit for analysis of the problem

Table 122–4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Report from the REPORT_DIAGNOSIS_TASK Function in text form
TYPE_XML	VARCHAR2(3)	'XML'	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 122–5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2(3)	'ALL'	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2(5)	'BASIC'	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2(7)	'TYPICAL'	Simple report shows only information about the actions taken by the advisor.

Table 122–6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2(3)	'ALL'	All statements
SECTION_ERRORS	VARCHAR2(6)	'ERRORS'	Statements with errors
SECTION_FINDINGS	VARCHAR2(8)	'FINDINGS'	Tuning findings
SECTION_INFORMATION	VARCHAR2(11)	'INFORMATION'	General information
SECTION_PLANS	VARCHAR2(5)	'PLANS'	Explain plans
SECTION_SUMMARY	VARCHAR2(7)	'SUMMARY'	Summary information

Table 122–7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem

Table 122–7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation
PROBLEM_TYPE_EXECUTION_ERROR	NUMBER	4	User sees a crash in execution

Table 122–8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDATION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURES	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_PLANS	NUMBER	4	Show the alternative plans generated by the advisor

Examples

Patch Pack / Unpack

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to `CREATE_STGTAB_SQLPATCH`:

```
EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
    table_name      => 'STAGING_TABLE',
    schema_name     => 'SH');
```

2. Call `PACK_STGTAB_SQLPATCH` one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the `DEFAULT` category into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    staging_table_name => 'STAGING_TABLE');
```

3. In this case, only a single SQL patch `SP_FIND_EMPLOYEE` is copied into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    patch_name       => 'SP_FIND_EMPLOYEE',
    staging_table_name => 'STAGING_TABLE');
```

The staging table can then be moved to another system using either `datapump`, `import/export` commands or via a `databaselink`.

4. Call `UNPACK_STGTAB_SQLPATCH` to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the `SP_FIND_EMPLOYEE` patch stored in the staging table to `'SP_FIND_EMP_PROD'`:

```
exec dbms_sqldiag.remap_stgtab_sqlpatch(
    old_patch_name   => 'SP_FIND_EMPLOYEE',
    new_patch_name   => 'SP_FIND_EMP_PROD');
```

Summary of DBMS_SQLDIAG Subprograms

Table 122–9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure on page 122-11	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure on page 122-13	Alters specific attributes of an existing SQL patch object
CANCEL_DIAGNOSIS_TASK Procedure on page 122-14	Cancel a diagnostic task
CREATE_STGTAB_SQLPATCH Procedure on page 122-17	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure on page 122-18	Drops a diagnostic task
DROP_SQL_PATCH Procedure on page 122-19	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure on page 122-20	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function on page 122-21	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures on page 122-22	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_DIR_BY_INC Function on page 122-24	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function on page 122-25	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_SQL Function on page 122-26	Imports a SQL test case
INCIDENTID_2_SQL Procedure on page 122-27	Initializes a sql_setrow from an incident ID
INTERRUPT_DIAGNOSIS_TASK Procedure on page 122-28	Interrupts a diagnostic task
PACK_STGTAB_SQLPATCH Procedure on page 122-29	SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure
REPORT_DIAGNOSIS_TASK Function on page 122-30	Reports on a diagnostic task
RESET_DIAGNOSIS_TASK Procedure on page 122-31	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure on page 122-32	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_PARAMETER Procedure on page 122-33	Sets a diagnosis task parameter

Table 122–9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
UNPACK_STGTAB_SQLPATCH Procedure on page 122-34	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure , using the patch data stored in the staging table to create patches on this system

ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER := NULL,
  name           IN  VARCHAR2 := NULL,
  description    IN  VARCHAR2 := NULL,
  category       IN  VARCHAR2 := NULL,
  task_owner     IN  VARCHAR2 := NULL,
  replace        IN  BOOLEAN := FALSE,
  force_match    IN  BOOLEAN := FALSE)
RETURN VARCHAR2;

DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
  task_name      IN  VARCHAR2,
  object_id      IN  NUMBER := NULL,
  name           IN  VARCHAR2 := NULL,
  description    IN  VARCHAR2 := NULL,
  category       IN  VARCHAR2 := NULL,
  task_owner     IN  VARCHAR2 := NULL,
  replace        IN  BOOLEAN := FALSE,
  force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 122–10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.
category	Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.

Table 122–10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
<code>replace</code>	If the patch already exists, it will be replaced if this argument is <code>TRUE</code> . It is an error to pass a name that is already being used for another signature/category pair, even with <code>replace</code> set to <code>TRUE</code> .
<code>force_match</code>	If <code>TRUE</code> this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the <code>FORCE</code> option of the <code>CURSOR_SHARING</code> parameter. If <code>FALSE</code> , literals are not transformed. This is analogous to the matching algorithm used by the <code>EXACT</code> option of the <code>CURSOR_SHARING</code> parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires `CREATE ANY SQL PATCH` privilege

ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
  name           IN VARCHAR2,
  attribute_name IN VARCHAR2,
  value          IN VARCHAR2);
```

Parameters

Table 122–11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
name	Name of SQL patch to alter.
attribute_name	Name of SQL patch to alter. Possible values: <ul style="list-style-type: none"> ■ STATUS -> can be set to ENABLED or DISABLED ■ NAME -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). ■ DESCRIPTION -> can be set to any string of size no more than 500 ■ CATEGORY -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.
value	New value of the attribute. See attribute_name for valid attribute values. This parameter is mandatory.

Usage Notes

Requires ALTER ANY SQL PATCH privilege

CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 122–12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text          IN    CLOB,
    bind_list         IN    sql_binds := NULL,
    user_name         IN    VARCHAR2 := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN    VARCHAR2 := NULL,
    description       IN    VARCHAR2 := NULL,
    problem_type      IN    NUMBER   := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id            IN    VARCHAR2,
    plan_hash_value   IN    NUMBER   := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN    VARCHAR2 := NULL,
    description       IN    VARCHAR2 := NULL,
    problem_type      IN    NUMBER   := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name       IN    VARCHAR2,
    basic_filter      IN    VARCHAR2 := NULL,
    object_filter     IN    VARCHAR2 := NULL,
    rank1             IN    VARCHAR2 := NULL,
    rank2             IN    VARCHAR2 := NULL,
    rank3             IN    VARCHAR2 := NULL,
    result_percentage IN    NUMBER   := NULL,
    result_limit      IN    NUMBER   := NULL,
    scope             IN    VARCHAR2 := SCOPE_COMPREHENSIVE,
    time_limit        IN    NUMBER   := TIME_LIMIT_DEFAULT,
    task_name         IN    VARCHAR2 := NULL,
    description       IN    VARCHAR2 := NULL,
    plan_filter       IN    VARCHAR2 := 'MAX_ELAPSED_TIME',
    sqlset_owner      IN    VARCHAR2 := NULL,
    problem_type      IN    NUMBER   := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Parameters

Table 122–13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values

Table 122–13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
<code>user_name</code>	Username for who the statement/sqlset will be diagnosed
<code>scope</code>	Diagnosis scope (limited/comprehensive)
<code>time_limit</code>	Maximum duration in seconds for the diagnosis session
<code>task_name</code>	Optional diagnosis task name
<code>description</code>	Maximum of 256 SQL diagnosis session description
<code>problem_type</code>	Determines the goal of the task. Possible values are: <ul style="list-style-type: none"> ■ <code>PROBLEM_TYPE_WRONG_RESULTS</code> ■ <code>PROBLEM_TYPE_COMPILATION_ERROR</code> ■ <code>PROBLEM_TYPE_EXECUTION_ERROR</code>
<code>sql_id</code>	Identifier of the statement
<code>plan_hash_value</code>	Hash value of the SQL execution plan
<code>sqlset_name</code>	Sqlset name
<code>basic_filter</code>	SQL predicate to filter the SQL from the SQL tuning set (STS)
<code>object_filter</code>	Object filter
<code>rank(i)</code>	Order-by clause on the selected SQL
<code>result_percentage</code>	Percentage on the sum of a ranking measure
<code>result_limit</code>	Top L(imit) SQL from (filtered/ranked) SQL
<code>plan_filter</code>	Plan filter. It is applicable in case there are multiple plans (<code>plan_hash_value</code>). This filter allows selecting one plan (<code>plan_hash_value</code>) only. Possible values are: <ul style="list-style-type: none"> ■ <code>LAST_GENERATED</code>: plan with most recent timestamp ■ <code>FIRST_GENERATED</code>: opposite to <code>LAST_GENERATED</code> ■ <code>LAST_LOADED</code>: plan with most recent <code>first_load_time</code> stat info ■ <code>FIRST_LOADED</code>: opposite to <code>LAST_LOADED</code> ■ <code>MAX_ELAPSED_TIME</code>: plan with maximum elapsed time ■ <code>MAX_BUFFER_GETS</code>: plan with maximum buffer gets ■ <code>MAX_DISK_READS</code>: plan with maximum disk reads ■ <code>MAX_DIRECT_WRITES</code>: plan with maximum direct writes ■ <code>MAX_OPTIMIZER_COST</code>: plan with maximum optimum cost
<code>sqlset_owner</code>	Owner of the sqlset, or null for current schema owner

CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
  table_name      IN  VARCHAR2,
  schema_name    IN  VARCHAR2 := NULL,
  tablespace_name IN  VARCHAR2 := NULL);
```

Parameters

Table 122–14 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
table_name	(Mandatory) Name of the table to create (case-sensitive)
schema_name	Schema to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)

DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 122–15 *DROP_DIAGNOSIS_TASK Procedure Parameters*

Parameter	Description
taskname	Name of task

DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (  
    name      IN  VARCHAR2,  
    ignore    IN  BOOLEAN := FALSE);
```

Parameters

Table 122–16 *DROP_SQL_PATCH Function & Procedure Parameters*

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires DROP ANY SQL PATCH privilege

EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 122–17 EXECUTE_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (  
    sqlTestCase      IN  CLOB)  
RETURN CLOB;
```

Parameters

Table 122–18 *EXPLAIN_SQL_TESTCASE Procedure Parameters*

Parameter	Description
sqlTestCase	XML document describing the SQL test case

EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory      IN   VARCHAR2,
  sql_text       IN   CLOB,
  user_name      IN   VARCHAR2 := 'SYS',
  bind_list      IN   sql_binds := NULL,
  exportEnvironment IN  BOOLEAN := TRUE,
  exportMetadata IN  BOOLEAN := TRUE,
  exportData     IN  BOOLEAN := TRUE,
  samplingPercent IN  NUMBER := 100,
  ctrlOptions    IN  VARCHAR2 := NULL,
  timeLimit      IN  NUMBER := 0,
  testcase_name  IN  VARCHAR2 := NULL,
  testcase       IN  OUT NOCOPY CLOB);
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory      IN   VARCHAR2,
  incident_id    IN   VARCHAR2,
  exportEnvironment IN  BOOLEAN := TRUE,
  exportMetadata IN  BOOLEAN := TRUE,
  exportData     IN  BOOLEAN := TRUE,
  samplingPercent IN  NUMBER := 100,
  ctrlOptions    IN  VARCHAR2 := NULL,
  timeLimit      IN  NUMBER := 0,
  testcase_name  IN  VARCHAR2 := NULL,
  testcase       IN  OUT NOCOPY CLOB);
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use V\$SQL to get the SQL identifier and the SQL hash value.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
  directory      IN   VARCHAR2,
  sql_id         IN   VARCHAR2,
  plan_hash_value IN  NUMBER := NULL,
  exportEnvironment IN  BOOLEAN := TRUE,
  exportMetadata IN  BOOLEAN := TRUE,
  exportData     IN  BOOLEAN := TRUE,
  samplingPercent IN  NUMBER := 100,
  ctrlOptions    IN  VARCHAR2 := NULL,
  timeLimit      IN  NUMBER := 0,
  testcase_name  IN  VARCHAR2 := NULL,
  testcase       IN  OUT NOCOPY CLOB);
```

Parameters

Table 122–19 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export

Table 122–19 (Cont.) EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcaseMetadata	Resulting test case
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache

EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL Test Case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    exportEnvironment IN  VARCHAR2 := 'TRUE',
    exportMetadata   IN  VARCHAR2 := 'TRUE',
    exportData       IN  VARCHAR2 := 'FALSE',
    samplingPercent  IN  VARCHAR2 := '100',
    ctrlOptions      IN  VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Parameters

Table 122–20 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters

EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id      IN    NUMBER,
    directory        IN    VARCHAR2,
    sql_text         IN    CLOB,
    user_name        IN    VARCHAR2 := 'SYS',
    exportEnvironment IN    VARCHAR2 := 'TRUE',
    exportMetadata   IN    VARCHAR2 := 'TRUE',
    exportData       IN    VARCHAR2 := 'FALSE',
    samplingPercent  IN    VARCHAR2 := '100',
    ctrlOptions      IN    VARCHAR2 := NULL)
RETURN BOOLEAN;
```

Parameters

Table 122–21 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
incident_id	Incident ID containing the offending SQL
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to explain
username	Name of the user schema to use to parse the SQL, defaults to SYS
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters

GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (  
    incident_id IN    VARCHAR2)  
    RETURN SQLSET_ROW;
```

Parameters

Table 122–22 *GET_SQL Function Parameters*

Parameter	Description
<code>incident_id</code>	Identifier of the incident

INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
  incident_id  IN   VARCHAR2,
  sql_stmt    OUT  SQLSET_ROW,
  problem_type OUT  NUMBER,
  err_code    OUT  BINARY_INTEGER,
  err_mesg    OUT  VARCHAR2);
```

Parameters

Table 122–23 *INCIDENTID_2_SQL Procedure Parameters*

Parameter	Description
<code>incident_id</code>	Identifier of the incident
<code>sql_stmt</code>	Resulting SQL
<code>problem_type</code>	Tentative type of SQL problem (currently among <code>PROBLEM_TYPE_COMPILATION_ERROR</code> and <code>PROBLEM_TYPE_EXECUTION_ERROR</code>)
<code>err_code</code>	Error code if any otherwise it is set to <code>NULL</code>
<code>err_msg</code>	Error message if any otherwise it is set to <code>NULL</code>

INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 122–24 *INTERRUPT_DIAGNOSIS_TASK Procedure Parameters*

Parameter	Description
taskname	Name of task

PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the [CREATE_STGTAB_SQLPATCH Procedure](#).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category     IN  VARCHAR2 := 'DEFAULT',
  staging_table_name  IN  VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 122–25 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to pack (% wildcards acceptable, case-sensitive)
patch_category	Category to which to pack patches (% wildcards acceptable, case-insensitive)
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- Requires: ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. See the [Examples](#) on page 122-8 for details. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
  taskname          IN  VARCHAR2,
  type              IN  VARCHAR2 := TYPE_TEXT,
  level             IN  VARCHAR2 := LEVEL_TYPICAL,
  section          IN  VARCHAR2 := SECTION_ALL,
  object_id        IN  NUMBER   := NULL,
  result_limit     IN  NUMBER   := NULL,
  owner_name       IN  VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 122–26 REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
taskname	Name of task to report
type	Type of the report. Possible values are: TEXT, HTML, XML (see Table 122–4, "DBMS_SQLDIAG Constants - Report Type (possible values) Constants").
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 122–5, "DBMS_SQLDIAG Constants - Report Level (possible values) Constants").
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 122–6, "DBMS_SQLDIAG Constants - Report Section (possible values) Constants").
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 122–27 *RESET_DIAGNOSIS_TASK Procedure Parameters*

Parameter	Description
taskname	Name of task

RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (  
    taskname          IN  VARCHAR2);
```

Parameters

Table 122–28 RESUME_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2. The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE : diag scope (comprehensive, limited)
- _SQLDIAG_FINDING_MODE : findings in the report (see "[DBMS_SQLDIAG Constants - Findings Filter Constants](#)" on page 122-7 for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
  taskname          IN  VARCHAR2,
  parameter         IN  VARCHAR2,
  value             IN  NUMBER);
```

Parameters

Table 122–29 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the [PACK_STGTAB_SQLPATCH Procedure](#). It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the [ACCEPT_SQL_PATCH Function & Procedure](#)).

Syntax

```
DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH (
  patch_name          IN  VARCHAR2 := '%',
  patch_category     IN  VARCHAR2 := '%',
  replace            IN  BOOLEAN,
  staging_table_name IN  VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 122–30 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to unpack (% wildcards acceptable, case-sensitive)
patch_category	Category from which to unpack patches (% wildcards acceptable, case-insensitive)
replace	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

The DBMS_SQLPA package provides the interface SQL Performance Analyzer.

The chapter contains the following topics:

- [Using DBMS_SQLPA](#)
 - Overview
 - Security Model
- [Summary of DBMS_SQLPA Subprograms](#)

Using DBMS_SQLPA

- [Overview](#)
- [Security Model](#)

Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the [CREATE_ANALYSIS_TASK Functions](#) to create an analysis task for a single statement or a group of SQL statements.s
2. The [EXECUTE_ANALYSIS_TASK Function & Procedure](#) executes a previously created analysis task.
3. The [REPORT_ANALYSIS_TASK Function](#) displays the results of an analysis task.

Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

Summary of DBMS_SQLPA Subprograms

Table 123–1 DBMS_SQLPA Package Subprograms

Subprogram	Description
CANCEL_ANALYSIS_TASK Procedure on page 123-6	Cancels the currently executing task analysis of one or more SQL statements
CREATE_ANALYSIS_TASK Functions on page 123-7	Creates an advisor task to process and analyze one or more SQL statements
DROP_ANALYSIS_TASK Procedure on page 123-10	Drops a SQL analysis task
EXECUTE_ANALYSIS_TASK Function & Procedure on page 123-11	Executes a previously created analysis task
INTERRUPT_ANALYSIS_TASK Procedure on page 123-14	Interrupts the currently executing analysis task
REPORT_ANALYSIS_TASK Function on page 123-15	Displays the results of an analysis task
RESET_ANALYSIS_TASK Procedure on page 123-17	Resets the currently executing analysis task to its initial state
RESUME_ANALYSIS_TASK Procedure on page 123-18	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
SET_ANALYSIS_TASK_PARAMETER Procedures on page 123-19	Sets the SQL analysis task parameter value
SET_ANALYSIS_DEFAULT_PARAMETER Procedures on page 123-21	Sets the SQL analysis task parameter default value

CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

Parameters

Table 123–2 CANCEL_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task to cancel

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements. You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  parsing_schema    IN VARCHAR2  := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER     := NULL,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  begin_snap       IN NUMBER,
  end_snap         IN NUMBER,
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER     := NULL,
  task_name        IN VARCHAR2  := NULL,
  description      IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name      IN VARCHAR2,
  basic_filter     IN VARCHAR2  := NULL,
  order_by         IN VARCHAR2  := NULL,
  top_sql          IN VARCHAR2  := NULL,
  task_name        IN VARCHAR2  := NULL,
```

```

description      IN VARCHAR2 := NULL
sqlset_owner     IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

Parameters

Table 123–3 CREATE_ANALYSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	A set of bind values
parsing_schema	Name of the schema where the statement can be compiled
task_name	Optional analysis task name
description	Description of the SQL analysis task to a maximum of 256 characters
sql_id	Identifier of a SQL statement
plan_hash_value	Hash value of the SQL execution plan
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```

variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id    => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap   => 2,
    sql_id     => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)

```

```
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -  
    sqlset_name    => 'my_workload', -  
    order_by       => 'BUFFER_GETS', -  
    description    => 'process workload ordered by buffer gets');
```

DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

Parameters

Table 123–4 *DROP_ANALYSIS_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the analysis task to drop

EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
  task_name          IN VARCHAR2,
  execution_type     IN VARCHAR2          := 'test execute',
  execution_name     IN VARCHAR2          := NULL,
  execution_params   IN dbms_advisor.argList := NULL,
  execution_desc     IN VARCHAR2          := NULL)
RETURN VARCHAR2;
```

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK (
  task_name          IN VARCHAR2,
  execution_type     IN VARCHAR2          := 'test execute',
  execution_name     IN VARCHAR2          := NULL,
  execution_params   IN dbms_advisor.argList := NULL,
  execution_desc     IN VARCHAR2          := NULL);
```

Parameters

Table 123–5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the <code>DEFAULT_EXECUTION_TYPE</code> parameter. Possible values are: <ul style="list-style-type: none"> ▪ [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. ▪ EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the <code>EXPLAIN PLAN</code> command. The resulting plans will be stored in the advisor framework in association with the task. ▪ COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type <code>EXPLAIN_PLAN</code> or <code>TEST_EXECUTE</code> already exist in the task ▪ CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set via the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).

Table 123–5 (Cont.) EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
execution_desc	A 256-length string describing the execution

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_TUNING_TASK(
    sqlset_name => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
    task_name      => :tname,
    execution_type => 'test execute',
    execution_name => 'before_change');
```

3. Make change

...

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
    task_name      => :tname, -
    execution_type => 'test execute ',
    execution_name => 'after_change');
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_TUNING_TASK_PARAMETER(
    :tname, 'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
    task_name      => :tname, -
    execution_type => 'test execute', -
    execution_name => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
    task_name      => :tname, -
    execution_type => 'compare performance',
    execution_params => dbms_advisor.arglist(
```

```
'execution_name1',  
'before_change',  
'execution_name2',  
'after_change',  
'comparion_metric',  
'buffer_gets'));
```

INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(  
    task_name          IN VARCHAR2);
```

Parameters

Table 123–6 *INTERRUPT_ANALYSIS_TASK Procedure Parameters*

Parameter	Description
task_name	Identifier of the analysis task to interrupt

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
  task_name      IN  VARCHAR2,
  type           IN  VARCHAR2  := 'text',
  level          IN  VARCHAR2  := 'typical',
  section        IN  VARCHAR2  := 'summary',
  object_id      IN  NUMBER     := NULL,
  top_sql        IN  NUMBER     := 100,
  task_owner     IN  VARCHAR2  := NULL,
  execution_name IN  VARCHAR2  := NULL))
RETURN CLOB;
```

Parameters

Table 123–7 REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML and XML.
level	Level of detail in the report: <ul style="list-style-type: none"> ▪ BASIC - currently the same as typical ▪ TYPICAL (default) - show information about every statement analyzed, including changing and errors ▪ ALL - details of all SQL ▪ IMPROVED - only improved SQL ▪ REGRESSED - only regressed SQL ▪ CHANGED - only SQL with changed performance ▪ UNCHANGED - only SQL with unchanged performance ▪ CHANGED_PLANS - only SQL with plan changes ▪ UNCHANGED_PLANS - only SQL with unchanged plans ▪ ERRORS - SQL with errors only
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> ▪ SUMMARY (default) - workload summary only ▪ SECTION_ALL - summary and details on SQL
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

Return Values

A CLOB containing the desired report.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS',
5) from dual;
```

RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution. All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(  
  task_name          IN VARCHAR2);
```

Parameters

Table 123–8 *RESET_ANALYSIS_TASK Procedure Parameters*

Parameter	Description
task_name	Identifier of the analysis task to reset

Examples

```
-- reset and re-execute a task  
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);  
  
-- re-execute the task  
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name      IN VARCHAR2,
  basic_filter   IN VARCHAR2 := NULL);
```

Parameters

Table 123–9 RESUME_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter <code>basic_filter</code>) that was specified when calling the CREATE_ANALYSIS_TASK Functions .

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name      IN VARCHAR2,
  parameter      IN VARCHAR2,
  value          IN VARCHAR2);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name      IN VARCHAR2,
  parameter      IN VARCHAR2,
  value          IN NUMBER);
```

Parameters

Table 123–10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 123–10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
value	New value of the specified parameter

SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER (  
    parameter    IN  VARCHAR2,  
    value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER (  
    parameter    IN  VARCHAR2,  
    value        IN  NUMBER);
```

Parameters

Table 123–11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter	<p>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</p> <ul style="list-style-type: none"> ■ <code>APPLY_CAPTURED_COMPILEENV</code>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). ■ <code>BASIC_FILTER</code>: basic filter for SQL tuning set ■ <code>COMPARISON_METRIC</code>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>) ■ <code>DATABASE_LINK</code>: can be set to the global name of a PUBLIC database link. When it is set, SPA will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. ■ <code>DAYS_TO_EXPIRE</code>: number of days until the task is deleted ■ <code>DEFAULT_EXECUTION_TYPE</code>: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. ■ <code>EXECUTION_DAYS_TO_EXPIRE</code>: number of days until the task's executions will be deleted (without deleting the task) ■ <code>EXECUTION_NAME1</code>: name of the first task execution to analyze ■ <code>EXECUTION_NAME2</code>: name of the second task execution to analyze ■ <code>LOCAL_TIME_LIMIT</code>: per-statement time out (seconds) ■ <code>PLAN_FILTER</code>: plan filter for SQL tuning set (see <code>SELECT_SQLSET</code> for possible values) ■ <code>RANK_MEASURE1</code>: first ranking measure for SQL tuning set ■ <code>RANK_MEASURE2</code>: second possible ranking measure for SQL tuning set ■ <code>RANK_MEASURE3</code>: third possible ranking measure for SQL tuning set ■ <code>RESUME_FILTER</code>: a extra filter for SQL tuning sets besides <code>BASIC_FILTER</code> ■ <code>SQL_IMPACT_THRESHOLD</code>: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. ■ <code>SQL_LIMIT</code>: maximum number of SQL statements to tune ■ <code>SQL_PERCENTAGE</code>: percentage filter of SQL tuning set statements ■ <code>TIME_LIMIT</code>: global time out (seconds) ■ <code>WORKLOAD_IMPACT_THRESHOLD</code>: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.

Parameter	Description
value	New value of the specified parameter

The DBMS_SQLTUNE package provides the interface to tune SQL statements.

The chapter contains the following topics:

- [Using DBMS_SQLTUNE](#)
 - Overview
 - Security Model
- [Data Structures](#)
- [Subprogram Groups](#)
 - SQL Tuning Advisor Subprograms
 - SQL Profile Subprograms
 - SQL Tuning Set Subprograms
 - Real-time SQL Monitoring Subprograms
- [Summary of DBMS_SQLTUNE Subprograms](#)

Using DBMS_SQLTUNE

- [Overview](#)
- [Security Model](#)

Overview

The DBMS_SQLTUNE package provides a number interrelated areas of functionality:

- [SQL Tuning Advisor Subprograms](#)
- [SQL Profile Subprograms](#)
- [SQL Tuning Set Subprograms](#)
- [Real-time SQL Monitoring Subprograms](#)

SQL Tuning Advisor

The SQL Tuning Advisor is one of a suite of Advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, the SQL Tuning Advisor automates the tuning process of problematic SQL statements. That is, it takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advice is provided in the form of precise SQL actions for tuning the SQL along with their expected performance benefit.

The group of [SQL Tuning Advisor Subprograms](#) provide a task-oriented interface that lets you access the Advisor. You can call the following subprograms in the order given to use some of the SQL Tuning Advisor's features:

1. You use the [CREATE_TUNING_TASK Functions](#) to create a tuning task for tuning a single statement or a group of SQL statements.
2. The [EXECUTE_TUNING_TASK Function & Procedure](#) executes a previously created tuning task.
3. The [REPORT_TUNING_TASK Function](#) displays the results of a tuning task.
4. You use the [SCRIPT_TUNING_TASK Function](#) to create a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

The SQL Tuning Advisor may recommend the creation of a SQL Profile to improve the performance of a statement. SQL Profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL Profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of [SQL Profile Subprograms](#) provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the [ACCEPT_SQL_PROFILE Procedure and Function](#) to accept a SQL Profile recommended by the SQL Tuning Advisor.
- You can alter the `STATUS`, `NAME`, `DESCRIPTION`, and `CATEGORY` attributes of an existing SQL Profile with the [ALTER_SQL_PROFILE Procedure](#).
- You can drop a SQL Profile with the [DROP_SQL_PROFILE Procedure](#).

SQL Tuning Sets

The SQL Tuning Advisor input can be a single SQL statement or a set of statements. When tuning multiple statements in one advisor task, you give the input in the form of a SQL Tuning Set (STS). A SQL Tuning Set is a database object that stores SQL

statements along with their execution context in a system-provided schema. SQL Tuning Sets provide an infrastructure for dealing with SQL workloads and simplify tuning of a large number of SQL statements.

SQL Tuning Sets store SQL statements along with

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans - which are the sequence of operations Oracle performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

SQL Tuning Sets can be created by filtering or ranking SQL statements from several sources:

- The cursor cache using the [SELECT_CURSOR_CACHE Function](#)
- Top SQL statements from the Automatic Workload Repository using the [SELECT_WORKLOAD_REPOSITORY Functions](#)
- Other SQL Tuning Sets using the [SELECT_SQLSET Function](#)
- SQL Trace files using the [SELECT_SQL_TRACE Function](#)
- A user-defined workload

The complete group of [SQL Tuning Set Subprograms](#) facilitates this functionality. As examples:

- You use the [CREATE_SQLSET Procedure and Function](#) to create a SQL tuning set object in the database
- The [LOAD_SQLSET Procedure](#) populates the SQL tuning set with a set of selected SQL
- The [CAPTURE_CURSOR_CACHE_SQLSET Procedure](#) collects SQL statements from the cursor cache over a specified time interval, attempting to build a realistic picture of system workload.

Import/Export SQL Tuning Sets and SQL Profiles

You use DBMS_SQLTUNE subprograms to move SQL Profiles and SQL Tuning Sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source system and populate that staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as datapump, import/export, or database link), where it is used to reconstitute the objects in their original form. These steps are implemented by means of subprograms included in this package:

1. Call the [CREATE_STGTAB_SQLPROF Procedure](#) or the [CREATE_STGTAB_SQLSET Procedure](#) to create the staging table on the source system.
2. Call the [PACK_STGTAB_SQLPROF Procedure](#) or [PACK_STGTAB_SQLSET Procedure](#) to populate the staging table with information from the source system.
3. Once you have moved the staging table to the destination system, you call the [UNPACK_STGTAB_SQLPROF Procedure](#) or the [UNPACK_STGTAB_SQLSET Procedure](#) to recreate the object on the new system.

See Also: Oracle Database Performance Tuning Guide for more information about programmatic flow.

Automatic Tuning Task Functions

There is a reserved system task "SYS_AUTO_SQL_TUNING_TASK" that performs SQL Tuning in the maintenance window, within the Autotask framework. It automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor upon them. It performs the same comprehensive analysis of any other SQL Tuning Task. In addition, it tests any SQL Profiles it finds by executing both the old and new query plan and implements the ones with a large benefit. SQL Profiles are implemented immediately at the time of tuning so the system can automatically benefit from the new plan. In each maintenance window, the task stores its results as a new execution, so that all results over the lifetime of the task are available, connected to each other through the task name but kept distinct by their execution names. You can use the DBA_ADVISOR_EXECUTIONS views to see information about the task's executions.

The automatic task is created by the system as part of the catalog scripts. It has its own special interface for displaying the report (the [REPORT_AUTO_TUNING_TASK Function](#)), and it shares the other interface with the standard tuning tasks. The task has its own report interface for viewing reports that span multiple executions.

To set parameters of the automatic task, use the [SET_TUNING_TASK_PARAMETER Procedures](#). To execute the task immediately, use the function version of the [EXECUTE_TUNING_TASK Function & Procedure](#). Disabling the task is done by means of the [DBMS_AUTO_TASK_ADMIN](#) package.

Real-time SQL Monitoring

Real-time SQL Monitoring allows DBAs or performance analysts to monitor the execution of long running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated close to real-time during statement execution. These statistics are exposed by two new fixed views, V\$SQL_MONITOR and V\$SQL_PLAN_MONITOR. In addition, DBMS_SQLTUNE provides a subprogram REPORT_SQL_MONITOR() to report on monitoring information.

Security Model

This package is available to PUBLIC and performs its own security checking:

- As the SQL Tuning advisor relies on the advisor framework, all tuning task interfaces (XXX_TUNING_TASK) require privilege ADVISOR.
- SQL Tuning Set subprograms (XXX_SQLSET) require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set they own, while the ADMINISTER ANY SQL TUNING SET privilege allows them to operate upon all SQL tuning sets, even those owned by other users. For example, using the [CREATE_SQLSET Procedure and Function](#) you can create a SQL tuning set to be owned by another user. In this case, the user need not necessarily have the ADMINISTER SQL TUNING SET privilege to operate upon her tuning set.
- Previously, three different privileges were needed to invoke subprograms concerned with SQL Profiles:
 - CREATE ANY SQL PROFILE
 - ALTER ANY SQL PROFILE
 - DROP ANY SQL PROFILE

These have now been deprecated in favor of ADMINISTER SQL MANAGEMENT OBJECT

Data Structures

The DBMS_SQLTUNE package defines the following OBJECT type

Object Types

- [SQLSET_ROW Object Type](#)

SQLSET_ROW Object Type

The `SQLSET_ROW` object models the content of a SQL Tuning Set for the user. Logically, a SQL Tuning Set is a collection of `SQLSET_ROWS` where each `SQLSET_ROW` contains a single SQL statement along with its execution context, statistics, binds and plan. The `SELECT_XXX` subprograms each model a data source as a collection of `SQLSET_ROWS`, unique by (`sql_id`, `plan_hash_value`). Similarly, the `LOAD_SQLSET` procedure takes as input a cursor whose row type is `SQLSET_ROW`, treating each `SQLSET_ROW` in isolation according to the policies requested by the user.

Several subprograms in the `DBMS_SQLTUNE` package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the `SQLSET_ROW` as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text              CLOB,
  object_list           sql_objects,
  bind_data             RAW(2000),
  parsing_schema_name   VARCHAR2(30),
  module                VARCHAR2(48),
  action                VARCHAR2(32),
  elapsed_time          NUMBER,
  cpu_time              NUMBER,
  buffer_gets           NUMBER,
  disk_reads            NUMBER,
  direct_writes         NUMBER,
  rows_processed        NUMBER,
  fetches               NUMBER,
  executions            NUMBER,
  end_of_fetch_count    NUMBER,
  optimizer_cost        NUMBER,
  optimizer_env         RAW(2000),
  priority              NUMBER,
  command_type          NUMBER,
  first_load_time       VARCHAR2(19),
  stat_period           NUMBER,
  active_stat_period    NUMBER,
  other                 CLOB,
  plan_hash_value       NUMBER,
  sql_plan              sql_plan_table_type,
  bind_list             sql_binds)
```

Attributes

Table 124–1 *SQLSET_ROW Attributes*

Attribute	Description
<code>sql_id</code>	Unique SQL ID
<code>forcing_matching_signature</code>	Signature with literals, case, and whitespace removed
<code>sql_text</code>	Full text for the statement
<code>object_list</code>	Currently not implemented

Table 124-1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.
parsing_schema	Schema where the SQL is parsed
module	Last application module for the SQL
action	Last application action for the SQL
elapsed_time	Sum total elapsed time for this SQL statement
cpu_time	Sum total CPU time for this SQL statement
buffer_gets	Sum total number of buffer gets
disk_reads	Sum total number of disk reads
direct_writes	Sum total number of direct writes
rows_processed	Sum total number of rows processed by this SQL
fetches	Sum total number of fetches
executions	Total executions of this SQL
end_of_fetch_count	Number of times the statement was fully executed with all of its rows fetched
optimizer_cost	Optimizer cost for this SQL
optimizer_env	Optimizer environment for this SQL statement
priority	User-defined priority (1,2,3)
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of parent cursor
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active
other	Other column for user defined attributes
plan_hash_value	Plan hash value of the plan
sql_plan	Explain plan
bind_list	List of user specified binds for SQL This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data - they are mutually exclusive.

Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function:

- [SQL Tuning Advisor Subprograms](#)
- [SQL Profile Subprograms](#)
- [SQL Tuning Set Subprograms](#)
- [Real-time SQL Monitoring Subprograms](#)

SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 124–2 SQL Tuning Task Subprograms

Subprogram	Description
CANCEL_TUNING_TASK Procedure on page 124-24	Cancels the currently executing tuning task
CREATE_TUNING_TASK Functions on page 124-30	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor
DROP_TUNING_TASK Procedure on page 124-37	Drops a SQL tuning task
EXECUTE_TUNING_TASK Function & Procedure on page 124-38	Executes a previously created tuning task
IMPLEMENT_TUNING_TASK Function on page 124-39	Implements a set of SQL Profile recommendations made by the SQL Tuning Advisor
INTERRUPT_TUNING_TASK Procedure on page 124-40	Interrupts the currently executing tuning task
REPORT_AUTO_TUNING_TASK Function on page 124-51	Displays a report from the automatic tuning task, reporting on a range of executions
REPORT_TUNING_TASK Function on page 124-56	Displays the results of a tuning task
RESET_TUNING_TASK Procedure on page 124-58	Resets the currently executing tuning task to its initial state
RESUME_TUNING_TASK Procedure on page 124-59	Resumes a previously interrupted task that was created to process a SQL tuning set.
SCRIPT_TUNING_TASK Function on page 124-60	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations
SET_TUNING_TASK_PARAMETER Procedures on page 124-73	Updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

The [Summary of DBMS_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

SQL Profile Subprograms

This subprogram group provides an interface to manage SQL Profiles.

Table 124–3 SQL Profile Subprograms

Subprogram	Description
ACCEPT_SQL_PROFILE Procedure and Function on page 124-18	Creates a SQL Profile for the specified tuning task
ALTER_SQL_PROFILE Procedure on page 124-22	Alters specific attributes of an existing SQL Profile object
CREATE_STGTAB_SQLPROF Procedure on page 124-28	Creates the staging table used for copying SQL profiles from one system to another.
DROP_SQL_PROFILE Procedure on page 124-35	Drops the named SQL Profile from the database
PACK_STGTAB_SQLPROF Procedure on page 124-45	Moves profile data out of the SYS schema into the staging table
REMAP_STGTAB_SQLPROF Procedure on page 124-48	Changes the profile data values kept in the staging table prior to performing an unpack operation
SQLTEXT_TO_SIGNATURE Function on page 124-75	Returns a SQL text's signature
UNPACK_STGTAB_SQLPROF Procedure on page 124-76	Uses the profile data stored in the staging table to create profiles on this system

The [Summary of DBMS_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 124–4 SQL Tuning Set Subprograms

Subprogram	Description
ADD_SQLSET_REFERENCE Function on page 124-21	Adds a new reference to an existing SQL tuning set to indicate its use by a client
CAPTURE_CURSOR_CACHE_SQLSET Procedure on page 124-25	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set
CREATE_SQLSET Procedure and Function on page 124-27	Creates a SQL tuning set object in the database
CREATE_STGTAB_SQLSET Procedure on page 124-29	Creates a staging table through which SQL Tuning Sets are imported and exported
DELETE_SQLSET Procedure on page 124-34	Deletes a set of SQL statements from a SQL tuning set
DROP_SQLSET Procedure on page 124-36	Drops a SQL tuning set if it is not active
LOAD_SQLSET Procedure on page 124-41	Populates the SQL tuning set with a set of selected SQL
PACK_STGTAB_SQLSET Procedure on page 124-46	Copies tuning sets out of the <code>SYS</code> schema into the staging table
REMOVE_SQLSET_REFERENCE Procedure on page 124-50	Deactivates a SQL tuning set to indicate it is no longer used by the client
SELECT_CURSOR_CACHE Function on page 124-62	Collects SQL statements from the cursor cache
SELECT_SQL_TRACE Function on page 124-66	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>
SELECT_SQLSET Function on page 124-69	Collects SQL statements from an existing SQL tuning set
SELECT_WORKLOAD_REPOSITORY Functions on page 124-71	Collects SQL statements from the workload repository
UNPACK_STGTAB_SQLSET Procedure on page 124-77	Copies one or more SQL tuning sets from the staging table
UPDATE_SQLSET Procedures on page 124-79	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The [Summary of DBMS_SQLTUNE Subprograms](#) contains a complete listing of all subprograms in the package.

Real-time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 124–5 SQL Tuning Set Subprograms

Subprogram	Description
REPORT_SQL_MONITOR Function on page 124-53	Reports on real-time SQL Monitoring

Summary of DBMS_SQLTUNE Subprograms

Table 124–6 DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
ACCEPT_SQL_PROFILE Procedure and Function on page 124-18	Create a SQL Profile for the specified tuning task	SQL Profile Subprograms on page 124-12
ADD_SQLSET_REFERENCE Function on page 124-21	Adds a new reference to an existing SQL tuning set to indicate its use by a client	SQL Tuning Set Subprograms on page 124-13
ALTER_SQL_PROFILE Procedure on page 124-22	Alters specific attributes of an existing SQL Profile object	SQL Profile Subprograms on page 124-12
CANCEL_TUNING_TASK Procedure on page 124-24	Cancels the currently executing tuning task	SQL Tuning Advisor Subprograms on page 124-11
CAPTURE_CURSOR_CACHE_SQLSET Procedure on page 124-25	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set	SQL Tuning Set Subprograms on page 124-13
CREATE_SQLSET Procedure and Function on page 124-27	Creates a SQL tuning set object in the database	SQL Tuning Set Subprograms on page 124-13
CREATE_STGTAB_SQLPROF Procedure on page 124-28	Creates the staging table used for copying SQL profiles from one system to another.	SQL Profile Subprograms on page 124-12
CREATE_STGTAB_SQLSET Procedure on page 124-29	Creates a staging table through which SQL Tuning Sets are imported and exported	SQL Tuning Set Subprograms on page 124-13
CREATE_TUNING_TASK Functions on page 124-30	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor	SQL Tuning Advisor Subprograms on page 124-11
DELETE_SQLSET Procedure on page 124-34	Deletes a set of SQL statements from a SQL tuning set	SQL Tuning Set Subprograms on page 124-13
DROP_SQL_PROFILE Procedure on page 124-35	Drops the named SQL Profile from the database	SQL Profile Subprograms on page 124-12
DROP_SQLSET Procedure on page 124-36	Drops a SQL tuning set if it is not active	SQL Tuning Set Subprograms on page 124-13
DROP_TUNING_TASK Procedure on page 124-37	Drops a SQL tuning task	SQL Tuning Advisor Subprograms on page 124-11
EXECUTE_TUNING_TASK Function & Procedure on page 124-38	Executes a previously created tuning task	SQL Tuning Advisor Subprograms on page 124-11

Table 124-6 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
IMPLEMENT_TUNING_TASK Function on page 124-39	implements a set of SQL Profile recommendations made by the SQL Tuning Advisor	SQL Tuning Advisor Subprograms on page 124-11
INTERRUPT_TUNING_TASK Procedure on page 124-40	Interrupts the currently executing tuning task	SQL Tuning Advisor Subprograms on page 124-11
LOAD_SQLSET Procedure on page 124-41	Populates the SQL tuning set with a set of selected SQL	SQL Tuning Set Subprograms on page 124-13
PACK_STGTAB_SQLPROF Procedure on page 124-45	Moves profile data out of the SYS schema into the staging table	SQL Profile Subprograms on page 124-12
PACK_STGTAB_SQLSET Procedure on page 124-46	Moves tuning sets out of the SYS schema into the staging table	SQL Tuning Set Subprograms on page 124-13

REPORT_TUNING_TASK Function on page 124-56	Displays the results of a tuning task	SQL Tuning Set Subprograms on page 124-13
RESET_TUNING_TASK Procedure on page 124-58	Resets the currently executing tuning task to its initial state	SQL Tuning Advisor Subprograms on page 124-11
RESUME_TUNING_TASK Procedure on page 124-59	Resumes a previously interrupted task that was created to process a SQL tuning set.	SQL Tuning Advisor Subprograms on page 124-11
SCRIPT_TUNING_TASK Function on page 124-60	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations	SQL Tuning Advisor Subprograms on page 124-11
SELECT_CURSOR_CACHE Function on page 124-62	Collects SQL statements from the cursor cache	SQL Tuning Set Subprograms on page 124-13

Table 124–6 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
SELECT_SQL_TRACE Function on page 124-66	Reads the content of one or more trace files and returns the SQL statements it finds in the format of <code>sqlset_row</code>	SQL Tuning Set Subprograms on page 124-13
SELECT_SQLSET Function on page 124-69	Collects SQL statements from an existing SQL tuning set	SQL Tuning Set Subprograms on page 124-13
SELECT_WORKLOAD_REPOSITORY Functions on page 124-71	Collects SQL statements from the workload repository	SQL Tuning Set Subprograms on page 124-13
SET_TUNING_TASK_PARAMETER Procedures on page 124-73	Updates the value of a SQL tuning parameter of type <code>VARCHAR2</code> or <code>NUMBER</code> .	SQL Tuning Set Subprograms on page 124-13
SQLTEXT_TO_SIGNATURE Function on page 124-75	Returns a SQL text's signature	SQL Profile Subprograms on page 124-12
UNPACK_STGTAB_SQLPROF Procedure on page 124-76	Uses the profile data stored in the staging table to create profiles on this system	SQL Profile Subprograms on page 124-12
UNPACK_STGTAB_SQLSET Procedure on page 124-77	Moves one or more SQL tuning sets from the staging table	SQL Tuning Set Subprograms on page 124-13
UPDATE_SQLSET Procedures on page 124-79	Updates selected fields for a SQL statement in a SQL tuning set	SQL Tuning Set Subprograms on page 124-13

ACCEPT_SQL_PROFILE Procedure and Function

This procedure creates a SQL Profile recommended by the SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn't exist, an error is reported.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name      IN  VARCHAR2,
  object_id     IN  NUMBER      := NULL,
  name          IN  VARCHAR2   := NULL,
  description   IN  VARCHAR2   := NULL,
  category     IN  VARCHAR2   := NULL);
task_owner    IN  VARCHAR2   := NULL,
replace       IN  BOOLEAN     := FALSE,
force_match   IN  BOOLEAN     := FALSE);
```

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
  task_name      IN  VARCHAR2,
  object_id     IN  NUMBER      := NULL,
  name          IN  VARCHAR2   := NULL,
  description   IN  VARCHAR2   := NULL,
  category     IN  VARCHAR2   := NULL;
  task_owner    IN  VARCHAR2   := NULL,
  replace       IN  BOOLEAN     := FALSE,
  force_match   IN  BOOLEAN     := FALSE)
RETURN VARCHAR2;
```

Parameters

Table 124-7 ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL Profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL Profile.
description	A user specified string describing the purpose of the SQL Profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.
category	This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL Profile. It defaults to the value "DEFAULT". This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL Profile. An ACCEPT_SQL_PROFILE will fail if this combination is duplicated.

Table 124–7 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL Profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL Profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.

Return Values

The name of the SQL profile.

Usage Notes

The CREATE ANY SQL PROFILE privilege is required.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement from the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, object_id) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, TEST), so that it will not be used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (  
    task_name => :stmt_task, -  
    category  => 'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -  
                                       force_match => TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to '5'. Please notice that you must pass an object id to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object id is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -  
    sqlset_name => 'my_workload', -  
    rank1      => 'ELAPSED_TIME', -  
    time_limit  => 3600,          -  
    description => 'my workload ordered by elapsed time');
```

-- execute the resulting task

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

-- create the profile for the sql statement corresponding to object_id = 5.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (  
    task_name => :sts_task, -  
    object_id => 5);
```

ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 124–8 ADD_SQLSET_REFERENCE Function Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
description	The description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only.

The function returns a reference ID that is used to remove it later. You use the REMOVE_SQLSET_REFERENCE Procedure to delete references to a SQL tuning set.

```
variable rid number;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
  sqlset_name => 'my_workload', -
  description => 'my sts reference');
```

You can use the views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.

ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL Profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text)

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
  name           IN  VARCHAR2,
  attribute_name IN  VARCHAR2,
  value          IN  VARCHAR2);
```

Parameters

Table 124–9 ALTER_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of the existing SQL Profile to alter
attribute_name	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
value	The (mandatory) new value of the attribute using valid attribute values

Usage Notes

Requires the "ALTER ANY SQL PROFILE" privilege.

Examples

```
-- Disable a profile, so it will be not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name           => :pname, -
                                     attribute_name => 'STATUS', -
                                     value          => 'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                     attribute_name => 'STATUS', -
                                     value          => 'ENABLED');

-- Change the category of the profile so it will be used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name           => :pname, -
                                     attribute_name => 'CATEGORY', -
                                     value          => 'TEST');
```

```
-- Change it back:  
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name      => :pname, -  
                                     attribute_name => 'CATEGORY', -  
                                     value         => 'DEFAULT');
```

CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK(  
  task_name          IN VARCHAR2);
```

Parameters

Table 124–10 CANCEL_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task to cancel

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

CAPTURE_CURSOR_CACHE_SQLSET Procedure

Over a specified time interval this procedure incrementally captures a workload from the cursor cache into a SQL tuning set. The procedure captures a workload from the cursor cache into a SQL tuning set, polling the cache multiple times over a time period and updating the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
  sqlset_name      IN VARCHAR2,
  time_limit       IN POSITIVE := 1800,
  repeat_interval  IN POSITIVE := 300,
  capture_option   IN VARCHAR2 := 'MERGE',
  capture_mode     IN NUMBER   := MODE_REPLACE_OLD_STATS,
  basic_filter     IN VARCHAR2 := NULL,
  sqlset_owner     IN VARCHAR2 := NULL);
```

Parameters

Table 124–11 CAPTURE_CURSOR_CACHE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
time_limit	The total amount of time, in seconds, to execute
repeat_interval	The amount of time, in seconds, to pause between sampling
capture_option	During capture, either insert new statements, update existing ones, or both. 'INSERT', 'UPDATE', or 'MERGE' just like load_option in load_sqlset
capture_mode	capture mode (UPDATE and MERGE capture options). Possible values: <ul style="list-style-type: none"> ▪ MODE_REPLACE_OLD_STATS - Replace statistics when the number of executions seen is greater than that stored in the SQL tuning set ▪ MODE_ACCUMULATE_STATS - Add new values to current values for SQL we already store. Note that this mode detects if a statement has been aged out, so the final value for a statistics will be the sum of the statistics of all cursors that statement existed under.
basic_filter	Filter to apply to cursor cache on each sampling (see select_XXX subprograms)
sqlset_owner	The owner of the SQL tuning set or NULL for current schema owner

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This will capture all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and cursor cache turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5, -
    capture_mode     => dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name      => 'my_workload', -
    time_limit       => 30, -
    repeat_interval  => 5, -
    capture_option   => 'INSERT');
```

CREATE_SQLSET Procedure and Function

The procedure creates a SQL tuning set object in the database.

The function causes the system to generate a name for the SQL Tuning Set.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.CREATE_SQLSET (
  sqlset_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  sqlset_owner IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 124–12 CREATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
description	The description of the SQL tuning set
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 124–13 CREATE_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
table_name	The name of the table to create (case-insensitive unless double quoted). Required.
schema_name	The schema to create the table in, or NULL for current schema (case-insensitive unless double quoted)
tablespace_name	The tablespace to store the staging table within, or NULL for current user's default tablespace (case-insensitive unless double quoted)

Usage Notes

- Call this procedure once before issuing a call to the [PACK_STGTAB_SQLPROF Procedure](#).
- This procedure can be called multiple times if you would like to have different SQL profiles in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');
```

CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL Tuning Sets are imported and exported

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
  table_name          IN VARCHAR2,
  schema_name        IN VARCHAR2 := NULL,
  tablespace_name     IN VARCHAR2 := NULL);
```

Parameters

Table 124–14 CREATE_STGTAB_SQLSET Procedure Parameters

Parameter	Description
table_name	The name of the table to create (case-sensitive)
schema_name	The schema in which to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	The tablespace in which to store the staging table, or NULL for current user's default tablespace (case-sensitive)

Usage Notes

- Call this procedure once before issuing a call to the [PACK_STGTAB_SQLSET Procedure](#).
- This procedure can be called multiple times if you would like to have different tuning sets in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.
- Users issuing the call must have permission to CREATE TABLE in the schema provided and the relevant tablespace.
- Please note that the staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

CREATE_TUNING_TASK Functions

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the Cursor Cache given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.

In all cases, the function mainly creates an advisor task and sets its parameters.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_text          IN CLOB,
  bind_list        IN sql_binds := NULL,
  user_name        IN VARCHAR2 := NULL,
  scope            IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit       IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name        IN VARCHAR2 := NULL,
  description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_id           IN VARCHAR2,
  plan_hash_value  IN NUMBER    := NULL,
  scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit      IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name       IN VARCHAR2 := NULL,
  description     IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Workload Repository format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  sql_id          IN VARCHAR2,
  plan_hash_value IN NUMBER    := NULL,
  scope          IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit     IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name      IN VARCHAR2 := NULL,
  description    IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQLSET format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sqlset_name     IN VARCHAR2,
  basic_filter    IN VARCHAR2 := NULL,
```

```

object_filter    IN VARCHAR2 := NULL,
rank1           IN VARCHAR2 := NULL,
rank2           IN VARCHAR2 := NULL,
rank3           IN VARCHAR2 := NULL,
result_percentage IN NUMBER  := NULL,
result_limit    IN NUMBER   := NULL,
scope           IN VARCHAR2 := SCOPE_COMPREHENSIVE,
time_limit      IN NUMBER   := TIME_LIMIT_DEFAULT,
task_name       IN VARCHAR2 := NULL,
description     IN VARCHAR2 := NULL
plan_filter     IN VARCHAR2 := 'MAX_ELAPSED_TIME',
sqlset_owner    IN VARCHAR2 := NULL)
RETURN VARCHAR2;

```

Parameters

Table 124–15 *CREATE_TUNING_TASK* Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sql_id	Identifier of a SQL statement
bind_list	An ordered list of bind values in ANYDATA type
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from the (filtered/ranked) SQL
user_name	Username for whom the statement is to be tuned
scope	Tuning scope (limited/comprehensive)
time_limit	The maximum duration in seconds for the tuning session
task_name	Optional tuning task name
description	Description of the SQL tuning session to a maximum of 256 characters

Table 124–15 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
plan_filter	<p>Plan filter. It is applicable in case there are multiple plans (plan_hash_value) associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are:</p> <ul style="list-style-type: none"> ■ LAST_GENERATED: plan with the most recent timestamp ■ FIRST_GENERATED: plan with the earliest timestamp, the opposite to LAST_GENERATED ■ LAST_LOADED: plan with the most recent first_load_time statistics information ■ FIRST_LOADED: plan with the earliest first_load_time statistics information, the opposite to LAST_LOADED ■ MAX_ELAPSED_TIME: plan with the maximum elapsed time ■ MAX_BUFFER_GETS: plan with the maximum buffer gets ■ MAX_DISK_READS: plan with the maximum disk reads ■ MAX_DIRECT_WRITES: plan with the maximum direct writes ■ MAX_OPTIMIZER_COST: plan with the maximum optimizer cost
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL Tuning Set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24');

-- tune in limited scope
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
    scope => 'LIMITED');

-- only give 10 minutes for tuning statement
```

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
    time_limit => 600);

-- Workload repository format
exec :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
    end_snap => 2, sql_id => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then tune it)

-- Tune our statements in order by buffer gets, time limit of one hour
-- the default ranking measure is elapsed time.
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sqlset_name => 'my_workload', -
    rank1      => 'BUFFER_GETS', -
    time_limit => 3600, -
    description => 'tune my workload ordered by buffer gets');
```

DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
  sqlset_name   IN  VARCHAR2,
  basic_filter  IN  VARCHAR2 := NULL,
  sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 124–16 *DELETE_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the Tuning Set.
sqlset_owner	The owner of the SQL tuning set, or NULL for current schema owner

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name => 'my_workload', -
                                basic_filter => 'elapsed_time < 1000000');
```

DROP_SQL_PROFILE Procedure

This procedure drops the named SQL Profile from the database.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
  name          IN  VARCHAR2,
  ignore        IN  BOOLEAN  := FALSE);
```

Parameters

Table 124–17 *DROP_SQL_PROFILE Procedure Parameters*

Parameter	Description
name	The (mandatory) name of SQL Profile to be dropped. The name is case sensitive.
ignore	Ignores errors due to object not existing

Usage Notes

Requires the "DROP ANY SQL PROFILE" privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (  
    sqlset_name    IN VARCHAR2,  
    sqlset_owner   IN VARCHAR2 := NULL);
```

Parameters

Table 124–18 DROP_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
sqlset_owner	The owner of the SQL tuning set, or NULL for current schema owner

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.  
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK(  
    task_name          IN VARCHAR2);
```

Parameters

Table 124–19 *DROP_TUNING_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the tuning task to drop

EXECUTE_TUNING_TASK Function & Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
    task_name          IN VARCHAR2,
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL)
RETURN VARCHAR2;

DBMS_SQLTUNE.EXECUTE_TUNING_TASK (
    task_name          IN VARCHAR2,
    execution_name     IN VARCHAR2          := NULL,
    execution_params   IN dbms_advisor.argList := NULL,
    execution_desc     IN VARCHAR2          := NULL);
```

Parameters

Table 124–20 EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to execute
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set via the SET_TUNING_TASK_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK (:stmt_task);
```

IMPLEMENT_TUNING_TASK Function

This function implements a set of SQL Profile recommendations made by the SQL Tuning Advisor. Call this subprogram is equivalent to calling the [SCRIPT_TUNING_TASK Function](#) and then running the script.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
  task_name      IN VARCHAR2,
  rec_type       IN VARCHAR2 := REC_TYPE_SQL_PROFILES,
  owner_name     IN VARCHAR2 := NULL,
  execution_name IN VARCHAR2 := NULL);
```

Parameters

Table 124–21 *IMPLEMENT_TUNING_TASK Function Parameters*

Parameter	Description
task_name	Name of the tuning task for which to implement recommendations
rec_type	Filter the types of recommendations to implement. Only 'PROFILES' is supported.
owner_name	Owner of the relevant tuning task or NULL for the current user.
execution_name	name of the task execution to use. If NULL, recommendations from the last task execution will be implemented.

INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task will end its operations as it would at normal exit so that the user will be able access the intermediate results.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(  
  task_name          IN VARCHAR2);
```

Parameters

Table 124–22 *INTERRUPT_TUNING_TASK Procedure Parameters*

Parameter	Description
task_name	Name of the tuning task to interrupt

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
  sqlset_name      IN  VARCHAR2,
  populate_cursor  IN  sqlset_cursor,
  load_option      IN  VARCHAR2 := 'INSERT',
  update_option    IN  VARCHAR2 := 'REPLACE',
  update_condition IN  VARCHAR2 := NULL,
  update_attributes IN VARCHAR2 := NULL,
  ignore_null      IN  BOOLEAN  := TRUE,
  commit_rows     IN  POSITIVE  := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL);
```

Parameters

Table 124–23 *LOAD_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name to populate
populate_cursor	The cursor reference from which to populate
load_option	Specifies how the statements will be loaded into the SQL tuning set. The possible values are: <ul style="list-style-type: none"> ■ INSERT (default) - add only new statements ■ UPDATE - update existing the SQL statements and ignores any new statements ■ MERGE - this is a combination of the two other options. This option inserts new statements and updates the information of the existing ones.
update_option	Specifies how the existing statements will be updated. This parameter is considered only if load_option is specified with 'UPDATE'/'MERGE' as an option. The possible values are: <ul style="list-style-type: none"> ■ REPLACE (default) - update the statement using the new statistics, bind list, object list, and so on. ■ ACCUMULATE - when possible combine attributes (for example, statistics like elapsed_time, and so on) otherwise just replace the old values (for example, module, action, and so on) by the new provided ones. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.

Table 124–23 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
<code>update_condition</code>	Specifies a where clause to execute the update operation. The update is performed only if the specified condition is true. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: <ul style="list-style-type: none"> ■ OLD - to refer to statement attributes from the SQL tuning set (destination) ■ NEW - to refer to statements attributes from the input statements (source)
<code>update_attributes</code>	Specifies the list of a SQL statement attributes to update during a merge or update operation. The possible values are: <ul style="list-style-type: none"> ■ NULL (default) - the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution context like module, action, and so on. ■ BASIC - statistics and binds only ■ TYPICAL - BASIC + SQL plans (without row source statistics) and without object reference list ■ ALL - all attributes including the execution context attributes like module, action, and so on. ■ List of comma separated attribute names to update - EXECUTION_CONTEXT, EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)
<code>ignore_null</code>	If TRUE do not update an attribute if the new value is NULL. That is, do not override with NULL values unless intentional.
<code>commit_rows</code>	If a value is provided, the load will commit after each set of that many statements is inserted. If NULL is provided, the load will commit only once, at the end of the operation.
<code>sqlset_owner</code>	The owner of the SQL tuning set, or the current schema owner or NULL for current owner

Exceptions

- This procedure returns an error when `sqlset_name` is invalid, or a corresponding SQL tuning set does not exist, or the `populate_cursor` is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in `sqlset_row`), or because they violate the user's privileges.

Usage Notes

Rows in the input `populate_cursor` must be of type `SQLSET_ROW`.

Examples

In this example, you create and populate a SQL tuning set with all cursor cache statements with an elapsed time of 5 seconds or more excluding statements that belong to `SYS` schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which will only load new statements, since the SQL tuning set is empty.

```

-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the cursor cache
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
          'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                          populate_cursor => cur);

END;
/

```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your `update_option` because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the `elapsed_time` filter because it is assumed that any statement captured in AWR is important, but still you throw away the `SYS`-parsed cursors to avoid recursive SQL.

```

DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
          'parsing_schema_name <> ''SYS''',
          NULL, NULL, NULL, NULL,
          1,
          NULL,
          'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                          populate_cursor => cur,
                          Using DBMS_SQLTUNE
                          load_option => 'MERGE',
                          update_option => 'ACCUMULATE');

END;

```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the `load_option` argument of the `LOAD_SQLSET` procedure.

```

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

```

```
    DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

    DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
        populate_cursor => cur,
        load_option => 'UPDATE');
END;
/
```

PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
  profile_name          IN VARCHAR2 := '%',
  profile_category      IN VARCHAR2 := 'DEFAULT',
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 124–24 *PACK_STGTAB_SQLPROF Procedure Parameters*

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

- This procedure requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.
- Note that this function issues a COMMIT after packing each SQL profile, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles that will be used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this will even move profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
                                         staging_table_name => 'PROFILE_STGTAB');
```

PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the [CREATE_STGTAB_SQLSET Procedure](#).

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2,
  sqlset_owner         IN VARCHAR2 := NULL,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 124–25 *PACK_STGTAB_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The name of the SQL Tuning Set to pack (% wildcards acceptable, case-sensitive)
sqlset_owner	The category from which to pack SQL Tuning Sets (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-sensitive)
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- This procedure can be called several times to move more than one SQL tuning set. Users can then move the populated staging table to another system using any method, such as database link or datapump. Users can then call the [UNPACK_STGTAB_SQLSET Procedure](#) create the SQL tuning set on the other system.
- Note that this function issues a COMMIT after packing each SQL tuning set, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the system in the staging table (to create a staging table, see the [CREATE_STGTAB_SQLSET Procedure](#)).

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name => '%', -
                                     sqlset_owner  => '%', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

Put only those SQL tuning sets owned by the current user in the staging table.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name => '%', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

Pack a specific SQL tuning set.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name => 'my_workload', -
                                     staging_table_name => 'STGTAB_SQLSET');
```

Pack a second SQL tuning set.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name      => 'workload_subset', -  
                                     staging_table_name => 'STGTAB_SQLSET');
```

REMAP_STGTAB_SQLPROF Procedure

This procedure allows DBAs to change the profile data values kept in the staging table prior to performing an unpack operation. The procedure can be used to change the category of a profile. It can be used to change the name of a profile if one already exists on the system with the same name.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 124–26 REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
old_profile_name	The name of the profile to target for a remap operation (case-sensitive)
new_profile_name	The new name of the profile, or NULL to remain the same (case-sensitive)
new_profile_category	The new category for the profile, or NULL to remain the same (case-sensitive)
staging_table_name	The name of the table on which to perform the remap operation (case-sensitive). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

Using this procedure requires the UPDATE privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name => :pname,      -
                                         new_profile_name => 'IMP' || :pname, -
                                         staging_table_name => 'PROFILE_STGTAB');
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name => :pname,      -
                                         new_profile_category => 'TEST',    -
                                         staging_table_name => 'PROFILE_STGTAB');
```

REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
  old_sqlset_name      IN VARCHAR2,
  old_sqlset_owner    IN VARCHAR2 := NULL,
  new_sqlset_name     IN VARCHAR2 := NULL,
  new_sqlset_owner    IN VARCHAR2 := NULL,
  staging_table_name  IN VARCHAR2,
  tagging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 124–27 REMAP_STGTAB_SQLSET Procedure Parameters

Parameter	Description
old_sqlset_name	The name of the tuning set to target for a remap operation. Wildcards are not supported.
old_sqlset_owner	The new name of the tuning set owner to target for a remap operation. NULL for current schema owner
new_sqlset_name	The new name for the tuning set, or NULL to keep the same tuning set name.
new_sqlset_owner	The new owner for the tuning set, or NULL to remain the same owner name.
staging_table_name	The name of the table on which to perform the remap operation (case-sensitive)
staging_schema_owner	The name of staging table owner, or NULL for current schema owner (case-sensitive)

Usage Notes

You can call this procedure multiple times to remap more than one tuning set name or owner. Note that this procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'my_workload', -
                                       old_sqlset_owner => 'SH', -
                                       new_sqlset_name => 'imp_workload', -
                                       staging_table_name => 'STGTAB_SQLSET');
```

```
-- Change the owner of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name => 'imp_workload', -
                                       old_sqlset_owner => 'SH', -
                                       new_sqlset_owner => 'SYS', -
                                       staging_table_name => 'STGTAB_SQLSET');
```

REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate it is no longer used by the client.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
  sqlset_name  IN VARCHAR2,
  reference_id IN NUMBER);
```

Parameters

Table 124–28 REMOVE_SQLSET_REFERENCE Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
reference_id	The identifier of the reference to remove

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again.

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
                                     sqlset_name => 'my_workload', -
                                     reference_id => :rid);
```

Use views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.

REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task. This differs from the [REPORT_AUTO_TUNING_TASK Function](#) in that it reports on a range of subtasks.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK (
  begin_exec      IN VARCHAR2  := NULL,
  end_exec       IN VARCHAR2  := NULL,
  type           IN VARCHAR2  := TYPE_TEXT,
  level          IN VARCHAR2  := LEVEL_TYPICAL,
  section        IN VARCHAR2  := SECTION_ALL,
  object_id      IN NUMBER    := NULL,
  result_limit   IN NUMBER    := NULL,
  segment_scheme IN VARCHAR2  := SEGMENT_NONE)
RETURN CLOB;
```

Parameters

Table 124–29 *REPORT_AUTO_TUNING_TASK Function Parameters*

Parameter	Description
begin_exec	Name of execution from which to begin the report. NULL retrieves a report on the most recent run
end_exec	Name of execution at which to end the report. NULL retrieves a report on the most recent run.
type	Type of the report to produce. Possible values are TYPE_TEXT which produces a text report
level	Level of detail in the report: <ul style="list-style-type: none"> ▪ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. ▪ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. ▪ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> ▪ SECTION_SUMMARY - summary information ▪ SECTION_FINDINGS - tuning findings ▪ SECTION_PLAN - explain plans ▪ SECTION_INFORMATION - general information ▪ SECTION_ERROR - statements with errors ▪ SECTION_ALL - all statements
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report
segment_scheme	Currently non-operational

Return Values

A CLOB containing the desired report.

REPORT_SQL_MONITOR Function

This function builds a report (in Text, HTML or XML) to present the monitoring information collected with regard to the execution of a SQL statement. Note that this function is provided for ease of use and the structure or content of this report could change in future releases.

See Also: [Real-time SQL Monitoring Subprograms](#) on page 124-14 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR (
  sql_id           IN VARCHAR2 := NULL,
  session_id      IN NUMBER   := NULL,
  session_serial  IN NUMBER   := NULL,
  sql_exec_start  IN DATE     := NULL,
  sql_exec_id     IN NUMBER   := NULL,
  inst_id        IN NUMBER   := -1,
  start_time_filter IN DATE   := NULL,
  end_time_filter IN DATE   := NULL,
  instance_id_filter IN NUMBER := NULL,
  parallel_filter IN VARCHAR2 := NULL,
  event_detail    IN VARCHAR2 := 'YES',
  report_level    IN VARCHAR2 := 'TYPICAL',
  type           IN VARCHAR2 := 'TEXT')
RETURN CLOB;
```

Parameters

Table 124–30 *REPORT_SQL_MONITOR Function Parameters*

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, this parameter targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
sql_exec_id	This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.

Table 124–30 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
<code>inst_id</code>	Only considers statements started on the specified instance. Use -1 (the default) to target the login instance. NULL will target all instances.
<code>start_time_filter</code>	If not NULL, the report will only consider the activity (from <code>GV\$ACTIVE_SESSION_HISTORY</code>) recorded after the specified date. If NULL, the reported activity will start when the execution of the targeted SQL statement has started.
<code>end_time_filter</code>	If not NULL, the report will show only the activity (from <code>GV\$ACTIVE_SESSION_HISTORY</code>) collected before the date <code>end_time_filter</code> . If NULL, the reported activity will end when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
<code>instance_id_filter</code>	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.
<code>parallel_filter</code>	<p>Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel Execution servers). The value of this parameter can be:</p> <ul style="list-style-type: none"> ▪ NULL to target all processes ▪ <code>[qc] [servers (<svr_grp> [,] <svr_set> [,] <srv_num>)]</code>: 'qc' stands for query coordinator and <code>servers ()</code> stipulate which PX servers to consider. <p>The following examples show how to target a subset of the parallel processes:</p> <ul style="list-style-type: none"> ▪ <code>qc</code>: targets only the query coordinator ▪ <code>servers (1)</code>: targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. ▪ <code>servers (, 2)</code>: targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) ▪ <code>servers (1, 1)</code>: consider only group 1, set 1 ▪ <code>servers (1, 2, 4)</code>: consider only group 1, set 2, server number 4. This reports for a single parallel server process ▪ <code>qc servers (1, 2, 4)</code>: same as above by also including the query coordinator
<code>event_detail</code>	When value is 'YES' (the default), reported activity from <code>GV\$ACTIVE_SESSION_HISTORY</code> is aggregated by (<code>wait_class</code> , <code>event_name</code>). Use 'NO' to only aggregate by <code>wait_class</code> .
<code>report_level</code>	<p>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Individual report sections can also be enabled/disabled by using a <code>+/-<section_name></code>. Several sections are defined: 'PLAN', 'PARALLEL', 'SESSIONS', 'INSTANCE', and 'SQL_TEXT'.</p> <p>For example, use 'BASIC +PARALLEL' to show the basic report with an additional section reporting parallel information. Or use 'ALL -PLAN -INSTANCE' for a complete report excluding plan detail and instance information.</p>

Table 124–30 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML' or 'XML'.

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
 - The last SQL monitored by Oracle (this is the default behavior, so there is no need to specify any parameter)
 - The last SQL executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id=>USERENV('SID')` for the current session or `session_id=>20, session_serial=>103` for session ID 20, serial number 103.
 - The last execution of a specific statement identified by its `sql_id`.
 - A specific execution of a SQL statement identified by its execution key (`sql_id`, `sql_exec_start` and `sql_exec_id`).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
 - `GV$SQL_MONITOR`
 - `GV$SQL_PLAN_MONITOR`
 - `GV$SQL_PLAN`
 - `GV$ACTIVE_SESSION_HISTORY`
 - `GV$SESSION_LONGOPS`
 - `GV$SQL`

See Also: *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.

REPORT_TUNING_TASK Function

This procedure displays the results of a tuning task.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK (
  task_name      IN  VARCHAR2,
  type           IN  VARCHAR2  := TYPE_TEXT,
  level         IN  VARCHAR2  := LEVEL_TYPICAL,
  section       IN  VARCHAR2  := SECTION_ALL,
  object_id     IN  NUMBER    := NULL,
  result_limit  IN  NUMBER    := NULL,
  owner_name    IN  VARCHAR2  := NULL,
  execution_name IN  VARCHAR2  := NULL))
RETURN CLOB;
```

Parameters

Table 124–31 REPORT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task to report
type	Type of the report to produce. Possible values are TYPE TEXT which produces a text report.
level	Level of detail in the report: <ul style="list-style-type: none"> ■ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. ■ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. ■ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Optionally limit the report to a single section (ALL for all sections): <ul style="list-style-type: none"> ■ SECTION_SUMMARY - summary information ■ SECTION_FINDINGS - tuning findings ■ SECTION_PLAN - explain plans ■ SECTION_INFORMATION - general information ■ SECTION_ERROR - statements with errors ■ SECTION_ALL - all statements
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

Return Values

A CLOB containing the desired report.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS',
5) from dual;
```

RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(  
  task_name          IN VARCHAR2);
```

Parameters

Table 124–32 *RESET_TUNING_TASK Procedure Parameters*

Parameter	Description
task_name	The name of the tuning task to reset

Examples

```
-- reset and re-execute a task  
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);  
  
-- re-execute the task  
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
  task_name          IN VARCHAR2,
  basic_filter       IN VARCHAR2 := NULL);
```

Parameters

Table 124–33 RESUME_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to resume
basic_filter	A SQL predicate to filter the SQL from the SQL Tuning Set. Note that this filter will be applied in conjunction with the basic filter (i.e., parameter <code>basic_filter</code>) when calling CREATE_TUNING_TASK Functions .

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide. For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

SCRIPT_TUNING_TASK Function

This function creates a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

See Also: [SQL Tuning Advisor Subprograms](#) on page 124-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMBER    := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

Table 124–34 *SCRIPT_TUNING_TASK Procedure Parameters*

Parameter	Description
task_name	Name of the tuning task for which to apply a script
rec_type	Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL: 'PROFILES' 'STATISTICS' 'INDEXES'. For example, a script with profiles and statistics: 'PROFILES, STATISTICS'
object_id	Optionally filters by a single object ID
result_limit	Optionally shows commands for only top N SQL (ordered by object_id and ignored if an object_id is also specified)
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner
excution_name	Name of the task execution to use. If NULL, the script will be generated for the last task execution.

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- Once the script is returned, it should then be checked by the DBA and executed.
- Wrap with a call to `DBMS_ADVISOR.CREATE_FILE` to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```

```
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

SELECT_CURSOR_CACHE Function

This function collects SQL statements from the SQL Cursor Cache.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter      IN  VARCHAR2 := NULL,
  object_filter     IN  VARCHAR2 := NULL,
  ranking_measure1  IN  VARCHAR2 := NULL,
  ranking_measure2  IN  VARCHAR2 := NULL,
  ranking_measure3  IN  VARCHAR2 := NULL,
  result_percentage IN  NUMBER   := 1,
  result_limit      IN  NUMBER   := NULL,
  attribute_list    IN  VARCHAR2 := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 124–35 *SELECT_CURSOR_CACHE Function Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	The SQL predicate to filter the SQL from the cursor cache defined on attributes of the <code>SQLSET_ROW</code>
object_filter	Specifies the objects that should exist in the object list of selected SQL from the cursor cache
ranking_measure (n)	An order-by clause on the selected SQL
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> ■ BASIC (default) -all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list ■ ALL - return all attributes ■ Comma separated list of attribute names this allows to return only a subset of SQL attributes: <code>EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS</code>: similar to <code>SQL_PLAN + row source statistics</code>

Return Values

This function returns a one `SQLSET_ROW` per `SQL_ID` or `PLAN_HASH_VALUE` pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the cursor cache views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''));

-- Notice that some statements can have multiple plans. The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset will be called after opening a cursor, along the
-- lines given below

-- Select all statements in the cursor cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
end;
/

-- All statements from a particular module/action.
```

```

                                                'ELAPSED_TIME', NULL, NULL,
                                                1,
                                                100)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the cursor cache. This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'BUFFER_GETS', NULL, NULL,
                                                .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQL_TRACE (
  directory          IN VARCHAR2,
  file_name          IN VARCHAR2 := NULL,
  mapping_table_name IN VARCHAR2 := NULL,
  mapping_table_owner IN VARCHAR2 := NULL, ,
  select_mode        IN POSITIVE := SINGLE_EXECUTION,
  options             IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start       IN VARCHAR2 := NULL,
  pattern_end         IN VARCHAR2 := NULL,
  result_limit        IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 124–36 *SELECT_SQL_TRACE Function Parameters*

Parameter	Description
<code>directory</code>	The directory object containing the trace file(s). This field is mandatory.
<code>file_name</code>	All or part of name of the trace file(s) to process. If <code>NULL</code> then the current or most recent file in the specified location/path will be used. '%' wildcards are supported for matching trace file names.
<code>mapping_table_name</code>	The mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is <code>NULL</code> , the mappings in the current database will be used.
<code>mapping_table_owner</code>	the mapping table owner. If it is <code>NULL</code> , the current user will be used.
<code>select_mode</code>	the mode for selecting SQL from the trace. By default, it is <code>SINGLE_EXECUTION</code> . <ul style="list-style-type: none"> ■ <code>SINGLE_EXECUTION</code> - return one execution of a SQL.(default). ■ <code>ALL_EXECUTIONS</code> - return all executions.
<code>options</code>	The options. By default, it is <code>LIMITED_COMMAND_TYPE</code> which can be specified to include SQL statements from all Oracle command types. <ul style="list-style-type: none"> ■ <code>LIMITED_COMMAND_TYPE</code> - returns the SQL statements with the command types <code>CREATE</code>, <code>INSERT</code>, <code>SELECT</code>, <code>UPDATE</code>, <code>DELETE</code>, <code>UPSERT</code>. It is the default. ■ <code>ALL_COMMAND_TYPE</code> - returns the SQL statements with all command types.
<code>pattern_start</code>	Opening delimiting pattern of the trace file section(s) to consider. <code>CURRENTLY INOPERABLE</code> .

Table 124–36 (Cont.) SELECT_SQL_TRACE Function Parameters

Parameter	Description
pattern_end	closing delimiting pattern of the trace file section(s) to process. CURRENTLY INOPERABLE.
result_limit	Top SQL from the (filtered) source. Default to MAXSB4 if NULL.

Return Values

This function returns a SQLSET_ROW object.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL Tuning Set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
FROM dba_objects
WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                          'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                          'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                          'LOB', 'OPERATOR', 'PACKAGE',
                          'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                          'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                          'TYPE BODY')

UNION ALL
SELECT user_id id, username owner, NULL name
FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
  FROM TABLE(
    DBMS_SQLTUNE.SELECT_SQL_TRACE(
      directory=>'SQL_TRACE_DIR',
      file_name=>'%trc',
      mapping_table_name=>'mapping')) p;
  DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
```

/

SELECT_SQLSET Function

This function reads SQLSET contents.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name      IN  VARCHAR2,
  basic_filter     IN  VARCHAR2 := NULL,
  object_filter    IN  VARCHAR2 := NULL,
  ranking_measure1 IN  VARCHAR2 := NULL,
  ranking_measure2 IN  VARCHAR2 := NULL,
  ranking_measure3 IN  VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN  NUMBER := NULL),
  attribute_list   IN  VARCHAR2 := NULL,
  plan_filter      IN  VARCHAR2 := NULL,
  sqlset_owner     IN  VARCHAR2 := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 124-37 *SELECT_SQLSET Procedure Parameters*

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	The SQL predicate to filter the SQL from the SQL Tuning Set defined on attributes of the SQLSET_ROW
object_filter	Specifies the objects that should exist in the object list of selected SQL from the cursor cache
ranking_measure(n)	An order-by clause on the selected SQL
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> ▪ BASIC (default) -all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ▪ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list ▪ ALL - return all attributes ▪ Comma separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)
plan_filter	The plan filter

Table 124–37 (Cont.) SELECT_SQLSET Procedure Parameters

Parameter	Description
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SELECT_WORKLOAD_REPOSITORY Functions

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between `begin_snap` and `end_snap`.
- Collect SQL statements from a workload repository baseline.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLAOD_REPOSITORY (
  begin_snap      IN NUMBER,
  end_snap        IN NUMBER,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLAOD REPOSITORY (
  baseline_name   IN VARCHAR2,
  basic_filter     IN VARCHAR2 := NULL,
  object_filter   IN VARCHAR2 := NULL,
  ranking_measure1 IN VARCHAR2 := NULL,
  ranking_measure2 IN VARCHAR2 := NULL,
  ranking_measure3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := 1,
  result_limit     IN NUMBER := NULL,
  attribute_list  IN VARCHAR2 := NULL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 124-38 *SELECT_WORKLOAD_REPOSITORY Function Parameters*

Parameter	Description
<code>begin_snap</code>	Begin snapshot (non-inclusive)
<code>end_snap</code>	End snapshot (inclusive)
<code>baseline_name</code>	The name of the baseline period
<code>basic_filter</code>	The SQL predicate to filter the SQL from the workload repository defined on attributes of the <code>SQLSET_ROW</code>
<code>object_filter</code>	Specifies the objects that should exist in the object list of selected SQL from the SWRF
<code>ranking_measure (n)</code>	An order-by clause on the selected SQL
<code>result_percentage</code>	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.

Table 124–38 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: <ul style="list-style-type: none"> ■ BASIC (default) -all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list ■ ALL - return all attributes ■ Comma separated list of attribute names allowing return of only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or NUMBER.

The task must be set to its initial state before calling this procedure.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.set_tuning_task_parameter(
  task_name      IN  VARCHAR2,
  parameter      IN  VARCHAR2,
  value          IN  VARCHAR2);
```

```
DBMS_SQLTUNE.set_tuning_task_parameter(
  task_name      IN  VARCHAR2,
  parameter      IN  VARCHAR2,
  value          IN  NUMBER);
```

Parameters

Table 124–39 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute

Table 124–39 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	<p>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</p> <ul style="list-style-type: none"> ■ MODE: tuning scope (comprehensive, limited) ■ USERNAME: username under which the statement will be parsed ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions will be deleted (without deleting the task) ■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function & Procedure. ■ TIME_LIMIT: global time out (seconds) ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ TEST_EXECUTE: FULL/AUTO/OFF. <ul style="list-style-type: none"> * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute ■ BASIC_FILTER: basic filter for SQL tuning set ■ OBJECT_FILTER: object filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements
parameter (cont.)	<p>The following parameters are supported for the automatic tuning task only:</p> <ul style="list-style-type: none"> ■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL Profiles automatically ■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum ■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.
value	New value of the specified parameter

SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in `dba_sql_profiles`.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (  
    sql_text      IN CLOB,  
    force_match IN BOOLEAN := FALSE)  
RETURN NUMBER;
```

Parameters

Table 124-40 *SQLTEXT_TO_SIGNATURE Function Parameters*

Parameter	Description
<code>sql_text</code>	SQL text whose signature is required. Required.
<code>force_match</code>	If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also: [SQL Profile Subprograms](#) on page 124-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
  profile_name      IN VARCHAR2 := '%',
  profile_category IN VARCHAR2 := 'DEFAULT',
  replace           IN BOOLEAN,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 124–41 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
profile_category	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
replace	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists
staging_table_name	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the CREATE ANY SQL PROFILE privilege and the SELECT privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace           => FALSE, -
                                         staging_table_name => 'PROFILE_STGTAB');

-- If there is a failure during the unpack operation, users can find the profile
-- we failed on and perform a remap_stgtab_sqlprof operation targeting it. Then
-- they can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created will just be replaced
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace           => TRUE, -
                                         staging_table_name => 'PROFILE_STGTAB');
```

UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name          IN VARCHAR2 := '%',
  sqlset_owner         IN VARCHAR2 := NULL,
  replace              IN BOOLEAN,
  staging_table_name   IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 124-42 UNPACK_STGTAB_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The name of the tuning set to unpack (not NULL). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.
sqlset_owner	The name of tuning set owner, or NULL for current schema owner. Wildcards supported.
replace	Replaces tuning set if they already exist. If FALSE, raises errors if you try to create a tuning set that already exists
staging_table_name	The name of the staging table, moved after a call to the PACK_STGTAB_SQLSET Procedure (case-sensitive)
staging_schema_owner	The name of staging table owner, or NULL for current schema owner (case-sensitive)

Usage Notes

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended will continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the [REMAP_STGTAB_SQLSET Procedure](#) to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner     => '%', -
                                       replace           => FALSE, -
                                       staging_table_name => 'STGTAB_SQLSET');
```

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system. In this case, users should call

```
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name      => '%', -
                                       sqlset_owner      => '%', -
                                       replace            => TRUE, -
                                       staging_table_name => 'STGTAB_SQLSET');
```

UPDATE_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

See Also: [SQL Tuning Set Subprograms](#) on page 124-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  VARCHAR2 := NULL);
```

```
DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name      IN  VARCHAR2,
  sql_id           IN  VARCHAR2,
  attribute_name   IN  VARCHAR2,
  attribute_value  IN  NUMBER := NULL);
```

Parameters

Table 124-43 UPDATE_SQLSET Function Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
sql_id	The identifier of the statement to update
attribute_name	The name of the attribute to modify
attribute_value	The new value of the attribute

DBMS_STAT_FUNCS

The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

- [Summary of DBMS_STAT_FUNCS Subprograms](#)

Summary of DBMS_STAT_FUNCS Subprograms

Table 125–1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure on page 125-3	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure on page 125-4	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure on page 125-5	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure on page 125-6	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure on page 125-7	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure on page 125-8	Tests how well a sample of values fits a Weibull distribution

EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  mu          IN   NUMBER,
  sig        OUT  NUMBER);
```

Parameters

Table 125–2 EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
  ownname      IN   VARCHAR2,
  tablename    IN   VARCHAR2,
  columnname   IN   VARCHAR2,
  test_type    IN   VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
  mean         IN   NUMBER,
  stdev        IN   NUMBER,
  sig          OUT  NUMBER);
```

Parameters

Table 125–3 *NORMAL_DIST_FIT Procedure Parameters*

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  lambda      IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 125-4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`. The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  sigma_value IN   NUMBER DEFAULT 3,
  s           OUT  SummaryType);
```

Parameters

Table 125–5 *SUMMARY Procedure Parameters*

Parameter	Description
<code>ownername</code>	The schema where the table resides.
<code>tablename</code>	The table where the column resides.
<code>columnname</code>	The column of the table to be summarized.
<code>sigma_value</code>	The number of sigmas for the set of extreme values, defaults to 3.
<code>s</code>	The Record containing summary information about given column.

Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
  count          NUMBER,
  min            NUMBER,
  max           NUMBER,
  range         NUMBER,
  mean          NUMBER,
  cmode         num_table,
  variance      NUMBER,
  stddev       NUMBER,
  quantile_5   NUMBER,
  quantile_25  NUMBER,
  median       NUMBER,
  quantile_75  NUMBER,
  quantile_95  NUMBER,
  plus_x_sigma NUMBER,
  minus_x_sigma NUMBER,
  extreme_values num_table,
  top_5_values  n_arr,
  bottom_5_values n_arr);
```

UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  var_type    IN   VARCHAR2 DEFAULT 'CONTINUOUS',
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  paramA      IN   NUMBER,
  paramB      IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 125–6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
  ownername   IN   VARCHAR2,
  tablename   IN   VARCHAR2,
  columnname  IN   VARCHAR2,
  test_type   IN   VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
  alpha       IN   NUMBER,
  mu          IN   NUMBER,
  beta        IN   NUMBER,
  sig         OUT  NUMBER);
```

Parameters

Table 125–7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

With the DBMS_STATS package you can view and modify optimizer statistics gathered for database objects.

- [Summary of DBMS_STATS Subprograms](#)

Using DBMS_STATS

This section contains topics which relate to using the DBMS_STATS package.

- [Overview](#)
- [Types](#)
- [Constants](#)
- [Operational Notes](#)
- [Deprecated Subprograms](#)
- [Examples](#)

Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the `DELETE_COLUMN_STATS` procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel

See Also: *Oracle Database Performance Tuning Guide* for more information about "Managing Optimizer Statistics".

Types

Types for the minimum and maximum values and histogram endpoints include:

```
TYPE numarray IS VARRAY(256) OF NUMBER;
TYPE datearray IS VARRAY(256) OF DATE;
TYPE chararray IS VARRAY(256) OF VARCHAR2(4000);
TYPE rawarray IS VARRAY(256) OF RAW(2000);
TYPE fltarray IS VARRAY(256) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(256) OF BINARY_DOUBLE;
```

```
TYPE StatRec IS RECORD (
    epc NUMBER,
    minval RAW(2000),
    maxval RAW(2000),
    bkvals NUMARRAY,
    novals NUMARRAY);
```

Types for listing stale tables include:

```
TYPE ObjectElem IS RECORD (
    ownname VARCHAR2(30), -- owner
    objtype VARCHAR2(6), -- 'TABLE' or 'INDEX'
    objname VARCHAR2(30), -- table/index
    partname VARCHAR2(30), -- partition
    subpartname VARCHAR2(30)); -- subpartition
type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```
TYPE DiffRepElem IS RECORD (
    report CLOB, -- stats difference report
    maxdiffpct number); -- max stats difference (percentage)
type DiffRepTab is table of DiffRepElem;
```

Constants

The DBMS_STATS package uses the constants shown in [Table 126-1](#):

Table 126-1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
AUTO_CASCADE	BOOLEAN	NULL	Lets Oracle decide whether to collect statistics for indexes or not
AUTO_DEGREE	NUMBER	32768	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
AUTO_INVALIDATE	BOOLEAN	NULL	Lets Oracle decide when to invalidate dependent cursors
AUTO_SAMPLE_SIZE	NUMBER	0	Indicates that auto-sample size algorithms should be used

Operational Notes

The `DBMS_STATS` subprograms perform the following general operations:

- [Gathering Optimizer Statistics](#)
- [Setting or Getting Statistics](#)
- [Deleting Statistics](#)
- [Transferring Statistics](#)
- [Locking or Unlocking Statistics](#)
- [Restoring and Purging Statistics History](#)
- [User-Defined Statistics](#)
- [Pending Statistics](#)
- [Comparing Statistics](#)
- [Extended Statistics](#)

Most of the `DBMS_STATS` procedures include the three parameters `statown`, `stattab`, and `statid`. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with *sets* of statistics.

The `stattab` parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the `statown` parameter is specified). You can create multiple tables with different `stattab` identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single `stattab` by using the `statid` parameter, which avoids cluttering the user's schema.

For the `SET` and `GET` procedures, if `stattab` is not provided (that is, `NULL`), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if `stattab` is not `NULL`, then the `SET` or `GET` operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of `DBMS_STATS` procedures using the [SET_PARAM Procedure](#).

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, `force` which allows you to override any lock on statistics.

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the `ANALYZE` command:

- [GATHER_DATABASE_STATS Procedures](#)
- [GATHER_DICTIONARY_STATS Procedure](#)
- [GATHER_FIXED_OBJECTS_STATS Procedure](#)
- [GATHER_INDEX_STATS Procedure](#)

[GATHER_SCHEMA_STATS Procedures](#)
[GATHER_SYSTEM_STATS Procedure](#)
[GATHER_TABLE_STATS Procedure](#)

The `GATHER_*` procedures also collect user-defined statistics for columns and domain indexes.

The `statown`, `stattab`, and `statid` parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

[GENERATE_STATS Procedure](#)

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

[PREPARE_COLUMN_VALUES Procedures](#)
[PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure](#)
[PREPARE_COLUMN_VALUES_ROWID Procedure](#)

[SET_COLUMN_STATS Procedures](#)
[SET_INDEX_STATS Procedures](#)
[SET_SYSTEM_STATS Procedure](#)
[SET_TABLE_STATS Procedure](#)

[GET_COLUMN_STATS Procedures](#)
[GET_INDEX_STATS Procedures](#)
[GET_SYSTEM_STATS Procedure](#)
[GET_TABLE_STATS Procedure](#)

In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or external statistics table:

- User-defined statistics (`extstats`)
- The statistics type schema name (`statsschema`)
- The statistics type name (`statsname`)

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

[DELETE_COLUMN_STATS Procedure](#)
[DELETE_DATABASE_STATS Procedure](#)
[DELETE_DICTIONARY_STATS Procedure](#)

[DELETE_FIXED_OBJECTS_STATS Procedure](#)
[DELETE_INDEX_STATS Procedure](#)
[DELETE_SCHEMA_STATS Procedure](#)
[DELETE_SYSTEM_STATS Procedure](#)
[DELETE_TABLE_STATS Procedure](#)

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

[CREATE_STAT_TABLE Procedure](#)
[DROP_STAT_TABLE Procedure](#)

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table ([EXPORT_*](#))
- from a user statistics table to the dictionary ([IMPORT_*](#))

[EXPORT_COLUMN_STATS Procedure](#)
[EXPORT_DATABASE_STATS Procedure](#)
[EXPORT_DICTIONARY_STATS Procedure](#)
[EXPORT_FIXED_OBJECTS_STATS Procedure](#)
[EXPORT_INDEX_STATS Procedure](#)
[EXPORT_SCHEMA_STATS Procedure](#)
[EXPORT_SYSTEM_STATS Procedure](#)
[EXPORT_TABLE_STATS Procedure](#)

[IMPORT_COLUMN_STATS Procedure](#)
[IMPORT_DATABASE_STATS Procedure](#)
[IMPORT_DICTIONARY_STATS Procedure](#)
[IMPORT_FIXED_OBJECTS_STATS Procedure](#)
[IMPORT_INDEX_STATS Procedure](#)
[IMPORT_SCHEMA_STATS Procedure](#)
[IMPORT_SYSTEM_STATS Procedure](#)
[IMPORT_TABLE_STATS Procedure](#)

Note: Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

[LOCK_SCHEMA_STATS Procedure](#)
[LOCK_TABLE_STATS Procedure](#)

[UNLOCK_SCHEMA_STATS Procedure](#)
[UNLOCK_TABLE_STATS Procedure](#)

The [LOCK_*](#) procedures either freeze the current set of the statistics or to keep the statistics empty (uncollected). When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

[RESET_GLOBAL_PREFS_DEFAULTS Procedure](#)

[RESTORE_DICTIONARY_STATS Procedure](#)

[RESTORE_FIXED_OBJECTS_STATS Procedure](#)

[RESTORE_SCHEMA_STATS Procedure](#)

[RESTORE_SYSTEM_STATS Procedure](#)

[RESTORE_TABLE_STATS Procedure](#)

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the [ALTER_STATS_HISTORY_RETENTION Procedure](#).

The other DBMS_STATS procedures related to restoring statistics are:

- [PURGE_STATS Procedure](#): This procedure lets you manually purge old versions beyond a time stamp.
- [GET_STATS_HISTORY_RETENTION Function](#): This function gets the current statistics history retention value.
- [GET_STATS_HISTORY_AVAILABILITY Function](#): This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

RESTORE_* operations are not supported for user defined statistics.

User-Defined Statistics

The DBMS_STATS package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the [GET_INDEX_STATS Procedures](#) invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

SET_* and GET_* operations for user-defined statistics are also supported using a special version of the SET and GET interfaces for columns and indexes.

EXPORT_*, IMPORT_* and RESTORE_* operations are not supported for user defined statistics.

Pending Statistics

The package gather statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the PUBLISH option to FALSE using the SET*PREFS procedures. The default value for PUBLISH is TRUE. The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_private_statistics` is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the [EXPORT_PENDING_STATS Procedure](#)) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the [PUBLISH_PENDING_STATS Procedure](#)) if the performance is acceptable or delete (run the [DELETE_PENDING_STATS Procedure](#)) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- [DELETE_PENDING_STATS Procedure](#)
- [EXPORT_PENDING_STATS Procedure](#)
- [PUBLISH_PENDING_STATS Procedure](#)

Comparing Statistics

The `DIFF_TABLE_STATS_*` statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using `stats`
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the differential percentage.

Extended Statistics

This package allows you to collect statistics for column groups and expressions (known as "statistics extensions"). The statistics collected for column groups and expressions are called "extended statistics".

Statistics on Column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on (c1, c2), the optimizer will use this statistics for estimating the combined selectivity of the predicates. The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extension names in place of column names.

Related subprograms:

- [CREATE_EXTENDED_STATS Function](#)
- [DROP_EXTENDED_STATS Procedure](#)

- [SHOW_EXTENDED_STATS_NAME](#) Function

Deprecated Subprograms

The following subprograms are obsolete with Release 11g:

- [GET_PARAM Function](#)
Instead, use [GET_PREFS Function](#)
- [SET_PARAM Procedure](#)
Instead, use [SET_GLOBAL_PREFS Procedure](#)
- [RESET_GLOBAL_PREFS_DEFAULTS Procedure](#)
Instead use [RESET_GLOBAL_PREF_DEFAULTS Procedure](#)

Examples

- [Using Pending Statistics](#)
- [Gathering Daytime System Statistics](#)

Using Pending Statistics

Assume many modifications have been made to the `employees` table since the last time statistics were gathered. To ensure that the cost-based optimizer is still picking the best plan, statistics should be gathered once again; however, the user is concerned that new statistics will cause the optimizer to choose bad plans when the current ones are acceptable. The user can do the following:

```
EXEC DBMS_STATS.SET_TABLE_PREFS('hr', 'employees', 'PUBLISH', 'false');
```

By setting the `employees` tables publish preference to `FALSE`, any statistics gather from now on will not be automatically published. The newly gathered statistics will be marked as pending.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS ('hr', 'employees');
```

To test the newly gathered statistics, set `optimizer_pending_statistics` to `TRUE` in a session and run sample queries.

```
ALTER SESSION SET optimizer_use_pending_statistics = TRUE;
```

If the pending statistics generate sound execution plans, they can be published:

```
EXEC DBMS_STATS.PUBLISH_PENDING_STATS('hr', 'employees');
EXEC DBMS_STATS.SET_TABLE_PREF('hr', 'employees', 'PUBLISH', 'true');
```

Gathering Daytime System Statistics

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab  => 'mystats',
    statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab  => 'mystats',
    statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE jobno number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
```

```
    ('mystats','OLTP');'  
    sysdate, 'sysdate + 1');  
    COMMIT;  
END;  
  
BEGIN  
    DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS  
    ('mystats','OLAP');'  
    sysdate + 0.5, 'sysdate + 1');  
    COMMIT;  
END;
```

Summary of DBMS_STATS Subprograms

Table 126–2 DBMS_STATS Package Subprograms

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure on page 126-20	Changes the statistics history retention value
CONVERT_RAW_VALUE Procedures on page 126-21	Convert the internal representation of a minimum or maximum value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure on page 126-22	Convert the internal representation of a minimum or maximum value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure on page 126-23	Convert the internal representation of a minimum or maximum value into a datatype-specific value
COPY_TABLE_STATS Procedure on page 126-24	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function on page 126-25	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure on page 126-27	Creates a table with name <code>stattab</code> in ownname's schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure on page 126-28	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure on page 126-30	Deletes the statistics preferences of all the tables, excluding the tables owned by Oracle.
DELETE_DATABASE_STATS Procedure on page 126-33	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure on page 126-34	Deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure on page 126-33	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure on page 126-36	Deletes index-related statistics
DELETE_PENDING_STATS Procedure on page 126-37	Deletes the private statistics that have been collected but have not been published
DELETE_SCHEMA_PREFS Procedure on page 126-38	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure on page 126-41	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure on page 126-42	Deletes system statistics
DELETE_TABLE_PREFS Procedure on page 126-43	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure on page 126-46	Deletes table-related statistics
DIFF_TABLE_STATS_IN_HISTORY Function on page 126-48	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps

Table 126–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
DIFF_TABLE_STATS_IN_PENDING Function on page 126-49	Compares pending statistics and statistics as of a timestamp or statistics from dictionary.
DIFF_TABLE_STATS_IN_STATTAB Function on page 126-50	Compares statistics for a table from two different sources
DROP_EXTENDED_STATS Procedure on page 126-51	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure on page 126-52	Drops a user statistics table created by <code>CREATE_STAT_TABLE</code>
EXPORT_COLUMN_STATS Procedure on page 126-53	Retrieves statistics for a particular column and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_DATABASE_PREFS Procedure on page 126-54	Exports the statistics preferences of all the tables, excluding the tables owned by Oracle.
EXPORT_DATABASE_STATS Procedure on page 126-55	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by <code>statown.stattab</code>
EXPORT_DICTIONARY_STATS Procedure on page 126-56	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_FIXED_OBJECTS_STATS Procedure on page 126-57	Retrieves statistics for fixed tables and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_INDEX_STATS Procedure on page 126-58	Retrieves statistics for a particular index and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_PENDING_STATS Procedure on page 126-59	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREFS Procedure on page 126-60	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STATS Procedure on page 126-61	Retrieves statistics for all objects in the schema identified by <code>ownname</code> and stores them in the user statistics table identified by <code>stattab</code>
EXPORT_SYSTEM_STATS Procedure on page 126-62	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure on page 126-63	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure on page 126-64	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONITORING_INFO Procedure on page 126-65	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_STATS Procedures on page 126-66	Gathers statistics for all objects in the database
GATHER_DICTIONARY_STATS Procedure on page 126-66	Gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components
GATHER_FIXED_OBJECTS_STATS Procedure on page 126-74	Gathers statistics of fixed objects
GATHER_INDEX_STATS Procedure on page 126-75	Gathers index statistics

Table 126–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
GATHER_SCHEMA_STATS Procedures on page 126-77	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STATS Procedure on page 126-81	Gathers system statistics
GATHER_TABLE_STATS Procedure on page 126-83	Gathers table and column (and index) statistics
GENERATE_STATS Procedure on page 126-87	Generates object statistics from previously collected statistics of related objects
GET_COLUMN_STATS Procedures on page 126-88	Gets all column-related information
GET_INDEX_STATS Procedures on page 126-90	Gets all index-related information
GET_PARAM Function on page 126-93	Gets the default value of parameters of DBMS_STATS procedures [see Deprecated Subprograms on page 126-12]
GET_STATS_HISTORY_AVAILABILITY Function on page 126-97	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_RETENTION Function on page 126-98	Returns the current retention value
GET_SYSTEM_STATS Procedure on page 126-99	Gets system statistics from stattab, or from the dictionary if stattab is NULL
GET_TABLE_STATS Procedure on page 126-101	Gets all table-related information
IMPORT_COLUMN_STATS Procedure on page 126-103	Retrieves statistics for a particular column from the user statistics table identified by stattab and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure on page 126-104	Imports the statistics preferences of all the tables, excluding the tables owned by Oracle.
IMPORT_DATABASE_STATS Procedure on page 126-105	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure on page 126-106	Retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_STATS Procedure on page 126-107	Retrieves statistics for fixed tables from the user statistics table identified by stattab and stores them in the dictionary
IMPORT_INDEX_STATS Procedure on page 126-108	Retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary
IMPORT_SCHEMA_PREFS Procedure on page 126-109	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure on page 126-110	Retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary
IMPORT_SYSTEM_STATS Procedure on page 126-111	Retrieves system statistics from the user statistics table and stores them in the dictionary

Table 126–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
IMPORT_TABLE_PREFS Procedure on page 126-112	Sets the statistics preferences of the specified table in the specified schema.
IMPORT_TABLE_STATS Procedure on page 126-113	Retrieves statistics for a particular table from the user statistics table identified by <code>stattab</code> and stores them in the dictionary
LOCK_PARTITION_STATS Procedure on page 126-114	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure on page 126-115	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure on page 126-116	Locks the statistics on the table
PREPARE_COLUMN_VALUES Procedures on page 126-117	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure on page 126-119	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PREPARE_COLUMN_VALUES_ROWID Procedure on page 126-121	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PUBLISH_PENDING_STATS Procedure on page 126-123	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure on page 126-124	Purges old versions of statistics saved in the dictionary
RESET_GLOBAL_PREFS_DEFAULTS Procedure on page 126-125	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure on page 126-126	Resets global preferences to default values
RESTORE_DICTIONARY_STATS Procedure on page 126-128	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_STATS Procedure on page 126-129	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure on page 126-130	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure on page 126-131	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure on page 126-132	Restores statistics of a table as of a specified timestamp (<code>as_of_timestamp</code>), as well as statistics of associated indexes and columns
SET_COLUMN_STATS Procedures on page 126-133	Sets column-related information
SET_DATABASE_PREFS Procedure on page 126-135	Sets the statistics preferences of all the tables, excluding the tables owned by Oracle

Table 126–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
SET_GLOBAL_PREFS Procedure on page 126-133	Sets the global statistics preferences
SET_INDEX_STATS Procedures on page 126-141	Sets index-related information
SET_PARAM Procedure on page 126-144	Sets default values for parameters of DBMS_STATS procedures [see Deprecated Subprograms on page 126-12]
SET_SCHEMA_PREFS Procedure on page 126-146	Sets the statistics preferences of all the tables owned by the specified owner name
SET_SYSTEM_STATS Procedure on page 126-147	Sets system statistics
SET_TABLE_PREFS Procedure on page 126-149	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure on page 126-152	Sets table-related information
SHOW_EXTENDED_STATS_NAME Function on page 126-154	Returns the name of the virtual column that is created for the user-specified extension
UNLOCK_PARTITION_STATS Procedure on page 126-155	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure on page 126-156	Unlocks the statistics on all the table in a schema
UNLOCK_TABLE_STATS Procedure on page 126-157	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure on page 126-158	Upgrades user statistics on an older table

ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and [PURGE_STATS Procedure](#).

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (  
    retention          IN          NUMBER);
```

Parameters

Table 126–3 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
retention	<p>The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:</p> <ul style="list-style-type: none">▪ 0 - old statistics are never saved. The automatic purge will delete all statistics history▪ 1 - statistics history is never purged by automatic purge.▪ NULL - change statistics history retention to default value

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges.

CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT BINARY_FLOAT);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT BINARY_DOUBLE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT DATE);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT NUMBER);
```

```
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval      RAW,
    resval OUT VARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 126–4 *CONVERT_RAW_VALUE Procedure Parameters*

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The `minval` and `maxval` fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
    rawval      RAW,
    resval OUT NVARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value_nvarchar, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 126–5 *CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters*

Parameter	Description
<code>rawval</code>	The raw representation of a column minimum or maximum datatype-specific output parameters
<code>resval</code>	The converted, type-specific value

CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
    rawval      RAW,
    resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 126–6 *CONVERT_RAW_VALUE_ROWID Procedure Parameters*

Parameter	Description
rawval	The raw representation of a column minimum or maximum datatype-specific output parameters
resval	The converted, type-specific value

COPY_TABLE_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition after scaling (the number of blks, number of rows). It sets the high bound partitioning value as the maximum value of the first partitioning column and high bound partitioning value of the previous partition as the minimum value of the first partitioning column for a range partitioned table. It finds the maximum and minimum from the list of values for the list partitioned table. It also sets the normalized maximum and minimum values. If the destination partition is the first partition then minimum values are equal to maximum values. If the statistics for source are not available then nothing is copied.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    srcpartname      VARCHAR2,
    dstpartname      VARCHAR2,
    scale_factor     VARCHAR2 DEFAULT 1,
    force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–7 COPY_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of index to analyze
tabname	Table name of source and destination [sub] partitions
srcpartname	Source [sub] partition
dstpartname	Destination [sub] partition
scale_factor	Scale factor to scale nblks, nrows etc. in dstpartname
force	When value of this argument is TRUE, copy statistics even if locked

Exceptions

ORA-20000: Invalid partition name

ORA-20001: Bad input value

CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    extension  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 126–8 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by SYS.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables..
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column can not appear more than once in a column group.
- A column group can not contain expressions.

- An expression must contain at least one column.
- An expression can not contain a subquery.

CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2,  
    tblspace VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–9 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>stattab</code>	Name of the table to create. This value should be passed as the <code>stattab</code> parameter to other procedures when the user does not want to modify the dictionary statistics directly.
<code>tblspace</code>	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.

Exceptions

ORA-20000: Table already exists or insufficient privileges.

ORA-20001: Tablespace does not exist.

DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    colname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    statab           VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    cascade_parts    BOOLEAN  DEFAULT TRUE,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    force            BOOLEAN  DEFAULT FALSE,
    col_stat_type    VARCHAR2 DEFAULT 'ALL');
```

Parameters

Table 126–10 *DELETE_COLUMN_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global column statistics are deleted.
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>).
cascade_parts	If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then setting this to <code>true</code> causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing <code>statab</code> (if different than <code>ownname</code>)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	When value of this argument is <code>TRUE</code> , deletes column statistics even if locked
col_stat_type	Type of column statistics to be deleted. This argument takes the following values: <ul style="list-style-type: none"> ■ HISTOGRAM - delete column histogram only ■ ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20005: Object statistics are locked.

DELETE_DATABASE_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the `add_sys` parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
  pname          IN  VARCHAR2,
  add_sys        IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–11 *DELETE_DATABASE_PREFS Procedure Parameters*

Parameter	Description
<code>pname</code>	<p>Preference name. The default value for following parameters can be set:</p> <ul style="list-style-type: none"> ▪ CASCADE ▪ DEGREE ▪ ESTIMATE_PERCENT ▪ METHOD_OPT ▪ NO_INVALIDATE ▪ GRANULARITY ▪ PUBLISH ▪ INCREMENTAL ▪ STALE_PERCENT <p>CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .</p> <p>DEGREE - The value determines degree of parallelism used for gathering statistics.</p> <p>ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

Table 126–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ▪ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ▪ FOR COLUMNS [size_clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to have the **SYSDBA** role or both **ANALYZE ANY DICTIONARY** and **ANALYZE ANY SYSTEM** privileges.
- All **pname** arguments are of type **VARCHAR2** and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS ('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS ('ESTIMATE_PERCENT', TRUE);
```

DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force           BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 126–12 *DELETE_DATABASE_STATS Procedure Parameters*

Parameter	Description
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>)
statown	Schema containing <code>statab</code> (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	When the value of this argument is <code>TRUE</code> , deletes statistics of tables in a database even if they are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  statown        VARCHAR2 DEFAULT NULL,
  no_invalidate  BOOLEAN   DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force          BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 126–13 *DELETE_DICTIONARY_STATS Procedure Parameters*

Parameter	Description
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>)
statown	Schema containing <code>statab</code> (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	When the value of this argument is <code>TRUE</code> , deletes statistics of tables in a database even if they are locked

Usage Notes

You must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–14 *DELETE_FIXED_OBJECTS_STATS Procedure Parameters*

Parameter	Description
stattab	The user statistics table identifier describing from where to delete the current statistics. If <code>stattab</code> is <code>NULL</code> , the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within <code>stattab</code> . This only applies if <code>stattab</code> is not <code>NULL</code> .
statown	Schema containing <code>stattab</code> (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Ignores the statistics lock on objects and deletes the statistics if set to <code>TRUE</code>

Usage Notes

You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN  DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force           BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–15 *DELETE_INDEX_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then index statistics are deleted at the global level.
statab	User statistics table identifier describing from where to delete the statistics. If <code>statab</code> is <code>NULL</code> , then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>statab</code> (Only pertinent if <code>statab</code> is not <code>NULL</code>)
cascade_parts	If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then setting this to <code>TRUE</code> causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing <code>statab</code> (if different than <code>ownname</code>)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	When value of this argument is <code>TRUE</code> , deletes index statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20005: Object statistics are locked.

DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (  
    ownname    IN  VARCHAR2  DEFAULT USER,  
    tablename  IN  VARCHAR2);
```

Parameters

Table 126–16 *DELETE_PENDING_STATS Procedure Parameters*

Parameter	Description
ownname	Owner name
tablename	Table name

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tablename` is `NULL` then delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
  ownname  IN  VARCHAR2,
  pname    IN  VARCHAR2);
```

Parameters

Table 126–17 *DELETE_SCHEMA_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
pname	<p>Preference name. The default value for following parameters can be set:</p> <ul style="list-style-type: none"> ▪ CASCADE ▪ DEGREE ▪ ESTIMATE_PERCENT ▪ METHOD_OPT ▪ NO_INVALIDATE ▪ GRANULARITY ▪ PUBLISH ▪ INCREMENTAL ▪ STALE_PERCENT <p>· CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .</p> <p>· DEGREE - The value determines degree of parallelism used for gathering statistics.</p> <p>· ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

Table 126–17 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size_clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. .	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>

Table 126–17 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
  ownname          VARCHAR2,
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–18 *DELETE_SCHEMA_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to delete the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	When value of this argument is <code>TRUE</code> , deletes statistics of tables in a schema even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (  
    stattab      VARCHAR2 DEFAULT NULL,  
    statid       VARCHAR2 DEFAULT NULL,  
    statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–19 *DELETE_SYSTEM_STATS Procedure Parameters*

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table where the statistics will be saved
<code>statid</code>	Optional identifier associated with the statistics saved in the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

DELETE_TABLE_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
  ownname   IN  VARCHAR2,
  tabname   IN  VARCHAR2,
  pname     IN  VARCHAR2);
```

Parameters

Table 126–20 *DELETE_TABLE_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following preferences can be set: <ul style="list-style-type: none"> ▪ CASCADE ▪ DEGREE ▪ ESTIMATE_PERCENT ▪ METHOD_OPT ▪ NO_INVALIDATE ▪ GRANULARITY ▪ PUBLISH ▪ INCREMENTAL ▪ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 126–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size_clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default value.</p>

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  statab          VARCHAR2 DEFAULT NULL,
  statid          VARCHAR2 DEFAULT NULL,
  cascade_parts   BOOLEAN  DEFAULT TRUE,
  cascade_columns BOOLEAN  DEFAULT TRUE,
  cascade_indexes BOOLEAN  DEFAULT TRUE,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
  force           BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–21 *DELETE_TABLE_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
statab	User statistics table identifier describing from where to retrieve the statistics. If statab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within statab (Only pertinent if statab is not NULL)
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well
cascade_columns	Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter)
cascade_indexes	Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter)
statown	Schema containing statab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	When value of this argument is TRUE, deletes table statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(  
    ownname      IN  VARCHAR2,  
    tabname      IN  VARCHAR2,  
    time1        IN  TIMESTAMP WITH TIME ZONE,  
    time2        IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    pctthreshold IN  NUMBER  DEFAULT 10)  
RETURN DiffRepTab pipelined;
```

Parameters

Table 126–22 *DIFF_TABLE_STATS_IN_HISTORY Procedure Parameters*

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
time1	First timestamp 1
time2	Second timestamp 2
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
    ownname      IN VARCHAR2,
    tabname      IN VARCHAR2,
    timestamp    IN TIMESTAMP WITH TIME ZONE,
    pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 126–23 *DIFF_TABLE_STATS_IN_PENDING Function Parameters*

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
timestamp	Time stamp to get statistics from the history
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using `statids`
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the difference percentage.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
    ownname          IN  VARCHAR2,
    tabname          IN  VARCHAR2,
    stattab1         IN  VARCHAR2,
    stattab2         IN  VARCHAR2 DEFAULT NULL,
    pctthreshold     IN  NUMBER   DEFAULT 10,
    statid1          IN  VARCHAR2 DEFAULT NULL,
    statid2          IN  VARCHAR2 DEFAULT NULL,
    stattab1own      IN  VARCHAR2 DEFAULT NULL,
    stattab2own      IN  VARCHAR2 DEFAULT NULL)
RETURN DiffRepTab pipelined;
```

Parameters

Table 126–24 *DIFF_TABLE_STATS_IN_STATTAB Procedure Parameters*

Parameter	Description
<code>ownname</code>	Owner of the table. Specify NULL for current schema.
<code>tabname</code>	Table for which statistics are to be compared
<code>stattab1</code>	User statistics table 1
<code>stattab2</code>	User statistics table 2. If NULL, statistics in <code>stattab1</code> is compared with current statistics in dictionary. This is the default. Specify same table as <code>stattab1</code> to compare two sets within the statistics table (see <code>statid</code> below).
<code>pctthreshold</code>	The function reports difference in statistics only if it exceeds this limit. The default value is 10.
<code>statid1</code>	(optional) Identifies statistics set within <code>stattab1</code> .
<code>statid2</code>	(optional) Identifies statistics set within <code>stattab2</code>
<code>stattab1own</code>	Schema containing <code>stattab1</code> (if other than <code>ownname</code>)
<code>stattab2own</code>	Schema containing <code>stattab2</code> (if other than <code>ownname</code>)

DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the [CREATE_EXTENDED_STATS Function](#).

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
  ownname    VARCHAR2,
  tabname    VARCHAR2,
  extension  VARCHAR2);
```

Parameters

Table 126–25 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Usage Notes

If no extended statistics set is created for the extension, this function throws an error.

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist.
- ORA-20001: Error when processing extension

DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (  
    ownname VARCHAR2,  
    stattab VARCHAR2);
```

Parameters

Table 126–26 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
  ownname VARCHAR2,
  tabname VARCHAR2,
  colname VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab VARCHAR2,
  statid VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–27 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>tabname</code>	Name of the table to which this column belongs
<code>colname</code>	Name of the column or extension
<code>partname</code>	Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are exported.
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL,
  add_sys      IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–28 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
<code>stattab</code>	Statistics table name to where statistics should be exported
<code>statid</code>	(Optional) Identifier to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if other than <code>ownname</code>)
<code>add_sys</code>	Value <code>TRUE</code> will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privileges.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

EXPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
  stattab VARCHAR2,
  statid  VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–29 EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
  stattab VARCHAR2,
  statid  VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–30 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Usage Notes

- You must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` and `ANALYZE ANY system` privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
  stattab VARCHAR2,
  statid  VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126-31 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
  ownname  VARCHAR2,
  indname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  stattab  VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–32 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are exported.
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
  ownname   IN  VARCHAR2  DEFAULT USER,
  tabname   IN  VARCHAR2,
  stattab   IN  VARCHAR2,
  statid    IN  VARCHAR2  DEFAULT NULL,
  statown   IN  VARCHAR2  DEFAULT USER);
```

Parameters

Table 126–33 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- If the parameter `tabname` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
  ownname      IN  VARCHAR2,
  stattab      IN  VARCHAR2,
  statid       IN  VARCHAR2 DEFAULT NULL,
  statown      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–34 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

EXPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
  ownname VARCHAR2,
  stattab VARCHAR2,
  statid  VARCHAR2 DEFAULT NULL,
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–35 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Name of the schema
<code>stattab</code>	User statistics table identifier describing where to store the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–36 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table that describes where the statistics will be stored.
<code>statid</code>	Optional identifier associated with the statistics stored from the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to export system statistics.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
  ownname   IN VARCHAR2,
  tablename IN VARCHAR2,
  stattab   IN VARCHAR2,
  statid    IN VARCHAR2 DEFAULT NULL,
  statown   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–37 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
  ownname  VARCHAR2,
  tabname  VARCHAR2,
  partname VARCHAR2 DEFAULT NULL,
  statab   VARCHAR2,
  statid   VARCHAR2 DEFAULT NULL,
  cascade  BOOLEAN  DEFAULT TRUE,
  statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–38 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.
statab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within statab
cascade	If true, then column and index statistics for this table are also exported
statown	Schema containing statab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

The ANALYZE_ANY system privilege is required to run this procedure.

GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                              (get_param('ESTIMATE_PERCENT')),
  block_sample             BOOLEAN DEFAULT FALSE,
  method_opt              VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree                  NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
  granularity             VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade                 BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab                 VARCHAR2 DEFAULT NULL,
  statid                  VARCHAR2 DEFAULT NULL,
  options                 VARCHAR2 DEFAULT 'GATHER',
  objlist                 OUT      ObjectTab,
  statown                 VARCHAR2 DEFAULT NULL,
  gather_sys              BOOLEAN DEFAULT TRUE,
  no_invalidate           BOOLEAN DEFAULT to_no_invalidate_type (
                              get_param('NO_INVALIDATE')),
  obj_filter_list         ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_DATABASE_STATS (
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                              (get_param('ESTIMATE_PERCENT')),
  block_sample             BOOLEAN DEFAULT FALSE,
  method_opt              VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree                  NUMBER  DEFAULT to_degree_type(get_param('DEGREE')),
  granularity             VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade                 BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab                 VARCHAR2 DEFAULT NULL,
  statid                  VARCHAR2 DEFAULT NULL,
  options                 VARCHAR2 DEFAULT 'GATHER',
  statown                 VARCHAR2 DEFAULT NULL,
  gather_sys              BOOLEAN DEFAULT TRUE,
  no_invalidate           BOOLEAN DEFAULT to_no_invalidate_type (
                              get_param('NO_INVALIDATE')),
  obj_filter_list         ObjectTab DEFAULT NULL);
```

Parameters

Table 126–39 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 126–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.</p>
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>
cascade	<p>Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure.</p>

Table 126–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.
statid	Identifier (optional) to associate with these statistics within stattab.
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns a list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the 'SYS' user
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List .

Usage Notes

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.

GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                          (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  objlist          OUT      ObjectTab,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                          get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
  comp_id          VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT
                          to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(GET_PARAM('DEGREE')),
  granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER AUTO',
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT
                          to_no_invalidate_type(get_param('NO_INVALIDATE')),
  obj_filter_list  ObjectTab DEFAULT NULL);
```

Parameters

Table 126–40 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	The component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components). Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure .

Table 126–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.</p>
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure . NULL means use of table default value that was specified by the DEGREE clause in the CREATE or ALTER INDEX statement. Use the constant DBMS_STATS.DEFAULT_DEGREE for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>cascade</code>	Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure .
<code>stattab</code>	User statistics table identifier describing where to save the current statistics
<code>statid</code>	The (optional) identifier to associate with these statistics within <code>stattab</code>
<code>options</code>	Further specification of objects for which to gather statistics: <ul style="list-style-type: none"> ■ <code>'GATHER'</code> - gathers statistics on all objects in the schema ■ <code>'GATHER AUTO'</code> - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When <code>'GATHER AUTO'</code> is specified, the only additional valid parameters are <code>comp_id</code>, <code>stattab</code>, <code>statid</code> and <code>statown</code>; all other parameter settings will be ignored. Also, returns a list of objects processed. ■ <code>'GATHER STALE'</code> - gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, returns a list of objects found to be stale. ■ <code>'GATHER EMPTY'</code> - gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. ■ <code>'LIST AUTO'</code> - returns list of objects to be processed with <code>'GATHER AUTO'</code> ■ <code>'LIST STALE'</code> - returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views ■ <code>'LIST EMPTY'</code> - returns list of objects which currently have no statistics
<code>objlist</code>	The list of objects found to be stale or empty
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
<code>obj_filter_list</code>	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1 like s1</code>) and (<code>o.a2 like s2</code>) and ... is true. See Applying an Object Filter List .

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges.

ORA-20001: Bad input value.

ORA-20002: Bad user statistics table, may need to upgrade it.

GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
  statab      VARCHAR2 DEFAULT NULL,
  statid      VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 126–41 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
statab	The user statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.

ORA-20002: Bad user statistics table, may need to upgrade it.

GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
  ownname          VARCHAR2,
  indname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (GET_PARAM('ESTIMATE_PERCENT')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–42 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	Schema of index to analyze
<code>indname</code>	Name of index
<code>partname</code>	Name of partition
<code>estimate_percent</code>	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure .
<code>stattab</code>	User statistics table identifier describing where to save the current statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>degree</code>	Degree of parallelism. The default for <code>degree</code> is NULL. The default value can be changed using the SET_PARAM Procedure . NULL means use of table default value that was specified by the <code>DEGREE</code> clause in the <code>CREATE/ALTER INDEX</code> statement. Use the constant <code>DBMS_STATS.DEFAULT_DEGREE</code> for the default value based on the initialization parameters. The <code>AUTO_DEGREE</code> value determines the degree of parallelism automatically. This is either 1 (serial execution) or <code>DEFAULT_DEGREE</code> (the system default value based on number of CPUs and initialization parameters) according to size of the object.

Table 126–42 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>
no_invalidate	<p>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</p>
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges.

ORA-20001: Bad input value.

GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
  ownname          VARCHAR2,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER',
  objlist          OUT      ObjectTab,
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);
```

```
DBMS_STATS.GATHER_SCHEMA_STATS (
  ownname          VARCHAR2,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                        (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN  DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  options          VARCHAR2 DEFAULT 'GATHER',
  statown          VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                        get_param('NO_INVALIDATE')),
  force            BOOLEAN  DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);
```

Parameters

Table 126–43 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure .

Table 126–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	<p>Accepts:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.</p>
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure . NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within <code>stattab</code>
options	Further specification of which objects to gather statistics for: <p><code>GATHER</code>: Gathers statistics on all objects in the schema.</p> <p><code>GATHER AUTO</code>: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When <code>GATHER AUTO</code> is specified, the only additional valid parameters are <code>ownname</code>, <code>stattab</code>, <code>statid</code>, <code>objlist</code> and <code>statown</code>; all other parameter settings are ignored. Returns a list of processed objects.</p> <p><code>GATHER STALE</code>: Gathers statistics on stale objects as determined by looking at the <code>*_tab_modifications</code> views. Also, return a list of objects found to be stale.</p> <p><code>GATHER EMPTY</code>: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics.</p> <p><code>LIST AUTO</code>: Returns a list of objects to be processed with <code>GATHER AUTO</code>.</p> <p><code>LIST STALE</code>: Returns list of stale objects as determined by looking at the <code>*_tab_modifications</code> views.</p> <p><code>LIST EMPTY</code>: Returns list of objects which currently have no statistics.</p>
objlist	List of objects found to be stale or empty
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Gather statistics on objects even if they are locked
obj_filter_list	A list of object filters. When provided, <code>GATHER_SCHEMA_STATS</code> will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values <code>s1</code> , <code>s2</code> , ... are specified for attributes <code>a1</code> , <code>a2</code> , ... in one object filter. An object <code>o</code> is said to satisfy this object filter if (<code>o.a1</code> like <code>s1</code>) and (<code>o.a2</code> like <code>s2</code>) and ... is true. See Applying an Object Filter List .

Usage Notes

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges.

ORA-20001: Bad input value.

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```
DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SAMPLE';
    filter_lst(1).objname := 'T%';
    filter_lst(2).ownname := 'SYS';
    DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                   options => 'gather_stale');
END;
```

GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
  gathering_mode  VARCHAR2 DEFAULT 'NOWORKLOAD',
  interval        INTEGER   DEFAULT NULL,
  stattab         VARCHAR2  DEFAULT NULL,
  statid          VARCHAR2  DEFAULT NULL,
  statown         VARCHAR2  DEFAULT NULL);
```

Parameters

Table 126–44 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	<p>Mode values are:</p> <p>NOWORKLOAD: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. Oracle recommends to run <code>GATHER_SYSTEM_STATS ('noworkload')</code> after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: <code>cpuspeednw</code>, <code>ioseektim</code>, <code>iotfrspeed</code>.</p> <p>INTERVAL: Captures system activity during a specified interval. This works in combination with the <code>interval</code> parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or <code>stattab</code>. You can use <code>GATHER_SYSTEM_STATS (gathering_mode=> 'STOP')</code> to stop gathering earlier than scheduled. Collected components: <code>maxthr</code>, <code>slavethr</code>, <code>cpuspeed</code>, <code>sreadtim</code>, <code>mreadtim</code>, <code>mbrc</code>.</p> <p>START STOP: Captures system activity during specified start and stop times and refreshes the dictionary or <code>stattab</code> with statistics for the elapsed period. Interval value is ignored. Collected components: <code>maxthr</code>, <code>slavethr</code>, <code>cpuspeed</code>, <code>sreadtim</code>, <code>mreadtim</code>, <code>mbrc</code>.</p>
interval	Time, in minutes, to gather statistics. This parameter applies only when <code>gathering_mode= 'INTERVAL'</code>
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the <code>stattab</code>
statown	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to gather system statistics.

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0.

GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
  ownname          VARCHAR2,
  tablename        VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                     (get_param('ESTIMATE_PERCENT')),
  block_sample     BOOLEAN   DEFAULT FALSE,
  method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
  degree           NUMBER    DEFAULT to_degree_type(get_param('DEGREE')),
  granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
  cascade          BOOLEAN   DEFAULT to_cascade_type(get_param('CASCADE')),
 stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  statown         VARCHAR2 DEFAULT NULL,
  no_invalidate    BOOLEAN   DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force           BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 126–45 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of table to analyze
tablename	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_PARAM Procedure .
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 126–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	<p>Accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.</p>
degree	<p>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_PARAM Procedure NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.</p>

Table 126–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
granularity	<p>Granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. Global statistics are gathered if <code>partname</code> is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing).</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>
cascade	<p>Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant <code>DBMS_STATS.AUTO_CASCADE</code> to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_PARAM Procedure.</p>
stattab	<p>User statistics table identifier describing where to save the current statistics</p>
statid	<p>Identifier (optional) to associate with these statistics within <code>stattab</code></p>
statown	<p>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</p>
no_invalidate	<p>Does not invalidate the dependent cursors if set to <code>TRUE</code>. The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code>. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure.</p>
force	<p>Gather statistics of table even if it is locked</p>

Usage Notes

Index statistics collection can be parallelized except for cluster, domain and join indexes.

Exceptions

ORA-20000: Table does not exist or insufficient privileges.

ORA-20001: Bad input value.

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(  
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(  
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

GENERATE_STATS Procedure

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Syntax

```
DBMS_STATS.GENERATE_STATS (
  ownname    VARCHAR2,
  objname    VARCHAR2,
  organized  NUMBER DEFAULT 7,
  force      BOOLEAN default FALSE);
```

Parameters

Table 126–46 *GENERATE_STATS Procedure Parameters*

Parameter	Description
ownname	Schema of object
objname	Name of object
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

Usage Notes

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist.

ORA-20001: Invalid option or invalid statistics.

GET_COLUMN_STATS Procedures

These procedures gets all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
    ownname      VARCHAR2,
    tabname      VARCHAR2,
    colname      VARCHAR2,
    partname     VARCHAR2 DEFAULT NULL,
    stattab      VARCHAR2 DEFAULT NULL,
    statid       VARCHAR2 DEFAULT NULL,
    distcnt     OUT NUMBER,
    density     OUT NUMBER,
    nullcnt     OUT NUMBER,
    srec        OUT StatRec,
    avgclen    OUT NUMBER,
    statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
    ownname      VARCHAR2,
    tabname      VARCHAR2,
    colname      VARCHAR2,
    partname     VARCHAR2 DEFAULT NULL,
    stattab      VARCHAR2 DEFAULT NULL,
    statid       VARCHAR2 DEFAULT NULL,
    ext_stats    OUT RAW,
    statypown    OUT VARCHAR2 DEFAULT NULL,
    statypname   OUT VARCHAR2 DEFAULT NULL,
    statown     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–47 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
statypown	Schema of the statistics type

Table 126–47 (Cont.) GET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density
nullcnt	Number of NULLs
srec	Structure holding internal representation of column minimum, maximum, and histogram values
avgclen	Average length of the column (in bytes)
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object.

GET_INDEX_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
    numlblks         OUT NUMBER,
    numdist          OUT NUMBER,
    avglblk          OUT NUMBER,
    avgdblks         OUT NUMBER,
    clstfct          OUT NUMBER,
    indlevel         OUT NUMBER,
    statown          VARCHAR2 DEFAULT NULL,
    cachedblk       OUT NUMBER,
    cachehit         OUT NUMBER);
```

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    numrows          OUT NUMBER,
    numlblks         OUT NUMBER,
    numdist          OUT NUMBER,
    avglblk          OUT NUMBER,
    avgdblks         OUT NUMBER,
    clstfct          OUT NUMBER,
    indlevel         OUT NUMBER,
    statown          VARCHAR2 DEFAULT NULL,
    guessq           OUT NUMBER,
    cachedblk       OUT NUMBER,
    cachehit         OUT NUMBER);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    ext_stats        OUT RAW,
    stattypown       OUT VARCHAR2 DEFAULT NULL,
    stattypname      OUT VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    cachedblk       OUT NUMBER,
    cachehit         OUT NUMBER);
```

Parameters

Table 126–48 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are retrieved for the global index level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblks	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
guessq	Guess quality for the index (partition)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object.

GET_PARAM Function

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [GET_PREFS Function](#).

See also [Deprecated Subprograms](#) on page 126-12.

This function returns the default value of parameters of DBMS_STATS procedures.

Syntax

```
DBMS_STATS.GET_PARAM (  
    pname      IN  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 126-49 *GET_PARAM Function Parameters*

Parameter	Description
pname	The parameter name

Exceptions

ORA-20001: Invalid input values

GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (
  pname      IN   VARCHAR2,
  ownname    IN   VARCHAR2 DEFAULT NULL,
  tabname    IN   VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Parameters

Table 126–50 GET_PREFS Function Parameters

Parameter	Description
pname	<p>Preference name. The default value for following preferences can be retrieved:</p> <ul style="list-style-type: none"> ▪ AUTOSTATS_TARGET ▪ CASCADE ▪ DEGREE ▪ ESTIMATE_PERCENT ▪ METHOD_OPT ▪ NO_INVALIDATE ▪ GRANULARITY ▪ PUBLISH ▪ INCREMENTAL ▪ STALE_PERCENT <p>AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values:</p> <ul style="list-style-type: none"> ▪ 'ALL' - statistics collected for all objects in system ▪ 'ORACLE' - statistics collected for all Oracle owned objects ▪ 'AUTO' - Oracle decides on which objects to collect statistics <p>CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .</p> <p>DEGREE - The value determines degree of parallelism used for gathering statistics.</p> <p>ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

Table 126–50 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size_clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_PARAM Procedure.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–50 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>
ownname	Owner name
tabname	Table name

Exceptions

ORA-20001: Invalid input values

Usage Notes

If the **ownname** and **tabname** are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.

GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY  
RETURN TIMESTAMP WITH TIMEZONE;
```

GET_STATS_HISTORY_RETENTION Function

This function returns the current retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION  
RETURN NUMBER;
```

GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is NULL.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
  status      OUT  VARCHAR2,
  dstart      OUT  DATE,
  dstop       OUT  DATE,
  pname       VARCHAR2,
  pvalue      OUT  NUMBER,
  stattab     IN   VARCHAR2 DEFAULT NULL,
  statid      IN   VARCHAR2 DEFAULT NULL,
  statown     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–51 *GET_SYSTEM_STATS Procedure Parameters*

Parameter	Description
<code>status</code>	Output is one of the following: <ul style="list-style-type: none"> ▪ COMPLETED: ▪ AUTOGATHERING: ▪ MANUALGATHERING: ▪ BADSTATS:
<code>dstart</code>	Date when statistics gathering started. If <code>status = MANUALGATHERING</code> , the start date is returned.
<code>dstop</code>	Date when statistics gathering stopped. <ul style="list-style-type: none"> ▪ If <code>status = COMPLETE</code>, the finish date is returned. ▪ If <code>status = AUTOGATHERING</code>, the future finish date is returned. ▪ If <code>status = BADSTATS</code>, the must-finished-by date is returned.

Table 126–51 (Cont.) GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
<code>pname</code>	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> ▪ <code>iotfrspeed</code> - I/O transfer speed in bytes for each millisecond ▪ <code>ioseektim</code> - seek time + latency time + operating system overhead time, in milliseconds ▪ <code>sreadtim</code> - average time to read single block (random read), in milliseconds ▪ <code>mreadtim</code> - average time to read an mbrc block at once (sequential read), in milliseconds ▪ <code>cpuspeed</code> - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ▪ <code>cpuspeednw</code> - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option). ▪ <code>mbrc</code> - average multiblock read count for sequential read, in blocks ▪ <code>maxthr</code> - maximum I/O system throughput, in bytes/second ▪ <code>slavethr</code> - average slave I/O throughput, in bytes/second
<code>pvalue</code>	The parameter value to get
<code>stattab</code>	Identifier of the user statistics table where the statistics will be obtained. If <code>stattab</code> is null, the statistics will be obtained from the dictionary.
<code>statid</code>	Optional identifier associated with the statistics saved in the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to gather system statistics.

ORA-20004: Parameter does not exist.

GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  numrows         OUT NUMBER,
  numblks         OUT NUMBER,
  avgrlen         OUT NUMBER,
  statown         VARCHAR2 DEFAULT NULL,
  cachedblk       OUT NUMBER,
  cachehit        OUT NUMBER);
```

Parameters

Table 126–52 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
numrows	Number of rows in the table (partition).
numblks	Number of blocks the table (partition) occupies.
avgrlen	Average row length for the table (partition).
statown	Schema containing stattab (if different than ownname).
cachedblk	
cachehit	

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the

user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–53 *IMPORT_COLUMN_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	The name of the schema
<code>tabname</code>	The name of the table to which this column belongs
<code>colname</code>	Name of the column or extension
<code>partname</code>	The name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition column statistics are imported.
<code>stattab</code>	The user statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	The (optional) identifier to associate with these statistics within <code>stattab</code>
<code>statown</code>	The schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
<code>force</code>	If set to <code>TRUE</code> , imports statistics even if statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20005: Object statistics are locked.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
  statab      IN  VARCHAR2,
  statid      IN  VARCHAR2 DEFAULT NULL,
  statown     IN  VARCHAR2 DEFAULT NULL,
  add_sys     IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–54 *IMPORT_DATABASE_PREFS Procedure Parameters*

Parameter	Description
<code>statab</code>	Statistics table name where to import the statistics
<code>statid</code>	Optional identifier to associate with these statistics within <code>statab</code>
<code>statown</code>	Schema containing <code>statab</code> (if different than <code>ownname</code>)
<code>add_sys</code>	Value <code>TRUE</code> will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the `SYSDBA` role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY system` privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
  statab      VARCHAR2,
  statid      VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force       BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–55 *IMPORT_DATABASE_STATS Procedure Parameters*

Parameter	Description
statab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> ▪ TRUE - Ignores the statistics lock and imports the statistics. ▪ FALSE - The statistics will be imported only if they are not locked.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–56 *IMPORT_DICTIONARY_STATS Procedure Parameters*

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Overrides statistics lock at the object (table) level: <ul style="list-style-type: none"> ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20002: Bad user statistics table, may need to upgrade it.

IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
  statab      VARCHAR2,
  statid      VARCHAR2 DEFAULT NULL,
  statown     VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force       BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–57 *IMPORT_FIXED_OBJECTS_STATS Procedure Parameters*

Parameter	Description
statab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within statab
statown	Schema containing statab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Overrides statistics lock: <ul style="list-style-type: none"> ■ TRUE - Ignores the statistics lock and imports the statistics ■ FALSE - The statistics will be imported only if there is no lock

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20002: Bad user statistics table, may need to upgrade it.

IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
    ownname      VARCHAR2,
    indname      VARCHAR2,
    partname     VARCHAR2 DEFAULT NULL,
    stattab      VARCHAR2,
    statid       VARCHAR2 DEFAULT NULL,
    statown      VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                                get_param('NO_INVALIDATE')),
    force        BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–58 *IMPORT_INDEX_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	Name of the schema
<code>indname</code>	Name of the index
<code>partname</code>	Name of the index partition. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition index statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code> .
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
<code>force</code>	Imports statistics even if index statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    statab     IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–59 *IMPORT_SCHEMA_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
statab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within statab
statown	Schema containing statab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
  ownname      VARCHAR2,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–60 *IMPORT_SCHEMA_STATS Procedure Parameters*

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Overrides statistics locked at the object (table) level: <ul style="list-style-type: none"> ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SYSTEM_STATS Procedure

http://usunnab06.us.oracle.com:80/servers/MifChecker/Out/Y10312_01.htm retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–61 *IMPORT_SYSTEM_STATS Procedure Parameters*

Parameter	Description
<code>stattab</code>	Identifier of the user statistics table where the statistics will be retrieved
<code>statid</code>	Optional identifier associated with the statistics retrieved from the <code>stattab</code>
<code>statown</code>	Schema containing <code>stattab</code> (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to import system statistics.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname     IN  VARCHAR2,
    tablename   IN  VARCHAR2,
    stattab     IN  VARCHAR2,
    statid      IN  VARCHAR2 DEFAULT NULL,
    statown     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–62 *IMPORT_TABLE_PREFS Procedure Parameters*

Parameter	Description
ownname	Owner name
tablename	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2,
  statid       VARCHAR2 DEFAULT NULL,
  cascade      BOOLEAN  DEFAULT TRUE,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–63 *IMPORT_TABLE_STATS Procedure Parameters*

Parameter	Description
<code>ownname</code>	Name of the schema
<code>tabname</code>	Name of the table
<code>partname</code>	Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code> , then global and partition table statistics are imported.
<code>stattab</code>	User statistics table identifier describing from where to retrieve the statistics
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code>
<code>cascade</code>	If true, then column and index statistics for this table are also imported
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
<code>force</code>	Imports statistics even if table statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    partname   VARCHAR2);
```

Parameters

Table 126–64 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tabname	Name of the table
partname	Partition name

LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 126–65 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema to lock

Usage Notes

See "Usage Notes" for [LOCK_TABLE_STATS Procedure](#).

LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2);
```

Parameters

Table 126–66 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

Usage Notes

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use Dynamic Sampling.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.

PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  charvals  CHARARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  datevals  DATEARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  dblvals   DBLARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  fltvals   FLTARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  numvals   NUMARRAY);
```

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
  srec      IN OUT StatRec,
  rawvals   RAWARRAY);
```

Pragmas

```
pragma restrict_references(prepare_column_values, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 126–67 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.epc	<p>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid).</p> <p>The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</p>

Table 126–67 (Cont.) PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
<code>srec.bkvals</code>	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in <code>charvals</code> , <code>datevals</code> , <code>dblvals</code> , <code>fltvals</code> , <code>numvals</code> , or <code>rawvals</code> . Otherwise, it is merely an output parameter, and it must be set to <code>NULL</code> when this procedure is called.

Datatype-specific input parameters (use one) are shown in [Table 126–68](#).

Table 126–68 Datatype-Specific Input Parameters

Type	Description
<code>charvals</code>	The array of values when the column type is character-based. Up to the first 32 bytes of each string should be provided. Arrays must have between 2 and 256 entries, inclusive. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization.
<code>datevals</code>	The array of values when the column type is date-based
<code>dblvals</code>	The array of values when the column type is double-based
<code>fltvals</code>	The array of values when the column type is float-based
<code>numvals</code>	The array of values when the column type is numeric-based
<code>rawvals</code>	The array of values when the column type is <code>RAW</code> . Up to the first 32 bytes of each strings should be provided.
<code>nvmin</code> , <code>nvmax</code>	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed <code>CHAR</code> , the strings must be space-padded to 15 characters for correct normalization.
<code>rwmin</code> , <code>rwmax</code>	The minimum and maximum values when the column type is <code>rowid</code> . No histogram information is provided for a column of this type.

Output Parameters

Table 126–69 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
<code>srec.minval</code>	Internal representation of the minimum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.maxval</code>	Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.bkvals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.novals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code>

Exceptions

ORA-20001: Invalid or inconsistent input values.

PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR2 (
  srec      IN OUT StatRec,
  nvmin     NVARCHAR2,
  nvmax     NVARCHAR2);
```

Pragmas

```
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
```

Parameters

Table 126–70 PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in [Table 126–68](#).

Table 126–71 Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 126–72 *PREPARE_COLUMN_VALUES Procedure Output Parameters*

Parameter	Description
<code>srec.minval</code>	Internal representation of the minimum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.maxval</code>	Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code>
<code>srec.bkvals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .
<code>srec.novals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code>

Exceptions

ORA-20001: Invalid or inconsistent input values.

PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
  srec IN OUT StatRec,
  rwmn          ROWID,
  rwmax          ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 126–73 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in [Table 126–68](#).

Table 126–74 Datatype-Specific Input Parameters

Type	Description
rwmn, rwmax	The minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 126–75 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.

Table 126-75 (Cont.) PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
<code>srec.maxval</code>	Internal representation of the maximum suitable for use in a call to <code>SET_COLUMN_STATS</code> .
<code>srec.bkvals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .
<code>srec.novals</code>	Array suitable for use in a call to <code>SET_COLUMN_STATS</code> .

Exceptions

ORA-20001: Invalid or inconsistent input values.

PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
  ownname          IN VARCHAR2 DEFAULT USER,
  tabname          IN VARCHAR2,
  no_invalidate    BOOLEAN DEFAULT
    to_no_invalidate_type(get_param('NO_INVALIDATE')),
  force           IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–76 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
no_invalidate	Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	If TRUE, will override the lock

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter `tabname` is `NULL` then `publish` applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS (  
    before_timestamp          TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 126–77 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

RESET_GLOBAL_PREFS_DEFAULTS Procedure

This procedure sets global preference, such as `CASCADE`, `ESTIMATE_PERCENT` and `GRANULARITY`, to default values. This reverses the global preferences set by the [SET_GLOBAL_PREFS Procedure](#).

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREFS_DEFAULTS;
```

RESET_PARAM_DEFAULTS Procedure

This procedure resets the default values of all parameters to Oracle recommended values.

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DATABASE_STATS (
  as_of_timestamp    TIMESTAMP WITH TIME ZONE,
  force              BOOLEAN DEFAULT FALSE,
  no_invalidate     BOOLEAN DEFAULT to_no_invalidate_type
                    (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 126–78 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS (
  as_of_timestamp      TIMESTAMP WITH TIME ZONE,
  force                BOOLEAN DEFAULT FALSE,
  no_invalidate        BOOLEAN DEFAULT to_no_invalidate_type
                      (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 126–79 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .

Usage Notes

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
  as_of_timestamp    TIMESTAMP WITH TIME ZONE,
  force              BOOLEAN DEFAULT FALSE,
  no_invalidate      BOOLEAN DEFAULT to_no_invalidate_type
                    (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 126–80 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .

Usage Notes

To run this procedure, you must have the `SYSDBA` or `ANALYZE ANY DICTIONARY` system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS (
  ownname          VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                  (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 126–81 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	The schema of the tables for which the statistics are to be restored
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>force</code>	Restores statistics even if their statistics are locked
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS (  
    as_of_timestamp          TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 126–82 *RESTORE_SYSTEM_STATS Procedure Parameters*

Parameter	Description
<code>as_of_timestamp</code>	The timestamp to which to restore statistics

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (`as_of_timestamp`). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  as_of_timestamp  TIMESTAMP WITH TIME ZONE,
  restore_cluster_index  BOOLEAN DEFAULT FALSE,
  force            BOOLEAN DEFAULT FALSE,
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type
                                     (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 126–83 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
<code>ownname</code>	The schema of the table for which the statistics are to be restored
<code>tabname</code>	The table name
<code>as_of_timestamp</code>	The timestamp to which to restore statistics
<code>restore_cluster_index</code>	If the table is part of a cluster, restore statistics of the cluster index if set to <code>TRUE</code>
<code>force</code>	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

SET_COLUMN_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  distcnt      NUMBER DEFAULT NULL,
  density      NUMBER DEFAULT NULL,
  nullcnt      NUMBER DEFAULT NULL,
  srec         StatRec DEFAULT NULL,
  avgclen     NUMBER DEFAULT NULL,
  flags        NUMBER DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
  ownname      VARCHAR2,
  tabname      VARCHAR2,
  colname      VARCHAR2,
  partname     VARCHAR2 DEFAULT NULL,
  stattab      VARCHAR2 DEFAULT NULL,
  statid       VARCHAR2 DEFAULT NULL,
  ext_stats    RAW,
  stattpown    VARCHAR2 DEFAULT NULL,
  stattpname   VARCHAR2 DEFAULT NULL,
  statown      VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
  force        BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–84 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.

Table 126–84 (Cont.) SET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is <code>NULL</code> and if <code>distcnt</code> is not <code>NULL</code> , then density is derived from <code>distcnt</code> .
nullcnt	Number of <code>NULL</code> s
srec	<code>StatRec</code> structure filled in by a call to <code>PREPARE_COLUMN_VALUES</code> or <code>GET_COLUMN_STATS</code>
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as <code>NULL</code>)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> . to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent input values.

ORA-20005: Object statistics are locked.

SET_DATABASE_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the `add_sys` parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
  pname          IN  VARCHAR2,
  pvalue        IN  VARCHAR2,
  add_sys       IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 126–85 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
<code>pname</code>	<p>Preference name. The default value for following parameters can be set:</p> <ul style="list-style-type: none"> ▪ CASCADE ▪ DEGREE ▪ ESTIMATE_PERCENT ▪ METHOD_OPT ▪ NO_INVALIDATE ▪ GRANULARITY ▪ PUBLISH ▪ INCREMENTAL ▪ STALE_PERCENT <p>· CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .</p> <p>· DEGREE - The value determines degree of parallelism used for gathering statistics.</p> <p>· ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant <code>DBMS_STATS.AUTO_SAMPLE_SIZE</code> to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

Table 126–85 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size_clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–85 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Invalid or illegal input values.

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE', '99');
```

SET_GLOBAL_PREFS Procedure

This procedure is used to set the global statistics preferences.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

Parameters

Table 126–86 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	<p>Preference name. The default value for the following preferences can be set:</p> <ul style="list-style-type: none"> ■ AUTOSTATS_TARGET ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT <p>AUTOSTATS_TARGET - This preference is applicable only for auto stats collection. The value of this parameter controls the objects considered for stats collection. It takes the following values:</p> <ul style="list-style-type: none"> ■ 'ALL' - statistics collected for all objects in system ■ 'ORACLE' - statistics collected for all Oracle owned objects ■ 'AUTO' - Oracle decides on which objects to collect stats <p>CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .</p> <p>DEGREE - The value determines degree of parallelism used for gathering statistics.</p> <p>ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</p>

Table 126–86 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size_clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–86 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- To run this procedure, you need to have the **SYSDBA** or both **ANALYZE ANY DICTIONARY** and **ANALYZE ANY SYSTEM** privilege.
- Both arguments are of type **VARCHAR2** and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE', '99');
```

SET_INDEX_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  stattab      VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  numrows      NUMBER    DEFAULT NULL,
  numblks      NUMBER    DEFAULT NULL,
  numdist      NUMBER    DEFAULT NULL,
  avglblk      NUMBER    DEFAULT NULL,
  avgdblks     NUMBER    DEFAULT NULL,
  clstfct      NUMBER    DEFAULT NULL,
  indlevel     NUMBER    DEFAULT NULL,
  flags        NUMBER    DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  guessq       NUMBER    DEFAULT NULL,
  cachedblk    NUMBER    DEFAULT NULL,
  cachehit     NUMBER    DEFAULT NULL,
  force        BOOLEAN   DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (
  ownname      VARCHAR2,
  indname      VARCHAR2,
  partname     VARCHAR2  DEFAULT NULL,
  stattab      VARCHAR2  DEFAULT NULL,
  statid       VARCHAR2  DEFAULT NULL,
  ext_stats    RAW,
  statypown    VARCHAR2  DEFAULT NULL,
  statypname   VARCHAR2  DEFAULT NULL,
  statown      VARCHAR2  DEFAULT NULL,
  no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                get_param('NO_INVALIDATE')),
  cachedblk    NUMBER    DEFAULT NULL,
  cachehit     NUMBER    DEFAULT NULL,
  force        BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 126–87 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index

Table 126–87 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
<code>partname</code>	Name of the index partition in which to store the statistics. If the index is partitioned and if <code>partname</code> is <code>NULL</code> , then the statistics are stored at the global index level.
<code>stattab</code>	User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.
<code>statid</code>	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
<code>ext_stats</code>	The user-defined statistics
<code>stattypown</code>	Schema of the statistics type
<code>stattypname</code>	Name of the statistics type
<code>numrows</code>	Number of rows in the index (partition)
<code>numlblks</code>	Number of leaf blocks in the index (partition)
<code>numdist</code>	Number of distinct keys in the index (partition)
<code>avglblk</code>	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from <code>numlblks</code> and <code>numdist</code> .
<code>avgdblk</code>	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from <code>clstfct</code> and <code>numdist</code> .
<code>clstfct</code>	See <code>clustering_factor</code> column of the <code>all_indexes</code> view for a description
<code>indlevel</code>	Height of the index (partition)
<code>flags</code>	For internal Oracle use (should be left as <code>NULL</code>)
<code>statown</code>	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
<code>no_invalidate</code>	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
<code>guessq</code>	Guess quality. See the <code>pct_direct_access</code> column of the <code>all_indexes</code> view for a description.
<code>cachedblk</code>	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
<code>cachehit</code>	The average cache hit ratio for the segment (index/table/index partition/table partition)
<code>force</code>	Sets the values even if statistics of the index are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only

when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20005: Object statistics are locked.

SET_PARAM Procedure

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the [SET_GLOBAL_PREFS Procedure](#).

See also [Deprecated Subprograms](#) on page 126-12.

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
  pname      IN   VARCHAR2,
  pval      IN   VARCHAR2);
```

Parameters

Table 126–88 SET_PARAM Procedure Parameters

Parameter	Description
pname	<p>The parameter name The default value for following parameters can be set.</p> <ul style="list-style-type: none"> ■ CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	<p>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values:</p> <ul style="list-style-type: none"> ■ 'ALL' - Statistics are collected for all objects in the system ■ 'ORACLE' - Statistics are collected for all Oracle owned objects ■ 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':

- When `NULL` is unquoted, this sets the parameter to the value Oracle recommends.
- In the case of the quoted `'NULL'`, this sets the value of the parameter to `NULL`.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or illegal input value.

Examples

```
DBMS_STATS.SET_PARAM('CASCADE', 'DBMS_STATS.AUTO_CASCADE');  
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT', '5');  
DBMS_STATS.SET_PARAM('DEGREE', 'NULL');
```

SET_SCHEMA_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname    IN    VARCHAR2,
    pname      IN    VARCHAR2,
    pvalue     IN    VARCHAR2);
```

Parameters

Table 126–89 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be set: <ul style="list-style-type: none"> ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or illegal input value.

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE', '99');
```

SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
  pname          VARCHAR2,
  pvalue         NUMBER,
  stattab       IN   VARCHAR2 DEFAULT NULL,
  statid        IN   VARCHAR2 DEFAULT NULL,
  statown       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 126–90 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: <ul style="list-style-type: none"> ▪ <code>iotfrspeed</code>—I/O transfer speed in bytes for each millisecond ▪ <code>ioseektim</code> - seek time + latency time + operating system overhead time, in milliseconds ▪ <code>sreadtim</code> - average time to read single block (random read), in milliseconds ▪ <code>mreadtim</code> - average time to read an mbrc block at once (sequential read), in milliseconds ▪ <code>cpuspeed</code> - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ▪ <code>cpuspeednw</code> - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option. ▪ <code>mbrc</code> - average multiblock read count for sequential read, in blocks ▪ <code>maxthr</code> - maximum I/O system throughput, in bytes/second ▪ <code>slavethr</code> - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to set system statistics.

ORA-20004: Parameter does not exist.

SET_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
  ownname   IN  VARCHAR2,
  tablename IN  VARCHAR2,
  pname     IN  VARCHAR2,
  pvalue    IN  VARCHAR2);
```

Parameters

Table 126–91 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tablename	Table name
pname	Preference name. The default value for following preferences can be set: <ul style="list-style-type: none"> ▪ CASCADE ▪ DEGREE ▪ ESTIMATE_PERCENT ▪ METHOD_OPT ▪ NO_INVALIDATE ▪ GRANULARITY ▪ PUBLISH ▪ INCREMENTAL ▪ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 126–91 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	<p>METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</p> <ul style="list-style-type: none"> ■ FOR ALL [INDEXED HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column attribute [size_clause] [,column attribute [size_clause]...] <p>size_clause is defined as size_clause := SIZE {integer REPEAT AUTO SKEWONLY}</p> <p>column is defined as column := column_name (extension)</p> <ul style="list-style-type: none"> - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, column_name [, ...]) or an expression <p>The default is FOR ALL COLUMNS SIZE AUTO.</p>
.	<p>NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</p>
.	<p>GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned).</p> <p>'ALL' - gathers all (subpartition, partition, and global) statistics</p> <p>'AUTO' - determines the granularity based on the partitioning type. This is the default value.</p> <p>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</p> <p>'GLOBAL' - gathers global statistics</p> <p>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</p> <p>'PARTITION' - gathers partition-level statistics</p> <p>'SUBPARTITION' - gathers subpartition-level statistics.</p>

Table 126–91 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	<p>PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11g, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.</p>
.	<p>INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:</p> <ul style="list-style-type: none"> ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. <p>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and timely operation for large tables.</p>
.	<p>STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.</p>
pvalue	<p>Preference value. If NULL is specified, it will set the Oracle default value.</p>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table or should have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');
```

SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab         VARCHAR2 DEFAULT NULL,
    statid          VARCHAR2 DEFAULT NULL,
    numrows         NUMBER   DEFAULT NULL,
    numblks         NUMBER   DEFAULT NULL,
    avgrlen         NUMBER   DEFAULT NULL,
    flags           NUMBER   DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                get_param('NO_INVALIDATE')),
    cachedblk      NUMBER   DEFAULT NULL,
    cachehit       NUMBER   DEFAULT NULL,
    force          BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 126–92 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition in which to store the statistics. If the table is partitioned and <code>partname</code> is <code>NULL</code> , then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If <code>stattab</code> is <code>NULL</code> , then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within <code>stattab</code> (Only pertinent if <code>stattab</code> is not <code>NULL</code>)
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
flags	For internal Oracle use (should be left as <code>NULL</code>)
statown	Schema containing <code>stattab</code> (if different than <code>ownname</code>)
no_invalidate	Does not invalidate the dependent cursors if set to <code>TRUE</code> . The procedure invalidates the dependent cursors immediately if set to <code>FALSE</code> . Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_PARAM Procedure .
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Table 126-92 (Cont.) SET_TABLE_STATS Procedure Parameters

Parameter	Description
<code>force</code>	Sets the values even if statistics of the table are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
 - When not enough data has been analyzed, such as when an object has been recently create
 - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

- ORA-20000: Object does not exist or insufficient privileges.
- ORA-20001: Invalid input value.
- ORA-20005: Object statistics are locked.

SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 126–93 *SHOW_EXTENDED_STATS_NAME Function Parameters*

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column <i>c1</i> , <i>c2</i> . An example column group can be "(<i>c1</i> , <i>c2</i>)" and an example expression can be "(<i>c1</i> + <i>c2</i>)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    partname   VARCHAR2);
```

Parameters

Table 126-94 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	Partition name

UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (  
    ownname    VARCHAR2);
```

Parameters

Table 126–95 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
  ownname    VARCHAR2,
  tabname    VARCHAR2);
```

Parameters

Table 126–96 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (  
    ownname    VARCHAR2,  
    stattab    VARCHAR2);
```

Parameters

Table 126–97 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table.

DBMS_STORAGE_MAP

With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process `FMON` to invoke mapping operations that populate mapping views. `FMON` communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- [Using DBMS_STORAGE_MAP](#)
 - Overview
 - Operational Notes
- [Summary of DBMS_STORAGE_MAP Subprograms](#)

Using DBMS_STORAGE_MAP

- [Overview](#)
- [Operational Notes](#)

Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- Mapping libraries

Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

See Also:

- *Oracle Database Administrator's Guide* for more information
- *Oracle Database Reference* for V\$MAP views, including V\$MAP_FILE, V\$MAP_ELEMENT, V\$MAP_SUBELEMENT, V\$MAP_FILE_EXTENT

Operational Notes

For `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL`: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

See Also: *Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

Summary of DBMS_STORAGE_MAP Subprograms

Table 127-1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function on page 127-6	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function on page 127-7	Drops the mapping information for the element defined by <code>elemname</code>
DROP_FILE Function on page 127-8	Drops the file mapping information defined by <code>filename</code>
LOCK_MAP Procedure on page 127-9	Locks the mapping information in the shared memory of the instance
MAP_ALL Function on page 127-10	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function on page 127-11	Builds mapping information for the element identified by <code>elemname</code>
MAP_FILE Function on page 127-12	Builds mapping information for the file identified by <code>filename</code>
MAP_OBJECT Function on page 127-13	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function on page 127-14	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function on page 127-15	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure on page 127-16	Unlocks the mapping information in the shared memory of the instance.

DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 127–2 *DROP_ALL Function Parameters*

Parameter	Description
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(  
    elemname          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 127-3 *DROP_ELEMENT Function Parameters*

Parameter	Description
<code>elemname</code>	The element for which mapping information is dropped.
<code>cascade</code>	If <code>TRUE</code> , then <code>DROP_ELEMENT</code> is invoked recursively on all elements of the DAG defined by <code>elemname</code> , if possible.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(  
    filename          IN VARCHAR2,  
    cascade           IN BOOLEAN,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 127-4 *DROP_FILE Function Parameters*

Parameter	Description
<code>filename</code>	The file for which file mapping information is dropped.
<code>cascade</code>	If <code>TRUE</code> , then the mapping DAGs for the elements where the file resides are also dropped, if possible.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V\$MAP tables. Without locking the mapping information, V\$MAP_ELEMENT and V\$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(  
    max_num_fileext IN NUMBER DEFAULT 100,  
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 127–5 MAP_ALL Function Parameters

Parameter	Description
max_num_fileext	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.
dictionary_update	If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.

Usage Notes

You must explicitly call MAP_ALL in a cold startup scenario.

MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT (
  elemname          IN VARCHAR2,
  cascade           IN BOOLEAN,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 127–6 *MAP_ELEMENT Function Parameters*

Parameter	Description
<code>elemname</code>	The element for which mapping information is built.
<code>cascade</code>	If <code>TRUE</code> , all elements within the <code>elemname</code> I/O stack DAG are mapped.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
  filename          IN VARCHAR2,
  filetype          IN VARCHAR2,
  cascade           IN BOOLEAN,
  max_num_fileextent IN NUMBER DEFAULT 100,
  dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 127–7 MAP_FILE Function Parameters

Parameter	Description
<code>filename</code>	The file for which mapping information is built.
<code>filetype</code>	Defines the type of the file to be mapped. It can be "DATAFILE", "SPFILE", "TEMPFILE", "CONTROLFILE", "LOGFILE", or "ARCHIVEFILE".
<code>cascade</code>	Should be <code>TRUE</code> only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an <code>ALTER SYSTEM</code> command or DML operations on extended files), <code>cascade</code> can be set to <code>FALSE</code> because the mapping changes are limited to the file extents only. If <code>TRUE</code> , mapping DAGs are also built for the elements where the file resides.
<code>max_num_fileextent</code>	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; <code>max_num_fileextent</code> is an overloaded argument.
<code>dictionary_update</code>	If <code>TRUE</code> , mapping information in the data dictionary is updated to reflect the changes. The default value is <code>TRUE</code> ; <code>dictionary_update</code> is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(  
  objname IN VARCHAR2,  
  owner   IN VARCHAR2,  
  objtype IN VARCHAR2);
```

Parameters

Table 127–8 *MAP_OBJECT Function Parameters*

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

The `DBMS_STREAMS` package, one of a set of Oracle Streams packages, provides subprograms to convert `ANYDATA` objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

Summary of DBMS_STREAMS Subprograms

Table 128–1 DBMS_STREAMS Package Subprograms

Subprogram	Description
COMPATIBLE_11_1 Function on page 128-5	Returns the <code>DBMS_STREAMS.COMPATIBLE_11_1</code> constant
COMPATIBLE_10_2 Function on page 128-6	Returns the <code>DBMS_STREAMS.COMPATIBLE_10_2</code> constant
COMPATIBLE_10_1 Function on page 128-7	Returns the <code>DBMS_STREAMS.COMPATIBLE_10_1</code> constant
COMPATIBLE_9_2 Function on page 128-8	Returns the <code>DBMS_STREAMS.COMPATIBLE_9_2</code> constant
CONVERT_ANYDATA_TO_LCR_DDL Function on page 128-9	Converts a <code>ANYDATA</code> object to a <code>SYS.LCR\$_DDL_RECORD</code> object
CONVERT_ANYDATA_TO_LCR_ROW Function on page 128-10	Converts a <code>ANYDATA</code> object to a <code>SYS.LCR\$_ROW_RECORD</code> object
CONVERT_LCR_TO_XML Function on page 128-11	Converts a logical change record (LCR) encapsulated in a <code>ANYDATA</code> object into an XML object that conforms to the XML schema for LCRs
CONVERT_XML_TO_LCR Function on page 128-12	Converts an XML object that conforms to the XML schema for LCRs into a logical change record (LCR) encapsulated in a <code>ANYDATA</code> object
GET_INFORMATION Function on page 128-13	Returns information about various Oracle Streams attributes
GET_STREAMS_NAME Function on page 128-14	Returns the name of the invoker
GET_STREAMS_TYPE Function on page 128-15	Returns the type of the invoker
GET_TAG Function on page 128-16	Gets the binary tag for all redo entries generated by the current session
SET_TAG Procedure on page 128-17	Sets the binary tag for all redo entries subsequently generated by the current session

Note: The subprograms in this package do not commit.

COMPATIBLE_11_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_11_1` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_1  
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- [GET_COMPATIBLE Member Function](#) on page 228-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

COMPATIBLE_10_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_10_2` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_2  
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- [GET_COMPATIBLE Member Function](#) on page 228-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

COMPATIBLE_10_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_10_1` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_1  
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- [GET_COMPATIBLE Member Function](#) on page 228-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

COMPATIBLE_9_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_9_2  
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- [GET_COMPATIBLE Member Function](#) on page 228-29
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR\$_DDL_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
    source IN ANYDATA)
RETURN SYS.LCR$_DDL_RECORD;
```

Parameters

Table 128–2 *CONVERT_ANYDATA_TO_LCR_DDL Function Parameters*

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR\$_DDL_RECORD typed queue.

See Also: *Oracle Streams Concepts and Administration* for more information about this function

CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR\$_ROW_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
    source IN ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;
```

Parameters

Table 128–3 CONVERT_ANYDATA_TO_LCR_ROW Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR\$_ROW_RECORD typed queue.

See Also: *Oracle Streams Concepts and Administration* for more information about this function

CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in a `ANYDATA` object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

See Also: *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_LCR_TO_XML(  
    anylcr IN ANYDATA)  
RETURN SYS.XMLTYPE;
```

Parameters

Table 128–4 *CONVERT_LCR_TO_XML Function Parameters*

Parameter	Description
<code>anylcr</code>	The <code>ANYDATA</code> encapsulated LCR to be converted. If this object is not a <code>ANYDATA</code> encapsulated LCR, then the function raises an exception.

CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a `ANYDATA` object. The LCR can be a row or DDL LCR.

See Also: *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_XML_TO_LCR(
    xml_dat IN SYS.XMLTYPE)
RETURN ANYDATA;
```

Parameters

Table 128–5 *CONVERT_XML_TO_LCR Function Parameters*

Parameter	Description
<code>xml_dat</code>	The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.

GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

```
DBMS_STREAMS.GET_INFORMATION(  
    name IN VARCHAR2)  
RETURN ANYDATA;
```

Parameters

Table 128–6 *GET_INFORMATION Function Parameters*

Parameter	Description
name	<p>The type of information you want to retrieve. Currently, the following names are available:</p> <ul style="list-style-type: none"> ▪ SENDER: Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside an apply handler. An apply handler is a DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2. ▪ CONSTRAINT_NAME: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a DML handler or error handler for an apply process. Returns NULL if called outside of a DML handler or error handler. The return value is to be interpreted as a VARCHAR2.

GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME  
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the `GET_STREAMS_NAME` function to determine the name of the apply process that raised the error.

GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE  
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the `GET_STREAMS_TYPE` function to instruct a DML handler to operate differently if it is processing messages from the error queue (`ERROR_EXECUTION` type) instead of the apply process queue (`APPLY` type).

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.GET_TAG  
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON  
DECLARE  
    raw_tag RAW(2000);  
BEGIN  
    raw_tag := DBMS_STREAMS.GET_TAG();  
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));  
END;  
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.SET_TAG (
    tag IN RAW DEFAULT NULL);
```

Parameters

Table 128–7 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: [BUILD Procedure](#) on page 28-15

DBMS_STREAMS_ADM

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams replication environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level.

See Also:

- *Oracle Streams Concepts and Administration*, *Oracle Streams Replication Administrator's Guide*, and *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about this package and Oracle Streams
- [Chapter 111, "DBMS_RULE"](#)

This chapter contains the following topics:

- [Using DBMS_STREAMS_ADM](#)
 - Overview
 - Deprecated Subprograms
 - Security Model
 - Operational Notes
- [Summary of DBMS_STREAMS_ADM Subprograms](#)

Using DBMS_STREAMS_ADM

This section contains topics which relate to using the DBMS_STREAMS_ADM package.

- [Overview](#)
- [Deprecated Subprograms](#)
- [Security Model](#)
- [Operational Notes](#)

Overview

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams replication environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to [Chapter 111, "DBMS_RULE"](#) package.

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10g Release 2 and later:

- `MAINTAIN_SIMPLE_TABLESPACE`

This procedure is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

See Also: [MAINTAIN_SIMPLE_TTS Procedure](#) on page 129-98

- `MAINTAIN_TABLESPACES`

This procedure is replaced by the `MAINTAIN_TTS` procedure.

See Also: [MAINTAIN_TTS Procedure](#) on page 129-113

Security Model

A user is associated with each Oracle Streams client. The following sections describe these users:

- [Capture User](#)
- [Propagation User](#)
- [Apply User](#)
- [Messaging Client User](#)

Capture User

The following procedures can create a capture process:

- [ADD_GLOBAL_RULES Procedure](#)
- [ADD_SCHEMA_RULES Procedure](#)
- [ADD_SUBSET_RULES Procedure](#)
- [ADD_TABLE_RULES Procedure](#)

The following procedures can create a synchronous capture:

- [ADD_SUBSET_RULES Procedure](#)
- [ADD_TABLE_RULES Procedure](#)

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user `ENQUEUE` privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

See Also: [CREATE_CAPTURE Procedure](#) on page 28-16 and [CREATE_SYNC_CAPTURE Procedure](#) on page 28-26 for information about the privileges required to capture changes (refer to the `capture_user` parameter)

Propagation User

The following procedures can create a propagation:

- [ADD_GLOBAL_PROPAGATION_RULES Procedure](#)
- [ADD_MESSAGE_PROPAGATION_RULE Procedure](#)
- [ADD_SCHEMA_PROPAGATION_RULES Procedure](#)
- [ADD_SUBSET_PROPAGATION_RULES Procedure](#)
- [ADD_TABLE_PROPAGATION_RULES Procedure](#)

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

Note:

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
 - For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.
-

See Also:

- [CREATE_PROPAGATION Procedure](#) on page 92-5 for more information about the required privileges
- ["Propagation Rules for LCRs"](#) on page 129-10 for information about when a propagation job is created

Apply User

The following procedures can create an apply process:

- [ADD_GLOBAL_RULES Procedure](#)
- [ADD_MESSAGE_RULE Procedure](#)
- [ADD_SCHEMA_RULES Procedure](#)
- [ADD_SUBSET_RULES Procedure](#)
- [ADD_TABLE_RULES Procedure](#)

If one of these procedures creates an apply process, then it configures the current user as the apply user. The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

See Also: [CREATE_APPLY Procedure](#) on page 20-11 for information about the privileges required to apply changes (refer to the `apply_user` parameter)

Messaging Client User

The following procedures can create a messaging client:

- [ADD_GLOBAL_RULES Procedure](#)
- [ADD_MESSAGE_RULE Procedure](#)
- [ADD_SCHEMA_RULES Procedure](#)
- [ADD_SUBSET_RULES Procedure](#)
- [ADD_TABLE_RULES Procedure](#)

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging

client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

Operational Notes

Several procedures in this package create rules for Oracle Streams clients, and several procedures configure an Oracle Streams replication environment. The following sections provide information about using these procedures:

- [Procedures That Create Rules and Oracle Streams Clients](#)
- [Procedures That Configure an Oracle Streams Replication Environment](#)

Procedures That Create Rules and Oracle Streams Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. Some of the procedures in the `DBMS_STREAMS_ADM` package add rules to the rule sets of Oracle Streams clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML change or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, or messaging client can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all Oracle Streams clients except for synchronous captures, you use the `inclusion_rule` parameter to specify the type of rule set (either positive or negative) for the created rules. If the Oracle Streams client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the Oracle Streams client are not affected. Additional rules can be added to a rule set using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If an Oracle Streams client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- [Capture Process Rules for Changes in the Redo Log](#)
- [Synchronous Capture Rules for DML Changes to Tables](#)
- [Propagation Rules for LCRs](#)
- [Propagation Rules for User Messages](#)
- [Apply Process Rules for LCRs](#)
- [Apply Process Rules for User Messages](#)
- [Messaging Client Rules for LCRs](#)
- [Messaging Client Rules for User Messages](#)

See Also: *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify capture for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all changes made to a source database. See [ADD_GLOBAL_RULES Procedure](#) on page 129-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified schema. See [ADD_SCHEMA_RULES Procedure](#) on page 129-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See [ADD_SUBSET_RULES Procedure](#) on page 129-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See [ADD_TABLE_RULES Procedure](#) on page 129-69.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the `source_database` parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the `CREATE_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

See Also: [Chapter, "Summary of DBMS_CAPTURE_ADM Subprograms"](#) on page 28-2 for more information about the `CREATE_CAPTURE` procedure and the procedures that prepare database objects for instantiation

Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify `sync_capture` for the `streams_type` parameter:

- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See [ADD_SUBSET_RULES Procedure](#) on page 129-59.
- The `ADD_TABLE_RULES` procedure adds a rule whose rule condition evaluates to `TRUE` for DML changes made to a specified table. See [ADD_TABLE_RULES Procedure](#) on page 129-69.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the `PREPARE_SYNC_INSTANTIATION` function in the `DBMS_CAPTURE_ADM` package at the source database.

Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than `ADD_SUBSET_RULES` or `ADD_TABLE_RULES`.
 - When the `ADD_TABLE_RULES` or the `ADD_SUBSET_RULES` procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.
-
-

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

- The `ADD_GLOBAL_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in a source queue. See [ADD_GLOBAL_PROPAGATION_RULES Procedure](#) on page 129-30.
- The `ADD_SCHEMA_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified schema. See [ADD_SCHEMA_PROPAGATION_RULES Procedure](#) on page 129-46.
- The `ADD_SUBSET_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in a source queue containing the results

of DML changes made to a subset of rows in a specified table. See "[ADD_SUBSET_PROPAGATION_RULES Procedure](#)" on page 129-55.

- The `ADD_TABLE_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified table. See "[ADD_TABLE_PROPAGATION_RULES Procedure](#)" on page 129-64.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database.

Propagation Rules for User Messages

The `ADD_MESSAGE_PROPAGATION_RULE` procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to `TRUE` for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to `TRUE` for the rule condition. This procedure generates a rule name for the rule.

See Also: "[ADD_MESSAGE_PROPAGATION_RULE Procedure](#)" on page 129-39

Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify `apply` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the apply process queue. See "[ADD_GLOBAL_RULES Procedure](#)" on page 129-34.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process queue containing changes made to a specified schema. See "[ADD_SCHEMA_RULES Procedure](#)" on page 129-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the apply process queue containing the results of DML changes made to a subset of rows in a specified table. See "[ADD_SUBSET_RULES Procedure](#)" on page 129-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the apply process queue containing changes made to a specified table. See "[ADD_TABLE_RULES Procedure](#)" on page 129-69.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the `source_database` parameter. If the `source_database`

parameter is `NULL`, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the `source_database` parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the `source_database` parameter cannot be different than the source database for the apply process. You can determine the source database for an apply process by querying the `DBA_APPLY_PROGRESS` data dictionary view.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to alter the tag value after the apply process is created, if necessary.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the `CREATE_APPLY` procedure in the `DBMS_APPLY_ADM` package.

You can also use the `DBMS_APPLY_ADM.CREATE_APPLY` procedure to specify nondefault values for the `apply_captured`, `apply_user`, `apply_database_link`, and `apply_tag` parameters when you run that procedure. You can use one of the procedures in the `DBMS_STREAMS_ADM` package to add rules to a rule set used by the apply process after you create it.

See Also: ["ALTER_APPLY Procedure"](#) on page 20-4 and ["CREATE_APPLY Procedure"](#) on page 20-11

Apply Process Rules for User Messages

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of an apply process when you specify `apply` for the `streams_type` parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the `ALTER_APPLY` procedure in the `DBMS_APPLY_ADM` package to set the message handler. If this procedure adds a rule to the negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.

See Also:

- [ADD_MESSAGE_RULE Procedure](#) on page 129-43
- [ALTER_APPLY Procedure](#) on page 20-4

Messaging Client Rules for LCRs

The following procedures add rules to a rule set of a messaging client when you specify `enqueue` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the messaging client queue. See ["ADD_GLOBAL_RULES Procedure"](#) on page 129-34.

- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client queue containing changes made to a specified schema. See "[ADD_SCHEMA_RULES Procedure](#)" on page 129-50.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the messaging client queue containing the results of DML changes made to a subset of rows in a specified table. See "[ADD_SUBSET_RULES Procedure](#)" on page 129-59.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client queue containing changes made to a specified table. See "[ADD_TABLE_RULES Procedure](#)" on page 129-69.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

Procedures That Configure an Oracle Streams Replication Environment

The following procedures in this package configure a replication environment that is maintained by Oracle Streams:

- [MAINTAIN_GLOBAL Procedure](#)
- [MAINTAIN_SCHEMAS Procedure](#)
- [MAINTAIN_SIMPLE_TTS Procedure](#)
- [MAINTAIN_TABLES Procedure](#)
- [MAINTAIN_TTS Procedure](#)
- [PRE_INSTANTIATION_SETUP Procedure](#) and [POST_INSTANTIATION_SETUP Procedure](#)

The `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures must be used together to complete the Oracle Streams replication configuration.

The following sections contain information about using these procedures:

- [Local Capture or Downstream Capture for the Source Database](#)
- [Single Source and Bi-Directional Configurations](#)
- [Oracle Streams Clients and Queues Configured By These Procedures](#)

- [Change Cycling and Tags](#)
- [Automatic Platform Conversion](#)
- [Actions Performed by These Procedures](#)
- [Configuration Progress and Recoverability](#)
- [Requirements for Running These Procedures](#)
- [Common Parameters for the Configuration Procedures](#)

Local Capture or Downstream Capture for the Source Database

Local capture means that a capture process runs on the source database. Downstream capture means that a capture process runs on a database other than the source database. These procedures can either configure local capture or downstream capture for the database specified in the `source_database` parameter.

The database that captures changes made to the source database is called the capture database. These procedures can configure one of the following databases as the capture database:

- Source database (local capture)
- Destination database (downstream capture)
- A third database (downstream capture)

The database on which the procedure is run is configured as the capture database for the source database. Therefore, to configure local capture at the source database, run the procedure at the source database. To configure downstream capture at the destination database or a third database, run the procedure at the destination database or third database.

Note:

- When these procedures configure downstream capture, they always configure archived-log downstream capture. These procedures do not configure real-time downstream capture. However, you can configure redo transport services for real-time downstream capture before running a procedure, and then set the `downstream_real_time_mine` capture process parameter to `Y` after the procedure completes. You can also generate scripts with the procedures and modify the scripts to configure real-time downstream capture.
 - If these procedures configure bi-directional replication, then the capture process for the destination database always is a local capture process. That is, these procedures always configure the capture process for changes made to the destination database to run on the destination database.
 - When the `RMAN DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation with one of these procedures, the destination database cannot be the capture database.
-
-

See Also:

- *Oracle Streams Concepts and Administration* for information about local capture and downstream capture
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that uses the `MAINTAIN_SCHEMAS` procedure to configure a Streams replication environment that uses a real-time downstream capture process
- ["Single Source and Bi-Directional Configurations"](#) on page 129-15

Single Source and Bi-Directional Configurations

These procedures either set up a single source Oracle Streams configuration with the database specified in the `source_database` parameter acting as the only source database, or these procedures set up a bi-directional Oracle Streams configuration with both databases acting as source and destination databases. The `bi_directional` parameter controls whether the Oracle Streams configuration is single source or bi-directional:

- If `bi_directional` is `FALSE`, then a capture process captures changes made to the source database and an apply process at the destination database applies these changes. If the destination database is not the capture database, then a propagation propagates the captured changes to the destination database. The default value for this parameter is `FALSE`.
- If `bi_directional` is `TRUE`, then a separate capture process captures changes made to each database, propagations propagate these changes to the other database, and each database applies changes from the other database.

If `bi_directional` is set to `FALSE`, then these procedures do not configure bi-directional replication. Therefore, changes made to the shared database objects at the destination database are not replicated to the source database, and the shared database objects are not kept synchronized at the two databases, unless no changes are made to the shared database objects at the destination database. However, if `bi_directional` is set to `TRUE`, then Oracle Streams is configured to keep the shared database objects synchronized at the two databases, even if both databases allow changes to the database objects.

Note: You might need to configure conflict resolution if bi-directional replication is configured.

See Also:

- [SET_UPDATE_CONFLICT_HANDLER Procedure](#) on page 20-52
- ["Local Capture or Downstream Capture for the Source Database"](#) on page 129-14
- *Oracle Streams Replication Administrator's Guide* for more information about conflict resolution

Oracle Streams Clients and Queues Configured By These Procedures

These procedures configure the following Oracle Streams clients:

- These procedures configure a capture process that captures changes to the source database. If bi-directional replication is configured, then these procedures also configure a capture process that captures changes to the destination database.
- If the capture database and the destination database are different databases, then these procedures configure a propagation that propagates changes from the capture database to the destination database.
- If the capture database and the destination database are the same database, then the queue names determine whether a propagation is created:
 - If the `capture_queue_name` and `apply_queue_name` parameters specify different queue names, then a propagation is created between the two queues within the destination database.
 - If the `capture_queue_name` and `apply_queue_name` parameters specify the same queue name, then a propagation is not created, and the downstream capture process and the apply process use the same queue. This configuration is possible only if the `bi_directional` parameter is set to `FALSE` to configure a single source replication environment.
- If bi-directional replication is configured, then these procedures configure a propagation that propagates changes from the destination database to the source database.
- These procedures configure an apply process that applies changes at the destination database. These changes originated at the source database. If bi-directional replication is configured, then these procedures also configure an apply process that applies changes to the source database. These changes originated at the destination database.

By default, the `capture_queue_name` and `apply_queue_name` parameters are set to `NULL`. When these parameters are set to `NULL`, these procedures configure a separate queue for each capture process and apply process. The Oracle Streams replication environment might operate more efficiently if each Oracle Streams client has its own separate queue.

However, two Oracle Streams clients share a queue in the following configurations:

- The configuration described previously in this section in which the downstream capture process and the apply process at the destination database share a queue.
- A configuration in which all of the following conditions are met:
 - The capture database is the source database or a third database.
 - The `bi_directional` parameter is set to `TRUE`.
 - The same queue name is specified for the `capture_queue_name` and `apply_queue_name` parameters.

In this case, the local capture process and the apply process at the destination database share the same queue. If the source database is the capture database, then the local capture process and the apply process at the source database also share the same queue.

The `capture_name` and `capture_queue_name` parameters must be set to `NULL` when both of the following conditions are met:

- The destination database is the capture database.
- The `bi_directional` parameter is set to `TRUE`.

When both of these conditions are met, these procedures configure two capture processes at the destination database, and these capture processes must have different names. When the `capture_name` and `capture_queue_name` parameters are set to `NULL`, the system generates a different name for the capture processes and queues. These procedures raise an error if both conditions are met and either the `capture_name` parameter or the `capture_queue_name` parameter is set to a non-`NULL` value.

- ["Single Source and Bi-Directional Configurations"](#) on page 129-15
- ["Local Capture or Downstream Capture for the Source Database"](#) on page 129-14

Change Cycling and Tags

Change cycling happens when a change is sent back to the database where it originated. Typically, change cycling should be avoided because it can result in each change going through endless loops back to the database where it originated. Such loops can result in unintended data in the database and tax the networking and computer resources of an environment.

If the `bi_directional` parameter is set to `TRUE`, then these procedures configure bi-directional replication. To prevent change cycling in a bi-directional Oracle Streams replication environment, these procedures configure the environment in the following way:

- The apply process at each database applies each change with an apply tag that is unique to the environment. An apply tag is an Oracle Streams tag that is part of each redo record created by the apply process. For example, if a procedure configures databases `sfdb.net` and `nydb.net` for bi-directional replication, then the apply tag for the apply process at `sfdb.net` might be the hexadecimal equivalent of '1', and the apply tag for the apply process at `nydb.net` might be the hexadecimal equivalent of '2'.
- The capture process at each database captures all changes to the shared database objects, regardless of tags in the redo records for the changes to these database objects.
- Each propagation propagates all changes made to the shared database objects to the other database in the bi-directional replication environment, except for changes that originated at the other database. Continuing the example, the propagation at `sfdb.net` propagates all changes to `nydb.net`, except for changes with a tag value that is the hexadecimal equivalent of '1', because these changes originated at `nydb.net`. Similarly, the propagation at `nydb.net` propagates all changes to `sfdb.net`, except for changes with a tag value that is the hexadecimal equivalent of '2'. A change that is not propagated because of its tag value is discarded.

These procedures cannot be used to configure multi-directional replication where changes can be cycled back to a source database by a third database in the environment. For example, these procedures cannot be used to configure an Oracle Streams replication environment with three databases where each database shares changes with the other two databases in the environment. Such an environment is sometimes called an "n-way" replication environment. If these procedures were used to configure a three way replication environment such as this, then changes made at a source database would be cycled back to the same source database. In a valid three way replication environment, a particular change is made only once at each database.

These procedures can be used to configure an Oracle Streams replication environment that includes more than two databases, as long as changes made at a source database cannot cycle back to the same source database. For example, a procedure can be run multiple times to configure an environment in which a primary database shares changes with multiple secondary databases. Such an environment is sometimes called a "hub-and-spoke" replication environment.

You can configure the Oracle Streams environment manually to replicate changes in a multiple source environment where each source database shares changes with the other source databases, or you can modify generated scripts to achieve this.

See Also:

- ["Single Source and Bi-Directional Configurations"](#) on page 129-15
- *Oracle Streams Replication Administrator's Guide* for more information about tags, for information about configuring a hub-and-spoke replication environment, and for information about configuring an n-way replication environment
- *Oracle Database 2 Day + Data Replication and Integration Guide* or examples that configure hub-and-spoke replication environments

Automatic Platform Conversion

If the source and destination databases are running on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.

Configuration Progress and Recoverability

When one of these procedures is run with the `perform_actions` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When one of these procedures is run with the `perform_actions` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

See Also: ["RECOVER_OPERATION Procedure"](#) on page 129-131

Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database.

- If the `bi_directional` parameter is set to `TRUE`, or if the source database is not the capture database, then the `source_database` parameter must specify a database that contains the database objects to be shared. The database specified in the `destination_database` parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then these procedures will instantiate the database objects at the destination database (excluding the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures).
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs one of these procedures should be granted DBA role. This user must have the necessary privileges to complete the following actions:
 - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
 - Specify supplemental logging
 - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
 - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
- If the `bi_directional` parameter is set to `TRUE` or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If these procedures configure downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If these procedures configure downstream capture, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes one of these procedures must have `READ` and `WRITE` privilege on each one.
- These procedures, or the scripts generated by these procedures, must be run at an Oracle Database 10g Release 2 or later database.
- If the `perform_actions` parameter is set to `TRUE` in one of these procedures to configure the Oracle Streams replication environment directly, then all of the databases configured by the procedure must be Oracle Database 10g Release 2 or later databases.
- If the `perform_actions` parameter is set to `FALSE` in one of these procedures, and the replication environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10g Release 1 or later databases. If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

See Also: *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

Common Parameters for the Configuration Procedures

Table 129–1 describes the common parameters for the procedures in this package that configure an Oracle Streams replication environment.

Table 129–1 Common Parameters for Configuration Procedures

Parameter	Description
<code>source_database</code>	<p>The global name of the source database.</p> <p>If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database.</p> <p>If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure uses the global name of the local database.</p>
<code>destination_database</code>	<p>The global name of the destination database.</p> <p>If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If NULL, then the procedure raises an error.</p>
<code>perform_actions</code>	<p>If TRUE, then the procedure performs the necessary actions to configure the replication environment directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to configure the replication environment directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> ■ <code>script_name</code> ■ <code>script_directory_object</code>

Table 129-1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the replication environment. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p>
<code>capture_name</code>	<p>The name of each capture process configured to capture changes. Do not specify an owner. If the <code>bi_directional</code> parameter is set to TRUE, then each capture process created by this procedure has the specified name.</p> <p>If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set.</p> <p>If NULL, then the system generates a name for each capture process it creates.</p> <p>Note: The capture process name cannot be altered after the capture process is created.</p>
<code>capture_queue_table</code>	<p>The name of the queue table for each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</p>

Table 129–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
capture_queue_name	<p>The name of each queue used by a capture process, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the system generates a name for each queue used by a capture process.</p>
capture_queue_user	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
propagation_name	<p>The name of each propagation configured to propagate changes. Do not specify an owner.</p> <p>If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set.</p> <p>If NULL, then the system generates a name for each propagation it creates.</p> <p>Note: The propagation name cannot be altered after the propagation is created.</p>
apply_name	<p>The name of each apply process configured to apply changes. Do not specify an owner.</p> <p>If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set.</p> <p>The specified name must not match the name of an existing messaging client at the destination database.</p> <p>If NULL, then the system generates a name for each apply process it creates. When to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter.</p> <p>Note: The apply process name cannot be altered after the apply process is created.</p>
apply_queue_table	<p>The name of the queue table for each queue used by an apply process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.</p>

Table 129-1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
apply_queue_name	<p>The name of each queue used by an apply process, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the system generates a name for each queue used by an apply process.</p>
apply_queue_user	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
bi_directional	<p>Specify TRUE to configure bi-directional replication between the database specified in <i>source_database</i> and the database specified in <i>destination_database</i>. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist.</p> <p>Specify FALSE to configure one way replication from the database specified in <i>source_database</i> and the database specified in <i>destination_database</i>. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary.</p> <p>See Also: "Oracle Streams Clients and Queues Configured By These Procedures" on page 129-15 for information about when propagations are configured</p>
include_ddl	<p>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.</p> <p>Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.</p>

Summary of DBMS_STREAMS_ADM Subprograms

Table 129–2 DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure on page 129-27	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure on page 129-30	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure on page 129-34	Adds global rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_MESSAGE_PROPAGATION_RULE Procedure on page 129-39	Either adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_MESSAGE_RULE Procedure on page 129-43	Adds a message rule to either the positive or negative rule set of an apply process or messaging client, and creates the specified apply process or messaging client if it does not exist
ADD_SCHEMA_PROPAGATION_RULES Procedure on page 129-46	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure on page 129-50	Adds schema rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_SUBSET_PROPAGATION_RULES Procedure on page 129-55	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure on page 129-59	Adds subset rules to the positive rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist
ADD_TABLE_PROPAGATION_RULES Procedure on page 129-64	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure on page 129-69	Adds table rules to the rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist

Table 129–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
CLEANUP_INSTANTIATION_SETUP Procedure on page 129-75	Removes an Oracle Streams replication configuration that was set up by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures in this package
DELETE_COLUMN Procedure on page 129-79	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
GET_MESSAGE_TRACKING Function on page 129-81	Returns the tracking label for the current session
GET_SCN_MAPPING Procedure on page 129-82	Gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment
MAINTAIN_GLOBAL Procedure on page 129-84	Configures an Oracle Streams environment that replicates changes at the database level between two databases
MAINTAIN_SCHEMAS Procedure on page 129-88	Configures an Oracle Streams environment that replicates changes to specified schemas between two databases
MAINTAIN_SIMPLE_TABLESPACE Procedure on page 129-93	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure is deprecated.
MAINTAIN_SIMPLE_TTS Procedure on page 129-98	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases
MAINTAIN_TABLES Procedure on page 129-101	Configures an Oracle Streams environment that replicates changes to specified tables between two databases
MAINTAIN_TABLESPACES Procedure on page 129-106	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure is deprecated.
MAINTAIN_TTS Procedure on page 129-113	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases
MERGE_STREAMS Procedure on page 129-116	Merges a stream flowing from one capture process with a stream flowing from another capture process
MERGE_STREAMS_JOB Procedure on page 129-119	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the <code>MERGE_STREAMS</code> procedure to merge the two streams
POST_INSTANTIATION_SETUP Procedure on page 129-122	Performs the actions required after instantiation to configure an Oracle Streams replication environment
PRE_INSTANTIATION_SETUP Procedure on page 129-126	Performs the actions required before instantiation to configure an Oracle Streams replication environment

Table 129–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
PURGE_SOURCE_CATALOG Procedure on page 129-130	Removes all Oracle Streams data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure on page 129-131	Provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure on page 129-133	Removes the specified ANYDATA queue
REMOVE_RULE Procedure on page 129-134	Removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, propagation, apply process, or messaging client.
REMOVE_STREAMS_CONFIGURATION Procedure on page 129-136	Removes the Oracle Streams configuration at the local database
RENAME_COLUMN Procedure on page 129-138	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure on page 129-141	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure on page 129-143	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_NOTIFICATION Procedure on page 129-145	Sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue
SET_MESSAGE_TRACKING Procedure on page 129-150	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_RULE_TRANSFORM_FUNCTION Procedure on page 129-151	Sets or removes the transformation function name for a rule-based transformation
SET_UP_QUEUE Procedure on page 129-155	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of Oracle Streams
SPLIT_STREAMS Procedure on page 129-158	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process

Note: All subprograms commit unless specified otherwise.

ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- `ADD_COLUMN` transformations cannot add columns of the following datatypes: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REFs`, `varrays`, nested tables), and Oracle-supplied types (including any types, `XML` types, spatial types, and media types).
 - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
-
-

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.ADD_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  column_value   IN  ANYDATA,
  value_type     IN  VARCHAR2      DEFAULT 'NEW',
  step_number    IN  NUMBER        DEFAULT 0,
  operation      IN  VARCHAR2      DEFAULT 'ADD');
```

```
DBMS_STREAMS_ADM.ADD_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  column_function IN  VARCHAR2,
  value_type     IN  VARCHAR2      DEFAULT 'NEW',
  step_number    IN  NUMBER        DEFAULT 0,
  operation      IN  VARCHAR2      DEFAULT 'ADD');
```

Parameters

Table 129–3 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [<i>schema_name.</i>] <i>rule_name</i> . If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [<i>schema_name.</i>] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column data type and the column value. For example, if the data type of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatype of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. See Also: <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.

table_name	column_name	step_number	Result
NULL	NULL	non-NULL	Remove all add column transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified <code>table_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN   VARCHAR2  DEFAULT NULL,
    source_queue_name     IN   VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN   BOOLEAN   DEFAULT TRUE,
    include_ddl           IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN   BOOLEAN   DEFAULT FALSE,
    source_database       IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name         OUT  VARCHAR2,
    ddl_rule_name         OUT  VARCHAR2,
    inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
    and_condition         IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue       IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES (
    streams_name          IN   VARCHAR2  DEFAULT NULL,
    source_queue_name     IN   VARCHAR2,
    destination_queue_name IN  VARCHAR2,
    include_dml           IN   BOOLEAN   DEFAULT TRUE,
    include_ddl           IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr    IN   BOOLEAN   DEFAULT FALSE,
    source_database       IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
    and_condition         IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue       IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 129–4 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>

Table 129–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[@<i>dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>dbs2.net</i>, enter <i>strmadmin.streams_queue@dbs2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>In most cases, specify TRUE for this parameter if the <i>inclusion_rule</i> parameter is set to FALSE.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 129–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. The source database is where the changes originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The <code>:lcr</code> in the specified condition must be <code>:dml</code> or <code>:ddl</code>. For example, to specify that the global rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of <code>'02'</code>, specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Chapter 228, "Logical Change Record TYPES"</p>

Table 129–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	<p>If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

See Also:

- ["Operational Notes"](#) on page 129-8 and ["Propagation Rules for LCRs"](#) on page 129-10 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 129-5

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to an entire database when the `streams_type` parameter is set to `capture`. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 129-9 for more information about these rules.
- Apply process rules for applying all logical change records (LCRs) in a queue when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 129-11 for more information about these rules.
- Messaging client rules for dequeuing all persistent LCRs from a queue when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 129-12 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES (
  streams_type      IN   VARCHAR2,
  streams_name      IN   VARCHAR2 DEFAULT NULL,
  queue_name        IN   VARCHAR2 DEFAULT 'streams_queue',
  include_dml       IN   BOOLEAN  DEFAULT TRUE,
  include_ddl       IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
  source_database   IN   VARCHAR2 DEFAULT NULL,
  dml_rule_name     OUT  VARCHAR2,
  ddl_rule_name     OUT  VARCHAR2,
  inclusion_rule    IN   BOOLEAN  DEFAULT TRUE,
  and_condition     IN   VARCHAR2 DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES (
  streams_type      IN   VARCHAR2,

  include_dml       IN   BOOLEAN  DEFAULT TRUE,
```

```

include_ddl          IN   BOOLEAN   DEFAULT FALSE,
include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
source_database     IN   VARCHAR2   DEFAULT NULL,
inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
and_condition       IN   VARCHAR2   DEFAULT NULL);

```

Parameters

Table 129–5 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> ▪ Specify <code>capture</code> for a capture process. ▪ Specify <code>apply</code> for an apply process. ▪ Specify <code>dequeue</code> for a messaging client.
streams_name	<p>The name of the capture process, apply process, or messaging client. Do not specify an owner.</p> <p>If the specified Oracle Streams client does not exist, then the procedure creates it automatically.</p> <p>If NULL, if <code>streams_type</code> is <code>capture</code> or <code>dequeue</code>, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> ▪ If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process. ▪ If <code>source_database</code> is NULL and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>An apply process and a messaging client cannot have the same name.</p>
queue_name	<p>The name of the local queue, specified as <code>[schema_name.] queue_name</code>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>

Table 129–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
<code>include_dml</code>	If <code>TRUE</code> , then the procedure creates a rule for DML changes. If <code>FALSE</code> , then the procedure does not create a DML rule. <code>NULL</code> is not permitted.
<code>include_ddl</code>	If <code>TRUE</code> , then the procedure creates a rule for DDL changes. If <code>FALSE</code> , then the procedure does not create a DDL rule. <code>NULL</code> is not permitted.
<code>include_tagged_lcr</code>	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-<code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a <code>NULL</code> tag. If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a <code>NULL</code> tag.</p> <p>In most cases, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
<code>source_database</code>	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify <code>NULL</code> if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>

Table 129-5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the Oracle Streams client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the global rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Chapter 228, "Logical Change Record TYPES"</p>

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules created for filtering.

See Also:

- ["Operational Notes"](#) on page 129-8
- ["Security Model"](#) on page 129-5

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the OUT parameter `rule_name`, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE (
  message_type          IN   VARCHAR2,
  rule_condition        IN   VARCHAR2,
  streams_name          IN   VARCHAR2  DEFAULT NULL,
  source_queue_name     IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
  rule_name             OUT  VARCHAR2,
  queue_to_queue        IN   BOOLEAN   DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE (
  message_type          IN   VARCHAR2,
  rule_condition        IN   VARCHAR2,
  streams_name          IN   VARCHAR2  DEFAULT NULL,
  source_queue_name     IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  inclusion_rule        IN   BOOLEAN   DEFAULT TRUE,
  queue_to_queue        IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 129–6 ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
<code>message_type</code>	<p>The type of the message. The type can be an Oracle built-in type, such as <code>VARCHAR2</code> or <code>NUMBER</code>, or it can be a user-defined type.</p> <p>If the type is not an Oracle built-in type, then it is specified as <code>[schema_name.] type_name</code>. If the schema is not specified, then the current user is the default.</p> <p>For example, to specify <code>VARCHAR2</code>, enter <code>VARCHAR2 (n)</code>, where <code>n</code> is the size specification. To specify a type named <code>usr_msg</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.usr_msg</code> for this parameter.</p> <p>The following datatypes require a size specification: <code>VARCHAR2</code>, <code>NVARCHAR2</code>, and <code>RAW</code>.</p> <p>See Also: <i>Oracle Database SQL Language Reference</i> for more information about data types</p>
<code>rule_condition</code>	<p>The rule condition for this message type. The rule variable name specified in the rule condition must be the following:</p> <pre>:msg</pre>

See Also: "Examples" on page 129-41

Table 129–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name.</i>] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name.</i>] <i>queue_name</i>[@<i>dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>db2.net</i>, enter <i>strmadmin.streams_queue@db2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
inclusion_rule	<p>If <i>inclusion_rule</i> is TRUE, then the procedure adds the rule to the positive rule set for the propagation.</p> <p>If <i>inclusion_rule</i> is FALSE, then the procedure adds the rule to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
rule_name	Contains the rule name

Table 129–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
queue_to_queue	<p>If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- ["Operational Notes"](#) on page 129-8 and ["Propagation Rules for User Messages"](#) on page 129-11 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 129-5

Examples

Suppose the message type is VARCHAR2 (128). Given this type, the following rule condition can be specified:

```
:msg = 'HQ'''
```

This rule condition evaluates to TRUE if a user message of type VARCHAR2 (128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:

```
:msg.source_dbname = 'DBS1.NET' AND ' || ':msg.owner = 'HR' AND ' ||
```

```
:msg.name = 'EMPLOYEES'
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- Apply process rule for dequeuing user messages of a specific message type from a queue when the `streams_type` parameter is set to `apply`. See ["Apply Process Rules for User Messages"](#) on page 129-12 for more information about such rules.
- Messaging client rule dequeuing user messages of a specific message type from a queue when the `streams_type` parameter is set to `dequeue`. See ["Messaging Client Rules for User Messages"](#) on page 129-13 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE (
  message_type  IN  VARCHAR2,
  rule_condition IN  VARCHAR2,
  streams_type  IN  VARCHAR2,
  streams_name  IN  VARCHAR2 DEFAULT NULL,
  queue_name    IN  VARCHAR2 DEFAULT 'streams_queue',
  inclusion_rule IN  BOOLEAN  DEFAULT TRUE,
  rule_name     OUT  VARCHAR2);
```

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE (
  message_type  IN  VARCHAR2,
  rule_condition IN  VARCHAR2,
  streams_type  IN  VARCHAR2,
  streams_name  IN  VARCHAR2 DEFAULT NULL,
  queue_name    IN  VARCHAR2 DEFAULT 'streams_queue',
  inclusion_rule IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 129–7 ADD_MESSAGE_RULE Procedure Parameters

Parameter	Description
message_type	<p>The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type.</p> <p>If the type is not an Oracle built-in type, then it is specified as [<i>schema_name</i>.] <i>type_name</i>. If the schema is not specified, then the current user is the default.</p> <p>For example, to specify VARCHAR2, enter VARCHAR2 (<i>n</i>), where <i>n</i> is the size specification. To specify a type named <i>usr_msg</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.usr_msg</i> for this parameter.</p> <p>The following datatypes require a size specification: VARCHAR2, NVARCHAR2, and RAW.</p> <p>See Also: <i>Oracle Database SQL Language Reference</i> for more information about data types</p>
rule_condition	<p>The rule condition for this message type. The rule variable name specified in the rule condition must be the following:</p> <p>:msg</p> <p>See Also: "Examples" on page 129-45</p>
streams_type	The type of message consumer, either <i>apply</i> for apply process or <i>dequeue</i> for messaging client
streams_name	<p>The name of the Oracle Streams apply process or messaging client.</p> <p>If the specified <i>streams_type</i> is <i>apply</i>, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name.</p> <p>If the specified <i>streams_type</i> is <i>dequeue</i>, then specify the messaging client. For example, if the user <i>strmadmin</i> is the messaging client, then specify <i>strmadmin</i>.</p> <p>If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error.</p> <p>If NULL and no Oracle Streams client of the specified <i>streams_type</i> exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name.</p> <p>An apply process and a messaging client cannot have the same name.</p>
queue_name	<p>The name of the local queue from which messages will be dequeued, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.</p>
inclusion_rule	<p>If <i>inclusion_rule</i> is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client.</p> <p>If <i>inclusion_rule</i> is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
rule_name	Contains the rule name

Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- ["Operational Notes"](#) on page 129-8
- ["Security Model"](#) on page 129-5
- [ALTER_APPLY Procedure](#) on page 20-4 for more information about setting a message handler for an apply process

Examples

Suppose the message type is `VARCHAR2 (128)`. Given this type, the following rule condition can be specified:

```
':msg = 'HQ'''
```

This rule condition evaluates to `TRUE` if a user message of type `VARCHAR2 (128)` has `HQ` for its value.

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = 'DBS1.NET'' AND ' || ':msg.owner = 'HR'' AND ' || ':msg.name = 'EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES (
  schema_name          IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  source_queue_name    IN   VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN  DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue       IN   BOOLEAN  DEFAULT NULL);
```

Parameters

Table 129–8 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 129–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[<i>@dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>dbs2.net</i>, enter <i>strmadmin.streams_queue@dbs2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>In most cases, specify TRUE for this parameter if the <i>inclusion_rule</i> parameter is set to FALSE.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 129–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. The source database is where the change originated. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>
and_condition	<p>If non-<code>NULL</code>, appends the specified condition to the system-generated rule condition using an <code>AND</code> clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The <code>:lcr</code> in the specified condition must be <code>:dml</code> or <code>:ddl</code>. For example, to specify that the schema rules generated by the procedure evaluate to <code>TRUE</code> only if the Oracle Streams tag is the hexadecimal equivalent of <code>'02'</code>, specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify <code>TRUE</code> for the <code>include_dml</code> parameter and <code>FALSE</code> for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify <code>FALSE</code> for the <code>include_dml</code> parameter and <code>TRUE</code> for the <code>include_ddl</code> parameter.</p> <p>See Also: Chapter 228, "Logical Change Record TYPES"</p>

Table 129–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	<p>If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules created for filtering.

See Also:

- ["Operational Notes"](#) on page 129-8 and ["Propagation Rules for LCRs"](#) on page 129-10 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 129-5

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SCHEMA_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to a specified schema when the `streams_type` parameter is set to `capture`. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 129-9 for more information about these rules.
- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 129-11 for more information about these rules.
- Messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 129-12 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not supported by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES (
  schema_name          IN   VARCHAR2,
  streams_type         IN   VARCHAR2,
  streams_name         IN   VARCHAR2  DEFAULT NULL,
  queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml          IN   BOOLEAN   DEFAULT TRUE,
  include_ddl          IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
  source_database      IN   VARCHAR2  DEFAULT NULL,
  dml_rule_name        OUT  VARCHAR2,
  ddl_rule_name        OUT  VARCHAR2,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES (
  schema_name          IN   VARCHAR2,
```

```

streams_type      IN  VARCHAR2 ,
streams_name      IN  VARCHAR2  DEFAULT NULL ,
queue_name        IN  VARCHAR2  DEFAULT 'streams_queue' ,
include_dml       IN  BOOLEAN    DEFAULT TRUE ,
include_ddl       IN  BOOLEAN    DEFAULT FALSE ,
include_tagged_lcr IN  BOOLEAN    DEFAULT FALSE ,
source_database   IN  VARCHAR2  DEFAULT NULL ,
inclusion_rule     IN  BOOLEAN    DEFAULT TRUE ,
and_condition     IN  VARCHAR2  DEFAULT NULL) ;

```

Parameters

Table 129–9 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	<p>The name of the schema. For example, hr.</p> <p>You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.</p>
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> ▪ Specify <code>capture</code> for a capture process. ▪ Specify <code>apply</code> for an apply process. ▪ Specify <code>dequeue</code> for a messaging client.
streams_name	<p>The name of the capture process, apply process, or messaging client. Do not specify an owner.</p> <p>If the specified Oracle Streams client does not exist, then the procedure creates it automatically.</p> <p>If NULL, if <code>streams_type</code> is <code>capture</code> or <code>dequeue</code>, and if one relevant capture process or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified <code>streams_type</code> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <code>streams_type</code> is <code>apply</code>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> ▪ If one existing apply process has the source database specified in <code>source_database</code> and uses the queue specified in <code>queue_name</code>, then the procedure uses this apply process. ▪ If <code>source_database</code> is NULL and one existing apply process is using the queue specified in <code>queue_name</code>, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>An apply process and a messaging client cannot have the same name.</p>

Table 129–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
queue_name	<p>The name of the local queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p>
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag.</p> <p>In most cases, specify TRUE for this parameter if the <code>inclusion_rule</code> parameter is set to FALSE.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 129–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. If <code>NULL</code>, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify <code>NULL</code> or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify <code>NULL</code> if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p>
dml_rule_name	<p>If <code>include_dml</code> is <code>TRUE</code>, then this parameter contains the DML rule name.</p> <p>If <code>include_dml</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
ddl_rule_name	<p>If <code>include_ddl</code> is <code>TRUE</code>, then this parameter contains the DDL rule name.</p> <p>If <code>include_ddl</code> is <code>FALSE</code>, then this parameter contains a <code>NULL</code>.</p>
inclusion_rule	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure adds the rules to the negative rule set for the Oracle Streams client.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 129–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
<code>and_condition</code>	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p>See Also: Chapter 228, "Logical Change Record TYPES"</p>

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules created for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
( (:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name          IN  VARCHAR2,
  dml_condition       IN  VARCHAR2,
  streams_name        IN  VARCHAR2  DEFAULT NULL,
  source_queue_name   IN  VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr  IN  BOOLEAN  DEFAULT FALSE,
  source_database     IN  VARCHAR2  DEFAULT NULL,
  insert_rule_name    OUT VARCHAR2,
  update_rule_name    OUT VARCHAR2,
  delete_rule_name    OUT VARCHAR2,
  queue_to_queue      IN  BOOLEAN  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES (
  table_name          IN  VARCHAR2,
  dml_condition       IN  VARCHAR2,
  streams_name        IN  VARCHAR2  DEFAULT NULL,
  source_queue_name   IN  VARCHAR2,
  destination_queue_name IN  VARCHAR2,
  include_tagged_lcr  IN  BOOLEAN  DEFAULT FALSE,
  source_database     IN  VARCHAR2  DEFAULT NULL,
  queue_to_queue      IN  BOOLEAN  DEFAULT NULL);
```

Parameters

Table 129–10 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
table_name	<p>The name of the table specified as [<i>schema_name.</i>] <i>object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</p>
dml_condition	<p>The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL.</p> <p>For example, to specify rows in the <i>hr.employees</i> table where the <i>salary</i> is greater than 4000 and the <i>job_id</i> is SA_MAN, enter the following as the condition:</p> <pre>' salary > 4000 and job_id = 'SA_MAN' '</pre> <p>Note: The quotation marks in the preceding example are all single quotation marks.</p>

Table 129–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	<p>The name of the propagation. Do not specify an owner.</p> <p>If the specified propagation does not exist, then the procedure creates it automatically.</p> <p>If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.</p> <p>If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</p>
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name.</i>] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name.</i>] <i>queue_name</i>[@<i>dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <code>streams_queue</code> in the <code>strmadmin</code> schema and use a database link named <code>db2.net</code>, enter <code>strmadmin.streams_queue@db2.net</code> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
include_tagged_lcr	<p>If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database.</p> <p>If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify <code>DBS1</code> and the domain is <code>.NET</code>, then the procedure specifies <code>DBS1.NET</code> automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>

Table 129–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes
queue_to_queue	<p>If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the `dml_condition` parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified `dml_condition`, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified `dml_condition`, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified `dml_condition`, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules created for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- ["Operational Notes"](#) on page 129-8 and ["Propagation Rules for LCRs"](#) on page 129-10 for more information about the rules created by this procedure
- ["Propagation User"](#) on page 129-5

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `db1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to a subset of rows in a specified table when the `streams_type` parameter is set to `capture`. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 129-9 for more information about these rules.
- Synchronous capture rules for capturing changes to a subset of rows in a specified table when the `streams_type` parameter is set to `sync_capture`. See ["Synchronous Capture Rules for DML Changes to Tables"](#) on page 129-10 for more information about these rules.
- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 129-11 for more information about these rules.
- Messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 129-12 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_type        IN   VARCHAR2 DEFAULT 'apply',
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL,
  insert_rule_name    OUT  VARCHAR2,
  update_rule_name    OUT  VARCHAR2,
  delete_rule_name    OUT  VARCHAR2);
```

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES (
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_type        IN   VARCHAR2 DEFAULT 'apply',
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 129–11 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	<p>The name of the table specified as [<i>schema_name.</i>] <i>object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, or LONG RAW columns currently or in the future.</p>
dml_condition	<p>The subset condition. Specify this condition similar to the way you specify conditions in a <i>WHERE</i> clause in SQL.</p> <p>For example, to specify rows in the <i>hr.employees</i> table where the <i>salary</i> is greater than 4000 and the <i>job_id</i> is <i>SA_MAN</i>, enter the following as the condition:</p> <pre>' salary > 4000 and job_id = 'SA_MAN' '</pre> <p>Note: The quotation marks in the preceding example are all single quotation marks.</p>
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> ▪ Specify <i>capture</i> for a capture process. ▪ Specify <i>sync_capture</i> for a synchronous capture. ▪ Specify <i>apply</i> for an apply process. ▪ Specify <i>dequeue</i> for a messaging client.
streams_name	<p>The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.</p> <p>If the specified Oracle Streams client does not exist, then the procedure creates it automatically.</p> <p>If <i>NULL</i>, if <i>streams_type</i> is <i>capture</i>, <i>sync_capture</i>, or <i>dequeue</i>, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If <i>NULL</i> and multiple Oracle Streams clients of the specified <i>streams_type</i> for the queue exist, then the procedure raises an error.</p> <p>If <i>NULL</i>, if <i>streams_type</i> is <i>apply</i>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> ▪ If one existing apply process has the source database specified in <i>source_database</i> and uses the queue specified in <i>queue_name</i>, then the procedure uses this apply process. ▪ If <i>source_database</i> is <i>NULL</i> and one existing apply process is using the queue specified in <i>queue_name</i>, then the procedure uses this apply process. <p>If <i>NULL</i> and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If <i>NULL</i> and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>An apply process and a messaging client cannot have the same name.</p>

Table 129–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
queue_name	<p>The name of the local queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>
include_tagged_lcr	<p>If TRUE, then the Oracle Streams client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. <p>If FALSE, then an Oracle Streams client performs its action only when the tag is NULL:</p> <ul style="list-style-type: none"> ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. <p>A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 129–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For synchronous capture rules, specify the name of the local database.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes

Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the `dml_condition` parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified `dml_condition`, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified `dml_condition`, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified `dml_condition`, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified `dml_condition`, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules created for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- ["Operational Notes"](#) on page 129-8
- ["Security Model"](#) on page 129-5

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID') IS NOT NULL)
AND (:dml.get_value('OLD','REGION_ID').AccessNumber()=2)
AND (:dml.get_value('NEW','REGION_ID').AccessNumber()=2)
```

ADD_TABLE_PROPAGATION_RULES Procedure

This procedure adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN   VARCHAR2,
    streams_name       IN   VARCHAR2  DEFAULT NULL,
    source_queue_name  IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml       IN   BOOLEAN  DEFAULT TRUE,
    include_ddl       IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
    source_database   IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name     OUT  VARCHAR2,
    ddl_rule_name     OUT  VARCHAR2,
    inclusion_rule     IN   BOOLEAN  DEFAULT TRUE,
    and_condition     IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue    IN   BOOLEAN  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES (
    table_name          IN   VARCHAR2,
    streams_name       IN   VARCHAR2  DEFAULT NULL,
    source_queue_name  IN   VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml       IN   BOOLEAN  DEFAULT TRUE,
    include_ddl       IN   BOOLEAN  DEFAULT FALSE,
    include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
    source_database   IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule     IN   BOOLEAN  DEFAULT TRUE,
    and_condition     IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue    IN   BOOLEAN  DEFAULT NULL);
```

Parameters

Table 129–12 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [<i>schema_name.</i>] <i>table_name</i> . For example, <i>hr.employees</i> . If the schema is not specified, then the current user is the default.
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 129–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	<p>The name of the source queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the source queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a source queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the destination queue, including a database link, specified as [<i>schema_name</i>.] <i>queue_name</i>[<i>@dblink_name</i>], if the destination queue is in a remote database. The queue must be ANYDATA type.</p> <p>For example, to specify a destination queue named <i>streams_queue</i> in the <i>strmadmin</i> schema and use a database link named <i>dbs2.net</i>, enter <i>strmadmin.streams_queue@dbs2.net</i> for this parameter.</p> <p>If the schema is not specified, then the current user is the default.</p> <p>If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database.</p> <p>Note: Connection qualifiers are not allowed.</p>
include_dml	<p>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> <p>The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</p>

Table 129–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	<p>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR.</p> <p>If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag.</p> <p>In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>
source_database	<p>The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p> <p>Oracle recommends that you specify a source database for propagation rules.</p>
dml_rule_name	<p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>
ddl_rule_name	<p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p>
inclusion_rule	<p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 129–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.</p> <p>See Also: Chapter 228, "Logical Change Record TYPES"</p>
queue_to_queue	<p>If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.</p> <p>If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.</p> <p>This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:</p> <ul style="list-style-type: none"> ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. <p>See Also: <i>Oracle Streams Concepts and Administration</i> for more information about queue-to-queue propagations</p>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the

sequence number is too long, then the table name is truncated. A propagation uses the rules created for filtering.

See Also:

- ["Operational Notes"](#) on page 129-8 and ["Propagation Rules for LCRs"](#) on page 129-10 for more information about the rules created by this procedure
- ["Security Model"](#) on page 129-5

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))  
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- Capture process rules for capturing changes to a specified table when the `streams_type` parameter is set to `capture`. See ["Capture Process Rules for Changes in the Redo Log"](#) on page 129-9 for more information about these rules.
- Synchronous capture rules for capturing changes to a specified table when the `streams_type` parameter is set to `sync_capture`. See ["Synchronous Capture Rules for DML Changes to Tables"](#) on page 129-10 for more information about these rules.
- Apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table when the `streams_type` parameter is set to `apply`. The rules can specify that the LCRs must be from a particular source database. See ["Apply Process Rules for LCRs"](#) on page 129-11 for more information about these rules.
- Messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table when the `streams_type` parameter is set to `dequeue`. The rules can specify that the LCRs must be from a particular source database. See ["Messaging Client Rules for LCRs"](#) on page 129-12 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_RULES (
  table_name          IN   VARCHAR2,
  streams_type        IN   VARCHAR2,
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN  DEFAULT TRUE,
  include_ddl         IN   BOOLEAN  DEFAULT FALSE,

and_condition     IN   VARCHAR2 DEFAULT NULL);

```

Parameters

Table 129–13 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	<p>The name of the table specified as [<i>schema_name.</i>] <i>object_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.</p>
streams_type	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> ■ Specify <i>capture</i> for a capture process. ■ Specify <i>sync_capture</i> for a synchronous capture. ■ Specify <i>apply</i> for an apply process. ■ Specify <i>dequeue</i> for a messaging client.
streams_name	<p>The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner.</p> <p>If the specified Oracle Streams client does not exist, then the procedure creates it automatically.</p> <p>If NULL, if <i>streams_type</i> is <i>capture</i>, <i>sync_capture</i>, or <i>dequeue</i>, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified <i>streams_type</i> for the queue exist, then the procedure raises an error.</p> <p>If NULL, if <i>streams_type</i> is <i>apply</i>, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</p> <ul style="list-style-type: none"> ■ If one existing apply process has the source database specified in <i>source_database</i> and uses the queue specified in <i>queue_name</i>, then the procedure uses this apply process. ■ If <i>source_database</i> is NULL and one existing apply process is using the queue specified in <i>queue_name</i>, then the procedure uses this apply process. <p>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error.</p> <p>An apply process and a messaging client cannot have the same name.</p>

Table 129–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
queue_name	<p>The name of the local queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue, and the queue must be ANYDATA type.</p> <p>For example, to specify a queue named <i>streams_queue</i> in the <i>strmadmin</i> schema, enter <i>strmadmin.streams_queue</i> for this parameter. If the schema is not specified, then the current user is the default.</p> <p>For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</p>
include_dml	<p>If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</p>
include_ddl	<p>If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</p> <p>The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.</p>

Table 129–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	<p>If <code>TRUE</code>, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to <code>TRUE</code> regardless of whether a redo entry, session, or LCR has a non-<code>NULL</code> tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag:</p> <ul style="list-style-type: none"> ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-<code>NULL</code> tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-<code>NULL</code> tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-<code>NULL</code> tag. <p>If the rules are added to a positive rule set, then setting this parameter to <code>TRUE</code> is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag.</p> <p>If <code>FALSE</code>, then the procedure adds a condition to each generated rule that causes the rule to evaluate to <code>TRUE</code> only if a redo entry, session, or LCR has a <code>NULL</code> Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is <code>NULL</code>:</p> <ul style="list-style-type: none"> ■ A redo entry is considered for capture by a capture process only when the redo entry contains a <code>NULL</code> tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a <code>NULL</code> tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a <code>NULL</code> tag. <p>If the rules are added to a positive rule set, then setting this parameter to <code>FALSE</code> might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a <code>NULL</code> tag.</p> <p>A setting of <code>FALSE</code> is often specified in update-anywhere configurations to avoid sending a change back to its source database.</p> <p>In most cases, specify <code>TRUE</code> for this parameter if the <code>inclusion_rule</code> parameter is set to <code>FALSE</code>.</p> <p>See Also: <i>Oracle Streams Replication Administrator's Guide</i> for more information about tags</p>

Table 129–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	<p>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules.</p> <p>For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured.</p> <p>For synchronous capture rules, specify the name of the local database.</p> <p>For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database.</p> <p>For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information.</p> <p>If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</p>
dml_rule_name	<p>If include_dml is TRUE, then this parameter contains the DML rule name.</p> <p>If include_dml is FALSE, then this parameter contains a NULL.</p>
ddl_rule_name	<p>If include_ddl is TRUE, then this parameter contains the DDL rule name.</p> <p>If include_ddl is FALSE, then this parameter contains a NULL.</p>
inclusion_rule	<p>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client.</p> <p>If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error.</p> <p>In either case, the system creates the rule set if it does not exist.</p>

Table 129–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
<code>and_condition</code>	<p>If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:</p> <pre>(system_condition) AND (and_condition)</pre> <p>The variable in the specified condition must be <code>:lcr</code>. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:</p> <pre>:lcr.get_tag() = HEXTORAW('02')</pre> <p>The <code>:lcr</code> in the specified condition is converted to <code>:dml</code> or <code>:ddl</code>, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.</p> <p>Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the <code>include_dml</code> parameter and FALSE for the <code>include_ddl</code> parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the <code>include_dml</code> parameter and TRUE for the <code>include_ddl</code> parameter.</p> <p>See Also: Chapter 228, "Logical Change Record TYPES"</p>

Usage Notes

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules created for filtering.

See Also:

- ["Operational Notes"](#) on page 129-8
- ["Security Model"](#) on page 129-5

Examples

The following is an example of a table rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

CLEANUP_INSTANTIATION_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Attention: When the `CLEANUP_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures were run, except for the values of the following parameters: `perform_actions`, `script_name`, and `script_directory_object`.

See Also:

- ["PRE_INSTANTIATION_SETUP Procedure"](#) on page 129-126
- ["POST_INSTANTIATION_SETUP Procedure"](#) on page 129-122

    apply_queue_table      IN VARCHAR2   DEFAULT NULL,
    apply_queue_name       IN VARCHAR2   DEFAULT NULL,
    apply_queue_user       IN VARCHAR2   DEFAULT NULL,
    bi_directional         IN BOOLEAN   DEFAULT FALSE,
    change_global_name     IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 129–14 CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
<code>maintain_mode</code>	<p>Specify one of the following:</p> <ul style="list-style-type: none"> ▪ <code>GLOBAL</code> to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases ▪ <code>TRANSPORTABLE TABLESPACES</code> to cleanup the Oracle Streams configuration that maintained a set of tablespaces at both the source and destination database
<code>tablespace_names</code>	<p>If <code>maintain_mode</code> is set to <code>TRANSPORTABLE TABLESPACES</code>, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have <code>READ</code> privilege on these directory objects.</p> <p>If <code>maintain_mode</code> is set to <code>GLOBAL</code>, then specify an empty tablespace set.</p> <p>Regardless of the <code>maintain_mode</code> setting, an error is raised if the <code>tablespace_names</code> parameter is not set or is set to <code>NULL</code>.</p> <p>See Also: TABLESPACE_SET Table Type on page 133-8</p>
<code>source_database</code>	<p>The global name of the source database.</p> <p>If <code>NULL</code>, then the procedure uses the global name of the local database.</p>
<code>destination_database</code>	<p>The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>
<code>perform_actions</code>	<p>If <code>TRUE</code>, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> ▪ <code>script_name</code> ▪ <code>script_directory_object</code>

Table 129-14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the statements are appended to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then this parameter is ignored, and this procedure does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p>
<code>capture_name</code>	<p>The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner.</p> <p>If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures.</p>
<code>capture_queue_table</code>	<p>The name of the queue table for each queue used by a capture process, specified as <code>[schema_name.]queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures.</p>
<code>capture_queue_name</code>	<p>The name of each queue used by a capture process, specified as <code>[schema_name.]queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the procedure automatically identifies the capture queues with system-generated names created by the <code>PRE_INSTANTIATION_SETUP</code> and <code>POST_INSTANTIATION_SETUP</code> procedures.</p>
<code>capture_queue_user</code>	<p>The name of the user who has <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue at the source database. This user is a secure queue user of the queue.</p>

Table 129–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
propagation_name	<p>The name of the propagations configured to propagate changes in the Oracle Streams configuration. Do not specify an owner.</p> <p>If NULL, then the procedure automatically identifies the propagations with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_name	<p>The name of the apply processes configured to apply changes in the Oracle Streams configuration. Do not specify an owner.</p> <p>If NULL, then the procedure automatically identifies the apply processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_queue_table	<p>The name of the queue table for each queue used by an apply process, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the procedure automatically identifies the apply queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_queue_name	<p>The name of each queue used by an apply process, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If NULL, then the procedure automatically identifies the apply queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.</p>
apply_queue_user	<p>The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is a secure queue user of the queue.</p>
bi_directional	<p>Specify TRUE if the Oracle Streams replication configuration is bi-directional between the database specified in <i>source_database</i> and the database specified in <i>destination_database</i>.</p> <p>Specify FALSE if the Oracle Streams replication configuration is one way replication from the current database to the database specified in <i>destination_database</i>.</p>
change_global_name	<p>If TRUE, then the procedure changes the global name of the database specified in <i>destination_database</i> to match the global name of the current database.</p> <p>If FALSE, then the procedure does not change the global name of the database specified in <i>destination_database</i>.</p>

DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The `DELETE_COLUMN` procedure supports the same datatypes supported by Oracle Streams capture processes.
 - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
-
-

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```
DBMS_STREAMS_ADM.DELETE_COLUMN(
  rule_name      IN  VARCHAR2,
  table_name     IN  VARCHAR2,
  column_name    IN  VARCHAR2,
  value_type     IN  VARCHAR2  DEFAULT '*',
  step_number    IN  NUMBER     DEFAULT 0,
  operation      IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 129–15 *DELETE_COLUMN Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [<i>schema_name</i> .] <i>rule_name</i> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>table_name</code>	The name of the table from which the column is deleted in the row LCR, specified as [<i>schema_name</i> .] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>column_name</code>	The name of the column deleted from each row LCR that satisfies the rule.

Table 129–15 (Cont.) DELETE_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. See Also: <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `DELETE_COLUMN` procedure when one or more of these parameters is `NULL`:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified <code>column_name</code> and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified <code>table_name</code> for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: [SET_MESSAGE_TRACKING Procedure](#) on page 129-150

Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING  
RETURN VARCHAR2;
```

GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

See Also: *Oracle Streams Replication Administrator's Guide* for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

Syntax

```
DBMS_STREAMS_ADM.GET_SCN_MAPPING (
  apply_name          IN  VARCHAR2,
  src_pit_scn         IN  NUMBER,
  dest_instantiation_scn OUT NUMBER,
  dest_start_scn      OUT NUMBER,
  dest_skip_txn_ids   OUT DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 129–16 *GET_SCN_MAPPING Procedure Parameters*

Parameter	Description
apply_name	Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.
src_pit_scn	The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then NULL is returned for both <code>dest_start_scn</code> and <code>dest_instantiation_scn</code> . In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.
dest_instantiation_scn	The SCN at the destination database that corresponds to the specified <code>src_pit_scn</code> at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.
dest_start_scn	For point in time recovery, the SCN to use for the <code>start_scn</code> parameter for the recovery capture process.

Table 129-16 (Cont.) GET_SCN_MAPPING Procedure Parameters

Parameter	Description
<code>dest_skip_txn_ids</code>	<p>Transaction IDs of transactions that were skipped at the <code>dest_instantiation_scn</code> because the apply process was applying nondependent transactions out of order.</p> <p>For point in time recovery, these transaction IDs should be ignored by the recovery apply process.</p> <p>This parameter is relevant only if the <code>commit_serialization</code> for the apply process that applied these transactions was set to <code>none</code>, and the transactions were applied out of order.</p>

MAINTAIN_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
 - If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the `MAINTAIN_GLOBAL` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
 - A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
-
-

See Also: ["Procedures That Configure an Oracle Streams Replication Environment"](#) on page 129-13 for more information about this procedure

Syntax

```

DBMS_STREAMS_ADM.MAINTAIN_GLOBAL (
  source_directory_object      IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  source_database              IN VARCHAR2,
  destination_database         IN VARCHAR2,
  perform_actions              IN BOOLEAN   DEFAULT TRUE,
  script_name                  IN VARCHAR2   DEFAULT NULL,
  script_directory_object      IN VARCHAR2   DEFAULT NULL,
  dump_file_name               IN VARCHAR2   DEFAULT NULL,
  capture_name                 IN VARCHAR2   DEFAULT NULL,
  capture_queue_table          IN VARCHAR2   DEFAULT NULL,
  capture_queue_name           IN VARCHAR2   DEFAULT NULL,
  capture_queue_user           IN VARCHAR2   DEFAULT NULL,
  propagation_name            IN VARCHAR2   DEFAULT NULL,
  apply_name                   IN VARCHAR2   DEFAULT NULL,
  apply_queue_table            IN VARCHAR2   DEFAULT NULL,
  apply_queue_name             IN VARCHAR2   DEFAULT NULL,
  apply_queue_user             IN VARCHAR2   DEFAULT NULL,
  log_file                     IN VARCHAR2   DEFAULT NULL,
  bi_directional               IN BOOLEAN   DEFAULT FALSE,
  include_ddl                  IN BOOLEAN   DEFAULT FALSE,

```

```
instantiation          IN INTEGER          DEFAULT
                        DBMS_STREAMS_ADM.INSTANTIATION_FULL);
```

Parameters

See Also: ["Common Parameters for the Configuration Procedures"](#) on page 129-20 for descriptions of the procedure parameters

Table 129–17 MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>source_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the procedure raises an error.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In these cases, specify <code>NULL</code> for the <code>destination_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the procedure raises an error.</p>
dump_file_name	<p>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>

Table 129–17 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code>, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

Table 129–17 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
instantiation	<p>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then the user who runs this procedure must have <code>EXECUTE</code> privilege on the <code>DBMS_FILE_TRANSFER</code> package.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code> does not perform an instantiation. This setting is valid only if the <code>perform_actions</code> parameter is set to <code>FALSE</code>, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the <code>RMAN DUPLICATE</code> or <code>CONVERT DATABASE</code> command for database instantiation, then the destination database cannot be the capture database.</p> <p>If this parameter is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK</code>, then the database objects being instantiated must exist at the source database.</p> <p>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</p>

MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `schema_names` parameter is type `VARCHAR2` and the other `schema_name` parameters is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
 - If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_SCHEMAS` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
-
-

See Also: ["Procedures That Configure an Oracle Streams Replication Environment"](#) on page 129-13 for more information about this procedure

Syntax

```

DBMS_STREAMS_ADM.MAINTAIN_SCHEMAS (
  schema_names           IN VARCHAR2,
  source_directory_object IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  source_database        IN VARCHAR2,
  destination_database   IN VARCHAR2,

Parameters

See Also: ["Common Parameters for the Configuration Procedures"](#) on page 129-20 for descriptions of the procedure parameters that are not in [Table 129-18](#)

Table 129-18 *MAINTAIN_SCHEMAS Procedure Parameters*

Parameter	Description
schema_names	<p>The schemas to be configured for replication and maintained by Oracle Streams after configuration. The schemas can be specified in the following ways:</p> <ul style="list-style-type: none"> ■ Comma-delimited list of type VARCHAR2 ■ A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. The first schema should be in position 1. The last position must be NULL. <p>If a specified schema does not exist at the source database, then the procedure raises an error. If this parameter is set to NULL, then the procedure raises an error.</p>

Table 129–18 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>source_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the procedure raises an error.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>destination_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the procedure raises an error.</p>
dump_file_name	<p>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
capture_queue_user	<p>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option.</p> <p>If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p>

Table 129–18 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
<code>log_file</code>	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code>, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

Table 129–18 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
instantiation	<p>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then the user who runs this procedure must have <code>EXECUTE</code> privilege on the <code>DBMS_FILE_TRANSFER</code> package.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the <code>instantiation</code> parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code> does not perform an instantiation. This setting is valid only if the <code>perform_actions</code> parameter is set to <code>FALSE</code>, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.</p> <p>If this parameter is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK</code>, then the database objects being instantiated must exist at the source database.</p> <p>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</p>

MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

See Also:

- ["Deprecated Subprograms"](#) on page 129-4
- [MAINTAIN_SIMPLE_TTS Procedure](#) on page 129-98

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE (
  tablespace_name           IN VARCHAR2,
  source_directory_object   IN VARCHAR2,
  destination_directory_object IN VARCHAR2,
  destination_database      IN VARCHAR2,
  setup_streams            IN BOOLEAN   DEFAULT TRUE,
  script_name              IN VARCHAR2  DEFAULT NULL,
  script_directory_object  IN VARCHAR2  DEFAULT NULL,
  bi_directional          IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 129–19 MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
<code>tablespace_name</code>	<p>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespace must exist at the source database, but it must not exist at the destination database.</p> <p>A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have <code>READ</code> privilege on this directory object.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>
<code>source_directory_object</code>	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>

Table 129–19 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
<code>destination_directory_object</code>	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>If NULL, then the procedure raises an error.</p>
<code>destination_database</code>	<p>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist.</p> <p>If NULL, then the procedure raises an error.</p>
<code>setup_streams</code>	<p>If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> ■ <code>script_name</code> ■ <code>script_directory_object</code>
<code>script_name</code>	<p>If non-NULL and the <code>setup_streams</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>setup_streams</code> parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.</p> <p>If NULL and the <code>setup_streams</code> parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly.</p> <p>If NULL and the <code>setup_streams</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p>

Table 129–19 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
bi_directional	<p>Specify TRUE to configure bi-directional replication between the current database and the database specified in <code>destination_database</code>. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages.</p> <p>Specify FALSE to configure one way replication from the current database to the database specified in <code>destination_database</code>. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</p>

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate `ALTER TABLESPACE` statements on the tablespace, nor is it configured to replicate `ALTER TABLE` statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The documentation in the following sections applies to the `MAINTAIN_SIMPLE_TABLESPACE` procedure:

- [Single Source and Bi-Directional Configurations](#) on page 129-15
- [Change Cycling and Tags](#) on page 129-17
- [Automatic Platform Conversion](#) on page 129-18

Requirements for Running this Procedure

Meet the following requirements when run the `MAINTAIN_SIMPLE_TABLESPACE` procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted DBA role. This user must have the necessary privileges to complete the following actions:

- Create ANYDATA queues, capture processes, propagations, and apply processes.
- Specify supplemental logging
- Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
- Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the `CLONE_SIMPLE_TABLESPACE` procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See [CLONE_SIMPLE_TABLESPACE Procedure](#) on page 133-17 for the list of required privileges.
- The necessary privileges to run the `ATTACH_SIMPLE_TABLESPACE` procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See [ATTACH_SIMPLE_TABLESPACE Procedure](#) on page 133-10 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

- If the `bi_directional` parameter is set to `TRUE`, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
 - The procedure is run at an Oracle Database 10g Release 2 or later database.
 - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
 - The procedure is run at an Oracle Database 10g Release 2 or later database.
 - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

See Also: *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TABLESPACES procedure that do not exist in the MAINTAIN_SIMPLE_TABLESPACE procedure. For example, this procedure creates a capture process at the source database named `capture`, because that is the default value for the `capture_name` parameter in the MAINTAIN_TABLESPACES procedure.

See Also: [MAINTAIN_TABLESPACES Procedure](#) on page 129-106

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also: ["RECOVER_OPERATION Procedure"](#) on page 129-131

MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNUNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
 - This procedure replaces the deprecated `MAINTAIN_SIMPLE_TABLESPACE` procedure.
-
-

See Also: ["Procedures That Configure an Oracle Streams Replication Environment"](#) on page 129-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
    tablespace_name          IN VARCHAR2,
    source_directory_object  IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    source_database          IN VARCHAR2,
    destination_database     IN VARCHAR2,
    perform_actions          IN BOOLEAN  DEFAULT TRUE,
    script_name              IN VARCHAR2  DEFAULT NULL,
    script_directory_object  IN VARCHAR2  DEFAULT NULL,
    bi_directional           IN BOOLEAN  DEFAULT FALSE);
```

Parameters

See Also: ["Common Parameters for the Configuration Procedures"](#) on page 129-20 for descriptions of the procedure parameters that are not in [Table 129-20](#)

Table 129–20 MAINTAIN_SIMPLE_TTS Procedure Parameters

Parameter	Description
tablespace_name	<p>The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespace must exist at the source database, but it must not exist at the destination database.</p> <p>A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object.</p> <p>If NULL, then the procedure raises an error.</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes.</p> <p>If NULL, then the procedure raises an error.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>If NULL, then the procedure raises an error.</p>

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in ["Requirements for Running These Procedures"](#) on page 129-18, the user who runs the MAINTAIN_SIMPLE_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See

[CLONE_SIMPLE_TABLESPACE Procedure](#) on page 133-17 for the list of required privileges.

- The necessary privileges to run the `ATTACH_SIMPLE_TABLESPACE` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See [ATTACH_SIMPLE_TABLESPACE Procedure](#) on page 133-10 for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the `MAINTAIN_TTS` procedure that do not exist in the `MAINTAIN_SIMPLE_TTS` procedure. For example, this procedure automatically generates the capture process name, because `NULL` is the default value for the `capture_name` parameter in the `MAINTAIN_TTS` procedure, and the procedure generates the capture process name when `NULL` is specified for `capture_name`.

See Also: [MAINTAIN_TTS Procedure](#) on page 129-113

MAINTAIN_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_name` parameters is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

Note: If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_TABLES` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: ["Procedures That Configure an Oracle Streams Replication Environment"](#) on page 129-13 for more information about this procedure

Syntax

Table 129–21 MAINTAIN_TABLES Procedure Parameters

Parameter	Description
table_names	<p>The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways:</p> <ul style="list-style-type: none"> Comma-delimited list of type VARCHAR2 A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL. <p>Each table should be specified as [<i>schema_name.</i>] <i>table_name</i>. For example, <i>hr.employees</i>. If the schema is not specified, then the current user is the default.</p> <p>If a specified table does not exist at the source database, then the procedure raises an error. If this parameter is set to NULL, then the procedure raises an error.</p>

Table 129–21 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>source_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the procedure raises an error.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>. In this case, specify <code>NULL</code> for the <code>destination_directory_object</code> parameter.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the procedure raises an error.</p>
dump_file_name	<p>The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>This parameter is ignored if <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code>.</p> <p>If <code>NULL</code> and <code>instantiation</code> is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code>, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
capture_queue_user	<p>The name of the user who requires <code>ENQUEUE</code> and <code>DEQUEUE</code> privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the <code>GRANT</code> option.</p> <p>If <code>NULL</code>, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the <code>DBMS_AQADM</code> package.</p>

Table 129–21 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE.</p> <p>If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.</p>

Table 129–21 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
instantiation	<p>Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation:</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code> performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the <code>instantiation</code> parameter is set to this value, then the user who runs this procedure must have <code>EXECUTE</code> privilege on the <code>DBMS_FILE_TRANSFER</code> package.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code> performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the <code>instantiation</code> parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure.</p> <p><code>DBMS_STREAMS_ADM.INSTANTIATION_NONE</code> does not perform an instantiation. This setting is valid only if the <code>perform_actions</code> parameter is set to <code>FALSE</code>, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly.</p> <p>If this parameter is set to <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE</code> or <code>DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK</code>, then the tables being instantiated must exist at the source database.</p> <p>If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.</p> <p>Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table already exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.</p>

MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the MAINTAIN_TTS procedure.

```

Parameters

Table 129–22 *MAINTAIN_TABLESPACES Procedure Parameters*

Parameter	Description
tablespace_names	<p>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have <code>READ</code> privilege on these directory objects.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p> <p>See Also: TABLESPACE_SET Table Type on page 133-8</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>
destination_database	<p>The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure.</p> <p>If <code>NULL</code>, then the procedure raises an error.</p>
setup_streams	<p>If <code>TRUE</code>, then the procedure performs the necessary actions to maintain the tablespaces directly.</p> <p>If <code>FALSE</code>, then the procedure does not perform the necessary actions to maintain the tablespaces directly.</p> <p>Specify <code>FALSE</code> when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify <code>FALSE</code> and either of the following parameters is <code>NULL</code>:</p> <ul style="list-style-type: none"> ■ <code>script_name</code> ■ <code>script_directory_object</code>

Table 129–22 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>setup_streams</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>setup_streams</code> parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly.</p> <p>If NULL and the <code>setup_streams</code> parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly.</p> <p>If NULL and the <code>setup_streams</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p>
<code>dump_file_name</code>	<p>The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
<code>source_queue_table</code>	<p>The name of the queue table for the queue at the source database, specified as [<code>schema_name.</code>] <code>queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p>
<code>source_queue_name</code>	<p>The name of the queue at the source database that will function as the ANYDATA queue, specified as [<code>schema_name.</code>] <code>queue_name</code>. For example, <code>strmadmin.streams_queue</code>.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p>

Table 129–22 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
source_queue_user	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
destination_queue_table	<p>The name of the queue table for the queue at the destination database, specified as [<i>schema_name</i>.] <i>queue_table_name</i>. For example, stradmin.streams_queue_table. If the schema is not specified, then the current user is the default.</p>
destination_queue_name	<p>The name of the queue at the destination database that will function as the ANYDATA queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. For example, stradmin.streams_queue.</p> <p>If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.</p>
destination_queue_user	<p>The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option.</p> <p>If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.</p>
capture_name	<p>The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner.</p> <p>If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set.</p> <p>Note: The capture process name cannot be altered after the capture process is created.</p>
propagation_name	<p>The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner.</p> <p>If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set.</p> <p>If NULL, then the system generates a name for each propagation it creates.</p> <p>Note: The propagation name cannot be altered after the propagation is created.</p>

Table 129–22 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
apply_name	<p>The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner.</p> <p>If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set.</p> <p>The specified name must not match the name of an existing messaging client at the destination database.</p> <p>If NULL, then the system generates a name for each apply process it creates.</p> <p>Note: The apply process name cannot be altered after the apply process is created.</p>
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>If NULL, then the log file name is the same name as the export dump file name with an extension of .c1g.</p>
bi_directional	<p>Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages.</p> <p>Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.</p>
include_ddl	<p>Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes.</p> <p>Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.</p>

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The documentation in the following sections applies to the MAINTAIN_TABLESPACES procedure:

- [Single Source and Bi-Directional Configurations](#) on page 129-15
- [Change Cycling and Tags](#) on page 129-17
- [Automatic Platform Conversion](#) on page 129-18

Requirements for Running this Procedure

Meet the following requirements when run the `MAINTAIN_TABLESPACES` procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted DBA role. This user must have the necessary privileges to complete the following actions:
 - Create ANYDATA queues, capture processes, propagations, and apply processes.
 - Specify supplemental logging
 - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
 - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
 - Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
 - The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See [CLONE_TABLESPACES Procedure](#) on page 133-19 for the list of required privileges.
 - The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See [ATTACH_TABLESPACES Procedure](#) on page 133-12 for the list of required privileges.

To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.

- If the `bi_directional` parameter is set to `TRUE`, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10g Release 2 or later databases when this procedure is run under the following conditions:
 - The procedure is run at an Oracle Database 10g Release 2 or later database.
 - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.

- The databases configured by this procedure must be Oracle Database 10g Release 1 or later databases when this procedure is run under the following conditions:
 - The procedure is run at an Oracle Database 10g Release 2 or later database.
 - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

- If the procedure is run at an Oracle Database 10g Release 1 database, then the databases configured by the procedure must be Oracle Database 10g Release 1 or later databases.

See Also: *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also: "[RECOVER_OPERATION Procedure](#)" on page 129-131

MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the DBA_STREAMS_UNsupported data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
 - This procedure replaces the deprecated MAINTAIN_TABLESPACES procedure.
-
-

See Also: ["Procedures That Configure an Oracle Streams Replication Environment"](#) on page 129-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TTS(
  tablespace_names          IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,

```

Parameters

See Also: ["Common Parameters for the Configuration Procedures"](#) on page 129-20 for descriptions of the procedure parameters that are not in [Table 129–23](#)

Table 129–23 MAINTAIN_TTS Procedure Parameters

Parameter	Description
tablespace_names	<p>The local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.</p> <p>If NULL, then the procedure raises an error.</p> <p>See Also: TABLESPACE_SET Table Type on page 133-8</p>
source_directory_object	<p>The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes.</p> <p>If NULL, then the procedure raises an error.</p>
destination_directory_object	<p>The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred.</p> <p>If the source database and destination database are running on the same computer system, then the source and destination directories must be different.</p> <p>If NULL, then the procedure raises an error.</p>
dump_file_name	<p>The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the <code>source_directory_object</code> or <code>destination_directory_object</code> parameter, then the procedure raises an error.</p> <p>If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is <code>expatnn.dmp</code>, where <code>nn</code> is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.</p>
log_file	<p>The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file.</p> <p>If NULL, then the log file name is the same name as the export dump file name with an extension of <code>.clg</code>.</p>

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "[Requirements for Running These Procedures](#)" on page 129-18, the user who runs the MAINTAIN_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See [CLONE_TABLESPACES Procedure](#) on page 133-19 for the list of required privileges.
- The necessary privileges to run the ATTACH_TABLESPACES procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See [ATTACH_TABLESPACES Procedure](#) on page 133-12 for the list of required privileges.

MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the `MERGE_STREAMS_JOB` procedure. The `MERGE_STREAMS_JOB` procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the `MERGE_STREAMS_JOB` procedure does nothing. Typically, it is best to run the `MERGE_STREAMS_JOB` procedure instead of running the `MERGE_STREAMS` procedure directly.

However, you can choose to run the `MERGE_STREAMS` procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The `CAPTURE_MESSAGE_CREATE_TIME` in the `GV$STREAMS_CAPTURE` view of the cloned capture process has caught up to, or nearly caught up to, the `CAPTURE_MESSAGE_CREATE_TIME` of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The `MERGE_STREAMS` procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
 - The acknowledged SCN of the cloned propagation.
 - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS (
  cloned_propagation_name  IN  VARCHAR2,
  propagation_name        IN  VARCHAR2  DEFAULT NULL,
  queue_name              IN  VARCHAR2  DEFAULT NULL,
  perform_actions         IN  BOOLEAN   DEFAULT TRUE,
  script_name             IN  VARCHAR2  DEFAULT NULL,
  script_directory_object IN  VARCHAR2  DEFAULT NULL);
```

Parameters**Table 129–24 MERGE_STREAMS Procedure Parameters**

Parameter	Description
cloned_propagation_name	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
propagation_name	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. See "Usage Notes" on page 129-118 for more information.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> ■ The queue specified in the <code>queue_name</code> parameter does not exist. ■ The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.

Table 129–24 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure.</p> <p>Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 129-118 for more information.</p>
perform_actions	<p>If TRUE, then the procedure performs the necessary actions to merge the streams directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to merge the streams directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> ▪ script_name ▪ script_directory_object
script_name	<p>If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script.</p> <p>If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.</p>
script_directory_object	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the script_name parameter is non-NULL, then the procedure raises an error.</p>

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the `MERGE_STREAMS` procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the `SPLIT_STREAMS` procedure in this package. The `SPLIT_STREAMS` procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the `SPLIT_STREAMS` procedure has a cloned queue, cloned capture process, and cloned propagation.

If the `auto_merge_threshold` parameter was set to a positive number in the `SPLIT_STREAMS` procedure that split the streams, then a merge job runs the `MERGE_STREAMS_JOB` procedure automatically according to its schedule. The schedule name is specified for the `schedule_name` parameter, and the merge job name is specified for the `merge_job_name` parameter when the `MERGE_STREAMS_JOB` procedure is run automatically. The merge job and its schedule were created by the `SPLIT_STREAMS` procedure.

If the `auto_merge_threshold` parameter was set to `NULL` or 0 (zero) in the `SPLIT_STREAMS` procedure that split the streams, then you can run the `MERGE_STREAMS_JOB` procedure manually. In this case, it is not run automatically.

- *Oracle Streams Replication Administrator's Guide* for instructions on using the `MERGE_STREAMS_JOB` procedure

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
  cloned_propagation_name      IN VARCHAR2,
  propagation_name            IN VARCHAR2 DEFAULT NULL,
  queue_name                   IN VARCHAR2 DEFAULT NULL,
  merge_threshold              IN NUMBER,
  schedule_name                IN VARCHAR2 DEFAULT NULL,
  merge_job_name               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 129–25 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
cloned_propagation_name	<p>The name of the cloned propagation used by the stream that was split off from the original stream using the <code>SPLIT_STREAMS</code> procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation.</p> <p>You must specify an existing propagation name. Do not specify an owner.</p>
propagation_name	<p>The name of the propagation that is merged back to the original stream.</p> <p>If <code>NULL</code>, then the name of the original propagation in the original stream is used. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. See "Usage Notes" on page 129-121 for more information.</p> <p>If a non-<code>NULL</code> value is specified, then an error is raised under either of the following conditions:</p> <ul style="list-style-type: none"> ■ The queue specified in the <code>queue_name</code> parameter does not exist. ■ The queue specified in the <code>queue_name</code> parameter exists but is not used by a capture process.
queue_name	<p>The name of the queue that is the source queue for the propagation that is merged back.</p> <p>If <code>NULL</code>, then the existing, original queue is the source queue for the propagation that is merged back. Specify <code>NULL</code> only if the streams were split using the <code>SPLIT_STREAMS</code> procedure.</p> <p>Specify a non-<code>NULL</code> value if you are merging two streams that were not split by the <code>SPLIT_STREAMS</code> procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 129-121 for more information.</p>
merge_threshold	<p>The merge threshold in seconds.</p> <p>The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$STREAMS_CAPTURE</code> dynamic performance view determines whether or not the streams are merged.</p> <p>Specifically, if the difference, in seconds, between the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the <code>MERGE_STREAMS</code> procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.</p>
schedule_name	<p>The name of the schedule for the merge job.</p> <p>If <code>NULL</code>, then no schedule name is specified. Typically, you set this parameter to <code>NULL</code> when the <code>auto_merge_threshold</code> parameter was set to <code>NULL</code> or 0 (zero) in the <code>SPLIT_STREAMS</code> procedure that split the streams.</p> <p>Specify <code>NULL</code> if you run this procedure manually.</p>

Table 129–25 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
merge_job_name	<p>The name of the job that merges the streams.</p> <p>If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams.</p> <p>Specify NULL if you run this procedure manually.</p>

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

POST_INSTANTIATION_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Attention: When the `POST_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` procedure was run, except for the values of the following parameters: `perform_actions`, `script_name`, `script_directory_object`, and `start_processes`.

Note: A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

Parameters

See Also: ["Common Parameters for the Configuration Procedures"](#) on page 129-20 for descriptions of the procedure parameters that are not in [Table 129–26](#)

Table 129–26 *POST_INSTANTIATION_SETUP Procedure Parameters*

Parameter	Description
maintain_mode	Specify one of the following: <ul style="list-style-type: none"> GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	<p>If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.</p> <p>If maintain_mode is set to GLOBAL, then specify an empty tablespace set.</p> <p>Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL.</p>

See Also: [TABLESPACE_SET Table Type](#) on page 133-8

Table 129–26 (Cont.) POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
start_processes	<p>If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTIATION_SETUP procedure also is started.</p> <p>If FALSE, then the procedure does not start any capture processes or apply processes.</p>
instantiation_scn	<p>Specify the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the <i>Oracle Streams Replication Administrator's Guide</i> for more information.</p> <p>Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.</p>
exclude_schemas	<p>A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas.</p> <p>Specify an asterisk (*) to exclude all of the schemas in the database.</p> <p>If NULL, then the procedure does not exclude any schemas in the database.</p> <p>This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</p>
exclude_flags	<p>Specify what is excluded from the replication configuration in the schemas specified by the exclude_schemas parameter. This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See "Usage Notes" on page 129-128 for the PRE_INSTANTIATION_SETUP procedure for more information.</p>

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Destination Database Renamed During RMAN Database Instantiation

If the `maintain_mode` parameter is set to `GLOBAL`, then database instantiation is required before running the `POST_INSTANTIATION_SETUP` procedure. If the RMAN

DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the POST_INSTANTIATION_SETUP procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the `destination_database` parameter.
2. At the destination database, drop and recreate any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database `db1.net` has a database link that refers to itself. Suppose the destination database is `db2.net`. At the destination database, drop and recreate this database link as a loopback database link that refers to itself (`db2.net`).
3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is `db1.net` and the destination database is `db2.net`, then drop any database links on the destination database that are from `db1.net` to `db2.net`.
4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database.

This database link is required because the POST_INSTANTIATION_SETUP procedure runs the SET_GLOBAL_INSTANTIATION_SCN procedure in the DBMS_APPLY_ADM package at the destination database, and the SET_GLOBAL_INSTANTIATION_SCN procedure requires the database link. The instantiation SCN is set to the value specified in the `instantiation_scn` parameter of the POST_INSTANTIATION_SETUP procedure.

Note: When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

Oracle Streams Components Removed From the Destination Database

If the `maintain_mode` parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. During database instantiation, Oracle Streams components created by the PRE_INSTANTIATION_SETUP procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The POST_INSTANTIATION_SETUP procedure removes the Stream components created by the PRE_INSTANTIATION_SETUP procedure from the destination database.

In some cases, rule sets and rules created by the PRE_INSTANTIATION_SETUP procedure might not be removed from the destination database. The POST_INSTANTIATION_SETUP procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the POST_INSTANTIATION_SETUP procedure, or the script generated by the procedure, completes.

Note: The POST_INSTANTIATION_SETUP procedure only removes Oracle Streams components that were created by the PRE_INSTANTIATION_SETUP procedure. It does not remove Oracle Streams components that were created in a different way.

PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Note:

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
 - When the `RMAN DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.
-

```

Parameters

See Also: ["Common Parameters for the Configuration Procedures"](#) on page 129-20 for descriptions of the procedure parameters that are not in [Table 129-27](#)

Table 129-27 *PRE_INSTANTIATION_SETUP Procedure Parameters*

Parameter	Description
maintain_mode	Specify one of the following: <ul style="list-style-type: none"> GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the <code>destination_database</code> parameter TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the <code>destination_database</code> parameter
tablespace_names	<p>If <code>maintain_mode</code> is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams.</p> <p>The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database.</p> <p>Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects.</p> <p>If <code>maintain_mode</code> is set to GLOBAL, then specify an empty tablespace set.</p> <p>Regardless of the <code>maintain_mode</code> setting, an error is raised if the <code>tablespace_names</code> parameter is not set or is set to NULL.</p>

See Also: [TABLESPACE_SET Table Type](#) on page 133-8

Table 129–27 (Cont.) PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
capture_queue_table	<p>The name of the queue table for each queue used by a capture process, specified as <code>[schema_name.]queue_table_name</code>. For example, <code>strmadmin.streams_queue_table</code>. If the schema is not specified, then the current user is the default.</p> <p>If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.</p>
start_processes	<p>If TRUE, then the procedure starts each capture process and apply process.</p> <p>If FALSE, then the procedure does not start any capture processes or apply processes.</p>
exclude_schemas	<p>A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas.</p> <p>Specify an asterisk (*) to exclude all of the schemas in the database.</p> <p>If NULL, then the procedure does not exclude any schemas in the database.</p> <p>This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.</p>
exclude_flags	<p>Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See "Usage Notes" on page 129-128 for more information.</p>

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

See Also: *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

The exclude_flags Parameter

Specify one of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` to exclude changes to the schemas and all of the database objects in the schemas
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED` to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` or `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED`, specify one or both of the following values:

- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML` to exclude data manipulation language (DML) changes made to the excluded database objects
- `DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL` to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the `exclude_schemas` parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the `exclude_schemas` parameter, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a non-NULL value. If the `maintain_mode` parameter is set to `GLOBAL` and the `exclude_schemas` parameter is set to a NULL, then the procedure ignores this parameter. If the `maintain_mode` parameter is set to `TRANSPORTABLE TABLESPACES`, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the `exclude_schemas` parameter, but the `exclude_flags` parameter is set to NULL, then the procedure does not add any rules to the negative rule set of any capture process, and the procedure includes the schemas specified in the `exclude_schemas` parameter in the replication environment.

PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG (
    source_database      IN  VARCHAR2,
    source_object_name  IN  VARCHAR2,
    source_object_type  IN  VARCHAR2);
```

Parameters

Table 129–28 *PURGE_SOURCE_CATALOG Procedure Parameters*

Parameter	Description
source_database	The global name of the source database containing the object. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [<i>schema_name</i> .] <i>object_name</i> . For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.

Usage Notes

The global name of the source database containing the object must be specified for the `source_database` parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the `hr.employees` table at the `dbs1.net` source database are being applied to the `hr.employees` table at the `dbs2.net` destination database. Also, suppose `hr.employees` at `dbs2.net` is not a source at all. In this case, specifying `dbs2.net` as the `source_database` for this table results in an error. However, specifying `dbs1.net` as the `source_database` for this table while running the `PURGE_SOURCE_CATALOG` procedure at the `dbs2.net` database removes data dictionary information about the table at `dbs2.net`.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

Note: These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

RECOVER_OPERATION Procedure

This procedure provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for replication configuration operations being done by one of the following procedures:

- [MAINTAIN_GLOBAL Procedure](#)
- [MAINTAIN_SCHEMAS Procedure](#)
- [MAINTAIN_SIMPLE_TABLESPACE Procedure](#)
- [MAINTAIN_SIMPLE_TTS Procedure](#)
- [MAINTAIN_TABLES Procedure](#)
- [MAINTAIN_TABLESPACES Procedure](#)
- [MAINTAIN_TTS Procedure](#)
- [PRE_INSTANTIATION_SETUP Procedure](#)
- [POST_INSTANTIATION_SETUP Procedure](#)

When these procedures configure the replication environment directly (not by generating a script), information about the configuration actions is stored in the following data dictionary views when the procedure is running:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

The data dictionary views are populated at the database where the replication configuration procedure is run. When one of these procedures completes successfully, metadata about the configuration operation is purged from these views. However, when one of these procedures encounters an error and stop, metadata about the configuration operation remains in these views. In this case, you can either roll forward, roll back, or purge the metadata about the operation using the `RECOVER_OPERATION` procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in `DBA_RECOVERABLE_SCRIPT_ERRORS` before proceeding.

Run the `RECOVER_OPERATION` procedure at the database where the replication configuration procedure was run.

Note: To run the `RECOVER_OPERATION` procedure, both databases must be Oracle Database 10g Release 2 or later databases.

Syntax

```
DBMS_STREAMS_ADM.RECOVER_OPERATION(
  script_id      IN RAW,
  operation_mode IN VARCHAR2 DEFAULT 'FORWARD');
```

Parameters

Table 129–29 RECOVER_OPERATION Procedure Parameters

Parameter	Description
<code>script_id</code>	The operation id of the procedure invocation that is being rolled forward, rolled back, or purged. Query the <code>SCRIPT_ID</code> column of the <code>DEA_RECOVERABLE_SCRIPT</code> data dictionary view to determine the operation id.
<code>operation_mode</code>	If <code>FORWARD</code> , then the procedure rolls forward the operation. Specify <code>FORWARD</code> to try to complete the operation. If <code>ROLLBACK</code> , then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then the procedure purges all of the metadata about the operation. If <code>PURGE</code> , then the procedure purges all of the metadata about the operation without rolling the operation back.

REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the `drop_unused_queue_table` parameter is set to `TRUE`, then drops the queue table if it is empty and no other queues are using it.
5. If the `cascade` parameter is set to `TRUE`, then drops all of the Oracle Streams clients that are using the queue.

Note: The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_QUEUE(
  queue_name          IN  VARCHAR2,
  cascade             IN  BOOLEAN  DEFAULT FALSE,
  drop_unused_queue_table IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 129–30 REMOVE_QUEUE Procedure Parameters

Parameter	Description
<code>queue_name</code>	The name of the queue to remove, specified as [<i>schema_name</i> .] <i>queue_name</i> . For example, <code>strmadmin.streams_queue</code> . If the schema is not specified, then the current user is the default.
<code>cascade</code>	If <code>TRUE</code> , then the procedure drops any Oracle Streams clients that use the queue. If <code>FALSE</code> , then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the <code>cascade</code> parameter set to <code>FALSE</code> , make sure no Oracle Streams clients are using the queue currently.
<code>drop_unused_queue_table</code>	If <code>TRUE</code> and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If <code>FALSE</code> , then the procedure does not drop the queue table.

REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

Note: If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_RULE (
    rule_name          IN  VARCHAR2,
    streams_type       IN  VARCHAR2,
    streams_name       IN  VARCHAR2,
    drop_unused_rule   IN  BOOLEAN  DEFAULT TRUE,
    inclusion_rule     IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 129–31 REMOVE_RULE Procedure Parameters

Parameter	Description
<code>rule_name</code>	<p>The name of the rule to remove, specified as <code>[schema_name .] rule_name</code>. If <code>NULL</code>, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</p>
<code>streams_type</code>	<p>The type of Oracle Streams client:</p> <ul style="list-style-type: none"> ■ Specify <code>capture</code> for a capture process. ■ Specify <code>sync_capture</code> for a synchronous capture. ■ Specify <code>propagation</code> for a propagation. ■ Specify <code>apply</code> for an apply process. ■ Specify <code>dequeue</code> for a messaging client.
<code>streams_name</code>	<p>The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner.</p> <p>If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata.</p> <p>If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.</p>

Table 129-31 (Cont.) REMOVE_RULE Procedure Parameters

Parameter	Description
<code>drop_unused_rule</code>	<p>If <code>TRUE</code> and the rule is not in any rule set, then the procedure drops the rule from the database.</p> <p>If <code>TRUE</code> and the rule exists in any rule set, then the procedure does not drop the rule from the database.</p> <p>If <code>FALSE</code>, then the procedure does not drop the rule from the database.</p>
<code>inclusion_rule</code>	<p>If <code>inclusion_rule</code> is <code>TRUE</code>, then the procedure removes the rule from the positive rule set for the Oracle Streams client.</p> <p>If <code>inclusion_rule</code> is <code>FALSE</code>, then the procedure removes the rule from the negative rule set for the Oracle Streams client.</p>

REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rules that were created using the `DBMS_STREAMS_ADM` package. Does not drop rules that were created using the `DBMS_RULE_ADM` package.

This procedure stops capture processes and apply processes before it drops them.

Attention: Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

Note:

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
 - This procedure commits multiple times.
-

RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The `RENAME_COLUMN` procedure supports the same datatypes supported by Oracle Streams capture processes.
 - Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.
-
-

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```
DBMS_STREAMS_ADM.RENAME_COLUMN(
    rule_name          IN  VARCHAR2,
    table_name         IN  VARCHAR2,
    from_column_name   IN  VARCHAR2,
    to_column_name     IN  VARCHAR2,
    value_type         IN  VARCHAR2  DEFAULT '*',
    step_number        IN  NUMBER     DEFAULT 0,
    operation          IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 129-32 *RENAME_COLUMN Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as <code>[schema_name.] rule_name</code> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>table_name</code>	The name of the table in which the column is renamed in the row LCR, specified as <code>[schema_name.] object_name</code> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>from_column_name</code>	The name of the column to be renamed in each row LCR that satisfies the rule.
<code>to_column_name</code>	The new name of the column in each row LCR that satisfies the rule.

Table 129–32 (Cont.) RENAME_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. See Also: <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the `operation` parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified `table_name`, `column_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the `RENAME_COLUMN` procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified <code>step_number</code> for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>to_column_name</code> and <code>step_number</code> for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>step_number</code> for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>column_name</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> and <code>column_name</code> for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified <code>table_name</code> , <code>column_name</code> , and <code>step_number</code> for the specified rule.

RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note: Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_SCHEMA(
  rule_name          IN  VARCHAR2,
  from_schema_name  IN  VARCHAR2,
  to_schema_name    IN  VARCHAR2,
  step_number       IN  NUMBER    DEFAULT 0,
  operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 129–33 *RENAME_SCHEMA Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [<i>schema_name.</i>] <i>rule_name</i> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>from_schema_name</code>	The name of the schema to be renamed in each row LCR that satisfies the rule.
<code>to_schema_name</code>	The new name of the schema in each row LCR that satisfies the rule.
<code>step_number</code>	The order of execution of the transformation. See Also: <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering
<code>operation</code>	Specify <code>'ADD'</code> to add the transformation to the rule. Specify <code>'REMOVE'</code> to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table

lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

from_schema_name	to_schema_name	step_number	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note: Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_TABLE(
  rule_name          IN  VARCHAR2,
  from_table_name    IN  VARCHAR2,
  to_table_name      IN  VARCHAR2,
  step_number        IN  NUMBER    DEFAULT 0,
  operation           IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 129–34 *RENAME_TABLE Procedure Parameters*

Parameter	Description
<code>rule_name</code>	The name of the rule, specified as [<i>schema_name.</i>] <i>rule_name</i> . If <code>NULL</code> , then the procedure raises an error. For example, to specify a rule in the <code>hr</code> schema named <code>employees12</code> , enter <code>hr.employees12</code> . If the schema is not specified, then the current user is the default.
<code>from_table_name</code>	The name of the table to be renamed in each row LCR that satisfies the rule, specified as [<i>schema_name.</i>] <i>object_name</i> . For example, <code>hr.employees</code> . If the schema is not specified, then the current user is the default.
<code>to_table_name</code>	The new name of the table in each row LCR that satisfies the rule, specified as [<i>schema_name.</i>] <i>object_name</i> . For example, <code>humres.staff</code> . The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
<code>step_number</code>	The order of execution of the transformation. See Also: <i>Oracle Streams Concepts and Administration</i> for more information about transformation ordering

Table 129–34 (Cont.) RENAME_TABLE Procedure Parameters

Parameter	Description
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
 - The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.
-
-

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
  streams_name      IN  VARCHAR2,
  notification_action  IN  VARCHAR2,
  notification_type   IN  VARCHAR2      DEFAULT 'PROCEDURE',
  notification_context IN  ANYDATA      DEFAULT NULL,
  include_notification IN  BOOLEAN      DEFAULT TRUE,
  queue_name         IN  VARCHAR2      DEFAULT 'streams_queue');
```

Parameters

Table 129–35 SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
streams_name	The name of the Oracle Streams messaging client. Do not specify an owner. For example, if the user strmadmin is the messaging client, then specify strmadmin.

Table 129–35 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
notification_action	<p>The action to be performed on message notification. Specify one of the following:</p> <ul style="list-style-type: none"> ■ For URL notifications, specify a URL without the prefix <code>http://</code>. For example, to specify the URL <code>http://www.company.com:8080</code>, enter the following: <code>www.company.com:8080</code> ■ For email notifications, specify an email address. For example, to specify an the email address <code>xyz@company.com</code>, enter the following: <code>xyz@company.com</code> ■ For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form <code>[schema_name.]procedure_name</code>. If the <code>schema_name</code> is not specified, then the user who invokes the <code>SET_MESSAGE_NOTIFICATION</code> procedure is the default. The procedure must be a <code>PLSQLCALLBACK</code> data structure. For example, to specify a procedure named <code>notify_orders</code> in the <code>oe</code> schema, enter the following: <code>oe.notify_orders</code> <p>See Also: Examples on page 129-148 for more information about message notification procedures</p>
notification_type	<p>The type of notification. Specify one of the following:</p> <ul style="list-style-type: none"> ■ <code>HTTP</code> if you specified a URL for <code>notification_action</code> ■ <code>MAIL</code> if you specified an email address for <code>notification_action</code> ■ <code>PROCEDURE</code> if you specified a user-defined procedure for <code>notification_action</code> <p>The type must match the specification for the <code>notification_action</code> parameter.</p>
notification_context	<p>The context of the notification. The context must be specified using <code>RAW</code> datatype information. For example, to specify the hexadecimal equivalent of <code>'FF'</code>, enter the following: <code>ANYDATA.ConvertRaw(HEXTORAW('FF'))</code></p> <p>The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.</p>
include_notification	<p>If <code>TRUE</code>, then the procedure adds this notification for the specified <code>streams_name</code> and <code>queue_name</code>. That is, specifying <code>TRUE</code> turns on the notification for the <code>streams_name</code> and <code>queue_name</code>.</p> <p>If <code>FALSE</code>, then the procedure removes this notification for the specified <code>streams_name</code> and <code>queue_name</code>. That is, specifying <code>FALSE</code> turns off the notification for the <code>streams_name</code> and <code>queue_name</code>. If you specify <code>FALSE</code>, then this procedure ignores any specified values for the <code>notification_action</code> or <code>notification_context</code> parameters.</p>

Table 129–35 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
queue_name	<p>The name of a local ANYDATA queue, specified as [<i>schema_name</i>.] <i>queue_name</i>. The current database must contain the queue. The specified queue must be a ANYDATA queue.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>

Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.
- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.
- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the `DBMS_AQELM` package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the `DBMS_AQELM` package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an `AQXMLNotification`, which includes of the following:

- `notification_options`, which includes the following:
 - `destination` - The destination queue from which the message was dequeued
 - `consumer_name` - The name of the messaging client that dequeued the message
- `message_set` - The set of message properties

See Also:

- The documentation for the DBMS_AQELM package for more information on email notifications and HTTP notifications
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that configures message notification to automatically dequeue of messages of interest
- *Oracle Streams Concepts and Administration* for an example that configures e-mail notifications
- *Oracle Streams Advanced Queuing User's Guide* and *Oracle XML DB Developer's Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```
PROCEDURE procedure_name(
    context IN ANYDATA,
    reginfo IN SYS.AQ$_REG_INFO,
    descr   IN SYS.AQ$_DESCRIPTOR);
```

Here, *procedure_name* stands for the name of the procedure. The procedure is a PLSQLCALLBACK data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type `oe.user_msg` using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```
CREATE TYPE oe.user_msg AS OBJECT(
    object_name  VARCHAR2(30),
    object_owner VARCHAR2(30),
    message      VARCHAR2(50));
/
```

Next, create the procedure:

```
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
    context ANYDATA,
    reginfo SYS.AQ$_REG_INFO,
    descr   SYS.AQ$_DESCRIPTOR)
AS
    dequeue_options DBMS_AQ.DEQUEUE_OPTIONS_T;
    message_properties DBMS_AQ.MESSAGE_PROPERTIES_T;
    message_handle    RAW(16);
    message            ANYDATA;
    oe_message         oe.user_msg;
    rc                 PLS_INTEGER;
BEGIN
    -- Get the message identifier and consumer name from the descriptor
    dequeue_options.msgid := descr.msgid;
    dequeue_options.consumer_name := descr.consumer_name;
    -- Dequeue the message
    DBMS_AQ.DEQUEUE(
```

```
queue_name      => descr.queue_name,  
dequeue_options => dequeue_options,  
message_properties => message_properties,  
payload         => message,  
msgid          => message_handle);  
rc := message.getobject(oe_message);  
COMMIT;  
END;  
/
```

See Also: *Oracle Database PL/SQL Packages and Types Reference* for more information about PLSQLCALLBACK data structures

SET_MESSAGE_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note: The tracking label set by this procedure does not track non-LCR messages.

See Also: [GET_MESSAGE_TRACKING Function](#) on page 129-81

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING (
  tracking_label IN VARCHAR2 DEFAULT 'Streams_tracking',
  actions       IN NUMBER   DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

Parameters

Table 129-36 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
tracking_label	The label used to track the LCRs produced by the session. Set this parameter to NULL to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
actions	If DBMS_STREAMS_ADM.ACTION_MEMORY is specified, then the LCRs are tracked in memory, and the V\$STREAMS_MESSAGE_TRACKING dynamic performance view is populated with information about the LCRs. If DBMS_STREAMS_ADM.ACTION_TRACE is specified, then the LCRs are tracked in the trace files of each database that processes the LCRs. The values specified for this parameter are enumerated constants. Enumerated constants must be prefixed with the package name.

SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
    rule_name          IN  VARCHAR2,
    transform_function IN  VARCHAR2);
```

Parameters

Table 129–37 SET_RULE_TRANSFORM_FUNCTION Procedure Parameters

Parameter	Description
<code>rule_name</code>	<p>The name of the rule whose rule-based transformation function you are setting or removing, specified as <code>[schema_name.]rule_name</code>.</p> <p>For example, to specify a rule in the <code>hr</code> schema named <code>prop_rule1</code>, enter <code>hr.prop_rule1</code>. If the schema is not specified, then the current user is the default.</p>
<code>transform_function</code>	<p>Either the name of the transformation function to be used in the rule-based transformation for the rule or <code>NULL</code>.</p> <p>If you specify a transformation function name, then specify an existing function in one of the following forms:</p> <ul style="list-style-type: none"> ▪ <code>[schema_name.]function_name</code> ▪ <code>[schema_name.]package_name.function_name</code> <p>If the function is in a package, then you must specify the <code>package_name</code>. For example, to specify a function in the <code>transform_pkg</code> package in the <code>hr</code> schema named <code>executive_to_management</code>, enter <code>hr.transform_pkg.executive_to_management</code>. An error is returned if the specified procedure does not exist.</p> <p>If the <code>schema_name</code> is not specified, then the user who invokes the rule-based transformation function is the default.</p> <p>If you specify <code>NULL</code>, then the <code>SET_RULE_TRANSFORM_FUNCTION</code> procedure removes the current custom rule-based transformation from the rule.</p>

Usage Notes

The following sections contain usage notes for this procedure:

- [Transformation Function Signature](#)
- [Rule Action Context](#)
- [User Who Calls the Transformation Function](#)
- [Function Verification](#)

Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (
    parameter_name IN ANYDATA)
RETURN ANYDATA;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an ANYDATA encapsulation of a message.

A custom rule-based transformation function that can return more than one message is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```
FUNCTION user_function (
    parameter_name IN ANYDATA)
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an array that contains zero or more ANYDATA encapsulations of a message. If the array contains zero ANYDATA encapsulations of a message, then the original message is discarded.

The STREAMS\$_ANYDATA_ARRAY type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
    AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagation, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.

Note:

- An error is raised if a one-to-one or one-to-many transformation function returns NULL.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the `source_database_name`, `transaction_id`, and `scn` parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

Rule Action Context

This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is `STREAMS$_TRANSFORM_FUNCTION`. If the function is a one-to-many transformation function, then the name is `STREAMS$_ARRAY_TRANS_FUNCTION`.
- The value is a `ANYDATA` instance containing a PL/SQL function name specified as a `VARCHAR2`. This function performs the transformation.

User Who Calls the Transformation Function

The user that calls the transformation function must have `EXECUTE` privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

Function Verification

This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.

SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.SET_UP_QUEUE(
  queue_table      IN  VARCHAR2  DEFAULT 'streams_queue_table',
  storage_clause   IN  VARCHAR2  DEFAULT NULL,
  queue_name       IN  VARCHAR2  DEFAULT 'streams_queue',
  queue_user       IN  VARCHAR2  DEFAULT NULL,
  comment          IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 129–38 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	<p>The name of the queue table specified as [<i>schema_name.</i>] <i>queue_table_name</i>. For example, <i>strmadmin.streams_queue_table</i>. If the schema is not specified, then the current user is the default.</p> <p>If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner.</p> <p>Queue table names can be a maximum of 24 bytes.</p>
storage_clause	<p>The storage clause for queue table</p> <p>The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause.</p> <p>If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause.</p> <p>If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created.</p> <p>See Also: <i>Oracle Database SQL Language Reference</i> for more information about storage clauses</p>
queue_name	<p>The name of the queue that will function as the ANYDATA queue, specified as [<i>schema_name.</i>] <i>queue_name</i>. For example, <i>strmadmin.streams_queue</i>.</p> <p>If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue.</p> <p>If the schema is not specified for this parameter, and the queue table owner is not specified in <i>queue_table</i>, then the current user is the default.</p> <p>Queue names can be a maximum of 24 bytes.</p>

Table 129–38 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
<code>queue_user</code>	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
<code>comment</code>	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

Also, if the database is Oracle Database 10g release 2 or later, the `sort_list` setting in CREATE_QUEUE_TABLE is set to `commit_time`. If the database is a release prior to Oracle Database 10g release 2, the `sort_list` setting in CREATE_QUEUE_TABLE is set to `enq_time`.

- If the specified queue table already exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not already exist. If an agent with this name already exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

Note:

- To enqueue messages into and dequeue messages from a queue, a queue user must have EXECUTE privilege on the DBMS_STREAMS_MESSAGING package or the DBMS_AQ package. The SET_UP_QUEUE procedure does not grant this privilege.
 - If the agent that SET_UP_QUEUE tries to create already exists and is associated with a user other than the user specified by queue_user, then the procedure raises an error. In this case, rename or remove the existing agent, and retry SET_UP_QUEUE.
-

See Also: *Oracle Streams Concepts and Administration* for more information about secure queue users

SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

Note: If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

- ["MERGE_STREAMS_JOB Procedure"](#) on page 129-119
- *Oracle Streams Replication Administrator's Guide* for instructions on using the SPLIT_STREAMS procedure

Syntax

```
DBMS_STREAMS_ADM.SPLIT_STREAMS (
  propagation_name      IN      VARCHAR2,
  cloned_propagation_name IN    VARCHAR2 DEFAULT NULL,
  cloned_queue_name     IN      VARCHAR2 DEFAULT NULL,
  cloned_capture_name   IN      VARCHAR2 DEFAULT NULL,
  perform_actions       IN      BOOLEAN  DEFAULT TRUE,
  script_name           IN      VARCHAR2 DEFAULT NULL,
  script_directory_object IN    VARCHAR2 DEFAULT NULL,
  auto_merge_threshold  IN      NUMBER   DEFAULT NULL,
  schedule_name        IN OUT  VARCHAR2,
  merge_job_name        IN OUT  VARCHAR2);
```

Parameters**Table 129–39 SPLIT_STREAMS Procedure Parameters**

Parameter	Description
propagation_name	The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.
perform_actions	<p>If TRUE, then the procedure performs the necessary actions to split the stream directly.</p> <p>If FALSE, then the procedure does not perform the necessary actions to split the stream directly.</p> <p>Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:</p> <ul style="list-style-type: none"> ■ script_name ■ script_directory_object

Table 129–39 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
<code>script_name</code>	<p>If non-NULL and the <code>perform_actions</code> parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the <code>script_directory_object</code> parameter, then the procedure appends the statements to the existing file.</p> <p>If non-NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly.</p> <p>If NULL and the <code>perform_actions</code> parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script.</p> <p>If NULL and the <code>perform_actions</code> parameter is FALSE, then the procedure raises an error.</p>
<code>script_directory_object</code>	<p>The directory object for the directory on the local computer system into which the generated script is placed.</p> <p>If the <code>script_name</code> parameter is NULL, then the procedure ignores this parameter and does not generate a script.</p> <p>If NULL and the <code>script_name</code> parameter is non-NULL, then the procedure raises an error.</p>
<code>auto_merge_threshold</code>	<p>If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the <code>MERGE_STREAMS_JOB</code> procedure at set intervals according to its schedule. The value of the <code>CAPTURE_MESSAGE_CREATE_TIME</code> column for each capture process in the <code>GV\$STREAMS_CAPTURE</code> dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process and the original capture process is less than or equal to the value specified for the <code>auto_merge_threshold</code> parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream.</p> <p>If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the <code>MERGE_STREAM</code> procedure manually when the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the cloned capture process catches up to, or nearly catches up to, the <code>CAPTURE_MESSAGE_CREATE_TIME</code> of the original capture process.</p> <p>The <code>CAPTURE_MESSAGE_CREATE_TIME</code> records the time when a captured change was recorded in the redo log.</p>

Table 129–39 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
schedule_name	<p>The Oracle Scheduler schedule name, specified as [<i>schema_name</i>.] <i>schedule_name</i>. For example, <i>strmadmin.merge_schedule</i>. If the schema is not specified, then the current user is the default.</p> <p>If <i>auto_merge_threshold</i> is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name if you want to adhere to naming conventions or if you want to track the schedule more easily.</p> <p>If NULL and <i>auto_merge_threshold</i> is a non-NULL positive number, then the system generates a schedule name.</p> <p>If <i>auto_merge_threshold</i> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run.</p> <p>If an existing schedule name is specified, an error is raised.</p>
merge_job_name	<p>The Oracle Scheduler job name, specified as [<i>schema_name</i>.] <i>merge_job_name</i>. For example, <i>strmadmin.merge_job</i>. If the schema is not specified, then the current user is the default.</p> <p>If <i>auto_merge_threshold</i> is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name if you want to adhere to naming conventions or if you want to track the job more easily.</p> <p>If NULL and <i>auto_merge_threshold</i> is a non-NULL positive number, then the system generates a job name.</p> <p>If <i>auto_merge_threshold</i> is NULL or 0 (zero), then this parameter must be NULL.</p> <p>If an existing job name is specified, an error is raised.</p>

See Also: *Oracle Database Administrator's Guide* for information about Oracle Scheduler

DBMS_STREAMS_ADVISOR_ADM

The `DBMS_STREAMS_ADVISOR_ADM` package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered. This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

- [Using DBMS_STREAMS_ADVISOR_ADM](#)
 - Overview
 - Constants
 - Views
- [Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms](#)

See Also: *Oracle Streams Concepts and Administration* for instructions about using this package

Using DBMS_STREAMS_ADVISOR_ADM

This section contains topics which relate to using the DBMS_STREAMS_ADVISOR_ADM package.

- [Overview](#)
- [Constants](#)
- [Views](#)

Overview

The `DBMS_STREAMS_ADVISOR_ADM` package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

Constants

The `DBMS_STREAMS_ADVISOR_ADM` package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_DBMS_ADVISOR_ADM.CAPTURE_TYPE`.

Table 130–1 *DBMS_STREAMS_ADVISOR_ADM Parameters With Enumerated Constants*

Parameter	Option	Type	Description
<code>component_type</code>	<ul style="list-style-type: none"> ■ <code>CAPTURE_TYPE</code> ■ <code>PROPAGATION_SENDER_TYPE</code> ■ <code>PROPAGATION_RECEIVER_TYPE</code> ■ <code>APPLY_TYPE</code> ■ <code>QUEUE_TYPE</code> 	NUMBER	<p><code>CAPTURE_TYPE</code> indicates that the Oracle Streams component is a capture process. The constant number for this option is 1.</p> <p><code>PROPAGATION_SENDER_TYPE</code> indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2.</p> <p><code>PROPAGATION_RECEIVER_TYPE</code> indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3.</p> <p><code>APPLY_TYPE</code> indicates that the Oracle Streams component is an apply process. The constant number for this option is 4.</p> <p><code>QUEUE_TYPE</code> indicates that the Oracle Streams component is a queue. The constant number for this option is 5.</p>

Views

The DBMS_STREAMS_ADVISOR_ADM package uses the following views:

- DBA_STREAMS_TP_COMPONENT contains information about each Oracle Streams component at each database.
- DBA_STREAMS_TP_COMPONENT_LINK contains information about how messages flow between Oracle Streams components.
- DBA_STREAMS_TP_COMPONENT_STAT contains temporary performance statistics about each Oracle Streams component.
- DBA_STREAMS_TP_DATABASE contains information about each database that contains Oracle Streams components.
- DBA_STREAMS_TP_PATH_BOTTLENECK contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- DBA_STREAMS_TP_PATH_STAT contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: DBA_STREAMS_TP_DATABASE, DBA_STREAMS_TP_COMPONENT, and DBA_STREAMS_TP_COMPONENT_LINK.

However, the following views contain temporary information: DBA_STREAMS_TP_COMPONENT_STAT, DBA_STREAMS_TP_PATH_BOTTLENECK, and DBA_STREAMS_TP_PATH_STAT. Some of the data in these views is retained only for the user session that runs the ANALYZE_CURRENT_PERFORMANCE procedure. When this user session ends, this temporary information is purged.

See Also:

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views

Operational Notes

This section contains the following operational notes for the `DBMS_STREAMS_ADVISOR_ADM` package:

- [Oracle Streams Components Analyzed by the `DBMS_STREAMS_ADVISOR_ADM` Package](#)
- [General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information](#)

Oracle Streams Components Analyzed by the `DBMS_STREAMS_ADVISOR_ADM` Package

The `DBMS_STREAMS_ADVISOR_ADM` analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The `DBMS_STREAMS_ADVISOR_ADM` package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the `DBMS_STREAMS_ADVISOR_ADM` package, complete the following general steps:

1. Identify the database that you will use to gather the information.

An administrative user at this database must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the `DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

Typically, in an Oracle Streams environment, the Oracle Streams administrator uses this package.

If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.

2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.
3. Run the `ANALYZE_CURRENT_PERFORMACE` procedure.
4. Optionally, allow messages to flow in the environment for some time.
5. Optionally, rerun the `ANALYZE_CURRENT_PERFORMACE` procedure one or more times.

6. Query the data dictionary views listed in "[Views](#)" on page 130-5 to analyze the Oracle Streams environment.
7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

Note: When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.

Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

Table 130–2 *DBMS_STREAMS_ADVISOR_ADM Package Subprograms*

Subprogram	Description
ANALYZE_CURRENT_PERFORMANCE Procedure on page 130-9	Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered

ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

Note: The parameters in this procedure must all be either non-NULL or NULL.

See Also:

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- "[Views](#)" on page 130-5

Syntax

```
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE (
  component_name IN VARCHAR2 DEFAULT NULL,
  component_db   IN VARCHAR2 DEFAULT NULL,
  component_type IN NUMBER   DEFAULT NULL);
```

Parameters

Table 130–3 ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
component_name	The name of the Oracle Streams component to analyze. For example, to analyze a capture process named <code>capture01</code> , then specify <code>capture01</code> . If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.
component_db	The global name of the database that contains the component specified in the <code>component_name</code> parameter. For example, if the <code>db.net</code> database contains the component, then specify <code>db.net</code> . If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.

Table 130–3 (Cont.) ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
<code>component_type</code>	<p>The type of the component specified in the <code>component_name</code> parameter. If the <code>component_name</code> parameter is non-NULL, then specify one of the following:</p> <ul style="list-style-type: none">■ <code>DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE</code>■ <code>DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE</code>■ <code>DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE</code>■ <code>DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE</code>■ <code>DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE</code> <p>See "Constants" on page 130-4 for information about these constants.</p> <p>If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.</p>

DBMS_STREAMS_AUTH

The DBMS_STREAMS_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

See Also: *Oracle Streams Concepts and Administration* for more information about this package and Oracle Streams administrators

This chapter contains the following topic:

- [Summary of DBMS_STREAMS_AUTH Subprograms](#)

Summary of DBMS_STREAMS_AUTH Subprograms

Table 131–1 DBMS_STREAMS_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure on page 131-3	Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure on page 131-6	Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure on page 131-7	Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 131-9	Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link

Note: All subprograms commit unless specified otherwise.

GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE (
  grantee           IN  VARCHAR2,
  grant_privileges IN  BOOLEAN   DEFAULT TRUE,
  file_name        IN  VARCHAR2  DEFAULT NULL,
  directory_name   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 131–2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
grant_privileges	<p>If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error.</p> <p>If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view.</p> <p>You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.</p>
file_name	<p>The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege

- EXECUTE on the following packages:
 - DBMS_APPLY_ADM
 - DBMS_AQ
 - DBMS_AQADM
 - DBMS_AQIN
 - DBMS_AQELM
 - DBMS_CAPTURE_ADM
 - DBMS_FLASHBACK
 - DBMS_PROPAGATION_ADM
 - DBMS_RULE_ADM
 - DBMS_STREAMS_ADM
 - DBMS_STREAMS_MESSAGING
 - DBMS_TRANSFORM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
 - Evaluation contexts
 - Rule sets
 - Rules

In addition, the grantee has the ability to grant these privileges to other users.

- SELECT_CATALOG_ROLE
- SELECT privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
 - This procedure does not grant any roles to the grantee.
 - This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.
-
-

See Also:

- ["GRANT_REMOTE_ADMIN_ACCESS Procedure"](#) on page 131-6
- *Oracle Streams Concepts and Administration* for more information about configuring an Oracle Streams administrator

GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS (
  grantee IN VARCHAR2);
```

Parameters

Table 131–3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

Note: The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: ["GRANT_ADMIN_PRIVILEGE Procedure"](#) on page 131-3

REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges.

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE (
  grantee           IN  VARCHAR2,
  revoke_privileges IN  BOOLEAN   DEFAULT TRUE,
  file_name         IN  VARCHAR2   DEFAULT NULL,
  directory_name    IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 131–4 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user from whom privileges are revoked
revoke_privileges	<p>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked.</p> <p>If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view.</p> <p>You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</p>
file_name	<p>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file.</p> <p>If NULL, then the procedure does not generate a file.</p>
directory_name	<p>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object.</p> <p>If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file.</p> <p>If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</p>

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: ["GRANT_ADMIN_PRIVILEGE Procedure"](#) on page 131-3

REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

Note: The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: ["REVOKE_ADMIN_PRIVILEGE Procedure"](#) on page 131-7

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS (
  grantee IN VARCHAR2);
```

Parameters

Table 131-5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	<p>The user for whom access from a remote Oracle Streams administrator is disabled.</p> <p>If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view.</p> <p>If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.</p>

DBMS_STREAMS_MESSAGING

The `DBMS_STREAMS_MESSAGING` package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a `ANYDATA` queue.

Note: Currently, messaging clients cannot dequeue buffered messages. In addition, the `DBMS_STREAMS_MESSAGING` package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, the `DBMS_AQ` package can be used to enqueue and dequeue buffered messages.

See Also:

- *Oracle Streams Concepts and Administration* for more information about Oracle Streams and for an example that uses the procedures in this package
- *Oracle Streams Advanced Queuing User's Guide* for more information about queues, messaging, and the `DBMS_AQ` package

This chapter contains the following topic:

- [Summary of `DBMS_STREAMS_MESSAGING` Subprograms](#)

Summary of DBMS_STREAMS_MESSAGING Subprograms

Table 132–1 *DBMS_STREAMS_MESSAGING Package Subprograms*

Subprogram	Description
DEQUEUE Procedure on page 132-3	Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue
ENQUEUE Procedure on page 132-5	The current user enqueues a message into the specified queue

Note: The subprograms in this package do not commit.

DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid` OUT parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.DEQUEUE (
  queue_name      IN   VARCHAR2,
  streams_name    IN   VARCHAR2,
  payload         OUT  ANYDATA,
  dequeue_mode    IN   VARCHAR2      DEFAULT 'REMOVE',
  navigation      IN   VARCHAR2      DEFAULT 'NEXT MESSAGE',
  wait           IN   BINARY_INTEGER DEFAULT FOREVER,
  msgid          OUT  RAW);
```

```
DBMS_STREAMS_MESSAGING.DEQUEUE (
  queue_name      IN   VARCHAR2,
  streams_name    IN   VARCHAR2,
  payload         OUT  ANYDATA,
  dequeue_mode    IN   VARCHAR2      DEFAULT 'REMOVE',
  navigation      IN   VARCHAR2      DEFAULT 'NEXT MESSAGE',
  wait           IN   BINARY_INTEGER DEFAULT FOREVER);
```

Parameters

Table 132–2 DEQUEUE Procedure Parameters

Parameter	Description
<code>queue_name</code>	<p>The name of the local queue from which messages will be dequeued, specified as [<i>schema_name.</i>] <i>queue_name</i>. The current database must contain the queue, and the queue must be a secure queue of ANYDATA type.</p> <p>For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.</p>
<code>streams_name</code>	<p>The name of the Oracle Streams messaging client. For example, if the user <code>strmadmin</code> is the messaging client, then specify <code>strmadmin</code>.</p> <p>If NULL and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If NULL and multiple relevant messaging clients for the queue exist, then the procedure raises an error.</p>
<code>payload</code>	The payload that is dequeued
<code>dequeue_mode</code>	<p>Specify one of the following settings:</p> <p>REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.</p> <p>LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a <code>select for update</code> statement.</p> <p>BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a <code>select</code> statement.</p>

Table 132–2 (Cont.) DEQUEUE Procedure Parameters

Parameter	Description
navigation	<p>Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved.</p> <p>Specify one of the following settings:</p> <p>NEXT MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default.</p> <p>NEXT TRANSACTION: Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue.</p> <p>FIRST MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.</p> <p>Note: Each message group contains the messages in a single transaction.</p> <p>See Also: <i>Oracle Streams Advanced Queuing User's Guide</i> for more information about dequeue options</p>
wait	<p>Either <code>FOREVER</code> or <code>NO_WAIT</code></p> <p>If <code>FOREVER</code>, then the dequeue call is blocked without a time out until a message is available in the queue.</p> <p>If <code>NO_WAIT</code>, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue.</p>
msgid	Specifies the message identifier of the message that is dequeued

Exceptions

Table 132–3 DEQUEUE Procedure Exceptions

Exception	Description
ENDOFCURTRANS	<p>Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way:</p> <pre>SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS</pre> <p>Every dequeue procedure should include an exception handler that handles this exception.</p>
NOMOREMSGS	<p>There are no more messages in the queue for the dequeue operation. Specify this exception in the following way:</p> <pre>SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS</pre> <p>A dequeue procedure that specifies <code>NO_WAIT</code> for the <code>wait</code> parameter should include an exception handler that handles this exception.</p>

ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid` OUT parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.ENQUEUE (
  queue_name IN  VARCHAR2,
  payload    IN  ANYDATA,
  msgid      OUT RAW) ;
```

```
DBMS_STREAMS_MESSAGING.ENQUEUE (
  queue_name IN  VARCHAR2,
  payload    IN  ANYDATA) ;
```

Parameters

Table 132–4 ENQUEUE Procedure Parameters

Parameter	Description
<code>queue_name</code>	The name of the local queue into which messages will be enqueued, specified as [<i>schema_name</i> .] <i>queue_name</i> . The current database must contain the queue, and the queue must be a secure queue of ANYDATA type. For example, to specify a queue named <code>streams_queue</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.streams_queue</code> for this parameter. If the schema is not specified, then the current user is the default.
<code>payload</code>	The payload that is enqueued
<code>msgid</code>	Specifies the message identifier of the message that is enqueued

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

See Also: [SET_UP_QUEUE Procedure](#) on page 129-155

DBMS_STREAMS_TABLESPACE_ADM

The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

This chapter contains the following topics:

- [Using DBMS_STREAMS_TABLESPACE_ADM](#)
 - Overview
- [Data Structures](#)
- [Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms](#)

Using DBMS_STREAMS_TABLESPACE_ADM

This section contains topics which relate to using the DBMS_STREAMS_TABLESPACE_ADM package.

- [Overview](#)

Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- [ATTACH_SIMPLE_TABLESPACE Procedure](#)
- [CLONE_SIMPLE_TABLESPACE Procedure](#)
- [DETACH_SIMPLE_TABLESPACE Procedure](#)
- [PULL_SIMPLE_TABLESPACE Procedure](#)

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- [ATTACH_TABLESPACES Procedure](#)
- [CLONE_TABLESPACES Procedure](#)
- [DETACH_TABLESPACES Procedure](#)
- [PULL_TABLESPACES Procedure](#)

To determine whether a set of tablespaces is self-contained, use the `TRANSPORT_SET_CHECK` procedure in the Oracle supplied package `DBMS_TTS`.

See Also: *Oracle Database Administrator's Guide* for more information about self-contained tablespaces and tablespace sets

Data Structures

The `DBMS_STREAMS_TABLESPACE_ADM` package defines `RECORD` types and `TABLE` types.

RECORD Types

- [FILE Record Type](#)

TABLE Types

- [DIRECTORY_OBJECT_SET Table Type](#)
- [FILE_SET Table Type](#)
- [TABLESPACE_SET Table Type](#)

DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement `CREATE DIRECTORY`.

Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)  
INDEX BY BINARY_INTEGER;
```

FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(  
    directory_object VARCHAR2(32),  
    file_name        VARCHAR2(4000));
```

Fields

Table 133–1 FILE Fields

Field	Description
directory_object	The name of a directory object. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.
file_name	The name of the file in the corresponding directory associated with the directory object

FILE_SET Table Type

Contains one or more files.

Syntax

```
TYPE FILE_SET IS TABLE OF FILE  
INDEX BY BINARY_INTEGER;
```

TABLESPACE_SET Table Type

Contains the names of one or more tablespaces.

Syntax

```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)  
INDEX BY BINARY_INTEGER;
```

Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Table 133–2 DBMS_STREAMS_TABLESPACE_ADM Package Subprograms

Subprogram	Description
ATTACH_SIMPLE_TABLESPACE Procedure on page 133-10	Uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package or Data Pump export
ATTACH_TABLESPACES Procedure on page 133-12	Uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) <code>TRANSPORT TABLESPACE</code> command
CLONE_SIMPLE_TABLESPACE Procedure on page 133-17	Clones a simple tablespace. The tablespace can later be attached to a database.
CLONE_TABLESPACES Procedure on page 133-19	Clones a set of self-contained tablespaces. The tablespaces can later be attached to a database.
DETACH_SIMPLE_TABLESPACE Procedure on page 133-23	Detaches a simple tablespace. The tablespace can later be attached to a database.
DETACH_TABLESPACES Procedure on page 133-25	Detaches a set of self-contained tablespaces. The tablespaces can later be attached to a database.
PULL_SIMPLE_TABLESPACE Procedure on page 133-29	Copies a simple tablespace from a remote database and attaches it to the current database
PULL_TABLESPACES Procedure on page 133-31	Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database

Note: All subprograms commit unless specified otherwise.

ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
  directory_object      IN  VARCHAR2,
  tablespace_file_name IN  VARCHAR2,
  converted_file_name   IN  VARCHAR2  DEFAULT NULL,
  datafile_platform    IN  VARCHAR2  DEFAULT NULL,
  tablespace_name      OUT VARCHAR2);
```

Parameters

Table 133–3 *ATTACH_SIMPLE_TABLESPACE Procedure Parameters*

Parameter	Description
<code>directory_object</code>	<p>The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code>.</p> <p>The name of the Data Pump export dump file must be the same as the data file name for the tablespace, except with a <code>.dmp</code> extension. If the <code>converted_file_name</code> is non-NULL, specify the dump file produced by the export database, not the file name after conversion.</p> <p>The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with an <code>.alg</code> extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</p> <p>If NULL, then the procedure raises an error.</p>
<code>tablespace_file_name</code>	<p>The name of the datafile for the tablespace being imported.</p> <p>If NULL, then the procedure raises an error.</p>
<code>converted_file_name</code>	<p>If the <code>datafile_platform</code> parameter is non-NULL and is not the same as the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted.</p> <p>If non-NULL and the <code>datafile_platform</code> parameter is NULL, then the procedure ignores this parameter.</p> <p>If non-NULL and the <code>datafile_platform</code> parameter specifies the same platform as the local import database, then the procedure ignores this parameter.</p> <p>If NULL and the <code>datafile_platform</code> parameter is non-NULL, then the procedure raises an error.</p>

Table 133-3 (Cont.) ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
datafile_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
tablespace_name	Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: [Overview](#) on page 133-3

ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES (
  datapump_job_name      IN OUT VARCHAR2,
  dump_file              IN      FILE,
  tablespace_files       IN      FILE_SET,
  converted_files        IN      FILE_SET,
  datafiles_platform     IN      VARCHAR2  DEFAULT NULL,
  log_file               IN      FILE      DEFAULT NULL,
  tablespace_names      OUT     TABLESPACE_SET);
```

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES (
  file_group_name        IN      VARCHAR2,
  version_name           IN      VARCHAR2  DEFAULT NULL,
  datafiles_directory_object IN  VARCHAR2  DEFAULT NULL,
  logfile_directory_object IN  VARCHAR2  DEFAULT NULL,
  repository_db_link    IN      VARCHAR2  DEFAULT NULL,
  tablespace_names      OUT     TABLESPACE_SET);
```

Parameters

Table 133–4 ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
<code>data_pump_job_name</code>	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If <code>NULL</code> , then the system generates a Data Pump job name.

Table 133–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
dump_file	The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.
tablespace_files	The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.
converted_files	If the datafiles_platform parameter is non-NULL and is not the same as the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.
datafiles_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
file_group_name	The name of the file group, specified as [<i>schema_name</i>]. <i>file_group_name</i> . For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.
version_name	The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.

Table 133–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
<code>datafiles_directory_object</code>	<p>The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory.</p> <p>If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the <code>version_name</code> parameter consists of the files in the original directory, not in the directory specified by this <code>datafiles_directory_object</code> parameter.</p> <p>If NULL, then the procedure does not copy the datafiles and dump file.</p>
<code>logfile_directory_object</code>	<p>The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension <code>.alg</code>.</p> <p>If NULL, then the procedure places the import log file in the same directory as the dump file.</p>
<code>repository_db_link</code>	<p>If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</p> <p>If this parameter is non-NULL, then meet the following requirements:</p> <ul style="list-style-type: none"> ■ Each directory object that contains files in the version being attached must exist on both databases. ■ The corresponding directory objects must have the same names on both databases. <p>If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.</p>
<code>tablespace_names</code>	<p>Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use <code>ALTER TABLESPACE</code> statements to make the tablespaces read/write if necessary.</p>

Usage Notes

The following sections contain usage notes for this procedure:

- [User Requirements](#)
- [Procedures Used to Clone or Detach a Tablespace Set](#)
- [When the Attach Database Is Different Than the Clone or Detach Database](#)
- [Automatic Storage Management Directories](#)

See Also:

- [Overview](#) on page 133-3
- *Oracle Streams Concepts and Administration*

User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have `IMP_FULL_DATABASE` role

- Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the `dump_file` and `tablespace_files` parameters, or by the `datafiles_directory_object` parameter
- Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the `log_file` parameter or `logfile_directory_object` parameter if it is non-NULL

If the Data Pump job version of the procedure is run, then the user must have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the `converted_files` parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Procedures Used to Clone or Detach a Tablespace Set

After a tablespace set is cloned or detached using the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure, respectively, the tablespace set can be attached to a database using the `ATTACH_TABLESPACES` procedure. If the Data Pump job version of the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure was used, then use the Data Pump job version of the `ATTACH_TABLESPACES` procedure. If the file group version of the `CLONE_TABLESPACES` or `DETACH_TABLESPACES` procedure was used, then use the file group version of the `ATTACH_TABLESPACES` procedure.

See Also:

- [CLONE_TABLESPACES Procedure](#) on page 133-19
- [DETACH_TABLESPACES Procedure](#) on page 133-25

When the Attach Database Is Different Than the Clone or Detach Database

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the `ATTACH_TABLESPACES` procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.
- If you use the file group version of the procedure, then you can use the `repository_db_link` parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

- [CLONE_TABLESPACES Procedure](#) on page 133-19
- [DETACH_TABLESPACES Procedure](#) on page 133-25
- [Chapter 55, "DBMS_FILE_GROUP"](#) for more information about file groups

Automatic Storage Management Directories

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

See Also: *Oracle Database Utilities* for information about specifying ASM directories for directory objects

CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE (
    tablespace_name      IN  VARCHAR2,
    directory_object     IN  VARCHAR2,
    destination_platform IN  VARCHAR2 DEFAULT NULL,
    tablespace_file_name OUT VARCHAR2);
```

Parameters

Table 133–5 CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_name	The tablespace to be cloned. If NULL, then the procedure raises an error.
directory_object	The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .clg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V\$DATABASE dynamic performance view. The V\$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.

Table 133–5 (Cont.) CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_file_name	Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter <code>directory_object</code> .

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES (
  datapump_job_name      IN OUT VARCHAR2,
  tablespace_names       IN      TABLESPACE_SET,
  dump_file              IN      FILE,
  tablespace_directory_objects IN DIRECTORY_OBJECT_SET,
  destination_platform   IN      VARCHAR2 DEFAULT NULL,
  log_file               IN      FILE      DEFAULT NULL,
  tablespace_files       OUT     FILE_SET);
```

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES (
  tablespace_names       IN      TABLESPACE_SET,
  tablespace_directory_object IN VARCHAR2 DEFAULT NULL,
  log_file_directory_object IN VARCHAR2 DEFAULT NULL,
  file_group_name        IN      VARCHAR2,
  version_name           IN      VARCHAR2 DEFAULT NULL,
  repository_db_link     IN      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 133–6 CLONE_TABLESPACES Procedure Parameters

Parameter	Description
<code>data_pump_job_name</code>	<p>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily.</p> <p>If NULL, then the system generates a Data Pump job name.</p>
<code>tablespace_names</code>	<p>The tablespace set to be cloned.</p> <p>If NULL, then the procedure raises an error.</p>
<code>dump_file</code>	<p>The file name of the Data Pump dump file that is exported.</p> <p>If NULL or if a file attribute is NULL, then the procedure raises an error.</p> <p>If the specified file already exists, then the procedure raises an error.</p>
<code>tablespace_directory_objects</code>	<p>The set of directory objects into which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set.</p> <p>If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.</p>
<code>destination_platform</code>	<p>Specify NULL if the platform is the same for the current export database and the intended import database.</p> <p>Specify the platform for the intended import database if the platform is different for the export database and the import database.</p> <p>You can determine the platform of a database by querying the <code>PLATFORM_NAME</code> column in the <code>V\$DATABASE</code> dynamic performance view. The <code>V\$TRANSPORTABLE_PLATFORM</code> dynamic performance view lists all platforms that support cross-platform transportable tablespaces.</p>
<code>log_file</code>	<p>Specify the log file name for the Data Pump export.</p> <p>If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension <code>.clg</code> and places it in the dump file directory.</p> <p>If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</p>

Table 133–6 (Cont.) CLONE_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_directory_object	<p>The directory object into which the data files are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension <code>.dmp</code>.</p> <p>If <code>NULL</code>, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.</p> <p>If <code>NULL</code> and no default directory object exists for the version or file group, then the procedure raises an error.</p>
log_file_directory_object	<p>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension <code>.clg</code>.</p> <p>If <code>NULL</code>, then the procedure uses the directory object specified in <code>tablespace_directory_object</code>.</p>
file_group_name	<p>The name of the file group, specified as <code>[schema_name.]file_group_name</code>. For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales</code>, then specify <code>hq_dba.sales</code>. If the schema is not specified, then the current user is the default.</p> <p>If the specified file group does not exist, then the procedure creates it.</p>
version_name	<p>The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer.</p> <p>If the specified version does not exist, then the procedure creates it.</p> <p>If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.</p> <p>If <code>NULL</code>, then the procedure creates a new version, and the version number can be used to manage the version.</p>
repository_db_link	<p>If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</p> <p>If this parameter is non-<code>NULL</code>, then the directory object specified in <code>tablespace_directory_object</code> must exist on the local database and on the remote database. If <code>tablespace_directory_object</code> is <code>NULL</code>, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.</p> <p>If <code>NULL</code>, then the procedure does not use a database link, and the procedure uses the file group in the local database.</p>
tablespace_files	<p>Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter <code>tablespace_directory_objects</code>.</p>

Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the `tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `dump_file` parameter or the `tablespace_directory_object` parameter
- Have `WRITE` privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter if non-NULL or the `tablespace_directory_object` parameter
- Have `WRITE` privilege on the directory object that will contain the Data Pump export log file, specified by the `log_file` parameter if non-NULL or the `log_file_directory_object` parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

See Also:

- [Overview](#) on page 133-3
- [ATTACH_TABLESPACES Procedure](#) on page 133-12
- [Chapter 55, "DBMS_FILE_GROUP"](#) for more information about file groups

DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE (
    tablespace_name      IN  VARCHAR2,
    directory_object     OUT VARCHAR2,
    tablespace_file_name OUT VARCHAR2);
```

Parameters

Table 133–7 DETACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
<code>data_pump_job_name</code>	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
<code>directory_object</code>	Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
<code>tablespace_file_name</code>	Contains the name of the detached tablespace datafile.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only

- Have `READ` and `WRITE` privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can use the two `OUT` parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

Note: Do not use the `DETACH_SIMPLE_TABLESPACE` procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

See Also:

- [Overview](#) on page 133-3
- [ATTACH_SIMPLE_TABLESPACE Procedure](#) on page 133-10 and [PULL_SIMPLE_TABLESPACE Procedure](#) on page 133-29
- *Oracle Database Administrator's Guide* for more information about the Oracle-managed files feature

DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

Note: Do not use the `DETACH_TABLESPACES` procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES (
  datapump_job_name      IN OUT VARCHAR2,
  tablespace_names       IN    TABLESPACE_SET,
  dump_file              IN    FILE,
  log_file               IN    FILE DEFAULT NULL,
  tablespace_files       OUT   FILE_SET);
```

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES (
  tablespace_names       IN TABLESPACE_SET,
  export_directory_object IN VARCHAR2 DEFAULT NULL,
  log_file_directory_object IN VARCHAR2 DEFAULT NULL,
  file_group_name        IN VARCHAR2,
```

```

version_name          IN VARCHAR2  DEFAULT NULL,
repository_db_link    IN VARCHAR2  DEFAULT NULL);

```

Parameters

Table 133–8 DETACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	<p>The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily.</p> <p>If NULL, then the system generates a Data Pump job name.</p>
tablespace_names	<p>The tablespace set to be detached.</p> <p>If NULL, then the procedure raises an error.</p>
dump_file	<p>The file name of the Data Pump dump file that is exported.</p> <p>If NULL or if a file attribute is NULL, then the procedure raises an error.</p> <p>If the specified file already exists, then the procedure raises an error.</p>
log_file	<p>Specify the log file name for the Data Pump export.</p> <p>If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension <code>.dlg</code> and places it in the dump file directory.</p> <p>If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.</p>
tablespace_files	<p>Contains the names of the datafiles for the detached tablespace set.</p>
export_directory_object	<p>The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension <code>.dmp</code>.</p> <p>If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group.</p> <p>If NULL and no default directory object exists for the version or file group, then the procedure raises an error.</p>
log_file_directory_object	<p>The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension <code>.dlg</code>.</p> <p>If NULL, then the procedure places the export log file in the same directory as the export dump file.</p>
file_group_name	<p>The name of the file group, specified as <code>[schema_name.]file_group_name</code>. For example, if the schema is <code>hq_dba</code> and the file group name is <code>sales</code>, then specify <code>hq_dba.sales</code>. If the schema is not specified, then the current user is the default.</p> <p>If the specified file group does not exist, then the procedure creates it.</p>

Table 133–8 (Cont.) DETACH_TABLESPACES Procedure Parameters

Parameter	Description
version_name	<p>The name of the version into which the detached tablespace set is placed. The specified version name cannot be a positive integer.</p> <p>If the specified version does not exist, then the procedure creates it.</p> <p>If the specified version exists, then procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version.</p> <p>If NULL, then the procedure creates a new version, and the version number can be used to manage the version.</p>
repository_db_link	<p>If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure.</p> <p>If this parameter is non-NULL, then the directory object specified in <code>export_directory_object</code> must exist on the local database and on the remote database. If <code>export_directory_object</code> is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system.</p> <p>If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.</p>

Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the export_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL or by the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

PULL_SIMPLE_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the at the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE (
    tablespace_name      IN VARCHAR2,
    database_link        IN VARCHAR2,
    directory_object     IN VARCHAR2  DEFAULT NULL,
    conversion_extension IN VARCHAR2  DEFAULT NULL,
    convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 133–9 PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
<code>tablespace_name</code>	The tablespace to be pulled. If NULL, then the procedure raises an error.
<code>database_link</code>	The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
<code>directory_object</code>	The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code> . The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a <code>.plg</code> extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.

Table 133–9 (Cont.) PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
<code>conversion_extension</code>	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafile that is different than the extension for the tablespace datafile at the remote database. In this case, the procedure transfers the datafile to the import database and converts it to be compatible with the current import database platform automatically. After conversion is complete, the original datafile is deleted at the import database.
<code>convert_directory_object</code>	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code> .

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the `EXP_FULL_DATABASE` role
- Have `EXECUTE` privilege on the `DBMS_STREAMS_TABLESPACE_ADM` package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` privilege on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL
- Have `WRITE` privilege on the directory object that will hold the datafile for the tablespace, specified by the `directory_object` parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: [Overview](#) on page 133-3

PULL_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES (
  datapump_job_name          IN OUT VARCHAR2,
  database_link              IN     VARCHAR2,
  tablespace_names          IN     TABLESPACE_SET,
  tablespace_directory_objects IN  DIRECTORY_OBJECT_SET,
  log_file                  IN     FILE,
  conversion_extension      IN     VARCHAR2  DEFAULT NULL,
  convert_directory_object  IN     VARCHAR2  DEFAULT NULL);
```

Parameters

Table 133–10 *PULL_TABLESPACES Procedure Parameters*

Parameter	Description
<code>data_pump_job_name</code>	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If <code>NULL</code> , then the system generates a Data Pump job name.
<code>database_link</code>	The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure. If <code>NULL</code> , then the procedure raises an error.

Table 133–10 (Cont.) PULL_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The tablespace set to be pulled. If NULL, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects to which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the data file directories. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement <code>CREATE DIRECTORY</code> .

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the `EXP_FULL_DATABASE` role
- Have `EXECUTE` privilege on the `DBMS_STREAMS_TABLESPACE_ADM` package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` privilege on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the

`tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-NULL
- Have `WRITE` privilege on the directory objects that will hold the datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

See Also: [Overview](#) on page 133-3

The DBMS_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

See Also: *Oracle Database Backup and Recovery User's Guide* regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

- [Using DBMS_TDB](#)
 - Overview
 - Security Model
 - Constants
 - Views
 - Operational Notes
- [Summary of DBMS_TDB Subprograms](#)

Using DBMS_TDB

This section contains topics which relate to using DBMS_TDB.

- [Overview](#)
- [Constants](#)
- [Views](#)
- [Operational Notes](#)

Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The DBMS_TDB package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the DBMS_TDB subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

Security Model

Use of this package requires the DBA privilege.

Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in [Table 134-1](#).

Table 134-1 DBMS_TDB Constants

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in readonly tablespaces when checking whether a database is ready for transport.

Views

The DBMS_TDB package uses the following view listed in *Oracle Database Reference*:

- V\$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

Summary of DBMS_TDB Subprograms

Table 134–2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function on page 134-9	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function on page 134-9	Checks whether a database has external tables, directory or BFILEs

CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2,
    skip_option           IN NUMBER)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
    target_platform_name  IN VARCHAR2)
RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
RETURN BOOLEAN;
```

Parameters

Table 134–3 CHECK_DB Procedure Parameters

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V\$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 134–1, "DBMS_TDB Constants" on page 134-5.

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see [Table 134–4, "Reasons for CHECK_DB Function to Return FALSE"](#) on page 134-9.

Table 134–4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check V\$DB_TRANSPORTABLE_PLATFORM for recognized platform names.

Table 134–4 (Cont.) Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the COMPATIBLE initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of CHECK_DB with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
    db_ready BOOLEAN;
BEGIN
    db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
END;
/
```

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.

CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL  
RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON  
SQL> DECLARE  
    external BOOLEAN;  
BEGIN  
    external := DBMS_TDB.CHECK_EXTERNAL;  
END;  
/
```

The following external tables exist in the database:

```
SH.SALES_TRANSACTIONS_EXT
```

The following directories exist in the database:

```
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
```

The following BFILEs exist in the database:

```
PM.PRINT_MEDIA
```

PL/SQL procedure successfully completed.

The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- [Using DBMS_TRACE](#)
 - Overview
 - Security Model
 - Constants
 - Restrictions
 - Operational Notes
- [Summary of DBMS_TRACE Subprograms](#)

Using DBMS_TRACE

- [Overview](#)
- [Security Model](#)
- [Constants](#)
- [Restrictions](#)
- [Operational Notes](#)

Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

- Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

Security Model

This package must be created under SYS.

Constants

The DBMS_TRACE package uses the constants shown in [Table 135–1, "DBMS_TRACE Constants"](#):

Table 135–1 DBMS_TRACE Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses tracing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as <ul style="list-style-type: none"> ■ PL/SQL Trace Tool started ■ Trace flags changed ■ PL/SQL Virtual Machine started ■ PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Oracle recommends using the symbolic form for all these constants.

Restrictions

You cannot use PL/SQL tracing in a shared server environment.

Operational Notes

- [Controlling Data Volume](#)
- [Creating Database Tables to Collect DBMS_TRACE Output](#)
- [Collecting Trace Data](#)
- [Collected Data](#)
- [Trace Control](#)

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY] <libunit-name> compile debug;
```

Note: You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including TRACE_LIMIT in the TRACE_LEVEL parameter of the SET_PLSQL_TRACE procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the DBMS_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script TRACETAB.SQL. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script DBMSPBT.SQL. Some of the key tracing features are:

- [Tracing Calls](#)
- [Tracing Exceptions](#)
- [Tracing SQL](#)
- [Tracing Lines](#)

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant TRACE_ALL_CALLS.

- Level 2: Trace calls to enabled program units only. This corresponds to the constant `TRACE_ENABLED_CALLS`.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to `TRACE_ALL_EXCEPTIONS`.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to `TRACE_ENABLED_EXCEPTIONS`.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant `TRACE_ALL_SQL`.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant `TRACE_ENABLED_SQL`.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant `TRACE_ALL_LINES`.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant `TRACE_ENABLED_LINES`.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

Note: For both all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller's unit is enabled, the calling procedure name will also be output. If the callee's unit is enabled, the called procedure name will be output.

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled.

All calls to `DBMS_TRACE.SET_PLSQL_TRACE` and `DBMS_TRACE.CLEAR_PLSQL_TRACE` place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated.

Summary of DBMS_TRACE Subprograms

Table 135–2 DBMS_TRACE Package Subprograms

Subprogram	Description
CLEAR_PLSQL_TRACE Procedure on page 135-11	Stops trace data dumping in session
GET_PLSQL_TRACE_LEVEL Function on page 135-12	Gets the trace level
PLSQL_TRACE_VERSION Procedure on page 135-13	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure on page 135-14	Starts tracing in the current session

CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as a list of the enabled constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL  
RETURN BINARY_INTEGER;
```

PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (  
    major OUT BINARY_INTEGER,  
    minor OUT BINARY_INTEGER);
```

Parameters

Table 135-3 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (  
    trace_level INTEGER);
```

Parameters

Table 135–4 SET_PLSQL_TRACE Procedure Parameters

Parameter	Description
trace_level	<p>You must supply one or more of the constants as listed in Table 135–1, "DBMS_TRACE Constants". By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "TRACE_PAUSE", "TRACE_RESUME" and "TRACE_STOP" should not be used in combination with other constants</p> <p>Also see "Collecting Trace Data" on page 135-7 for more information.</p>

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

See Also: *Oracle Database SQL Language Reference*

This chapter contains the following topics:

- [Using DBMS_TRANSACTION](#)
 - Security Model
- [Summary of DBMS_TRANSACTION Subprograms](#)

Using DBMS_TRANSACTION

- [Security Model](#)

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Summary of DBMS_TRANSACTION Subprograms

Table 136–1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure on page 136-6	Equivalent to the SQL statement: ALTER SESSION ADVISE COMMIT
ADVISE_NOTHING Procedure on page 136-7	Equivalent to the SQL statement: ALTER SESSION ADVISE NOTHING
ADVISE_ROLLBACK Procedure on page 136-8	Equivalent to the SQL statement: ALTER SESSION ADVISE ROLLBACK
BEGIN_DISCRETE_TRANSACTION Procedure on page 136-9	Sets "discrete transaction mode" for this transaction
COMMIT Procedure on page 136-10	Equivalent to the SQL statement: COMMIT
COMMIT_COMMENT Procedure on page 136-11	Equivalent to the SQL statement: COMMIT COMMENT <text>
COMMIT_FORCE Procedure on page 136-12	Equivalent to the SQL statement: COMMIT FORCE <text>, <number>
LOCAL_TRANSACTION_ID Function on page 136-13	Returns the local (to instance) unique identifier for the current transaction
PURGE_LOST_DB_ENTRY Procedure on page 136-14	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure on page 136-16	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure on page 136-17	Equivalent to the SQL statement: SET TRANSACTION READ ONLY
READ_WRITE Procedure on page 136-18	equivalent to the SQL statement: SET TRANSACTION READ WRITE
ROLLBACK Procedure on page 136-19	Equivalent to the SQL statement: ROLLBACK
ROLLBACK_FORCE Procedure on page 136-20	Equivalent to the SQL statement: ROLLBACK FORCE <text>
ROLLBACK_SAVEPOINT Procedure on page 136-21	Equivalent to the SQL statement: ROLLBACK TO SAVEPOINT <savepoint_name>
SAVEPOINT Procedure on page 136-22	Equivalent to the SQL statement: SAVEPOINT <savepoint_name>
STEP_ID Function on page 136-23	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction

Table 136-1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
USE_ROLLBACK_SEGMENT Procedure on page 136-24	Equivalent to the SQL statement: SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>

ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

BEGIN_DISCRETE_TRANSACTION Procedure

This procedure sets "discrete transaction mode" for this transaction.

Syntax

```
DBMS_TRANSACTION.BEGIN_DISCRETE_TRANSACTION;
```

Exceptions

Table 136–2 *BEGIN_DISCRETE_TRANSACTION Procedure Exceptions*

Exception	Description
ORA-08175	A transaction attempted an operation which cannot be performed as a discrete transaction. If this exception is encountered, then rollback and retry the transaction
ORA-08176	A transaction encountered data changed by an operation that does not generate rollback data: create index, direct load or discrete transaction. If this exception is encountered, then retry the operation that received the exception.

Examples

```
DISCRETE_TRANSACTION_FAILED exception;
  pragma exception_init(DISCRETE_TRANSACTION_FAILED, -8175);
CONSISTENT_READ_FAILURE exception;
  pragma exception_init(CONSISTENT_READ_FAILURE, -8176);
```

COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (  
    cmt VARCHAR2);
```

Parameters

Table 136–3 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>"
```

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (  
    xid VARCHAR2,  
    scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 136–4 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.
scn	System change number.

LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (  
    create_transaction BOOLEAN := FALSE)  
RETURN VARCHAR2;
```

Parameters

Table 136-5 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
create_transaction	If true, then start a transaction if one is not currently active.

PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in `DBA_2PC_PENDING` and associated tables are never removed, and recovery will periodically retry. Procedure `PURGE_LOST_DB_ENTRY` enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
    xid VARCHAR2);
```

Parameters

Table 136–6 *PURGE_LOST_DB_ENTRY Procedure Parameters*

Parameter	Description
<code>xid</code>	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

Usage Notes

WARNING: `PURGE_LOST_DB_ENTRY` should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in `DBA_2PC_PENDING` as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the `MIXED` column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is `ORA-02062`). In this case, the DBA may use the procedure `PURGE_LOST_DB_ENTRY` to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 136-7 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

NOTE 1: Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

NOTE 2: Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.

PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (  
    xid VARCHAR2);
```

Parameters

Table 136–8 *PURGE_MIXED Procedure Parameters*

Parameter	Description
<code>xid</code>	Must be set to the value of the <code>LOCAL_TRAN_ID</code> column in the <code>DBA_2PC_PENDING</code> table.

READ_ONLY Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ ONLY
```

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (  
  xid VARCHAR2);
```

Parameters

Table 136–9 *ROLLBACK_FORCE Procedure Parameters*

Parameter	Description
<code>xid</code>	Local or global transaction ID.

ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK TO SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 136–10 *ROLLBACK_SAVEPOINT Procedure Parameters*

Parameter	Description
savept	Savepoint identifier.

SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (  
    savept VARCHAR2);
```

Parameters

Table 136–11 *SAVEPOINT Procedure Parameters*

Parameter	Description
savept	Savepoint identifier.

STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID  
RETURN NUMBER;
```

USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>
```

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (  
    rb_name VARCHAR2);
```

Parameters

Table 136–12 *USE_ROLLBACK_SEGMENT Procedure Parameters*

Parameter	Description
rb_name	Name of rollback segment to use.

DBMS_TRANSFORM

The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

See Also: *Oracle Streams Advanced Queuing User's Guide* for more on message format transformations.

This chapter contains the following topic:

- [Summary of DBMS_TRANSFORM Subprograms](#)

Summary of DBMS_TRANSFORM Subprograms

Table 137-1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_TRANSFORMATION Procedure on page 137-3	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_TRANSFORMATION Procedure on page 137-5	Drops the given transformation
MODIFY_TRANSFORMATION Procedure on page 137-6	Modifies an existing transformation

CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
  schema          VARCHAR2 (30) ,
  name            VARCHAR2 (30) ,
  from_schema     VARCHAR2 (30) ,
  from_type       VARCHAR2 (30) ,
  to_schema       VARCHAR2 (30) ,
  to_type         VARCHAR2 (30) ,
  transformation   VARCHAR2 (4000)) ;
```

Parameters

Table 137–2 CREATE_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user_data*.

- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
  schema  VARCHAR2(30),
  name    VARCHAR2(30) );
```

Parameters

Table 137-3 *DROP_TRANSFORMATION Procedure Parameters*

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
  schema          VARCHAR2(30),
  name            VARCHAR2(30),
  attribute_number INTEGER,
  transformation  VARCHAR2(4000));
```

Parameters

Table 137–4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
attribute_number	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
transformation	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

This chapter contains the following topics:

- [Using DBMS_TTS](#)
 - Security Model
 - Exceptions
 - Operational Notes
- [Summary of DBMS_TTS Subprograms](#)

Using DBMS_TTS

- [Security Model](#)
- [Exceptions](#)
- [Operational Notes](#)

Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user `SYS`.

Exceptions

```
ts_not_found EXCEPTION;  
PRAGMA exception_init(ts_not_found, -29304);  
ts_not_found_num NUMBER := -29304;  
  
invalid_ts_list EXCEPTION;  
PRAGMA exception_init(invalid_ts_list, -29346);  
invalid_ts_list_num NUMBER := -29346;  
  
sys_or_tmp_ts EXCEPTION;  
PRAGMA exception_init(sys_or_tmp_ts, -29351);  
sys_or_tmp_ts_num NUMBER := -29351;
```

Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 138–1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure on page 138-7	Downgrades transportable tablespace related data
TRANSPORT_SET_CHECK Procedure on page 138-8	Checks if a set of tablespaces (to be transported) is self-contained

DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
    ts_list          IN CLOB,
    incl_constraints IN BOOLEAN DEFAULT FALSE,
    full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
ts_list	List of tablespace, separated by comma.
incl_constraints	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)
full_check	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to false. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

The `DBMS_TYPES` package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- [Using DBMS_TYPES](#)
 - Constants
 - Exceptions

Using DBMS_TYPES

- [Constants](#)
- [Exceptions](#)

Constants

The following table lists the constants in the DBMS_TYPES package.

Table 139–1 DBMS_TYPES Constants

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or anydataset. Denotes the end of collection/anydataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- [Using DBMS_UTILITY](#)
 - Security Model
 - Constants
 - Types
 - Exceptions
- [Summary of DBMS_UTILITY Subprograms](#)

Using DBMS_UTILITY

- [Security Model](#)
- [Constants](#)
- [Types](#)
- [Exceptions](#)

Security Model

DBMS_UTILITY runs with the privileges of the calling user for the [NAME_RESOLVE Procedure](#) and the [COMPILE_SCHEMA Procedure](#). This is necessary so that the SQL works correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.

Constants

The `DBMS_UTILITY` package uses the constants shown in [Table 140-1, "DBMS_UTILITY Constants"](#).

Table 140-1 DBMS_UTILITY Constants

Name	Type	Value	Description
<code>INV_ERROR_ON_RESTRICTIONS</code>	<code>PLS_INTEGER</code>	1	This constant is the only legal value for the <code>p_option_flags</code> parameter of the <code>INVALIDATE</code> subprogram

Types

- [dblink_array](#)
- [index_table_type](#)
- [instance_record](#)
- [lname_array](#)
- [name_array](#)
- [number_array](#)
- [uncl_array](#)

dblink_array

```
TYPE dblink_array IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

Lists of database links should be stored here.

index_table_type

```
TYPE index_table_type IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

The order in which objects should be generated is returned here.

instance_record

```
TYPE instance_record IS RECORD (
    inst_number    NUMBER,
    inst_name      VARCHAR2(60));
TYPE instance_table IS TABLE OF instance_record INDEX BY BINARY_INTEGER;
```

The list of active instance number and instance name.

The starting index of `instance_table` is 1; `instance_table` is dense.

lname_array

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) index by BINARY_INTEGER;
```

Lists of Long NAME should be stored here, it includes fully qualified attribute names.

name_array

```
TYPE name_array IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

Lists of NAME should be stored here.

number_array

```
TYPE number_array IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

The order in which objects should be generated is returned here for users.

uncl_array

```
TYPE uncl_array IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

Lists of "USER"."NAME"."COLUMN"@LINK should be stored here.

Exceptions

The following table lists the exceptions raised by `DBMS_UTILITY`.

Table 140–2 Exceptions Raised by `DBMS_UTILITY`

Exception	Error Code	Description
<code>INV_NOT_EXIST_OR_NO_PRIV</code>	-24237	Raised by the <code>INVALIDATE</code> subprogram when the <code>object_id</code> argument is <code>NULL</code> or invalid, or when the caller does not have <code>CREATE</code> privileges on the object being invalidated
<code>INV_MALFORMED_SETTINGS</code>	-24238	Raised by the <code>INVALIDATE</code> subprogram if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
<code>INV_RESTRICTED_OBJECT</code>	-24239	Raised by the <code>INVALIDATE</code> subprogram when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

Summary of DBMS_UTILITY Subprograms

Table 140–3 DBMS_UTILITY Package Subprograms

Subprogram	Description
ACTIVE_INSTANCES Procedure on page 140-9	Returns the active instance
ANALYZE_PART_OBJECT Procedure on page 140-10	Analyzes the given tables and indexes
CANONICALIZE Procedure on page 140-11	Canonicalizes a given string
COMMA_TO_TABLE Procedures on page 140-12	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure on page 140-13	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure on page 140-14	Creates an error table to be used in the EXCEPTION clause of the ALTER TYPE statement
CURRENT_INSTANCE Function on page 140-15	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function on page 140-16	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function on page 140-17	Gets the file number part of a data block address
DB_VERSION Procedure on page 140-18	Returns version information for the database
EXEC_DDL_STATEMENT Procedure on page 140-19	Executes the DDL statement in parse_string
FORMAT_CALL_STACK Function on page 140-20	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function on page 140-21	Formats the backtrace from the point of the current error to the exception handler where the error has been caught
FORMAT_ERROR_STACK Function on page 140-24	Formats the current error stack
GET_CPU_TIME Function on page 140-25	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure on page 140-26	Shows the dependencies on the object passed in.
GET_HASH_VALUE Function on page 140-27	Computes a hash value for the given string
GET_PARAMETER_VALUE Function on page 140-28	Gets the value of specified init.ora parameter
GET_TIME Function on page 140-30	Finds out the current time in 100th's of a second
INVALIDATE Procedure on page 140-31	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_CLUSTER_DATABASE Function on page 140-34	Finds out if this database is running in cluster database mode

Table 140–3 (Cont.) DBMS_UTILITY Package Subprograms

Subprogram	Description
MAKE_DATA_BLOCK_ADDRESS Function on page 140-35	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure on page 140-36	Resolves the given name
NAME_TOKENIZE Procedure on page 140-38	Calls the parser to parse the given name
PORT_STRING Function on page 140-39	Returns a string that uniquely identifies the version of Oracle and the operating system
TABLE_TO_COMMA Procedures on page 140-40	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure on page 140-41	Makes invalid database objects valid

ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (  
    instance_table  OUT INSTANCE_TABLE,  
    instance_count  OUT NUMBER);
```

Parameters

Table 140–4 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
instance_table	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
instance_count	Number of active instances.

ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:

```
"ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>]
 [<command_opt>] [<sample_clause>]
```

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
  schema          IN VARCHAR2 DEFAULT NULL,
  object_name     IN VARCHAR2 DEFAULT NULL,
  object_type     IN CHAR      DEFAULT 'T',
  command_type    IN CHAR      DEFAULT 'E',
  command_opt     IN VARCHAR2  DEFAULT NULL,
  sample_clause   IN VARCHAR2  DEFAULT 'sample 5 percent ');
```

Parameters

Table 140–5 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name.
object_name	Name of object to be analyzed, must be partitioned.
object_type	Type of object, must be T (table) or I (index).
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	The sample clause to use when command_type is 'E'.

Usage Notes

For each partition of the object, run in parallel using job queues.

CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
  name          IN   VARCHAR2,
  canon_name    OUT  VARCHAR2,
  canon_len     IN   BINARY_INTEGER);
```

Parameters

Table 140–6 CANONICALIZE Procedure Parameters

Parameter	Description
name	The string to be canonicalized
canon_name	The canonicalized string
canon_len	The length of the string (in bytes) to canonicalize

Return Values

Returns the first `canon_len` bytes in `canon_name`.

Usage Notes

- If `name` is NULL, `canon_name` becomes NULL.
- If `name` is not a dotted name, and if `name` begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with `NLS_UPPER`. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If `name` is a dotted name (such as `a."b".c`), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with `NLS_UPPER` and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by `"."`.
- Any other character after `a[b]*` will be ignored.
- The procedure does not handle cases like `'A B.'`

Examples

- `a` becomes `A`
- `"a"` becomes `a`
- `"a".b` becomes `"a"."B"`
- `"a".b,c.f` becomes `"a"."B"` with `" , c . f "` ignored.

COMMA_TO_TABLE Procedures

These procedures convert a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list IN VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab OUT uncl_array);
```

```
DBMS_UTILITY.COMMA_TO_TABLE (
  list IN VARCHAR2,
  tablen OUT BINARY_INTEGER,
  tab OUT lname_array);
```

Parameters

Table 140–7 COMMA_TO_TABLE Procedure Parameters

Parameter	Description
list	Comma separated list of list of 'names', where a name should have the following format for the first overloading: a [. b [. c]][@ d] and the following format for the second overloading: a [. b]* where a, b, c, d are simple identifiers (quoted or unquoted).
tablen	Number of tables in the PL/SQL table.
tab	PL/SQL table which contains list of names.

Return Values

A PL/SQL table is returned, with values 1..n and n+1 is null.

Usage Notes

The `list` must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.

Entries in the comma-delimited list cannot include multibyte characters.

The values in `tab` are copied from the original list, with no transformations.

COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
  schema          VARCHAR2,
  compile_all     BOOLEAN DEFAULT TRUE,
  reuse_settings  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 140–8 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 140–9 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for [RECOMP_SERIAL Procedure](#) included with the [UTL_RECOMP](#) package.
- After calling this procedure, you should select from view `ALL_OBJECTS` for items with status of `INVALID` to see if all objects were successfully compiled.
- To see the errors associated with `INVALID` objects, you may use the Enterprise Manager command:

```
SHOW ERRORS <type> <schema>.<name>
```

CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table to be used in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(  
    schema_name    IN    VARCHAR2,  
    table_name     IN    VARCHAR2);
```

Parameters

Table 140–10 *CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters*

Parameter	Description
<code>schema_name</code>	The name of the schema.
<code>table_name</code>	The name of the table created.

Exceptions

An error is returned if the table already exists.

CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns NULL when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE  
RETURN NUMBER;
```

DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (  
    dba NUMBER)  
RETURN NUMBER;
```

Parameters

Table 140–11 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address.

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (  
    dba NUMBER)  
RETURN NUMBER;
```

Parameters

Table 140–12 DATA_BLOCK_ADDRESS_FILE Function Parameters

Parameter	Description
dba	Data block address.

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (  
    version      OUT VARCHAR2,  
    compatibility OUT VARCHAR2);
```

Parameters

Table 140–13 *DB_VERSION Procedure Parameters*

Parameter	Description
version	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
compatibility	The compatibility setting of the database determined by the "compatible" <code>init.ora</code> parameter. If the parameter is not specified in the <code>init.ora</code> file, then <code>NULL</code> is returned.

EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (  
    parse_string IN VARCHAR2);
```

Parameters

Table 140–14 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
<code>parse_string</code>	DDL statement to be executed.

FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK  
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

FORMAT_ERROR_BACKTRACE Function

This procedure displays the call stack at the point where an exception was raised, even if the procedure is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
          g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
          (Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

  or write an exception handler for this condition.
  Or you may need to contact your application administrator
  or database administrator.
*/
```

FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK  
RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

Return Values

See [FORMAT_ERROR_BACKTRACE Function](#) on page 140-21.

GET_CPU_TIME Function

This function returns the current CPU time in 100th's of a second. The returned CPU time is the number of 100th's of a second from some arbitrary epoch.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME  
RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

This subprogram reports cycles (CPU time) used in performing work, and is unrelated to clock time or any other fixed reference. Since the base line is rubricator, and the relationship between work performed and the number generated is Operating System specific, the amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

GET_DEPENDENCY Procedure

This procedure shows the dependencies on the object passed in.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY  
type          IN      VARCHAR2,  
schema        IN      VARCHAR2,  
name          IN      VARCHAR2);
```

Parameters

Table 140–15 *GET_DEPENDENCY Procedure Parameters*

Parameter	Description
type	The type of the object, for example if the object is a table give the type as 'TABLE'.
schema	The schema name of the object.
name	The name of the object.

Usage Notes

This procedure uses the [DBMS_OUTPUT](#) package to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
    name      VARCHAR2,
    base      NUMBER,
    hash_size NUMBER)
RETURN NUMBER;
```

Parameters

Table 140–16 *GET_HASH_VALUE Function Parameters*

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value to start at.
hash_size	Desired size of the hash table.

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.

GET_PARAMETER_VALUE Function

This function gets the value of specified `init.ora` parameter.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
    parnam      IN      VARCHAR2,
    intval      IN OUT  BINARY_INTEGER,
    strval      IN OUT  VARCHAR2,
    listno      IN      BINARY_INTEGER DEFAULT 1)
RETURN BINARY_INTEGER;
```

Parameters

Table 140–17 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
parnam	Parameter name.
intval	Value of an integer parameter or the value length of a string parameter.
strval	Value of a string parameter.
listno	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an INTEGER/BOOLEAN parameter
- 1 if parameter is a string/file parameter

Usage Notes

When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

```
utl_file_dir = /dir1
utl_file_dir = /dir2
```

However, the full comma-delimited string is returned if you are using:

```
utl_file_dir = /dir1, /dir2
```

Examples

```
DECLARE
    parnam VARCHAR2(256);
    intval BINARY_INTEGER;
    strval VARCHAR2(256);
    partyp BINARY_INTEGER;
BEGIN
    partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                              intval, strval);

    dbms_output.put('parameter value is: ');
    IF partyp = 1 THEN
        dbms_output.put_line(strval);
```

```
ELSE
    dbms_output.put_line(intval);
END IF;
IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
END IF;
dbms_output.put('parameter type is: ');
IF partyp = 1 THEN
    dbms_output.put_line('string');
ELSE
    dbms_output.put_line('integer');
END IF;
END;
```

GET_TIME Function

This function determines the current time in 100th's of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME  
    RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
  p_object_id          NUMBER,
  p_plsql_object_settings VARCHAR2 DEFAULT NULL,
  p_option_flags       PLS_INTEGER DEFAULT 0);
```

Parameters

Table 140–18 *INVALIDATE Procedure Parameters*

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.
p_plsql_object_settings	This optional parameter is ignored if the object specified by p_object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value has been specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	This parameter is optional and defaults to zero (no flags). Option flags supported by invalidate. <ul style="list-style-type: none"> inv_error_on_restrictions (see Constants on page 140-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.

Exceptions

Table 140–19 *INVALIDATE Exceptions*

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the <code>object_id</code> argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the <code>p_plsql_object_settings</code> parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the <code>p_object_id</code> parameter are contravened

Usage Notes

The object type (`object_type` column from ALL_OBJECTS) of the object specified by `p_object_id` must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

If the object specified by `p_object_id` is an object type specification and there exist tables which depend on the type and the flag `inv_error_on_restrictions` is specified in `p_option_flags` then the exception `inv_restricted_object` is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the `object_id` 1232 refers to the procedure `remove_emp` in the HR schema. Then the above call will mark the `remove_emp` procedure invalid and change its `PLSQL_OPTIMIZE_LEVEL` compiler setting to 2. The values of other compiler settings will remain unchanged since `REUSE SETTINGS` is specified.

Objects that depend on `hr.remove_emp` will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the `object_id` 40775 refers to the type body `leaf_category_typ` in the OE schema. Then the above call will mark the type body invalid and change its `PLSQL_CODE_TYPE` compiler setting to `NATIVE`. The values of other compiler settings will be picked up from the current session environment since `REUSE SETTINGS` has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the OE schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

IS_CLUSTER_DATABASE Function

This function finds out if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE  
RETURN BOOLEAN;
```

Return Values

This function returns TRUE if this instance was started in cluster database mode;
FALSE otherwise.

MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (  
    file NUMBER,  
    block NUMBER)  
RETURN NUMBER;
```

Parameters

Table 140–20 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
file	File that contains the block.
block	Offset of the block within the file in terms of block increments.

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
  name          IN  VARCHAR2,
  context       IN  NUMBER,
  schema        OUT VARCHAR2,
  part1         OUT VARCHAR2,
  part2         OUT VARCHAR2,
  dblink        OUT VARCHAR2,
  part1_type    OUT NUMBER,
  object_number OUT NUMBER);
```

Parameters

Table 140–21 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	<p>Name of the object.</p> <p>This can be of the form <code>[[a.]b.]c[@d]</code>, where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the <code>schema</code>, <code>part1</code>, <code>part2</code> and <code>dblink</code> OUT parameters are filled in.</p> <p>a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).</p>
context	<p>Must be an integer between 0 and 9.</p> <ul style="list-style-type: none"> ■ 0 - table ■ 1 - PL/SQL (for 2 part names) ■ 2 - sequences ■ 3 - trigger ■ 4 - Java Source ■ 5 - Java resource ■ 6 - Java class ■ 7 - type ■ 8 - Java shared data ■ 9 - index
schema	<p>Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.</p>
part1	<p>First part of the name. The type of this name is specified <code>part1_type</code> (synonym or package).</p>
part2	<p>If this is non-NULL, then this is a subprogram name. If <code>part1</code> is non-NULL, then the subprogram is within the package indicated by <code>part1</code>. If <code>part1</code> is NULL, then the subprogram is a top-level subprogram.</p>

Table 140–21 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
<code>dblink</code>	If this is non-NULL, then a database link was either specified as part of <code>name</code> or <code>name</code> was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the <code>DBMS_UTILITY.NAME_RESOLVE</code> procedure on this remote node.
<code>part1_type</code>	Type of <code>part1</code> is: <ul style="list-style-type: none">■ 5 - synonym■ 7 - procedure (top level)■ 8 - function (top level)■ 9 - package
<code>object_number</code>	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as "a [. b [. c]][@ dblink]". It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (  
    name      IN  VARCHAR2,  
    a         OUT VARCHAR2,  
    b         OUT VARCHAR2,  
    c         OUT VARCHAR2,  
    dblink    OUT VARCHAR2,  
    nextpos   OUT BINARY_INTEGER);
```

Parameters

For each of a, b, c, dblink, tell where the following token starts in anext, bnext, cnext, dnext respectively.

PORT_STRING Function

This function returns a string that identifies the operating system and the TWO TASK PROTOCOL version of the database. For example, "VAX/VMX-7.1.0.0"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING  
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

TABLE_TO_COMMA Procedures

These procedures convert a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, 1 . . n, terminated with n+1 null. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (  
    tab    IN UNCL_ARRAY,  
    tablen OUT BINARY_INTEGER,  
    list   OUT VARCHAR2);
```

```
DBMS_UTILITY.TABLE_TO_COMMA (  
    tab    IN lname_array,  
    tablen OUT BINARY_INTEGER,  
    list   OUT VARCHAR2);
```

Parameters

Table 140–22 *TABLE_TO_COMMA Procedure Parameters*

Parameter	Description
tab	PL/SQL table which contains list of table names.
tablen	Number of tables in the PL/SQL table.
list	Comma separated list of tables.

Return Values

A comma-delimited list and the number of elements found in the table.

VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id      NUMBER);
```

```
DBMS_UTILITY.VALIDATE(
    owner          VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER,
    edition_name   := SYS_CONTEXT ('USERENV', 'CURRENT_EDITION'));
```

Parameters

Table 140–23 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj\$. Equivalent numeric values are as follows: <ul style="list-style-type: none"> ■ 1 = TABLE/PROCEDURE/TYPE ■ 2 = BODY ■ 3 = TRIGGER ■ 4 = INDEX ■ 5 = CLUSTER ■ 8 = LOB ■ 9 = DIRECTORY ■ 10 = QUEUE ■ 11 = REPLICATION OBJECT GROUP ■ 12 = REPLICATION PROPAGATOR ■ 13 = JAVA SOURCE ■ 14 = JAVA RESOURCE ■ 58 = (Data Mining) MODEL
edition_name	[Note: Currently not operable. Reserved for future use]

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.

- The [INVALIDATE Procedure](#) invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

DBMS_WARNING

The `DBMS_WARNING` package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the `PLSQL_WARNINGS` initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- [Using DBMS_WARNING](#)
 - Security Model
- [Summary of DBMS_WARNING Subprograms](#)

Using DBMS_WARNING

- [Security Model](#)

Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

Summary of DBMS_WARNING Subprograms

Table 141-1 DBMS_WARNING Package Subprograms

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure on page 141-5	Modifies the current session or system warning settings of the <code>warning_category</code> previously supplied
ADD_WARNING_SETTING_NUM Procedure on page 141-6	Modifies the current session or system warning settings of the or <code>warning_number</code> previously supplied
GET_CATEGORY Function on page 141-7	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function on page 141-8	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function on page 141-9	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function on page 141-10	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure on page 141-11	Replaces previous settings with the new value

ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (ENABLE/DISABLE/ERROR) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
    warning_category    IN    VARCHAR2,
    warning_value       IN    VARCHAR2,
    scope               IN    VARCHAR2);
```

Parameters

Table 141–2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
<code>warning_category</code>	Name of the category. Allowed values are ALL, INFORMATIONAL, SEVERE and PERFORMANCE.
<code>warning_value</code>	Value for the category. Allowed values are ENABLE, DISABLE, and ERROR.
<code>scope</code>	Specifies if the changes are being performed in the session context or the system context. Allowed values are SESSION or SYSTEM.

ADD_WARNING_SETTING_NUM Procedure

You can modify the current *session* or *system* warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (*ENABLE* / *DISABLE* / *ERROR*) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (  
    warning_number    IN    NUMBER,  
    warning_value     IN    VARCHAR2,  
    scope             IN    VARCHAR2);
```

Parameters

Table 141–3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
warning_number	The warning number. Allowed values are all valid warning numbers.
warning_value	Value for the category. Allowed values are <i>ENABLE</i> , <i>DISABLE</i> , and <i>ERROR</i> .
scope	Specifies if the changes are being performed in the session context or the system context. Allowed values are <i>SESSION</i> or <i>SYSTEM</i> .

GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (  
    warning_number IN pls_integer)  
RETURN VARCHAR2;
```

Parameters

Table 141-4 *GET_CATEGORY Function Parameters*

Parameter	Description
warning_number	The warning message number.

GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (  
    warning_category IN VARCHAR2)  
RETURN warning_value;
```

Parameters

Table 141–5 *GET_WARNING_SETTING_CAT Function Parameters*

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (  
    warning_number    IN    NUMBER)  
RETURN warning_value;
```

Parameters

Table 141-6 *GET_WARNING_SETTING_NUM Function Parameters*

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING  
RETURN pls_integer;
```

Usage Notes

Use this function when you do not have `SELECT` privilege on `v$parameter` or `v$parameter2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

SET_WARNING_SETTING_STRING Procedure

This procedure replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an ALTER SESSION or SYSTEM SET PLSQL_WARNINGS command. This will have same effect as ALTER SESSION OR ALTER SYSTEM command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (  
    warning_value IN VARCHAR2,  
    scope         IN VARCHAR2);
```

Parameters

Table 141-7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
warning_value	The new string that will constitute the new value.
scope	This will specify if the changes are being done in the session context, or system context. Allowed values are SESSION or SYSTEM.

The DBMS_WM package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- [Documentation of DBMS_WM](#)

Documentation of DBMS_WM

For a complete description of this package, see DBMS_WM in *Oracle Database Workspace Manager Developer's Guide*.

DBMS_WORKLOAD_CAPTURE

The `DBMS_WORKLOAD_CAPTURE` package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the [DBMS_WORKLOAD_REPLAY](#) package.

See Also: *Oracle Database Real Application Testing User's Guide* for more information about "Database Replay"

This chapter contains the following topics:

- [Using DBMS_WORKLOAD_CAPTURE](#)
 - Overview
 - Security Model
- [Summary of DBMS_WORKLOAD_CAPTURE Subprograms](#)

Using DBMS_WORKLOAD_CAPTURE

- [Overview](#)
- [Security Model](#)

Overview

Since the capture infrastructure is instance wide (and RAC-wide) only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms

Security Model

The following code describes the minimal set of privileges required to

- Create directory objects
- Operate the interface provided by the DBMS_WORKLOAD_CAPTURE and DBMS_WORKLOAD_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that will be used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table lists the package subprograms in alphabetical order.

Table 143–1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedures on page 143-6	Adds a specified filter
DELETE_CAPTURE_INFO Procedure on page 143-7	Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID
DELETE_FILTER Procedure on page 143-8	Deletes a specified filter
EXPORT_AWR Procedure on page 143-9	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure on page 143-10	Finalizes the workload capture by signaling all connected sessions to stop capture and stopping future requests to the database from being captured
GET_CAPTURE_INFO Function on page 143-11	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID
IMPORT_AWR Function on page 143-12	Imports the AWR snapshots associated with a given capture ID
PROCESS_CAPTURE Procedure on page 143-13	Processes the workload capture found in capture_dir in place, analyzes it, and creates new workload replay specific metadata files that are required to replay the given workload capture.
REPORT Function on page 143-14	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates the series of actions that are part of the capture process

ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
  fname          IN  VARCHAR2 NOT NULL,
  fattribute     IN  VARCHAR2 NOT NULL,
  fvalue         IN  VARCHAR2 NOT NULL);
```

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
  fname          IN  VARCHAR2 NOT NULL,
  fattribute     IN  VARCHAR2 NOT NULL,
  fvalue         IN  NUMBER NOT NULL);
```

Parameters

Table 143–2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	A name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: <ul style="list-style-type: none"> ■ INSTANCE_NUMBER - type NUMBER ■ USER - type STRING ■ MODULE - type STRING ■ ACTION - type STRING ■ PROGRAM - type STRING ■ SERVICE - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute will be parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory)

Usage Notes

- The workload capture filters work in either the `DEFAULT INCLUSION` or the `DEFAULT EXCLUSION` mode as determined by the `default_action` input to the [START_CAPTURE Procedure](#).
- `ADD_FILTER` adds a new filter that will affect the next workload capture, and whether the filters will be considered as `INCLUSION` filters or `EXCLUSION` filters depends on the value of the `default_action` input to [START_CAPTURE Procedure](#).
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the [START_CAPTURE Procedure](#) is executed.
- All the filters are listed in the `DBA_WORKLOAD_FILTERS` view.

DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO  
  (capture_id IN NUMBER);
```

Parameters

Table 143–3 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (  
    filter_name          IN  VARCHAR2(40) NOT NULL);
```

Parameters

Table 143–4 *DELETE_FILTER Procedure Parameters*

Parameter	Description
<code>filter_name</code>	The filter to be deleted

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (  
    capture_id    IN NUMBER);
```

Parameters

Table 143–5 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure will work only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the [GET_CAPTURE_INFO Function](#)) and the AWR snapshots that correspond to the original capture time period are still available.

FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and then stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
  timeout      IN  NUMBER  DEFAULT 30
  reason       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 143–6 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush its capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason will appear in the column <code>ERROR_MESSAGE</code> of the view <code>DBA_WORKLOAD_CAPTURES</code> .

Usage Notes

- By default, `FINISH_CAPTURE` will wait for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while `FINISH_CAPTURE` was waiting for acknowledgements, will flush their buffers and send back their acknowledgement to `FINISH_CAPTURE`.
- If a database session remains idle (waiting for the next user request) throughout the duration of `FINISH_CAPTURE`, the session might have unflushed capture buffers and will not send its acknowledgement to `FINISH_CAPTURE`.
To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking `FINISH_CAPTURE`. Either close the database session(s) before running `FINISH_CAPTURE` or send new database requests to those sessions during `FINISH_CAPTURE`.

GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
  dir      IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 143–7 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA_WORKLOAD_CAPTURES, the [GET_CAPTURE_INFO Function](#) will simply return that row's DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row will be inserted to DBA_WORKLOAD_CAPTURES and that row's ID will be returned.

IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the [EXPORT_AWR Procedure](#).

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
  capture_id      IN  NUMBER,
  staging_schema  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 143–8 *IMPORT_AWR Function Parameters*

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory, Case sensitive).

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM\$_SNAPSHOT or WRH\$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place, analyzes it, and creates new workload replay specific metadata files that are required to replay the given workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.PROCESS_CAPTURE (
  capture_dir      IN VARCHAR2,
  parallel_level   IN NUMBER DEFAULT NULL);
```

Parameters

Table 143–9 *PROCESS_CAPTURE Procedure Parameters*

Parameter	Description
<code>capture_dir</code>	Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has appropriate permissions. New files will be added to this directory. (Mandatory)
<code>parallel_level</code>	Number of oracle processes used to process the capture in a parallel fashion. The <code>NULL</code> default value will auto-compute the parallelism level, whereas a value of 1 will enforce serial execution.

Usage Notes

This procedure can be run multiple times on the same capture directory, which is useful when it encounters unexpected errors or is cancelled by the user.

Once this procedure runs successfully, the `capture_dir` can be used as input to [INITIALIZE_REPLAY Procedure](#) in the `DBMS_WORKLOAD_REPLAY` package in order to replay the captured workload present in `capture_dir`.

REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
  capture_id      IN  NUMBER,
  format          IN  VARCHAR2)
RETURN CLOB;
```

Parameters

Table 143–10 *REPORT Function Parameters*

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB

Table 143–11 *Constants Used by Report Function*

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Use this as input to the format argument to generate the text version of the report.

START_CAPTURE Procedure

This procedure initiates a database wide workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
  name           IN VARCHAR2,
  dir            IN VARCHAR2,
  duration       IN NUMBER   DEFAULT NULL,
  default_action IN VARCHAR2 DEFAULT 'INCLUDE',
  auto_unrestrict IN BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 143–12 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name will be preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files will be stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture will continue until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. <ul style="list-style-type: none"> ▪ If INCLUDE, by default all user requests to the database will be captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures will be treated as EXCLUSION filters, determining the workload that will not be captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) ▪ If EXCLUDE, by default no user request to the database will be captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures will be treated as INCLUSION filters, determining the workload that will be captured.
auto_unrestrict	Can be either TRUE or FALSE. <ul style="list-style-type: none"> ▪ If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT will be automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) ▪ If FALSE, no database instance will be automatically unrestricted.

Usage Notes

- All user requests sent to database after a successful invocation of `START_CAPTURE` will be recorded in the given `dir` directory for the given duration provided that one was specified. If no duration was specified, the capture will last indefinitely until the [FINISH_CAPTURE Procedure](#) is executed.
- A workload capture once started will continue to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the [ADD_FILTER Procedures](#)) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests will be captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the [DBMS_SCHEDULER](#) package) will not be captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` will be `UNRESTRICTED` upon a successful invocation of `START_CAPTURE`. Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions will not be replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` will be replayed.

DBMS_WORKLOAD_REPLAY

The `DBMS_WORKLOAD_REPLAY` package provides an interface to replay a workload capture that was originally created by way of the `DBMS_WORKLOAD_CAPTURE` package. Typically, the `DBMS_WORKLOAD_CAPTURE` package will be used in the production system to capture a production workload, and the `DBMS_WORKLOAD_REPLAY` package will be subsequently used in a test system to replay the captured production workload for testing purposes.

See Also: *Oracle Database Real Application Testing User's Guide* for more information about "Database Replay"

This chapter contains the following topics:

- [Using DBMS_WORKLOAD_REPLAY](#)
 - Security Model
- [Summary of DBMS_WORKLOAD_REPLAY Subprograms](#)

Using DBMS_WORKLOAD_REPLAY

- [Security Model](#)

Security Model

The following code describes the minimal set of privileges required to

- Create directory objects
- Operate the interface provided by the DBMS_WORKLOAD_CAPTURE and DBMS_WORKLOAD_REPLAY packages
- Act as a replay client user (wrc someuser/somepassword or wrc USER=someuser PASSWORD=somepassword)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that will be used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table lists the package subprograms in alphabetical order.

Table 144-1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
CALIBRATE Function on page 144-5	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure on page 144-6	Cancels the workload replay in progress
DELETE_REPLAY_INFO Procedure on page 144-7	Deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID
EXPORT_AWR Procedure on page 144-8	Exports the AWR snapshots associated with a given replay ID
GET_REPLAY_INFO Function on page 144-9	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
IMPORT_AWR Function on page 144-10	Imports the AWR snapshots associated with a given replay ID
INITIALIZE_REPLAY Procedure on page 144-11	Initializes replay, and loads specific data produced during processing into the database
PAUSE_REPLAY Procedure on page 144-12	Pauses the in-progress workload replay
PREPARE_REPLAY Procedure on page 144-13	Puts the RDBMS in a special "Prepare" mode
PROCESS_CAPTURE Procedure on page 144-16	Processes the workload capture found in capture_dir in place
REMAP_CONNECTION Procedure on page 144-17	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.
REPORT Function on page 144-18	Generates a report on the given workload replay
RESUME_REPLAY Procedure on page 144-19	Resumes a paused workload replay
START_REPLAY Procedure on page 144-20	Starts the workload replay

CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
  capture_dir          IN VARCHAR2,
  process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
  threads_per_process  IN BINARY_INTEGER DEFAULT 50)
RETURN CLOB;
```

Parameters

Table 144–2 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of process allowed per CPU (default is 4)
threads_per_process	Maximum number of threads allowed per process (default is 50)

Return Values

Returns a CLOB formatted as XML, that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

```
$ wrc mode=calibrate replaydir=
```

CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (  
    error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 144–3 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which will be recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. DEFAULT is NULL

Usage Notes

Prerequisite: A call to the [INITIALIZE_REPLAY Procedure](#), or [PAUSE_REPLAY Procedure](#), or [START_REPLAY Procedure](#) was already issued.

DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (  
    replay_id    IN NUMBER);
```

Parameters

Table 144–4 *DELETE_REPLAY_INFO Procedure Parameters*

Parameter	Description
replay_id	ID of the workload replay that needs to be deleted. Corresponds To DBA_WORKLOAD_REPLAYS.ID (Mandatory)

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (  
    replay_id    IN NUMBER);
```

Parameters

Table 144–5 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	ID of the replay whose AWR snapshots should be exported. (Mandatory)

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the [GET_REPLAY_INFO Function](#)) and the AWR snapshots that correspond to that replay time period are still available.

GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
    dir    IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 144–6 GET_REPLAY_INFO Function Parameters

Parameter	Description
dir	Name of the workload replay directory object (case sensitive). (Mandatory)

Return Values

The procedure returns the CAPTURE_ID which can be associated with both DBA_WORKLOAD_CAPTURE_ID and DBA_WORKLOAD_REPLAYS.CAPTURE.ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then, imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.
- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
    replay_id      IN  NUMBER,
    staging_schema IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 144–7 *IMPORT_AWR Function Parameters*

Parameter	Description
replay_id	ID of the replay whose AWR snapshots should be exported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory)

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the `AWR_DBID` column in the `DBA_WORKLOAD_REPLAYS` view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the [EXPORT_AWR Procedure](#).
- `IMPORT_AWR` will fail if the `staging_schema` provided as input contains any tables with the same name as any of the AWR tables, such as `WRM$_SNAPSHOT` or `WRH$_PARAMETER`. Please drop any such tables in the `staging_schema` before invoking `IMPORT_AWR`.

INITIALIZE_REPLAY Procedure

This procedure puts the database state in INIT for REPLAY mode, and loads data into the replay system that is required before preparing for the replay (by executing the [PAUSE_REPLAY Procedure](#)).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
    replay_name      IN  VARCHAR2,
    replay_dir       IN  VARCHAR2);
```

Parameters

Table 144–8 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
replay_name	Name of the workload replay. Every replay of a processed workload capture can be given a name. (Mandatory)
replay_dir	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data

Usage Notes

- Prerequisites:
 - Workload capture was already processed using the [PROCESS_CAPTURE Procedure](#) in the same database version.
 - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the [PAUSE_REPLAY Procedure](#).

For instance, during capture we may record the connection string each session used to connect to the server. The [INITIALIZE_REPLAY Procedure](#) loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

Elaborating on the example described in the [PROCESS_CAPTURE Procedure](#), one could invoke the following:

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
```

This command will load up the connection map and by default will set all replay time connection strings to be equal to NULL. A NULL replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the [REMAP_CONNECTION Procedure](#).

PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay. All subsequent user calls from the replay clients will be stalled until either a call to the [RESUME_REPLAY Procedure](#) is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the [START_REPLAY Procedure](#) must have already been issued.
- User calls that were already in-progress when PAUSE_REPLAY was issued will be allowed to run to completion. Only subsequent user calls, when issued, will be paused.

PREPARE_REPLAY Procedure

This procedure puts the database state in `PREPARE FOR REPLAY` mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
    synchronization          IN BOOLEAN   DEFAULT TRUE,
    connect_time_scale      IN NUMBER   DEFAULT 100,
    think_time_scale        IN NUMBER   DEFAULT 100,
    think_time_auto_correct IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 144–9 *PREPARE_REPLAY Procedure Parameters*

Parameter	Description
<code>synchronization</code>	Turns synchronization ON or OFF during workload replay. When synchronization is ON, the COMMIT order observed during the original workload capture will be preserved during replay. Every action that is replayed will be executed ONLY AFTER all of it's dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution. DEFAULT is TRUE which preserves commit order.
<code>connect_time_scale</code>	Scales the time elapsed between the instant the workload capture was started and session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See Application of the connect_time_scale Parameter .
<code>think_time_scale</code>	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See Application of the think_time_scale Parameter .
<code>think_time_auto_correct</code>	Auto corrects the think time between calls appropriately when user calls takes longer time to complete during replay than how long the same user call took to complete during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See Application of the think_time_auto_correct Parameter

Usage Notes

- Prerequisites:
 - The database has been initialized for replay using the [INITIALIZE_REPLAY Procedure](#).
 - Any capture time connection strings that require remapping have been already done using the [REMAP_CONNECTION Procedure](#).
- One or more external replay clients (WRC) can be started once the `PREPARE_REPLAY` procedure has been executed.

Examples

Application of the `connect_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect (42m after)
```

If the `connect_time_scale` is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
12:05 : First session connect ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect (21m after)
```

If the `connect_time_scale` is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect (84m after)
```

Application of the `think_time_scale` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
       previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
       call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min (50% of 2m) after the completion of prev
       call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Application of the `think_time_auto_correct` Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the `think_time_scale` is 100 and the `think_time_auto_correct` is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
       call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
       call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
    capture_dir          IN  VARCHAR2);
```

Parameters

Table 144–10 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
<code>capture_dir</code>	Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files will be added to this directory. (Mandatory)

Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the `capture_dir` can be used as input to the [INITIALIZE_REPLAY Procedure](#) in order to replay the captured workload present in `capture_dir`.
- Before a workload capture can be replayed in a particular database version, the capture needs to be "processed" using this `PROCESS_CAPTURE` procedure in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload needs to be processed in version 11.1.0.1. The following procedure needs to be executed in a 11.1.0.1 database in order to process the capture directory `rec_dir`:

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
```

Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many number of times as required.

REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
  connection_id      IN  NUMBER,
  replay_connection  IN  VARCHAR2);
```

Parameters

Table 144–11 REMAP_CONNECTION Procedure Parameters

Parameter	Description
connection_id	ID of the connection to be remapped. Corresponds to DBA_WORKLOAD_CONNECTION_MAP.CONN_ID
replay_connection	New connection string to be used during replay

Usage Notes

- By default, all instances of `replay_connection` will be equal to `NULL`. When `replay_connection` is `NULL` (default), replay sessions will connect to the default host as determined by the replay client's runtime environment. Consequently, if no capture time connect strings are remapped, then all the replay sessions will simply connect to the default host to replay the workload.
- A valid `replay_connection` should specify a connect identifier or a service point. Please refer to the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that will be used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
  replay_id      IN NUMBER,
  format         IN VARCHAR2 )
RETURN CLOB;
```

Parameters

Table 144–12 *REPORT Function Parameters*

Parameter	Description
replay_id	Specifies the ID of the workload replay whose report is requested. (Mandatory)
format	Specifies the report format. Valid values are XML, HTML, or TEXT. (Mandatory)

Return Values

The report body in the desired format returned as a CLOB

Table 144–13 *Constants Used by Report Function*

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Use this as input to the <code>format</code> argument to generate the text version of the report.
TYPE_XML	VARCHAR2(3)	'XML'	Generates the XML version of the report

RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the [PAUSE_REPLAY Procedure](#) must have already been issued.

START_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified and those replay clients (WRC) will begin issuing the captured workload.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
 - The call to the [PAUSE_REPLAY Procedure](#) was already issued.
 - Enough number of external replay clients (WRC) that can faithfully replay the captured workload have already been started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

```
$ wrc mode=calibrate replaydir=.
```

DBMS_WORKLOAD_REPOSITORY

The DBMS_WORKLOAD_REPOSITORY package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

See Also: *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

- [Using DBMS_WORKLOAD_REPOSITORY](#)
 - Examples
- [Data Structures](#)
- [Summary of DBMS_WORKLOAD_REPOSITORY Subprograms](#)

Using DBMS_WORKLOAD_REPOSITORY

This section contains topics which relate to using the DBMS_WORKLOAD_REPOSITORY package.

- [Examples](#)

Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
  DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
    1557521192, 1, 5390, 5392) );
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (`awrrpt.sql` in this case) for the packaged function, which prompts the user for required information.

Data Structures

The `DBMS_WORKLOAD_REPOSITORY` package defines an object and associated table type.

OBJECT Types

- [AWR_BASELINE_METRIC_TYPE](#) Object Type

TABLE Types

- [AWR_BASELINE_METRIC_TYPE_TABLE](#) Table Type

AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE breakpoint_info AS OBJECT (
  baseline_name      VARCHAR2(64),
  dbid               NUMBER NOT NULL,
  instance_number    NUMBER NOT NULL,
  beg_time           DATE NOT NULL,
  end_time           DATE NOT NULL,
  metric_id          NUMBER NOT NULL,
  metric_name        VARCHAR2(64) NOT NULL,
  metric_unit        VARCHAR2(64) NOT NULL,
  num_interval       NUMBER NOT NULL,
  interval_size      NUMBER NOT NULL,
  average            NUMBER NOT NULL,
  minimum            NUMBER NOT NULL,
  maximum            NUMBER NOT NULL);
```

Fields

Table 145–1 *RUNTIME_INFO* Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the [SELECT_BASELINE_METRICS Function](#).

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Table 145–2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ASH_REPORT_HTML Function on page 145-9	Displays the ASH report in HTML
ASH_REPORT_TEXT Function on page 145-11	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function on page 145-13	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function on page 145-14	Displays the AWR Diff-Diff report in text
AWR_REPORT_HTML Function on page 145-15	Displays the AWR report in HTML
AWR_REPORT_TEXT Function on page 145-16	Displays the AWR report in text
AWR_SQL_REPORT_HTML Function on page 145-17	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function on page 145-18	Displays the AWR SQL Report in text format
CREATE_BASELINE Functions & Procedures on page 145-19	Creates a single baseline
CREATE_BASELINE_TEMPLATE Procedures on page 145-19	Creates a baseline template
CREATE_SNAPSHOT Function and Procedure on page 145-22	Creates a manual snapshot immediately
DROP_BASELINE Procedure on page 145-23	Drops a range of snapshots
DROP_BASELINE_TEMPLATE Procedure on page 145-24	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure on page 145-25	Activates service
MODIFY_SNAPSHOT_SETTINGS Procedures on page 145-26	Modifies the snapshot settings
MODIFY_BASELINE_WINDOW_SIZE Procedure on page 145-28	Modifies the window size for the Default Moving Window Baseline
RENAME_BASELINE Procedure on page 145-30	Renames a baseline
SELECT_BASELINE_METRICS Function on page 145-31	Shows the values of the metrics corresponding to a baseline

ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a TOP SQL). Capture occurs if the SQL is found in the cursor cache at snapshot time.

To uncolor the SQL, invoke the [REMOVE_COLORED_SQL Procedure](#).

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(  
    sql_id          IN VARCHAR2,  
    dbid           IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
sql_id	13-character external SQL ID
dbid	Optional dbid, defaults to Local DBID

ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
  l_dbid          IN NUMBER,
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime         IN DATE,
  l_options       IN NUMBER          DEFAULT 0,
  l_slot_width    IN NUMBER          DEFAULT 0,
  l_sid           IN NUMBER          DEFAULT NULL,
  l_sql_id        IN VARCHAR2        DEFAULT NULL,
  l_wait_class    IN VARCHAR2        DEFAULT NULL,
  l_service_hash  IN NUMBER          DEFAULT NULL,
  l_module        IN VARCHAR2        DEFAULT NULL,
  l_action        IN VARCHAR2        DEFAULT NULL,
  l_client_id     IN VARCHAR2        DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2        DEFAULT NULL)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 145–4 ASH_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpt.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 145-5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code>)	Yes

ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT (
  l_dbid          IN NUMBER,
  l_inst_num      IN NUMBER,
  l_btime         IN DATE,
  l_etime        IN DATE,
  l_options       IN NUMBER          DEFAULT 0,
  l_slot_width    IN NUMBER          DEFAULT 0,
  l_sid           IN NUMBER          DEFAULT NULL,
  l_sql_id        IN VARCHAR2        DEFAULT NULL,
  l_wait_class    IN VARCHAR2        DEFAULT NULL,
  l_service_hash  IN NUMBER          DEFAULT NULL,
  l_module        IN VARCHAR2        DEFAULT NULL,
  l_action        IN VARCHAR2        DEFAULT NULL,
  l_client_id     IN VARCHAR2        DEFAULT NULL,
  l_plsql_entry   IN VARCHAR2        DEFAULT NULL)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 145–6 ASH_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Return Values

The output will be one column of VARCHAR2 (80).

Usage Notes

- You can call the function directly but Oracle recommends you use the `ashrpt.sql` script which prompts users for the required information.
- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as `SQL_ID 'abcdefghijkl123'` pass that `sql_id` value to the `l_sql_id` argument:

```
l_sql_id => 'abcdefghijkl123'
```

Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on `MODULE "PAYROLL"` and `ACTION "PROCESS"`, use the following predicate:

```
l_module => 'PAYROLL', l_action => 'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type `VARCHAR2`.

Table 145–7 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
<code>l_sid</code>	Session ID (for example, <code>V\$SESSION.SID</code>)	No
<code>l_sql_id</code>	SQL ID (for example, <code>V\$SQL.SQL_ID</code>)	Yes
<code>l_wait_class</code>	Wait class name (for example, <code>V\$EVENT_NAME.WAIT_CLASS</code>)	Yes
<code>l_service_hash</code>	Service name hash (for example, <code>V\$ACTIVE_SERVICES.NAME_HASH</code>)	No
<code>l_module</code>	Module name (for example, <code>V\$SESSION.MODULE</code>)	Yes
<code>l_action</code>	Action name (for example, <code>V\$SESSION.ACTION</code>)	Yes
<code>l_client_id</code>	Client ID for end-to-end backtracing (for example, <code>V\$SESSION.CLIENT_IDENTIFIER</code>)	Yes
<code>l_plsql_entry</code>	PL/SQL entry point (for example, <code>"SYS.DBMS_LOB.*"</code>)	Yes

AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML (
  dbid1      IN NUMBER,
  inst_num1  IN NUMBER,
  bid1       IN NUMBER,
  eid1       IN NUMBER,
  dbid2      IN NUMBER,
  inst_num2  IN NUMBER,
  bid2       IN NUMBER,
  eid2       IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

Parameters

Table 145–8 AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrd rpt . sql` script which prompts users for the required information.

AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT (
    dbid1      IN NUMBER,
    inst_num1  IN NUMBER,
    bid1       IN NUMBER,
    eid1       IN NUMBER,
    dbid2      IN NUMBER,
    inst_num2  IN NUMBER,
    bid2       IN NUMBER,
    eid2       IN NUMBER)
RETURN awrd rpt_text_type_table PIPELINED;
```

Parameters

Table 145–9 AWR_DIFF_REPORT_TEXT Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrd rpt . sql` script which prompts users for the required information.

AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
  l_dbid      IN      NUMBER,
  l_inst_num  IN      NUMBER,
  l_bid       IN      NUMBER,
  l_eid       IN      NUMBER,
  l_options   IN      NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 145–10 AWR_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> ▪ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2 (150).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 145–11 AWR_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: <ul style="list-style-type: none"> ▪ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2 (80).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_sqlid     IN    VARCHAR2,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 145–12 AWR_SQL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2 (500).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
  l_dbid      IN    NUMBER,
  l_inst_num  IN    NUMBER,
  l_bid       IN    NUMBER,
  l_eid       IN    NUMBER,
  l_sqlid     IN    VARCHAR2,
  l_options   IN    NUMBER DEFAULT 0)
RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 145–13 AWR_SQL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2 (120).

Usage Notes

You can call the function directly but Oracle recommends you use the `awrsqrpt.sql` script which prompts users for the required information.

CREATE_BASELINE Functions & Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_snap_id   IN NUMBER,
  end_snap_id     IN NUMBER,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_snap_id   IN NUMBER,
  end_snap_id     IN NUMBER,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL)
RETURN NUMBER;
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
```

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
  start_time      IN DATE,
  end_time        IN DATE,
  baseline_name   IN VARCHAR2,
  dbid            IN NUMBER DEFAULT NULL,
  expiration      IN NUMBER DEFAULT NULL);
RETURN NUMBER;
```

Parameters

Table 145–14 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline'
end_snap_id	End snapshot sequence number for the baseline
start_time	Start time for the baseline'
end_time	End time for the baseline
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.

- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,  
end_snap_id => 107,  
baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name       IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
  day_of_week         IN VARCHAR2,
  hour_in_day         IN NUMBER,
  duration            IN NUMBER,
  start_time          IN DATE,
  end_time            IN DATE,
  baseline_name_prefix IN VARCHAR2,
  template_name       IN VARCHAR2,
  expiration          IN NUMBER,
  dbid                IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–15 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(  
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL');  
  
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(  
    flush_level IN VARCHAR2 DEFAULT 'TYPICAL')  
    RETURN NUMBER;
```

Parameters

Table 145–16 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	Flush level for the snapshot is either 'TYPICAL' or 'ALL'

Examples

This example creates a manual snapshot at the TYPICAL level:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.

DROP_BASELINE Procedure

This procedure drops a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
  baseline_name IN VARCHAR2,
  cascade       IN BOOLEAN DEFAULT FALSE,
  dbid          IN NUMBER DEFAULT NULL);
```

Parameters

Table 145–17 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

Examples
